[1] The water quality targets for copper in the TMDL are expressed as the copper water quality criteria from the federal California Toxics Rule (CTR). Those criteria include a numerical threshold multiplied by a water-effect ratio (WER). The WER has a default value of 1.0 unless a site-specific WER is approved. To use a WER other than the default of 1.0, a study must be conducted consistent with USEPA's WER guidance and adopted by the Regional Board through the state's basin plan amendment process. A WER study for Mugu Lagoon (Reach 1), lower Calleguas Creek (Reach 2), Revolon Slough (Reach 4) and Beardsley Wash (Reach 5) has been submitted to the Regional Board. If the Regional Board approves site-specific WERs for copper in these waterbodies, the TMDL targets will be modified in accordance with all legal and regulatory requirements and implemented in accordance with the approved WERs using the equations set forth above.

[2] Sediment targets were not selected as alternative target for this reach as it is not on the 303(d) list.

[3] Sediment targets are based on screening levels endorsed by the National Oceanic and Atmospheric Administration (NOAA) in their Screening Quick Reference Tables (SQuiRTs) (Buchman, 1999)

Mercury Targets

Media	Target
Fish Tissue (Human Health)	0.3 mg methylmercury/kg wet weight
Fish Tissue (Wildlife)	
*** Trophic Level (TL) 3[1]<50 mm**	0.03 mg methylmercury/kg wet weight
*** TL3 50-150 mm**	0.05 mg methylmercury/kg wet weight
*** TL3 150-350 mm**	0.1 mg methylmercury/kg wet weight
Bird Egg (Wildlife)	less than 0.5 mg total mercury/kg wet weight
Water Column	0.051 ug total mercury/L

[1] Trophic Level 3: Predators (e.g., minnows, sunfish) on trophic level 2 organism (e.g., copepods and water fleas)

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Numeric Targets (continued)	**Nickel Targets**

Subwatershed	Water Quality Target (ug dissolved Nickel/L)		Sediment Target[1] (SQuiRTs, ERL) (ppb dry weight)
	Dry Weather CCC	Wet Weather CMC	
Mugu Lagoon	8.2	74	20900
Calleguas Creek 2	8.2	74	NA[2]
Calleguas Creek 3	149	856	NA[2]
Revolon/Beardsley	8.2	74	NA[2]
Conejo	160	1292	NA[2]
Arroyo Simi/Las Posas	168	958	NA[2]

[1] Sediment targets are based on screening levels endorsed by the National Oceanic and Atmospheric Administration (NOAA) in their Screening Quick Reference Tables (SQuiRTs) (Buchman, 1999)

[2] Sediment targets were not selected as alternative target for this reach as it is not listed on the 303(d) list.

A study to support a site specific objective (SSO) for nickel has been submitted to the Regional Board and is currently under reviewed by the Regional Board and U.S. EPA staff. If a SSO for nickel is approved, the Regional Board will consider revision to the numeric targets for nickel based on the approved SSO.

Selenium Targets

Subwatershed	Water Quality Target (ug total selenium/L)		Bird Egg (ug/g)
	Dry Weather CCC	Wet Weather CMC	
Mugu Lagoon	71	290	6
Calleguas Creek 2	5	290	6
Calleguas Creek 3	5	NA[1]	6
Revolon/Beardsley	5	290	6
Conejo	5	NA[1]	6
Arroyo Simi/Las Posas	5	NA[1]	6

[1] "NA" indicates that a target is not available for this constituent because criterion for fresh water is not defined in the CTR.

[2] Sediment targets were not selected as alternative target for this reach because it is not on the 303(d) list.
</td></tr>
<tr><td>Source Analysis</td><td>Significant sources of metals and selenium include urban runoff, agricultural runoff, groundwater seepage, and POTW effluent. For mercury, open space was also a significant source. Sources were also analyzed as a function of wet and dry weather. Higher loads were delivered during wet weather for all constituents, due to the association between metals and particulate matter.

The source analysis indicates naturally occurring mercury in soil may be a significant source, and that naturally occurring nickel, copper, zinc, and selenium in soil may be a contributing source, and that naturally occurring selenium in groundwater may be a significant source. The TMDL Implementation Plan includes special studies to further assess natural sources of metals in soil.</td></tr>
<tr><td>Linkage Analysis</td><td>Linkage between sources and instream pollutant concentrations was established through a dynamic water quality Hydrologic Simulation Program – FORTRAN (HSPF). The model output generally resulted in a conservative estimate of receiving water concentrations for metals. The model was used to calculate load reductions necessary to meet the numeric targets.The load reductions were used to calculate the load and waste load allocations.</td></tr>
<tr><td>Waste Load Allocations</td><td>In the case of copper, nickel, and selenium, waste load allocations (WLAs) were developed for both wet and dry-weather. The dry-weather WLAs apply to days when flows in the stream are less than the 86th percentile flow rate for each reach. The wet-weather WLAs apply to days when flows in the stream exceed the 86th percentile flow rate for each reach. Annual mass loads of mercury in suspended sediment were developed according to low, medium, and high annual flow categories.</td></tr>
</table>

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Waste Load Allocations (continued)	**Publicly Owned Treatment Works (POTWs)** Concentration-based and mass-based WLAs are established for copper, and nickel, in total recoverable forms, and are applied to POTWs during both wet and dry weather. Mass-based WLAs are developed for mercury for POTWs. Zinc allocations are not set because current information indicate that numeric targets for zinc are attained. The TMDL Implementation Plan includes a task to provide State Board data to support delisting of zinc. Waste load allocations for selenium are not set for POTWs because POTWs do not discharge to reaches listed for selenium. Interim limits are included to allow time for dischargers to put in place implementation measures necessary to achieve final waste load allocations. The daily maximum and monthly average interim limits are set equal to the 99th and 95th percentile of available discharge data, respectively. **Interim and Final WLAs for Total Recoverable Copper in Water Column**

POTW	Interim		Final[1]		
	Daily Maximum (ug/L)	Monthly Average (ug/L)	Daily Maximum (ug/L)[2]	Monthly Average (ug/L)[2]	lb/day
Hill Canyon WWTP	20.0	16.0	(a)	(a)	0.11*WER - 0.04
Simi Valley WQCP	(b)	(b)	31.0	30.5	(c)
Moorpark WTP	(b)	(b)	31.0	30.5	(d)
Camarillo WRP	57.0	20.0	(a)	(a)	0.12*WER - 0.04
Camrosa WRP	(b)	(b)	27.4	27.0	(d)

[1] If site-specific WERs are approved by the Regional Board, TMDL waste load allocations shall be implemented in accordance with the approved WERs using the equations set forth above. Regardless of the final WERs, total copper loading shall not exceed current loading. In addition, effluent concentrations shall not exceed the performance standards of current treatment technologies.

[2] Concentration-based targets have been converted to total recoverable allocations using the CTR default translator of 0.96

(a) Concentration-based final limits will be included in the permits in accordance with NPDES guidance and requirements, but are not calculated as part of the TMDL.

(b) Interim limits are not required because the discharger is meeting the final limits.

(c) Discharges from Simi Valley WQCP do not reach lower Calleguas Creek and Mugu lagoon during dry weather. Monitoring will be conducted and mass-based WLAs will be evaluated if targets are not met in Arroyo Simi/Las Posas or downstream reaches.

(d) Discharger does not contribute loading during dry weather. Concentration-based WLAs apply during wet weather when discharges occur. Monitoring will be conducted and mass-based WLAs will be evaluated if targets are not met in receiving water and/or downstream reaches.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Waste Load Allocations (continued)	**Interim and Final WLAs for Total Recoverable Nickel in Water Column**

POTW	Interim		Final

[1] If site-specific WERs are approved by the Regional Board, TMDL waste load allocations shall be implemented in accordance with the approved WERs using the equations set forth above. Regardless of the final WERs, total copper loading shall not exceed current loading. In addition, effluent concentrations shall not exceed the performance standards of current treatment technologies

[2] Concentration-based targets have been converted to total recoverable allocations using the CTR default translator of 0.96 for freshwater reaches and 0.83 for saltwater reaches.

[3] Concentration-based targets have been converted to total recoverable allocations using the CTR default translator of 0.997 for freshwater reaches and 0.99 for saltwater reaches.

(a) Discharges from these reaches do not reach lower Calleguas Creek and Mugu Lagoon during dry weather. Allocations are not required for these reaches.

(b) Selenium waste load allocations have not been developed for this reach as it is not on the 303(d) list.

Final WLAs for Mercury

There is insufficient information to assign mass based WLAs to these sources. Therefore concentration-based waste loads allocations are set equal to 0.051 ug/L for other NPDES dischargers based on the CTR water column target for protection of human health from consumption organism only.

Load Allocation	Mass-based load allocations (LAs) for agriculture, and open space are developed for copper, nickel, and selenium in total recoverable forms. Open space represents background loads from ambient sources (i.e. natural soil concentrations, atmospheric deposition, and natural groundwater seepage) discharged from undeveloped open space, but not ambient sources that are discharged from developed land, such as agricultural and urban areas. LAs are developed for both wet and dry-weather. The dry-weather LAs apply to days when flows in the stream are less than 86th percentile flow rate for each reach. The wet-weather LAs apply to days when flows in the stream exceed 86th percentile flow rate for each reach. Annual mass loads of mercury in suspended sediment were developed according to low, medium, and high annual flow categories.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Load Allocation	**Interim and Final Load Allocations for Total Recoverable Copper, Nickel, and Selenium**

Interim limits are included to allow time for dischargers to put in place implementation measures necessary to achieve final load allocations. The daily maximum and monthly average interim limits are set equal to the 99th and 95th percentile of available discharge data. Interim limits and final load allocations are applied in receiving water at the compliance points.

A. Interim Limits

Constituents	Calleguas and Conejo Creek			Revolon Slough		
	Dry Daily Maximum (ug/L)	Dry Monthly Average (ug/L)	Wet Daily Maximum (ug/L)	Dry Daily Maximum (ug/L)	Dry Monthly Average (ug/L)	Wet Daily Maximum (ug/L)

Q Daily storm volume

Interim and Final LAs for Mercury in Suspended Sediment

Final LAs are set at 80% reduction of HSPF load estimates. Interim limits for mercury in suspended sediment are set equal to the highest annual load within each flow category, based on HSPF output for the years 1993-2003

Flow Range	Calleguas Creek				Revolon Slough			
	Agriculture		Open Space		Agriculture		Open Space	
	Interim (lbs/yr)	Final (lbs/yr)	Interim (lbs/yr)	Final (lbs/yr)	Interim (lbs/yr)	Final (lbs/yr)	Interim (lbs/yr)	Final (lbs/yr)
0-15,000 MGY[1]	3.9	0.5	5.5	0.7	2	.	2.9	0.2
15,000-25,000 MGY	12.6	1.9	17.6	2 .7	4.8	0.8	6.7	1.1
Above 25,000 MGY	77.5	11.2	108.4	17.9	12.2	2.2	17.1	2

MGY: million gallons per year.

Margin of Safety	A margin of safety (MOS) for the TMDL is designed to address any uncertainty in the analysis that could result in targets not being achieved in the water bodies. Both implicit and explicit MOS are included for this TMDL. The implicit MOS stems from 1) the use of conservative assumptions made during development of multiple numeric targets to ensure sufficient protection under all conditions, and 2) conservative methods employed in developing the TMDL. Background loads are assigned to the TMDL and assumed to remain constant throughout implementation of the TMDL. This results in higher required reductions for the other sources. Calculation of allocations is based on never exceeding numeric target concentrations more than once in three years as specified in the CTR. Calculations of current loads and loading capacity for Mugu Lagoon are based on the combined discharges from Calleguas Creek and Revolon Slough (without any dilution provided by tidal flushing), which over predicts actual concentrations in the Lagoon. A 15% explicit MOS is also included for copper and nickel to account for the uncertainty resulting from the calculation of the allowable load based on the median flow rate and translator of each flow category. The 15% explicit MOS is determined sufficient to address the elevated flow category, but still account for the more conservative nature of low and average category.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Future Growth	Ventura County accounts for slightly more than 2% of the state's residents with a population of 753,197 (US Census Bureau, 2000). GIS analysis of the 2000 census data yields a population estimate of 334,000 for the CCW, which equals about 44% of the county population. According to the Southern California Association of Governments (SCAG), growth in Ventura County averaged about 51% per decade from 1900-2000; with growth exceeding 70% in the 1920s, 1950s, and 1960s. Significant population growth is expected to occur within and near present city limits until at least 2020. Future growth may initially increase loadings as construction activities expose bare soil and increase erosion-related discharges to receiving water. However, once development has been completed the presence of impermeable land surface and landscaped areas may reduce the amount of natural soils that are eroded and carried to the stream. For copper, future growth could increase loadings from urban areas and POTWs due to increased traffic (i.e., brake pad residues), architectural copper use and corrosion of copper pipes. Selenium loading may increase if increased irrigation raises the groundwater table and increases high selenium groundwater seepage to surface waters. However, if increased growth results in increased water demand and high selenium groundwater is pumped and treated to supply this demand, the selenium could decrease.
Seasonal Variations and Critical Conditions	Seasonal variations are addressed for copper, nickel, and selenium by developing separate allocations for wet and dry weather. Critical conditions for copper, nickel, and selenium were developed using model results to calculate the maximum observed 4-day average dry weather concentration and the associated flow condition. Wet weather, as a whole, is defined as a critical condition. For mercury, there is no indication that mercury contamination in Mugu Lagoon is consistently exacerbated at any particular time of the year. Since the potential effects of mercury are related to bioaccumulation in the food chain over a long period time, any other short term variations in concentration which might occur are not likely to cause significant impacts upon beneficial uses. Therefore, seasonal variations do not affect critical conditions for the Calleguas Creek watershed mercury TMDL.
Special Studies and Monitoring Plan	<u>Special Studies</u> Several special studies are planned to improve understanding of key aspects related to achievement of WLAs and LAs for the Metals and Selenium TMDL ***1. Special Study #1 (Optional) – Evaluation and Initiation of Natural Sources Exclusion*** The TMDL technical report has identified ambient sources as the primary significant selenium and mercury loadings in the watershed and as potentially significant sources of copper and nickel. The portion of all ambient sources associated with open space runoff and natural groundwater seepage is accounted for in this TMDL as "background load." This special study will evaluate whether or not background loads for each constituent qualify for natural source exclusion.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Special Studies and Monitoring Plan (continued)	This study will also consider whether any portion of the ambient source contribution for agricultural or urban runoff loads qualify for natural source exclusions and/or provide a basis for site specific objectives. The presence of natural sources makes achievement of selenium and mercury targets during all conditions unlikely. For copper, achievement of the CTR targets or the WER based targets (if approved) in Revolon Slough may not be feasible due to the magnitude of background loads. Completion of site specific objectives and/or a use attainability analysis shall be required to review any potential change to water quality objectives for these constituents. This special study will be used to develop the necessary information to revise the water quality objectives for selenium and mercury and possibly for copper and nickel. ***2. Special Study #2 – Identification of selenium contaminated Groundwater Sources*** The purpose of this special study will be to identify groundwater with high concentrations of selenium that is either being discharged directly to the stream or used as irrigation water. The investigation will focus on areas where groundwater has a high probability of reaching the stream and identify practical actions to reduce the discharge of the groundwater to the stream. The analysis will include an assessment of the availability of alternative water supplies for irrigation water, the costs of the alternative water supplies and the costs of reducing groundwater discharges. ***3. Special Study #3– Investigation of Soil Concentrations and Identification of "Hot Spots"*** The purpose of this special study will be to identify terrestrial areas with high concentrations of metals and/or selenium, either due to anthropogenic sources or resulting from high natural concentrations in soils. Use of detailed soil maps for the watershed in combination with field survey and soil sampling may lead to identification of areas important for reducing overall loads reaching the stream. Identification of any areas with elevated soil concentrations of metals and/or selenium would create an opportunity for efficient and targeted implementation actions, such as remediation or erosion control. ***4. Special Study #4 (Optional) – Determination of Water Effect Ratio for Copper in Revolon Slough*** The purpose of this optional special study would be to calculate a WER for copper that is specific to Revolon Slough. A WER was not previously developed for Revolon Slough because it was not listed for copper. Subsequent monitoring demonstrated that the saltwater copper CTR criterion was exceeded in Revolon Slough. This Study would parallel the developed WER for Mugu Lagoon and Calleguas Creek. This is an optional special study to be conducted if desired by the stakeholders or determined necessary by the Executive Officer.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Special Studies and Monitoring Plan (continued)	***5. Special Study #5 (Optional) – Determination of Site-Specific Objectives for Mercury and Selenium*** Special Study #1 will evaluate whether a natural source exclusion is appropriate for background loads of mercury and selenium or any portion of the ambient source contributions to non-background loads in the Calleguas Creek watershed. This special study will develop any SSOs deemed necessary to account for the background conditions and/or site-specific impacts of mercury and selenium (and possibly for copper and nickel) on wildlife and humans in the watershed. This is an optional special study to be conducted if desired by the stakeholders or determined necessary for establishing a natural source exclusion. **<u>Monitoring Plan</u>** The Calleguas Creek Watershed TMDL Monitoring Plan (CCWTMP) is designed to monitor and evaluate the implementation of this TMDL and refine the understanding of metal and selenium loads. CCWTMP is intended to parallel efforts of the Calleguas Creek Watershed Nutrients TMDL, Toxicity TMDL, and OC Pesticide, PCBs, and Sediment TMDL monitoring programs. The proposed CCWTMP shall be made available for public review before approval by the Executive Officer. The goals of the CCWTMP include: (1) to determine compliance with copper, mercury, nickel, and selenium numeric targets at receiving water monitoring stations and at POTWs discharges; (2) to determine compliance with waste load and load allocations for copper, mercury, nickel, and selenium at receiving water monitoring stations and at POTWs discharges; (3) to monitor the effect of implementation action by PSDs, POTW, agricultural dischargers, and other NPDES permittees on in-stream water quality; and (4) to implement the CCWTMP in a manner consistent with other TMDL implementation plans and regulatory actions within the Calleguas Creek watershed. Monitoring conducted through the Conditional Waiver for Disharges from Irrigated Lands (Conditional Waiver Program) may meet part of the needs of the CCWTMP. To the extent monitoring required by the Metals and Selenium TMDL Implementation Plan parallels monitoring required by the Conditional Waiver Program, monitoring shall be coordinated with monitoring conducted by individuals and groups subject to the term and conditions of the Conditional Waiver Program.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Special Studies and Monitoring Plan (continued)	Monitoring will begin within one year of the effective date of the TMDL. For the first year, in-stream water column samples will be collected monthly for analysis of general water quality constituents (GWQC), copper, mercury, nickel, selenium, and zinc. After the first year, the Executive Officer will review the monitoring report and revise the monitoring frequency as appropriate. In-stream water column samples will be generally be collected at the base of Revolon Slough and Calleguas Creek, and in Mugu Lagoon (collection of flow-based samples will occur above the tidal prism). Additionally, sediment samples will be collected semi-annually in Mugu Lagoon and analyzed for sediment toxicity resulting from copper, mercury, nickel, selenium, and zinc. At such a time as numeric targets are consistently met at these points, an additional site or sites will be considered for monitoring to ensure numeric targets are met throughout the lower watershed. Additional samples will be collected concurrently at stations that are representative of agricultural and urban runoff as well as at POTWs in each of the subwatersheds and analyzed for GWQCs, copper, mercury, nickel, selenium, and zinc. The location of these stations will be determined before initiation of the CCWTMP. Environmentally relevant detection limits will be used for metals and selenium (i.e. detection limits lower than applicable target), if available at a commercial laboratory. Compliance sampling station locations:

Subwatershed	Station ID	Station Location	Constituent
Mugu Lagoon	01-11-BR	11th Street Bridge	Water Column: Cu, Ni, Hg, Se, Zn
			Bird Egg: Hg, Se
			Fish Tisue: Hg, Se
			Sediment: Cu, Ni, Hg, Se, Zn
Revolon Slough	04-WOOD	Revolon Slough East Side of Wood Road	Water Column: Cu, Ni, Hg, Se, Zn
			Fish Tisue: Hg, Se
Calleguas Creek	03-CAMAR	Calleguas Creek at University Drive	Water Column: Cu, Ni, Hg, Se, Zn
	03D-CAMR	Camrosa Water Reclamation Plant	Water Column: Cu, Ni, Hg, Se, Zn
	9AD-CAMA	Camarillo Water Reclamation Plant	Water Column: Cu, Ni, Hg, Se, Zn
Conejo Creek	10D-HILL	Hill Canyon Wastew ater Treatment Plant	Water Column: Cu, Ni, Hg, Se, Zn

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Implementation Plan	The final WLAs will be included for permitted stormwater discharges, POTWs, and other NPDES discharges in accordance with the compliance schedules provided in Table 7-19.2. The Regional Board may revise these WLAs based on additional information developed through special studies and/or monitoring conducted as part of this TMDL. In addition, the implementation schedule was developed with the assumption that a WER for copper and a SSO for nickel will proceed following the TMDL. Should adoption and approvals of the WER and SSO not proceed, additional implementation actions could be required. The implementation plan includes discussion of implementation actions to address these conditions. WLAs established for Simi Valley WQCP, Camrosa WRP, and Moorpark WTP in this TMDL will be implemented through NPDES permit limits. Compliance will be determined through monitoring of final effluent discharge as defined in the NPDES permit. The Hill Canyon and Camarillo WRPs are working towards discontinuing the discharge of effluent to Conejo Creek. If this plan is implemented, the POTW allocations for the watershed will be achieved by reduction of effluent discharges to the stream. The implementation plan includes sufficient time for this plan to be implemented. However, if this plan is altered, the POTWs will need to meet allocations through other methods such as source control activities. The Regional Board will need to ensure that permit conditions are consistent with the assumptions of the WLAs. Should federal, state, or regional guidance or practice for implementing WLAs into permits be revised, the Regional Board may reevaluate the TMDL to incorporate such guidance. In accordance with current practice, a group concentration-based WLA has been developed for all permitted stormwater discharges, including municipal separate storm sewer systems (MS4s), Caltrans, general industrial and construction stormwater permits, and Naval Air Weapons Station Point Mugu. MS4 WLAs will be incorporated into the NPDES permit as receiving water limits measured in-stream at the base of Revolon Slough and Calleguas Creek, and in Mugu Lagoon and will be achieved through the implementation of BMPs as outlined in the implementation plan. The Regional Board will need to ensure that permit conditions are consistent with the assumptions of the WLAs. If BMPs are to be used, the Regional Board will need to detail its findings and conclusions supporting the use of BMPs in the NPDES permit fact sheets. Should federal, state, or regional guidance or practice for implementing WLAs into permits be revised, the Regional Board may reevaluate the TMDL to incorporate such guidance. The Regional Board may revise these WLAs based on the collection of additional information developed through special studies and/or monitoring conducted as part of this TMDL.

TMDL Element	Calleguas Creek Watershed Metals and Selenium TMDL
Implementation Plan (continued)	LAs will be implemented through the State's Nonpoint Source Pollution Control Program (NPSPCP) and Conditional Waiver for Discharges from Irrigated Lands adopted by the Los Angeles Regional Water Quality Control Board on November 3, 2005. Compliance with LAs will be measured in-stream at the base of Revolon Slough and Calleguas Creek and in Mugu Lagoon and will be achieved through the implementation of BMPs consistent with the NPSPCP and the Conditional Waiver Program. The Conditional Waiver Program requires the development of an agricultural water quality management plan (AWQMP) to address pollutants that are exceeding receiving water quality objectives as a result of agricultural discharges. Therefore, implementation of the load allocations will be through the development of an AWQMP for metals and selenium. Implementation of the load allocations will also include the coordination of BMPs being implemented under other required programs to ensure metal discharges are considered in the implementation. Additionally, agricultural dischargers will participate in educational seminars on the implementation of BMPs as required under the Conditional Waiver Program. Studies are currently being conducted to assess the extent of BMP implementation and provide information on the effectiveness of BMPs for agriculture. This information will be integrated into the AWQMP that will guide the implementation of agricultural BMPs in the Calleguas Creek watershed. After implementation of these actions, compliance with the allocations and TMDL will be evaluated and the allocations reconsidered if necessary based on the special studies and monitoring plan section of the implementation plan Agricultural and PSDs dischargers will have a required 25%, 50% and 100% reduction in the difference between the current loadings and the load allocations at 5, 10 and 15 years after the effective date, respectively. Achievement of required reductions will be evaluated based on progress towards BMP implementation as outlined in the UWQMPs, AWQMP, Conditional Waiver Program, and in consideration of background loading information, if available. If the interim reductions are not met, the dischargers will submit a report to the Executive Officer detailing why the reductions were not met and the steps that will be taken to meet the required reductions. As shown in Table 7-19.2, implementation of LAs will be conducted over a period of time to allow for implementation of the BMPs, as well as coordination with special studies and implementation actions resulting from other TMDL Implementation Plans for the Calleguas Creek watershed. The Regional Board may revise the LAs based on the collection of additional information developed through special studies and/or monitoring conducted as part of this TMDL.

Table 7-19.2 Calleguas Creek Watershed Metals and Selenium TMDL: Implementation Schedule

Item	Implementation Action[1]	Responsible Party	Completion Date
1	Effective date of interim Metals and Selenium TMDL waste load allocation (WLAs), and final WLAs for other NPDES permittees	POTWs, Permitted Stormwater Dischargers[2] (PSD), Other NPDES Permittees	Effective date of the amendment
2	Effective date of interim Metals and Selenium TMDL load allocation (LAs)	Agricultural Dischargers	Effective date of the amendment
3a	Submit Calleguas Creek Watershed Metals and Selenium Monitoring Program	POTWs, PSD, Agricultural Dischargers	Within 3 months after the effective date of the amendment
3b	Implement Calleguas Creek Watershed Metals and Selenium Monitoring Program	POTWs, PSD, Agricultural Dischargers	Within 3 months of Executive Officer approval of the monitoring program
3c	Re-calibrate HSPF water quality model based on first year of monitoring data	POTWs, PSD, Agricultural Dischargers	1 year after submittal of first annual monitoring report
4a	Conduct a source control study, develop and submit an Urban Water Quality Management Program (UWQMP) for copper, mercury, nickel, and selenium	MS4s	Within 2 years after the effective date of the amendment
4b	Conduct a source control study, develop and submit an UWQMP for copper, mercury, nickel, and selenium	Caltrans	Within 2 years after the effective date of the amendment
4c	Conduct a source control study, develop and submit an UWQMP for copper, mercury, nickel, and selenium	NAWS point Mugu (US Navy)	Within 2 years after the effective date of the amendment
5	Implement UWQMP	PSD	Within 1 year of approval of UWQMP by the Executive Officer
6	Develop and submit an Agricultural Water Quality Management Program (AWQMP) as described in the Conditional Waiver Program	Agricultural Dischargers	Within 2 years after the effective date of the amendment
7	Implement AWQMP	Agricultural Dischargers	Within 1 year of approval of AWQMP by the Executive Officer
8	Develop WLAs and LAs for zinc if impairment for Mugu Lagoon is maintained on the final 2006 303(d) list	Regional Board or USEPA	Within 1 year of the final 2006 303(d) list
9	Submit progress report on salinity management plan, including status of reducing WRP effluent discharges to Conejo and Calleguas Creek reaches of the watershed	POTWs	Within 3 years after the effective date of the amendment
10	If progress report identifies the effluent discharges reduction is not progressing, develop and implement source control activities for copper, mercury, nickel, and selenium	POTWs	Within 4 years after the effective date of the amendment

Item	Implementation Action[1]	Responsible Party	Completion Date
11	Re-evaluation of POTW interim waste load allocations for copper, mercury, and nickel	POTWs	Within 5 years after the effective date of the amendment
12a	Evaluate the results of the OCs TMDL, Special Study – Calculation of sediment transport rates in the Calleguas Creek watershed for applicability to the metals and selenium TMDL	Agricultural Dischargers, PSD	Within 6 months of completion of the study
12b	Include monitoring for copper, mercury, nickel, and selenium in the OC pesticides TMDL, special Study – Monitoring of sediment by source and land use type	Agricultural Dischargers, PSD	Within 2 years after the effective date of the amendment
12c	Expand scope of the OC Pesticide TMDL, Special Study – Examination of food webs and accumulation in the Calleguas Creek watershed to ensure protection of wildlife to include mercury	Interested parties	If necessary, prior to end of the implementation period
12d	Evaluate the results of the OC Pesticides TMDL, Special Study – Effects of BMPs on Sediment and Siltation to determine the impacts on metals and selenium	Agricultural Dischargers, PSD	Within 6 months of completion of the study
13a	Submit work plan for Special Study #1 (Optional) – Identification of Natural Sources Exclusion	Agricultural Dischargers, PSD	Within 1 year after the effective date of the amendment
13b	Submit results of Special Study #1 (Optional) – Identification of Natural Sources Exclusion	Agricultural Dischargers, PSD	Within 3 years of approval of workplan by Executive Officer
14a	Submit work plan for Special Study #2 – Identification of selenium Contaminated Groundwater Sources	POTWs, PSD, and Agricultural Dischargers	Within 1 year after the effective date of the amendment
14b	Submit results of Special Study #2 – Identification of selenium Contaminated Groundwater Sources	POTWs, PSD, and Agricultural Dischargers	Within 1 year of approval of workplan by Executive Officer
15a	Submit work plan for Special Study #3 – Investigation of Metals' "Hot Spot" and Natural Soil	PSD and Agricultural Discharger	Within 1 year after the effective date of the amendment
15b	Submit results of Special Study #3 – Investigation of metals' "Hot Spot" and Natural Soil	PSD and Agricultural Discharger	Within 2 years of approval of workplan by Executive Officer
16	Special Study #4 (Optional) – Determination of WER for copper in Revolon Slough	PSD and Agricultural Dischargers	If necessary, prior to end of the implementation period
17	Special Study #5 (Optional) – Determination of Site Specific Objective for Mercury and Selenium	PSD and Agricultural Dischargers	If necessary, prior to end of the implementation period
18	Evaluate effectiveness of BMPs implemented under the AWQMP and UWQMP in controlling metals and selenium discharges	PSD and Agricultural Dischargers	6 years after the effective date of the amendment
19	Evaluate the results of implementation actions 14 and 15 (Special Study #2 & #3) and implement actions identified by the studies	POTWs, PSD, and Agricultural Dischargers	Within 1 year after the completion of the studies

Item	Implementation Action[1]	Responsible Party	Completion Date
20	If needed, implement additional BMPs or revise existing BMPs to address any issues not covered by implementation efforts of related Calleguas Creek watershed TMDLs (Nutrients, Toxicity, OC Pesticides, PCBs, and Siltation) and the Conditional Waiver Program	Agricultural Dischargers	7 years after the effective date of the amendment
21	Consider nickel SSO proposed by stakeholders	Regional Board	1 years after the effective date of the amendment
22	Publicly notice tentative copper water effects ratio for Regional Board consideration, if deemed appropriate based on peer review	Regional Board Staff	Within 2 months of receipt of peer review comments
23	Based on the result from items 1-23, Regional Board will consider re-evaluation of the TMDLs, WLAs, and LAs if necessary	Regional Board	2 years from submittal of information necessary for re-evaluation
24	POTWs will be required to reduce loadings by 50%, and 100% of the difference between the current loading and the WLAs at 8 and 10 years after the effective date, respectively.	POTWs	8 and 10 years after the effective date of the amendment
25	Re-evaluation of Agricultural and Urban load and waste load allocations for copper, mercury, nickel, and selenium based on the evaluation of BMP effectiveness. Agricultural and urban dischargers will have a required 25%, 50%, and 100% reduction in the difference between the current loadings and the load allocations at 5, 10, and 15 years after the effective date, respectively.	Agricultural and PSDs	5, 10, and 15 years after the effective date of the amendment
26	Stakeholders and Regional Board staff will provide information items to the Regional Board, including: progress toward meeting TMDL load reductions, water quality data, and a summary of implementation activities completed to date	Regional Board	2 years after the effective date, and every 2 years following
27	Achievement of Final WLAs and attainment of water quality standards for copper, mercury, nickel, and selenium	POTWs	Within 10 years after the effective date of the amendment[3]
28	Achievement of Final WLAs and LAs and attainment of water quality standards for copper, nickel, mercury and selenium	Agricultural Dischargers, PSD	Within 15 years after the effective date of the amendment[3]

1 The Regional Board regulatory programs addressing all discharges in effect at the time this implementation task is due may contain requirements substantially similar to the requirements of these implementation tasks. If such requirements are in place in another regulatory program including other TMDLs, the Executive Officer may revise or eliminate this implementation task to coordinate this TMDL implementation plan with other regulatory programs.

2 Permitted Stormwater Dischargers (PSD) include MS4s, Caltrans, the Naval Air Weapons Station at Point Mugu, and general industrial and construction permittees.

3 Date of achievement of WLAs and LAs based on the estimated timeframe for educational programs, special studies, and implementation of appropriate BMPs and associated monitoring. The Conditional Waiver Program will set timeframes for the BMP management plans.

7-21 Ballona Creek, Ballona Estuary, and Sepulveda Channel Bacteria TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on June 8, 2006.

This TMDL was approved by:
The State Water Resources Control Board on November 15, 2006.
The Office of Administrative Law on February 20, 2007.
The U.S. Environmental Protection Agency on March 26, 2007.

The effective date of this TMDL is: April 27, 2007.

The following table includes all the elements of this TMDL.

Table 7-21.1. Ballona Creek, Estuary, and Tributaries Bacteria TMDL: Elements

Element	Key Findings and Regulatory Provisions
Problem Statement	Elevated bacterial indicator densities are causing impairment of the water contact recreation (REC-1) beneficial use designated for Ballona Estuary and Sepulveda Channel, limited water contact recreation (LREC) designated for Ballona Creek Reach 2, and non-contact recreation (REC-2) beneficial uses of Ballona Creek Reach 1. Recreating in waters with elevated bacterial indicator densities has long been associated with adverse human health effects. Specifically, local and national epidemiological studies compel the conclusion that there is a causal relationship between adverse health effects and recreational water quality, as measured by bacterial indicator densities.
Numeric Target (Interpretation of the numeric water quality objective, used to calculate the waste load allocations)	The TMDL has a multi-part numeric target based on the bacteriological water quality objectives for marine and fresh water to protect the contact and non-contact recreation uses. These targets are the most appropriate indicators of public health risk in recreational waters. These bacteriological objectives are set forth in Chapter 3 of the Basin Plan.[1] The objectives are based on four bacterial indicators and include both geometric mean limits and single sample limits. The Basin Plan objectives that serve as the numeric targets for this TMDL are: **In Marine Waters Designated for Water Contact Recreation (REC-1)** 1. Geometric Mean Limits a. Total coliform density shall not exceed 1,000/100 ml. b. Fecal coliform density shall not exceed 200/100 ml. c. Enterococcus density shall not exceed 35/100 ml. 2. Single Sample Limits a. Total coliform density shall not exceed 10,000/100 ml. b. Fecal coliform density shall not exceed 400/100 ml. c. Enterococcus density shall not exceed 104/100 ml. d. Total coliform density shall not exceed 1,000/100 ml, if the ratio of fecal-to-total coliform exceeds 0.1.

Element	Key Findings and Regulatory Provisions
Numeric Target (Interpretation of the numeric water quality objective, used to calculate the waste load allocations) (continued)	**In Fresh Waters Designated for Water Contact Recreation (REC-1)** 1. Geometric Mean Limits a. *E. coli* density shall not exceed 126/100 ml. b. Fecal coliform density shall not exceed 200/100 ml. 2. Single Sample Limits a. *E. coli* density shall not exceed 235/100 ml. b. Fecal coliform density shall not exceed 400/100 ml. In Fresh Waters Designated for Limited Water Contact Recreation (LREC-1)[2] 1. Geometric Mean Limits a. *E. coli* density shall not exceed 126/100 ml. b. Fecal coliform density shall not exceed 200/100 ml. 2. Single Sample Limits a. *E. coli* density shall not exceed 576/100 ml. **In Fresh Waters Designated for Non-Contact Water Recreation (REC-2)** 1. Geometric Mean Limits a. Fecal coliform density shall not exceed 2000/100 ml. 2. Single Sample Limits a. Fecal coliform density shall not exceed 4000/100 ml. The targets apply throughout the year. Determination of attainment of the targets will be at in-stream monitoring sites to be specified in the compliance monitoring report. Implementation of the above REC-1 and LREC-1 bacteria objectives and the associated TMDL numeric targets is achieved using a 'reference system/anti-degradation approach' rather than the alternative 'natural sources exclusion approach subject to antidegradation policies' or strict application of the single sample objectives. As required by the CWA and Porter-Cologne Water Quality Control Act, Basin Plans include beneficial uses of waters, water quality objectives to protect those uses, an anti-degradation policy, collectively referred to as water quality standards, and other plans and policies necessary to implement water quality standards. This TMDL and its associated waste load allocations, which shall be incorporated into relevant permits, and load allocations are the vehicles for implementation of the Region's standards.

Element	Key Findings and Regulatory Provisions
Numeric Target (Interpretation of the numeric water quality objective, used to calculate the waste load allocations) (continued)	The 'reference system/anti-degradation approach' means that on the basis of historical exceedance levels at existing monitoring locations, including a local reference beach within Santa Monica Bay, a certain number of daily exceedances of the single sample bacteria objectives are permitted. The allowable number of exceedance days is set such that (1) bacteriological water quality at any site is at least as good as at a designated reference site within the watershed and (2) there is no degradation of existing bacteriological water quality. This approach recognizes that there are natural sources of bacteria that may cause or contribute to exceedances of the single sample objectives and that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas. The geometric mean targets may not be exceeded at any time. The rolling 30-day geometric means will be calculated on each day. If weekly sampling is conducted, the weekly sample result will be assigned to the remaining days of the week in order to calculate the daily rolling 30-day geometric mean. For the single sample targets, each existing monitoring site is assigned an allowable number of exceedance days for three time periods (1) summer dry-weather (April 1 to October 31), (2) winter dry-weather (November 1 to March 31), and (3) wet-weather (defined as days with 0.1 inch of rain or greater and the three days following the rain event.) Implementation of the REC-2 target will be as specified in the Basin Plan. The REC-2 bacteria objectives allow for a 10% exceedance frequency of the single sample limit in samples collected during a 30-day period. This allowance, which is based on an acceptable level of health risk, will be applied in lieu of the allowable exceedance days discussed earlier. As with the other REC-1 and LREC-1 objectives, the geometric mean target for REC-2, which is based on a rolling 30-day period, will be strictly adhered to and may not be exceeded at any time.
Source Analysis	The major contributors of flows and associated bacteria loading to Ballona Creek and Estuary, are dry- and wet-weather urban runoff discharges from the storm water conveyance system. Run-off to Ballona Creek is regulated as a point source under the Los Angeles County MS4 Permit, the Caltrans Storm Water Permit, and the General Construction and Industrial Storm Water Permits. In addition to these regulated point sources, the Ballona Estuary receives input from the Del Rey Lagoon and Ballona Wetlands through connecting tide gates.

Element	Key Findings and Regulatory Provisions
Source Analysis (continued)	Preliminary data suggest that the Ballona Wetlands are a sink for bacteria from Ballona Creek and it is therefore not considered a source in this TMDL. Inputs to Ballona Estuary from Del Rey Lagoon, are considered non-point sources of bacterial contamination. This waterbody may be considered for a natural source exclusion if its contributing bacteria loads are determined to be as a result of wildlife in the area, as opposed to anthropogenic inputs. The TMDL will require a source identification study for the lagoon in order to apply the natural source exclusion. Other nonpoint sources in Ballona Creek and Estuary include natural sources from birds, waterfowl and other wildlife. Data do not currently exist to quantify the extent of the impact of wildlife on bacteria water quality in the Estuary.
Loading Capacity	The loading capacity is defined in terms of bacterial indicator densities, which is the most appropriate for addressing public health risk, and is equivalent to the numeric targets, listed above.
Waste Load Allocations (for point sources)	The Los Angeles County MS4 and Caltrans storm water permittees and co-permittees are assigned waste load allocations (WLAs) expressed as the number of daily or weekly sample days that may exceed the single sample targets equal to the TMDLs established for the impaired reaches (see Table 7.21.2a), and Waste Load Allocations assigned to waters tributary to impaired reaches (Table 7.21.2b). Waste load allocations are expressed as allowable exceedance days because the bacterial density and frequency of single sample exceedances are the most relevant to public health protection. For each monitoring site, allowable exceedance days are set on an annual basis as well as for three time periods. These three periods are: 1. summer dry-weather (April 1 to October 31) 2. winter dry-weather (November 1 to March 31) 3. wet-weather days (defined as days of 0.1 inch of rain or more plus three days following the rain event). The County of Los Angeles, Caltrans, and the Cities of Los Angeles, Culver City, Beverly Hills, Inglewood, West Hollywood, and Santa Monica are the responsible jurisdictions and responsible agencies[3] for the Ballona Creek Watershed. The responsible jurisdictions and responsible agencies within the watershed are jointly responsible for complying with the waste load allocation in each reach.

Element	Key Findings and Regulatory Provisions
Waste Load Allocations (for point sources) (continued)	For the single sample objectives of the impaired REC-1 and LREC-1 reaches, the proposed WLA for summer dry-weather are zero (0) days of allowable exceedances, and those for winter dry-weather and wet-weather are three (3) days and seventeen (17) days of exceedance, respectively. In the instances where more than one single sample objective applies, exceedance of any one of the limits constitutes an exceedance day. The proposed waste load allocation for the rolling 30-day geometric mean for the responsible agencies and jurisdictions is zero (0) days of allowable exceedances. For the single sample objectives of the impaired REC-2 reach, the proposed WLA for all periods is a 10% exceedance frequency of the REC-2 single sample water quality objectives. The proposed waste load allocation for the rolling 30-day geometric mean for the responsible agencies and jurisdictions is zero (0) days of allowable exceedances. In addition to assigning TMDLs for the impaired reaches, Waste Load Allocations and Load Allocations are assigned to the tributaries to these impaired reaches. These WLAs and LAs are to be met at the confluence of each tributary and its downstream reach (see Table 7.21.2b).
Load Allocations (for nonpoint sources)	Load allocations are expressed as the number of daily or weekly sample days that may exceed the single sample targets identified under "Numeric Target" at a monitoring site, along with a rolling 30-day geometric mean. Load allocations are expressed as allowable exceedance days because the bacterial density and frequency of single sample exceedances are the most relevant to public health protection. Del Rey Lagoon is considered a nonpoint source and is therefore subject to load allocations. The proposed LA for summer dry-weather are zero (0) days of allowable exceedances, and those for winter dry-weather and wet-weather are three (3) days and seventeen (17) days of exceedance, respectively. In the instances where more than one single sample objective applies, exceedance of any one of the limits constitutes an exceedance day. The proposed load allocation for the rolling 30-day geometric mean for the responsible agencies and jurisdictions is zero (0) days of allowable exceedances (see Table 7.21.2a). The City of Los Angeles is the responsible jurisdiction for the Del Rey lagoon, and is responsible for complying with the assigned load allocations presented in Table 7.21.2b at the tide gate(s) between the Lagoon and the Estuary. If other unidentified nonpoint sources are directly impacting bacteriological water quality and causing an exceedance of the numeric targets, within the Estuary, the permittee(s) under the Municipal Storm Water NPDES Permits are not responsible through these permits. However, the jurisdiction or agency adjacent to the monitoring location may have further obligations to identify such sources.

Element	Key Findings and Regulatory Provisions
Implementation	The regulatory mechanisms used to implement the TMDL will include the Los Angeles County Municipal Storm Water NPDES Permit (MS4), the Caltrans Storm Water Permit, general NPDES permits, general industrial storm water permits, general construction storm water permits, and the authority contained in Sections 13263 and 13267 of the Water Code. Each NPDES permit assigned a WLA shall be reopened or amended at re-issuance, in accordance with applicable laws, to incorporate the applicable WLAs as a permit requirement. Each responsible jurisdictions and agency will be required to meet the storm water waste load allocations shared by the LA County MS4 and Caltrans permittees at the designated TMDL effectiveness monitoring points. An iterative implementation approach using a combination of non-structural and structural BMPs may be used to achieve compliance with the waste load allocations. The administrative record and the fact sheets for the MS4 and Caltrans storm water permits must provide reasonable assurance that the BMPs selected will be sufficient to implement the waste load allocation. Load allocations for nonpoint sources will be incorporated into Waste Discharge Requirements and MOUs with the responsible jurisdictional agencies. This TMDL will be implemented in two phases over a ten-year period (see Table 7-21.3). Within six years of the effective date of the TMDL, compliance with the allowable number of summer dry-weather (April 1 to October 31), winter dry-weather exceedance days (November 1 to March 31) and the rolling 30-day geometric mean targets for both periods must be achieved. Within ten years of the effective date of the TMDL, compliance with the allowable number of wet-weather exceedance days and rolling 30-day geometric mean targets must be achieved. In order to clearly justify an extended implementation schedule beyond 10 years and up to 14 years from the effective date of the TMDL, the responsible agencies are required to submit additional quantifiable analyses as described below to demonstrate (1) the proposed plans will meet the final WLAs and (2) the proposed implementation actions will achieve multiple water quality benefits and other public goals. The types of approaches proposed coupled with quantifiable estimates of the integrated water resources benefits of the proposed structural and non-structural BMPs included in the Implementation Plan would provide the obligatory demonstration that an integrated water resources approach is being pursued. This demonstration shall include numeric estimates of the benefits, including but not limited to reductions in other pollutants, groundwater recharged, acres of multi-use projects and water (e.g. urban runoff) beneficially reused.

Element	Key Findings and Regulatory Provisions
Implementation (continued)	The responsible jurisdictions and the responsible agencies must submit a report to the Executive Officer (see Table 7-21.3) describing how they intend to comply with the dry-weather and wet-weather WLAs. As the primary jurisdiction, the City of Los Angeles is responsible for submitting the implementation plan report described above. In addition, as the responsible agency for Del Rey Lagoon, the City of Los Angeles must submit a report detailing how it intends to comply with the load allocations assigned to this waterbody. Alternatively, the City of Los Angeles may submit data clearly demonstrating that Del Rey Lagoon is not a source, for the Regional Board's consideration.. The Regional Board intends to reconsider this TMDL, within 4 years of its effective date to incorporate modifications to the WLAs based on results of the scheduled reconsideration of the Santa Monica Bay (SMB) beaches TMDLs. The SMB beaches TMDLs are scheduled to be reconsidered in four years to re-evaluate the allowable winter dry-weather and wet-weather exceedance days based on additional data on bacterial indicator densities in the wave wash; to re-evaluate the reference system selected to set allowable exceedance levels; to re-evaluate the reference year used in the calculation of allowable exceedance days, and to re-evaluate the need for revision of the geometric mean implementation provision. The Regional Board also intends to re-asses the WLAs for Benedict Canyon Channel, Sepulveda Channel, and Centinela Creek based on results of the required compliance monitoring, and/or any voluntary beneficial use investigations.
Margin of Safety	By directly applying the numeric water quality standards and implementation procedures as Waste Load Allocations, there is little uncertainty about whether meeting the TMDLs will result in meeting the water quality standards.
Seasonal Variations and Critical Conditions	Seasonal variations are addressed by developing separate waste load allocations for three time periods (summer dry-weather, winter-dry weather, and wet-weather) based on public health concerns and observed natural background levels of exceedance of bacterial indicators. The critical condition for bacteria loading to the Ballona Creek, Ballona Estuary, and Sepulveda Channel is during wet weather when monitoring data indicate greater exceedance probabilities of the single sample bacteria objectives than during dry-weather.

Element	Key Findings and Regulatory Provisions
Seasonal Variations and Critical Conditions (continued)	The Santa Monica Bay Beaches Bacteria TMDL identified the critical condition within wet weather more specifically, in order to set the allowable number of exceedances of the single sample limit days. The 90th percentile storm year in terms of wet days was used as the reference year. The 90th percentile year was selected for several reasons. First, selecting the 90th percentile year avoids an untenable situation where the reference system is frequently out of compliance. Second, selecting the 90th percentile year allows responsible jurisdictions and responsible agencies to plan for a 'worst-case scenario', as a critical condition is intended to do.
Monitoring	The TMDL effectiveness monitoring program will assess attainment of the allowable exceedances for Ballona Creek, Ballona Estuary, and Sepulveda Channel, and the WLAs for the tributaries. Responsible jurisdictions and responsible agencies shall conduct daily or systematic weekly sampling at a minimum of two locations within Ballona Estuary and Reach 2 of Ballona Creek, at least one location each in Reach 1 of Ballona Creek and Sepulveda Channel, and at the confluence with Centinela Creek and Benedict Canyon Channel, to determine compliance. Similar monitoring at the connecting tide gates of Del Rey Lagoon is also required. Where monitoring locations are located at or close to the boundary of two reaches, data from sampling points will also be used to assess the immediate downstream reach. This will ensure that the downstream reaches, which have more stringent water quality objectives, are adequately protected. If the number of exceedance days is greater than the allowable number of exceedance days in the REC-1 and LREC-1 waters, and/or the frequency of exceedance is greater than 10% in the REC-2 waters, the responsible jurisdictions and/or responsible agencies shall be considered not to be attaining the TMDLs and/or assigned allocations (non-attaining). Responsible jurisdictions or agencies shall not be deemed non-attaining if the investigation described in the paragraph below demonstrates that bacterial sources originating within the jurisdiction of the responsible agency have not caused or contributed to the exceedance. If an in-stream location is non-attaining as determined in the previous paragraph, the Regional Board shall require responsible agencies to initiate an investigation, which at a minimum shall include daily sampling at the existing monitoring location until all single sample events meet bacteria water quality objectives.

Element	Key Findings and Regulatory Provisions
Special Studies	Should the jurisdictional agency for Del Rey Lagoon opt for the natural source exclusion, the TMDL requires that a separate bacteria source identification study be conducted to determine its eligibility. The study should identify all probable sources of bacteria loads, their estimated contributions to the Lagoon, and a determination of the frequency of exceedances of the single sample bacteria objectives caused by the identified natural sources.

1 The bacteriological objectives were revised by a Basin Plan amendment adopted by the Regional Board on October 25, 2001, and subsequently approved by the State Water Resources Control Board, the Office of Administrative Law and finally by U.S. EPA on September 25, 2002.

2 The bacteriological objectives for the LREC-1 use designation were provided in a Basin Plan Amendment adopted by State Board on January 20, 2005, and subsequently approved by the Office of Administrative Law and finally by U.S. EPA on February 17, 2006.

3 For the purposes of this TMDL, "responsible jurisdictions and responsible agencies" are defined as (1) local agencies that are permittees or co-permittees on a municipal storm water permit, (2) local or state agencies that have jurisdiction over Ballona Creek and Estuary, and (3) the California Department of Transportation pursuant to its storm water permit.

Table 7-21.2a: Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL: Final Allowable Exceedance Days by Reach

Time Period	Ballona Estuary, Ballona Creek Reach 2, and Sepulveda Channel *	Ballona Creek Reach 1**
Summer Dry-Weather (April 1 to October 31)	Zero (0) exceedance days based on the applicable Single Sample Bacteria Water Quality Objectives Zero (0) exceedance days based on the Rolling 30-Day Geometric Mean Bacteria Water Quality Objectives	No more than 10% of the Single Sample Bacteria Water Quality Objectives Zero (0) exceedance days based on the Rolling 30-Day Geometric Mean Bacteria Water Quality Objectives
Winter Dry-Weather (November 1-March 31)	Three (3) exceedance days based on the applicable Single Sample Bacteria Water Quality Objectives Zero (0) exceedance days based on the Rolling 30-Day Geometric Mean Bacteria Water Quality Objectives	No more than 10% of the Single Sample Bacteria Water Quality Objectives Zero (0) exceedance days based on the Rolling 30-Day Geometric Mean Bacteria Water Quality Objectives
Wet-Weather (days with ≥0.1 inch of rain + 3 days following the rain event)	17*** exceedance days based on the applicable Single Sample Bacteria Water Quality Objectives Zero (0) exceedance days based on the Rolling 30-Day Geometric Mean Bacteria Water Quality Objectives	No more than 10% of the Single Sample Bacteria Water Quality Objectives Zero (0) exceedance days based on the Rolling 30-Day Geometric Mean Bacteria Water Quality Objectives

* Exceedance days for Ballona Estuary based on REC-1 marine water numeric targets; for Ballona Creek Reach 2 based on LREC-1 freshwater numeric targets; and for Sepulveda Channel, based on fresh water REC-1 numeric targets

** Exceedance frequency for Ballona Creek Reach 1 based on freshwater REC-2 numeric targets

*** In Reach 2, the greater of the allowable exceedance days under the reference system approach or high flow suspension shall apply.

Table 7-21.2b: Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL: WLAs and LAs for tributaries to the Impaired Reaches.

Tributary	Point of Application	Water Quality Objectives	Waste Load Allocation (No. exceedance days)
Ballona Creek Reach 1	At confluence with Reach 2	LREC-1 Freshwater	For single sample objectives: *(0) summer dry weather,* *(3) winter dry weather* *(17*) winter wet weather* For geometric mean objectives: *(0) for all periods*
Benedict Canyon Channel	At confluence with Reach 2	LREC-1 Freshwater	For single sample objectives: *(0) summer dry weather,* *(3) winter dry weather* *(17*) winter wet weather* For geometric mean objectives: *(0) for all periods*
Ballona Creek Reach 2	At confluence with Ballona Estuary	REC-1 Marine water	For single sample objectives: *(0) summer dry weather,* *(3) winter dry weather* *(17) winter wet weather* For geometric mean objectives: *(0) for all periods*
Centinela Creek	At confluence with Ballona Estuary	REC-1 Marine water	For single sample objectives: *(0) summer dry weather,* *(3) winter dry weather* *(17) winter wet weather* For geometric mean objectives: *(0) for all periods*
Del Rey Lagoon	At confluence with Ballona Estuary	REC-1 Marine water	For single sample objectives: *(0) summer dry weather,* *(3)winter dry weather* *(17) winter wet weather* For geometric mean objectives: *(0) for all periods*

* At the confluence with Reach 2, the greater of the allowable exceedance days under the reference system approach or high flow suspension shall apply.
Sepulveda Channel was not assigned a waste load allocation at its confluence with Reach 2 since the TMDL requires the more stringent REC-1 objectives to be met in this waterbody, which should lead to the attainment of the less stringent LREC-1 objectives of the downstream reach.

Table 7-21.3 Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL: Significant Dates

Date	Action
Responsible Jurisdictions for the Waste Load Allocations	
12 months after the effective date of the TMDL	Responsible jurisdictions and responsible agencies must submit, for Regional Board approval, a comprehensive bacteria water quality monitoring plan for the Ballona Creek Watershed. The plan must be approved by the Executive Officer before the monitoring data can be considered during the implementation of the TMDL. The plan must provide for analyses of all applicable bacteria indicators for which the Basin Plan and subsequent amendments have established objectives The plan must also include a minimum of two sampling locations (mid-stream and downstream) in Ballona Estuary, Ballona Creek (Reach 1 and 2), and their tributaries. The draft monitoring report shall be made available for public comment and the Executive Officer shall accept public comments for at least 30 days. Once the coordinated monitoring plan is approved by the Executive Officer, monitoring shall commence within 6 months.
$2^{1}/_{2}$ years after the effective date of the TMDL	Responsible jurisdictions and agencies must provide a draft Implementation Plan to the Regional Board outlining how each intends to cooperatively achieve compliance with the dry-weather and wet-weather TMDL Waste Load Allocations. The report shall include implementation methods, an implementation schedule, and proposed milestones. The description of the implementation methods and milestones shall include a technically defensible quantitative linkage to the interim and final waste load allocations (WLAs). The linkage should include target reductions in stormwater runoff and/or fecal indicator bacteria. The plan shall include quantitative estimates of the water quality benefits provided by the proposed structural and non-structural BMPs. Estimates should address reductions in exceedance days, bacteria concentration and loading, and flow in the drain and at each beach compliance monitoring location. As part of the draft plan, responsible agencies must submit results of all special studies and/or Environmental Impact Assessments, designed to determine feasibility of any strategy that requires diversion and/or reduction of Creek flows. If a responsible jurisdiction or agency is requesting a longer schedule for wet-weather compliance based on an integrated approach, the plan must include a clear demonstration that the plan meets the criteria of an IWRA, and a clear demonstration of the need for the proposed schedule. Compliance with the wet-weather allocations shall be as soon as possible but under no circumstances shall it exceed the time frame adopted in the TMDL for non-integrated approaches or for an integrated approach.

Date	Action
$2^{1}/_{2}$ years after the effective date of the TMDL (continued)	The draft Plan shall be made available for public comment and the Executive Officer shall accept public comments for at least 30 days.
3 months after receipt of Regional Board comments on the draft plan	Responsible jurisdictions and agencies submit a Final Implementation Plan to the Regional Board.
Responsible agencies for Load Allocations	
1 year after the effective date of the TMDL	Responsible agencies must submit, for Regional Board approval, separate comprehensive bacteria water quality monitoring plans for inputs from Del Rey Lagoon and the Ballona Wetlands to the Ballona Estuary. Each plan must be approved by the Executive Officer before the monitoring data can be considered during the implementation of the TMDL. The plan must provide for analyses of all applicable bacteria indicators for which the Basin Plan and subsequent amendments have established objectives The plan must also include a minimum of one sampling location at the connecting tide gate(s). The draft monitoring reports shall be made available for public comment and the Executive Officer shall accept public comments for at least 30 days. Once a coordinated monitoring plan is approved by the Executive Officer, monitoring shall commence within 6 months.
3 years after the effective date of the TMDL	If the responsible agency for the Del Rey Lagoon intends to pursue a natural source exclusion, it shall submit the results of separate natural source study for the Lagoon to the Executive Officer of the Regional Board. The study shall include a comprehensive assessment of all sources of bacteria loads to the Lagoon and estimates of their individual contributions. In addition, a determination of the number of exceedance days caused by these sources should be made. These studies shall be made available for public comment and the Executive Officer shall accept public comments for at least 30 days.

Date	Action
Responsible Agencies for WLAs and LAs* *(*Only if not eligible for natural source exclusion(s)*	
4 years after the effective date of the TMDL	The Regional Board shall reconsider this TMDL to: (1) Re-assess the allowable winter dry-weather and wet-weather exceedance days based on a re-evaluation of the selected reference watershed and consideration of other reference watersheds that may better represent reaches of Ballona Creek and Estuary, (2) Consider whether the allowable winter dry-weather and wet-weather exceedance days should be adjusted annually dependent on the rainfall conditions and an evaluation of natural variability in exceedance levels in the reference system(s), (3) Re-evaluate the reference year used in the calculation of allowable exceedance days, and (4) Re-evaluate whether there is a need for further clarification or revision of the geometric mean implementation provision. (5) Consider natural source exclusions for bacteria loading from Del Rey Lagoon and the Ballona Wetlands based on results of the source identification study. (6) Re-assess WLAs for Benedict Canyon Channel, Sepulveda Channel, and Centinela Creek based on results of the required compliance monitoring, and/or any voluntary beneficial use investigations.
6 years after the effective date of the TMDL:	Achieve compliance with the allowable exceedance days for summer and winter dry-weather as set forth in Table 6-1 and rolling 30-day geometric mean targets.
10 years after effective date of the TMDL or, if an Integrated Water Resources Approach is implemented, up to July 15, 2021.*	Achieve compliance with the allowable exceedance days as set forth in Table 6-1 and rolling 30-day geometric mean targets during wet-weather.

* July 15, 2021 is the final compliance date of the Santa Monica Bay Beaches Bacteria Wet-Weather TMDL.

7-22 Calleguas Creek Watershed Salts TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on October 4, 2007.

This TMDL was approved by:
The State Water Resources Control Board on May 20, 2008.
The Office of Administrative Law on November 6, 2008.
The U.S. Environmental Protection Agency on December 2, 2008.

The effective date of this TMDL is: December 2, 2008.

The elements of the TMDL are presented in Table 7-22.1 and the Implementation Plan in Table 7-22.2

Table 7-22.1. Calleguas Creek Watershed Salts TMDL: Elements

<table>
<tr><th>TMDL Element</th><th>Key Findings and Regulatory Provisions</th></tr>
<tr><td>Problem Statement</td><td>Eleven of fourteen reaches in the Calleguas Creek Watershed (CCW) are identified on the 2002 Clean Water Act Section 303(d) list of water-quality limited segments as impaired due to elevated levels of boron, chloride, sulfate, or total dissolved solids (TDS) (these constitutions are commonly referred to as salts). Salts primarily impact two beneficial uses: agricultural supply and groundwater recharge. Below is 2002 303(d) list of water quality limited segments of the Calleguas Creek watershed:

<table>
<tr><th>Reach Name</th><th>Pollutant/Stressor</th></tr>
<tr><td>Calleguas Creek Reach 3</td><td>Chloride, TDS</td></tr>
<tr><td>Calleguas Creek Reach 6</td><td>Chloride, Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 7</td><td>Boron, Chloride, Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 8</td><td>Boron, Chloride, Sulfate, TDS</td></tr>
<tr><td>Calleguas creek Reach 9A</td><td>Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 9B</td><td>Chloride, Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 10</td><td>Chloride, Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 11</td><td>Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 12</td><td>Sulfate, TDS</td></tr>
<tr><td>Calleguas Creek Reach 13</td><td>Chloride, Sulfate, TDS</td></tr>
</table>

The list of impaired segments of the Calleguas Creek watershed in the 2002 303(d) list was maintained in the 2006 303(d) list.

The segment of Reach 4 below Laguna Road is tidally influenced and therefore not impaired for chloride, boron, sulfate, and TDS. Consequently, the waste load and load allocations developed for Reach 4 in this TMDL do not apply below Laguna Road.

The goal of this TMDL is to protect and restore the water quality in the Calleguas Creek watershed by controlling the loading and accumulation of salts.</td></tr>
</table>

TMDL Element	Key Findings and Regulatory Provisions
Numeric Targets	Numeric targets are based on the site-specific numeric water quality objectives (WQOs) provided in the Basin Plan.

1. Surface Water Quality Objectives

Site-specific surface water quality objectives for the Calleguas Creek watershed are applicable upstream of Potrero Road. Site specific objectives have not been determined for Calleguas Creek below Potrero Road because the reach is tidally influenced. Below are WQOs for Calleguas Creek upstream of Potrero Road.

Constituent	Water Quality Objective Upstream Potrero Road (mg/L)
Boron	1
Chloride	150
Sulfate	250
TDS	850

2. Groundwater Quality Objectives

Groundwater Basin[1]			Boron (mg/L)	Chloride (mg/L)	Sulfate (mg/L)	TDS (mg/L)
DWR Basin No.	Groundwater Basin as Listed in the 1994 Basin Plan	Implementation Areas for Salts TMDL				
4-6	Pleasant Valley	Conejo and Calleguas/Pleasant Valley	1.0	150	300	700
4-7	Arroyo Santa Rosa	Arroyo Santa Rosa and Conejo/Arroyo Santa Rosa	1.0	150	300	900
4-8	Las Posas Valley – East of Grimes Canyon and Hitch Blvd	Arroyo Simi/South Las Posas	3.0	400	1200	2500
4-8	Las Posas Valley – South of LA Ave between Somis Rd & Hitch Blvd	Arroyo Las Posas/ South Las Posas	1.0	250	700	1500
4-8	Las Posas Valley – North Las Posas Area	Arroyo Las Posas/ North Las Posas	1.0	150	250	500
4-9	Simi Valley	Arroyo Simi/Simi Valley	1.0	150	600	1200
4-10	Conejo Valley	Arroyo Conejo/ Conejo Valley	1.0	150	250	800
4-15	Tierra Rejada	Arroyo Santa Rosa/ Tierra Rejada	0.5	100	250	700
4-19	Thousand Oaks	Arroyo Conejo/ Thousand Oaks	1.0	150	700	1400

[1]The groundwater quality objectives specified in this table are equivalent to the groundwater quality objectives in the 1994 Basin Plan. Groundwater basins are numbered in the first column according to Bulletin 118-80 (Department of Water Resources, 1980). Designated groundwater basins in the 1994 Basin Plan are specified in the second column and groundwater basin descriptions of Calleguas Creek used in this TMDL are listed in the third column of the table.

TMDL Element	Key Findings and Regulatory Provisions
Source Analysis	Sources of salts in the watershed include water supply (water imported from the State Water Project or Freeman Diversion and deep aquifer groundwater pumping), water softeners that discharge to publicly owned treatment works (POTWs), POTW treatment chemicals, atmospheric deposition, pesticides and fertilizers, and indoor water use (chemicals, cleansers, food, etc.). These salts are then transported through POTW discharges and runoff to surface water, shallow groundwater, and/or stranded on the watershed in the soils. Salts transported in the surface water to the ocean are currently the only salts that are exported from the watershed. While the concentration of salts in the introduced water is usually below the Basin Plan Objectives, the quantity of water brought into the watershed is sufficient to rank introduced water as the greatest source of salts to the watershed. Salts that are transported during dry weather to the surface water are quantified via the following mechanisms: groundwater pumping, groundwater exfiltration, POTWs, dry weather urban and agricultural runoff. Wet weather loadings from each of these sources have the potential to be significant, but tend to be lower in concentration and do not occur during the critical conditions for salts. Wet weather loads are significant from the perspective of transporting stranded salts off the watershed.
Linkage Analysis	The linkage analysis for salts focuses on the surface water concentrations of salts. However, surface water concentrations are only one component of the watershed salts issue. Because it is difficult to model other aspects of the salt problem (i.e. surface water and groundwater interactions, stranded salts), two simplified approaches have been used to demonstrate that salts will be removed from the watershed, which should have a correspondingly positive impact on surface water and groundwater salts concentrations. First, a surface water model was developed to provide a linkage between sources and surface water quality and to demonstrate the impact of projects on receiving water quality in the watershed. Second, a salt balance was developed to quantify the removal of salts from the watershed with the goal of achieving a mass balance in which the mass of boron, sulfate, TDS and chloride imported into Calleguas Creek subwatersheds is no more than the mass of boron, sulfate, TDS and chloride exported from the Calleguas Creek subwatershed. Achieving a salt balance in the watershed will prevent additional build-up of salts in any medium in the watershed and protect ground water supplies from increasing in salt concentrations. The Calleguas Creek Modeling System is a mass balance based model that was developed for the surface water to provide a linkage between sources and surface water quality. To estimate the salts balance in the watershed, a simple chloride mass balance was developed by the Camrosa Water District (Hajas, 2003a) and modified to address the other salts.

TMDL Element	Key Findings and Regulatory Provisions
Waste Load Allocations	**A. POTWs** The TMDL includes waste load allocations (WLAs) for five POTWs in the Calleguas Creek watershed: Simi Valley Water Quality Control Plant (WQCP), Hill Canyon Wastewater Treatment Plan (WWTP), Moorpark WWTP, Camarillo Water Reclamation Plant (WRP), and Camrosa Water Reclamation Facility (WRF). At the end of the implementation period, only Simi Valley WQCP and the Hill Canyon WWTP are expected to discharge to surface waters. Moorpark WWTP and Camrosa WRF currently discharge directly to ponds under dry weather conditions. As part of the TMDL implementation, the Renewable Water Resources Management Program (RWRMP) will introduce treated wastewater from the Camarillo WRP into the Camrosa recycled water storage and distribution system. Surplus treated wastewater from Camarillo WRP and Camrosa WRF will be discharged at a point downstream of Potrero Road Bridge to Calleguas Creek. Dry weather WLAs are included for the case when Camarillo WRP, Camrosa WRF, and Moorpark WWTP need to discharge to the stream (for example, if there is insufficient recycled water demand during the wet season). Including WLAs for these POTWs ensures that water quality objectives are not exceeded as a result of their discharge. POTW mass-based WLAs are calculated as the POTW effluent flow rate multiplied by the water quality objective and include a mass-based adjustment factor (AF) that is subtracted from the product of the flow-rate and the water quality objective. The adjustment factor is used to link POTW allocations to the required reductions in background loads. The adjustment factors are implemented through mechanisms that export salts out of the subwatershed, such as groundwater pumping, to meet the salt balance requirements. To ensure that the loading capacity is achieved in surface water and the reductions in background loads are achieved, minimum salt exports shown below are required for POTWs and are included in WLAs as a component of the adjustment factors. If the background load reductions are not achieved, POTWs shall be responsible for providing additional load reductions to achieve water quality standards. The AF is set equal to the difference between the minimum salts export requirement to attain a salt balance in the subject reaches and the actual salts export. If the calculated annual dry weather salt exports from the subwatershed to which the POTW discharges are less than the minimum required exports for the previous year and the annual average receiving water concentration at the base of the subwatershed to which the POTW discharges exceeds water quality objectives for the previous year, the POTW allocations will be reduced using the adjustment factor.

TMDL Element	Key Findings and Regulatory Provisions
Waste Load Allocations (continued)	The adjustment factors are also used to address unusual conditions in which the inputs to the POTWs from the water supply may challenge the POTWs ability to meet the assigned WLAs. The adjustment factor allows for the additional POTW loading only when the water quality objectives are met in the receiving waters. POTW allocations can be adjusted upwards when imported water supply chloride concentrations exceed 80 mg/L and discharges from the POTW exceed the WLA. In order to apply the AF to the assigned WLAs, the POTW is required to submit documentation of the water supply chloride concentrations, receiving water chloride concentration, the effluent mass, and evidence of increased salt exports to offset the increased discharges from the POTW to the RWQCB for approval. WLAs shown in table below apply to POTWS during dry weather when the flows in the receiving water are below the 86th percentile flow. During wet weather, the loading capacity of the stream is significantly increased by stormwater flows with very low salt concentrations. Any discharges from the POTWs during wet weather would be assimilated by these large storm flows and would not cause exceedances of water quality objectives. Boron is only listed in the Simi and Pleasant Valley (Revolon) subwatersheds and exceedances of boron do not occur in other portions of the watershed. Therefore, boron allocations are only included for the Simi Valley WQCP. Interim limits are included to allow time for dischargers to put in place implementation measures necessary to achieve final waste load allocations. The monthly average interim limits are set equal to the 95th percentile of available discharge data. **1. Minimum Salt Export Requirements for Adjustment Factor [a]** **POTW** / **Minimum Chloride Export (lb/day)** / **Minimum TDS Export (lb/day)** / **Minimum Sulfate Export (lb/day)** / **Minimum Boron Export (lb/day)** Simi Valley WQCP: 460 / 3220 / 9120 / 3.3 Moorpark WWTP: 460 / 3220 / 9120 / 3.3 Hill Canyon WWTP: 1060 / 7920 / 4610 / 0 Camrosa WRF: 1060 / 7920 / 4610 / 0 Camarillo WRP: 1060 / 7920 / 4610 / 0 [a] Minimum export requirements include a 10% Margin of Safety.

TMDL Element	Key Findings and Regulatory Provisions
Waste Load Allocations (continued)	**2. Interim Monthly Average WLAs for POTWs**

POTW	Chloride (mg/L)	TDS (mg/L)	Sulfate (mg/L)	Boron (mg/L)
Simi Valley WQCP	183	955	298	N/A
Hill Canyon WWTP	189	N/A	N/A	N/A
Moorpark WWTP	171	N/A	267	N/A
Camarillo WRP	216	1012	283	N/A
Camrosa WRF*	N/A	N/A	N/A	N/A

* Camrosa WRF has not discharged to surface water during the period under which interim limits were calculated. When effluent data are available, the Regional Board may adopt interim WLAs for Camrosa WRF.

N/A: The 95th percentile concentration is below the Basin Plan objective so interim limits are not necessary.

3. Final WLAs for POTWs[a,d]

POTW	Chloride (lb/day) [c]	TDS (lb/day) [c]	Sulfate (lb/day) [c]	Boron (lb/day) [c]
Simi Valley WQCP	150*Q-AF	850*Q-AF	250*Q-AF	1.0*Q-AF
Hill Canyon WWTP	150*Q-AF	850*Q-AF	250*Q-AF	N/A
Moorpark WWTP[b]	150*Q-AF	850*Q-AF	250*Q-AF	N/A
Camarillo WRP[b]	150*Q-AF	850*Q-AF	250*Q-AF	N/A
Camrosa WRF[b]	150*Q-AF	850*Q-AF	250*Q-AF	N/A

a. The allocations shown only apply during dry weather (as defined in this TMDL). During wet weather discharges from the POTWs do not cause exceedances of water quality objectives.

b. These POTWs are not expected to discharge after the end of the implementation period.

c. AF is the adjustment factor and equals the difference between the minimum salts export requirement and the actual salts export.

d. Q represents the POTW flow at the time the water quality measurement is collected and a conversion factor to lb/day based on the units of measurement for the flow.

N/A Boron is not listed in the reaches to which the POTW discharges. No WLA is required.

B. Urban Runoff

Permitted stormwater dischargers that are responsible parties to this TMDL include the Municipal Stormwater Dischargers (MS4s) of the Cities of Camarillo, Moorpark, Thousand Oaks, County of Ventura, Ventura County Watershed Protection District, and general industrial and construction permittees. Permitted stormwater dischargers are assigned a dry weather wasteload allocation equal to the average dry weather critical condition flow rate multiplied by the numeric target for each constituent. Waste load allocations apply in the receiving water at the base of each subwatershed. Because wet weather flows transport a large mass of salts at low concentrations, these dischargers meet water quality objectives during wet weather. Dry weather allocations apply when instream flow rates are below the 86th percentile flow and there has been no measurable precipitation in the previous 24 hours.

TMDL Element	Key Findings and Regulatory Provisions
Waste Load Allocations (continued)	Interim limits are assigned for dry weather discharges from areas covered by NPDES stormwater permits to allow time to implement appropriate actions. The interim limits are assigned as concentration based receiving water limits set to the 95th percentile of the discharger data as a monthly average limit except for chloride. The 95th percentile for chloride was 267 mg/L which is higher than the recommended criteria set forth in the Basin Plan for protection of sensitive beneficial uses including aquatic life. Therefore, the interim limit for chloride for Permitted Stormwater Dischargers is set equal to 230 mg/L to ensure protection of sensitive beneficial uses in the Calleguas Creek watershed.

1. Interim Dry Weather WLAs for Permitted Stormwater Dischargers

Constituent	Interim Limit (mg/L)
Boron Total	1.3
Chloride Total	230
Sulfate Total	1289
TDS Total	1720

2. Final Dry Weather WLAs for Permitted Stormwater Dischargers

Subwatershed	Critical Condition Flow Rate (mgd)	Chloride Allocation (lb/day)	TDS Allocation (lb/day)	Sulfate Allocation (lb/day)	Boron Allocation (lb/day)
Simi	1.39	1,738	9,849	2,897	12
Las Posas	0.13	157	887	261	N/A
Conejo	1.26	1,576	8,931	2,627	N/A
Camarillo	0.06	72	406	119	N/A
Pleasant Valley (Calleguas)	0.12	150	850	250	N/A
Pleasant Valley (Revolon)	0.25	314	1,778	523	2

C. Final WLAs for Other NPDES Dischargers

Concentration-based WLAs are assigned at the Basin Plan objectives for other NPDES dischargers.

Constituent	Allocation (mg/L)
Chloride	150
TDS	850
Sulfate	250
Boron[a]	1.0

<table>
<tr><th>TMDL Element</th><th>Key Findings and Regulatory Provisions</th></tr>
<tr><td>Waste Load Allocations (continued)</td><td>Other NPDES dischargers include, but are not limited to, permitted groundwater cleanup projects that could have significant salt concentrations as a result of the stranded salts in the shallow groundwater basins being treated. To facilitate the cleanup of the basins prior to alternative discharge methods (such as the brine line) being available, interim limits for other NPDES dischargers will be developed on a case-by-case basis and calculated as a monthly average using the 95th percentile of available discharge data.</td></tr>
<tr><td>Load Allocations</td><td>Dry weather load allocations are assigned as a group allocation to irrigated agricultural discharges. The load allocation (LA) is equal to the average dry weather critical condition flow rate multiplied by the numeric target for each constituent. Load allocations apply in the receiving water at the base of each subwatershed. Because wet weather flows transport a large mass of salts at a typically low concentration, these dischargers should meet water quality objectives during wet weather. Dry weather allocations apply when instream flow rates are below the 86th percentile flow and there has been no measurable precipitation in the previous 24 hours.

Interim limits are assigned for dry weather discharges from irrigated agricultural areas to allow time to implement appropriate actions. The interim limits are assigned as concentration based receiving water limits set to the 95th percentile of the discharger data as a monthly average limit except for chloride. The 95th percentile for chloride was 499 mg/L which is higher than the recommended criteria set forth in the Basin Plan for protection of sensitive beneficial uses including aquatic life. Therefore, the interim limit for chloride for Irrigated Agricultural Dischargers is set equal to 230 mg/L to ensure protection of sensitive beneficial uses in the Calleguas Creek watershed.

TMDL Element	Key Findings and Regulatory Provisions
Margin of Safety	A margin of safety (MOS) for the TMDL is designed to address uncertainties in the analysis that could result in targets not being achieved in the waterbodies. The primary uncertainties associated with this TMDL include the impact of implementing a salt balance on receiving water quality. The effect of the salt balance is estimated by the mass-balance and subject to the following uncertainties: 1) the flow rates used to determine the loading capacity may change due to TMDL implementation, 2) the use of a daily load for determining allocations and an annual mass balance to attain water quality objectives, and 3) the sources of salts may not be completely known. Both implicit and explicit MOS are included for this TMDL. The implicit MOS stems from the use of conservative assumptions made during development of the TMDL. The mass of salts transported out of the watershed during wet weather is on average over 15% of the annual mass of salts introduced to the watershed for all constituents. The salt export during wet weather ranges from 7% to 41% for TDS, 9% to 48% for chloride, and 13% to 89% for sulfate of the export required to meet a salt balance in the watershed. This mass is not used to determine compliance with the salt balance and represents a significant implicit margin of safety. The model also contains a component that serves to model the impact of "stranded" salts in the watershed. The component assumes low irrigation efficiencies and the ability of all salts applied as irrigation water anywhere in the watershed to be discharged to receiving water in critical years. This likely overestimates the impact of "stranded" salts and results in a higher concentration of salts due to irrigation in the receiving water. An explicit MOS of 10% is applied to the adjustment factors for the POTWs to account for the uncertainties in the TMDL analysis. By applying the margin of safety to the adjustment factor, more salts are required to be exported than are necessary to offset the background loads in the watershed. This additional salt export provides a margin of safety on the salt balance to address uncertainties that the salt balance will result in compliance with water quality objectives. The 10% explicit MOS is determined sufficient to address the uncertainties associated with the estimated impact of the salt balance on receiving water loadings.
Future Growth	Ventura County accounts for slightly more than 2% of the state's residents with a population of 753,197 (US Census Bureau, 2000). GIS analysis of the 2000 census data yields a population estimate of 334,000 for the CCW, which equals about 44% of the county population. According to the Southern California Association of Governments (SCAG), growth in Ventura County averaged about 51% per decade from 1900-2000; with growth exceeding 70% in the 1920s, 1950s, and 1960s. Significant population growth is expected to occur within and near present city limits until at least 2020. Increased growth requires additional water. Therefore, future growth could result in increased loads of salts being imported into the watershed. However, the TMDL implementation plan is designed to maintain a salts balance in the watershed. If additional salts are imported into the watershed, a larger volume of salts will also be exported out of the watershed to maintain the balance. Consequently, increased imports from future growth are not expected to result in higher concentrations in receiving waters.

TMDL Element	Key Findings and Regulatory Provisions
Seasonal Variations and Critical Conditions	The critical condition for salts is during dry weather periods. During wet weather, stormwater flows dilute the salt discharges and receiving water concentrations are significantly lower than water quality objectives. Dry weather, defined as days with flows lower than the 86th percentile flow and no measurable precipitation, is a critical condition regardless of the dry weather flows in the stream. The driving conditions for exceedances of water quality objectives are the concentrations in the water supply (which is driven by surface water concentrations in Northern California) and the previous year's annual precipitation and corresponding flows. Elevated salts concentrations during dry weather occur when stranded salts are discharged into the surface water after higher than average rainfall years. The elevated concentrations occur during years when the previous annual flow is greater than the 75th percentile of the annual flows for the watershed (critical year). The higher concentrations occur during the dry periods of critical years regardless of whether the annual flow for the critical year is an average flow year, higher than average year, or lower than average year. The key parameter determining a critical year is the total annual flow volume for the previous year. Based on model results, four critical years were defined based on modeled results that resulted in receiving water concentrations greater than the 99th percentile concentration during at least 10% of the dry period. The critical years identified from the model occur with conditions similar to what occurred in 1978, 1979, 1983 and 1998.
Special Studies and Monitoring Plan	**<u>Special Studies</u>** Several special studies are planned to improve understanding of key aspects related to achievement of WLAs and LAs for the Salts TMDL. ***1. Special Study #1 (Optional) – Develop Averaging Periods and Compliance Points*** The TMDL technical report has provided information that shows instantaneous salts objectives may not be required to protect groundwater recharge and agricultural beneficial uses. It is possible that the beneficial uses will be protected and a salt balance achieved without achieving instantaneous water quality objectives in all reaches of the watershed. This optional special study is included to allow an investigation of averaging periods for the salts objectives in the CCW. Additionally, this study will investigate the locations of beneficial uses and the possibility of identifying compliance points for the salts objectives at the point of beneficial use impacts. The use of compliance points would alleviate the need to develop site-specific objectives for the reaches of the watershed upstream of the POTW discharges (described in Special Study #3) while still ensuring the protection of beneficial uses. Sensitive beneficial uses are not present in the upper reaches and POTW discharges dilute the salts from the upper reaches and may allow compliance with the objectives at the point of groundwater recharge downstream. This is an optional special study to be conducted if desired by the stakeholders or determined necessary or appropriate by the Executive Officer.

TMDL Element	Key Findings and Regulatory Provisions
Special Studies and Monitoring Plan (continued)	***2. Special Study #2 (Optional) – Develop Natural Background Exclusion*** Discharges of groundwater from upstream of the Simi Valley WQCP (Reaches 7 and 8) and Hill Canyon WWTP (Reaches 12 and 13) and downstream of the Camrosa WRF (Reach 3) contain high salts concentrations. Natural marine sediments may contribute to the high concentrations in those discharges. This special study would evaluate whether or not the groundwater discharges in these areas would qualify for a natural sources exclusion. The special study could follow a 'reference system/anti-degradation approach' and/or a 'natural sources exclusion approach' for any allocations included in this TMDL that are proven unattainable due to the magnitude of natural sources. The purpose of a 'reference system/anti-degradation approach' is to ensure water quality is at least as good as an appropriate reference site and no degradation of existing water quality occurs where existing water quality is better than that of a reference site. The intention of a 'natural sources exclusion approach' is to ensure that all anthropogenic sources of salts are controlled such that they do not cause exceedances of water quality objectives. These approaches are consistent with state and federal anti-degradation policies (State Board Resolution No. 68-16 and 40 C.F.R. 131.12). This is an optional special study to be conducted if desired by the stakeholders or determined necessary for establishing a natural sources exclusion by the Executive Officer. ***3. Special Study #3 (Optional) – Develop Site-Specific Objectives*** The TMDL implementation plan provides for actions to protect the agricultural and groundwater recharge beneficial uses in the CCW. As shown in the linkage analysis, some downstream reaches may not achieve the water quality objectives through implementation of this TMDL because of the transport of salts out of the watershed through those reaches. Consequently, an optional special study is included to allow the CCW stakeholders to pursue development of site-specific objectives for salts for reaches upstream of the Hill Canyon WWTP and Simi Valley WQCP (Reaches 7, 8, 12, and 13), Calleguas Creek Reach 3, Revolon Slough (Reach 4) and Beardsley Wash (Reach 5). These alternative numeric water quality objectives would be developed based on the beneficial uses to be protected in a reach and the attainability of the current water quality objectives. This is an optional special study to be conducted if desired by the stakeholders or determined necessary or appropriate by the Executive Officer. ***4. Special Study #4 (Optional) – Develop Site-Specific Objectives for Drought Conditions*** During drought conditions, the load of salts into the watershed increases as a result of increasing concentrations in imported water. Stakeholders in the CCW cannot control the increased mass entering the watershed from the water supply. However, the stakeholders do have the ability to manage the salts within the watershed to protect beneficial uses and export the additional mass of salts out of the watershed.

TMDL Element	Key Findings and Regulatory Provisions
Special Studies and Monitoring Plan (continued)	If necessary, site-specific objectives may be developed to address situations that result in higher imported water salt concentrations to allow management of the salts and protection of beneficial uses. This special study may be combined with Special Study #3 if desired. This is an optional special study to be conducted if desired by the stakeholders or determined necessary or appropriate by the Executive Officer of the Regional Board. ***5. Special Study #5 (Optional) – Develop Site-Specific Objectives for Sulfate*** Sulfate is a necessary nutrient for plant growth and sulfate containing products are often applied to agriculture as fertilizers and pesticides. Therefore, site-specific objectives may be investigated and developed for sulfate that more accurately protects agricultural supply beneficial uses. Additionally, this study could evaluate whether or not a sulfate balance is necessary to maintain in the watershed. This special study may be combined with Special Study #3 and/or #4 if desired. This is an optional special study to be conducted if desired by the stakeholders or determined necessary or appropriate by the Executive Officer of the Regional Board. **<u>Monitoring Plan</u>** To ensure that the goal of a salts balance in the watershed is being achieved and water quality objectives are being met, a comprehensive method of tracking inputs and outputs to the watershed will be developed. A monitoring plan will be submitted to the RWQCB for Executive Officer approval within six months of the effective date of the CCW Salts TMDL. Monitoring will begin one year after Executive Officer approval of the monitoring plan to allow time for the installation of automated monitoring equipment. ***1. Input Tracking*** Inputs to the watershed are tracked through four mechanisms:1) Information on the import of State Water Project water is readily available and provides information on the mass of salts brought into the watershed; 2) Groundwater pumping records provide information on the mass of salts imported into the watershed from deep aquifer pumping; 3) Import records of water supply form the Santa Clara River can be obtained to determine the mass of salts imported through this source; 4) Monitoring data on imported water quality can be compared to monitoring of effluent quality to estimate the amount of salts added through human use of the water.

TMDL Element	Key Findings and Regulatory Provisions
Special Studies and Monitoring Plan (continued)	***2. Output Tracking and Determining Compliance with Water Quality Objectives*** Outputs from the watershed will be tracked through surface water monitoring at key locations in the watershed and monitoring of discharges to the brine line. Monitoring will include both flow and quality. Compliance with water quality objectives will be determined at key locations where beneficial uses occur in the watershed. The stations used for output tracking will also be used to determine compliance with water quality objectives. The monitoring program will determine if the TMDL compliance points are protective of the beneficial uses for the subwatershed. If the monitoring determines that the compliance points are not protective of beneficial uses, an alternative compliance point will be selected. The Executive Officer may revise the TMDL compliance point based on the result of the monitoring. Additionally, if other places in the watershed are identified where sensitive beneficial uses occur, water quality monitoring stations can be added to determine compliance with water quality objectives. For the RWRMP, three new or upgraded automated flow measuring and sample collection stations will be installed at three points on the stream system to continuously record flow and various water quality parameters during dry weather. Preliminary monitoring locations include Arroyo Conejo in Hill Canyon, Conejo Creek at Baron Brothers Nursery and Calleguas Creek at University Drive. For the NRRWMP, one new or upgraded automated flow measuring and sample collection station will be added downstream of Simi Valley at the point at which groundwater recharge begins. A preliminary monitoring location is at Hitch Blvd. where an existing flow gauging station exists. However, the amount of groundwater recharge upstream of this site will need to be evaluated to determine the exact monitoring location. For Revolon Slough, the existing monitoring station at Wood Road. will be used to monitor quality and flow on Revolon Slough to determine the outputs from the Revolon portion of the Pleasant Valley subwatershed. Additional land use monitoring will be conducted concurrently at representative agricultural and urban runoff discharge sites as well as at POTWs in each of the subwatersheds and analyzed for chloride, TDS, sulfate, and boron. The location of the land use stations will be determined before initiation of the Calleguas Creek Watershed TMDL Monitoring Program (CCWTMP). All efforts will be made to include at least two wet weather sampling events during the wet season (October through April) during a targeted storm event. ***3. Reporting and Modification of the Calleguas Creek Watershed TMDL Monitoring Program*** A monitoring report will be prepared annually within six months after completion of the final event of the sampling year. An adaptive management approach to the CCWTMP will be adopted as it may be necessary to modify aspects of the CCWTMP. Results of sampling carried out through the CCWTMP and other programs within the CCW may be used to modify this plan, as appropriate. These modifications will be summarized in the annual report. Possible modifications could include, but are not limited to the, following:

TMDL Element	Key Findings and Regulatory Provisions
Special Studies and Monitoring Plan (continued)	▪ The inclusion of additional land use stations to accurately characterize loadings; ▪ The removal of land use stations if it is determined they are duplicative (*i.e.*, a land use site in one subwatershed accurately characterize the land use in other subwatersheds); ▪ The inclusion of additional in-stream sampling stations; and ▪ The elimination of analysis for constituents no longer identified in land use and/or instream samples. If a coordinated and comprehensive monitoring plan is developed and meets the goals of this monitoring plan that plan should be considered as a replacement for the CCWTMP. ***4. Other Monitoring*** Other surface water and groundwater monitoring will be implemented as necessary to assess the impacts of the implementation actions and adjust the activities as necessary to protect beneficial uses and achieve the salts balance. Examples of additional monitoring that may be conducted include: ▪ Monitoring under Phase 2 and 3 of the RWRMP to evaluate the effects of replenishment water releases and groundwater treatment and releases. ▪ Monitoring to assess the impacts of management of the Simi Basin groundwater dewatering wells under Phase 1 of the NRRWMP.
Implementation Plan	The identified implementation actions provided in this TMDL will result in a salt balance in the stream and are expected to result in compliance with the allocations. The implementation plan is comprised of actions that directly impact discharges to the receiving water and actions that will indirectly impact discharges to receiving water. Responsible agencies and jurisdictions shall consider minimum flow requirements that may be imposed by federal or state regulatory agencies when implementing actions to comply with this TMDL. Should the proposed implementation actions not result in compliance with objectives and site-specific objective are not adopted, additional implementation actions may be required to achieve the water quality objectives. Any plans or programs for implementation of the TMDL for the Southern Reaches of the CCW upstream of the Conejo Creek Diversion and the Northern Reaches of the CCW, that would result in significant reduction in instream flow, including but not limited to, an application for Water Reclamation Requirements (WRRs) shall include an analysis of potential impacts to instream beneficial uses that could result from the reclamation of wastewater or extracted groundwater. For Phase 1 of the Southern Reaches of the CCW Renewable Water Resource Management Program (RWRMP), Water Rights Decision 1638 from SWRCB satisfies these requirements and establishes the minimum flow requirements for Conejo and Calleguas Creek downstream of the Conejo Creek Diversion Project.

TMDL Element	Key Findings and Regulatory Provisions
Implementation Plan (continued)	Any WRRs shall require that timely written notice be given to the Regional Board, and to any regulatory agency whose instream flow is at issue, if diversion or reclamation of waste water or extraction of groundwater results or threatens to result in (or contributes to) insufficient flows to maintain beneficial uses. The Executive Officer shall issue an order pursuant to Water Code section 13267, which requires responsible agencies and jurisdictions to file a technical report if reclamation of waste water or extraction of groundwater results or threatens to result in (or contributes to) insufficient flows to maintain beneficial uses. The order shall require that the technical report identify the causes of the impairments or threatened impairments, and identifies options to abate the conditions. The Regional Board shall reconsider this TMDL if adequate flows to protect instream beneficial uses are not maintained. The implementation actions described in the TMDL represent a range of activities that could be conducted to achieve a salts balance in the watershed. Future considerations may result in other actions being implemented rather than the options presented. However, any proposed actions will be reviewed using the salt balance model to ensure the action does not adversely impact other implementation actions in the watershed or the salt balance of a downstream subwatershed. Currently, the implementation plan is presented in phases with a tentative schedule for each phase. The implementation of projects may occur earlier than planned or begin during an earlier phase. Additionally, many of the implementation actions require the use of the Regional Salinity Management Conveyance (RSMC or brine line). As such, the implementation schedule for those actions will be linked the construction schedule for the RSMC. The implementation plan for the Salts TMDL includes regional and subwatershed specific implementation actions. There are four key structural elements to the regional implementation: Regional Salinity Management Conveyance (RSMC), Water Conservation, Water Softeners, and Best Management Practices for Irrigated Agriculture. Subwatershed implementation includes Renewable Water Resource Management Program (RWRMP) for the Southern Reaches and Northern Reach Renewable Water Management Plan (NRRWMP). Detailed discussion for each implementation element including description of the action, status and schedule for implementing the action, and a summary of the expected contribution to achievement of the salts balance are provided in the Staff Report and Technical Report for this TMDL. Proposed implementation actions in the watershed, responsible agencies, and the estimated completion date based on the effective date of the TMDL are summarized below.

TMDL Element	Key Findings and Regulatory Provisions
Implementation Plan (continued)	**Summary of Proposed Implementation Actions**

Action	Responsible Agency/ies	Schedule for Completion
Water Conservation	POTWs, Permitted Stormwater Dischargers, and Other NPDES Permittees	3 years
Water Softeners	POTWs and Permitted Stormwater Dischargers	10 years
Best Management Practice for Agricultural Dischargers	Agricultural Dischargers	2 years
RMSC Phase 1	Calleguas Municipal Water District	2 year
RMSC Phase 2	Calleguas Municipal Water District	5 year
RMSC Phase 3	Calleguas Municipal Water District	10 years
RWRMP Phase 1	CamrosaWater District, Camarillo Sanitation District	3 years
RWRMP Phase 2	Camrosa Water District, City of Thousand Oaks	6 years
RWRMP Phase 3	Camrosa Water District, City of Thousand Oaks	10 years
RWRMP Phase 4	To Be Determined	15 years
NRRWMP Phase 1	Calleguas Municipal Water District, City of Simi Valley, Ventura County Water Work-District No.1	3 years
NRRWMP Phase 2	Calleguas Municipal Water District, Ventura County Water Work-District No.1, City of Camarillo	7 years
NRRWMP Phase 3	City of Camarillo, City of Simi Valley	10 years
NRRWMP Phase 4	To Be Determined	15 years
Final Completion Date		15 years

The sections below provide discussion of the application of the final WLAs for POTWs, specific permitted stormwater discharges, other NPDES dischargers, and agricultural dischargers.

I. POTWs, permitted stormwater discharges, and other NPDES discharges

The final WLAs will be included for permitted stormwater discharges, POTWs, and other NPDES discharges in accordance with the compliance schedules provided in Table 7-22.2. The Regional Board may revise these WLAs based on additional information developed through special studies and/or monitoring conducted as part of this TMDL.

TMDL Element	Key Findings and Regulatory Provisions
Implementation Plan (continued)	▪ **POTWs** WLAs established for the POTWs in this TMDL will be implemented through NPDES permit limits. Compliance will be determined through monitoring of final effluent discharge as defined in the NPDES permit. The proposed permit limits will be applied as end-of-pipe mass-based monthly average effluent limits. Daily maximum effluent limit is not required because chloride is not expected to have an immediate or acute effect on the beneficial uses. Compliance with the minimum salt export requirements for POTWs will be based on the salt export from the subwatershed to which they discharge. The mechanisms for meeting the minimum salt export requirements and for monitoring progress towards meeting those requirements will be included in the monitoring program work plan and approved by the Executive Officer. At the end of each year, the amount of salt exported will be compared to the minimum required salt export. POTW allocations will be reduced using the adjustment factor if both of the following conditions occur: • The annual dry weather salt exports from the subwatershed to which the POTW discharges are below the minimum required exports for the previous year; and • The water quality objectives were exceeded in the receiving water at the base of the subwatershed The POTW allocations will be reduced for the following year by the difference between the minimum required salt export and the actual amount exported. The discharger shall be notified by the Regional Board that the assigned WLAs are reduced and the reduced effluent limits shall be applied for the next year. If the POTW allocations are reduced, the POTW will need to increase the amount of salt export or reduce the mass of salts discharged from the POTW before the end of the following year when the adjustment will be evaluated again. POTWs can only request to adjust the assigned WLAs upwards using the adjustment factor under limited conditions provided below: • Water quality objectives are met in the receiving waters; • Imported water supply chloride concentrations exceed 80 mg/L; and • Discharges from the POTW exceed the allocation.

TMDL Element	Key Findings and Regulatory Provisions
Implementation Plan (continued)	When imported water supply chloride concentrations exceed 80 mg/L, the POTW will monitor the effluent to determine if the wasteload allocation is exceeded. If the wasteload allocation is exceeded and the POTW desires an adjustment to the allocation, the POTW will submit documentation of the water supply chloride concentrations, the receiving water chloride concentration, the effluent mass, and the evidence of increased salt exports to offset the increased discharges from the POTW to the Regional Board for approval. The adjustment factor will apply for three months and the POTW must submit the evidence outlined above every three months to keep the adjustment factor active. As long as the required information is submitted, the adjustment factor will be in effect upon notification in writing from the RWQCB. ▪ **Urban Stormwater Discharger** A group mass-based dry weather WLA has been developed for all permitted stormwater discharges, including municipal separate storm sewer systems (MS4s), and general industrial and construction stormwater permits. USEPA regulation allows allocations for NPDES-regulated stormwater discharges from multiple point sources to be expressed as a single categorical WLA when the data and information are insufficient to assign each source or outfall individual WLAs (40 CFR 130). The grouped allocation will apply to all NPDES-regulated municipal stormwater discharges in the CCW. MS4 WLAs will be incorporated into the NPDES permit as receiving water limits measured in-stream at the base of each subwatershed. ▪ **Other NPDES Dischargers** WLAs established for other NPDES permitted dischargers in this TMDL, including minor non-stormwater permittees (other than Camrosa WRP) and general non-stormwater permittees, will be implemented through NPDES permit limits. The proposed permit limits will be applied as end-of-pipe concentration-based effluent limits, and compliance determined through monitoring of final effluent discharge as defined in the NPDES permit.

TMDL Element	Key Findings and Regulatory Provisions
Implementation Plan (continued)	**II. Agriculture** Load allocations for salts will be implemented through Conditional Waiver of Discharges from Irrigated Lands (Conditional Waiver Program) adopted by the LARWQCB on November 3, 2005. Compliance with LAs will be measured in-stream at the base of the subwatersheds and will be achieved through the implementation of Best Management Practices (BMPs) consistent with the Conditional Waiver Program. The Conditional Waiver Program requires the development of an agricultural water quality management plan (AWQMP) to address pollutants that are exceeding receiving water quality objectives as a result of agricultural discharges. Therefore, implementation of the load allocations will be through the development of an agricultural management plan for salts. Implementation of the load allocations will also include the coordination of BMPs being implemented under other required programs to ensure salts discharges are considered in the implementation. Additionally, agricultural dischargers will participate in educational seminars on the implementation of BMPs as required under the Conditional Program. Studies are currently being conducted to assess the extent of BMP implementation and provide information on the effectiveness of BMPs for agriculture. This information will be integrated into the AWQMP that will guide the implementation of agricultural BMPs in the Calleguas Creek watershed. After implementation of these actions, compliance with the allocations and TMDL will be evaluated and the allocations reconsidered if necessary based on the special studies and monitoring plan section of the implementation plan. As shown in Table 7-22.2, implementation of LAs will be conducted over a period of time to allow for implementation of the BMPs, as well as coordination with special studies and implementation actions resulting from other TMDL Implementation Plans (Nutrient, Historic Pesticides and PCBs, Sediment, Metals, Bacteria, etc.).

Table 7-22.2 Calleguas Creek Watershed Salts TMDL: Implementation Schedule

Item	Implementation Action	Responsible Party	Completion Date
1	Effective date of interim Salts TMDL waste load allocations (WLAs)	POTWs, Permitted Stormwater Dischargers[1] (PSD), and Other NPDES Permittees	Effective date of the amendment
2	Effective date of interim Salts TMDL load allocations (LAs)	Agricultural Dischargers	Effective date of the amendment
3	Responsible jurisdictions and agencies shall submit compliance monitoring plan to the Los Angeles Regional Board for Executive Officer approval.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	6 months after effective date of the TMDL
4	Responsible jurisdictions and agencies shall begin monitoring as outlined in the approved monitoring plan.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	1 year after monitoring plan approval by Executive Officer
5	Responsible jurisdictions and agencies shall submit workplans for the optional special studies.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	Within 10 years of effective date of the TMDL
6	Responsible jurisdictions and agencies shall submit results of the special studies.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	2 years after workplan approval by Executive Officer
7	Re-evaluation of the interim WLAs and interim LAs for boron, chloride, sulfate, and TDS based on new data. Responsible jurisdictions and agencies shall demonstrate that implementation actions have reduced the boron, sulfate, TDS, and chloride imbalance by 20%.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	3 years after effective date of the TMDL
8	Re-evaluation of the interim WLAs and interim LAs for boron, chloride, sulfate, and TDS based on new data. Responsible jurisdictions and agencies shall demonstrate that implementation actions have reduced the boron, sulfate, TDS and chloride imbalance by 40%.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	7 years after effective date of the TMDL
9	Re-evaluation of the interim WLAs and interim LAs for boron, chloride, sulfate, and TDS based on new data. Responsible jurisdictions and agencies shall demonstrate that implementation actions have reduced the boron, sulfate, TDS, and chloride imbalance by 70%.	POTWs, Permitted Stormwater Dischargers (PSD), Other NPDES Permittees, and Agricultural Dischargers	10 years after effective date of the TMDL
10	The Los Angeles Regional Board shall reconsider this TMDL to re-evaluate numeric targets, WLAs, LAs and the implementation schedule based on the results of the special studies and/or compliance monitoring.	The Regional Board	12 years after effective date of the TMDL
11	Responsible jurisdictions and agencies shall demonstrate that the watershed has achieved an annual boron, sulfate, TDS, and chloride balance.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	15 years after effective date of the TMDL
12	The POTWs and non-storm water NPDES permits shall achieve WLAs, which shall be expressed as NPDES mass-based effluent limitation specified in accordance with federal regulations and state policy on water quality control.	POTWs and Other NPDES Permittees	15 years after effective date of the TMDL

Item	Implementation Action	Responsible Party	Completion Date
13	Irrigated agriculture shall achieve LAs, which will be implemented through the Conditional Waiver for Irrigated Lands as mass-based receiving water limits.	Agricultural Dischargers	15 years after effective date of the TMDL
14	The permitted stormwater dischargers shall achieve WLAs, which shall be expressed as NPDES mass-based limits specified in accordance with federal regulations and state policy on water quality control.	Permitted Stormwater Dischargers	15 years after effective date of the TMDL
15	Water quality objectives will be achieved at the base of the subwatersheds designated in the TMDL.	POTWs, PSD, Other NPDES Permittees, and Agricultural Dischargers	15 years after effective date of the TMDL

1 Permitted stormwater dischargers that are responsible parties to this TMDL include the Municipal Stormwater Dischargers (MS4s) of the Cities of Camarillo, Moorpark, Thousand Oaks, County of Ventura, Ventura County Watershed Protection District, and general industrial and construction permittees.

7-23 Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on June 7, 2007.

This TMDL was approved by:
The State Water Resources Control Board on December 4, 2007.
The Office of Administrative Law on February 8, 2008.
The U.S. Environmental Protection Agency on February 27, 2008.

The effective date of this TMDL is: March 6, 2008.

The elements of the TMDL are presented in Table 7-23.1 and the Implementation Plan in Tables 7-23.2a and 7-23.2b.

Table 7-23.1 Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL: Elements

Element	Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL
Problem Statement	Current levels of trash discharges into Lake Elizabeth and Lake Hughes violate water quality objectives and are impairing beneficial uses. Based on trash abatement and cleanup efforts by the local landowner in the vicinity of Munz Lake and site visits by Regional Board staff, current assessment of trash levels indicates that Munz Lake is no longer impaired by trash and the local landowner will provide date to evaluate the feasibility of delisting Munz Lake. Relevant water quality objectives include Floating Material and Solid, Suspended, or Settleable Materials. The following designated beneficial uses are impacted by trash: water contact recreation (REC 1) and non-contact water recreation (REC 2), warm freshwater habitat (WARM), and wildlife habitat (WILD); rare and threatened species (RARE), that is specific for Lake Elizabeth.
Numeric Target (interpretation of the narrative water quality objective, used to calculate the load allocations)	Zero trash in Lake Elizabeth, Munz Lake, and Lake Hughes and their shorelines. Zero is defined as (1) for nonpoint sources, no trash immediately following each assessment and collection event consistent with an established Minimum Frequency of Assessment and Collection Program (MFAC Program). The MFAC Program is established at an interval that prevents trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, and (2) for point sources, zero trash discharged into Lake Elizabeth, Munz Lake and Lake Hughes and their shorelines.
Source Analysis	Litter from adjacent land areas, roadways and direct dumping and deposition are sources of trash to Lake Elizabeth and Lake Hughes. Point sources such as storm drains are also sources of trash discharged to Lake Elizabeth and Lake Hughes.
Loading Capacity	Zero, as defined in the Numeric Target.
Waste Load Allocations (for point sources)	Waste Load Allocations (WLAs) are assigned to the Permitees under the Los Angeles County Municipal Separate Storm Sewer System (MS4) NPDES permit, including Los Angeles County and local land owners with storm drains that discharge to Lake Elizabeth and Lake Hughes. WLAs are zero trash. WLAs may be issued to additional responsible jurisdictions in the future under Phase 2 of the US EPA Stormwater Permitting Program, or other applicable regulatory programs.

Element	Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL
Load Allocations (for nonpoint sources)	Load Allocations (LAs) are assigned to the National Forest Service and local land owners. LAs are zero trash. LAs may be issued to additional responsible jurisdictions in the future under applicable regulatory programs.
Implementation	Implementation of the trash TMDL for Lake Elizabeth and Lake Hughes includes structural and non-structural best management practices (BMPs) and a program of minimum frequency of assessment and collection (MFAC) to address point and nonpoint trash sources. **Point Sources** WLAs shall be implemented through storm water permits and via the authority vested in the Executive Officer by section 13267 of the Porter-Cologne Water Quality Control Act (Water Code section 13000 et seq.). If point source dischargers comply with WLAs by implementing an Executive Officer certified full capture system on conveyances that discharge to Lake Elizabeth and Lake Hughes through a progressive implementation schedule of full capture devices, they will be deemed in compliance with the WLA. In certain circumstances (if approved by the Executive Officer), point source dischargers may alternatively comply with WLAs by implementing a program for minimum frequency of assessment and collection in conjunction with best management practices (MFAC/ BMPs). 1. Compliance with the final WLA may be achieved through an adequately sized and maintained full capture system, once the Executive Officer has certified that the system meets the following minimum criteria. A full capture system, at a minimum, consists of any device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the sub-drainage area. The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour); and A= subdrainage area (acres).

Element	Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL
Implementation (continued)	Point sources that choose to comply via a full capture system, must demonstrate a phased implementation of full capture devices over an 8-year period until the final WLA of zero is attained. Zero will be deemed to have been met if full capture systems have been installed on all conveyances discharging to Lake Elizabeth and Lake Hughes. Irrespective of whether point sources employ a full capture system, they may comply with the WLA in any lawful manner. 2. Compliance through a MFAC program in conjunction with BMPs may be proposed to the Regional Board for incorporation into the relevant NPDES permit. The MFAC program must include requirements equivalent to those described in the Conditional Waiver set forth below. Agencies that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. **Nonpoint Sources** LAs shall be implemented through either (1) a conditional waiver from waste discharge requirements, or (2) an alternative program implemented through waste discharge requirements or an individual waiver or another appropriate order of the Regional Board. Non-point source dischargers may achieve compliance with the LAs by implementing a MFAC/BMP program approved by the Executive Officer. Responsible jurisdictions that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. 1) Conditional Waiver: Pursuant to Water Code section 13269, waste discharge requirements are waived for any responsible jurisdiction that implements a MFAC/BMP Program which, to the satisfaction of the Executive Officer, meets the following criteria:

Element	Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL
Implementation (continued)	a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the water and shoreline. Responsible jurisdictions shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to Lake Elizabeth, and Lake Hughes. For Lake Elizabeth and Lake Hughes, the initial minimum frequency shall be set as follows: 1. Once per week on the water, shoreline and the adjacent land areas of Lake Elizabeth and Lake Hughes where they are publicly accessible, as defined in the Executive Officer approved Trash Monitoring and Reporting Plan (TMRP), during May 15 through October 15. Once per month for areas with limited access. 2. Once per month on the water, shoreline and the adjacent land areas for Lake Elizabeth and Lake Hughes, as defined in the Executive Officer approved TMRP, from October 15 to May 15. 3. Within one week on the water, shoreline and the adjacent land areas of Lake Elizabeth and Lake Hughes after each storm event with one inch of rain or greater, and after each wind advisory. b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible jurisdiction. c) The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, as described below, and a requirement that the responsible jurisdictions will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board on an annual basis. d) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by dischargers and approved by the Executive Officer. e) Implementation of the MFAC/BMP program should include a Health and Safety Program to protect personnel. The MFAC/BMP program shall not require responsible jurisdictions to access and collect trash from areas where personnel are prohibited.

Element	Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL
Implementation (continued)	The Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the waiver: (a) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections; (b) To reflect the results of trash assessment and collection; (c) If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or (d) If the amount of trash collected is decreasing such that a longer interval between collections is warranted. At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses . With regard to (a), (b) or (c), above, the Executive Officer is authorized to allow responsible jurisdictions to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency. Any waivers implementing the TMDL shall expire pursuant to Water Code section 13269 five years after the effective date of this TMDL, unless reissued. The Regional Board may reissue this waiver through an order consistent herewith, instead of readopting these regulatory provisions. (2) Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through waste discharge requirements an individual waiver, a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the assumptions and requirements of the reductions described in Table 7-23.2b, below. The County of Los Angeles will act as a third party through the recently enacted County Ordinance to identify private party dischargers in unincorporated County land. Within six months of the effective date of this TMDL, the Executive Officer shall require responsible jurisdictions to submit either a notice of intent to be regulated under the conditional waiver with their proposed MFAC/BMP Program and Trash Monitoring and Reporting Plan (TMRP), or a report of waste discharge.

Element	Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL
Monitoring and Reporting Plan	Responsible jurisdictions will develop a TMRP for Executive Officer approval that describes the methodologies that will be used to assess and monitor trash in Lake Elizabeth and Lake Hughes and/or within responsible jurisdiction land areas. Requirements for the TMRP shall include, but are not limited to, assessment and quantification of trash collected from the surfaces and shoreline of Lake Elizabeth and Lake Hughes or from responsible jurisdiction land areas. The monitoring plan shall provide details of the frequency, location, and reporting of trash monitoring. Responsible jurisdictions shall propose a metric (e.g., weight, volume, pieces of trash) to measure the amount of trash in Lake Elizabeth and Lake Hughes and on the land area surrounding Lake Elizabeth and Lake Hughes, as defined in the Executive Officer approved TMRP. The TMRP shall include a prioritization of areas that have the highest trash generation rates. The TMRP shall give preference to this prioritization when scheduling the installation of full capture devices, BMPs, or trash collection programs. The TMRP shall also include an evaluation of effectiveness of the MFAC/BMP program to prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, proposals to enhance BMPs, and a revised MFAC for Executive Officer review. Responsible Jurisdictions may coordinate their TMRP activities for Lake Elizabeth and Lake Hughes.
Margin of Safety	Zero is a conservative numeric target which contains an implicit margin of safety.
Seasonal Variations and Critical Conditions	Discharge of trash from the conveyances occurs primarily during or shortly after a major rain event. Discharge of trash from nonpoint sources occurs during all seasons, but can be increased during or shortly after high wind events, which are defined as periods of wind advisories issued by the National Weather Service.

Table 7-23.2a Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL: Implementation Schedule Point Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Submit Trash Monitoring and Reporting Plan, including a plan for defining the trash baseline WLA and a proposed definition of "major rain event".	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	6 months from effective date of TMDL. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
2	Implement Trash Monitoring and Reporting Plan.	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.
3	Submit results of Trash Monitoring and Reporting Plan, recommend trash baseline WLA, and propose prioritization of Full Capture System installation or implementation of other measures to attain the required trash reduction.	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	2 years from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer.
4	Installation of Full Capture Systems or other measures to achieve 20% reduction of trash from Baseline WLA*.	Los Angeles County, Los Angeles County Flood Control Districts, and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	Four years from effective date of TMDL.
5	Installation of Full Capture Systems or other measures to achieve 40% reduction of trash from Baseline WLA*.	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	Five years from effective date of TMDL.
6	Evaluate the effectiveness of Full Capture Systems or other measures, and reconsider the WLA*.	Regional Board.	Five years from effective date of TMDL.

Task No.	Task	Responsible Jurisdiction	Date
7	Installation of Full Capture Systems or other measures to achieve 60% reduction of trash from Baseline WLA*.	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes	Six years from effective date of TMDL.
8	Installation of Full Capture Systems or other measures to achieve 80% reduction of trash from Baseline WLA*.	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	Seven years from effective date of TMDL.
9	Installation of Full Capture Systems or other measures to achieve 100% reduction of trash from Baseline WLA*.	Los Angeles County and local land owners with conveyances that discharge to Lake Elizabeth and Lake Hughes.	Eight years from effective date of TMDL.

* Compliance with percent reductions from the Baseline WLA will be assumed wherever full capture systems are installed in corresponding percentages of the conveyance discharging to the waterbody. Installation will be prioritized based on the greatest point source loadings.

Table 7-23.2b Lake Elizabeth, Munz Lake, and Lake Hughes TMDL: Implementation Schedule Minimum Frequency of Assessment and Collection Program *

Task No.	Task	Responsible Jurisdiction	Date
1	Conditional Waiver in effect.	National Forest Service; Land owners in the vicinity of Lake Elizabeth and Lake Hughes.	Regional Board adoption of TMDL.
2	Submit Notice of Intent to Comply with Conditional Waiver of Discharge Requirements, including MFAC/ BMP Program and Trash Monitoring and Reporting Plan.	National Forest Service; Land owners in the vicinity of Lake Elizabeth and Lake Hughes.	Six months from TMDL effective date.
3	Implement MFAC/ BMP Program.	National Forest Service; Land owners in the vicinity of Lake Elizabeth and Lake Hughes.	Six months from receipt of Notice of Acceptance from Regional Board Executive Officer.
4	Submit annual TMRP reports including proposal for revising MFAC/BMP for Executive Officer approval.	National Forest Service; Land owners in the vicinity of Lake Elizabeth and Lake Hughes.	Two years from effective date of TMDL, and annually thereafter.
5	Reconsideration of Trash TMDL based on evaluation of effectiveness of MFAC/BMP program.	Regional Board.	Five years from effective date of TMDL.

* At Task 3, all Responsible Jurisdictions must be attaining the zero trash target after each required trash assessment and collection event. At Task 4, all Responsible Jurisdictions must demonstrate full compliance and attainment of the zero trash target's requirement that trash is not accumulating in deleterious amounts between the required trash assessment and collection events. Based on Responsible Jurisdiction monitoring reports, the Executive Officer may adjust the minimum frequency of assessment and collection as necessary to ensure compliance between the required trash assessment and collection events.

7-24 Revolon Slough and Beardsley Wash Trash TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on June 7, 2007.

This TMDL was approved by:
The State Water Resources Control Board on December 4, 2007.
The Office of Administrative Law on January 24, 2008.
The U.S. Environmental Protection Agency on February 27, 2008.

The effective date of this TMDL is: March 6, 2008.

The elements of the TMDL are presented in Table 7-24.1 and the Implementation Plan in Tables 7-24.2a and 7-24.2b.

Table 7-24.1 Revolon Slough and Beardsley Wash Trash TMDL: Elements

Element	Revolon Slough and Beardsley Wash Trash TMDL
Problem Statement	Current levels of trash discharges into Revolon Slough and Beardsley Wash violate water quality objectives and are impairing beneficial uses. Relevant water quality objectives include Floating Material and Solid, Suspended, or Settleable Materials. The following designated beneficial uses are impacted by trash: water contact recreation (REC1); non-contact water recreation (REC2); warm freshwater habitat (WARM); wildlife habitat (WILD); wetland habitat (WET).
Numeric Target (Interpretation of the narrative water quality objective, used to calculate the load allocations)	Zero trash in Revolon Slough and Beardsley Wash, and in the channel. Zero is defined as (1) for nonpoint sources, no trash immediately following each assessment and collection event consistent with an established Minimum Frequency of Assessment and Collection Program (MFAC Program). The MFAC Program is established at an interval that prevents trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, and (2) for point sources, zero trash discharged into Revolon Slough and Beardsley Wash, shoreline and channel.
Source Analysis	Litter from adjacent land areas, roadways and direct dumping and deposition are sources of trash to Revolon Slough and Beardsley Wash. Point sources such as storm drains are also sources of trash discharged to Revolon Slough and Beardsley Wash.
Loading Capacity	Zero, as defined in the Numeric Target.
Waste Load Allocations (for point sources)	Waste Load Allocations (WLAs) are assigned to the Department of Transportation (Caltrans) Permittees and Co-Permittees of the Ventura County Municipal Separate Storm Sewer System (MS4) Permit, including Ventura County, the Ventura County Watershed Protection District, the City of Camarillo, and the City of Oxnard, and local landowners. WLAs are zero trash. WLAs may be issued to additional responsible jurisdictions in the future under Phase 2 of the US EPA Stormwater Permitting Program, or other applicable regulatory programs.

Element	Revolon Slough and Beardsley Wash Trash TMDL
Load Allocations (for nonpoint sources)	Load Allocations (LAs) are assigned to land owners and agencies in the vicinity of Revolon Slough and Beardsley Wash, including the County of Ventura, Ventura County Watershed Protection District, City of Camarillo, City of Oxnard, and Agricultural entities in the Revolon Slough and Beardsley Wash subwatersheds. LAs are zero trash. LAs may be issued to additional responsible jurisdictions in the future under applicable regulatory programs.
Implementation	Implementation of the trash TMDL for Revolon Slough and Beardsley Wash includes structural and non-structural best management practices (BMPs) and a program of minimum frequency of assessment and collection (MFAC) to address point and nonpoint trash sources. **Point Sources** WLAs shall be implemented through storm water permits and via the authority vested in the Executive Officer by section 13267 of the Porter-Cologne Water Quality Control Act (Water Code section 13000 et seq.). If point source dischargers comply with WLAs by implementing an Executive Officer certified full capture system on conveyances that discharge to Revolon Slough and Beardsley Wash through a progressive implementation schedule of full capture devices, they will be deemed in compliance with the WLA. In certain circumstances (if approved by the Executive Officer), point source dischargers may alternatively comply with WLAs by implementing a program for minimum frequency of assessment and collection in conjunction with best management practices (MFAC/ BMPs). 1. Compliance with the final WLA may be achieved through an adequately sized and maintained full capture system, once the Executive Officer has certified that the system meets the following minimum criteria. A full capture system, at a minimum, consists of any device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the sub-drainage area. The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour); and A= subdrainage area (acres).

Element	Revolon Slough and Beardsley Wash Trash TMDL
Implementation (continued)	Point sources that choose to comply via a full capture system, must demonstrate a phased implementation of full capture devices over an 8-year period until the final WLA of zero is attained. Zero will be deemed to have been met if full capture systems have been installed on all conveyances discharging to Revolon Slough and Beardsley Wash. Irrespective of whether point sources employ a full capture system, they may comply with the WLA in any lawful manner. 2. Compliance through a MFAC program in conjunction with BMPs may be proposed to the Regional Board for incorporation into the relevant NPDES permit. The MFAC program must include requirements equivalent to those described in the Conditional Waiver set forth below. Agencies that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. **Nonpoint Sources** LAs shall be implemented through either (1) a conditional waiver from waste discharge requirements, or (2) an alternative program implemented through waste discharge requirements or an individual waiver or another appropriate order of the Regional Board. Non-point source dischargers may achieve compliance with the LAs by implementing a MFAC/BMP program approved by the Executive Officer. Responsible jurisdictions that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if an MFAC/BMP program, approved by the Executive Officer, is implemented. 1) Conditional Waiver: Pursuant to Water Code section 13269, waste discharge requirements are waived for any responsible jurisdiction that implements a MFAC/BMP Program which, to the satisfaction of the Executive Officer, meets the following criteria: a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the water and on the shoreline. Responsible jurisdictions shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to Revolon Slough and Beardsley Wash. For Revolon Slough and Beardsley Wash, the initial minimum frequency shall be set as follows:

Element	Revolon Slough and Beardsley Wash Trash TMDL
Implementation (continued)	1. Monthly on Revolon Slough and its adjacent land areas at Wood Road (the end of the concrete-lined channel), as defined in the Executive Officer approved Trash Monitoring and Reporting Plan (TMRP). 2. Bi-monthly on the water, shoreline and channels of Beardsley Wash and Revolon Slough in areas under the jurisdiction of the County of Ventura, and agricultural lands. 3. Monthly assessment and collection at outlets on north side of Camarillo Hills Drain between Las Posas Rd. and Wood Rd. 4. Monthly on Las Posas Estate Drain between Central Ave. and the 101 Freeway. 5. Monthly at the inlet to the North Ramona Place Drain debris basin. 6. Monthly at inlet to Beardsley Wash at Wright Road and the adjacent land areas, as defined in the Executive Officer approved TMRP. 7. Monthly on a rotating basis of the following channels from the City of Oxnard (i.e. one drain cleaned per month): a. Fifth Street Drain from Del Norte Blvd. to Revolon Slough b. Sturgis Drain from Oxnard City Limits to Revolon Slough c. Nyeland Drain from Center Drive to Friedrich Rd. d. Del Norte Drain from Del Norte Blvd. to Revolon Slough 8. All Drains listed above will also be cleaned within one week of every storm event greater than 1 inch of rain. b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible jurisdiction.

Element	Revolon Slough and Beardsley Wash Trash TMDL
Implementation (continued)	c) The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, as described below, and a requirement that the responsible jurisdictions will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board on an annual basis. d) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by dischargers and approved by the Executive Officer. e) Implementation of the MFAC/BMP program should include a Health and Safety Plan to protect personnel. The MFAC/BMP shall not require responsible jurisdictions to access and collect trash from areas where personnel are prohibited. Compliance for Agricultural Sources For agricultural dischargers, the Conditional Waiver for Irrigated Lands will be revised to include a MFAC/BMP program for enrollees in the Revolon Slough and Beardsley Wash subwatershed. The Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the waiver: (a) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections; (b) To reflect the results of trash assessment and collection; (c) If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or (d) If the amount of trash collected is decreasing such that a longer interval between collections is warranted. At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses. With regard to (a), (b) or (c), above, the Executive Officer is authorized to allow responsible jurisdictions to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency.

Element	Revolon Slough and Beardsley Wash Trash TMDL
Implementation (continued)	Any waivers implementing the TMDL shall expire pursuant to Water Code section 13269 five years after the effective date of this TMDL, unless reissued. The Regional Board may reissue this waiver through an order consistent herewith, instead of readopting these regulatory provisions. (2) Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through waste discharge requirements, an individual waiver, a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the assumptions and requirements of the reductions described in Table 7-24.2b, below. Within six months of the effective date of this TMDL, the Executive Officer shall require responsible jurisdictions to submit either a notice of intent to be regulated under the conditional waiver with their proposed MFAC/BMP Program and Trash Monitoring and Reporting Plan (TMRP), or a report of waste discharge.
Monitoring and Reporting Plan	Responsible jurisdictions will develop a TMRP for Executive Officer approval that describes the methodologies that will be used to assess and monitor trash in Revolon Slough and Beardsley Wash and/or within responsible jurisdiction land areas. The TMRP shall include a plan to establish the trash Baseline WLAs for non-Caltrans entities, or an alternative to the default trash baseline for Caltrans to prioritize installation of full capture devices. The default trash baseline WLA for Caltrans is 6677.4 gallons per square mile per year. Requirements for the TMRP shall include, but are not limited to, assessment and quantification of trash collected from the surfaces and shoreline of Revolon Slough and Beardsley Wash or from responsible jurisdiction land areas. The monitoring plan shall provide details of the frequency, location, and reporting of trash monitoring. Responsible jurisdictions shall propose a metric (e.g., weight, volume, pieces of trash) to measure the amount of trash in Revolon Slough and Beardsley Wash and on the land area surrounding Revolon Slough and Beardsley Wash, as defined in the Executive Officer approved TMRP. The TMRP shall include a prioritization of areas that have the highest trash generation rates. The TMRP shall give preference to this prioritization when scheduling the installation of full capture devices, BMPs, or trash collection programs.

Element	Revolon Slough and Beardsley Wash Trash TMDL
Monitoring and Reporting Plan (continued)	The TMRP shall also include an evaluation of effectiveness of the MFAC/BMP program to prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, proposals to enhance BMPs, and a revised MFAC for Executive Officer review. Responsible Jurisdictions may coordinate their TMRP activities for Revolon Slough and Beardsley Wash.
Margin of Safety	Zero is a conservative numeric target which contains an implicit margin of safety.
Seasonal Variations and Critical Conditions	Discharge of trash from the conveyances occurs primarily during or shortly after a major rain event. Discharge of trash from nonpoint sources occurs during all seasons, but can be increased during or shortly after high wind events, which are defined as periods of wind advisories issued by the National Weather Service.

Table 7-24.2a Revolon Slough and Beardsley Wash Trash TMDL: Implementation Schedule - Point Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Submit Trash Monitoring and Reporting Plan, including a plan for defining the trash baseline WLA and a proposed definition of "major rain event".	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	6 months from effective date of TMDL. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
2	Implement Trash Monitoring and Reporting Plan.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.
3	Submit results of Trash Monitoring and Reporting Plan, recommend trash baseline WLA, and propose prioritization of Full Capture System installation or implementation of other measures to attain the required trash reduction.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	2 years from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer.
4	Installation of Full Capture Systems or other measures to achieve 20% reduction of trash from Baseline WLA*.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	Four years from effective date of TMDL.
5	Installation of Full Capture Systems or other measures to achieve 40% reduction of trash from Baseline WLA*.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	Five years from effective date of TMDL.
6	Evaluate the effectiveness of Full Capture Systems or other measures, and reconsider the WLA*.	Regional Board.	Five years from effective date of TMDL.

Task No.	Task	Responsible Jurisdiction	Date
7	Installation of Full Capture Systems or other measures to achieve 60% reduction of trash from Baseline WLA*.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	Six years from effective date of TMDL.
8	Installation of Full Capture Systems or other measures to achieve 80% reduction of trash from Baseline WLA*.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	Seven years from effective date of TMDL.
9	Installation of Full Capture Systems or other measures to achieve 100% reduction of trash from Baseline WLA*.	City of Camarillo; City of Oxnard; Ventura County Watershed Protection District; Ventura County; Caltrans; Local land owners with conveyances	Eight years from effective date of TMDL.

* Compliance with percent reductions from the Baseline WLA will be assumed wherever full capture systems are installed in corresponding percentages of the conveyance discharging to Revolon Slough and Beardsley Wash. Installation will be prioritized based on the greatest point source loadings.

Table 7-24.2b Revolon Slough and Beardsley Wash Trash TMDL:
Implementation Schedule - Minimum Frequency of Assessment and Collection Program *

Task No.	Task	Responsible Jurisdiction	Date
1	Conditional Waiver in effect.	City of Camarillo; City of Oxnard; Ventura County; Agricultural dischargers; Ventura County Watershed Protection District; Caltrans; Local land owners with conveyances	Regional Board adoption of TMDL.
2	Submit Notice of Intent to Comply with Conditional Waiver of Discharge Requirements, including MFAC/BMP Program and Trash Monitoring and Reporting Plan.	City of Camarillo; City of Oxnard; Ventura County; Agricultural dischargers; Ventura County Watershed Protection District; Caltrans; Local land owners with conveyances	Six months from TMDL effective date.
3	Implement MFAC/BMP Program.	City of Camarillo; City of Oxnard; Ventura County; Agricultural dischargers; Ventura County Watershed Protection District; Caltrans; Local land owners with conveyances	Six months from receipt of Notice of Acceptance from Regional Board Executive Officer.
4	Submit annual TMRP reports including proposal for revising MFAC/BMP for Executive Officer approval.	City of Camarillo; City of Oxnard; Ventura County; Agricultural dischargers; Ventura County Watershed Protection District; Caltrans; Local land owners with conveyances	Two years from effective date of TMDL, and annually thereafter.
5	Reconsideration of Trash TMDL based on evaluation of effectiveness of MFAC/ BMP program.	Regional Board.	Five years from effective date of TMDL.

* At Task 3, all Responsible Jurisdictions must be attaining the zero trash target after each required trash assessment and collection event. At Task 4, all Responsible Jurisdictions must demonstrate full compliance and attainment of the zero trash target's requirement that trash is not accumulating in deleterious amounts between the required trash assessment and collection events. Based on Responsible Jurisdiction monitoring reports, the Executive Officer may adjust the minimum frequency of assessment and collection as necessary to ensure compliance between the required trash assessment and collection events.

7-25 Ventura River Estuary Trash TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on June 7, 2007.

This TMDL was approved by:
The State Water Resources Control Board on December 4, 2007.
The Office of Administrative Law on February 11, 2008.
The U.S. Environmental Protection Agency on February 27, 2008.

The effective date of this TMDL is: March 6, 2008.

The elements of the TMDL are presented in Table 7-25.1 and the Implementation Plan in Tables 7-25.2a and 7-25.2b.

Table 7-25.1 Ventura River Estuary Trash TMDL: Elements

Element	Ventura River Estuary Trash TMDL
Problem Statement	Current levels of trash discharges into the Ventura River Estuary violate water quality objectives and are impairing beneficial uses. Relevant water quality objectives include Floating Material and Solid, Suspended, or Settleable Materials. The following designated beneficial uses are impacted by trash: navigation (NAV), contact recreation (REC 1) and non-contact recreation (REC 2), commercial and sport fishing (COMM), warm fresh water habitat (WARM), estuarine habitat (EST), marine habitat (MAR), wildlife habitat (WILD), rare, threatened or endangered species (RARE), migration of aquatic organisms (MIGR), spawning, reproduction, and/or early development (SPWN), shellfish harvesting (SHELL), and wetland habitat (WET).
Numeric Target (Interpretation of the narrative water quality objective, used to calculate the load allocations)	Zero trash in the Ventura River Estuary, shoreline and in the channel. Zero is defined as (1) for nonpoint sources, no trash immediately following each assessment and collection event consistent with an established Minimum Frequency of Assessment and Collection Program (MFAC Program). The MFAC Program is established at an interval that prevents trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, and (2) for point sources, zero trash discharged into the Ventura River Estuary, shoreline, and channel.
Source Analysis	Litter from adjacent land areas, roadways and direct dumping and deposition are sources of trash to the Ventura River Estuary. Point sources such as storm drains are also sources of trash discharged to the Ventura River Estuary.
Loading Capacity	Zero, as defined in the Numeric Target.
Waste Load Allocations (for point sources)	Waste Load Allocations (WLAs) are assigned to the City of Ventura, County of Ventura, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans with conveyances that discharge to the Ventura River Estuary. WLAs are zero trash. WLAs may be issued to additional responsible jurisdictions in the future under Phase 2 of the US EPA Stormwater Permitting Program, or other applicable regulatory programs.

Element	Ventura River Estuary Trash TMDL
Load Allocations (for nonpoint sources)	Load Allocations (LAs) are assigned to the City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Parks and Recreation, California Department of Food and Agriculture, and Agricultural Dischargers. LAs are zero trash. LAs may be issued to additional responsible jurisdictions in the future under applicable regulatory programs.
Implementation	Implementation of the trash TMDL for the Ventura River Estuary includes structural and non-structural best management practices (BMPs) and a program of minimum frequency of assessment and collection (MFAC) to address point and nonpoint trash sources. **Point Sources** WLAs shall be implemented through storm water permits and via the authority vested in the Executive Officer by section 13267 of the Porter-Cologne Water Quality Control Act (Water Code section 13000 et seq.). If point source dischargers comply with WLAs by implementing an Executive Officer certified full capture system on conveyances that discharge to the Ventura River Estuary through a progressive implementation schedule of full capture devices, they will be deemed in compliance with the WLA. In certain circumstances (if approved by the Executive Officer), point source dischargers may alternatively comply with WLAs by implementing a program for minimum frequency of assessment and collection in conjunction with best management practices (MFAC/ BMPs). 1. Compliance with the final WLA may be achieved through an adequately sized and maintained full capture system, once the Executive Officer has certified that the system meets the following minimum criteria. A full capture system, at a minimum, consists of any device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the sub-drainage area. The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour); and A= subdrainage area (acres). Point sources that choose to comply via a full capture system, must demonstrate a phased implementation of full capture devices over an 8-year period until the final WLA of zero is attained. Zero will be deemed to have been met if full capture systems have been installed on all conveyances discharging to the estuary.

Element	Ventura River Estuary Trash TMDL
Implementation (continued)	Irrespective of whether point sources employ a full capture system, they may comply with the WLA in any lawful manner. 2. Compliance through a MFAC program in conjunction with BMPs may be proposed to the Regional Board for incorporation into the relevant NPDES permit. The MFAC program must include requirements equivalent to those described in the Conditional Waiver set forth below. Agencies that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if an MFAC/BMP program, approved by the Executive Officer, is implemented. **Nonpoint Sources** LAs shall be implemented through either (1) a conditional waiver from waste discharge requirements, or (2) an alternative program implemented through waste discharge requirements or an individual waiver or another appropriate order of the Regional Board. Non-point source dischargers may achieve compliance with the LAs by implementing a MFAC/BMP program approved by the Executive Officer. Responsible jurisdictions that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. 1) Conditional Waiver: Pursuant to Water Code section 13269, waste discharge requirements are waived for any responsible jurisdiction that implements a MFAC/BMP Program which, to the satisfaction of the Executive Officer, meets the following criteria: a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the water, shoreline, and the channel. Responsible jurisdictions shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to the Ventura River Estuary. For the Ventura River Estuary, the initial minimum frequency shall be set as follows:

Element	Ventura River Estuary Trash TMDL
Implementation (continued)	1. Once per week for the sandy beach area between the estuary and the ocean and along the bike path between May 15 and October 15. Once per month for the rest of the year. 2. Within one week after each storm event with one inch of rain or greater at the Front Street storm drain, which discharges under the eastern levee, 50-feet north of the railroad tracks. 3. Quarterly for other areas of the estuary below the U.S. 101 Freeway. 4. After major public events that occur in the Ventura County Fairground that charge an admission price and are attended by greater than 7,000 people. b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible jurisdiction. c) The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, as described below, and a requirement that the responsible jurisdictions will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board on an annual basis. d) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by dischargers and approved by the Executive Officer. e) Implementation of the MFAC/BMP program should include a Health and Safety Plan to protect personnel. The MFAC/BMP shall not require responsible jurisdictions to access and collect trash from areas where personnel are prohibited. *Compliance for Agricultural Sources* For agricultural dischargers, the Conditional Waiver for Irrigated Lands will be revised to include a MFAC/BMP program for enrollees in the Ventura River Estuary subwatershed. The Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the waiver:

Element	Ventura River Estuary Trash TMDL
Implementation (continued)	(a) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections; (b) To reflect the results of trash assessment and collection; (c) If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or (d) If the amount of trash collected is decreasing such that a longer interval between collections is warranted. At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses. With regard to (a), (b) or (c), above, the Executive Officer is authorized to allow responsible jurisdictions to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency. Any waivers implementing the TMDL shall expire pursuant to Water Code section 13269 five years after the effective date of this TMDL, unless reissued. The Regional Board may reissue this waiver through an order consistent herewith, instead of readopting these regulatory provisions. (2) Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through waste discharge requirements an individual waiver, a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the assumptions and requirements of the reductions described in Table 7-25.2b, below. Within six months of the effective date of this TMDL, the Executive Officer shall require responsible jurisdictions to submit either a notice of intent to be regulated under the conditional waiver with their proposed MFAC/BMP Program and Trash Monitoring and Reporting Plan (TMRP), or a report of waste discharge.

Element	Ventura River Estuary Trash TMDL
Monitoring and Reporting Plan	Responsible jurisdictions will develop a TMRP for Executive Officer approval that describes the methodologies that will be used to assess and monitor trash in the Ventura River Estuary and/or within responsible jurisdiction land areas. The TMRP shall include a plan to establish the trash Baseline WLAs for non-Caltrans entities, or an alternative to the default trash baseline for Caltrans to prioritize installation of full capture devices. The default trash baseline WLA for Caltrans is 6677.4 gallons per square mile per year. Requirements for the TMRP shall include, but are not limited to, assessment and quantification of trash collected from the surfaces and shoreline of the Ventura River Estuary or from responsible jurisdiction land areas. The monitoring plan shall provide details of the frequency, location, and reporting of trash monitoring. Responsible jurisdictions shall propose a metric (e.g., weight, volume, pieces of trash) to measure the amount of trash in the estuary and on the land area surrounding the estuary, as defined in the Executive Officer approved TMRP. The TMRP shall include a prioritization of areas that have the highest trash generation rates. The TMRP shall give preference to this prioritization when scheduling the installation of full capture devices, BMPs, or trash collection programs. The TMRP shall also include an evaluation of effectiveness of the MFAC/BMP program to prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, proposals to enhance BMPs, and a revised MFAC for Executive Officer review. Responsible Jurisdictions may coordinate their TMRP activities for the Ventura River Estuary.
Margin of Safety	Zero is a conservative numeric target which contains an implicit margin of safety.
Seasonal Variations and Critical Conditions	Discharge of trash from the conveyances occurs primarily during or shortly after a major rain event. Discharge of trash from nonpoint sources occurs during all seasons, but can be increased during or shortly after high wind events, which are defined as periods of wind advisories issued by the National Weather Service, and the period from May 15 to October 15, or during and after public events that occur in the Ventura County Fairground.

Table 7-25.2a Ventura River Estuary Trash TMDL: Implementation Schedule - Point Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Submit Trash Monitoring and Reporting Plan, including a plan for defining the trash baseline WLA and a proposed definition of "major rain event".	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	6 months from effective date of TMDL. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
2	Implement Trash Monitoring and Reporting Plan.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.
3	Submit results of Trash Monitoring and Reporting Plan, recommend trash baseline WLA, and propose prioritization of Full Capture System installation or implementation of other measures to attain the required trash reduction.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	2 years from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer.
4	Installation of Full Capture Systems or other measures to achieve 20% reduction of trash from Baseline WLA*.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	Four years from effective date of TMDL.
5	Installation of Full Capture Systems or other measures to achieve 40% reduction of trash from Baseline WLA*.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	Five years from effective date of TMDL.
6	Evaluate the effectiveness of Full Capture Systems or other measures, and reconsider the WLA*.	Regional Board.	Five years from effective date of TMDL.

Task No.	Task	Responsible Jurisdiction	Date
7	Installation of Full Capture Systems or other measures to achieve 60% reduction of trash from Baseline WLA*.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	Six years from effective date of TMDL.
8	Installation of Full Capture Systems or other measures to achieve 80% reduction of trash from Baseline WLA*.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	Seven years from effective date of TMDL.
9	Installation of Full Capture Systems or other measures to achieve 100% reduction of trash from Baseline WLA*.	City of Ventura, Ventura County, Ventura County Watershed Protection District, California Department of Food and Agriculture, and Caltrans.	Eight years from effective date of TMDL.

* Compliance with percent reductions from the Baseline WLA will be assumed wherever full capture systems are installed in corresponding percentages of the conveyance discharging to the estuary. Installation will be prioritized based on the greatest point source loadings.

Table 7-25.2b Ventura River Estuary Trash TMDL: Implementation Schedule - Minimum Frequency of Assessment and Collection Program *

Task No.	Task	Responsible Jurisdiction	Date
1	Conditional Waiver in effect.	City of Ventura, Ventura County, Ventura County Watershed Protection District, Caltrans, California Department of Parks and Recreation, California Department of Food and Agriculture, and Agricultural Dischargers.	Regional Board adoption of TMDL.
2	Submit Notice of Intent to Comply with Conditional Waiver of Discharge Requirements, including MFAC/BMP Program and Trash Monitoring and Reporting Plan.	City of Ventura, Ventura County, Ventura County Watershed Protection District, Caltrans, California Department of Parks and Recreation, California Department of Food and Agriculture, and Agricultural Dischargers.	Six months from TMDL effective date.
3	Implement MFAC/BMP Program.	City of Ventura, Ventura County, Ventura County Watershed Protection District, Caltrans, California Department of Parks and Recreation, California Department of Food and Agriculture, and Agricultural Dischargers.	Six months from receipt of Notice of Acceptance from Regional Board Executive Officer.
4	Submit annual TMRP reports including proposal for revising MFAC/BMP for Executive Officer approval.	City of Ventura, Ventura County, Ventura County Watershed Protection District, Caltrans, California Department of Parks and Recreation, California Department of Food and Agriculture, and Agricultural Dischargers.	Two years from effective date of TMDL, and annually thereafter.
5	Reconsideration of Trash TMDL based on evaluation of effectiveness of MFAC/ BMP program.	Regional Board.	Five years from effective date of TMDL.

* At Task 3, all Responsible Jurisdictions must be attaining the zero trash target after each required trash assessment and collection event. At Task 4, all Responsible Jurisdictions must demonstrate full compliance and attainment of the zero trash target's requirement that trash is not accumulating in deleterious amounts between the required trash assessment and collection events. Based on Responsible Jurisdiction monitoring reports, the Executive Officer may adjust the minimum frequency of assessment and collection as necessary to ensure compliance between the required trash assessment and collection events.

7-26 Machado Lake Trash TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on June 7, 2007.

This TMDL was approved by:
The State Water Resources Control Board on December 4, 2007.
The Office of Administrative Law on February 8, 2008.
The U.S. Environmental Protection Agency on February 27, 2008.

The effective date of this TMDL is: March 6, 2008.

The elements of the TMDL are presented in Table 7-26.1 and the Implementation Plan in Tables 7-26.2a and 7-26.2b.

Table 7-26.1 Machado Lake Trash TMDL: Elements

Element	Machado Lake Trash TMDL
Problem Statement	Current levels of trash discharges into Machado Lake violate water quality objectives and are impairing beneficial uses. Relevant water quality objectives include Floating Material and Solid, Suspended, or Settleable Materials. The following designated beneficial uses are impacted by trash: municipal and domestic supply (MUN); contact water recreation (REC-1); non-contact water recreation (REC-2); warm freshwater habitat (WARM); wildlife habitat (WILD), rare, threatened, or endangered species (RARE), and wetland habitat (WET).
Numeric Target (Interpretation of the narrative water quality objective, used to calculate the load allocations)	Zero trash in Machado Lake, and on the shoreline. Zero is defined as (1) for nonpoint sources, no trash immediately following each assessment and collection event consistent with an established Minimum Frequency of Assessment and Collection Program (MFAC Program). The MFAC Program is established at an interval that prevents trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, and (2) for point sources, zero trash discharged into Machado Lake and on the shoreline.
Source Analysis	Litter from adjacent land areas, roadways and direct dumping and deposition are sources of trash to Machado Lake. Point sources such as storm drains are also sources of trash discharged to Machado Lake.
Loading Capacity	Zero, as defined in the Numeric Target.

Element	Machado Lake Trash TMDL
Waste Load Allocations (for point sources)	Waste Load Allocations (WLAs) are assigned to the California Department of Transportation (Caltrans) and permittees under the Los Angeles County Municipal Separate Storm Sewer System (MS4) NPDES permit, including Los Angeles County, Los Angeles Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance. WLAs are zero trash. WLAs may be issued to additional responsible jurisdictions in the future under Phase 2 of the US EPA Stormwater Permitting Program, or other applicable regulatory programs.
Load Allocations (for nonpoint sources)	Load Allocations (LAs) are assigned to the City of Los Angeles. LAs are zero trash. LAs may be issued to additional responsible jurisdictions in the future under applicable regulatory programs.
Implementation	Implementation of the trash TMDL for Machado Lake includes structural and non-structural best management practices (BMPs) and a program of minimum frequency of assessment and collection (MFAC) to address point and nonpoint trash sources. **Point Sources** WLAs shall be implemented through storm water permits and via the authority vested in the Executive Officer by section 13267 of the Porter-Cologne Water Quality Control Act (Water Code section 13000 et seq.). If point source dischargers comply with WLAs by implementing an Executive Officer certified full capture system on conveyances that discharge to Machado Lake through a progressive implementation schedule of full capture devices, they will be deemed in compliance with the WLA. In certain circumstances, (if approved by the Executive Officer), point source dischargers may alternatively comply with WLAs by implementing a program for minimum frequency of assessment and collection in conjunction with best management practices (MFAC/ BMPs).

Element	Machado Lake Trash TMDL
Implementation (continued)	1. Compliance with the final WLA may be achieved through an adequately sized and maintained full capture system, once the Executive Officer has certified that the system meets the following minimum criteria. A full capture system, at a minimum, consists of any device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the sub-drainage area. The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour); and A= subdrainage area (acres). Point sources that choose to comply via a full capture system, must demonstrate a phased implementation of full capture devices over an 8-year period until the final WLA of zero is attained. Zero will be deemed to have been met if full capture systems have been installed on all conveyances discharging to Machado Lake. Irrespective of whether point sources employ a full capture system, they may comply with the WLA in any lawful manner. 2. Compliance through an MFAC program in conjunction with BMPs may be proposed to the Regional Board for incorporation into the relevant NPDES permit. The MFAC program must include requirements equivalent to those described in the Conditional Waiver set forth below. Agencies that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. **Nonpoint Sources** LAs shall be implemented through either (1) a conditional waiver from waste discharge requirements, or (2) an alternative program implemented through waste discharge requirements or an individual waiver or another appropriate order of the Regional Board. Non-point source dischargers may achieve compliance with the LAs by implementing a MFAC/BMP program approved by the Executive Officer. Responsible jurisdictions that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if an MFAC/BMP program, approved by the Executive Officer, is implemented.

Element	Machado Lake Trash TMDL
Implementation (continued)	1) Conditional Waiver: Pursuant to Water Code section 13269, waste discharge requirements are waived for any responsible jurisdiction that implements a MFAC/BMP Program which, to the satisfaction of the Executive Officer, meets the following criteria: a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the water and on the shoreline. Responsible jurisdictions shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to Machado Lake. For Machado Lake, the initial minimum frequency shall be set as follows: 1. Five days per week on the shoreline and in the Ken Malloy Harbor Regional Park, as defined in the Executive Officer approved Trash Monitoring and Reporting Plan (TMRP). 2. Twice per week on waters of Machado Lake. b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible jurisdiction. c) The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, as described below, and a requirement that the responsible jurisdictions will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board on an annual basis. d) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by dischargers and approved by the Executive Officer. e) Implementation of the MFAC/BMP program should include a Health and Safety Plan to protect personnel. The MFAC/BMP shall not require responsible jurisdictions to access and collect trash from areas where personnel are prohibited.

Element	Machado Lake Trash TMDL
Implementation (continued)	The Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the waiver: (a) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections; (b) To reflect the results of trash assessment and collection; (c) If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or (d) If the amount of trash collected is decreasing such that a longer interval between collections is warranted. At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses. With regard to (a), (b) or (c), above, the Executive Officer is authorized to allow responsible jurisdictions to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency. Any waivers implementing the TMDL shall expire pursuant to Water Code section 13269 five years after the effective date of this TMDL, unless reissued. The Regional Board may reissue this waiver through an order consistent herewith, instead of readopting these regulatory provisions. (2) Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through waste discharge requirements an individual waiver, a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the assumptions and requirements of the reductions described in Table 7-26.2b, below. Within six months of the effective date of this TMDL, the Executive Officer shall require responsible jurisdictions to submit either a notice of intent to be regulated under the conditional waiver with their proposed MFAC/BMP Program and Trash Monitoring and Reporting Plan (TMRP), or a report of waste discharge.

Element	Machado Lake Trash TMDL
Monitoring and Reporting Plan	Responsible jurisdictions will develop a TMRP for Executive Officer approval that describes the methodologies that will be used to assess and monitor trash in Machado Lake and/or within responsible jurisdiction land areas. The TMRP shall include a plan to establish the trash Baseline WLAs for non-Caltrans entities, or an alternative to the default trash baseline for Caltrans to prioritize installation of full capture devices. The default trash baseline WLA for Caltrans is 6677.4 gallons per square mile per year. Requirements for the TMRP shall include, but are not limited to, assessment and quantification of trash collected from the surfaces and shoreline of Machado Lake or from responsible jurisdiction land areas. The monitoring plan shall provide details of the frequency, location, and reporting of trash monitoring. Responsible jurisdictions shall propose a metric (e.g., weight, volume, pieces of trash) to measure the amount of trash in Machado Lake and on the land area surrounding Machado Lake, as defined in the Executive Officer approved TMRP. The TMRP shall include a prioritization of areas that have the highest trash generation rates. The TMRP shall give preference to this prioritization when scheduling the installation of full capture devices, BMPs, or trash collection programs. The TMRP shall also include an evaluation of effectiveness of the MFAC/BMP program to prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, proposals to enhance BMPs, and a revised MFAC for Executive Officer review. Responsible Jurisdictions may coordinate their TMRP activities for Machado Lake.
Margin of Safety	Zero is a conservative numeric target which contains an implicit margin of safety.
Seasonal Variations and Critical Conditions	Discharge of trash from the conveyances occurs primarily during or shortly after a major rain event. Discharge of trash from nonpoint sources occurs during all seasons, but can be increased during or shortly after high wind events, which are defined as periods of wind advisories issued by the National Weather Service, and the period from May 15 to October 15.

Table 7-26.2a Machado Lake Trash TMDL: Implementation Schedule - Point Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Submit Trash Monitoring and Reporting Plan, including a plan for defining the trash baseline WLA and a proposed definition of "major rain event".	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	6 months from effective date of TMDL. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
2	Implement Trash Monitoring and Reporting Plan.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.
3	Submit results of Trash Monitoring and Reporting Plan, recommend trash baseline WLA, and propose prioritization of Full Capture System installation or implementation of other measures to attain the required trash reduction.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	2 years from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer.
4	Installation of Full Capture Systems or other measures to achieve 20% reduction of trash from Baseline WLA*.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	Four years from effective date of TMDL.
5	Installation of Full Capture Systems or other measures to achieve 40% reduction of trash from Baseline WLA*.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	Five years from effective date of TMDL.

Task No.	Task	Responsible Jurisdiction	Date
6	Evaluate the effectiveness of Full Capture Systems or other measures, and reconsider the WLA*.	Regional Board.	Five years from effective date of TMDL.
7	Installation of Full Capture Systems or other measures to achieve 60% reduction of trash from Baseline WLA*.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	Six years from effective date of TMDL.
8	Installation of Full Capture Systems or other measures to achieve 80% reduction of trash from Baseline WLA*.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	Seven years from effective date of TMDL.
9	Installation of Full Capture Systems or other measures to achieve 100% reduction of trash from Baseline WLA*.	California Department of Transportation (Caltrans) and Municipal Separate Storm Sewer System (MS4) Permittees including: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance	Eight years from effective date of TMDL.

* Compliance with percent reductions from the Baseline WLA will be assumed wherever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. Installation will be prioritized based on the greatest point source loadings.

Table 7-26.2b Machado Lake Trash TMDL: Implementation Schedule - Minimum Frequency of Assessment and Collection Program *

Task No.	Task	Responsible Jurisdiction	Date
1	Conditional Waiver in effect.	City of Los Angeles	Regional Board adoption of TMDL.
2	Submit Notice of Intent to Comply with Conditional Waiver of Discharge Requirements, including MFAC/ BMP Program and Trash Monitoring and Reporting Plan.	City of Los Angeles	Six months from TMDL effective date.
3	Implement MFAC/ BMP Program.	City of Los Angeles	Six months from receipt of Notice of Acceptance from Regional Board Executive Officer.
4	Submit annual TMRP reports including proposal for revising MFAC/BMP for Executive Officer approval.	City of Los Angeles	Two years from effective date of TMDL, and annually thereafter.
5	Reconsideration of Trash TMDL based on evaluation of effectiveness of MFAC/BMP program.	Regional Board.	Five years from effective date of TMDL.

* At Task 3, all Responsible Jurisdictions must be attaining the zero trash target after each required trash assessment and collection event. At Task 4, all Responsible Jurisdictions must demonstrate full compliance and attainment of the zero trash target's requirement that trash is not accumulating in deleterious amounts between the required trash assessment and collection events. Based on Responsible Jurisdiction monitoring reports, the Executive Officer may adjust the minimum frequency of assessment and collection as necessary to ensure compliance between the required trash assessment and collection events.

7-27 Legg Lake Trash TMDL

This TMDL was adopted by:

The Regional Water Quality Control Board on June 7, 2007.

This TMDL was approved by:

The State Water Resources Control Board on December 4, 2007.
The Office of Administrative Law on February 5, 2008.
The U.S. Environmental Protection Agency on February 27, 2008.

The effective date of this TMDL is: March 6, 2008.

The elements of the TMDL are presented in Table 7-27.1 and the Implementation Plan in Tables 7-27.2a and 7-27.2b.

Table 7-27.1 Legg Lake Trash TMDL: Elements

Element	Legg Lake Trash TMDL
Problem Statement	Current levels of trash discharges into Legg Lake violate water quality objectives and are impairing beneficial uses. Relevant water quality objectives include Floating Material and Solid, Suspended, or Settleable Materials. The following designated beneficial uses are impacted by trash: water contact recreation (REC 1) and non-contact water recreation (REC 2), warm freshwater habitat (WARM), cold freshwater (COLD), wildlife habitat (WILD), and wetland habitat (WET).
Numeric Target (Interpretation of the narrative water quality objective, used to calculate the load allocations)	Zero trash in Legg Lake and its shoreline. Zero is defined as (1) for nonpoint sources, no trash immediately following each assessment and collection event consistent with an established Minimum Frequency of Assessment and Collection Program (MFAC Program). The MFAC Program is established at an interval that prevents trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, and (2) for point sources, zero trash discharged into Legg Lake and its shoreline.
Source Analysis	Litter from adjacent land areas, roadways and direct dumping and deposition are sources of trash to Legg Lake. Point sources such as storm drains are also sources of trash discharged to Legg Lake.
Loading Capacity	Zero, as defined in the Numeric Target.
Waste Load Allocations (for point sources)	Waste Load Allocations (WLAs) are assigned to the California Department of Transportation, and permittees under the Los Angeles County Municipal Separate Storm Sewer System (MS4) NPDES permit, including the Los Angeles County Flood Control District, the County of Los Angeles, and the Cities of El Monte and South El Monte. WLAs are zero trash. WLAs may be issued to additional responsible jurisdictions in the future under Phase 2 of the US EPA Stormwater Permitting Program, or other applicable regulatory programs.
Load Allocations (for nonpoint sources)	Load Allocations (LAs) are assigned to the County of Los Angeles. LAs are zero trash. LAs may be issued to additional responsible jurisdictions in the future under applicable regulatory programs.

Element	Legg Lake Trash TMDL
Implementation	Implementation of the trash TMDL for Legg Lake includes structural and non-structural best management practices (BMPs) and a program of minimum frequency of assessment and collection (MFAC) to address point and nonpoint trash sources. **Point Sources** WLAs shall be implemented through storm water permits and via the authority vested in the Executive Officer by section 13267 of the Porter-Cologne Water Quality Control Act (Water Code section 13000 et seq.). If point source dischargers comply with WLAs by implementing an Executive Officer certified full capture system on conveyances that discharge to Legg Lake through a progressive implementation schedule of full capture devices, they will be deemed in compliance with the WLA. In certain circumstances (if approved by the Executive Officer), point source dischargers may alternatively comply with WLAs by implementing a program for minimum frequency of assessment and collection in conjunction with best management practices (MFAC/ BMPs). 1. Compliance with the final WLA may be achieved through an adequately sized and maintained full capture system, once the Executive Officer has certified that the system meets the following minimum criteria. A full capture system, at a minimum, consists of any device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the sub-drainage area. The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour); and A= subdrainage area (acres). Point sources that choose to comply via a full capture system, must demonstrate a phased implementation of full capture devices over an 8-year period until the final WLA of zero is attained. Zero will be deemed to have been met if full capture systems have been installed on all conveyances discharging to Legg Lake.

Element	Legg Lake Trash TMDL
Implementation (continued)	Irrespective of whether point source dischargers employ a full capture system, they may comply with the WLA in any lawful manner. 2. Compliance through a MFAC program in conjunction with BMPs may be proposed to the Regional Board for incorporation into the relevant NPDES permit. The MFAC program must include requirements equivalent to those described in the Conditional Waiver set forth below. Agencies that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. **Nonpoint Sources** LAs shall be implemented through either (1) a conditional waiver from waste discharge requirements, or (2) an alternative program implemented through waste discharge requirements or an individual waiver or another appropriate order of the Regional Board. Non-point source dischargers may achieve compliance with the LAs by implementing an MFAC/BMP program approved by the Executive Officer. Responsible jurisdictions that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if a MFAC/BMP program, approved by the Executive Officer, is implemented. 1) Conditional Waiver: Pursuant to Water Code section 13269, waste discharge requirements are waived for any responsible jurisdiction that implements a MFAC/BMP Program which, to the satisfaction of the Executive Officer, meets the following criteria: a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the water and shoreline. Responsible jurisdictions shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to Legg Lake. For Legg Lake, the initial minimum frequency shall be set as follows: 1. Five days per week on the shoreline and in the Whittier Narrows Recreation Park Area, as defined in the Executive Officer approved Trash Monitoring and Reporting Plan (TMRP). 2. Once per week on waters of Legg Lake.

Element	Legg Lake Trash TMDL
Implementation (continued)	b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible jurisdiction. c) The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, as described below, and a requirement that the responsible jurisdictions will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board on an annual basis. d) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by dischargers and approved by the Executive Officer. e) Implementation of the MFAC/BMP program should include a Health and Safety Program to protect personnel. The MFAC/BMP program shall not require responsible jurisdictions to access and collect trash from areas where personnel are prohibited. The Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the waiver: (a) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections; (b) To reflect the results of trash assessment and collection; (c) If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or (d) If the amount of trash collected is decreasing such that a longer interval between collections is warranted. At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses . With regard to (a), (b) or (c), above, the Executive Officer is authorized to allow responsible jurisdictions to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency.

Element	Legg Lake Trash TMDL
Implementation (continued)	Any waivers implementing the TMDL shall expire pursuant to Water Code section 13269 five years after the effective date of this TMDL, unless reissued. The Regional Board may reissue this waiver through an order consistent herewith, instead of readopting these regulatory provisions. (2) Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through waste discharge requirements an individual waiver, a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the assumptions and requirements of the reductions described in Table 7-27.2b, below. Within six months of the effective date of this TMDL, the Executive Officer shall require responsible jurisdictions to submit either a notice of intent to be regulated under the conditional waiver with their proposed MFAC/BMP Program and Trash Monitoring and Reporting Plan (TMRP), or a report of waste discharge.
Monitoring and Reporting Plan	Responsible jurisdictions will develop a TMRP for Executive Officer approval that describes the methodologies that will be used to assess and monitor trash in Legg Lake and/or within responsible jurisdiction land areas. The TMRP shall include a plan to establish the trash Baseline WLAs for non-Caltrans entities, or an alternative to the default trash baseline for Caltrans to prioritize installation of full capture devices. The default trash baseline WLA for Caltrans is 6677.4 gallons per square mile per year. Requirements for the TMRP shall include, but are not limited to, assessment and quantification of trash collected from the surfaces and shoreline of Legg Lake or from responsible jurisdiction land areas. The monitoring plan shall provide details of the frequency, location, and reporting of trash monitoring. Responsible jurisdictions shall propose a metric (e.g., weight, volume, pieces of trash) to measure the amount of trash in Legg Lake and on the land area surrounding Legg Lake, as defined in the Executive Officer approved TMRP. The TMRP shall include a prioritization of areas that have the highest trash generation rates. The TMRP shall give preference to this prioritization when scheduling the installation of full capture devices, BMPs, or trash collection programs. The TMRP shall also include an evaluation of effectiveness of the MFAC/BMP program to prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, proposals to enhance BMPs, and a revised MFAC for Executive Officer review. Responsible Jurisdictions may coordinate their TMRP activities for Legg Lake.

Element	Legg Lake Trash TMDL
Margin of Safety	Zero is a conservative numeric target which contains an implicit margin of safety.
Seasonal Variations and Critical Conditions	Discharge of trash from the conveyances occurs primarily during or shortly after a major rain event. Discharge of trash from nonpoint sources occurs during all seasons, but can be increased during or shortly after high wind events, which are defined as periods of wind advisories issued by the National Weather Service.

Table 7-27.2a Legg Lake Trash TMDL: Implementation Schedule - Point Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Submit Trash Monitoring and Reporting Plan, including a plan for defining the trash baseline WLA and a proposed definition of "major rain event".	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans.	6 months from effective date of TMDL. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
2	Implement Trash Monitoring and Reporting Plan.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans.	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.
3	Submit results of Trash Monitoring and Reporting Plan, recommend trash baseline WLA, and propose prioritization of Full Capture System installation or implementation of other measures to attain the required trash reduction.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans.	2 years from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer.
4	Installation of Full Capture Systems or other measures to achieve 20% reduction of trash from Baseline WLA*.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans.	Four years from effective date of TMDL.
5	Installation of Full Capture Systems or other measures to achieve 40% reduction of trash from Baseline WLA*.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans.	Five years from effective date of TMDL.
6	Evaluate the effectiveness of Full Capture Systems or other measures, and reconsider the WLA*.	Regional Board.	Five years from effective date of TMDL.

Task No.	Task	Responsible Jurisdiction	Date
7	Installation of Full Capture Systems or other measures to achieve 60% reduction of trash from Baseline WLA*.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans	Six years from effective date of TMDL.
8	Installation of Full Capture Systems or other measures to achieve 80% reduction of trash from Baseline WLA*.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans	Seven years from effective date of TMDL.
9	Installation of Full Capture Systems or other measures to achieve 100% reduction of trash from Baseline WLA*.	Los Angeles County, Los Angeles County Flood Control Districts, the Cities of El Monte and South El Monte, and Caltrans.	Eight years from effective date of TMDL.

* Compliance with percent reductions from the Baseline WLA will be assumed wherever full capture systems are installed in corresponding percentages of the conveyance discharging to the waterbody. Installation will be prioritized based on the greatest point source loadings.

Table 7-27.2b Legg Lake TMDL: Implementation Schedule -

Minimum Frequency of Assessment and Collection Program *

Task No.	Task	Responsible Jurisdiction	Date
1	Conditional Waiver in effect.	Los Angeles County, City of South El Monte, City of El Monte.	Regional Board adoption of TMDL.
2	Submit Notice of Intent to Comply with Conditional Waiver of Discharge Requirements, including MFAC/ BMP Program and Trash Monitoring and Reporting Plan.	Los Angeles County, City of South El Monte, City of El Monte.	Six months from TMDL effective date.
3	Implement MFAC/ BMP Program.	Los Angeles County, City of South El Monte, City of El Monte.	Six months from receipt of Notice of Acceptance from Regional Board Executive Officer.
4	Submit annual TMRP reports including proposal for revising MFAC/BMP for Executive Officer approval.	Los Angeles County, City of South El Monte, City of El Monte.	Two years from effective date of TMDL, and annually thereafter.
5	Reconsideration of Trash TMDL based on evaluation of effectiveness of MFAC/BMP program.	Regional Board.	Five years from effective date of TMDL.

* At Task 3, all Responsible Jurisdictions must be attaining the zero trash target after each required trash assessment and collection event. At Task 4, all Responsible Jurisdictions must demonstrate full compliance and attainment of the zero trash target's requirement that trash is not accumulating in deleterious amounts between the required trash assessment and collection events. Based on Responsible Jurisdiction monitoring reports, the Executive Officer may adjust the minimum frequency of assessment and collection as necessary to ensure compliance between the required trash assessment and collection events.

7-28 Harbor Beaches of Ventura County Bacteria TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on November 1, 2007.

This TMDL was approved by:
The State Water Resources Control Board on October 7, 2008.
The Office of Administrative Law on December 9, 2008.
The U.S. Environmental Protection Agency on December 18, 2008.

The effective date of this TMDL is: December 18, 2008.

The following table includes the elements of this TMDL.

Table 7-28.1. Harbor Beaches of Ventura County Bacteria TMDL: Elements

Element	Findings and Regulatory Provisions
Problem Statement	Elevated bacteria indicator densities are causing impairment of the water contact recreation (REC-1) beneficial use at Kiddie Beach and Hobie Beach. Kiddie and Hobie Beach are referenced in the Staff Report as the Harbor Beaches of Ventura County. Swimming in marine waters with elevated bacteria indicator densities has been associated with adverse health effects. Specifically, local and national epidemiological studies compel the conclusion that there is a causal relationship between adverse health effects and recreational water quality, as measured by bacteria indicator densities.
Numeric Target (Interpretation of the numeric water quality objective, used to calculate allocations)	The TMDL has a multi-part numeric target based on the bacteriological water quality objectives for marine water to protect the water contact recreation use. These targets are the most appropriate indicators of public health risk in recreational waters. Bacteriological objectives are set forth in Chapter 3 of the Basin Plan. The objectives are based on four bacteria indicators and include both geometric mean limits and single sample limits. The Basin Plan objectives that serve as the numeric targets for this TMDL are: <u>1. Rolling 30-day Geometric Mean Limits</u> a. Total coliform density shall not exceed 1,000/100 ml. b. Fecal coliform density shall not exceed 200/100 ml. c. Enterococcus density shall not exceed 35/100 ml. <u>2. Single Sample Limits</u> a. Total coliform density shall not exceed 10,000/100 ml. b. Fecal coliform density shall not exceed 400/100 ml. c. Enterococcus density shall not exceed 104/100 ml. d. Total coliform density shall not exceed 1,000/100 ml, if the ratio of fecal-to-total coliform exceeds 0.1.

Element	Findings and Regulatory Provisions
Numeric Target (Interpretation of the numeric water quality objective, used to calculate allocations) (continued)	These objectives are based on health risk for marine recreational waters of 19 illnesses per 1,000 exposed individuals as set by the United States Environmental Protection Agency (USEPA, 1986). For the Harbor Beaches of Ventura County, the targets will apply at existing monitoring sites, with samples taken at ankle to knee-high depths. These targets apply during both dry- and wet-weather. This TMDL uses a "reference system/anti-degradation approach" which means that on the basis of historical exceedance levels at existing monitoring locations, including a local reference beach within the Los Angles Region, a certain number of daily exceedances of the single sample bacteria objectives are permitted. The allowable number of exceedance days is set such that (1) bacteriological water quality at any site is at least as good as at a designated reference site within the watershed and (2) there is no degradation of existing bacteriological water quality. This approach recognizes that there are natural sources of bacteria that may cause or contribute to exceedances of the bacteriological objectives and that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas. The geometric mean targets may not be exceeded at any time. The rolling 30-day geometric mean will be calculated on each sample day. For the single sample targets, each existing monitoring site is assigned an allowable number of exceedance days for three time periods (1) summer dry-weather (April 1 to October 31), (2) winter dry-weather (November 1 to March 31), and (3) wet-weather (defined as days with 0.1 inch of rain or greater and the three days following the rain event.)
Source Analysis	Bacteria sources in the Harbor Beaches of Ventura County include anthropogenic and non-anthropogenic sources and point and non-point sources. Each of these sources contributes to the elevated levels of bacteria indicator densities at the Harbor Beaches of Ventura County during dry- and wet-weather. As of December 2006, there are four active, National Pollutant Discharge Elimination System (NPDES) permits or Waste Discharge Requirements (WDRs) for discharges to Channel Islands Harbor or Edison Canal. Discharges from the Statewide MS4 Permit for the California Department of Transportation (Caltrans) are a potentially significant source of bacteria loading. Discharges from general NPDES permits, individual NPDES permits, WDRs, the Statewide Industrial Storm Water General Permit, and the Statewide Construction Activity Storm Water General Permit are not expected to be a significant source of bacteria.

Element	Findings and Regulatory Provisions
Source Analysis (continued)	While a source identification study conducted at the Channel Islands Harbor indicated that local non-point sources are the majority contributor in summer dry-weather, high bacteria densities and exceedances during wet-weather may be more indicative of urban and agricultural run-off. Potential non-point sources of bacteria contamination at the Harbor Beaches of Ventura County include: marina activities such as waste disposal from boats, boat deck and slip washing, swimmer "wash-off", and restaurant washouts; natural sources including birds, waterfowl, and feral cat; and agricultural sources.
Loading Capacity	Loading capacity for the Harbor Beaches of Ventura County is defined in terms of bacteria indicator densities, which is the most appropriate for addressing public health risk, and is equivalent to the numeric targets, listed above. As the numeric targets shall be met at the specific sampling locations, which are representative of the corresponding beaches, no degradation or dilution allowance is provided.
Waste Load Allocations (for point sources)	Waste load allocations (WLAs) are expressed as allowable exceedance days. The allowable number of exceedance days for a monitoring site for each time period is based on the more stringent of two criteria (1) exceedance days in the designated reference system and (2) exceedance days based on historical bacteriological data at the monitoring site. This ensures that bacteriological water quality is at least as good as that of a largely undeveloped system and that there is no degradation of existing water quality. For each beach, allowable exceedance days are set on an annual basis as well as for three time periods. These three periods are: 1. Summer dry-weather (April 1 to October 31) 2. Winter dry-weather (November 1 to March 31) 3. Wet-weather days (defined as days of 0.1 inch of rain or more plus three days following the rain event) For the Channel Islands Harbor Beaches, the County of Ventura, the Ventura County Watershed Protection District (VCWPD) and associated Municipal Separate Storm Sewer System (MS4) permittees in the Channel Islands Harbor subwatershed, the City of Oxnard, and Caltrans are assigned WLAs. All WLAs for summer dry-weather single sample bacteria densities at the Harbor Beaches of Ventura County are zero (0) days of allowable exceedances.

Element	Findings and Regulatory Provisions
Waste Load Allocations (for point sources) (continued)	The WLA for the rolling 30-day geometric mean during any time period or monitoring site at the Harbor Beaches of Ventura County is zero (0) days of allowable exceedances. The WLA for winter dry-weather and wet-weather single sample bacteria densities for Kiddie Beach and Hobie Beach are listed in Table 7-28.2. General NPDES permits, individual NPDES permits, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, and WDR permittees in the Channel Islands Harbor subwatershed are assigned WLAs of zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean. Any future enrollees under a general NPDES permit, individual NPDES permit, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, and WDR will also be subject to a WLA of zero (0) days of allowable exceedances. The Harbor Beaches of Ventura County are assigned interim WLAs upon the effective date of the TMDL. Interim WLAs for single sample and the 30-day rolling geometric mean are expressed in terms of an exceedance day and listed below. **Single Sample Exceedances:** Summer Dry-Weather Location | Daily Sampling | Weekly Sampling Kiddie Beach | 54 | 8 Hobie Beach | 40 | 6 Winter Dry-Weather Location | Daily Sampling | Weekly Sampling Kiddie Beach | 23 | 4 Hobie Beach | 25 | 4 Wet-Weather Location | Daily Sampling | Weekly Sampling Kiddie Beach | 32 | 5 Hobie Beach | 38 | 6

<tr><td>Load Allocations
(for non-point sources)</td><td>
Load allocations (LAs) are expressed as the number of daily or weekly sample days that may exceed the single sample targets identified under “Numeric Target” at a monitoring site.

For the Channel Islands Harbor Beaches, the County of Ventura and the City of Oxnard are assigned LAs. LAs may be assigned to agricultural lands in the Channel Islands Harbor subwatershed during Regional Board Reconsideration based on monitoring data from the Conditional Waiver for Dischargers from Irrigated Lands.

All LAs for summer dry-weather, single sample bacteria densities at the Harbor Beaches of Ventura County are zero (0) days of allowable exceedances. The LA for winter dry-weather and wet-weather single sample bacteria densities for Kiddie Beach and Hobie Beach are listed in Table 7-28.2.

The LA for the rolling 30-day geometric mean during any time period or monitoring site at the Harbor Beaches of Ventura County is zero (0) days of allowable exceedances.

The Harbor Beaches of Ventura County are assigned interim LAs upon the effective date of the TMDL. Interim LAs for single sample and the 30-day rolling geometric mean are expressed in terms of an exceedance day and listed below.

<tr><td>Implementation</td><td>The regulatory mechanisms used to implement the TMDL will include general NPDES permits, individual NPDES permits, WDRs, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, the Conditional Waiver for Dischargers from Irrigated Lands, the Statewide MS4 Permit for Caltrans, and the authority contained in Sections 13263 and 13267 of the Water Code. Each NPDES permit, assigned a WLA, shall be reopened or amended when the permit is reissued, in accordance with applicable laws, to incorporate the applicable WLAs as a permit requirement. LAs for non-point sources will be implemented within the context of this TMDL.</td></tr>
</table>

Element	Findings and Regulatory Provisions
Implementation (continued)	This TMDL will be implemented in accordance with the implementation schedule for the Harbor Beaches of Ventura County. The compliance and implementation schedules are detailed in Table 7-28.3. Responsible parties are not specifically required to conduct pilot projects for Best Management Practices (BMPs), though conducting pilot projects is within their discretion. The Regional Board recognizes the long duration required to conduct a pilot project. As such, time is allocated in the implementation schedule for the option of piloting structural BMPs, which include but are not limited to enhanced circulation devices. Special studies are not required for implementation of the TMDL, though conducting special studies is within the discretion of the responsible parties. The Regional Board shall reconsider this TMDL four years after the effective date of the TMDL for the Harbor Beaches of Ventura County to re-evaluate WLAs and LAs based on monitoring data; to re-evaluate allowable exceedance levels, including whether the allowable number of exceedance days maybe adjusted based on a Ventura County rainfall record; to re-evaluate the selection of the reference beach if additional, appropriate reference beach options have been developed; to consider a natural source exclusion approach, subject to the antidegradation policy, if it can be demonstrated that such an approach is warranted by demonstration of the control of all anthropogenic sources of bacteria to the beaches, and demonstration that beneficial uses are being met; and to assign LAs to agricultural lands in the Chanel Islands Harbor subwatershed based on monitoring in the Conditional Waiver for Dischargers from Irrigated Lands. Five years after the effective date of the TMDL, there shall be no allowable exceedances of the single sample limits, in excess of the allowable exceedances listed in Table 7-28.2, at any monitoring location at the Harbor Beaches of Ventura County during summer dry-weather, winter dry-weather, and the rolling 30-day geometric mean targets shall be achieved. Ten years after the effective date of the TMDL there shall be no allowable exceedances of the single sample limits, in excess of the allowable exceedances listed in Table 7-28.2, at any monitoring location during dry-weather or wet-weather at the Harbor Beaches of Ventura County, and the rolling 30-day geometric mean targets shall be achieved.

Element	Findings and Regulatory Provisions
Margin of Safety	An implicit margin of safety is included through several conservative assumptions, such as the assumption that no dilution takes place between the on-shore sources and where the effluent initially mixes with the receiving water, and that bacteria degradation rates are not sufficient to affect bacteria densities in the receiving water. In addition, an explicit margin of safety has been incorporated, as the load allocations will allow exceedances of the single sample targets no more than 5% of the time on an annual basis, based on the cumulative allocations for dry- and wet-weather. The Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List concludes that there are water quality impairments using a binomial distribution method which lists waterbodies when the exceedances are between approximately 8 and 10 percent.
Seasonal Variations and Critical Conditions	Seasonal variations are addressed by developing separate waste load allocations for summer dry-weather, winter dry-weather, and wet-weather based on public health concerns and observed natural background levels of exceedance of bacteria indicators. Historic monitoring data for the Harbor Beaches of Ventura County and the reference beach indicate that the critical condition for bacteria loading is during wet-weather due to greater exceedance probabilities of the single sample bacteria objectives then during dry-weather. To more specifically identify a critical condition within wet-weather, in order to set the allowable exceedance days shown in Table 7-28.2, the 90th percentile 'storm year'[1] in terms of wet days[2] is used as the reference year for the reference system. Selecting the 90th percentile year avoids a situation where the reference system is frequently out of compliance. Selecting the 90th percentile year is a more conservative approach that will accommodate a 'worst-case' scenario resulting in fewer exceedance days than the maximum allowed in drier years. Conversely, in the 10% of wetter years, there may be more than the allowable number of exceedance days.
Compliance Monitoring	Compliance and monitoring for Harbor Beaches of Ventura County is based on existing monitoring protocols and locations. Monitoring shall continue at sampling locations (VCEHD 36000 and VCEHD 37000) and at the current weekly monitoring frequency, consistent with AB411 compliance monitoring. Monitoring shall be conducted on a year-round basis at the current monitoring locations including the summer months (i.e., April to October) and winter months (i.e., November to March). Bacteria sampling shall be conducted in ankle- to knee-high water, consistent with AB411. However, if additional monitoring stations are added or if changes are made to the sampling frequencies or existing monitoring locations, then submittal of a monitoring plan is required for Executive Officer approval.

Element	Findings and Regulatory Provisions
Compliance Monitoring (continued)	For agricultural dischargers, the Conditional Waiver for Dischargers from Irrigated Lands shall be revised to include monitoring for enrollees in the Channel Islands Harbor subwatershed.

1 For purposes of this TMDL, a 'storm year' means November 1 to October 31. The 90th percentile storm year was 1993 with 75 wet days at the LAX meteorological station.

2 A wet day is defined as a day with rainfall of 0.1 inch or more plus the 3 days following the rain event.

Table 7-28.2. Harbor Beaches of Ventura County Bacteria TMDL: Final Allowable Exceedance Days by Location

Location	Summer dry-weather*		Compliance Deadline	Winter dry-weather		Compliance Deadline	Wet-weather**		Compliance Deadline
	Daily sampling (No. days)	Weekly sampling (No. days)		Daily sampling (No. days)	Weekly sampling (No. days)		Daily sampling (No. days)	Weekly sampling (No. days)	
Hobie Beach	0	0	Five years after effective date of the TMDL	3	1	Five years after effective date of the TMDL	17	3	Ten years after effective date of the TMDL
Kiddie Beach	0	0	Five years after effective date of the TMDL	3	1	Five years after effective date of the TMDL	17	3	Ten years after effective date of the TMDL

*A dry day is defined as a non-wet day.
**A wet day is defined as a day with 0.1-inch or more of rain and the three days following the rain event.

Table 7-28.3 Harbor Beaches of Ventura County Bacteria TMDL: Implementation Table		
Implementation Action	**Responsible Parties**	**Date**
Compliance (WLAs): There shall be no exceedances of the interim WLAs (see the WLAs section in Table 7-28.1).	1. County of Ventura 2. Ventura County Watershed Protection District (VCWPD) and associated MS4 Co-permittees in the Channel Islands Harbor (CIH) subwatershed[3] 3. City of Oxnard 4. Caltrans	Effective date of the TMDL.
Compliance (LAs): There shall be no exceedances of the interim LAs (see the LAs section in Table 7-28.1).	1. County of Ventura 2. City of Oxnard	Effective date of the TMDL.
Monitoring: Continue monitoring at stations VCEHD 36000 and VCEHD 37000, at a weekly monitoring frequency, and on a year-round basis. Extend the monitoring period for Hobie Beach to include winter months.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Effective date of the TMDL.
Monitoring[4]: Submit a monitoring plan for the Harbor Beaches of Ventura County (HBVC) for approval by the Executive Officer.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Prior to the modification of existing monitoring locations or frequencies.
Implementation: Submit draft work plan to implement source control and BMPs, including but not limited to structural and non-structural BMPs, at the HBVC during dry-weather for Executive Officer approval.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Six months after the effective date of the TMDL.
Monitoring: Submit monitoring plan for agricultural discharges into the Channel Islands Harbor subwatershed for approval by the Executive Officer.	1. Agricultural Dischargers	One year after the effective date of the TMDL.
Monitoring: Monitor agricultural discharges at the frequency and monitoring locations approved by the Executive Officer in the monitoring plan.	1. Agricultural Dischargers	Six months after Executive Officer approval of the monitoring plan for agricultural discharges.
Pilot Project: Submit a work plan piloting Structural BMPs, including but not limited to enhanced circulation devices, for Executive Officer approval (optional).	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	One year and six months after the effective date of the TMDL.

Table 7-28.3 Harbor Beaches of Ventura County Bacteria TMDL: Implementation Table		
Implementation Action	**Responsible Parties**	**Date**
Implementation: Submit draft work plan to implement source control and BMPs, including but not limited to structural and non-structural BMPs, at the HBVC during wet-weather for Executive Officer approval.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	One year and six months after the effective date of the TMDL.
Pilot Project: Completion of Structural BMP pilot projects, including but not limited to enhanced circulation devices (optional).	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Two years and six months after the effective date of the TMDL.
Implementation: Submit final work plan; to implement source control and BMPs, including but not limited to structural and non-structural BMPs, at the HBVC during dry-weather for Executive Officer approval.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Three years and six months after the effective date of the TMDL.
Regional Board Reconsideration: a. Re-evaluate WLAs and LAs based on data. b. Re-evaluate the implementation schedule based on results from pilot projects. c. Re-evaluate allowable exceedance levels, including whether the allowable number of exceedance days maybe adjusted based on a Ventura County rainfall record. d. Re-evaluate the selection of the reference beach if additional, appropriate reference beach options have been developed and if an appropriate reference system cannot be identified for this enclosed harbor, evaluate using the 'natural sources exclusion' approach subject to antidegradation policies rather than the 'reference system/antidegradation' approach. e. Assign LAs to agricultural lands in the Channel Islands Harbor subwatershed based on monitoring in the Conditional Waiver for Dischargers from Irrigated Lands.	Regional Board	Four years after effective date of the TMDL.
Implementation: Submit final work plan to implement source control and BMPs, including but not limited to structural and non-structural BMPs, at the HBVC during wet-weather for Executive Officer approval.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Four years after the effective date of the TMDL.

Table 7-28.3 Harbor Beaches of Ventura County Bacteria TMDL: Implementation Table		
Implementation Action	**Responsible Parties**	**Date**
Compliance (WLAs): There shall be no exceedances in excess of the numbers in Table 7-28.2 of the single sample limits at any location during dry-weather, and the rolling 30-day geometric mean targets shall be achieved.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Five years after the effective date of the TMDL.
Compliance (LAs): There shall be no exceedances in excess of the numbers in Table 7-28.2 of the single sample limits at any location during dry-weather, and the rolling 30-day geometric mean targets shall be achieved.	1. County of Ventura 2. City of Oxnard	Five years after the effective date of the TMDL.
Compliance: Submit Compliance Report for Executive Officer approval. The Compliance Report shall include an evaluation of compliance with dry-weather allocations, interim wet-weather allocations, and rolling 30-day geometric mean targets.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Six and Eight years after the effective date of the TMDL.
Compliance: Submit Final Compliance Report for Executive Officer approval. The Compliance Report shall include an evaluation of compliance with dry-weather allocations, wet-weather allocations, and the rolling 30-day geometric mean targets.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Ten years after the effective date of the TMDL.
Final Compliance (WLAs): There shall be no allowable exceedances of single sample limits in excess of the numbers listed in Table 7-28.2 of the single sample limits at any location during any periods and the rolling 30-day geometric mean targets shall be achieved.	1. County of Ventura 2. VCWPD and associated MS4 Co-permittees in the CIH subwatershed 3. City of Oxnard 4. Caltrans	Ten years after the effective date of the TMDL.
Final Compliance (LAs): There shall be no allowable exceedances of single sample limits in excess of the numbers listed in Table 7-28.2 of the single sample limits at any location during any periods and the rolling 30-day geometric mean targets shall be achieved.	1. County of Ventura 2. City of Oxnard	Ten years after the effective date of the TMDL.

3 Co-permittees of Municipal Separate Storm Sewer System (MS4) permit for Channel Islands Harbor subwatershed include the County of Ventura and incorporated cities therein. The incorporated cities for Channel Islands Harbor subwatershed include the City of Oxnard.

4 Submittal of a monitoring plan is required if additional monitoring stations are added or if changes are made to the sampling frequencies or existing monitoring locations (VCEHD 36000 and VCEHD 37000).

7-29 Machado Lake Eutrophic, Algae, Ammonia, and Odors (Nutrient) TMDL

This TMDL was adopted by:

The Regional Water Quality Control Board on May 1, 2008**.**

This TMDL was approved by:

The State Water Resources Control Board on December 2, 2008.
The Office of Administrative Law on February 19, 2009.
The U.S. Environmental Protection Agency on March 11, 2009.

The effective date of this TMDL is: March 11, 2009.

The elements of the TMDL are presented in Table 7-29.1 and the Implementation Plan in Table 7-29.2

Table 7-29.1. Machado Lake Eutrophic, Algae, Ammonia, and Odors (Nutrient) TMDL: Elements

TMDL Element	Regulatory Provisions
Problem Statement	Excessive loadings of nutrients, in particular nitrogen (including ammonia) and phosphorus, cause eutrophic effects, including algae and odors, which impair the beneficial uses of Machado Lake. The nutrient enrichment results in high algal productivity; algal blooms have been observed in the lake during summer months. In addition, high nutrient concentrations contribute to excessive and nuisance macrophyte growth. Algae respiration and decay depletes oxygen from the water column creating an adverse aquatic environment. Machado Lake was placed on the Clean Water Act 303(d) list of impaired waterbodies in 1998, 2002, and 2006 for ammonia, algae, odors, and eutrophic. Applicable Water Quality Objectives for this TMDL are narrative objectives for Biostimulatory Substances and Taste and Odor; and numeric objectives for Dissolved Oxygen and Ammonia. The beneficial uses of Machado Lake include beneficial uses associated with recreation (REC 1 and REC 2), aquatic life (WARM, WILD, RARE, and WET) and water supply (MUN). This TMDL addresses the eutrophic, algae, ammonia, and odor listings which impair these uses.

<table>
<tr><th>TMDL Element</th><th>Regulatory Provisions</th></tr>
<tr><td>Numeric Targets</td><td>The total phosphorus target for Machado Lake is 0.1 mg/L as a monthly average concentration in the water column, which is based upon US EPA Nutrient Criteria Technical Guidance Manual for Lakes and Reservoirs. A ratio of total nitrogen to total phosphorus of 10 is the basis for the total nitrogen (TKN + NO_3-N + NO_2 –N) numeric target of 1.0 mg/L as a monthly average concentration in the water column. The total nitrogen target incorporates all forms of nitrogen including TKN, which is the sum of organic nitrogen and ammonia nitrogen, nitrate nitrogen (NO_3-N), and nitrite nitrogen (NO_2-N). The total nitrogen target expressed as a monthly average is protective of chronic aquatic life exposure for ammonia. There is a separate numeric target for ammonia of 5.95 mg/L as an hourly average to be protective of acute aquatic life exposure. The chlorophyll a target is 20 ug/L based on EPA guidance and the Carlson Trophic Status Index. The dissolved oxygen target is a single sample concentration of no less than 5 mg/L measured at 0.3 meter above the sediments based on the Basin Plan objective. The following table provides the numeric targets for the Machado Lake TMDL.

<table>
<tr><th>Indicator</th><th>Numeric Target</th></tr>
<tr><td>Total Phosphorus</td><td>0.1 mg/L monthly average</td></tr>
<tr><td>Total Nitrogen
(TKN + NO_3-N + NO_2 –N)</td><td>1.0 mg/L monthly average</td></tr>
<tr><td>Ammonia - N</td><td>5.95 mg/L one-hour average</td></tr>
<tr><td>Ammonia - N</td><td>2.15 mg/L 30 day average</td></tr>
<tr><td>Dissolved Oxygen</td><td>5 mg/L single sample minimum measured 0.3 meter above the sediments.</td></tr>
<tr><td>Chlorophyll a</td><td>20 µg/L monthly average</td></tr>
</table>
</td></tr>
<tr><td>Source Analysis</td><td>The point sources of nutrients into Machado Lake are stormwater discharges from the municipal separate storm sewer system (MS4), California Department of Transportation (Caltrans), and general construction and industrial discharges. Stormwater discharges to Machado Lake occur through the following subdrainage systems: Drain 553, Wilmington Drain, Project 77/510, and Walteria Lake. Discharges from Walteria Lake and Drain 553 are tributary to the Wilmington Drain, which then directly discharges in the northern portion of Machado Lake. Approximately, 88 % of the discharge into the lake enters through the Wilmington Drain.

The major nonpoint source of nutrients to Machado Lake is internal nutrient loading (nutrient flux from sediments). Atmospheric deposition is also a nonpoint source of total nitrogen. Nutrient loads from wind resuspension, bioturbation, birds, and general surface runoff are minor sources. Special studies may be conducted to further evaluate sources.</td></tr>
</table>

<table>
<tr><th>TMDL Element</th><th>Regulatory Provisions</th></tr>
<tr><td>Linkage Analysis</td><td>The linkage analysis focuses on the relationship between the nutrient loading to the lake and the numeric targets established to measure attainment of beneficial uses. The Nutrient Numeric Endpoints BATHTUB Spreadsheet Model, which was developed by Tetra Tech for US EPA, was used to establish the linkage between nutrient loading to Machado Lake and the predicted water quality response. The model performs water and nutrient balance calculations under steady-state conditions. Eutrophication related water quality conditions are expressed in terms of total phosphorus, ortho-phosphourus, total nitrogen, inorganic nitrogen, chlorophyll a, transparency (Secchi depth), and hypolimnetic oxygen depletion rates. The linkage analysis demonstrates that assigning waste load and load allocations for total nitrogen and total phosphorus will address eutrophication related water quality conditions.</td></tr>
<tr><td>Waste Load Allocations</td><td>Waste load allocations are assigned to urban stormwater dischargers (MS4, Caltrans, general construction and general industrial) in both wet and dry weather. The final waste load allocations are assigned as concentration based allocations of 0.1 mg/L and 1.0 mg/L as monthly averages for total phosphorus and total nitrogen (TKN + NO_3-N + NO_2 –N), respectively.

Interim WLAs are based on current in-lake concentrations. The effective date interim total nitrogen and total phosphorus waste load allocations are set as the 95th percentile of current concentrations in the lake. The 5 year interim total nitrogen WLAs are established as a 30 percent reduction from current in-lake concentrations. Concentration-based interim and final WLAs will be included in stormwater permits in accordance with NPDES guidance and requirements. The tables below present the interim and final waste load allocations for the stormwater discharges.

<table>
<tr><th>Waste Load Allocations</th><th>Total Phosphorus</th><th>Total Nitrogen (TKN + NO_3-N + NO_2-N)</th></tr>
<tr><th></th><th>Final WLA (mg/L)</th><th>Final WLA (mg/L)</th></tr>
<tr><td>MS4 Permittees[1] Caltrans, General Construction and Industrial stormwater permits</td><td>0.1</td><td>1.0</td></tr>
</table>
[1] Municipal Separate Storm Sewer System (MS4) Permittees that are responsible for discharges to Machado Lake include: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance.</td></tr>
</table>

TMDL Element	Regulatory Provisions
Waste Load Allocations (continued)	

Waste Load Allocations	Years After Effective Date	Interim Total Phosphorus WLAs (mg/L)	Interim Total Nitrogen (TKN + NO3-N + NO2-N) WLAs (mg/L)
MS4 Permittees, Caltrans, General Construction and Industrial Stormwater permits	At Effective Date[1]	1.25	3.50
	5[2]	1.25	2.45
	9.5 (Final WLAs[3])	0.10	1.00

[1] The compliance point for all effective date interim WLAs is measured in the lake.
[2] The compliance point for all year 5 interim WLAs is measured as specified in Implementation Plan Section II of Table 7-29.1
[3] The compliance point for all final WLAs is measured as specified in Implementation Plan Section II of Table 7-29-.1

Load Allocations

Load allocations are assigned for nonpoint source discharges to the lake, primarily internal loading from the lake. The final load allocations for internal loading are concentration based allocations of 0.1 mg/L and 1.0 mg/L as monthly averages for total phosphorus and total nitrogen (TKN + NO_3-N + NO_2 –N), respectively. Concentration based load allocations are appropriate and can be evaluated by monitoring the nutrient concentrations in the water column.

Interim LAs are based on current in-lake concentrations. The effective date interim total nitrogen and phosphorus load allocations are set at the 95th percentile of current concentrations in the lake. The 5 year interim total nitrogen LAs are established as a 30 percent reduction from current in-lake concentrations. The tables below present the final and interim load allocations for the nonpoint sources.

Load Allocations	Total Phosphorus	Total Nitrogen (TKN + NO_3-N + NO_2-N)
	Final LA (mg/L)	Final LA (mg/L)
Internal Nutrient Load (City of Los Angeles Department of Recreation and Parks)	0.1	1.0

Load Allocations	Years After Effective Date	Interim Total Phosphorus LAs (mg/L)	Interim Total Nitrogen (TKN + NO3-N + NO2-N) LAs (mg/L)
Internal Nutrient Load (City of Los Angeles Department of Recreation and Parks)	At Effective Date	1.25	3.50
	5	1.25	2.45
	9.5 (Final LAs)	0.10	1.00

TMDL Element	Regulatory Provisions
Margin of Safety	The uncertainties associated with this TMDL are due to limited data from the stormdrains entering the lake and the inherent seasonal and annual variability in delivery of phosphorus and nitrogen for external sources and nutrient cycling within the lake. To address these uncertainties, conservative numeric targets were selected by establishing the targets under a critical lake volume. Likewise, the waste load and load allocations are based on a constant value for internal loading. Moreover, the lake conditions under which the load capacity was developed were based on dry weather critical conditions when the lake level is reduced and therefore loading capacity is reduced. These conservative approaches provide an implicit margin of safety.
Seasonal Variations and Critical Conditions	The external nutrient loading to Machado Lake generally occurs during winter and spring months, in conjunction with storm events. During the dry season the lake receives minimal external loading. In the summer there is the release of nutrients from the sediments. At the same time there is very little water inflow and a decreased lake level due to evaporation. These seasonal variations cause increased nutrient concentrations. Moreover, the reduced lake volume during the summer months provides less assimilative capacity. The critical condition for the attainment of beneficial uses at Machado Lake occurs during the summer months. Also, the critical conditions for dissolved oxygen impairments related to algae growth are during the warm dry summer months when algal respiration is highest. The Machado Lake nutrient TMDL accounts for seasonal and critical conditions of the summer months by assigning a load allocation to the lake sediments and requiring a reduction in this source of nutrients to the lake, and by assigning WLAs to urban stormwater dischargers year-round.
Special Studies and Monitoring Plan	**<u>Special Studies</u>** Additional monitoring and special studies may be undertaken by dischargers and responsible agencies to evaluate the uncertainties and assumptions made in the development of this TMDL. (The results of special studies may be used to reevaluate waste load allocations and load allocations when the Machado Lake Nutrient TMDL is reconsidered.) ***Optional Study #1:*** Core flux study to estimate the nutrient flux from sediments under equilibrium conditions. Results from this study would be beneficial to gauge the success of implementation measures such as aeration. ***Optional Study #2:*** A study to understand factors such as nitrogen and phosphorus sedimentation rates (particulate settling velocities), the overall lake sedimentation rate, and sediment resuspension rate. These factors would be important for a Machado Lake nutrient budget and gauging the potential need for periodic hydraulic dredging.

TMDL Element	Regulatory Provisions
Special Studies and Monitoring Plan (continued)	***Optional Study #3***: A work plan for permittees to assess compliance with TMDL WLAs on a mass basis for total nitrogen and total phosphorous. The work plan should detail testing methodologies, BMPs, and treatments to be implemented to attain and demonstrate a reduction of total nitrogen and phosphorous loading on a mass basis. A final report including the results shall be submitted to the Regional Board for Executive Officer approval. Additional special studies proposed by stakeholders are optional and will be considered at the 7.5 year TMDL reconsideration. All proposed special study work plans and documents shall be submitted to the Regional Board for Executive Officer approval prior to special studies being initiated. **<u>Monitoring Plan</u>** A Monitoring and Reporting Program (MRP) plan to assess compliance with LAs and WLAs measured in lake must be submitted to the Executive Officer for approval within one year of the effective date. Monitoring will begin 60 days after the Executive Officer has approved the monitoring plan. This MRP plan will be required as part of the Lake Water Quality Management Plan as discussed in the Implementation Section. The MRP plan will be designed to monitor and implement this TMDL. The monitoring plan is required to measure the progress of pollutant load reductions and improvements in water quality. The monitoring plan shall ▪ Determine attainment of total phosphorus, total nitrogen, ammonia, dissolved oxygen, and chlorophyll *a* numeric targets. ▪ Determine compliance with the waste load and load allocations for total phosphorus, and total nitrogen. ▪ Monitor the effect of implementation actions on lake water quality Responsible jurisdictions shall be required to begin monitoring sixty days after the Executive Officer approves the MRP. Field samples and water samples shall be collected bi-weekly on a year-round basis. The lake sampling sites will be located in the open water portion of the lake with one in the northern portion and one in the southern portion of the lake. *In situ* measurements of water quality shall be made. The water quality probes will be calibrated immediately prior to departure to the field against known pH, EC, and DO solutions. Secchi depth, a measurement of transparency, will also be measured with a standard Secchi disk or other approved method. Additionally, a staff gauge shall be placed in an appropriate location at the lake to measure changes in lake elevation.

TMDL Element	Regulatory Provisions
Special Studies and Monitoring Plan (continued)	The monitoring plan shall consider stratification for the collection of water samples. Water samples shall be analyzed for constituents including but not limited to the following. ▪ Total nitrogen ▪ Total phosphorus ▪ Nitrate (NO_3-N) ▪ Total ammonia (NH_3-N) ▪ Ortho-phosphorus (PO_4) ▪ Total Dissolved Solids ▪ Total Suspended Solids ▪ Chlorophyll a ▪ Turbidity Detection limits shall be less than the numeric targets in this TMDL. A monitoring report shall be prepared and submitted to the Regional Board annually within six months after the completion of the final sampling event of the year. If an alternative WLA compliance option is selected, an appropriate separate TMDL compliance MRP Plan and TMDL Implementation Plan must be submitted for Executive Officer approval. Annual monitoring reports demonstrating compliance or non-compliance with WLAs shall be submitted for Executive Officer approval. All compliance monitoring must be conducted in conjunction with a Regional Board approved Quality Assurance Project Plan (QAPP). The QAPP shall include protocols for sample collection, standard analytical procedures, and laboratory certification.
Implementation Plan	Compliance with the TMDL is based on the assigned WLAs and LAs. Compliance with this TMDL will require the implementation of NPDES stormwater permit limits and lake management activities to reduce nutrient loading to the lake, reduce nutrient concentrations in the lake, prevent excessive algal biomass growth, and maintain an adequate dissolved oxygen concentration. Table 7-29.2 contains a schedule for responsible jurisdictions to implement BMPs and a Lake Water Quality Management Plan to comply with the TMDL. I. Implementation and Determination of Compliance with LAs Compliance with the LAs will be measured in the lake and will be achieved through a combination of implementation of lake management projects and BMPs to reduce external and internal nutrient loading to the lake and to reduce and manage internal nutrient sources.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	Load allocations will be implemented through the following: (1) Memorandum of Agreement (MOA), or (2) Clean Up and Abatement Order or Other Regulatory Order The responsible jurisdictions for the load allocations shall be allowed one year from the effective date of this TMDL to enter into a Memorandum of Agreement (MOA) with the Executive Officer, detailing the voluntary efforts that will be undertaken to attain the load allocations. The MOA shall comply with the Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options ("Policy"), including part II, section 2 c ii and related provisions, and shall be consistent the requirements of this TMDL. If the MOA is timely adopted, and so long as it is implemented, the program described in the MOA shall be deemed "certified", pursuant to the Policy, subject to the conditions of Policy section 2 e. The MOA shall include development of a Lake Water Quality Management Plan (LWQMP), must be approved by the Executive Officer, and may be amended with Executive Officer approval, as necessary. If a MOA is not established with responsible jurisdictions within one year or if responsible jurisdictions do not comply with the terms of the MOA, a cleanup and abatement order pursuant to Water Code section 13304, or another appropriate regulatory order, shall be issued to implement the load allocations. Furthermore, the implementation of the MOA must result in attainment of the TMDL load allocations. If the MOA and LWQMP are not implemented or otherwise do not result in attainment of load allocations, the certification shall be revoked, the MOA rescinded, and the load allocations shall be implemented through a cleanup and abatement order, or other order, as described above. Implementation of the MOA shall be reviewed annually by the Executive Officer as part of the Monitoring and Reporting Program (MRP) annual reports. To the satisfaction of the Executive Officer the LWQMP shall meet the following criteria: ▪ One and one half years from the effective date of the TMDL responsible jurisdictions shall submit a LWQMP, MRP Plan and QAPP for approval by the Executive Officer. ▪ The LWQMP shall include a list of cooperating parties.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	▪ The LWQMP shall address appropriate water quality monitoring and a timeline for the implementation of management practices to reduce and manage nutrient loading to the lake. The timeline shall ensure that the implementation actions are underway prior to Regional Board reconsideration of the TMDL. The LWQMP shall present a comprehensive management plan and strategy for achieving the LAs at Machado Lake and attaining numeric targets and beneficial uses. The LWQMP shall include a schedule for implementation actions. ▪ The LWQMP shall achieve compliance with the load allocations through the implementation of lake management strategies to reduce and manage internal nutrient sources. The lake management implementation actions may include, but are not limited to the following: ▪ Wetland restoration ▪ Aeration system ▪ Hydraulic Lake dredging ▪ Hydroponic Islands ▪ Alum treatment ▪ Fisheries Management ▪ Macrophyte Management and Harvesting ▪ Maintain Lake Level – Supplemental Water ▪ The LWQMP shall include a MRP Plan. The MRP shall include a requirement that the responsible jurisdictions report compliance and non-compliance with load allocations as part of annual reports submitted to the Regional Board. Compliance with the load allocations shall be measured in the lake at two locations, one in the north portion and one in the south. The average of these two sampling locations shall determine compliance with the load allocations. MRP protocols may be based on Surface Water Ambient Monitoring Program (SWAMP) protocols for water quality monitoring or alternative protocols proposed by dischargers and approved by the Executive Officer. ▪ A QAPP shall also be submitted to the Regional Board for approval by the Executive Officer to ensure data quality. The QAPP shall include protocols for sample collection, standard analytical procedures, and laboratory certification. The QAPP may be based on SWAMP protocols for water quality monitoring and quality assurance or alternative protocols proposed by dischargers and approved by the Executive Officer. ▪ The MOA and LWQMP program shall include assurances that it will be implemented by the responsible jurisdiction.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	▪ Implementation of the LWQMP program should include a Health and Safety Plan to protect personnel. The Executive Officer may require a revised assessment under the MOA and LWQMP: (a) To prevent nutrients from accumulating or recycling in the lake in deleterious amounts that impair water quality, contribute to negative eutrophic conditions or adversely affect beneficial uses; (b) To reflect the results of nutrient assessment or special studies Cleanup and Abatement Order or Other Regulatory Order: Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the allocations, reductions, and schedule described in Table 7-29.2. ❖ Determination of Compliance with Interim LAs Responsible parties shall comply with numeric interim LAs or may be deemed in compliance with the interim LAs through implementation of lake sediment removal and/or lake management implementation actions in accordance with the LWQMP schedule as approved by the Regional Board Executive Officer. II. Implementation and Determination of Compliance with WLAs WLAs will be incorporated into NPDES stormwater permits. Stormwater permittees may be deemed in compliance with waste load allocations by actively participating in a LWQMP and attaining the waste load allocations for Machado Lake. Stormwater permittees and the responsible party for the lake may work together to implement the LWQMP and reduce external nutrient loading to attain the TMDL waste load allocations measured in the lake. Alternatively, MS4 Permittees may be deemed in compliance with waste load allocations by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the stormdrain outfall of the permittee's drainage area. The annual mass based allocation shall be equal to a monthly average concentration of 0.1 mg/L TP and 1.0 mg/L TN based on approved flow conditions. Permittees must demonstrate total nitrogen and total phosphorous load reductions to be achieved in accordance with a special study workplan approved by the Executive Officer. Compliance may also be demonstrated as concentration based monthly averages for TP and TN measured at the stormdrain outfall of the permittee's drainage area.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	MS4 Permittees shall be required to develop and implement a MRP plan and TMDL Implementation Plan. The MRP plan shall include a requirement that the responsible jurisdictions report compliance and non-compliance with waste load allocations as part of annual reports submitted to the Regional Board. ❖ Determination of Compliance with Interim WLAs Responsible parties may comply with the numeric interim WLAs or may be deemed in compliance with the interim WLAs through implementation of external nutrient source reduction projects in accordance with the TMDL Implementation Plan schedule as approved by the Regional Board Executive Officer. The Regional Board may revise these WLAs and the compliance point based on the collection of additional information developed through special studies or monitoring conducted as part of this TMDL. The Regional Board will reconsider the TMDL at 7.5 years from the effective date based on water quality monitoring and special studies. III. APPLICATION OF ALLOCATIONS TO RESPONSIBLE JURISDICTIONS Responsible jurisdictions to attain WLAs for this TMDL include but are not limited to: • Caltrans • General Stormwater Permit Enrollees • MS4 Permittees including: ➢ Los Angeles County ➢ Los Angeles County Flood Control District ➢ Cities of Carson, ➢ City of Lomita, ➢ City of Los Angeles, ➢ City of Palos Verdes Estates, ➢ City of Rancho Palos Verdes, ➢ City of Redondo Beach, ➢ City of Rolling Hills, ➢ City of Rolling Hills Estates, ➢ City of Torrance. The City of Los Angeles, Department of Recreation and Parks is responsible jurisdiction to implement the assigned Load Allocations for this TMDL.

Table 7-29.2 Machado Lake Eutrophic, Algae, Ammonia, and Odors (Nutrient) TMDL: Implementation Schedule

Task Number	Task	Responsible Jurisdiction	Date
1	Effective date interim waste load (WLA) and load allocations (LA) for total nitrogen and total phosphorus apply.	California Department of Transportation (Caltrans), Municipal Separate Storm Sewer System Permittees[4] (MS4 Permittees), City of Los Angeles – Department of Recreation and Parks	Effective Date of TMDL
2	Responsible jurisdictions shall enter into a Memorandum of Agreement (MOA) with the Regional Board to implement the load allocations.	City of Los Angeles – Department of Recreation and Parks	1 year from effective date of TMDL
3	Regional Board staff shall begin development of a Clean Up and Abatement Order or other regulatory order to implement the load allocations if an MOA is not established with responsible jurisdictions.	Regional Board Staff	1 year from effective date of TMDL
4	Clean Up and Abatement Order or other regulatory order adopted by the Regional Board if an MOA is not established with responsible jurisdictions. The Clean Up and Abatement Order or other regulatory order shall reflect the TMDL Implementation Schedule.	Regional Board Staff	1.5 years from effective date of TMDL
5	Responsible jurisdictions whose compliance is determined as concentration based WLAs measured at end of pipe shall submit a Monitoring and Reporting Program (MRP) Plan to the Executive Officer for approval.	Caltrans, MS4 Permittees	One year from effective date of TMDL
6	Responsible jurisdictions shall submit a Lake Water Quality Management Plan, MRP Plan and Quality Assurance Project Plan for approval by the Executive Officer to comply with MOA.	City of Los Angeles – Department of Recreation and Parks	1.5 years from effective date of TMDL
7	Responsible jurisdictions shall submit a work plan for optional special study #3 (if responsible jurisdictions choose to conduct this special study) for approval by the Executive Officer.	Caltrans, MS4 Permittees	One year from effective date of TMDL
8	Responsible jurisdictions shall submit work plans for optional special studies #1 and #2 (if responsible jurisdictions choose to conduct special studies) for approval by the Executive Officer.	Caltrans, MS4 Permittees, City of Los Angeles – Department of Recreation and Parks	1.5 years from effective date of TMDL

Task Number	Task	Responsible Jurisdiction	Date
9	Responsible jurisdictions shall begin monitoring as outlined in the approved MRP plan.	Caltrans, MS4 Permittees, City of Los Angeles – Department of Recreation and Parks	Sixty days from date of MRP Plan approval
10	Responsible jurisdictions shall begin implementation of Lake Water Quality Management Plan.	City of Los Angeles – Department of Recreation and Parks	Sixty days from date of Lake Water Quality Management Plan approval
11	Responsible jurisdictions whose compliance is determined as concentration based WLAs measured at end of pipe shall submit a TMDL Implementation Plan including BMPs to address discharges from storm drains.	Caltrans, MS4 Permittees	Two years from effective date of TMDL
12	Responsible jurisdictions whose compliance is determined as concentration based WLAs measured at end of pipe shall begin implementation of BMPs to address discharges from stormdrains	Caltrans, MS4 Permittees	Sixty days from date of Implementation Plan approval
13	Responsible jurisdictions shall submit annual monitoring reports. The monitoring reports shall include a requirement that the responsible jurisdictions demonstrate compliance with the MOA. If the MOA and Lake Water Quality Management Plan are not implemented or otherwise do not result in attainment of load allocations, the Regional Board shall revoke the MOA and the load allocations shall be implemented through a Clean Up and Abatement Order or other regulatory order.	City of Los Angeles – Department of Recreation and Parks	Annually – from date of Lake Water Quality Management Plan approval
14	Responsible jurisdictions whose compliance is determined as concentration based WLAs measured at end of pipe shall submit annual monitoring reports.	Caltrans, MS4 Permittees	Annually – from date of MPR Plan approval
15	Optional Special Study #3 completed and final report submitted for Executive Officer approval.	Caltrans, MS4 Permittees	Within 2.5 years of effective date of TMDL
16	Responsible jurisdictions shall submit a MRP Plan and TMDL Implementation Plan for the alternative mass based WLA compliance option (if selected), to the Executive Officer for approval.	Caltrans, MS4 Permittees	Within 2.5 years of effective date of TMDL

Task Number	Task	Responsible Jurisdiction	Date
17	Responsible jurisdictions shall begin monitoring and implementing projects/ programs as outlined in the approved MRP and TMDL Implementation Plan for the alternative mass based WLA compliance option.	Caltrans, MS4 Permittees	Sixty days from date of MRP/ Implementation Plan approval
18	Responsible jurisdictions whose compliance is determined as mass based WLAs measured at end of pipe shall submit annual monitoring reports.	Caltrans, MS4 Permittees	Annually – from date of MPR/ Implementation Plan approval
19	Optional Special Studies completed and Special Study final reports submitted for Executive Officer approval.	Caltrans, MS4 Permittees, City of Los Angeles – Department of Recreation and Parks	Within 6 years of effective date of TMDL
20	Regional Board staff and responsible jurisdictions will present an Information Item to the Regional Board on the progress of TMDL implementation efforts and compliance with implementation schedules.	Regional Board staff and responsible jurisdictions	4 years from effective date of TMDL
21	5 Year interim total nitrogen WLA and LA apply.	Caltrans, MS4 permittees, City of Los Angeles – Department Recreation and Parks	Within 5 years of effective date of TMDL
22	Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs, and the implementation schedule as needed.	Regional Board	7.5 years from effective date of TMDL
23	Responsible jurisdictions shall achieve Final WLAs and LAs for total nitrogen (including ammonia) and total phosphorus and demonstrate attainment of numeric targets for total nitrogen, ammonia, total phosphorus, dissolved oxygen, and chlorophyll a. Responsible parties shall demonstrate attainment of water quality standards for total nitrogen, ammonia, total phosphorus, dissolved oxygen, and biostimulatory substances in accordance with federal regulations and state policy on water quality control.	Caltrans, MS4 Permittees, City of Los Angeles – Department of Recreation and Parks	Within 9.5 years of effective date of TMDL

[4] Municipal Separate Storm Sewer System (MS4) Permittees that are responsible for discharges to Machado Lake include: Los Angeles County, Los Angeles County Flood Control District, and the Cities of Carson, Lomita, Los Angeles, Palos Verdes Estates, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, and Torrance.

7-30 Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL

This TMDL was adopted by:

The Regional Water Quality Control Board on October 1, 2009**.**

This TMDL was approved by:

The State Water Resources Control Board on November 16, 2010.
The Office of Administrative Law on May 6, 2011.
The U.S. Environmental Protection Agency on June 14, 2011.

The effective date of this TMDL is: June 14, 2011.

The elements of the TMDL are presented in Table 7-30.1 and the Implementation Plan in Table 7-30.2

Table 7-30.1. Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL: Elements

TMDL Element	Regulatory Provisions
Problem Statement	Colorado Lagoon is identified on the 1998, 2002, and 2006 Clean Water Act Section 303(d) lists of water-quality limited segments as impaired due to elevated levels of OC pesticides, PCBs, sediment toxicity, PAHs, and metals in fish tissue and sediment. Applicable fish tissue, sediment, and water quality objectives for this TMDL are narrative objectives for chemical constituents, bioaccumulation, pesticides, and toxicity; and numeric objectives for metals and organic compounds. The beneficial uses of Colorado Lagoon include water contact recreation (REC-1) and non-contact water recreation (REC-2), commercial and sport fishing (COMM), warm freshwater habitat (WARM), wildlife habitat (WILD), and shellfish harvesting (SHELL). The goal of this TMDL is to protect and restore fish tissue and sediment quality in Colorado Lagoon by controlling the contaminated sediment loading and accumulation of contaminated sediment in the lagoon.

TMDL Element	Regulatory Provisions
Numeric Targets	Colorado Lagoon is listed on the 303(d) list for sediment toxicity, PAHs, lead, and zinc in sediment; DDT, Dieldrin, and PCBs in fish tissue; and chlordane in fish tissue and sediment. In order to address these listings, water column, fish tissue and sediment targets are selected. The following table provides the numeric targets for the Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL.

Numeric targets for water, fish tissue, and sediment for OC Pesticides, PCBs, PAHs, and metals

Constituents	Water Quality Target[1] (ug/L)	Fish Tissue Target[2] (ug/kg)	ERL Sediment Target[3] (ug/dry Kg)
Chlordane	0.00059	5.60	0.50
DDTs	0.00059	21.00	1.58[4]
Dieldrin	0.00014	0.46	0.02
PCBs	0.00017[5]	3.60[6]	22.70
Total PAHs[7]	0.049[8]	5.47	4,022.00
Total LPAHs[9]	NA	NA	552.00
Total HPAHs[10]	NA	NA	1,700.00
Lead	8.10[11]	NA	46,700.00
Zinc	81.00[11]	NA	150,000.00

1 The California Toxics Rule (CTR) water quality criteria for consumption of organisms only are applied as the numeric targets for Chlordane, 4,4' DDT, Dieldrin, and PCBs for protection of human health. The CTR aquatic life criteria for saltwater are applied as the numeric targets for protection of aquatic life for lead and zinc.

2 Office of Environmental Health Hazard Assessment (OEHHA) Fish Contaminant Goals are applied as numeric targets for Chlordane, DDTs, Dieldrin, and PCBs. The U.S. Environmental Protection Agency (USEPA) screening value is applied as the numeric target for total PAHs.

3 Effect Range Low (ERL) sediment criteria from National Oceanic and Atmospheric Administration (NOAA) Sediment Quality Guidelines are applied as numeric targets.

4 DDTs in sediment are measured as the sum of DDT, DDE, and DDD.

5 PCBs in water are measured as the sum of all congener or isomer or homolog or aroclor.

6 PCBs in fish tissue and sediment are measured as sum of all congeners.

7 PAHs: Polycyclic aromatic hydrocarbons (sum of acenaphthylene, anthracene, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, benzo(a)pyrene, chrysene, dibenz(a,h)anthracene, fluorene, indeno(1,2,3-c,d)pyrene, phenanthrene, and pyrene).

8 CTR human health criteria were not established for total PAHs, Therefore, the lowest CTR criteria for individual PAHs of 0.049 ug/L is applied to the sum of benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-c,d)pyrene. Other PAHs compounds in the CTR shall be screened as part of the TMDL monitoring plan.

9 LPAHs: Low molecular weight PAHs.

10 HPAHs: High molecular weight PAHs.

11 Saltwater criteria for metals are expressed in terms of the dissolved fraction of metals in water column.

TMDL Element	Regulatory Provisions
Source Analysis	**Point sources** The point sources of OC pesticides, PCBs, PAHs, and metals discharged to Colorado Lagoon are urban runoff and stormwater discharges from the municipal separate storm sewer systems (MS4s) and California Department of Transportation (Caltrans). The Colorado Lagoon watershed is divided into five sub-basins that discharge stormwater and urban dry weather runoff to Colorado Lagoon. Each of the sub-basins is served by a major storm sewer trunk line and supporting appurtenances that collect and transport stormwater and urban dry weather runoff to Colorado Lagoon**.** The sub-basins are as follows: **Sub-basin A.** Discharges to Colorado Lagoon via a 63-inch reinforced concrete pipe owned and operated by the Los Angeles County Flood Control District (Project 452 Drain) discharging into the north part of the west arm. The drainage pattern is generally to the south and east. Sub-basin A contains the most commercial activities mainly along Anaheim Street and the northern part of Redondo Avenue. **Sub-basin B.** Discharges to Colorado Lagoon via a 54-inch reinforced concrete pipe (Line I Storm Drain) discharging into the north part of the north arm. The drainage pattern is generally to the south and west. Sub-basin B is predominately park/golf course open space with some residential areas on the north east corner. **Sub-basin C.** Discharges to Colorado Lagoon via a 48-inch reinforced concrete pipe (Line K Storm Drain) discharging into the mid-point of the north arm. The drainage pattern is generally to the south and west. Sub-basin C is almost entirely residential with a few commercial activities at the eastern boundary. **Sub-basin D.** Discharges to Colorado Lagoon via a 24-inch reinforced concrete pipe (Line M Storm Drain) discharging into the south part of the west arm. The drainage pattern is generally to the north and east. Sub-basin D is almost entirely residential with schools and other public facilities. **Sub-basin E.** Discharges to Colorado Lagoon via a 48-inch reinforced concrete pipe (Termino Avenue Drain) discharging into the west arm. The drainage pattern is generally to the south and east. Sub-basin E is mainly residential with commercial activities located along 7th Street, Coronado and Redondo Avenues to the west, and public facilities to the north. Several other smaller storm drains serve the areas immediately adjacent to the lagoon. These smaller storm drains contribute small amounts of contaminants relative to the five sub-basin discharges described above.

TMDL Element	Regulatory Provisions
Source Analysis (continued)	**Non-point Sources** Sediment loading from non-point sources to Colorado Lagoon is mainly runoff from urban, recreational park areas including two golf courses and adjacent park areas, a right-of-way greenbelt, and the picnic and park areas surrounding Colorado Lagoon, and atmospheric deposition.
Linkage Analysis	This TMDL analysis makes a simplifying assumption that the relationship between OC pesticides and PCBs concentrations in fish tissue and sediments is linear, with the slope of the line being the overall sediment–organism bioaccumulation factor (BAF). The impairing contaminants in sediment are associated with fine-grained particles that are primarily delivered to the sediments through suspended solids in stormwater and urban runoff. It is expected that reductions in loadings of these pollutants will lead to reductions in sediment concentrations over time. The existing contaminants in surface sediments will be removed by dredging operations and reduced as sediments are scoured during storms. For the legacy pollutants (chlordane and PCBs), some losses will also occur through the slow decay and breakdown of these organic compounds. Concentrations in surface sediments will be reduced through mixing with cleaner sediments. Attenuation of pollutant concentration levels in sediment is expected to translate to reductions in fish tissue contaminant levels. The linkage analysis focuses on the relationship between source contributions and in-lagoon water and sediment response. The Environmental Fluid Dynamics Code (EFDC) model was selected to simulate source loadings and transport of the listed pollutants in the Colorado Lagoon. This model estimates the metals, PAHs, PCBs, and DDT concentrations in the receiving water to evaluate potential management scenarios and to identify waste load allocations to support water and sediment quality management decisions for Colorado Lagoon. Hydrodynamic, water quality, and sediment transport was developed to simulate the dynamic interaction between Marine Stadium and Colorado Lagoon.
Waste Load Allocations	**Sediment Waste Load Allocations (WLAs) for MS4 Discharges:** <u>Mass-based WLAs for MS4 Discharges</u> Mass-based waste load allocations for MS4 permittees including the City of Long Beach, Los Angeles County Flood Control District, and Caltrans are allocated to the five major storm drain outfalls that currently discharge to the lagoon. Because Colorado Lagoon is located completely within the jurisdictional boundaries of the City of Long Beach and land areas serviced by storm drains that currently discharge to the lagoon are under the jurisdiction of the City of Long Beach, the WLAs are assigned to the City of Long Beach. Caltrans and the City of Long Beach shall each be responsible for achieving the WLAs assigned to the Line I Storm Drain as it conveys stormwater from both Caltrans' facilities and the City of Long Beach. The Los Angeles County Flood Control District (District) owns and operates the Project 452 Storm Drain; therefore, the District and the City of Long Beach shall each be responsible for achieving the WLAs assigned to the Project 452 Storm Drain. Mass-based WLAs are applied as annual limits and compliance with the mass-based WLAs for sediment will be determined at the storm drain outfalls to the lagoon.

TMDL Element	Regulatory Provisions
Waste Load Allocations (continued)	

Constituent	Final Mass-based WLAs (mg/yr)				
	Project 452	**Line I**	**Termino Ave**	**Line K**	**Line M**
Chlordane	5.10	3.65	12.15	1.94	0.73
Dieldrin	0.20	0.15	0.49	0.08	0.03
Lead	476,646.68	340,455.99	1,134,867.12	181,573.76	68,116.09
Zinc	1,530,985.05	1,093,541.72	3,645,183.47	583,213.37	218,788.29
PAHs	41,050.81	29,321.50	97,739.52	15,637.89	5,866.44
PCBs	231.69	165.49	551.64	88.26	33.11
DDT	16.13	11.52	38.40	6.14	2.30

Concentration-based WLAs for MS4 Discharges

Concentration-based WLAs for sediment are assigned to MS4 permittees including the City of Long Beach, Los Angeles County Flood Control District, and Caltrans. Concentration-based WLAs for sediment are applied as average monthly limits. Compliance with the concentration-based WLAs for sediment shall be determined by pollutant concentrations in the sediment in the lagoon at points in the West Arm, North Arm, and Central Arm that represent the cumulative inputs from the MS4 drainage system to the lagoon. Concentration-based WLAs for sediment are also assigned to all other minor storm drains discharging from the MS4 to the lagoon.

Concentration-based interim WLAs for sediment are set to allow time for removal of contaminated sediment through proposed implementation actions. Interim WLAs are based on the 95th percentile value of sediment data collected from 2000 to 2008. The use of 95th percentile values to develop interim limits is consistent with current NPDES permitting methodology. If the 95th percentile is equal to or lower than the numeric target, the interim limit is equal to the final WLAs. Interim and final WLAs will be included in MS4 permits in accordance with NPDES guidance and requirements.

Constituent	Concentration-based WLAs	
	Interim WLAs (ug/dry kg)	**Final WLAs (ug/dry kg)**
Chlordane	129.65	0.50
Dieldrin	26.20	0.02
Lead	399,500.00	46,700.00
Zinc	565,000.00	150,000.00
PAHs	4,022.00	4,022.00
PCBs	89.90	22.7
DDT	149.80	1.58

<table>
<tr><th>TMDL Element</th><th>Regulatory Provisions</th></tr>
<tr><td>Waste Load Allocations (continued)</td><td>
Sediment Waste Load Allocations for Other Point Sources

Concentration-based waste load allocations are assigned to minor NPDES permits, other stormwater, and non-stormwater permittees. Any future minor NPDES permits or enrollees under a general non-stormwater NPDES permit, general industrial stormwater permit or general construction permit will also be subject to the concentration-based waste load allocations.

<table>
<tr><th>Constituents</th><th>Waste Load Allocation (ug/dry kg)</th></tr>
<tr><td>Chlordane</td><td>0.50</td></tr>
<tr><td>Dieldrin</td><td>0.02</td></tr>
<tr><td>Lead</td><td>46,700.00</td></tr>
<tr><td>Zinc</td><td>150,000.00</td></tr>
<tr><td>PAHs</td><td>4,022.00</td></tr>
<tr><td>PCBs</td><td>22.70</td></tr>
<tr><td>DDT</td><td>1.58</td></tr>
</table>
</td></tr>
<tr><td>Load Allocations</td><td>
A mass-based load allocation is developed for direct atmospheric deposition. An estimate of direct atmospheric deposition was developed based on the percent area of surface water within the watershed, which is approximately 15 acres or 1.3% of the total watershed area. The load allocation for atmospheric deposition is calculated by multiplying this percentage by the total loading capacity.

<table>
<tr><th>Constituent</th><th>Load Allocation (mg/year)</th></tr>
<tr><td>Chlordane</td><td>0.36</td></tr>
<tr><td>Dieldrin</td><td>0.014</td></tr>
<tr><td>Lead</td><td>33,217.48</td></tr>
<tr><td>Zinc</td><td>106,694.25</td></tr>
<tr><td>PAHs</td><td>2,860.83</td></tr>
<tr><td>PCBs</td><td>16.15</td></tr>
<tr><td>DDT</td><td>0.71</td></tr>
</table>
</td></tr>
<tr><td>Margin of Safety</td><td>
An implicit margin of safety exists in the final WLAs. The implicit margin of safety is based on the selection of multiple numeric targets, including targets for water, fish tissue and sediment to protect human health, and the selection of ERLs as numeric targets for sediment, which are the most protective of the potentially applicable sediment guidelines available.

Additionally, to address sources of uncertainty in the analysis, particularly the assumption of natural removal of contaminated sediment at the northern arm of the lagoon, an explicit 10% margin of safety is also included.
</td></tr>
</table>

TMDL Element	Regulatory Provisions
Seasonal Variations and Critical Conditions	No correlation with flow or seasonality (wet vs. dry season) was found to exist in sediment or tissue data. Given that allocations for this TMDL are expressed in terms of OC pesticides, PCBs, PAHs, and metals concentrations in sediment, a critical condition is not identified based upon flow or seasonality. Because the adverse effects of OC pesticides, PCBs, PAHs, and metals are related to sediment accumulation and bioaccumulation in the food chain over long periods of time, short term variations in concentrations are less likely to cause significant impacts upon beneficial uses.
Monitoring Plan	The Colorado Lagoon TMDL Monitoring Plan (CLTMP) is designed to monitor and evaluate implementation of this TMDL, and refine the understanding of current sediment loadings. The goals of the CLTMP are: To determine compliance with OC pesticides, PCBs, metals, and PAHs waste load and load allocations, To monitor the effectiveness of implementation actions proposed by Los Angeles County Flood Control District and the City of Long Beach on water and sediment quality, including the potential impacts of redirecting discharges from the Termino Ave. Drain and from cleaning the culvert on Marine Stadium and Colorado Lagoon, To monitor contaminated sediment levels in the Lagoon especially in the North Arm of the Lagoon and determine if additional implementation action such as dredging are necessary to achieve the TMDL, and To implement the CLTMP in a manner consistent with other TMDL implementation plans and regulatory actions within the Colorado Lagoon watershed. Monitoring shall begin six months after the monitoring plan is approved by the Executive Officer. Water column and sediment samples will be collected at the outlet of the storm drains discharging to the lagoon, while water column, sediment, and fish tissue samples will be collected in the West Arm, Central Arm, North Arm, at the outlet of the lagoon to Marine Stadium during an incoming tide, and at the outfall of Termino Ave. Drain to Marine Stadium. The number and location of monitoring sites shall be specified in the monitoring plan to be approved by the Executive Officer. The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans are each responsible for conducting water, sediment, and fish tissue monitoring. However, they are encouraged to collaborate or coordinate their efforts to avoid duplication and reduce associated costs. Water quality samples and total suspended solids samples shall be collected quarterly in the first year and semi-annually thereafter and analyzed for chlordane, dieldrin, OC pesticides, and total PCBs at detection limits that are at or below the minimum levels. The minimum levels are those published by the State Water Resources Control Board in Appendix 4 of the Policy for the Implementation of Toxic Standards for Inland Surface Water, Enclosed Bays, and Estuaries of California, 2005.

TMDL Element	Regulatory Provisions
Monitoring Plan (continued)	Water quality samples shall also be collected quarterly in the first year and semi-annually thereafter and analyzed for general water quality constituents (GWQC), total recoverable and dissolved PAHs, lead, and zinc. If water quality objectives are exceeded at any time, sampling frequency shall be accelerated to quarterly thereafter until water quality objectives are not exceeded. Total suspended solid samples shall also be collected to analyze for PAHs, lead, and zinc. For metal analysis, methods that allow for (1) the removal of salt matrix to reduce interference and avoid inaccurate results prior to the analysis; and (2) the use of trace metal clean sampling techniques, must be applied. Examples of such methods include EPA Method 1669 for sample collection and handling, and EPA Method 1640 for sample preparation and analysis. Sediment samples will be collected annually for analysis of general sediment quality constituents (GSQC), OC pesticides, PCBs, PAHs, and metals. Lead, zinc, chlordane, dieldrin, and total PCBs shall be analyzed at detection limits that are lower than the ERLs. The sediment toxicity testing shall include testing a minimum of three species for lethal and non-lethal endpoints. Toxicity testing may include: the 28-day and 10-day amphipod mortality test, the sea urchin fertilization testing using sediment pore water, and the bivalve embryo testing of the sediment/water interface. The chronic 28-day and shorter-term 10-day amphipod tests may be conducted in the first year. If there is no significant difference in the tests, then the less expensive 10-day test can be used throughout the rest of the monitoring, with some periodic 28-day tests. Sediment toxicity monitoring shall be conducted annually to provide sufficient data over the implementation timeframe to evaluate changes in sediment quality due to implementation actions. If sediment objectives are exceeded or sediment toxicity is observed at any time, sampling frequency for both sediment and sediment toxicity shall be accelerated to semi-annually thereafter until sediment objectives are not exceeded and sediment toxicity is not observed. Fish tissue samples will be collected annually and analyzed for chlordane, dieldrin, DDT, and PCBs to assess changes in concentrations of target organic constituents. The same rationale used for establishing sampling frequency for sediments is used to establish fish tissue sample collection frequency. For Colorado Lagoon, species with the potential for human and wildlife consumption will be targeted. Fish targeted to evaluate potential impacts to human health will be limited to species more commonly consumed by humans. Tissues analyzed will be based on the most appropriate and common preparation for the selected fish species. Tissues from resident California or bay mussels shall be collected annually and analyzed to further assess and track impairment. Monitoring reports shall be prepared and submitted to the Regional Board annually within six months after the completion of the final sampling event of the year. All compliance monitoring must be conducted in conjunction with a Regional Board approved Quality Assurance Project Plan (QAPP). The QAPP shall include protocols for sample collection, standard analytical procedures, and laboratory certification.

TMDL Element	Regulatory Provisions
Implementation Plan	The City of Long Beach, Los Angeles County Flood Control District, and California Department of Transportation (Caltrans) are each responsible for meeting the waste load allocations. However, to the extent their effluent discharges are commingled, they will be held jointly liable for abating the pollutants in the commingled discharge to the extent any of them are unable to disprove their own contribution of pollutants. Compliance with the TMDL is determined based on the assigned WLAs. NPDES permits will be amended to be consistent with the assumptions and requirements of the WLAs. Responsible agencies are required to implement the proposed actions to remove contaminated sediment; control the discharges of pollutants in urban runoff, stormwater and contaminated sediments to Colorado Lagoon; attain water, fish tissue, and sediment quality standards; and protect beneficial uses. Table 7-30.2 contains a schedule for responsible agencies to implement BMPs and proposed implementation actions to comply with the TMDL. Responsible agencies may employ a variety of implementation strategies such as non-structural and structural best management practices (BMPs) to meet the required waste load allocations. The implementation actions described in this section represent a range of activities that are proposed by the Los Angeles County Flood Control District and City of Long Beach in the *Los Angeles County Termino Avenue Drain Project* and *Colorado Lagoon Restoration Project*, respectively. **Implementation and Determination of Compliance with the WLAs** The WLAs will apply to all NPDES dischargers in the Colorado Lagoon watershed. The regulatory mechanisms used to implement the TMDL include the Los Angeles County MS4 permit, the City of Long Beach MS4 permit, the Caltrans stormwater permit, and any future general industrial stormwater permits, general construction stormwater permits, minor NPDES permits, and general NPDES permits as well as any other appropriate regulatory mechanism, including Board orders, where required. Each NPDES permit may be reopened immediately after the TMDL becomes effective, or amended at re-issuance, in accordance with applicable laws, to incorporate the waste load allocations and other provisions of this TMDL. Compliance with the WLAs will be measured at the storm drain outlets and in the lagoon and will be achieved through BMPs and a combination of proposed implementation actions provided in the Proposed Implementation section below to remove contaminated sediment and reduce loadings of contaminated sediment through the control of stormwater and contaminated sediments to Colorado Lagoon. The final WLAs will be included for permitted MS4 discharges and other NPDES discharges in accordance with the compliance schedules provided in Table 7-30.2. The Regional Board may revise these WLAs based on additional information developed through monitoring or special studies.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	The WLAs for the minor NPDES permits and general non-stormwater NPDES permits will be implemented through effluent limitations consistent with the assumptions and requirements of the WLAs. Permit writers for the non-stormwater permits may translate applicable waste load allocations into effluent limitations for the minor and general NPDES permits by applying applicable engineering practices. **Proposed Implementation Actions** <u>Non-Structural Best Management Practices</u> The non-structural BMPs are based on the premise that specific land uses or critical sources can be targeted to achieve the TMDL waste load allocations. Available non-structural BMPs include better sediment control at construction sites and improved street cleaning by upgrading to vacuum type sweepers, storm drain cleaning, and public education and out reach. The lagoon is also impacted by irrigation runoff from the golf course located adjacent to the lagoon in the dry season. Improvements to the golf course operation should also be considered to protect lagoon resources by reducing watering needs and eliminating pesticide and herbicide use. <u>Site-Specific Implementation Actions:</u> The Regional Board does not prescribe the methods of achieving compliance with the TMDL allocations. However, described below are several implementation actions proposed by the responsible agencies. *Relocation of the Termino Avenue Drain.* One of the major system outfalls, the Termino Avenue Drain, has been proposed by the Los Angeles County Flood Control District to be modified, which will no longer discharge into the Lagoon. As proposed in the Los Angeles County Flood Control District Termino Avenue Drain Project (TADP) the drain would bypass the Lagoon and discharge stormwater flows into Marine Stadium. Dry weather flows will be diverted into the sanitary sewer system. This project would also redirect flows from three other storm drains located on the south shore of the Lagoon that currently discharge into the Lagoon. *Low Flow Diversion and Trash Separation Device.* The City of Long Beach proposed in the Colorado Lagoon Restoration Project to divert low storm drain flows from other three major storm drain system outfalls and install trash separation devices to trap trash and debris prior to entering the wet well for the diverted runoff. The Colorado Lagoon Restoration Project would redirect or treat low flows from these drains to minimize contamination to water and sediment.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	*Vegetated Bioswale Installation.* The flows from the remaining four local storm drains would be treated via a vegetated bioswale as proposed in the Colorado Lagoon Restoration Project. A bioswale would also be developed on the north shore between the Lagoon and Recreation Park Golf Course. The vegetated bioswale would treat stormwater and dry weather runoff through filtration to remove sediment and pollutants prior to discharging into the Lagoon. *Clean Culvert, Repair Tidal Gates, and Remove Sill/Structural Impedances.* The Colorado Lagoon is connected to Alamitos Bay and the Pacific Ocean through an underground tidal culvert to Marine Stadium. The existing culvert has not been cleaned since it was built in the 1960s. The flow in the culvert is impeded by sediment that has accumulated on the bottom, extensive marine growth that has accumulated on the sides and ceiling, and debris that is trapped within the trash racks on the tide gate screens at both ends of the culvert. These existing conditions limit the Lagoon's tidal range and tidal flushing, which results in increased degradation of water quality. As proposed in the Colorado Lagoon Restoration Project, the City of Long Beach plans to clean the existing culvert and trash racks, repair the tidal gates, and remove the sill and structural impedances within and around the existing culvert. Implementation of this component of the Colorado Lagoon Restoration Project would result in increased tidal range, tidal flushing, and water circulation, and improvement of water and sediment quality. *Remove Contaminated Sediment in the Western Arm of the Lagoon.* OC pesticides, PCBs, PAHs, and metals were deposited over time from the particulates in the runoff brought to the Lagoon through the existing storm drains. It is estimated that the layer of contaminated sediment reaches 4 to 5 ft deep. The City of Long Beach proposes to remove sediment to a depth of 6 ft to provide a safeguard that only clean sediment remains. The excavation depth gradually decreases toward the footbridge. This component of the Colorado Lagoon Restoration Project would remove approximately 16,000 cubic yards (cy) of contaminated sediment within the western arm of the Lagoon. *Remove Contaminated Sediment in the Central Lagoon.* Similar to the sediment removal project above, the Colorado Lagoon Restoration Project would remove sediment and sand that has eroded and been deposited into the Lagoon over years, and create a larger subtidal area. Approximately 5,500 cy of sediment would be removed from the central Lagoon. Sediment removal from the central area of the lagoon would create a channel through the center of the central Lagoon to connect the dredge areas in the western arm to the outlet at the existing culvert or proposed open channel. Removal of this sediment would also provide additional space for water circulation and tidal flushing.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	As proposed in the Colorado Lagoon Restoration Project, only the Western Arm and the Central Lagoon are planned to be dredged based on the recommendation from the Sediment Testing and Disposal Report. The TMDL monitoring program will determine if additional implementation actions such as dredging in the North Arm will be required to remove contaminated sediment in the Lagoon. *Build Alternate Channel or Underground Culvert between Lagoon and Marine Stadium.* City is considering an open channel or parallel underground culvert option to further improve water quality at the Colorado Lagoon. However, this project was not included in the certified EIR. This proposed project consists of replacing the existing concrete box culvert with an open channel or new underground culvert that would run from the Lagoon through Marina Vista Park to Marine Stadium in a location generally parallel to the existing culvert. Creating an open channel or underground culvert would improve tidal flushing by an increase in the tidal range, and result in a corresponding improvement of water and sediment quality. In addition, it would provide improved flood flow conveyance. Implementation of the proposed actions should result in attainment of the TMDL allocations. If the proposed actions are not implemented or otherwise do not result in attainment of allocations, additional implementation actions shall be required.

Table 7-30.2 Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL: Implementation Schedule

Item	Implementation Action	Responsible Party	Date
1	Effective date of interim waste load allocations (WLAs).	The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans	Effective date of the TMDL
2	Responsible agencies shall submit a monitoring plan to the Los Angeles Regional Board for Executive Officer approval.	The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans	6 months after effective date of the TMDL
3	Responsible agencies shall begin monitoring as outlined in the approved monitoring plan.	The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans	6 months after monitoring plan approved by E.O.
4	Responsible agencies shall submit annual reports to the Los Angeles Regional Board for review.	The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans	15 months after monitoring starts and annually thereafter
5	Responsible agencies shall submit bi-annual progress reports to provide updates on the status of implementation actions performed under the TMDL. The plan shall contain mechanisms for demonstrating progress toward meeting the assigned WLAs.	The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans	Every 2 years after effective date of the TMDL
6	Responsible agencies shall achieve WLAs.	The City of Long Beach, the Los Angeles County Flood Control District, and Caltrans	7 years after effective date of the TMDL

7-31 Malibu Creek Watershed Trash TMDL

This TMDL was adopted by:
The Regional Water Quality Control Board on May 1, 2008.

This TMDL was approved by:
The State Water Resources Control Board on March 17, 2009.
The Office of Administrative Law on June 16, 2009.
The U.S. Environmental Protection Agency on June 26, 2009.

The effective date of this TMDL is: July 7, 2009.

The elements of the TMDL are presented in Table 7-31.1 and the Implementation Plan in Tables 7-31.2a and 7-31.2b.

Table 7-31.1 Malibu Creek Watershed Trash TMDL: Elements

Element	Malibu Creek Watershed Trash TMDL
Problem Statement	Discharges of trash into Malibu Creek, Malibu Lagoon, Malibou Lake, Medea Creek (Reach 1 and Reach 2), Lindero Creek (Reach 1 and Reach 2), Lake Lindero, and Las Virgenes Creek violate water quality objectives and impair beneficial uses. The waterbodies above were listed in the 1998, 2002, 2004, and 2006 303(d) lists of impaired waterbodies for trash. Relevant water quality objectives in the Water Quality Control Plan Los Angeles Region include Floating Material and Solid, Suspended, or Settleable Materials. The following designated beneficial uses are impaired by trash: municipal and domestic supply (MUN), ground water recharge (GWR), contact water recreation (REC-1), non-contact water recreation (REC-2), warm freshwater habitat (WARM), cold freshwater habitat (COLD), migration of aquatic organisms (MIGR), wildlife habitat (WILD), rare, threatened, or endangered species (RARE), spawning, reproduction, and or early development (SPWN), and wetland habitat (WET).
Numeric Target (Interpretation of the narrative water quality objective, used to calculate the load allocations)	Zero trash in the above listed subwatersheds of the Malibu Creek Watershed, and on the shorelines of those waterbodies. Zero is defined for nonpoint sources as no trash immediately following each assessment and collection event consistent with an established Minimum Frequency of Assessment and Collection Program (MFAC Program). The MFAC Program is established at an interval that prevents trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections. For point sources, zero is defined as no trash discharged into the listed waterbodies of the Malibu Creek Watershed and on the shoreline of those waterbodies.
Source Analysis	Litter from adjacent land areas, roadways and direct dumping and deposition are sources of trash to Malibu Creek Watershed. Point sources such as storm drains are also sources of trash discharged to Malibu Creek Watershed.
Loading Capacity	Zero, as defined in the Numeric Target.

Element	Malibu Creek Watershed Trash TMDL
Waste Load Allocations (for point sources)	Waste Load Allocations (WLAs) are assigned to the California Department of Transportation (Caltrans, permittee for Statewide National Pollutant Discharge Elimination System (NPDES) Storm Water Permit, No. 99-06-DWQ), Los Angeles County (principal permittee for NPDES Los Angeles County Municipal Separate Strom Sewer System (MS4) permit, No. CAS004001), and the Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, and Westlake Village (co-permittees for NPDES Los Angeles County MS4 permit) under the NPDES Los Angeles County MS4 permit, and to Ventura County Watershed Protection District (principal permittee for NPDES Ventura County MS4 permit, No. 004002), County of Ventura, and City of Thousand Oaks (co-permittees for NPDES Ventura County MS4 permit) under the NPDES Ventura County MS4 permit. WLAs are zero trash. WLAs may be issued to additional responsible jurisdictions in the future under Phase 2 of the USEPA Stormwater Permitting Program, or other applicable regulatory programs.
Load Allocations (for nonpoint sources)	Load Allocations (LAs) are assigned to the National Park Service, California Department of Parks and Recreation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Santa Monica Mountains Conservancy, Cities of Malibu, Agoura Hills, Hidden Hills, Thousand Oaks, Westlake Village, and Calabasas, and land owners in the vicinity of listed waterbodies in the Malibu Creek Watershed. LAs are zero trash. LAs may be issued to additional responsible jurisdictions in the future under applicable regulatory programs.
Implementation	Implementation of the trash TMDL for Malibu Creek Watershed includes structural and non-structural best management practices (BMPs) and a program of minimum frequency of assessment and collection (MFAC) to address point and nonpoint trash sources. **Point Sources** WLAs shall be implemented through storm water permits and via the authority vested in the Executive Officer by section 13267 of the Porter-Cologne Water Quality Control Act (Water Code section 13000 et seq.). If point source dischargers comply with WLAs by implementing an Executive Officer certified full capture system on conveyances that discharge to the listed subwatersheds of the Malibu Creek Watershed through a progressive implementation schedule of full capture devices, they will be deemed in compliance with the WLA.

Element	Malibu Creek Watershed Trash TMDL
Implementation (continued)	In certain circumstances, (if approved by the Executive Officer), point source dischargers may alternatively comply with WLAs by implementing a program for installing partial capture systems (PCS) in conjunction with best management practices. Compliance through implementation of a PCS/BMP program must demonstrate attainment of WLAs through trash monitoring in accordance with the Trash Monitoring and Reporting Plan (TMRP) approved by the Executive Officer. 1. Compliance with the final WLA may be achieved through an adequately sized and maintained full capture system, once the Executive Officer has certified that the system meets the following minimum criteria. A full capture system, at a minimum, consists of any device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the sub-drainage area. The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour); and A= subdrainage area (acres). Point sources discharges that choose to comply via a full capture system must demonstrate a phased implementation of full capture devices over an 8-year period until the final WLA of zero is attained. Zero will be deemed to have been met if full capture systems have been installed on all conveyances discharging to the listed subwatersheds of the Malibu Creek Watershed. Irrespective of whether point sources employ a full capture system, they may comply with the WLA in any lawful manner. 2. Compliance through a PCS/BMP program may be proposed to the Regional Board for incorporation into the relevant NPDES permit. **Nonpoint Sources** LAs shall be implemented through either (1) a conditional waiver from waste discharge requirements, (2) an alternative program implemented through waste discharge requirements, or (3) an individual waiver or another appropriate order of the Regional Board.

Element	Malibu Creek Watershed Trash TMDL
Implementation (continued)	Non-point source dischargers may achieve compliance with the LAs by implementing a MFAC/BMP program approved by the Executive Officer. Responsible jurisdictions that are responsible for both point and nonpoint sources will be deemed in compliance with both the WLAs and LAs if an MFAC/BMP program, approved by the Executive Officer, is implemented. 1) Conditional Waiver: Pursuant to Water Code section 13269, waste discharge requirements are waived for any responsible jurisdiction that implements a MFAC/BMP Program which, to the satisfaction of the Executive Officer, meets the following criteria: a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the water and on the shoreline. Responsible jurisdictions shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to Malibu Creek Watershed. For individual subwatershed in the Malibu Creek Watershed, the initial minimum frequency shall be set as follows: <u>Malibu Creek (from Malibu Lagoon to Malibou Lake)</u> 1. Within City of Malibu, the waterbody, shorelines and areas adjacent to Malibu Creek: once per week and within 72 hours after critical conditions. 2. Within the County of Los Angeles and in the State Parks: once per month, and within 72 hours after critical conditions. <u>Malibu Lagoon</u> 1. The waterbody, shorelines, beach and areas adjacent to Malibu Lagoon: twice per week during high visitation seasons from May 15 through October 15. 2. The waterbody, shorelines, beach and areas adjacent to Malibu Lagoon: once per week from October 15 through May 15, and within 72 hours after critical conditions. <u>Malibou Lake</u> Once per month for the waterbody, shorelines and the adjacent lands, and within 72 hours after critical conditions.

Element	Malibu Creek Watershed Trash TMDL
Implementation (continued)	Medea Creek Reach 1 (Malibou Lake to confluence with Lindero Creek) Twice per month for the waterbody, shorelines and the adjacent areas, and within 72 hours after critical conditions. Medea Creek Reach 2 (above confluence) 1. Once per week on the waterbody, shorelines and the adjacent areas from the confluence with Lindero Creek to the intersection with Thousand Oaks Blvd., and within 72 hours after critical conditions. 2. Twice per month above the intersection with Thousand Oaks Blvd., and within 72 hours after critical conditions. Lindero Creek Reach 1 (Confluence with Medea Creek to Lake Lindero) Twice per month for Lindero Creek Reach 1 including the waterbody, shorelines and the adjacent areas, and within 72 hours after critical conditions. Lindero Creek Reach 2 (Above Lake Lindero) Twice per month for Lindero Creek Reach 2 including the waterbody, shorelines and the adjacent areas, and within 72 hours after critical conditions. Lake Lindero Twice per month for the waterbody, shorelines and the adjacent land, and within 72 hours after critical conditions. Las Virgenes Creek 1. Within the State Parks northerly to the intersection with Mulholland Highway: once per month, and within 72 hours after critical conditions. 2. Once per week for the waterbody, shorelines and the adjacent areas between Mulholland Highway and Juan Bautista De Anza Park at Los Hills Road in the City of Calabasas, and within 72 hours after critical conditions. 3. Twice per week for the waterbody, shorelines and the adjacent areas for the rest of City of Calabasas. 4. Once per month for section in Los Angeles County along Ventura Freeway and within 72 hours after critical conditions. 5. Within Ventura County, once every two months for the waterbody, shorelines and the adjacent areas, and within 72 hours after critical conditions.

Element	Malibu Creek Watershed Trash TMDL
Implementation (continued)	b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible jurisdiction. c) The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, as described below, and a requirement that the responsible jurisdictions will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board on an annual basis. d) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by dischargers and approved by the Executive Officer. e) Implementation of the MFAC/BMP program should include a Health and Safety Plan to protect personnel. The MFAC/BMP shall not require responsible jurisdictions to access and collect trash from areas where personnel are prohibited. The Executive Officer may approve or require a revised assessment and collection frequency, location, and definition of the critical conditions under the waiver: (a) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections; (b) To reflect the results of trash assessment and collection; (c) If the amount of trash collected does not show a decreasing trend, where necessary to prevent nuisance or adverse effects on beneficial uses, such that a shorter interval between collections is warranted; or (d) If the amount of trash collected is decreasing such that a longer interval between collections is warranted. At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses. With regard to (a), (b) or (c), above, the Executive Officer is authorized to allow responsible jurisdictions to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency. Any waivers implementing the TMDL shall expire pursuant to Water Code section 13269 five years after the effective date of this TMDL, unless reissued. The Regional Board may reissue this waiver through an order consistent herewith, instead of readopting these regulatory provisions.

Element	Malibu Creek Watershed Trash TMDL
Implementation (continued)	(2) Alternatively, responsible jurisdictions may propose, or the Regional Board may impose, an alternative program which would be implemented through waste discharge requirements, an individual waiver, a cleanup and abatement order, or any other appropriate order or orders, provided the program is consistent with the assumptions and requirements of the reductions described in Table 7-31.2b, below. Within six months of the effective date of this TMDL, the Executive Officer shall require responsible jurisdictions to submit either a notice of intent to be regulated under the conditional waiver with their proposed MFAC/BMP Program and Trash Monitoring and Reporting Plan (TMRP), or a report of waste discharge.
Monitoring and Reporting Plan	Responsible jurisdictions will develop a TMRP for Executive Officer approval that describes the methodologies that will be used to assess and monitor trash in the listed subwatersheds of the Malibu Creek Watershed and/or within responsible jurisdiction land areas. The TMRP shall include a plan to establish the trash Baseline WLAs for non-Caltrans entities, or an alternative to the default trash baseline for Caltrans to prioritize installation of full capture devices. The default trash baseline WLA for Caltrans is 2136 gallons per year. Requirements for the TMRP shall include, but are not limited to, assessment and quantification of trash collected from the surfaces and shoreline of the listed waterbodies in the Malibu Creek Watershed or from responsible jurisdiction land areas. The monitoring plan shall provide details of the frequency, location, and reporting of trash monitoring. Responsible jurisdictions shall propose a metric (e.g., weight, volume, pieces of trash) to measure the amount of trash in the listed subwatersheds of the Malibu Creek Watershed and on the land area surrounding these subwatersheds, as defined in the Executive Officer approved TMRP. The TMRP shall include a prioritization of areas that have the highest trash generation rates. The TMRP shall give preference to this prioritization when scheduling the installation of full capture devices, BMPs, or trash collection programs. The TMRP shall also include an evaluation of effectiveness of the MFAC/BMP program to prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections, proposals to enhance BMPs, and a revised MFAC for Executive Officer review. Responsible Jurisdictions in Table 7-31.2a and 7-31.2b may cooperate and coordinate their TMRP activities for Malibu Creek Watershed.
Margin of Safety	Zero is a conservative numeric target which contains an implicit margin of safety.

Element	Malibu Creek Watershed Trash TMDL
Seasonal Variations and Critical Conditions	Discharge of trash from the conveyances occurs primarily during or shortly after a major rain event. Discharge of trash from nonpoint sources occurs during all seasons, but can be increased during or shortly after high wind events, which are defined as periods of wind advisories issued by the National Weather Service.

Table 7-31.2a Malibu Creek Watershed Trash TMDL: Implementation Schedule - Point Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Submit Trash Monitoring and Reporting Plan, including a plan for defining the trash baseline WLA and a proposed definition of "major rain event".	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	6 months from effective date of TMDL. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
2	Implement Trash Monitoring and Reporting Plan.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.
3	Submit results of Trash Monitoring and Reporting Plan, recommend trash baseline WLA, and propose prioritization of Full Capture System installation or implementation of other measures to attain the required trash reduction.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	One year from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer, and annually thereafter.
4	Installation of Full Capture Systems or other measures to achieve 20% reduction of trash from Baseline WLA*.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	Four years from effective date of TMDL.
5	Installation of Full Capture Systems or other measures to achieve 40% reduction of trash from Baseline WLA*.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	Five years from effective date of TMDL.
6	Evaluate the effectiveness of Full Capture Systems or other measures, and reconsider the WLA*.	Regional Board.	Five years from effective date of TMDL.

Task No.	Task	Responsible Jurisdiction	Date
7	Installation of Full Capture Systems or other measures to achieve 60% reduction of trash from Baseline WLA*.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	Six years from effective date of TMDL.
8	Installation of Full Capture Systems or other measures to achieve 80% reduction of trash from Baseline WLA*.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	Seven years from effective date of TMDL.
9	Installation of Full Capture Systems or other measures to achieve 100% reduction of trash from Baseline WLA*.	California Department of Transportation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village and Thousand Oaks.	Eight years from effective date of TMDL.

* Compliance with percent reductions from the Baseline WLA will be assumed wherever full capture systems are installed in corresponding percentages of the conveyance discharging to Malibu Creek Watershed. Installation will be prioritized based on the greatest point source loadings.

Table 7-31.2b Malibu Creek Watershed Trash TMDL: Implementation Schedule

Minimum Frequency of Assessment and Collection Program * - Nonpoint Sources

Task No.	Task	Responsible Jurisdiction	Date
1	Conditional Waiver in effect.	National Park Service, California Department of Parks and Recreation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Santa Monica Mountains Conservancy, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village, and Thousand Oaks, and land owners in the vicinity of the waterbodies addressed in the Nonpoint Source Implementation Section of this Basin Plan Amendment.	Regional Board adoption of TMDL.
2	Submit Notice of Intent to Comply with Conditional Waiver of Discharge Requirements, including MFAC/BMP Program and Trash Monitoring and Reporting Plan.	National Park Service, California Department of Parks and Recreation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Santa Monica Mountains Conservancy, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village, and Thousand Oaks, and land owners in the vicinity of the waterbodies addressed in the Nonpoint Source Implementation Section of this Basin Plan Amendment.	Six months from TMDL effective date. If a plan is not approved by the Executive Officer within 9 months, the Executive Officer will establish an appropriate monitoring plan.
3	Implement MFAC/BMP Program.	National Park Service, California Department of Parks and Recreation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Santa Monica Mountains Conservancy, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village, and Thousand Oaks, and land owners in the vicinity of the waterbodies addressed in the Nonpoint Source Implementation Section of this Basin Plan Amendment.	6 months from receipt of letter of approval from Regional Board Executive Officer, or the date a plan is established by the Executive Officer.

Task No.	Task	Responsible Jurisdiction	Date
4	Submit annual TMRP reports including proposal for revising MFAC/BMP for Executive Officer approval.	National Park Service, California Department of Parks and Recreation, County of Los Angeles, County of Ventura, Ventura County Watershed Protection District, Santa Monica Mountains Conservancy, Cities of Agoura Hills, Calabasas, Hidden Hills, Malibu, Westlake Village, and Thousand Oaks, and land owners in the vicinity of the waterbodies addressed in the Nonpoint Source Implementation Section of this Basin Plan Amendment.	One year from receipt of letter of approval for the Trash Monitoring and Reporting Plan from Regional Board Executive Officer, and annually thereafter.
5	Reconsideration of Trash TMDL based on evaluation of effectiveness of MFAC/ BMP program.	Regional Board.	Five years from effective date of TMDL.

* At Task 3, all Responsible Jurisdictions must be attaining the zero trash target after each required trash assessment and collection event. At Task 4, all Responsible Jurisdictions must demonstrate full compliance and attainment of the zero trash target's requirement that trash is not accumulating in deleterious amounts between the required trash assessment and collection events. Based on Responsible Jurisdiction monitoring reports, the Executive Officer may adjust the minimum frequency of assessment and collection as necessary to ensure compliance between the required trash assessment and collection events.

7-37 McGrath Lake PCBs, Pesticides and Sediment Toxicity TMDL

This TMDL was adopted by:

The Regional Water Quality Control Board on October 1, 2009.

This TMDL was approved by:

The State Water Resources Control Board on December 14, 2010.
The Office of Administrative Law on May 31, 2011.
The U.S. Environmental Protection Agency on June 30, 2011.

The effective date of this TMDL is: June 30, 2011.

The elements of the TMDL are presented in Table 7-37.1 and the Implementation Plan in Table 7-37.2.

Table 7-37.1. McGrath Lake PCBs, Pesticides and Sediment Toxicity TMDL: Elements

TMDL Element	Regulatory Provisions
Problem Statement	McGrath Lake was placed on the Clean Water Act Section 303(d) list in 1998, 2002, and 2006 as impaired for organochlorine pesticides (chlordane, dieldrin, DDT and derivatives) and polychlorinated biphenyls (PCBs) in sediment and for sediment toxicity. These toxic organic chemicals bind to soil particles, are stored in the fat tissue of exposed organisms, and create long term environmental impairments. Past studies concluded that sediment toxicity in McGrath Lake was likely due to the elevated concentrations of pesticides and PCBs in sediment. Applicable Water Quality Objectives for this TMDL are narrative water quality objectives for Chemical Constituents, Bioaccumulation, Pesticides and Toxicity contained in Chapter 3, the numeric water quality objective for PCBs contained in Chapter 3 and the numeric water quality criteria promulgated in 40 CFR 131 (California Toxics Rule (CTR)). The exposure of the McGrath Lake ecosystem to chlordane, DDT, dieldrin, and PCBs in amounts exceeding the objectives and criteria has impaired the beneficial uses of the lake, including aquatic life uses (rare, threatened or endangered species and estuarine, wildlife, and wetland habitat) and recreation uses (contact and non-contact recreation and commercial and sport fishing).

<table>
<tr><th>TMDL Element</th><th>Regulatory Provisions</th></tr>
<tr><td>Numeric Targets</td><td>Water column targets for PCBs, chlordane, DDT, and dieldrin are based on the CTR water quality criteria for protection of human health (organisms only). These criteria are more stringent than those for the protection of aquatic life and thus will protect both aquatic life and fish consumption beneficial uses. The sediment numeric targets are derived from the Effects Range-Low (ER-Ls) guidelines compiled by the National Oceanographic and Atmospheric Administration (NOAA). The sediment toxicity impairment is addressed by these numeric targets, which are protective of aquatic life in sediment.

<table>
<tr><th>Pollutant</th><th>Water Column Targets (µg/L)</th><th>Sediment Targets (ng/dry g)</th></tr>
<tr><td>Chlordane</td><td>0.00059</td><td>0.5</td></tr>
<tr><td>Dieldrin</td><td>0.00014</td><td>0.02</td></tr>
<tr><td>4,4’-DDT</td><td>0.00059</td><td>1</td></tr>
<tr><td>4,4’-DDE</td><td>0.00059</td><td>2.2</td></tr>
<tr><td>4,4’-DDD</td><td>0.00084</td><td>2</td></tr>
<tr><td>Total DDT</td><td>--</td><td>1.58</td></tr>
<tr><td>Total PCBs</td><td>0.00017</td><td>22.7</td></tr>
</table></td></tr>
<tr><td>Source Analysis</td><td>A source of the pesticide and PCB loading is contaminated surface water and sediments flushing into McGrath Lake from the Central Ditch, which drains agriculture and other lands. All of the contaminants included in this TMDL are legacy pollutants. While they are no longer legally sold or used, they remain ubiquitous in the environment, bound to fine-grained particles. Irrigation and rainfall in the watershed mobilize these particles, which are loaded to McGrath Lake. Surface water (stormwater and agricultural drainage) accounts for almost half of the total recharge of the lake, while groundwater accounts for the rest of the recharge. Pesticides and PCBs have been detected in the surface water inlet to the lake (Central Ditch) but not in the groundwater from local monitoring wells. There are no point sources of pesticides or PCBs to McGrath Lake. Atmospheric deposition may be contributing PCBs.

In addition to external loading, the in-situ sediments are likely a source of contaminants to the lake water column due to the high concentrations of contaminants in the sediment.</td></tr>
<tr><td>Linkage Analysis</td><td>A conceptual model identifies the assimilative capacity of McGrath Lake and links the source loading information to the numeric targets. The chemical properties of the pesticides and PCBs result in strong binding to particulate matter, therefore most of the incoming contaminants from the Central Ditch to the lake are bound to suspended solids. However, pesticide exceedances are observed in the Central Ditch even in low-flow conditions, indicating that some of the contaminants are transported to the lake in the water fraction. Therefore, there are water column and suspended sediment allocations for the Central Ditch.

Once the suspended sediment settles to the lake bottom, desorption is possible due to the high contaminant concentrations, favorable environmental conditions and extended contact time (between the sediment and water). The contaminated lake sediments are toxic to benthic organisms and may also be taken up through bioturbation and feeding processes. Therefore, both external loading sources from the lake subwatershed and internal loading from contaminated lake sediments are assigned load allocations.</td></tr>
</table>

<table>
<tr><th>TMDL Element</th><th>Regulatory Provisions</th></tr>
<tr><td>Load Allocations</td><td>Load allocations (LAs) addressing non-point sources of pesticides and PCBs are assigned to discharges from the Central Ditch to the lake and internal sources from the lake sediments. The lake sediments are defined as bed sediments in the main body of the lake and the riparian corridor west of Harbor Boulevard.

The in-lake LAs are for concentrations in sediment only.

<table>
<tr><th>Pollutant</th><th>Load Allocation for Concentration in Lake Sediment (µg/dry kg)</th></tr>
<tr><td>Chlordane</td><td>0.5</td></tr>
<tr><td>Dieldrin</td><td>0.02</td></tr>
<tr><td>4,4’-DDT</td><td>1</td></tr>
<tr><td>4,4’-DDE</td><td>2.2</td></tr>
<tr><td>4,4’-DDD</td><td>2</td></tr>
<tr><td>Total DDT</td><td>1.58</td></tr>
<tr><td>Total PCBs</td><td>22.7</td></tr>
</table>

The Central Ditch LAs are for concentrations in both suspended sediment and water.

<table>
<tr><th>Pollutant</th><th>Water Column Load Allocation (µg/L)</th><th>Load Allocation for Concentration in Suspended Sediment (µg/dry kg)</th></tr>
<tr><td>Chlordane</td><td>0.00059</td><td>0.5</td></tr>
<tr><td>Dieldrin</td><td>0.00014</td><td>0.02</td></tr>
<tr><td>4,4’-DDT</td><td>0.00059</td><td>1</td></tr>
<tr><td>4,4’-DDE</td><td>0.00059</td><td>2.2</td></tr>
<tr><td>4,4’-DDD</td><td>0.00084</td><td>2</td></tr>
<tr><td>Total DDT</td><td>--</td><td>1.58</td></tr>
<tr><td>Total PCBs</td><td>0.00017</td><td>22.7</td></tr>
</table>
</td></tr>
<tr><td>Margin of Safety</td><td>The uncertainties associated with this TMDL are due to limited data on the amount and media by which PCBs and pesticides are entering the lake and the extent to which these contaminants are already in the lake. The seasonal and annual variability in the hydrologic budget also creates uncertainty. To address these uncertainties, an implicit margin of safety is applied. Conservative assumptions were used to calculate the loading to the lake and more the protective ER-L sediment quality guidelines were used for the sediment numeric targets.</td></tr>
</table>

TMDL Element	Regulatory Provisions
Seasonal Variations and Critical Conditions	As the contaminants of concern for this TMDL are transported to the lake by the mobilization of sediment, it is expected that the greatest influx of PCBs and pesticides occurs during periods of increased runoff from the watershed. Due to the artificial interference in the watershed hydrologic cycle due to agricultural activities, peak runoff may not correspond to the southern California wet season. Seasonal variations and critical conditions are addressed by the use of concentration-based load allocations. However, due to the bioaccumulative properties of the pollutants, effects occur over extended time periods, which minimizes the importance of seasonal variations.
Monitoring	**<u>Monitoring Program</u>** The monitoring program shall measure the progress of pollutant load reductions and improvements in water and sediment quality. The monitoring program shall: • Determine attainment of numeric targets for PCBs and pesticides; • Determine compliance with the load allocations for PCBs and pesticides; and • Monitor the effect of implementation actions on lake water and sediment quality. The monitoring program shall consist of two phases. The first phase will focus on sampling the Central Ditch (for the first 10 years of the TMDL implementation schedule) and will be conducted by the responsible parties for the Central Ditch LAs. For the remaining portion of the TMDL implementation schedule, required water and sediment samples will be collected from the Central Ditch by "responsible parties" for the Central Ditch LAs, while required water and sediment samples will be collected from the lake as prescribed by the McGrath Lake Work Plan (MLWP) developed pursuant to a Memorandum of Agreement (MOA) entered into by and between "cooperative parties" and the Regional Board. The "responsible parties" and "cooperative parties" are defined in the implementation section below. <u>Phase 1</u> Phase 1 requires the development of a monitoring and reporting plan (MRP) to comply with the TMDL requirements. The MRP shall propose a monitoring frequency for water and sediment sampling that will characterize the variability in water and sediment quality observed in the Central Ditch. Water samples will be analyzed for the following constituents: • Total Organic Carbon • Total Suspended Solids • Total PCBs • DDT and Derivatives • Dieldrin • Total Chlordane

TMDL Element	Regulatory Provisions
Monitoring (continued)	Sediment samples will be analyzed for the following constituents: • Total Organic Carbon • Total PCBs • DDT and Derivatives • Dieldrin • Total Chlordane The annual monitoring reports will summarize proposed changes to the MRP based on the results of the previous year's monitoring. Sampling frequency may be reduced during future years once characterization of the variability in water and sediment quality has been achieved. In addition to the constituents above, general water chemistry (temperature, dissolved oxygen, pH and electrical conductivity) and a flow measurement will be required at each sampling event. Responsible parties for phase 1 monitoring shall submit a MRP plan to assess compliance with LAs and a Quality Assurance Project Plan (QAPP). The MRP and QAPP must be submitted to the Executive Officer for approval within six months of the effective date of the TMDL. The QAPP shall include protocols for sample collection, standard analytical procedures, and laboratory certification. All samples shall be collected in accordance with Surface Water Ambient Monitoring Program (SWAMP) protocols, where available or alternative protocols proposed by dischargers and approved by the Executive Officer. Monitoring shall begin 90 days after the Executive Officer has approved the MRP and QAPP. At the time of TMDL adoption, several of the constituents of concern had numeric targets lower than the laboratory detection limits. As analytical methods and detection limits continue to improve (i.e. development of lower detection limits) and become more environmentally relevant, responsible parties shall incorporate new analytical methods with lower detection limits in the MRP and the QAPP. A monitoring report shall be prepared and submitted to the Regional Board annually within three months after the completion of the final sampling event of the year. <u>Phase 2</u> The sampling, analysis and flow measurements begun in Phase 1 will continue. Additionally, samples will be collected from within the lake. Water column and surficial sediment (top 2 cm) samples will be collected at the northern end of the lake and from the deepest portion of the lake. All samples will be collected in accordance with SWAMP protocols. Cooperative parties shall only commence, participate or fund the Phase 2 monitoring as provided in the MLWP.

TMDL Element	Regulatory Provisions
Monitoring (continued)	Water samples will be analyzed for the following constituents: • Total Organic Carbon • Total Suspended Solids • Total PCBs • DDT and Derivatives • Dieldrin • Total Chlordane Sediment samples will be analyzed for the following constituents: • Total Organic Carbon • Total PCBs • DDT and Derivatives • Dieldrin • Total Chlordane • Toxicity (if toxicity is determined, a TIE shall be completed to elucidate the cause of the toxicity) Samples from the lake will be collected annually. The annual reports required for Phase 1 will continue during Phase 2. Additional monitoring may be required depending on which implementation option is chosen. Three years from the effective date of the TMDL, cooperative parties must submit the MLWP as discussed in the implementation section below. At the time of TMDL adoption, several of the constituents of concern had numeric targets lower than the laboratory detection limits. All required monitoring under Phase 1 and Phase 2 shall incorporate new analytical methods, once commercially available with lower detection limits, in the MRP and the QAPP. A monitoring report shall be prepared and submitted to the Regional Board annually within three months after the completion of the final sampling event of the year.
Implementation Plan	Compliance with this TMDL will require the elimination of pollutant loads in toxic amounts from the Central Ditch to the lake and identification and implementation of strategies to remediate the contaminated sediments at the bottom of the lake. Table 7-37.2 contains a schedule for cooperative parties to implement a MOA to jointly develop the MLWP to implement strategies to remediate the contaminated lake sediments and achieve lake sediment load allocations. I. Implementation and Determination of Compliance with the Central Ditch LAs for Agricultural Non-point Source Discharges The Central Ditch load allocations assigned to agriculture non-point source dischargers will be implemented through the Conditional Waiver of Waste Discharge Requirements for Discharges from Irrigated Lands (Conditional Waiver) or other appropriate Regional Board Orders. The load allocations for the Central Ditch shall be incorporated into the Conditional Waiver or other appropriate Regional Board Orders.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	It is likely that a combination of implementation measures will be needed to achieve the LAs. The Central Ditch implementation actions may include, but are not limited to the following: • On-Farm BMPs • Regional Sub-Watershed BMPs • Regional Treatment System • Redirect Agriculture Discharge The estimated costs for on-farm BMPs such as buffer crops, filter strips, and sedimentation basins are approximately $373/acre of BMP, $1002/acre of BMP, and $10,000/acre of BMP, respectively. The estimated costs for regional sub-watershed BMPs, such as converting the Central Ditch to a grassed waterway or converting the dirt road that runs along the Central Ditch into a filter strip, are approximately $1,288/ per acre of BMP and $1002/per acre of BMP, respectively. The estimated cost of a regional treatment system to address the Central Ditch water is about $151,536/year. The estimated costs to redirect the agriculture discharge toward a nearby canal are $612,611 (open ditch) to $1,287,402 (piped diversion). Potential sources of financing for these implementation alternatives, such as Clean Water Act section 319(h) grant funding, are discussed in Chapter 4. As discussed in Chapter 4, the U.S. Department of Agriculture Soil Conservation Service and the Resource Conservation Districts provide information on, and assistance in, implementing BMPs. Agricultural Dischargers will be considered in compliance with the TMDL LAs if they comply with all provisions of the Conditional Waiver established to implement the LAs , or those of any alternative regulatory order, if any, that may be established to implement the LAs in lieu of the Conditional Waiver. II. Implementation of Memorandum of Agreement to Develop McGrath Lake Work Plan and Determination of Compliance with LAs for Contaminated Lake Sediments The contaminated lake sediment LAs may be implemented through a MOA, which the Executive Officer is authorized to negotiate and execute, provided it is consistent with the following: The MOA shall detail the voluntary efforts that will be undertaken to attain the load allocations. The MOA shall comply with the Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options ("Policy"), including part II, section 2 (c)(ii) and related provisions, and shall be consistent with the requirements of this TMDL. If the MOA is timely adopted in accordance with the implementation schedule below, the program described in the MOA shall be deemed "certified", pursuant to the Policy, subject to the conditions of Policy section 2 (e). The MOA shall include development of the MLWP, which must be approved by the Executive Officer, and may be amended with Executive Officer approval, as necessary. Implementation of the MOA shall be reviewed annually by the Executive Officer as part of the MRP annual reports.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	The purpose of the MOA is not to create evidence of responsibility or ascertain legal liability for subsequent remediation of the lake sediments, but rather to organize stakeholders who have an interest in the remediation of the lake sediments. To be a valid non-regulatory implementation program adopted by the Regional Board, the MOA shall include the following requirements and conditions: • The MOA shall direct development of a MLWP that addresses the impaired waterbody as approved by the Executive Officer. • The MOA shall outline the roles and responsibilities of the Regional Board and each cooperative party. • The MOA shall contain conditions that require trackable progress on attaining load allocations and numeric targets. A timeline shall be included that identifies the point(s) at which Regional Board regulatory intervention and oversight will be triggered if the pace of work lags or fails. • The MOA shall contain a provision that it shall be revoked based upon findings that the program has not been adequately implemented, is not achieving its goals, or is no longer adequate to restore water quality. • The MOA shall be consistent with the California Policy for Implementation and Enforcement of the Non-point Source Pollution Control Program, including but not limited to, the "Key Elements of a Non-point Source Pollution Control Implementation Program". Pursuant to the terms of the MOA, the cooperative parties and the Regional Board will work jointly to develop the MLWP and remediate the lake sediments. The purpose of the MLWP is to set forth strategies to achieve lake sediment load allocations in a manner that is beneficial to subwatershed landowners and the public in general. To the satisfaction of the Executive Officer, the MLWP shall meet the following criteria: • Three years from the effective date of the TMDL cooperative parties shall submit a MLWP for approval by the Executive Officer. • The MLWP shall include identification of implementation measures that will achieve lake sediment LAs. • The MLWP shall include any additional monitoring needed to assess the effectiveness of the MLWP's chosen implementation strategies. • The MLWP shall include a MRP and QAPP for phase 2 monitoring. • The MLWP shall include a strategy to secure funds necessary to remediate the lake sediments and achieve lake sediment allocations.

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	• The MLWP shall include tasks and a clear timeline for task completion leading to attainment of lake sediment LAs. The roles and responsibilities of each cooperative party shall also be outlined in the MLWP. • The MLWP shall consider and address the potential impacts of lake sediment remediation strategies on the implementation of the McGrath Beach Bacteria TMDL and ongoing restoration efforts at McGrath State Beach. • The MLWP shall achieve compliance with the load allocations through the implementation of lake management strategies to reduce and manage internal pesticide and PCBs sources from lake bed sediments. The lake management implementation actions may include: • Sediment Capping; • Dredging/Hydraulic Dredging; • Monitored Natural Attenuation; or • Other appropriate means of implementation. The Executive Officer may require a revised MLWP to reflect the results of data obtained through TMDL implementation. III. APPLICATION OF ALLOCATIONS A. Responsible parties for the Central Ditch LAs are the agricultural dischargers in the McGrath Lake sub-watershed. B. Responsible parties for the lake sediment LAs have not yet been identified. Instead, cooperative parties for the lake sediment LAs are identified, not as responsible parties or as dischargers, but as landowners in the subwatershed who may execute a MOA jointly with the Regional Board for the development of the MLWP so that lake sediment allocations can be achieved in a manner that is in the best interest of both the subwatershed landowners and the public in general. Cooperative parties for the lake sediment LAs include: • State of California Department of Parks and Recreation • McGrath Family (owners of the Central Ditch west of Harbor Blvd and the northern end of the lake) • Agricultural Landowners in the McGrath Lake sub-watershed • Ventura Regional Sanitation District (Bailard Landfill)

TMDL Element	Regulatory Provisions
Implementation Plan (continued)	If a MOA is not established by and between cooperative parties and the Regional Board within two years of the effective date of the TMDL, or the cooperative parties do not comply with the terms of the MOA, or if the MOA and MLWP are not implemented or otherwise do not result in attainment of load allocations consistent with the provisions and schedule of the TMDL, the Executive Officer shall initiate an investigation, with input from current landowners, to (1) identify the responsible parties, whether named in this TMDL or not, whose discharges of the legacy pollutants have caused or contributed to the impairment of the lake; (2) ascertain the whereabouts and capacities of those responsible parties and/or their successors; (3) determine the parties to whom responsibility for remediation of sediments should be assigned; and (4) issue appropriate regulatory orders to those responsible parties. In addition, a comprehensive review of the MOA by the Executive Officer shall take place five years from the effective date of the MOA. The purpose of this review is to ensure adequate progress pursuant to the timeline established in the MOA on development of the MLWP and ultimately attainment of the lake sediment load allocations. If the Executive Officer determines that adequate progress has not been made, the Regional Board shall initiate the investigation described above. If the Executive Officer is unable to identify the responsible parties per the investigations above, then the TMDL shall be reconsidered.

Table 7-37.2 McGrath Lake PCBs and Pesticides TMDL: Implementation Schedule

Task Number	Task	Deadline
1	Responsible parties assigned Central Ditch LAs shall submit a Monitoring and Reporting Plan (MRP) to the Executive Officer for review and approval to address Phase 1 monitoring.	6 months from the effective date of the TMDL
2	Responsible parties assigned Central Ditch LAs shall begin monitoring as outlined in the approved MRP.	90 days from the date of MRP approval
3	Responsible parties assigned Central Ditch LAs shall submit annual monitoring reports. Reports shall be submitted within three months after the completion of the final sampling event of the year.	Annually
4	Cooperative parties shall enter into a Memorandum of Agreement (MOA) with the Regional Board to implement the lake sediment LAs.	Two years from the effective date of the TMDL
5	Parties subject to the MOA shall submit a McGrath Lake Work Plan (MLWP) for review and approval by the Executive Officer.	Three years from the effective date of the TMDL
6	Parties subject to the MOA shall submit annual progress reports.	Annually from the date of MLWP approval
7	Responsible parties shall attain Central Ditch LAs.	10 years from the effective date of the TMDL
8	Begin implementation of McGrath Lake sediment remediation actions based on MLWP.	As soon as possible, but no later than 10 years from the effective date of the TMDL
9	Phase 2 monitoring shall begin as outlined in the MLWP. The results shall be included as part of the annual progress reports initiated in Task 6.	To be determined based on MLWP.
10	Lake sediment LAs shall be achieved.	14 years from the effective date of the TMDL

VEGETATED BUFFER STRIP

Vegetated Buffer Strip TC-31

Design Considerations

- Tributary Area
- Slope
- Water Availability
- Aesthetics

Description

Grassed buffer strips (vegetated filter strips, filter strips, and grassed filters) are vegetated surfaces that are designed to treat sheet flow from adjacent surfaces. Filter strips function by slowing runoff velocities and allowing sediment and other pollutants to settle and by providing some infiltration into underlying soils. Filter strips were originally used as an agricultural treatment practice and have more recently evolved into an urban practice. With proper design and maintenance, filter strips can provide relatively high pollutant removal. In addition, the public views them as landscaped amenities and not as stormwater infrastructure. Consequently, there is little resistance to their use.

California Experience

Caltrans constructed and monitored three vegetated buffer strips in southern California and is currently evaluating their performance at eight additional sites statewide. These strips were generally effective in reducing the volume and mass of pollutants in runoff. Even in the areas where the annual rainfall was only about 10 inches/yr, the vegetation did not require additional irrigation. One factor that strongly affected performance was the presence of large numbers of gophers at most of the southern California sites. The gophers created earthen mounds, destroyed vegetation, and generally reduced the effectiveness of the controls for TSS reduction.

Advantages

- Buffers require minimal maintenance activity (generally just erosion prevention and mowing).
- If properly designed, vegetated, and operated, buffer strips can provide reliable water quality benefits in conjunction with high aesthetic appeal.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Flow characteristics and vegetation type and density can be closely controlled to maximize BMP effectiveness.
- Roadside shoulders act as effective buffer strips when slope and length meet criteria described below.

Limitations

- May not be appropriate for industrial sites or locations where spills may occur.
- Buffer strips cannot treat a very large drainage area.
- A thick vegetative cover is needed for these practices to function properly.
- Buffer or vegetative filter length must be adequate and flow characteristics acceptable or water quality performance can be severely limited.
- Vegetative buffers may not provide treatment for dissolved constituents except to the extent that flows across the vegetated surface are infiltrated into the soil profile.
- This technology does not provide significant attenuation of the increased volume and flow rate of runoff during intense rain events.

Design and Sizing Guidelines

- Maximum length (in the direction of flow towards the buffer) of the tributary area should be 60 feet.
- Slopes should not exceed 15%.
- Minimum length (in direction of flow) is 15 feet.
- Width should be the same as the tributary area.
- Either grass or a diverse selection of other low growing, drought tolerant, native vegetation should be specified. Vegetation whose growing season corresponds to the wet season is preferred.

Construction/Inspection Considerations

- Include directions in the specifications for use of appropriate fertilizer and soil amendments based on soil properties determined through testing and compared to the needs of the vegetation requirements.
- Install strips at the time of the year when there is a reasonable chance of successful establishment without irrigation; however, it is recognized that rainfall in a given year may not be sufficient and temporary irrigation may be required.
- If sod tiles must be used, they should be placed so that there are no gaps between the tiles; stagger the ends of the tiles to prevent the formation of channels along the strip.
- Use a roller on the sod to ensure that no air pockets form between the sod and the soil.

- Where seeds are used, erosion controls will be necessary to protect seeds for at least 75 days after the first rainfall of the season.

Performance

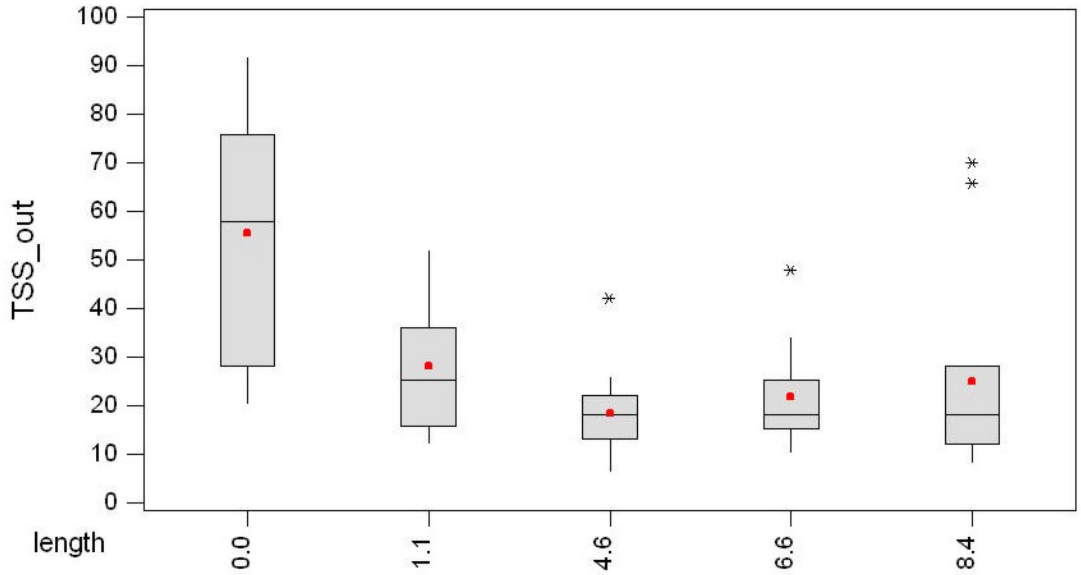
Vegetated buffer strips tend to provide somewhat better treatment of stormwater runoff than swales and have fewer tendencies for channelization or erosion. Table 1 documents the pollutant removal observed in a recent study by Caltrans (2002) based on three sites in southern California. The column labeled "Significance" is the probability that the mean influent and effluent EMCs are not significantly different based on an analysis of variance.

The removal of sediment and dissolved metals was comparable to that observed in much more complex controls. Reduction in nitrogen was not significant and all of the sites exported phosphorus for the entire study period. This may have been the result of using salt grass, a warm weather species that is dormant during the wet season, and which leaches phosphorus when dormant.

Another Caltrans study (unpublished) of vegetated highway shoulders as buffer strips also found substantial reductions often within a very short distance of the edge of pavement. Figure 1 presents a box and whisker plot of the concentrations of TSS in highway runoff after traveling various distances (shown in meters) through a vegetated filter strip with a slope of about 10%. One can see that the TSS median concentration reaches an irreducible minimum concentration of about 20 mg/L within 5 meters of the pavement edge.

Table 1 Pollutant Reduction in a Vegetated Buffer Strip

Constituent	Mean EMC		Removal %	Significance
	Influent (mg/L)	Effluent (mg/L)		P
TSS	119	31	74	<0.000
NO_3-N	0.67	0.58	13	0.367
TKN-N	2.50	2.10	16	0.542
Total N[a]	3.17	2.68	15	-
Dissolved P	0.15	0.46	-206	0.047
Total P	0.42	0.62	-52	0.035
Total Cu	0.058	0.009	84	<0.000
Total Pb	0.046	0.006	88	<0.000
Total Zn	0.245	0.055	78	<0.000
Dissolved Cu	0.029	0.007	77	0.004
Dissolved Pb	0.004	0.002	66	0.006
Dissolved Zn	0.099	0.035	65	<0.000



Filter strips also exhibit good removal of litter and other floatables because the water depth in these systems is well below the vegetation height and consequently these materials are not easily transported through them. Unfortunately little attenuation of peak runoff rates and volumes (particularly for larger events) is normally observed, depending on the soil properties. Therefore it may be prudent to follow the strips with another practice than can reduce flooding and channel erosion downstream.

Siting Criteria

The use of buffer strips is limited to gently sloping areas where the vegetative cover is robust and diffuse, and where shallow flow characteristics are possible. The practical water quality benefits can be effectively eliminated with the occurrence of significant erosion or when flow concentration occurs across the vegetated surface. Slopes should not exceed 15 percent or be less than 1 percent. The vegetative surface should extend across the full width of the area being drained. The upstream boundary of the filter should be located contiguous to the developed area. Use of a level spreading device (vegetated berm, sawtooth concrete border, rock trench, etc) to facilitate overland sheet flow is not normally recommended because of maintenance considerations and the potential for standing water.

Filter strips are applicable in most regions, but are restricted in some situations because they consume a large amount of space relative to other practices. Filter strips are best suited to treating runoff from roads and highways, roof downspouts, small parking lots, and pervious surfaces. They are also ideal components of the "outer zone" of a stream buffer or as pretreatment to a structural practice. In arid areas, however, the cost of irrigating the grass on the practice will most likely outweigh its water quality benefits, although aesthetic considerations may be sufficient to overcome this constraint. Filter strips are generally impractical in ultra-urban areas where little pervious surface exists.

Some cold water species, such as trout, are sensitive to changes in temperature. While some treatment practices, such as wet ponds, can warm stormwater substantially, filter strips do not

are not expected to increase stormwater temperatures. Thus, these practices are good for protection of cold-water streams.

Filter strips should be separated from the ground water by between 2 and 4 ft to prevent contamination and to ensure that the filter strip does not remain wet between storms.

Additional Design Guidelines

Filter strips appear to be a minimal design practice because they are basically no more than a grassed slope. In general the slope of the strip should not exceed 15fc% and the strip should be at least 15 feet long to provide water quality treatment. Both the top and toe of the slope should be as flat as possible to encourage sheet flow and prevent erosion. The top of the strip should be installed 2-5 inches below the adjacent pavement, so that vegetation and sediment accumulation at the edge of the strip does not prevent runoff from entering.

A major question that remains unresolved is how large the drainage area to a strip can be. Research has conclusively demonstrated that these are effective on roadside shoulders, where the contributing area is about twice the buffer area. They have also been installed on the perimeter of large parking lots where they performed fairly effectively; however much lower slopes may be needed to provide adequate water quality treatment.

The filter area should be densely vegetated with a mix of erosion-resistant plant species that effectively bind the soil. Native or adapted grasses, shrubs, and trees are preferred because they generally require less fertilizer and are more drought resistant than exotic plants. Runoff flow velocities should not exceed about 1 fps across the vegetated surface.

For engineered vegetative strips, the facility surface should be graded flat prior to placement of vegetation. Initial establishment of vegetation requires attentive care including appropriate watering, fertilization, and prevention of excessive flow across the facility until vegetation completely covers the area and is well established. Use of a permanent irrigation system may help provide maximal water quality performance.

In cold climates, filter strips provide a convenient area for snow storage and treatment. If used for this purpose, vegetation in the filter strip should be salt-tolerant (e.g., creeping bentgrass), and a maintenance schedule should include the removal of sand built up at the bottom of the slope. In arid or semi-arid climates, designers should specify drought-tolerant grasses to minimize irrigation requirements.

Maintenance

Filter strips require mainly vegetation management; therefore little special training is needed for maintenance crews. Typical maintenance activities and frequencies include:

- Inspect strips at least twice annually for erosion or damage to vegetation, preferably at the end of the wet season to schedule summer maintenance and before major fall run-off to be sure the strip is ready for winter. However, additional inspection after periods of heavy run-off is most desirable. The strip should be checked for debris and litter and areas of sediment accumulation.

- Recent research on biofiltration swales, but likely applicable to strips (Colwell et al., 2000), indicates that grass height and mowing frequency have little impact on pollutant removal;

consequently, mowing may only be necessary once or twice a year for safety and aesthetics or to suppress weeds and woody vegetation.

- Trash tends to accumulate in strip areas, particularly along highways. The need for litter removal should be determined through periodic inspection but litter should always be removed prior to mowing.

- Regularly inspect vegetated buffer strips for pools of standing water. Vegetated buffer strips can become a nuisance due to mosquito breeding in level spreaders (unless designed to dewater completely in 48-72 hours), in pools of standing water if obstructions develop (e.g. debris accumulation, invasive vegetation), and/or if proper drainage slopes are not implemented and maintained.

Cost

Construction Cost

Little data is available on the actual construction costs of filter strips. One rough estimate can be the cost of seed or sod, which is approximately 30¢ per ft^2 for seed or 70¢ per ft^2 for sod. This amounts to between $13,000 and $30,000 per acre of filter strip. This cost is relatively high compared with other treatment practices. However, the grassed area used as a filter strip may have been seeded or sodded even if it were not used for treatment. In these cases, the only additional cost is the design. Typical maintenance costs are about $350/acre/year (adapted from SWRPC, 1991). This cost is relatively inexpensive and, again, might overlap with regular landscape maintenance costs.

The true cost of filter strips is the land they consume. In some situations this land is available as wasted space beyond back yards or adjacent to roadsides, but this practice is cost-prohibitive when land prices are high and land could be used for other purposes.

Maintenance Cost

Maintenance of vegetated buffer strips consists mainly of vegetation management (mowing, irrigation if needed, weeding) and litter removal. Consequently the costs are quite variable depending on the frequency of these activities and the local labor rate.

1.0 INTRODUCTION

This Geotechnical Report presents the results of a geotechnical investigation conducted for the Venice Auxiliary Pumping Plant to be located at 133 East Hurricane Street in the Venice area of Los Angeles. This report was prepared in response to a request received from the Wastewater Conveyance Engineering Division dated September 10, 2014. This investigation was performed to evaluate subsurface characteristics and to provide geotechnical recommendations for design and construction of the proposed project.

This report is based on visual observation, subsurface investigation and laboratory testing. At the request of the Geotechnical Engineering Group (GEO), Geotechnical Professionals Inc. (GPI) performed subsurface exploration at the site and laboratory testing of samples collected from the site. The results of their field work and laboratory tests are included in their Data Report, dated September 29, 2015, presented in Appendix A of this report.

In addition, Amec previously prepared a Geotechnical Data Report as part of a geotechnical investigation for the Venice Dual Force Main project. Their scope of work included two exploratory borings (G-1A and G-1B) in the southeast portion of the Venice Auxiliary Pumping Plant site. Logs of these exploratory borings and laboratory test results of samples retrieved from these borings are presented in Appendix B of this report.

Also, the Department of General Services Standards Division previously advanced two exploratory borings on the site in support of previous projects. Logs of these exploratory borings and laboratory test results of samples retrieved from these borings are presented in Appendix B of this report.

GEO has reviewed the above referenced reports and concurs with the findings and accepts responsibility for the use of the contents as described herein.

2.0 SITE DESCRIPTION

The Venice Auxiliary Pumping Plant site consists of an approximately 7,800 square foot piece of land bounded by private property to the northwest, the Grand Canal to the northeast, Hurricane Street to the southeast and Canal Street to the southwest. The site is across Hurricane Street from the existing Venice Pump Plant. At the time this report was prepared, the site was unoccupied. The site was recently used to facilitate construction of the Venice Manifold Replacement project. Site ground surface elevations are on the order of 5 to 6 feet above sea level. Figure 1, "Vicinity Map", illustrates the site location.

3.0 PROJECT SCOPE

In preparation of this report we have reviewed an October 2105 draft of the Preliminary Design Report for the project, prepared by Arcadis. Appendix B of the draft Preliminary Design Report includes several preliminary design drawings. Drawing C-03A illustrates a proposed layout of the planned construction. As shown on this drawing, the project is planned to consist of an auxiliary pumping plant (wetwell/valve vault), an electrical building, a diversion structure, a new 66-inch diameter sewer between the diversion structure and the new auxiliary pumping plant wetwell, and a new 42-inch discharge line to connect to the existing force main. Drawing C-03A has been reproduced herein as Figure 2, "Proposed Construction".

Preliminary Design Drawing C-03A indicates the auxiliary pumping plant (wetwell/valve vault) will be located in the east central portion of the site and that this structure is anticipated to have plan dimensions on the order of 55 feet by 32 feet. Preliminary Design Drawing S-2 indicates the wetwell will be founded on a mat foundation with a bearing elevation on the order of -26 feet (below sea level) and the valve vault at an elevation on the order of -9 feet (below sea level).

Preliminary Design Drawing C-03A indicates the new electrical building will be located in the west central portion of the site and will have plan dimensions on the order of 25 feet by 50 feet. Preliminary Design Drawing A-04 indicates this building will be an at-grade, two-story structure with an overall height on the order of 30 feet. The finish floor elevation of the ground level floor is expected to be on the order of 6 feet above sea level.

Preliminary Design Drawing C-03A indicates the diversion structure will encompass an existing 66-inch reinforced concrete sewer pipe that extends along the east side of the site. This structure is anticipated to have plan dimensions on the order of 21 feet by 21 feet and is expected to be founded on a mat foundation bearing at an elevation of approximately -20 feet (below sea level).

Approximately 23 feet of new 66-inch diameter reinforced concrete sewer pipe will be constructed between the new diversion structure and the auxiliary pumping plant wetwell. Preliminary Design Drawing S-3 indicates this sewer will have an invert elevation of -7.37 feet (below sea level).

A new 42-inch diameter pipe header is shown on Preliminary Design Drawing C-03A to extend from the new valve vault to the west end of the new manifold within Hurricane Street. Preliminary Design Drawing M-02 indicates this pipe header will have an invert elevation on the order of -4.75 feet (below sea level).

Construction will also include new equipment pads and possibly sidewalks, planters, landscaping, and other minor improvements. Final site grades are expected to be within one to two feet of the current site grades.

The analyses and recommendations of this report reflect the layout of major improvements provided in Figure 2, but are also intended to be flexible to allow minor changes in the scope. GEO shall review the final project scope and grading plans to confirm that the recommendations contain within this report are appropriate. If the final scope includes significant changes from those described herein, a supplemental report will be necessary.

4.0 EXPLORATION PROGRAM

4.1 Subsurface investigation 2015

Five Cone Penetrometer tests (CPT's) were performed for the project on July 31, 2015. The CPT's were advanced to approximate depths of 40 to 80 feet below ground surface (bgs). In addition, three rotary wash boring were drilled on August 6 and 7, 2015 to depths of 49 feet to 79-1/2 feet bgs. Approximate locations of the CPTs and exploratory borings are shown in Figure 3, "Exploration Locations Map" and in the data report presented in Appendix A.

Relatively undisturbed geotechnical samples were obtained from the rotary wash borings by driving a modified California-type split spoon sampler lined with 1-inch high brass rings. Standard Penetration Tests (SPT) were also performed in these borings. Starting began at a depth of 2.5 feet and was performed every 2.5 feet thereafter to the final depth of the borings. The samplers were driven with successive drops of a 140-pound automatic-trip hammer falling 30 inches.

Each collected sample was inspected and described in general conformance with the Unified Soil Classification System (USCS). All samples were sealed and packaged for transportation to GPI's laboratory. After completion of drilling and sampling, the borings were backfilled with cement slurry.

Although GEO has no record of contamination at the project site, the samples obtained from the borings were screened in the field for volatile organic compounds (VOCs) to determine if the site may have been contaminated in the past by petroleum distillates or other types of contamination. Soil samples were screened in the field with a photo-ionization detector. No organic vapors were detected. No odor, staining, or other evidence of contamination was observed in the borings.

The site is located within a Methane Study Zone and a Methane Study has been performed for the project. The requirements of the Methane Study report shall be incorporated into the design and construction of the project. A copy of the methane report is presented in Appendix C of this report.

4.2 Subsurface investigation 2008

In 2008, Amec drilled two exploratory borings (G-1A and G-1B) within the southeastern portion of the site as part of a subsurface investigation for the Venice Dual Force Main project. Ring, Standard Penetration Test (SPT) and shelby tube samples were collected from exploratory boring G-1A at depth intervals of 2-1/2 to 5 feet to the explored depth of approximately 71.5 feet below the ground surface. Ring and SPT samples were collected from exploratory boring G-1B at depth intervals of 2-1/2 to 5 feet to the explored depth of approximately 25.5 feet below the ground surface. Ring and SPT samplers were driven into the bottom of the borings with successive drops of a 140-pound Automatic trip hammer falling 30 inches. Approximate locations of these borings are shown on Figure 3.

Each collected sample was inspected and described in general conformance with the Unified Soil Classification System (USCS). All samples were sealed and packaged for transportation to Amec's laboratory. After completion of drilling and sampling, the borings were converted to monitoring wells.

Soil samples obtained from the borings during exploration were field-screened for the presence of organic vapors using a MiniRAE 2000, a portable photo-ionization detector (PID). Results of the PID screening are presented in the boring logs (Appendix B).

A portable combustible gas meter (CGM), RAE QRAE Plus 4, capable of measuring the Lower Explosive Limit (LEL) of potential gases, the percent of oxygen, carbon monoxide (CO), and hydrogen sulfide gases (H_2S), was used to measure the LEL at the ground surface. For these borings, only zero readings were recorded, and thus the values are not shown on the boring logs.

4.3 Subsurface investigation 1994

In 1994, the Department of General Services Standards Division drilled one exploratory boring (94-072 B-8) within the eastern portion of the site as part of a subsurface investigation for the Venice Area Relief sewer project. Standard Penetration Test (SPT) samples were collected from this exploratory boring at depths of 5 feet, 10 feet and every 5 feet thereafter to the explored depth of approximately 31 feet below the ground surface. The SPT samplers were driven into the bottom of the borings with successive drops of a 140-pound hammer falling 30 inches. The approximate location of this boring is shown on Figure 3.

Each collected sample was inspected and described in general conformance with the Unified Soil Classification System (USCS). All samples were sealed and packaged for transportation to the Standards laboratory. After completion of drilling, the exploratory boring was backfilled with soil cuttings. An exploratory boring log and laboratory test results of samples retrieved from this boring are presented in Appendix B.

4.4 Subsurface investigation 1990

In 1990, the Department of General Services Standards Division drilled one exploratory boring (89-305 B-2) within the western portion of the site as part of a subsurface investigation for a seismic evaluation of the existing Venice Pumping Plant. Standard Penetration Test (SPT) samples were collected from this exploratory boring at depths of 5 feet, 10 feet and every 5 feet thereafter to the explored depth of approximately 41 feet below the ground surface. The SPT samplers were driven into the bottom of the borings with successive drops of a 140-pound hammer falling 30 inches. The approximate location of this boring is shown on Figure 3.

Each collected sample was inspected and described in general conformance with the Unified Soil Classification System (USCS). All samples were sealed and packaged for transportation to the Standards laboratory. After completion of drilling, the exploratory boring was backfilled with soil cuttings. An exploratory boring log for this boring is presented in Appendix B.

5.0 GEOLOGIC CONDITIONS

5.1 Regional Geology

The Venice Auxiliary Pumping Plant site is located within the Los Angeles Basin part of the Peninsular Ranges geomorphic province, which extends from Southern California to the southern tip of Baja California. This province is characterized by elongate northwest-trending mountain ridges separated by straight-sided sediment-filled valleys. The northwest trend is further displayed in the dominant structural features of the province, which are northwest to west-northwest trending folds and faults, such as the nearby Newport-Inglewood fault zone.

The site is located in an alluviated lowland area in the west portion of the Los Angeles Basin, a northwest trending alluviated plain about 50 miles long and 20 miles wide. The Basin is bound on the north by the Santa Monica Mountains and the Elysian, Repetto, and Puente Hills, and on the east and southeast by the Santa Ana Mountains and San Joaquin Hills. The aerially extensive alluviated plain slopes southward and seaward however in the vicinity of the project the plain is interrupted by the Baldwin Hills and Beverly Hills. The Baldwin Hills are the northern extension of the Newport-Inglewood structural block which has uplifted the Baldwin Hills, Dominquez Hills, and Signal Hill located to the south.

The Los Angeles Basin is underlain by a deep structural depression. Parts of this depression have been filled with sediments discontinuously since the Late Cretaceous (starting about 85 million years ago). Starting in the middle Miocene (about 20 million years ago) the basin (which extended to the Ventura Basin) continuously subsided as sediments were deposited. The buried basement surface has relief of as much as 4.5 miles in a distance of 8 miles (Yerkes, et al, 1965).

5.2 Local Geologic Setting

The Marina Del Rey and Venice areas were once a large wetland marsh fed by the meandering Ballona Creek, which drained into the Santa Monica Bay near the current location. The 1924 United States Geological Survey Map of the Venice Quadrangle shows the project site is adjacent to a large lowland marsh area northeast of the Grand Canal. The elevation of the site was approximately 5 feet above sea level. Surficial geologic exposures are all Quaternary Age sedimentary units.

5.3 Stratigraphy

5.3.1 Fill (af)

Artificial fill soils exist within the site as the result of previous construction and/or previous construction activities on the site. In general, the depth of fill is expected to be on the order of three to four feet within the site. Fill depths may be deeper in some areas. The fill materials generally consist of silty sand and sand with some construction debris.

5.3.2 Alluvium (Qa)

Alluvial sediments encountered in the borings were primarily coarse grained soils consisting of gravels, sands, and silty sands with interlayered fine grained soils consisting of silts and clays.

Coarse-grained alluvial materials range widely in type and consistency from poorly graded sands and gravels to silty and clayey sands. Generally, the coarse alluvium soils are typically brown or light brown in color though they may be gray or olive with high fine contents in the case of silty or clayey sands. The coarse grained materials are moist to wet, loose to very dense with varying amounts of silt, clay, gravel, and cobbles.

The fine-grained materials are typically moist to wet. Fine-grained alluvium consists of lean and fat (low to high plasticity) silts and clays of very soft to hard consistency. Generally, the fine grained alluvial soils are brown, dark brown, dark gray or greenish gray in color.

Seashells and seashell fragments were observed in many of the samples collected from the borings. These materials were observed to be interspersed anywhere within the matrix of the soil and as concentrated lenses and layers of several inches in thickness.

More detailed descriptions of the alluvium can be found in the boring logs in Appendices A and B.

5.4 Groundwater

The Grand Canal and the Venice Canals convey surface water runoff from nearby areas to the Marina Del Rey entrance channel. The Marina Del Rey harbor and entrance channel are also unlined, and was constructed via dredging in the 1950's. In order to reduce the chance of flooding low lying areas along the Grand Canal, the County of Los Angeles maintains tide gates that control flow into and out of the Grand Canal from the Marina Del Rey entrance channel. County personnel report that when a high tide in excess of 5.7 feet above sea level is forecast, the tide gates are closed. In the past, when tide gates were not closed, water levels in the Grand Canal increased and local flooding resulted. Historically, groundwater levels have been measured near the ground surface in the project area.

Measured groundwater levels in the project area have generally varied between elevations of -2 to +4 feet of sea level. Groundwater levels beneath the site fluctuate as the result of seasonal variations and tidal fluctuations. Based on the available geotechnical data, a baseline groundwater elevation of one foot above sea level has been selected for the project.

6.0 FAULTING AND SEISMICITY

The site lies within Seismic Zone 4 of the 2010 California Building Code (CBC). Primary seismic hazards that could affect the site include ground motion or shaking, ground surface rupture along faults, liquefaction, and earthquake-induced landslides.

6.1 Ground Motion

Based on the current understanding of the geologic framework of the site area, the seismic hazard which is expected to have the highest probability of affecting the site is ground shaking or motion resulting from an earthquake occurring along any of several major active and potentially active faults in Southern California. Known regional faults that could produce significant ground shaking at the site include the Malibu Coast, Santa Monica, Palos Verdes, Newport-Inglewood, among others.

Ground motion parameters were determined for the site using the United States Geological Survey (USGS) 2008 Probabilistic Seismic Hazard Analysis Interactive Deaggregation web tool. The site longitude and latitude, a 10% probability of

exceedance in 50 years and an average shear wave velocity of 230 meters per second for the upper 100 feet of subsurface were input into the program. Using these parameters a peak ground acceleration of 0.4g was determined for the site. The program also calculated a mean earthquake magnitude of 6.7 at a distance of 20.5 kilometers from the site.

6.2 Ground Rupture and Deformation

The Alquist-Priolo Earthquake Fault Zoning Act of 1972 (Act) requires that "Earthquake Fault Zones" be established along the trace of active faults. The purpose of the Act is to regulate development near active faults so as to mitigate the hazard of surface fault rupture. Earthquake faults that are "sufficiently active" (have evidence of surface displacement within Holocene time or the last 11,000 years) and "well-defined" (a fault whose trace is clearly detectable by a trained geologist as a physical feature at or just below the ground surface) are subject to zoning. Under the Act, the State Geologist is required to delineate Earthquake Fault Zones along all sufficiently active and well-defined faults that constitute a hazard to structures from surface displacement. Maps depicting the Earthquake Fault Zones are issued by the California Geological Survey (CGS). According to the CGS, the site is not located within an Alquist-Priolo Earthquake Fault Zone and no faults are known to be in close proximity of the site.

6.3 Liquefaction

According to the State of California Seismic Hazard Zones Map (Figure 4), the site is located within an area that has potential for liquefaction. Liquefaction is a process that occurs when saturated sediments are subjected to repeated strain reversals during a seismic event. The strain reversals cause an increase in pore water pressure such that the internal pore pressure approaches the overburden pressure and the shear strength approaches a low residual value. Liquefied soils are subject to flow, consolidation, or excessive strain. Liquefaction typically occurs in loose to medium dense sand and silty sand soils below the groundwater table. Predominately fine-grained soils, such as silts and clays are less susceptible to liquefaction.

Liquefaction analyses were performed for a ground acceleration of 0.43g (2/3 of the Maximum Considered Earthquake-Geometric Mean ground acceleration of 0.642g). The analyses were performed for the deepest rotary wash boring, RW-2, located near the center of the site. The analyses were performed with consideration to the soil particle size and plasticity information obtained through laboratory testing, and the measured and anticipated high groundwater levels. Potential liquefaction induced settlements on the order of 1-3/4 inches were calculated for the project site.

6.4 Earthquake-Induced Landslides

As shown by the State of California Seismic Hazard Zones Map (Figure 4), the site is not within a zone of earthquake-induced landslide potential.

6.5 Seismic Design Parameters

Table 1613.5.2 of 2013 California Building Code - "Site Class Definitions" list six Site Classes (A through F). The Site Class is based on the average properties of the upper 100 feet of the soil and/or bedrock beneath the site. The appropriate Site Class is chosen by referencing the average shear wave velocity, average Standard Penetration Test blow counts, and/or average undrained shear strength. Based on data obtained from the deepest boring, Site Class D is recommended for this site.

The mapped acceleration parameters Ss and S_1, 0.2 and 1-second spectral response accelerations, were determined and used along with the Site Class to obtain the site coefficients Fa and Fv. The maximum considered earthquake spectral response acceleration for short periods, S_{MS}, and at the 1.0-second period, S_{M1}, adjusted for Site Class effects were then calculated followed by the calculation of the design spectral response acceleration for short periods, S_{DS}, and at the 1.0-second period, S_{D1}. The values of T_O and T_S, in seconds, were then determined using the equations presented in the code to represent the beginning and end of the design response spectra peak.

The seismic parameter values for the site are summarized in Table 1, Seismic Design Parameters.

Table 1 – Seismic Design Parameters

Parameter	Value	2008 LABC Reference
Site Class	D	Table 1613.5.2
S_s	1.661	Figure 1613.5(3)
S_1	0.660	Figure 1613.5(4)
S_{MS}	1.661	Equation 16-37
S_{M1}	0.990	Equation 16-38
S_{DS}	1.107	Equation 16-39
S_{D1}	0.660	Equation 16-40
T_O (seconds)	0.119	Chapter 16
T_S (seconds)	0.596	Chapter 16

7.0 LABORATORY TESTING

Selected soil samples were tested for the following properties:

- In-Place Dry Density and Field Moisture (D2937)
- Laboratory Maximum Dry Density and Optimum Moisture Content (ASTM D1557)
- Consolidation (ASTM D 2435)
- Direct Shear (ASTM D 3080)
- Unconfined Compression Strength (ASTM D 2166)
- Triaxial Compresion Strength (ASTM D2850)
- Sieve and Hydrometer Analysis (ASTM D422)
- Liquid Limit and Plasticity Index (ASTM D4318)
- Conductivity (EPA 120.1)
- Chlorides (EPA 300.0)
- pH (SM 4500-H+B)
- Sulfates (EPA 300.0)

Laboratory test results are presented in Appendices A and B.

8.0 SITE RECOMMENDATIONS

8.1 General

Our primary geotechnical consideration with respect to the proposed construction is the existing uncertified fill soils and compressible shallow soils within the site, the potential for liquefaction at the site, and the potential for methane gas. Remedial earthwork is recommended in the area of the electrical building to provide suitable foundation support. To mitigate the potential effects of soil liquefaction, we recommend the project structures be supported on concrete mat foundations. Mat foundations should be designed and constructed to accommodate the estimated potential total and differential seismic induced settlements presented herein. The requirements of the Methane Study report shall be incorporated into the design and construction of the project. A copy of the methane report is presented in Appendix C of this report.

Detailed geotechnical engineering recommendations addressing the surficial soils, site preparation, site earthwork, foundations and retaining walls are presented in the remaining portions of this report. The following opinions, conclusions, and recommendations are based on the properties of materials encountered in the geotechnical field investigations and laboratory test results.

A representative of GEO will need to provide observation and testing services during site earthwork and construction of foundations. This will allow us the opportunity to compare actual conditions with those encountered in the exploratory borings and, if necessary, to expedite supplemental recommendations if warranted by the exposed subsurface conditions. We shall also review the preliminary foundation and earthwork plans and specifications. Specifications for groundwater control and discharge, shoring and jet grouting shall also be reviewed by our office. These reviews will provide us an opportunity to detect misinterpretation or misunderstandings of our recommendations prior to advertising the project for construction.

8.2 Site Clearing

Prior to construction, all organic or inorganic materials shall be removed from the construction area and disposed of outside the site. Any existing structural or landscape elements within these areas, including any foundation elements, shall be demolished and removed from the site. Any utilities, whether active or inactive, shall be identified and removed from the site or relocated per project plans and specifications. Any cavities resulting from removal of any existing foundations or utility lines shall be properly backfilled and compacted in accordance with the following sections.

8.3 Groundwater Control During Construction

Dewatering from outside of excavations is not allowed. Continuous, solid impervious shoring extending below planned excavation depths, to act as a groundwater cut-off, is required for all excavations that extend more than 3 feet below the baseline groundwater level. Acceptable methods of impervious shoring include sheet piles, secant piles or diaphragm walls.

In addition, Jet grouting shall be performed to create a structural and watertight bottom seal beneath the wetwell/vault structure and diversion structure. Jet grouting can also be used to create a bottom seal for the sewer pipe that will be constructed between the new diversion structure and the auxiliary pumping plant wetwell and the 42-inch header pipe. The zones of jet grouting shall extend from the bottom of proposed excavation to an elevation of at least -35 feet (below sea level). Jetted grouted bottom seals shall be in-place prior to excavating below the baseline groundwater level.

Actual plan dimensions and depths of the jetted grouted bottom seals shall be designed by a specialty geotechnical contractor and endorsed by a Geotechnical Engineer or Engineering Geologist with at least five years of experience in groundwater control applications in excavations. Calculations supporting the design dimensions of the treatment areas shall be provided to demonstrate that the goals of the treatment will be fulfilled and that the treated areas will have adequate factors of safety against bottom heave and piping.

Carefully controlled dewatering, in combination with continuous impervious shoring functioning as a groundwater cut-off, may be used to control groundwater to facilitate construction of the 66-inch diameter reinforced concrete sewer pipe as an alternative to jet grouting. This method of dewatering can also be used to facilitate construction of the 42-inch header pipe. For this method, impervious shoring shall be installed to extend from the ground surface to an elevation of -25 feet (below sea level) or deeper. Dewatering wells shall be located within the shored excavations and shall be constructed with the well points above the bottom of the shoring. The dewatering system shall be designed, constructed and operated to lower the ground water level within the excavation to at least 3 feet below the bottom of the excavation without drawing down groundwater levels outside the excavations. Dewatering to below the planned depth of excavation shall be completed prior to excavating below the baseline ground water level. The drawn down groundwater level should be maintained at least three (3) feet below the bottom of excavations until construction has progressed above the surrounding static groundwater level and sufficient structural dead-load and backfill have been placed to counteract hydrostatic uplift pressures. Backfill may be assumed to have a unit weight of 105 (pcf) above groundwater. Submerged backfill may be assumed to have a buoyant unit weight of 42 pcf. Monitoring wells shall be installed outside of the excavations. The locations shall be approved by GEO. Groundwater recharge shall be performed as necessary to maintain groundwater levels outside of excavations at their natural levels.

Sump pumps shall be provided at the base of excavations which extend below the baseline groundwater level to facilitate removal of any water that seeps into the excavations through the shoring system.

Any groundwater pumped from excavations shall be discharged into nearby sanitary sewers and discharge rates into the sewers shall not exceed those allowed by the Bureau of Sanitation.

8.4 Temporary Sloped Excavations

Based on our observations during subsurface investigation and results of laboratory tests, the materials at the site should be readily excavated by conventional earthmoving equipment in good operating condition. All temporary excavations shall conform to the State of California Construction Safety Orders (CAL/OSHA).

In level areas, unsurcharged, temporary vertical excavations can be a maximum depth of four feet. Unsurcharged excavations greater than 4 feet, to a maximum of 8 feet, in level areas shall be sloped at a 1:1 (H:V) or flatter inclination from the ground surface to the bottom of the excavation or should be shored. Excavations greater than 8 feet should be shored.

Any excavation that enters the influence zone (imaginary plane extending downward at a 1:1 inclination) of an adjacent structure, private property or right-of-way subject to vehicle loading shall utilize shoring.

8.5 Excavation Support

8.5.1 Excavation Methods

Based on the available geotechnical data and construction experience in similar materials, it is anticipated that excavations can be achieved using heavy excavation equipment. The artificial fill and alluvium can be excavated with backhoes, clam shells, excavators, dozers, and other hydraulic equipment.

In sizing and laying out excavations, the Contractor must consider allowable construction limits shown on the Contract Drawings, requirements for construction of permanent structures (indicated on the Contract Drawings), as well as requirements for construction methods selected for the work. The following sections address excavation methods and support requirements.

8.5.2 Excavation Support Requirements

Excavations will require continuous support unless the soils are strengthened or stabilized by implementing an effective ground improvement technique. Acceptable excavation support systems for excavations that extend more than three feet below the baseline groundwater level include water-tight interlocking sheet piling, secant piles or diaphragm walls or other approved water tight shoring.

Dewatering or bottom seals placed "in the wet" are not permitted. The relatively water-tight excavation support systems shall extend a sufficient depth below the bottom of the planned excavations to prevent heave and/or piping of excavation bottoms. Design of the embedment depth of the water tight shoring below the base of excavations shall be based on the assumption that the extension is embedded in pervious granular soils with seashell lenses and layers. Ground treatment consisting of jet grouting below the excavation bottom is also required for the wetwell/valve vault structure and the diversion structure to further reduce groundwater in-flow and the potential for bottom instability. As an alternative to jet grouting, impervious shoring and dewatering in accordance with the recommendations of section 8.3 can be used to facilitate construction of the 66-inch diameter reinforced concrete sewer pipe and 42-inch header pipe. Calculations supporting the design of the shoring cut-off depth and depth of jet grouting below the excavation bottoms shall be included in the shoring submittal.

Shoring for excavations shall be installed in accordance with the General Requirements, the project specifications and Section 306-1.1.6 of the Standard Specifications for Public Works Construction (SSPWC), most current edition adopted by the Board of Public Works. Design of shoring shall be in accordance with Title 8, Division 1, Chapter

4, Subchapter 4 of the California Code of Regulations: CAL/OSHA Construction Safety Orders or the lateral earth pressure distributions recommended in the following section of this report. Based on the soil classification system presented in the Construction Safety Orders, the site soils shall be considered as Type C soils. All shoring systems shall be designed for maximum deflections of ½-inch.

Where bracing is used, each excavation sequence must be designed to allow removals of struts during construction of permanent facilities within excavations and as excavations are backfilled.

Sheet piles, if used shall be installed and extracted using vibration- and percussive-free methods. Coating should be applied to the sheet piles to prevent the soils from adhering to the sheet piles to facilitate removal of the sheet piles at the end of construction.

For secant pile shoring, casing or other methods approved by the geotechnical engineer of record shall be used to support the sides of pile excavations in the artificial fill and alluvial materials. The inside diameter of casing shall be at least as large as the diameter of the pile as indicated on the plans. Drilling shall be accomplished within the casing. Drilling fluids shall not be used to support the sides of the excavation without the review and approval of GEO.

All proposed shoring system designs including supporting documentation and calculations shall be submitted to GEO for review and approval in reference to existing soil conditions. All shoring systems must meet the following minimum requirements to be considered for review.

- Shoring shall directly support the sides of the excavation. Shoring shall be designed to minimize the development and presence of voids behind shoring support.
- Shoring installation procedures shall be designed so that no person is required to enter an unsupported excavation greater than 5 feet in depth at any time.

Trench box and shield systems are not allowed as shoring for the project. Trench box or shield systems do not adequately support the adjacent soil and utilities. Also, voids can occur between the outside of the box and the firm soil.

8.5.3 Design Earth Pressures

Temporary internally braced shoring shall be designed using a lateral soil equivalent fluid pressure of 48 pounds per cubic foot (pcf) above groundwater. Below groundwater, the design soil lateral earth pressure can be assumed to increase at a rate of 24 pcf for braced shoring. Cantilevered shoring shall be designed using an effective fluid pressure (EFP) of 36 pounds per cubic foot (pcf). Cantilevered shoring shall not be allowed in areas where existing utilities and structures are located within a 1:1 projection upward from the bottom of the planned excavation. Hydrostatic pressures shall be added to the

lateral earth pressures for the portions of shoring that extend below the baseline groundwater level. These design pressures assume level backslopes.

A surcharge load equivalent to an additional 2 feet of retained soil shall be applied to the upper 10 feet of shoring. The minimum surcharge load shall be 100 psf. Heavy construction equipment wheel or outrigger loads shall not be located within a distance equal to 0.7H feet the face of the shoring unless considered as surcharge loads in the Contractor's shoring calculations.

Allowable passive earth pressures equal to 150 pounds per square foot (psf) per foot of depth below groundwater and 300 psf per foot of depth above groundwater, measured below the base on the planned excavation, to a maximum value of 3,000 psf can be used for resistance in the alluvium materials.

8.6 Over-excavation

All existing fill materials shall be removed from the area of the proposed electrical building. This area shall be further excavated as necessary to a depth of seven feet below the existing ground surface or to three feet below the bottom of the proposed mat foundation, whichever is deeper. Over-excavation depths may have to be greater in some areas to remove unsuitable soils. Removal excavations should extend a horizontal distance beyond the edges of the foundations equal to the depth of over excavation below the foundations or a minimum of 5 feet, whichever is greater. All exposed subgrade soil surfaces shall be observed by a representative of the GEO and the City of Los Angeles Grading Inspector prior to placement of fill.

Shallow sump pumps may be necessary to control groundwater within the over-excavation area. The exposed soils in the over-excavation bottom may be susceptible to pumping. The contractor should take precautionary measures to avoid disturbance of the over-excavation bottom. Heavy construction equipment, such as trucks or rubber tired equipment should not be allowed to operate within the over-excavation area. Over-excavation should be accomplished with excavation equipment operating from outside the over-excavation area to the extent possible. With-in the over-excavation area, only low ground pressure equipment should be used to excavate, place and compact materials over the over-excavation bottom. Track-mounted equipment will lessen the softening of wet soils as a result of the "pumping" action of moving heavy wheel loads.

After over-excavating for the foundation of the electrical building, the following shall be performed;

- The exposed over-excavation bottom shall be observed by a representative of the GEO and the City of Los Angeles Grading Inspector. The bottom shall be smooth and uniform (free of ruts). If necessary, additional over-excavation shall be performed as directed by the GEO. If additional over-excavation isn't

necessary, the subgrade shall be prepared as directed by the GEO.

- Place a Geotextile fabric over the over-excavation bottom. The geotextile shall be placed in accordance with manufacturer's recommendations. The geotextile fabric shall be temporary extended up the excavation slopes. The geofabric shall comply with following minimum requirements: Density of 6 ounces per square yard or more, Grab Tensile Strength (ASTM D-4632) of 120 pounds, Grab Tensile Elongation (ASTM D-4632) of 50%, Trapezoidal Tear Strength (ASTM D-4533) of 50 pounds. No equipment should operate directly over the geotextile fabric.

- Place a 24-inch layer of 1-inch crushed rock over the entire over-excavated area. Densify the crushed rock using vibration and track walking. Cover the crushed rock with the geotextile fabric that was temporary extended up the slopes of the excavation. Use additional geotextile fabric to completely cover the crushed rock. Overlap all seams per the geotextile manufacturer's recommendations.

- Place an 8-inch layer of Crushed Miscellaneous Base (CMB) over the geofabric. The CMB shall be moisture conditioned and compacted to at least 95-percent relative compaction.

- If pumping is observed, additional base shall be placed in 6-inch lifts until pumping ceases.

- Once pumping ceases, place a geotextile fabric over the compacted base and place suitable fill materials in lifts of 8 inches or less in thickness (before compaction) to finish subgrade elevation (base on the methane mitigation system). Each lift shall be moisture conditioned and compacted as specified section 8.9 of this report.

Exterior slab-on-grade and any pavement areas, should be over-excavated to a depth of at least 12 inches below existing grade or the finish subgrade elevation, whichever is lower, and replaced with properly compacted fill. Removal excavations should extend a horizontal distance of at least 2 feet beyond the plan dimensions of slabs-on-grade or pavements.

8.7 Subgrade Preparation

All exposed subgrade soil surfaces shall be observed by a representative of the GEO and the City of Los Angeles Grading Inspector prior to placement of fill. If soft, yielding, or unsuitable soils are exposed at the subgrade surface, then the unsuitable soils should be removed and replaced with properly compacted fill soils. Due to the nature of the site soils and shallow groundwater levels, unsuitable soft wet soils will be encountered below the ground surface in some areas. If a suitable bottom is not

obtainable within a reasonable depth of the excavation subgrade elevation, supplemental recommendations will be provided during construction to stabilize areas of soft soils.

Subgrade surfaces suitable for fill placement should be scarified to a depth of 6 inches, moisture-conditioned and compacted. Subgrade soils shall be moisture conditioned to between optimum moisture content and 2 percent above the optimum moisture content, at the time of compaction, and compacted to a minimum of 95 percent of the ASTM Test Method D1557-91 laboratory maximum density to a depth of 6 inches. After the completion and acceptance of the subgrade preparation, fill material may be placed in accordance with Section 8.9 of this report. Subgrade soils shall be kept moist (between 0 and 2 percent above the optimum moisture content) but not flooded until covered with subsequent fill or construction.

8.8 Fill Materials

Fill soils shall consist of select on-site soils or approved import material. The on-site soils encountered during the geotechnical investigation are generally acceptable for use as fill material for this project. On-site clayey and silty soils (such as elastic silt encountered in boring RW-1 between 4 and 6 feet) may not be used as fill within the electrical building footprint, below slabs or behind retaining walls. Before being used as fill, on-site soils shall be cleaned of all organic or inorganic debris and all materials with any dimension larger than 3 inches. Drying of wet site soils or mixing of these soils with dryer soils may be required prior to being used as compacted fill. Import material for use as fill for this project shall be predominantly granular (minimum 80% passing number 4 sieve and 25% or less passing the number 200 sieve), non-expansive (EI less than 20), and shall be free of organic or inorganic debris, contamination and materials with any dimension larger than 3 inches. Import material shall be tested and approved by GEO prior to importing to the job site. GEO shall be notified a minimum of five working days prior to scheduled importing of soil to the project site.

8.9 Fill and Backfill Placement

Structural fill shall only be placed on approved surfaces/subgrades prepared in accordance with Section 8.7 of this report. Fill material shall be placed in loose lifts not exceeding 8 inches in thickness, moisture-conditioned between 0 to 2 percent over the optimum moisture content and mechanically compacted. Fill soils placed below building foundations or slabs-on-grade shall be compacted to a minimum of 95 percent relative compaction, as determined by ASTM Test Method D1557.

Fill soils placed in non-structural areas such as paved areas, sidewalks, and landscaped areas shall be compacted to a minimum of 90 percent relative compaction, as determined by ASTM Test Method D1557. Any aggregate base should be moisture-conditioned between optimum and two percent above optimum-moisture and compacted to a minimum of 95 percent relative compaction.

Fill compaction shall be tested and recorded by a certified compaction testing agency working under the direct supervision of GEO. Densification by flooding or jetting is not allowed. Compacted fill soils shall be kept moist, (at or slightly above the specified moisture content at the time of compaction) but not flooded, until covered with subsequent construction. If fill soils are softened or eroded by excessive moisture or construction disturbance, they shall be replaced or recompacted at the discretion of the Geotechnical Engineer before additional fill or construction is placed. Certification and inspection approvals for compromised soils are void and invalid.

8.10 Trench Backfill

Trench excavations for utility pipes may be backfilled with on-site soils under the observation of a representative of GEO. After utility pipes have been laid, properly bedded, and covered per the project specifications, they shall be backfilled to the ground surface or design subgrade with controlled backfill. Controlled backfill shall be moisture conditioned, placed and compacted in accordance with the recommendations presented in Section 8.9 of this report.

8.11 Liquefaction Considerations

Based on the data presented in Section 3 of this report and the results of the liquefaction calculations, potential liquefaction induced settlements on the order of 1-3/4 inches are estimated for the site. A potential liquefaction induced differential settlement of 1 inch is estimated between the proposed structures and the pipe header. These potential liquefaction induced settlements shall be considered and accounted for in the design and construction of the project.

8.12 Mat Foundations

Mat foundations are recommended for support of the project structures with the understanding that the foundations will be susceptible to liquefaction induced settlements. Mat foundations for the wetwell/valve structure and diversion structures shall be founded on natural soils that have been jet grouted to create an excavation bottom seal. The mat foundation for the electrical building shall be founded on compacted fill soil. Mat foundations shall be designed and constructed to bear at a depth of at least 24 inches below the lowest adjacent grade. Mat foundations can be designed for an allowable bearing capacity of 1,500 pounds per square foot. A coefficient of vertical subgrade reaction, for a 1-foot-square loaded area, of 100 kips per cubic foot (kcf) may be used for design of the mats.

Total static settlement of the proposed foundations, designed and constructed in accordance with the recommendations presented herein, should not exceed 1-inch. Differential static settlement should not exceed one-half of the total settlement. The majority of these settlements are expected to occur within a year of construction. In

addition, the foundation will also be potentially susceptible to seismically induced settlements. Potential total and differential seismically induced settlements of 1-3/4 inches or less and 1 inch have been estimated for the project structures. The structural design of the proposed structures should consider the possibility that the estimated magnitudes of seismically induced settlement could occur during the life of the structures. The actual magnitude of total and differential static settlements of the mat foundations will be a function of the structural design and stiffness of the mats.

Resistance to lateral loads can be provided by friction acting at the base of the foundation and by passive earth pressure. A coefficient of friction of 0.35 may be assumed with dead-load forces. An allowable passive lateral earth pressure of 250 psf per foot of depth up to a maximum of 2,500 psf may be used for sides of the foundation poured against undisturbed natural soil or properly compacted fill. The allowable passive pressure may be increased by 33 percent of lateral loading due to wind or seismic forces.

8.13 Retaining Walls

Cantilevered retaining walls that retain a level granular (sand equivalent of 30 or greater) non-expansive backfill for a horizontal distance equal to or greater than the height of the wall may be designed for an active equivalent fluid pressure of 30 pcf. Walls that are fixed against rotation (no movement allowed) supporting a level ground surface and retaining native soils or granular (sand equivalent of 30 or greater) non-expansive backfill for a horizontal distance equal to or greater than the height of the wall can be designed using at-rest uniform pressure of 27H psf. Hydrostatic pressures shall be added to the lateral earth pressures for the portions of retaining walls that extend below the baseline groundwater level. A lateral seismic load of 24 psf per foot of height starting from 0 at the base of the retaining walls and increasing to a maximum at the top of the retaining walls can be considered for seismic conditions.

In addition to the above lateral pressures from retained earth, lateral pressures from other superimposed loads, such as those from vehicle traffic and adjacent structures, should be added, if the loads fall within a 1:1 projection of wall foundations. The effects of any surcharge loads should be added to the above recommended lateral earth pressures.

Backfill behind retaining walls should consist of free-draining granular soil as described in Section 8.8. Backfill should be placed in 8-inch or thinner loose lifts and compacted to a minimum of 90 percent of the ASTM Test Method D1557 maximum density. Compaction should be performed by mechanical means only and monitored by testing during construction. Care should be taken not to damage walls during backfill operations. Concrete should attain the strength specified by the structural designer prior to placement of large quantities of backfill.

Earth pressures presented herein also assume that only hand operated compaction equipment will be used within five feet of walls to limit compaction lateral stresses. The operation of compaction equipment behind retaining walls can induce horizontal pressures in excess of the at-rest pressures on the wall. To help reduce the development of excessive horizontal pressures over-compaction should be avoided.

Earth pressures used in the design of the walls should be indicated on the retaining wall plans. All retaining wall designs and plans should be reviewed by the project geotechnical consultant to confirm that the appropriate soil parameters are used.

Final surface grades should be sloped at a gradient such that surface water drains away from structures and retaining walls.

8.14 Cement Type and Corrosion Measures

Based on the results of soluble sulfate content testing of near-surface soils and our understanding of the proposed improvements, GEO recommends that Type II or Type V cement be used. Based on other test results including pH, chloride content, acidity, and conductivity, the site soils are moderately to severely corrosive. A corrosion expert should make the final determination of what corrosion measures are necessary for the project.

9.0 SUPPLEMENTAL GEOTECHNICAL SERVICES

9.1 Review of Plans and Specifications

The grading and foundation plans and specifications should implement the recommendations presented in this report and should be reviewed by GEO to ensure proper interpretation and application of our recommendations.

9.2 Geotechnical Observation and Testing During Construction

All grading, excavation, and construction of foundations should be performed under the observation and testing of the Geotechnical Engineer at the following stages:

- Upon completion of site clearing;
- During shoring installation;
- During jet grouting;
- During site excavation;
- During subgrade preparation;
- During fill placement;

- After excavation of foundations and immediately prior to placement of foundation concrete;
- During excavation and backfilling of all utility trenches; and
- When any unusual or unexpected geotechnical conditions are encountered

10.0 Closure

If there are any questions regarding this report, please contact Patrick Schmidt at (213) 847-0535 or Fred Burnett at (213) 847-0523.

Subject: Data Report
Geotechnical Investigation for
Venice Auxiliary Pump Plant (VAPP)
133 E. Hurricane Street
Venice Area of Los Angeles, California
Contract No. C-121601, Work Order No. SZC 12923
GPI Project No. 2500.06I

Dear Mr. Johnson:

This report presents geotechnical data from a subsurface field investigation and laboratory testing performed by Geotechnical Professionals Inc. (GPI) for the subject project. The site location is presented in Figure 1.

SCOPE OF WORK

The scope of the geotechnical investigation presented in this report was developed by the Geotechnical Engineering Group (GEO) of the City of Los Angeles Department of Public Works, as outlined in Task Order Solicitation No. 14-103 and further updated by GEO staff. We understand that GEO will review the data from this investigation and will be responsible for geotechnical recommendations for the subject project, as the Geotechnical Engineer of Record.

The full scope of work under the subject task order included a geotechnical investigation and a methane investigation. This report presents the results of the geotechnical investigation only. A separate methane investigation was performed by GeoKinetics under subcontract with GPI. Their report was submitted on August 20, 2015.

The geotechnical field investigation included five cone penetration tests to depths ranging from 40 to 80 feet and three rotary wash borings to depths ranging from 40 to 80 feet. The locations of the subsurface explorations were selected by GEO and marked in the field with GPI on July 28, 2015. The approximate locations are presented in Figure 2. A detailed description of CPT field procedures and results, including graphical CPT logs with site-specific soil descriptions, tabular data summaries and shearwave velocity measurements are presented in Appendix A. Field procedures and logs of the rotary wash borings are presented in Appendix B.

5736 Corporate Avenue • Cypress, CA 90630 • (714) 220-2211 • FAX (714) 220-2122

Geotechnical laboratory testing, as requested by GEO, included the following types and number of tests:

- 19 Moisture and Density (ASTM D 2216)
- 8 Percent Passing No. 200 Sieve (ASTM D 1140)
- 16 Full Sieve Analyses (ASTM D 6913)
- 5 Atterberg Limits (ASTM D 4318)
- 1 Compaction (ASTM D 1557)
- 3 Consolidation Tests (ASTM D 2435)
- 8 sets Direct Shear Tests (ASTM D 3080)
- 2 Unconfined Compression (ASTM D 2166)
- 2 Unconsolidated Undrained Triaxial Test (ASTM D 2850)
- 1 Expansion Index (ASTM D 4829)
- 2 sets Corrosivity (California Test Methods 417, 422, 643)

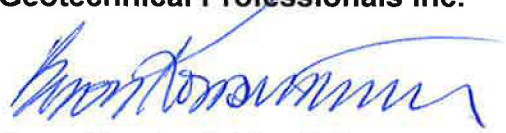
A detailed description of laboratory test procedures and results are presented in Appendix C.

CONCLUDING REMARKS

GPI warrants that the services covered by this report were performed as requested by GEO, in accordance with the standard procedures indicated, and with the standard of care of the geotechnical engineering profession in Southern California at this time. No other warranty or representation is included or intended in this report.

We appreciate the opportunity of offering our services on this project. Do not hesitate to call us if you have any questions on the contents of this report.

Respectfully submitted by,
Geotechnical Professionals Inc.



Byron Konstantinidis, G.E.

APPENDIX A

APPENDIX A

CONE PENETRATION TESTS

The subsurface conditions were investigated by performing five Cone Penetration Tests (CPT's) at the site. The soundings were advanced to depths ranging from 40.5 to 80.5 feet below existing grades. The locations of the CPT's are shown on the Site Plan, Figure 2. The latitude and longitude of each CPT location and distances from the northeastern and northwestern fences at the site are presented below:

CPT No.	Latitude	Longitude	Distance (feet)	
			from NE Fence	from NW Fence
C-1	33° 58' 34.44"	-118° 27' 40.62"	32	8
C-2	34.03"	40.33"	22	48
C-3	34.29"	40.89"	48	9
C-4	33.98"	40.67"	51	48
C-5	34.12"	41.13"	75	16

The Cone Penetration Test consists of pushing a cone-tipped probe into the soil deposit while simultaneously recording the cone tip resistance and side friction resistance of the soil to penetration (refer to Figure A-1). The CPT's described in this report were conducted in general accordance with ASTM specifications (ASTM D 5778) using an electric cone penetrometer.

The CPT equipment consists of a cone assembly mounted at the end of a series of hollow sounding rods. A set of hydraulic rams is used to push the cone and rods into the soil while a continuous record of cone and friction resistance versus depth is obtained in both analog and digital form at the ground surface. A specially designed truck is used to transport and house the test equipment and to provide a 30-ton reaction to the thrust of the hydraulic rams.

Standard data obtained during a CPT consists of continuous stratigraphic information with close vertical resolution. Stratigraphic interpretation is based on relationships between cone tip resistance and friction resistance. The calculated friction ratio (CPT friction sleeve resistance divided by cone tip resistance) is used as an indicator of soil type. Granular soils typically have low friction ratios and high cone resistance, while cohesive or organic soils have high friction ratios and low cone resistance. These stratigraphic material categories form the basis for all subsequent calculations which utilize the CPT data.

Computer plots of the reduced CPT data acquired for this investigation are presented in Figures A-2 to A-6 of this appendix. The field testing and computer processing was performed by Kehoe Testing and Engineering under subcontract to Geotechnical Professionals Inc. (GPI). The interpreted soil descriptions were prepared by GPI.

The CPT locations were laid out in the field by measuring from existing site features. Upon completion, the uncaved portions of the CPT holes were backfilled with bentonite chips.

Ground surface elevations at the CPT locations were estimated from Google Earth and should be considered very approximate.

The cone penetrometer used for the project was equipped with a pore pressure transducer to measure both transient and stabilized pore pressures. At selected depths in sandy soils, the penetration was stopped until stabilized pore pressures were obtained as an indication of the static piezometric groundwater levels. The piezometric measurements are summarized below.

CPT NO.	Depth (ft)	Static Pore Pressure (psi)	Piezometric Groundwater Depth (ft)
C-2	18.8	6.2±	4.5
C-2	37.7	13.9	5.6
C-3	21.5	7.0±	5.3
C-3	37.8	13.7	6.1

The cone penetrometer was also equipped with a tri-axial geophone set and impact source for obtaining shear wave velocity measurements versus depth in accordance with ASTM D 7400-08. Such measurements were obtained at 5-foot depth intervals in CPT C-4. The results of the measurements are summarized below:

Tip Depth (ft)	Geophone Depth (ft)	Travel Distance (ft)	S-Wave Arrival (msec)	S-Wave Velocity from Surface (ft/sec)	Interval S-Wave Velocity (ft/sec)
5.16	4.16	6.50	9.76	666.42	
10.05	9.05	10.34	16.54	625.11	565.65
15.07	14.07	14.93	25.47	586.26	514.29
20.10	19.10	19.74	34.62	570.29	525.86
25.22	24.22	24.73	41.43	596.93	732.32
30.13	29.13	29.56	54.58	541.52	366.94
35.14	34014	34.50	62.96	548.03	590.48
40.12	39.12	39.44	67.44	584.79	1101.35
45.06	44.06	44.34	71.58	619.49	1184.68
50.08	49.08	49.33	76.05	648.71	1116.61
55.01	54.01	54.24	81.35	666.76	925.83
60.04	59.04	59.25	86.39	685.86	994.13
64.98	63.98	64.18	90.14	711.95	1313.00
70.14	69.14	69.32	95.61	725.03	940.67
75.04	74.04	74.21	99.75	743.95	1180.70
80.11	79.11	79.27	103.41	766.54	1382.30

Notes:

1. Shear Wave Source Offset = 5 ft
2. S-Wave Velocity from Surface = Travel Distance/S-Wave Arrival
3. Interval S-Wave Velocity = (Travel Dist2-Travel Dist1) / (Time2-Time1)

APPENDIX B

APPENDIX B

EXPLORATORY BORINGS

The subsurface conditions at the site were investigated by drilling and sampling three rotary wash borings. The borings were advanced to depths ranging from 39.5 to 79.5 feet below the existing ground surface. The locations of the explorations are shown on the Site Plan, Figure 2. The latitude and longitude of each boring location and distances from the northeastern and northwestern fences at the site are as follows:

Boring No.	Latitude	Longitude	Distance (feet)	
			from NE Fence	from NW Fence
RW-1	33° 58' 34.48"	-118 27' 40.44"	7	11
RW-2	34.12"	40.71"	49	25
RW-3	33.73"	40.83"	75	68

Relatively undisturbed soil samples were obtained using two types of samplers. Thin walled Shelby tubes were used to obtain samples of relatively compressible silts and clays, in accordance with ASTM D 1587-08. The tubes were 30 inches long, had an inside diameter of 2.87 inches and an outside diameter of 3.00 inches. The Shelby tubes were pushed into the soils by hydraulic pressure. Thicker-walled, brass-ring lined samplers were used to sample mainly more granular soils and some cohesive soils, in accordance with ASTM D 3550-01. The sampler had an inside diameter of 2.42 inches and outside diameter of 3.25 inches. The sampler was driven into the soil using an automatic trip hammer weighing 140 pounds and dropping 30 inches. After seating the sampler into the soil 4 inches, the number of blows needed to drive the sampler 12 inches was recorded as the penetration resistance.

Relatively disturbed samples were also obtained using a split-spoon sampler by means of the Standard Penetration Test (SPT, ASTM D 1586-11). The spoon sampler was driven into the soil by a 140-pound hammer dropping 30 inches, employing the automatic trip hammer described above. The number of blows for each 6 inches of penetration was recorded and is presented on the logs. The blowcount for the first increment should be considered the seating blows while the sum of blows for the last 12 inches of penetration is considered the Standard Penetration Test blowcount. These values are the raw uncorrected blowcounts.

Bulk samples of the soils within the upper 4 feet were obtained with an auger at all boring locations.

The field explorations for the investigation were performed under the continuous technical supervision of GPI's representative, who visually inspected the site, maintained detailed logs of the borings, classified the soils encountered, and obtained relatively undisturbed samples for examination and laboratory testing. The soils encountered in the borings were classified in the field and through further examination in the laboratory in accordance with the Unified Soils Classification System. Detailed logs of the borings are presented in Figures B-1 to B-3 in this appendix. Laboratory test results of moisture content, density,

fines content (fraction passing No. 200 sieve) and Atterberg Limits are presented on the logs. For other laboratory tests, the type of test performed is shown with the following abbreviations:

CON – Consolidation Test
DS – Direct Shear Test
UC – Unconfined Compression Test
UU – Unconsolidated Undrained Triaxial Test

At selected depth intervals, soils were screened for organic vapors using a photo-ionization detector (Multi-Rae E-033). Organic vapors were not detected for any of the samples.

Upon completion of the borings, the boreholes were bailed (drilling mud removed) and groundwater level was measured. The boreholes were then backfilled with cement-bentonite grout to within approximately 2 feet from the ground surface and the balance was filled with soil. The grout was pumped from the bottom of the borehole up. Excess soil cuttings were placed in 55-gallon drums and hauled off site. The ground surface elevations at the exploration locations were estimated from a Google Earth and should be considered to be very approximate.

APPENDIX C

APPENDIX C

LABORATORY TESTS

INTRODUCTION

Representative undisturbed soil samples and bulk samples were carefully packaged in the field and sealed to prevent moisture loss. The samples were then transported to our Cypress office for examination and testing assignments. Laboratory tests were performed on selected representative samples as an aid in classifying the soils and to evaluate the physical properties of the soils affecting foundation design and construction procedures. Detailed descriptions of the laboratory tests are presented below under the appropriate test headings. Test results are presented on the boring logs and in the figures that follow.

MOISTURE CONTENT AND DRY DENSITY

Moisture content and dry density were determined from a number of the ring and Shelby tube samples. The samples were first trimmed to obtain volume and wet weight and then were dried in accordance with ASTM D 2216. After drying, the weight of each sample was measured, and moisture content and dry density were calculated. Moisture content and dry density values are presented on the boring logs in Appendix B.

COMPACTION TEST

A maximum dry density/optimum moisture test was performed in accordance with ASTM D 1557 on a representative bulk composite sample of the upper 4 feet of the on-site soils. The test results are graphically presented in Figure C-1 and summarized below.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	OPTIMUM MOISTURE* (%)	MAXIMUM DRY DENSITY* (pcf)
RW-1, -2, -3	0-4	Silty Sand with Gravel (SM)	9.0	125

Note: * includes rock correction

EXPANSION INDEX

One expansion index test was performed in accordance with D 4829 on a composite bulk sample, representative of the soils in the upper 4 feet of the site. The test results are presented below:

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	EXPANSION INDEX
Composite RW-1, 2,3	0-4	Silty Sand with gravel (SM)	0

ATTERBERG LIMITS

Liquid and plastic limits were determined for selected samples in accordance with ASTM D 4318. The results of the Atterberg Limits tests are presented in Figure C-2.

GRAIN SIZE DISTRIBUTION

A total of 24 soil samples were dried, weighed, soaked in water until individual soil particles were separated, and then washed on the No. 200 sieve. That portion of the material retained on the No. 200 sieve was oven-dried and weighed to determine the percentage of the material passing the No. 200 sieve. For 16 of the samples, the retained material was run through a standard set of sieves in accordance with ASTM D 422. The weight of soil retained on each sieve was recorded and the total dry weight was calculated. The grain size distribution data from the full sieve analyses is presented in Figures C-3 through C-8. A summary of the percentages passing the No. 200 sieve (ASTM D1140) is presented below.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	PERCENT PASSING No. 200 SIEVE
RW-1	32	Clayey Sand (SC)	49.8
	38	Gravelly Sand with Silt (SP-SM)	10.0
	43	Sand with Silt and Gravel (SW-SM)	9.8
RW-2	61	Sand with Silt and Gravel (SW-SM)	7.9
RW-3	8	Sand with Silt (SP-SM)	8.5
	10	Silty Sand (SM)	20.0
	15	Sand with Silt (SP-SM)	7.5
	20	Sand with Silt (SP-SM)	5.3

CONSOLIDATION

One-dimensional consolidation testing was performed on several undisturbed samples in accordance with ASTM D 2435. After trimming the ends, the samples were placed in the consolidometer and loaded to 0.25 or 0.4ksf. Thereafter, the samples were incrementally loaded to a maximum load of either 12.8 or 16 ksf. The samples were inundated at 0.4, or 0.5 ksf. Sample deformation was measured to 0.0001 inch. Rebound behavior was investigated by unloading the samples back to either 0.4 or 0.8 ksf. Results of the consolidation tests, in the form of percent consolidation versus log pressure, are presented in Figures C-9 to C-11.

DIRECT SHEAR

Direct shear tests were performed on remolded bulk samples and undisturbed samples in accordance with ASTM D 3080. The bulk sample was remolded to approximately 95 percent of maximum density (ASTM D1557). The samples were placed in the shear machine, and a normal load was applied. The samples were inundated, allowed to consolidate, and then were sheared to failure. The tests were repeated on additional test

specimens under increased normal loads. Shear stress and sample deformation were monitored throughout the test. The results of the direct shear tests are presented in Figures C-12 to C-19.

UNCOFINED COMPRESSION TESTS

Unconfined compression tests were performed on two samples of cohesive soils in accordance with ASTM D 2166. Detailed test results are presented in Figures C-20 and C-21.

UNCONSOLIDATED UNDRAINED TRIAXIAL TESTS

Unconsolidated undrained triaxial tests were performed on two samples of cohesive soils in accordance with ASTM D 2850. Detailed test results are presented in Figures C-22 and C-23.

SOIL CORROSIVITY

Soil corrosivity testing on samples from shallow depths was performed by AP Engineering and Testing. Test results are presented in Figure C-24 at the end of this appendix.

APPENDIX B

EXPLANATION OF BORING LOGS

VENICE DUAL FORCE MAIN
Los Angeles, California

MAJOR DIVISIONS		LTR	DESCRIPTION	MAJOR DIVISIONS		LTR	DESCRIPTION
COARSE GRAINED SOILS	GRAVEL	GW	Well-graded gravels or gravel-sand mixtures, little or no fines	FINE GRAINED SOILS	SILTS AND CLAYS LL<50	ML	Inorganic silts and very fine sand, rock flour, silty or clayey fine sands, or clayey silts with slight plasticity
		GP	Poorly-graded gravels or gravel-sand mixture, little or no fines			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		GM	Silty gravels, gravel-sand-silt mixtures			OL	Organic silts and organic silt-clays of low plasticity
		GC	Clayey gravels, gravel-sand-clay mixtures				
	SAND	SW	Well-graded sands or sand with gravel, little or no fines		SILTS AND CLAYS LL>50	MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		SP	Poorly-graded sands or sand with gravel, little or no fines			CH	Inorganic clays of hogh plasticity, fat clays
		SM	Silty sands, sand-silt mixtures			OH	Organic clays of medium to high plasticity
		SC	Clayey sands, sand-clay mixtures	HIGHLY ORGANIC SOILS		PT	Peat and other highly organic soils

SAMPLE COLUMN SYMBOLS

- Standard penetration test (SPT) sample
- Shelby tube sample
- Modified California split spoon sample
- Bulk sample
- P — Piston sample
- Continuous soil or rock core
- NR — No recovery

BLOWS/FOOT - Summation of blow counts for deepest 12 inches is sampling interval
RQD% - Rock quality designation in percent

DESCRIPTION COLUMN SYMBOLS

- Dashed lines separating soil strata represent inferred boundaries between sampled intervals or no recovery intervals and may be distinct or gradual transitions
- Solid lines represent distinct or gradual boundaries observed within sampled intervals
- Description right of bracket symbol represents soil conditions within the depth interval defined by the bracket length
- Description right of arrow symbol represents soil conditions to the next deeper boundary line unless otherwise noted
- Water level at time of drilling
- Water level after at least 12 hours from time of drilling

LABORATORY TEST ABBREVIATIONS

ATT	Atterberg Limits	CORR	Corrosion	S	Grain Size Analysis
COLL	Collapse Potential	DS	Direct Shear	SE	Sand Equivalent
COMP	Compaction	EI	Expansion Index	SG	Specific Gravity
CON	Consolidation	OC	Organic Content	TX	Triaxial Test
R	R-Value	PERM	Permeability	UC	Unconfined Compression Test
H	Hydrometer Test			#200	No. 200 Wash Sieve Analysis

NOTES

1. Soil descriptions are in accordance with the USCS as set forth by ASTM D2488 "Standard Practice for Description and Identification Soil (Visual-Manual Procedure)."
2. Soil color described according to Munsell Soil Color Chart. Rock color described according to Munsell Rock-Color Chart
3. Soil descriptions in these borings are generalized representations and based upon visual classification of cuttings and/or samples during drilling. Descriptions and related information in these borings depict subsurface conditions at the specific location and at the time of drilling only. Soil conditions at other locations may differ from conditions observed at the boring locations. Also, soil and groundwater conditions may change with time at these locations.

August 20, 2015

1.0 Introduction: GeoKinetics has completed a subsurface methane gas investigation at the proposed Venice Auxiliary Pumping Plant located at 133 Hurricane Street, in the City of Los Angeles. The location of the subject property is shown in Figure 1 while a recent aerial photograph of the site is provided as Figure 2. We understand that the proposed auxiliary pumping plant will consist of a wet well / valve vault, an electrical building and a diversion structure on the approximate 7,850 square foot property. The subject property is located in the Playa Del Rey Oil Field as it has been mapped by the California Department of Conservation, Division of Oil, Gas & Geothermal Resources (DOGGR). No oil wells are shown to exist at the property based upon our review of the DOGGR oil field map. The closest mapped oil well (Allied Petroleum Corp., "Rawco – Woodford", #1) is located approximately 55 feet southwest of the subject property. As a result, it is within a Methane Zone designated by LADBS. It will therefore be necessary to incorporate methane gas mitigation measures into the design of the proposed structures in accordance with LADBS requirements

Under the current building code, the nature and extent of the required mitigation measures are partially dependent upon the concentration and pressure of any methane gas that may be present at the site. The current investigation has been performed for the purpose of documenting the concentration and pressure of methane gas in the subsurface of the subject property such that appropriate mitigative improvements can be specified. This report presents the results of the subsurface gas investigation as well as associated methane mitigation recommendations in accordance with typical LADBS requirements.

2.0 Background: The presence of methane gas in the subsurface is common within former oil production areas and other locations where organic material - such as grass, leaves, wood, manure, etc. - are present in the soil. Biogenic methane is generated by the bacteriological digestion, or biodegradation, of organic matter in the absence of oxygen. Methane of thermogenic or petrogenic origin may also be present in surficial soils as a result of its upward migration from deeper oil and gas bearing zones. Our experience indicates methane gas is common and can be found in the soil at a relatively high percentage of building sites in southern California. Methane is not toxic, however it is combustible and potentially explosive at concentrations above 55,000 ppm in the presence of oxygen. This concentration is referred to as its Lower Explosive Level or LEL. Methane is lighter than air and therefore has a natural tendency to rise to the ground surface where it typically dissipates into the atmosphere. The presence of non-pressurized methane at shallow depths beneath the ground surface is normally not problematic. The rates at which the methane is generated and/or migrates towards the ground surface are slow enough such that the gas dissipates naturally under normal circumstances. However, as methane migrates to the ground surface, the

potential exists for its accumulation beneath slab-on-grade foundation systems or other relatively impermeable ground coverings. If the gas accumulates to high concentrations, and becomes pressurized, and a crack or other penetration is present in the floor slab of the structure, detectable levels of methane may enter the interior of the building. Improvements - such as sub-slab vent lines or gas membranes - are generally required by LADBS as a precautionary measure for new structures at Methane Zone sites.

3.0 Field Investigation: The field work associated with the methane gas investigation at the subject property included the installation and monitoring of five (5) multi-stage subsurface gas probes. The locations of these gas probes are shown in Figure 2. The subsurface gas probes were installed on August 6th, 2015 and they were subsequently monitored on August 7th and 11th, 2015. The gas probes were installed using 6" hollow stem auger drilling equipment. A schematic illustrating the general configuration of the gas probes is provided as Figure 3. The LADBS guidelines require that individual sampling tips be installed at depths of 5, 10, and 20 feet below the lowest floor level of the proposed structures. However, based on the known groundwater depth of approximately 8 feet bgs, probes were proposed to be installed on site at depths of 2, 5 and 7 feet bgs. Per LADBS guidelines, five shallow probes would be installed at a depth of 5' bgs and then two deeper probes would be installed at the two locations with the highest methane readings. However, in order to save time and reduce costs, all five borings were advanced to 8' bgs and probe tips were installed at 2, 5 and 7' bgs in each of the five borings. All five borings were logged in the field under the supervision of a registered engineering geologist. Copies of the boring logs for this project are included as Attachment A for your reference. As indicated, the upper four to five feet primarily consisted of moist fine grained sands. Clay, silty-clay and sandy estuarine deposits were noted just below the fine grain sands in each boring.

The sampling tips of the current installation were embedded within a 12-inch interval of washed Monterey #3 sand. Bentonite clay seals were placed above and below each sand interval in order to isolate the gas sampling tips. Gas tight quick connect fittings were installed on the ends of the polyethylene tubing at the ground surface in order to seal the probes between monitoring events. Flush-mounted vaults were installed at the ground surface to protect the installations.

As discussed previously, the installations were monitored on August 7th and 11th, 2015. All monitoring was performed during periods of falling barometric pressure. The subsurface gas pressure relative to atmospheric, and the concentrations of methane, oxygen, and carbon dioxide, were measured in the subsurface probes during each monitoring event. The monitoring equipment that was utilized and the associated detection limits, or resolutions, are summarized in Table 1. As indicated, subsurface gas pressures were

measured to the nearest 0.05 inches of water prior to each sampling event using a Magnahelic gauge while the barometric pressure was measured and recorded to the nearest 0.1 inches of mercury using a digital barometer. The gas probe methane, oxygen, and carbon dioxide concentrations were measured in the field using a portable, methane specific, LandTec GEM2000-Plus infra-red gas analyzer. A volume of gas equivalent to approximately ten times that of the ¼-inch diameter polyethylene gas probe tube was extracted through the LandTec GEM2000-Plus during the monitoring process. Steady state readings were generally obtained after approximately two tubing volumes of gas had been extracted. The highest methane reading displayed in each instance was recorded. The LandTec GEM2000-Plus was calibrated at the beginning and the end of each day of monitoring using a certified mixture of 15% methane, 15% carbon dioxide, and 70% nitrogen calibration gas (Note: all gas concentrations referred to in this report are on a volumetric basis). A Photovac Flame Ionization Detector (FID) was used to confirm combustible gas levels at selected probes where sufficient oxygen was present in the probe to operate the FID. The gas levels measured with both detectors were found to be consistent. Combustible gas concentrations in excess of 450 ppm were not detected with the FID.

Ambient gas levels in the air four feet above the ground surface were recorded at the site periodically during the monitoring. In each instance, the measured gas level fell within the following range:

Gas	Measured Range
Methane	<0.1%
Carbon Dioxide	<0.1%
Oxygen	20.8% – 20.9%

4.0 Results: The pressures and concentrations measured in each of the subsurface gas probes during the monitoring events are summarized in Table 2. As indicated, three of the 7' deep probe tips were flooded with water during the monitoring events. Also as indicated, the highest methane gas detection on site was 1,000 ppm (0.1%) at 5 feet bgs at probe P-5. Methane gas was not detected at any of the other gas probe installations. The site FID readings ranged from 0 to 449 ppm for the probes with enough oxygen to record a reading. This is consistent with the LandTec GEM2000-Plus readings.

The soil gas pressures measured in the gas probes range from 0.00 to 0.50 inches of water. This pressure range is normal and consistent with normal

barometric variations. There was no indication of elevated soil gas pressures associated with methane generation or migration.

The concentration of oxygen in the atmosphere at sea level is approximately 21%. The subsurface oxygen levels were found to be slightly to moderately depressed below typical atmospheric levels at each of the gas probe installations. The lowest subsurface oxygen level recorded at the site was 2.5% while the average oxygen concentration measured in the gas probes was approximately 14.6%. The average concentration of carbon dioxide in the atmosphere at sea level is approximately 0.03%. Subsurface carbon dioxide levels were slightly to moderately elevated above typical atmospheric levels in each of the gas probes. The highest carbon dioxide concentration measured at the site was 3.2% while the average carbon dioxide concentration measured in the gas probes was approximately 1.3%. The slightly to moderately depressed subsurface oxygen levels and slightly to moderately elevated carbon dioxide levels suggest residual organic matter entrained within the near surface soils is being biodegraded under aerobic conditions.

Based upon the measured methane levels and the corresponding soil gas pressures, we conclude the property should be classified as a Level II site with a Design Methane Pressure of #2" of water in accordance with LADBS guidelines. A copy of the LADBS methane testing compliance form for this project is included as Attachment B for your reference.

As discussed previously, the property is shown to be located within a Methane Zone. The following primary methane mitigation measures are typically required by LADBS for new Level II slab-on-grade structures within the methane zone:

1. **Sub-Slab Vent System:** A series of perforated vent lines and an associated 2" thick gravel blanket must be installed beneath the floor slab of the proposed structure. The perforated vent lines are connected to solid vent piping that extends through the walls or pipe chases of the building to outlets above the roof line. A dewatering system (sump and pump) must be installed if the design high groundwater level for the project is not at least one foot below the lowest vent piping elevation. A dewatering system is not necessary for on-grade structures for this project. However, structures that extend below approximately 5’ bgs will likely need either a dewatering system, or be constructed hydrostatically. If the hydrostatic option is selected, a modification from LADBS will likely be required in order to remove the sub-slab venting system requirement.

2. **Impervious Membrane:** A continuous gas membrane is required below the floor slab of the structures. This membrane must be sealed against footings, pilings, and utilities to form a gas-tight barrier beneath the buildings.

3. **Utility Trench Dams:** A section of impervious backfill consisting of compacted native soil or sand / cement slurry must be installed in utility trenches that extend beneath the perimeter of the buildings in order to prevent methane gas from migrating beneath the structure through sand bedding or backfill.

4. **Conduit Seals:** Gas tight seals must be installed on all conduits (e.g. electrical, cable T.V., telephone, etc.) that extend to the interior of the structure. The purpose of these seals is to prevent methane gas from entering subsurface cracks or discontinuities in the conduits and subsequently migrating to the interior of the buildings.

There are exceptions in the City Methane Ordinance (Ordinance No. 175790) that allow some of the requirements outlined above to be omitted, or modified, under certain conditions. These possible exceptions should be considered as the building plans are developed in order to determine the specific mitigative measures that will be required for the project.

5.0 Closing: This investigation has been performed with the degree of skill and care ordinarily exercised by engineers practicing in this, and similar, localities. No other warranty, expressed or implied, is given regarding the conclusions or professional opinions presented in this report. The scope of this report is limited to the matters expressly covered herein. This report is presented for the sole use of the Geotechnical Engineering Group and may not be relied upon by any other party without written authorization from GeoKinetics. All recommendations, findings, and conclusions presented in this report are based upon facts and circumstances as they existed at the time this report was prepared. A change in any fact or circumstance upon which this report is based may necessitate re-evaluation and/or modification of the recommendations, findings, and conclusions presented herein. Due to the nature of this type of investigation, uncertainty exists with respect to the subsurface conditions that are present between boring / sampling locations. The subsurface methane concentrations at the site could vary over time and may change in response to site modifications. The methane levels identified in this report represent the concentrations that were measured at the time of the

current investigation. Higher or lower concentrations could occur in the future. If the level of inherent uncertainty is unacceptable, additional sampling and/or testing should be considered.

We hope this information is helpful to you. Please do not hesitate to contact the undersigned if you have any questions or comments.

Sincerely,
GEOKINETICS, INC.

Methane Gas Investigation Compliance Certificate

FORM 1 - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA

Part 1: Certification Sheet

Site: Venice Auxiliary Pumping Station Project

Address: 133 East Hurricane Street, Los Angeles, California.

Legal Description: APN # 4225008904

Building Use: Auxiliary Pump Station

Name of Engineer:	Kevin J. Lea GeoKinetics	**Registered Civil / Soil Engineer Stamp:**
Mailing Address:	77 Bunsen Irvine, CA 92618	
Telephone:	(949) 502-5353	
Testing Laboratory:	GeoKinetics License # 10234	

REGISTERED PROFESSIONAL ENGINEER
KEVIN J. LEA
NO. C- 67844
EXP. 6-30-17
CIVIL
STATE OF CALIFORNIA

I hereby certify that I have tested the above site for the purpose of methane mitigation, and that all procedures were conducted by a City of Los Angeles licensed testing agency in conformity with the requirements of the LADBS Information Bulletin P/BC 2002-101. Where the inspection and testing of all or part of the work above is delegated, full responsibility shall be assumed by the licensed engineer or geologist whose signature is affixed thereon.

Signed: _____ **Date:** 8-20-15

Required Data:

- Project is in a *METHANE ZONE*
- Depth to ground water observed during testing was: 7-8 feet below existing ground surface.
- Depth of Historical High Ground Water Table Elevation* is ~5 ft below existing ground surface.
- Design Methane Concentration**: 1,000 parts per million in volume (ppmv).
- Design Methane Pressure***: ≤ 2 inches of water column.
- Methane Design Level: II

De-watering:

- De-watering is Required for all construction below approximately 5' bgs. This condition can be potentially removed using a hydrostatic design under LADBS modification.
- Pump discharge rate N/A gallons per minute.
- Reference geology or soil report: N/A

Additional Investigation:

- Additional investigation was Not conducted.

Latest Grading on Site:

- Date of last grading on site was: Years ago
- Explanation of the effect on soil gas survey results by grading operations: N/A
- Building Excavation: Not Yet Initiated

Notes:

* Historical High Ground Water Table Elevation Shall mean the highest recorded elevation of ground water based on historical records and field investigations as determined by the engineer for the methane mitigation system.

** Design Methane Concentration shall mean the highest recorded measured methane concentration from either shallow soil gas test or any gas probe set on the site.

*** Design Methane Pressure shall mean the highest total pressure measured from any Gas Probe Set on the site.

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities. For efficient handling of information internally and in the internet, conversion to this new format of code related and administrative information bulletins including MGD and RGA that were previously issued will allow flexibility and timely distribution of information to the public.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound

(or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

COV: Coefficient of variation
Source: Nationwide Urban Runoff Program (US EPA 1983)

Results from NURP indicate that there is not a significant difference in pollutant concentrations in runoff from different urban land use categories. There is a significant difference, however, in pollutant concentrations in runoff from urban sources than that produced from non-urban areas.

The pollutants that are found in urban storm water runoff originate from a variety of sources. The major sources include contaminants from residential and commercial areas, industrial activities, construction, streets and parking lots, and atmospheric deposition. Contaminants commonly found in storm water runoff and their likely sources are summarized in Table 4-2.

Table 4-3. Typical Pollutant Loadings from Runoff by Urban Land Use (lbs/acre-yr)

Land Use	TSS	TP	TKN	NH_3-N	NO_2+NO_3-N	BOD	COD	Pb	Zn	Cu
Commercial	1000	1.5	6.7	1.9	3.1	62	420	2.7	2.1	0.4
Parking Lot	400	0.7	5.1	2	2.9	47	270	0.8	0.8	0.04

As indicated in Table 4-3, urban storm water runoff can contain significant concentrations of solids, nutrients, organics and metals. A comparison of the concentration of water quality parameters in urban runoff with the concentrations in domestic wastewater is shown in Table 4-4.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

NOTICE OF EXEMPTION

(Articles II and III – City CEQA Guidelines)

Submission of this form is optional. The form shall be filed with the County Clerk, 12400 E. Imperial Highway, Norwalk, California, 90650, pursuant to Public Resources Code Section 21152(b). Pursuant to Public Resources Code Section 21167(d), the filing of this notice starts a 35-day statute of limitations on court challenges to the approval of the project.

LEAD CITY AGENCY AND ADDRESS: Bureau of Engineering
1149 South Broadway, Suite 600, Los Angeles, CA 90015.

COUNCIL DISTRICT
11

PROJECT TITLE:
GRAND CANAL WEST BANK EROSION CONTROL PROJECT (SZS11485)

LOG REFERENCE
T.G. P.671, H7 TO J7; p.701, J1.

PROJECT LOCATION: Within the public right-of-way at selected street-ends along the western bank of Grand Canal (Esplanade)--Anchorage, Driftwood, Eastwind, Fleet, and Galleon Streets, along with the terminus of Grand Canal Esplanade at Ballona Lagoon (B/G). All six sites lie upstream of and to the north-northwest from Ballona Lagoon, in the community of Venice, City of Los Angeles, California 90292.

DESCRIPTION OF NATURE, PURPOSE, AND BENEFICIARIES OF PROJECT: This project will restore eroded slopes and gullies at six locations along the west bank of Grand Canal (Esplanade), five street ends and the terminus at Ballona Lagoon. At each of the repair sites, non-native vegetation will be removed and then replaced with native, intertidal and coastal strand vegetation. Native vegetation will be planted to help restore intertidal coastal wetland habitat along the canal at the impacted sites. Work scope also includes the repair/reconstruction of the storm drainpipes and outlets, curbs and gutters, street resurfacing, the installation of new catch basins, and the re-installation of the street end, barrier fences. At the southern end of Grand Canal Esplanade, work will also include reconstruction of protective riprap and re-filling of the washed-out void under the existing sidewalk foundation structure. This project will protect the adjacent street and improve public safety for residents, recreational users of the canal walkways (Grand Canal Esplanade), as well as students of a nearby public, magnet school, and their parents.

☐ GENERAL EXEMPTION	Art. II, Sec. 1	Sec. 15061(b)(3)
☒ CATEGORICAL EXEMPTION*	Art. III, Sec. 1 Class 2	Sec. 15302
☒ CATEGORICAL EXEMPTION*		Sec. 15333
☐ STATUTORY*	Art. _____	Sec. _____

* See Public Resources Code Sec. 21080 and set forth state and city guidelines provisions.

JUSTIFICATION FOR PROJECT EXEMPTION: The project involves repair or reconstruction of an existing facility, or topographical feature, necessary to maintain service essential to the public health, safety or welfare. The reconstructed canal bank will be constructed of like materials, and be located in the same place as the original. The structure will also have substantially the same purpose, capacity and height as the structure being replaced. In addition, the structure abuts an existing officially designated environmentally sensitive habitat area. The project will maintain protection of wildlife habitat, or wildlife resources through removal of debris from sensitive habitat. There will be negligible or no expansion of use. Moreover, this project also serves as a small-scale habitat restoration project of less than 5 acres, designed to restore intertidal habitat along the Grand Canal. No exceptions to this categorical exemption were found (Section 15300.2).

CATEGORICAL EXEMPTION NARRATIVE

I. PROJECT DESCRIPTION

This project will restore eroded slopes and gullies at six locations along the west bank of Grand Canal (Esplanade), five street ends and the terminus at Ballona Lagoon (Photos 1 to 4). Native vegetation will be planted to restore intertidal coastal wetland habitat along the canal at the impacted sites. Work scope also includes the repair/reconstruction of the storm drainpipes and outlets, curbs and gutters, street resurfacing, the installation of new catch basins, and the re-installation of the street end, barrier fences. At the southern end of Grand Canal Esplanade, work will also include reconstruction of protective riprap and re-filling of the washed-out void under the existing sidewalk foundation structure. At each of the repair locations, non-native vegetation will be removed and then replaced with native, intertidal and coastal strand vegetation. This project will protect the adjacent street and improve public safety for residents, recreational users of the canal walkways (Grand Canal Esplanade), as well as students of a nearby public, magnet school, and their parents.

II. PROJECT HISTORY

Previous CEQA and Coastal Act Findings: There have been no CEQA action or Coastal Permit applications for this particular project. However, there have been previous plans and projects, designed to rehabilitate, or restore the banks of the Grand Canal.

The Grand Canal is part of a designated, Environmentally Sensitive Habitat Area (ESHA); the Venice Canals (North) and Ballona Lagoon (South) are also included within this designated area. The Grand Canal and its banks was also the object of an ecological restoration plan (PSOMAS 2007); south of Washington Street, a small portion of the east bank of Grand Canal has also been restored based upon that restoration plan (Ferren, 2008). Habitat restoration projects along the east and west banks of Ballona Lagoon have been completed. The southerly portion of Ballona Lagoon's west bank will be restored as part of a future, separate project.

Prior to preparation of the ecological restoration plan, the City proposed a project in 2001, designed to remediate erosion problems along Grand Canal (CDP 5-01-289 and CDP A-5-VEN 01-279). The entire canal was to be temporarily drained during construction, including extensive dredging of sediments and planting of native vegetation. A Mitigated Negative Declaration was prepared (BE-097-01), and a Mitigation Monitoring Program was approved. The project was delayed, then eventually cancelled, based upon a court injunction, filed against the California Coastal Commission and the City (500524, June 25, 2002).

A project to repair sluice gates at the Venice Pumping Plant would have involved construction of a temporary bypass pipeline along the Grand Canal Esplanade (A5-VEN-07-397). A Mitigated negative Declaration and Mitigation Monitoring Program (BE 033-07) was prepared. The Mitigation Program included habitat restoration work along the

Grand Canal, between Driftwood Street and Hurricane Street. This project was later cancelled, but subsequent projects were completed.

A project to rehabilitate a portion of the Grand Canal along the East bank, from Washington Street to Driftwood Street was completed in 2009 (CDP VEN 5-09-035). At the end of Hurricane Street, similar (catch basin, restoration, curb and gutter) work was recently completed; within the Grand Canal, a seawall, outlet and reconstruction of an existing sewer maintenance-hole structure were part of the project (CDP waiver VEN 5-12-068-W. Both projects were exempt from CEQA as the projects involved reconstruction of existing facilities, or restoration of habitat components.

This project has been evaluated for compliance with the *Environmental Quality Act.*

III. ENVIRONMENTAL REVIEW: Replacement or reconstruction of existing structures and facilities where the new structure will be located on the same site as the structure replaced and will have substantially the same purpose and capacity as the structure replaced is Categorically Exempt under Class 2 (CCR 15302). However, State CEQA Guidelines (CCR Sec 15300.2) limit the use of Categorical Exemptions in special circumstances. The applicability of Guidelines Section 15300.2 is discussed in the following:

1. Location: Categorical Exemption Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may be significant in a particularly sensitive environment. Therefore, these classes are considered to apply to all instances, except where the project may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.

The proposed project is exempt under Class 2 and 33. Therefore, this exception has no application here.

2. Cumulative Impact: This exception applies when, although a particular project may not have a significant impact, the cumulative impact of successive projects of the same type in the same place, over time is significant.

Other nearby facility improvement projects have been recently constructed, are under construction as of October 2013, or are planned for the future:

- Ballona Lagoon Phase IIIa, West Bank Restoration (recently constructed).
- Ballona Lagoon Phase IIIb, West Bank (planned).
- Ballona Lagoon, East Bank, Fencing (recently constructed).
- Grand Canal Maintenance Access Hole at Hurricane Street (recently constructed).
- Marina Channel Tide Gate Rehabilitation (post construction).
- Venice Dual Force Main (planned).

- Venice Pumping Plant Manifold (under construction).
- Via Dolce Park (planned).
- Washington Boulevard at Venice Canals, Culvert Rehabilitation (planned).

The cumulative impacts of these projects are to protect and enhance sensitive habitat, as well as to improve public health and safety. Thus, this exception has no application here.

3. Significant Effect: This exception applies when, although the project may otherwise be exempt, there is a reasonable possibility that the project will have a significant effect due to unusual circumstances. Examples include projects that may affect scenic or historical resources.

The City CEQA Thresholds Guide provides that project would normally have a significant impact on biological resources if it could result in (among other things) the loss of individuals, or the reduction of existing habitat, of a state or federal listed endangered, threatened, rare, protected, or candidate species, or a Species of Special Concern or federally listed critical habitat.

Eight state or federal listed endangered, threatened, rare, protected animal species have been recorded in the vicinity of the Grand Canal and the nearby Ballona Lagoon. Listed animals included six avian, one mammal and one insect species.

Two avian species- California brown pelican (*Pelecanus occidentalis californicus*) and California least tern (*Sterna antillarum browni*) - have been observed foraging at Ballona Lagoon. Brown pelicans also forage in the Grand Canal. The least tern nests within a protected (fenced) nesting site, located on Venice Beach, 1.5 km (0.95) miles to the southwest.

Four other listed avian species- the western snowy plover (*Charadrius alexandrinus nivosus*), Belding's savannah sparrow (*Passerculus sandwichensis beldingi*), California black rail (*Laterailus jamaicensis coturniculus*), and coastal California gnatcatcher (*Polioptila californica californica*) have not been recently observed in the vicinity at Ballona Lagoon. The coastal California gnatcatcher is associated with the coastal sage scrub community, which is not present within the project area. The Belding's savannah sparrow (*Passerculus sandwichensis beldingi*) is present in the Ballona Wetlands, south of the Marina Channel and Ballona Creek. The wetlands are located about 1.1 miles to the south of the Project Site. However, the Belding's savannah sparrow is not known to occur at or near the project site.

Two other species are listed: a mammal and an insect. The Pacific pocket mouse (*Perognathus longimembris pacificus*) has been historically collected in narrow coastal sites, such as Playa Del Rey and Pacific Palisades, but not the Ballona Lagoon area. The El Segundo Blue Butterfly (*Euphilotites battoides allyni*) has not been recorded at Ballona Lagoon, and its host plant, sea-cliff buckwheat (*Eriogonum parvifolium* Swith.) is not present at or near the project site.

No state or federal listed endangered, threatened, rare, protected plant species are present within the project boundaries. However, four California Native Plant Society-listed sensitive species have been found within, or recorded in the vicinity, of project. These include wooly sea-blight (*Suaeda taxifolia* (Standley) Standley), red sand verbena (*Abronia maritima* S. Watson), and south coast saltbush (At*riplex pacifica* Nelson). Wooly sea-blight is found in the intertidal zone, and is scattered along the margin of both the Grand Canal and Ballona Lagoon, the nearest being 50 feet south of the MH. Red sand verbena was previously recorded along Ballona Lagoon's eastern bank, but has not been observed since 2003. South coast salt bush was observed along the Grand Canal in 2002, but also has not been observed since the previous survey. The fourth sensitive species is a dune plant, Orcutt's Pincushion (*Chaenactis glabriuscula* DC var. *orcuttiana* (E. Greene) H. Hall), which occurs on the west bank of Ballona Lagoon. Yet, no dune habitat occurs within the project area.

With the bank susceptible to severe erosion at the street ends, intertidal habitat is currently open to disturbance, thus potentially causing the loss of individual plants and animals, and subsequently leading to the degradation of sensitive habitat. The project will restore protection of sensitive habitat. Therefore, this exception has no application here.

4. Scenic Highway: This exception applies when a project may result in damage to scenic resources within a duly designated state scenic highway.

The proposed project is not within sight of any designated scenic highway, and will not affect any resource within sight of any designated scenic highway. Thus, this exception has no application here.

5. Hazardous Waste Site: This exception applies when a project is located on a site listed as a hazardous waste site under Government Code Section 65962.5.

As of October 31, 2013, the State Department of Toxic Substances Control has not listed any site within one mile of the project area. So this exception has no application ere. (Ref. Envirostor at www.envirostor.dtsc.ca.gov)

6. Historical Resources: This exception applies when a project may cause a substantial adverse change in the significance of a historical resource.

The Venice Canal system is part of the Venice Canal Historic District (Federal Monument No. 2370), and the Grand Canal itself (City Monument No. 270) to north of Washington Boulevard is also considered an historic resource. However, the proposed project is located south of Washington Boulevard, and is within neither the historic district, nor the historic monument. This project will restore the sidewalk and bank along parts of the the Grand Canal, and add will add run-off control measures to protect them from damage in the future. The sidewalks and bank are not contributing features to any historic resource. Therefore, this exception has no application here.

Photos 1-4: Project Site locations along Grand Canal Esplanade- (1) Anchorage Street; (2) Driftwood Street; (3) Fleet Street; and, (4) Ballona Lagoon at Grand Canal Esplanade.

NOTICE TO CONTRACTORS

1. SPECIFICATIONS : ALL WORK SHALL CONFORM TO THE LATEST EDITION AND SUPPLEMENTS OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION ADOPTED BY THE BOARD OF PUBLIC WORKS OF THE CITY OF LOS ANGELES AS MODIFIED BY THE CORRESPONDING ISSUE OF THE CITY OF LOS ANGELES, DEPARTMENT OF PUBLIC WORKS ADDITIONS AND AMENDMENTS TO THE STANDARD SPECIFICATIONS AND TO THE SPECIAL PROVISIONS AND THE "BROWN BOOK".
2. THIS IMPROVEMENT CONSISTS OF WORK CALLED FOR ON THESE PLANS ONLY.
3. ADVANCE CONSTRUCTION NOTICE SIGNS:
   SIGNS FOR GIVING ADVANCE NOTICE TO MOTORISTS OF TRAFFIC DISRUPTION SHALL BE FURNISHED AND PLACED AS A PART OF THIS PROJECT IN ACCORDANCE WITH STANDARD PLANS S-610 AND S-791-1. INFORMATION TO BE PLACED ON SIGNS TO BE PROVIDED AT PRE-CONSTRUCTION MEETING.
4. INSPECTION: ALL WORK AND MATERIALS ARE SUBJECT TO INSPECTION PURSUANT TO SECTION 2-11 OF THE STANDARD SPECIFICATIONS. CALL (213) 580-5080 BEFORE NOON OF THE WORKING DAY BEFORE THE DAY INSPECTION IS REQUIRED.
5. THE CONTRACTOR IN CONFORMANCE WITH LOS ANGELES CITY ORDINANCE NO. 150478 SHALL POTHOLE EXISTING SUBSURFACE INSTALLATIONS CARRYING UNSTABLE SUBSTANCES TO DETERMINE THEIR LOCATIONS AND ELEVATIONS PRIOR TO COMMENCING EXCAVATION.
6. THE CONTRACTOR IS REMINDED TO GIVE REASONABLE NOTICE TO THE OWNERS OR OCCUPANTS OF THE PROPOSED IMPROVEMENT FRONTING THEIR PROPERTY, PER SECTION 7-10 OF THE STANDARD SPECIFICATIONS AND STANDARD PLAN S-610. NOTICE CONTENTS WILL BE PROVIDED BY THE ENGINEER.
7. THE CONTRACTOR SHALL PREPARE AND SUBMIT SHOP DRAWINGS IN ACCORDANCE WITH THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, SUBSECTION 2-5.3, "SHOP DRAWINGS AND SUBMITTALS". THESE SHOP DRAWINGS AND SUBMITTALS SHALL INCLUDE, BUT NOT BE LIMITED TO, THE FOLLOWING:
   A. TEMPORARY COFFERDAM.
   B. TRAFFIC CONTROL PLAN.
   C. UTILITIES SUPPORT PLAN.
   D. TEMPORARY PLUG.
   E. NEW GATE & OPERATOR.
   F. SEE SPECIAL PROVISIONS FOR OTHERS.
8. ANY ASPHALT OR CONCRETE PAVEMENT, CURB, GUTTER OR OTHER STRUCTURES, INCLUDING UTILITIES THAT WERE REMOVED TO ACCOMMODATE CONSTRUCTION SHALL BE REPLACED OR RELOCATED IN A CONDITION EQUAL TO OR BETTER THAN THAT REMOVED TO THE SATISFACTION OF THE ENGINEER AT NO ADDITIONAL COST TO THE CITY.
9. THE CONTRACTOR SHALL COMPLY WITH CONSTRUCTION SAFETY ORDER OF CAL/OSHA.

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

VAPP – Baseline Noise Measurements

Introduction

ARCADIS has completed a baseline noise measurement study for the VAPP Preliminary Design Project. This memo represents a summary of the community ambient noise levels surrounding the proposed project site during non-construction hours. For measurement locations, please refer to Figure 1: Aerial Image Showing Noise Measurement Locations.

Noise Measurement Equipment

The following equipment was used in the field to measure existing ambient baseline noise levels:

- Larson Davis – Model 831 Sound Level Meter with Pre-Amp and Microphone
- Larson Davis – Model CA200 Microphone Calibrator
- Windscreen and Tripod

The sound level meter was field-calibrated prior to and following each noise measurement to ensure accuracy. In accordance with industry standards, the sound level measurements were made with a sound

level meter that conforms to the American National Standards Institute (ANSI) specifications for sound level meters ANSI SI.4 1983 (R2006). All instruments are maintained with the National Bureau of Standards traceable calibrations.

Noise Measurement Methodology

To document the existing ambient noise conditions within the vicinity of the project site during non-construction hours, noise monitoring was conducted with a sound level meter at four separate locations. At each location, data was collected for a continuous 30-minute time period. The noise measurements were conducted during the quiet evening hours between 4:00 p.m. to 6:00 p.m. on Thursday, April 23rd, 2015. For a summary listing of the baseline noise measurement results, please refer to Table 1 below. For a complete set of the raw baseline noise measurement data, please refer to Attachment 1.

Table 1. Summary Results of Baseline Noise Measurements

Location	L_{eq} (dBA)	L_{max} (dBA)	L_{min} (dBA)	L_{90} (dBA)
1	47.9	63.8	41.2	44.2
2	48.6	65.6	42.2	44.1
3	50.1	73.9	44.2	46.0
4	53.0	66.5	44.4	51.2

Please review this memo at your earliest convenience. If you have any questions concerning this project, please contact Kevin Fowler at kevin.fowler@arcadis-us.com.

Sincerely,

Kevin Fowler, INCE
Project Acoustical Scientist

Trip Generation Memorandum & Parking Memorandum

FEHR PEERS

MEMORANDUM

Date: October 3, 2016

To: Gilbert Ruiz, ICF Inc.

From: Netai Basu

Subject: ***Parking Assessment – Venice Auxiliary Pumping Plant Project***

LA15-2780.00

Fehr & Peers has prepared this technical memorandum to summarize the results of a parking utilization analysis for the proposed Venice Auxiliary Pumping Plant project (VAPP) located in the Ballona West neighborhood in Los Angeles, California. This memorandum describes the existing parking supply and utilization in the vicinity of the project site, and analyzes whether there is sufficient existing parking supply for the VAPP in the vicinity of the project site. This memorandum is presented in four sections. First, we describe the project background and related projects. Next, we describe the data collection efforts. We then present the existing utilization and parking assessment for the VAPP project site and we discuss the parking implications for the surrounding neighborhood. We finally summarize the parking assessment for this project.

PROJECT BACKGROUND

The City of Los Angeles owns and operates the Venice Pumping Plant (VPP) near the Ballona Lagoon and Grand Canal. The VPP is the largest of the City's five pumping stations and is considered a critical facility to convey sewage from the tributary area, as there are currently no diversions to bypass the pumping plant. The facility collects sewage from the coastal areas of the City through one existing 48-inch pipeline (force main) and transports it south to the Hyperion Treatment Plant in Playa Del Rey.

During periods of heavy rain, the facility has almost exceeded capacity and has had multiple simultaneous pump failure. As such, system redundancy is needed. The Venice Auxiliary Pumping Plant (VAPP) project is intended to provide additional, dependable pumping capacity to accommodate peak wet-weather flows. Figure 1 displays the project site within the surrounding neighborhood.

Figure 1 – VAPP Project Location Map

Source: ICF. 2016

RELATED PROJECTS

Venice Dual Force Main Project

A second 54-inch pipeline, known as the Venice Dual Force Main Project (VDFM), is planned for construction to convey flows from VPP and VAPP to a discharge vault nearly two miles to the southeast near the intersection of Vista Del Mar & Gills Street. To minimize impacts to the surrounding community, streamline construction activities, and minimize overall project cost, the City is planning to schedule construction of the VAPP immediately following completion of the VDFM project. Construction of the VDFM is anticipated to begin in January 2017. Although work on the overall VDFM project will continue until December 2019, construction in the vicinity of Hurricane Street is scheduled to be completed by the end of 2017.

Manifold Project

Construction of the VPP manifold connecting the existing VPP and proposed VDFM project within Hurricane Street was completed in August 2015. With the Venice manifold in place, both the VPP and VAPP will be able to tie-in, thereby forming one system with one control facility.

DATA COLLECTION

Parking utilization surveys were conducted bi-hourly from 8:00 AM to 10:00 PM near the project site on a typical weekend day and a typical weekday (Saturday, September 12 and Thursday September 17, 2015). These days were selected to represent typical weekend and weekday conditions and because they do not fall on street sweeping or trash collection days. The local street sweeping schedule varies by street but parking is generally restricted on Mondays or Tuesdays from 10:00 AM to 12:00 PM. Trash collection occurs on Fridays.

Counts were collected of on-street public parking and one off-street public lot in a study radius of approximately 0.3 mile around the project site. The number of available parking spaces for each roadway segment or lot was inventoried at the beginning of data collection efforts. Parking utilization was separated between unrestricted parking and any restricted parking for a given location. The only time-restricted parking within the vicinity of the project site is the metered spaces located along Strongs Drive between Anchorage Street and Washington Boulevard, while the remaining spaces are only restricted per their respective scheduled street-sweeping and trash collection days.

Figure 2 identifies the parking supply for the VAPP project site. For unmarked, on-street spaces, the number of spaces was estimated by measuring the available curb space and assuming an average length of 22.5 feet per vehicle, unless occupancy surveys showed a higher occupancy on a particular block.

VAPP PROJECT SITE PARKING ANALYSIS

The proposed VAPP site is located in the Marina Peninsula neighborhood just west of the Venice Grand Canal, on the northeast corner of Hurricane Street and Canal Court. The area surrounding VAPP is a mix of predominantly single-family and multi-family residential. Washington Boulevard, located approximately 0.3 mile north of the project site, serves as the nearest and primary commercial corridor.

Parking within the community is predominantly unrestricted, publicly available and on-street. Several streets serve primarily as pedestrian walkways, linking the Grand Canal to the beach. A City-owned off-street parking lot is located on the northwestern edge of the study area, at the terminus of Washington Boulevard. It includes a total of 364 parking spaces (329 regular, 26 extended spaces for recreational vehicles and nine spaces designated for disabled parking). Hurricane Street, where the VAPP site is located, also contains restricted on-street parking. Once construction begins, Hurricane Street will be permanently closed to traffic between Esplanade and Canal Court. This will result in the loss of five on-street parking spaces. Additionally, the segment of Canal Court adjacent to the project site will be temporarily closed during the construction period; however, parking is prohibited there.

The Venice Pumping Plant currently requires two employees per 8-hour shift (three shifts over a 24-hour period) and two parking spaces are located within the VPP site. Once VAPP becomes operational, this staffing level will remain unchanged. Thus VAPP/VPP would require up to four parking spaces at the peak time, when shift changes occur. Per the Venice Specific Plan and the Venice Local Coastal Program Land Use Plan, the project must also provide one space for Beach Impact Zone parking. The proposed project will construct eight off-street parking spaces at 128 Hurricane Street, which will fully satisfy the need for replacement parking (five spaces), employee parking (four spaces including the existing two off-street employee spaces within the VPP), and the one new space required as Beach Impact Zone parking.

As shown in Table 1 and Table 2, there are an estimated 763 publicly available parking spaces in the survey area, including 399 publicly available on-street spaces and 364 spaces at the public parking lot. This also includes eight time-restricted parking spaces and 391 unrestricted parking spaces. We divided the study area by zones, as shown in Figure 3 and Figure 4 to better summarize the peak period weekend and weekday occupancy data:

- Zone 1 – Parking capacity within 700 feet of the project site
- Zone 2 – Parking capacity from 700 to 1,000 feet of the project site.
- Zone 3 – Parking capacity from 1,000 to 1,700 feet of the project site
- Zone 4 – Public parking lot located at the western terminus of Washington Boulevard

Table 3 and Table 4 illustrate parking occupancy for the entire 14-hour data collection period for the weekend and weekday, organized by zone. Figure 3 and Figure 4 illustrate the peak-period occupancy rates by zone on a typical weekend day and weekday, which is discussed further below.

As shown in Figure 3, the weekend peak utilization by zone for the surveyed parking near the project site, observed from 4:00 to 6:00 PM on Saturday September 12, 2015, shows that the on-street spaces are almost fully occupied:

- Zone 1 – 97% of spaces utilized, with three spaces available
- Zone 2 – 95% of spaces utilized, with eight spaces available
- Zone 3 – 99% of spaces utilized, with one space available
- Zone 4 – 71% of spaces utilized, with 106 spaces available

Figure 4 displays the weekday peak utilization by zone for the surveyed parking near the project site, observed from 2:00 to 4:00 PM on Thursday September 17, 2015 as follows:

- Zone 1 – 79% of spaces utilized, with 22 spaces available
- Zone 2 – 71% of spaces utilized, with 48 spaces available
- Zone 3 – 81% of spaces utilized, with 24 spaces available
- Zone 4 – 44% of spaces utilized, with 204 spaces available

Based on this analysis, the available parking supply near the VAPP site is sufficient under normal circumstances to replace the five spaces that would be removed from Hurricane Street as part of the proposed project. Within approximately 1,000 feet of the VAPP site, at least 70 spaces are available during the weekday peak period and at least 11 spaces are available during the busier weekend peak period.

SUMMARY AND CONCLUSIONS

The planned VAPP project, located in the Marina Peninsula neighborhood in Los Angeles, California, is intended to provide additional pumping capacity to the existing VPP. Parking utilization surveys were conducted in the neighborhood around the project site over a typical weekday and a typical weekend day at 2-hour intervals.

During the 2-year construction period of the VAPP, the loss of the five existing parking spaces from Hurricane Street between Canal Court and the Grand Canal would temporarily reduce the parking supply in the project vicinity. This will affect the convenience of drivers seeking to park, by reducing the total supply of on-street parking in the neighborhood around the VAPP site, although the total on-street parking in the vicinity could still accommodate these vehicles. During peak times on peak summer weekend days, weekdays and holidays, however, it is recognized that parking utilization is higher than what was observed on the survey dates. On those days the loss of these on-street spaces could result in a small increase in vehicles circling through the neighborhood as they seek available parking.

Upon project completion, the on-street parking on Hurricane Street east of Canal Court would be fully replaced off-street at 128 Hurricane Street. In addition, the proposed VAPP project, together with the existing VPP facility, would provide four employee parking spaces, sufficient to accommodate its needs, as well as one additional space as required for Beach Impact Zone parking. Thus, upon completion the project would result in one additional parking space in the project vicinity.

FEHR PEERS

MEMORANDUM

Date: October 3, 2016

To: Gilbert Ruiz, ICF Inc.

From: Netai Basu

Subject: ***Trip Generation Analysis – Venice Auxiliary Pumping Plant Project***

LA15-2780.00

This technical memorandum summarizes the results of a trip generation analysis for the proposed Venice Auxiliary Pumping Plant project (VAPP). This memorandum includes several sections. The first section provides the project background, a description of related infrastructure projects, and construction information for the proposed VAPP project. That is followed by a description of the street system in the vicinity of the project. Estimates of construction-period and permanent trip generation are made and their significance assessed. The memorandum concludes with a summary of the key conclusions.

PROJECT BACKGROUND

The City of Los Angeles owns and operates the Venice Pumping Plant (VPP) near the Ballona Lagoon and Grand Canal. The VPP is the largest of the City's five pumping stations and is considered a critical facility to convey sewage from the tributary area, as there are currently no diversions to bypass the pumping plant. The facility collects sewage from the coastal areas of the City through one existing 48-inch pipeline (force main) and transports it south to the Hyperion Treatment Plant in Playa Del Rey. The Venice Auxiliary Pumping Plant (VAPP) project is intended to provide additional, dependable pumping capacity to accommodate peak wet-weather flows.

The proposed VAPP site is located in the Ballona West neighborhood just west of the Venice Grand Canal, on the northeast corner of Hurricane Street & Canal Court. The area surrounding VAPP is a mix of predominantly single-family and multi-family residential. Washington Boulevard, located approximately 0.4 mile north of the project site, is the nearest commercial corridor. Figure 1 displays the project site within the surrounding neighborhood.

Figure 1 – VAPP Project Location Map

Source: ICF. 2016

RELATED PROJECTS

Venice Dual Force Main Project

A second 54-inch pipeline, known as the Venice Dual Force Main Project (VDFM), is planned for construction to convey flows from VPP and VAPP to a discharge vault nearly two miles to the southeast near the intersection of Vista Del Mar & Gills Street. To minimize impacts to the surrounding community, streamline construction activities, and minimize overall project cost, the City is planning to schedule construction of the VAPP immediately following completion of the VDFM project. Construction of the VDFM is anticipated to begin in January 2017. Although work on the overall VDFM project will continue until December 2019, construction in the vicinity of Hurricane Street is scheduled to be completed by the end of 2017.

Manifold Project

Construction of the VPP manifold connecting the existing VPP and proposed VDFM project within Hurricane Street was completed in August 2015. With the Venice manifold in place, both the VPP and proposed VAPP will be able to tie-in, thereby forming one system with one control facility.

EXISTING STREET SYSTEM

Below is a brief description of the major streets serving the proposed project site. Sidewalks are generally available in the vicinity of the project area. Table 1 displays the operational characteristics of the local street system.

- Canal Court – Canal Court is a short undivided alleyway that runs between Driftwood Street to the north and the Ballona Lagoon to the south. Parking is not permitted along Canal Street.

- Galleon Street – Galleon Street is a short undivided local street that runs east/west between Pacific Avenue and Esplanade, just west of the Venice Canal/Ballona Lagoon. Parking is permitted on both sides of the street, though some restrictions are present along several properties.

- Hurricane Street – Hurricane Street is a short undivided local street that runs east/west between Ocean Front Walk and Esplanade, just west of the Venice Canal/Ballona Lagoon. The street terminates adjacent to the project site and parking is permitted on both sides of the street.

- Lincoln Boulevard (SR 1) – SR 1 is an arterial street that runs north/south in the study area and it generally provides four travel lanes. Metered parking is available on both sides of the street and the speed limit is 35 MPH.

- Marquesas Way – Marquesas Way is a short 4-lane secondary street that runs east/west and connects Via Dolce and Via Marina. Parking is permitted on the east side of the street and the speed limit is 25 MPH.

- Pacific Avenue – Pacific Avenue is a 2-lane secondary arterial that runs north/south between Barnard Way to the north and Via Marina to the south. Between Washington Boulevard and Hurricane Street, parking is restricted along the east side of the street but it is unrestricted on the north side. The posted speed limit within this segment is 30 MPH.

- Via Marina – Via Marina is a 4-lane street that runs north/south between Washington Boulevard and Pacific Avenue. No parking is allowed on either side of the street and the speed limit is 40 MPH.

- Via Dolce – Via Dolce is a secondary arterial that runs north/south between Washington Boulevard and Marquesas Way. It includes two northbound lanes and one southbound lane, plus bicycle lanes. Parking is allowed on both sides of the street and the speed limit is 35 MPH.

- Washington Boulevard – Washington Boulevard is a Major Highway Class II arterial street that runs east/west between Venice Beach and the City of Whittier. It generally provides four travel lanes plus bicycle lanes. Metered parking is generally available on both sides of the street. The speed limit is 35 MPH.

The City of Los Angeles allows major and secondary arterials to be used as truck routes. The City's policy is to allow trucks to also travel in a "reasonable fashion" to and from a work site, including over collector and local streets.

EXISTING TRANSIT SYSTEM

Transit service within the study area is provided as follows:

- Metro Lines 108 and 358 operate on Pacific Avenue between Via Marina and Washington Boulevard and along Washington Boulevard between Pacific Avenue and Palawan Way. The lines run between Marina del Rey and Pico Rivera, with Line 358 providing limited stop service during the peak periods.
- Culver City Bus Line 1 provides service on Washington Boulevard between Venice and the West Los Angeles Transit Center.
- Commuter Express Line 437 is operated by LAODT and runs on Via Dolce and Pacific Avenue in the project area. This line runs between Marina del Rey and downtown Los Angeles.

PROJECT TRAFFIC PROJECTIONS – CONSTRUCTION-PERIOD

The traffic projections for the proposed project were developed using three steps: estimating the trip generation of the project, determining trip distribution, and assigning the project traffic to the roadway system. The information used in this analysis was provided by the Los Angeles Bureau of Engineering (LABOE) and the project team.

Construction of the project is planned to begin in March 2018 and is expected to take approximately two years to complete, ending in 2020. The construction involves several key phases, which may overlap, as described below:

1. Stages 1-2: Mobilization, Site Preparation, and Excavation – three to four months (155 days), including approximately two to three months of soil hauling;
2. Stage 3: Pump Station Foundation/Electrical – nine to 10 months;
3. Stage 4: Diversion Structure – four to six months; and
4. Stages 5-6: Pump Station Integration/Finishing – two to four months.

Construction activities will be limited to the hours from 8:00 AM to 6:00 PM on weekdays and Saturdays. No construction is permitted on Sundays and holidays. Soil trucks are proposed to be at the project site only between 9:00 AM and 4:00 PM. The use of the pile driver, grader and jackhammer construction equipment would only occur between 9:00 AM to 3:30 PM. Workers would park at an off-site location and be shuttled to and from the project site each work day. While no specific off-site location has been identified at this time, it would likely lie within five miles of the project site. The selected contractor would be required to identify and secure a suitable location. Worker shuttles are generally expected to depart the site between 5:00 and 6:00 PM. On days when soil export is occurring, workers would all be on-site before soil trucks begin

to arrive and would remain on-site until after the last soil export truck departs. Table 2 presents the estimated vehicle trip generation at the project site during the analyzed peak hours and on a typical weekday.

Soil Haul Trucks

Figure 1 shows the three laydown areas that will be used during construction for material and equipment storage: Laydown Area 1 is at 128 Hurricane Street, Laydown Area 2 occupies two County-owned properties at 3819 and 3821 Via Dolce that lie directly east of the VAPP site across the Grand Canal, and Laydown Area 3 is a City-owned property at 9940 Jefferson Boulevard in Culver City. Peak hauling activity is anticipated to occur during Stages 1 and 2 when the site preparation and excavation occur and during Stage 3, when soil will be needed to backfill the site once the major infrastructure is in place. It is anticipated that the site excavation would involve the removal of approximately 10,000 cubic yards (CY) of earth over a 2- to 3-month period during Stages 1 and 2. Approximately 2,300 CY would be stockpiled at Laydown Area 1 and approximately 7,700 CY would be transported off-site and stockpiled at Laydown Area 3. It is expected that approximately half of this soil (3,850 CY) will be returned to the project site and used as backfill. Upon project completion, the remaining 3,850 CY of soil stockpiled at Laydown Area 3 would be exported to an area landfill, such as Sunshine Canyon. These activities are estimated to generate up to 24 truckloads of soil per day. This equates to 48 1-way trips (24 inbound, 24 outbound) on the peak days of activity. Applying a Passenger Car Equivalent (PCE) factor of 2.0 for these heavy trucks to account for their influence on the traffic stream (that is, they occupy additional road space and have different operating capabilities compared with passenger cars), these 48 1-way trips would be 96 1-way PCE trips.

The capacity of soil hauling trucks used is expected to be seven CY or 10 CY. If each truck were to carry seven CY of soil and, the 10,000 CY of export soil would require a total of approximately 1,430 truckloads or 2,860 1-way trips. The larger trucks would require approximately 1,000 truckloads or 2,000 1-way trips. Of this, approximately 1,540 or 2,200 1-way truck trips would occur between the project site and Laydown Area 3 to export 7,700 CY of soil, the difference being whether trucks used have a capacity of seven CY or 10 CY. Under the scenario which includes return of up to half of that soil as backfill at the project site, an additional 770 to 1,100 1-way truck trips would occur.

To account for the possibility of less-than-full loads, soil expansion or other factors, as many as 35% more total soil-hauling truck trips may be required, yielding estimates of up to approximately 2,970 or 2,080 1-way truck trips to export soil (with seven or 10 CY trucks) and up to 1,486 or 1,040 1-way truck trips to import soil (with seven or 10 CY trucks).

Equipment and Delivery Trucks

In addition to soil haul trucks, the project would generate equipment and delivery truck trips during each phase of construction. Such trips are estimated to be two per day (four PCE trips per

day) and could include cranes, bulldozers, excavators, and other large items of machinery. These materials would be delivered to the site and stored on-site.

Construction Employees

The number of construction workers would vary throughout the construction period. During Stages 1 and 2 and Stage 4, approximately eight workers would be on-site each day. Stage 3 would require up to 20 workers on-site daily. Stages 5 and 6 would require approximately six workers per day. Parking for all construction workers will be provided off-site and they would be transported to/from the project site by 10- to 15-passenger shuttles or vans. The off-site location for workers traveling to the site via shuttle is currently unknown but is assumed to be within five miles and lie south of the project site.

Construction Period Trip Generation Estimates

Based on the aforementioned information, a construction period trip generation analysis was conducted to estimate daily peak PCE trips. It was found that the soil hauling during Stages 1 to 3 would generate the highest number of daily trips to and from the site. During the initial phase, as shown in Table 2, a maximum net increase of 104 daily 1-way PCE trips is estimated to and from the site, composed of 48 1-way soil truck trips, four 1-way delivery trips and two 1-way worker shuttle trips. During Stage 3, up to 58 daily vehicle trips would occur, composed of 48 1-way soil truck trips, four 1-way delivery trips and four 1-way worker shuttle trips, as shown in Table 2. Considering the PCE factor of 2.0 for the truck trips, this stage of construction would result in up to 108 daily PCE trips. The soil hauling trips would be spread across the day and are estimated to occur at up to three loads per hour (six 1-way trips). Employee shuttle trips would occur before soil hauling activities begin each day, and after they end. As such, site-generated traffic would be quite low during the weekday AM and PM peak hours.

Potential Haul Routes

Trucks traveling to and from the site will use a specific haul route, which will be defined once the storage site for the export soil has been definitely identified. Laydown Area 3 is a City-owned property at 9940 Jefferson Boulevard. Access to Laydown Area 3 would follow Hurricane Street, Canal Court, Galleon Street, Pacific Avenue, Washington Boulevard, Lincoln Boulevard, and other streets such as Slauson Avenue, Sepulveda Boulevard and Jefferson Boulevard. The final haul route will be selected in consultation with LADOT and Culver City.

NEIGHBORHOOD STREET IMPACTS

This section assesses the likelihood of potential traffic impacts from construction activity on local streets within the study area. The City of Los Angeles has established threshold criteria to determine significant traffic impacts of a proposed project in its jurisdiction. Although the methodologies and the criteria to calculate volume-to-capacity (V/C) ratios for intersections are intended by LADOT to identify potential traffic impacts during operation, they can also be applied to construction periods.

Under the City of Los Angeles guidelines, a project would be considered to significantly impact a local residential street if the projected increase in daily traffic volumes is as follows:

Projected Average Daily Traffic with Project (Final ADT)	**Project-Related Increase in ADT**
0 to 999	120 or more
1,000 to 1,999	12% or more of final ADT
2,000 to 2,999	10% or more of final ADT
3,000 or more	8% or more of final ADT

Based on these guidelines, VAPP construction activity would not result in any significant traffic impacts on study area streets because the maximum number of daily project trips is estimated to be 108 1-way trips, which is below the minimum threshold volume considered significant.

PROJECT IMPACT ANALYSIS – OPERATIONAL PERIOD

Once VAPP becomes operational, site-generated traffic is not expected to change. The current staffing level, two employees at all times, working in three eight-hour shifts each day, will be maintained. Thus, no additional traffic would be generated the impact would be considered less than significant.

CMP AND FREEWAY ANALYSIS

2010 Congestion Management Program (CMP) for Los Angeles County (Metro, July 2010) provides procedures for conducting transportation impact analyses for the regional transportation system. The CMP requires that when an environmental impact report is prepared for a project, traffic and transit impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use these facilities. The CMP guidelines require that the first issue addressed is the determination of the geographic scope of the study area. The criteria for determining the study area for CMP arterial monitoring intersections and for freeway monitoring locations are:

- All CMP arterial monitoring intersections where the proposed project will add 50 or more trips during either the AM or PM weekday peak hours of adjacent street traffic.
- All CMP mainline freeway monitoring locations where the proposed project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.

The CMP arterial monitoring intersection nearest to the project site is located at Lincoln and SR 90. Based on the project trip generation previously presented, the proposed project would not add more than 50 vehicles per hour (vph) at any CMP monitoring intersections during the peak hours, nor more than 150 1-way trips on a CMP freeway monitoring station. Thus, no further CMP analysis is required and these impacts are considered less than significant.

SUMMARY AND CONCLUSIONS

Fehr & Peers conducted a trip generation assessment for the VAPP Project to evaluate the potential for the project to significantly impact traffic conditions, according to the City's adopted thresholds of significance. The key findings and conclusions of the study are summarized below:

- Construction of the proposed project would occur in six stages, which would result in temporary increases in traffic at the site for approximately 24 months between 2018 and 2020. The greatest number of daily trips would occur during Stages 1 and 2 when soil would be excavated from the site and exported, and in Stage 3 when a portion of it would be returned to the site as backfill. During each of these stages, an estimated 24 truckloads of soil would be taken from or delivered to the site per day.

- PCE factors were applied to the estimated number of soil and delivery truck trips to develop project trip generation estimates with PCE, and the estimated PCE trips were used in the traffic impact analysis. Trip generation estimates included employee trips, delivery truck trips and soil hauling truck trips. It is estimated that construction of the proposed project would generate up to 104 1-way daily PCE trips at the project site during Stages 1 and 2 and up to 108 1-way daily PCE trips during Stage 3. Daily trips during Stages 4 through 6 would be considerably lower.

- Traffic impacts during construction were found to be less than significant, based on the volume of traffic generated.

TABLE 1
EXISTING SURFACE STREET CHARACTERISTICS

Subject: Phase I Environmental Site Assessment
128 Hurricane Street
Venice, California 90292

Dear Mr. Lee:

In general accordance with our proposal dated April 8, 2016, Ninyo & Moore has performed a Phase I Environmental Site Assessment of the above-referenced site. The attached report presents our methodology, findings, opinions, and conclusions regarding the environmental conditions at the site. We appreciate the opportunity to be of service to you on this project.

Sincerely,
NINYO & MOORE

EXECUTIVE SUMMARY

Ninyo & Moore conducted a Phase I Environmental Site Assessment (ESA) of the approximately 3,400 square-foot property at 128 Hurricane Street in the community of Venice, Los Angeles, California (site; Figure 1). Ninyo & Moore was contracted by Brown and Caldwell to conduct this assessment on behalf of the City of Los Angeles (the user) in general accordance with our proposal dated April 8, 2016. Historical research, document review, and site assessment activities were conducted in April and May, 2016. In general, the following items were noted.

- The site is assigned the Los Angeles County Assessor's Parcel Number (APN) 422-5010-016. Based on the environmental lien search, the site is currently owned by Sharon R McQueen and Daniel P Whalen Trustees of McQueen-Whalen Revocable Trust, and is not occupied.

- The site has not been developed with structures from at least 1928 through the time of this report.

- The area surrounding the site was developed with oil production facilities from at least 1938 through 1952, and with residential properties from at least 1963 through the time of this report. The Venice Pumping Plant appeared adjacent to the east of the site by at least 1963.

- The site address was not listed on searched environmental databases.

- Site access was not granted; therefore, a site reconnaissance was conducted from public rights-of way. This is considered a significant physical limitation and data gap. Two groundwater monitoring wells were observed on Hurricane Street, adjacent to the north and northeast of the site. One pole-mounted transformer was observed adjacent to the east of the site.

- To date, Ninyo & Moore has not received an owner questionnaire from the site owners, Sharon R McQueen and Daniel P Whalen Trustees. This is considered a data gap. If information from the completed owner questionnaire is received that alters the conclusions and recommendations of this report, an addendum will be prepared.

- According to the State of California, Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR) well finder website, a historical oil production well is present on the site (McDonald 2, API 03713842). Based on a review of documents provided by the user, the "McDonald 2" well was abandoned in 1932. A permit to re-abandon the well was issued in 2002 and renewed annually from 2004 to 2008. According to DOGGR, the well has not been re-abandoned. This represents a REC.

- According to the ZIMAS website, the site lies within a methane zone. This is considered a REC.

- Based on a review of documents provided by the user, a geotechnical investigation conducted on the site in 2006 found two concrete vaults and concentrations of petroleum hydrocarbons in the upper 2 feet of soil at up to 6,500 parts per million (ppm). Records indicating the removal, mixing, stockpiling, testing, and/or disposal of the contaminated soil were not found. This is considered a REC.

- Based on historical research and results of the Vapor Encroachment Screening Matrix (VESM) conducted by Ninyo & Moore, a VEC is likely to currently exist beneath the site.

- Off-site concerns were not observed based on historical documents review.

Ninyo & Moore has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 of the property at 128 Hurricane Street in the community of Venice, Los Angeles, California, the site. Any exception to, or deletions from, this practice are described in Section 1.4 of this report. This assessment has revealed the following RECs in connection with the property:

- The presence of an abandoned oil well (McDonald 2, API 03713842) on the site.

- The site lies within a methane zone.

- The results of geotechnical investigation in 2006 indicate high concentrations of petroleum hydrocarbons in soil on site.

- The results of the VESM indicate that a possible VEC currently exists beneath the site.

Ninyo & Moore recommends a limited subsurface investigation to evaluate the RECs and VEC.

1. INTRODUCTION

Ninyo & Moore conducted a Phase I Environmental Site Assessment (ESA) of the approximate 3,400 square-foot (sf) property at 128 Hurricane Street, in the community of Venice, Los Angeles, California (site; Figure 1). Ninyo & Moore was contracted by Brown & Caldwell (client) on behalf of the City of Los Angeles (the user) to conduct this assessment in general accordance with our proposal dated April 8, 2016. The following sections identify the purpose, involved parties, scope of services, and limitations and exceptions associated with this Phase I ESA.

1.1. Purpose

The objective of the Phase I ESA is to evaluate, in general accordance with the process described in ASTM International (ASTM) Practice E 1527-13, recognized environmental conditions (RECs), which are defined by ASTM as "the presence or likely presence of any hazardous substance or petroleum products in, on, or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment."

As defined in ASTM E 1527-13, de minimis conditions are not considered RECs. A de minimis condition is defined as "a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

Identification of RECs fall into three categories: existing RECs (as defined above); Historical RECs (HRECs); or Controlled RECs (CRECs).

- HREC – A HREC is defined as "a past release of any hazardous substance or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations [AULs], institutional controls, or engineering controls)."

- CREC – A CREC is defined as "recognized environmental conditions resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria

established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, AULs, institutional controls, or engineering controls)."

1.2. Involved Parties

Mr. Dennis Fee of Ninyo & Moore performed regulatory inquiries, historical research, and document review. Mr. Patrick Cullip of Ninyo & Moore performed the site reconnaissance on June 17, 2016. Messrs. Cullip and John Jay Roberts of Ninyo & Moore performed project oversight and quality review. Resumes of professionals conducting this Phase I ESA are provided in Appendix A. The Phase I ESA was prepared for the City of Los Angeles (user).

1.3. Scope of Services

Ninyo & Moore's scope of services for this Phase I ESA included the following:

- Review readily available maps and reports pertaining to the site.
- Review available lease and title records for the site to evaluate probable past site uses and their possible impact on the current environmental status of the site.
- Conduct an interview if available with a property representative regarding the environmental status of the site.
- Perform a site reconnaissance to document existing hazardous materials handling, storage, and disposal practices, areas of possibly contaminated surficial soil or surface water, possible sources of polychlorinated biphenyls (PCBs), USTs and aboveground storage tanks (ASTs), and possible sources of contamination from activities at the site and adjacent properties. Ninyo & Moore was not provided access to the site by the owner to perform the site reconnaissance.
- Review readily available historical documents, including aerial photographs, Sanborn Fire Insurance Rate maps, building department records, historical topographic maps, and reverse city directories, as applicable.
- Review federal, state, tribal, and local regulatory agency databases for the site and for properties located within a specified radius of the site. The databases document locations of known hazardous waste sites, landfills, leaking underground storage tanks (LUSTs), and permitted facilities that utilize USTs.
- Review of readily available local regulatory agency files for the site.

- Prepare this Phase I ESA report for the site. The Phase I ESA report documents the findings and provides opinions and recommendations regarding possible environmental impacts at the site. Color photographs are provided in the report.

1.4. Limitations and Exceptions

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information or has questions regarding the content, interpretations presented, or completeness of this document.

The findings, opinions, and conclusions are based on an analysis of the observed site conditions and the referenced literature. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject property or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control. Ninyo & Moore cannot warrant or guarantee that not finding indicators of any particular hazardous material means that this particular hazardous material or any other hazardous materials do not exist on the site. Additional research, including invasive testing, can reduce the uncertainty, but no techniques now commonly employed can eliminate the uncertainty altogether.

1.5. Special Terms and Conditions

This study did not include an evaluation of geotechnical conditions or potential geologic hazards. In addition, unless otherwise indicated in this report, this Phase I ESA does not include analysis of the following: asbestos-containing materials, methane gas, radon, lead-based paint, lead in drinking water, underground pipelines, wetlands, regulatory compliance,

cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, or high voltage power lines.

1.6. User Reliance

This report may be relied upon by, and is intended exclusively for the client and the City of Los Angeles. Any use or reuse of the findings, opinions, and/or conclusions of this report by parties other than these is undertaken at said parties' sole risk.

1.7. Physical Limitations

Ninyo & Moore was not provided access to the site by the owner to perform the site reconnaissance. This is considered a significant physical limitation.

1.8. Data Gaps

The following data gaps were encountered during the preparation of this Phase I ESA. If information from these data gaps alters the conclusions and recommendations of this report, an addendum will be prepared.

- Ninyo & Moore was not provided access to the site by the owner to perform the site reconnaissance.
- The owner was not available for an interview concerning the past and current conditions of the site.

2. SITE DESCRIPTION

The following sections describe the location, general characteristics and current uses of the site, the structures present at the site, the occupants of the site, the heating and cooling systems utilized in the site buildings, the sewage disposal system, and the potable water provider for the site. The current uses of adjacent properties are also described. A site location map is presented as Figure 1. An aerial photograph depicting the site and vicinity are presented as Figure 2. Photographs of the site taken during the site reconnaissance are presented in Appendix B.

2.1. General Site Characteristics

The site consists of an approximate 3,400 sf, irregularly-shaped property at 128 Hurricane Street in the community of Venice, Los Angeles, California. The site is assigned the Los Angeles County Assessor's Parcel Number (APN) 422-5010-016.

2.1.1. Site Description

The site is currently a vacant lot, and was recently used for storage of vehicles and miscellaneous items during the construction of various public construction projects, based on a review of aerial photographs, Google Earth, the site reconnaissance, and information provided by the City.

2.1.2. Occupants

The site is currently unoccupied.

2.1.3. Roads

The site is bound to the north by Hurricane Street. The site is bound to the east by Canal Court.

2.1.4. Heating and Cooling Systems

Heating and cooling systems in the site vicinity are powered by natural gas and electricity provided by Southern California Gas Company and the Los Angeles Department of Water and Power (LADWP), respectively.

2.1.5. Sewage Disposal/Septic Systems

Sewage disposal is provided to the site vicinity by the City of Los Angeles Department of Public Works (LACDPW).

2.1.6. Potable Water

Potable water is provided to the site vicinity by LADWP.

2.1.7. Other Utilities

Other utilities are not currently provided to the site.

2.2. Adjoining Properties

Table 1 lists the properties adjoining the site and associated land use. Based on the nature of the adjacent properties and observations made during our site reconnaissance, it is unlikely that these properties have impacted the environmental integrity of the site.

Table 1 – Adjoining Properties

Location	Current Occupant(s)
North	Residential Properties (primarily houses) and the Esplanade, a City-owned public right-of-way (ROW), beyond which are Via Dolce and apartment buildings.
East	Venice Pumping Plant
South	The Esplanade, beyond which is Ballona Lagoon
West	Residential Properties (houses and apartment buildings), beyond which are Venice Beach and the Pacific Ocean.

3. USER PROVIDED INFORMATION

The following sections summarize information provided by the user to assist the environmental professional in identifying the possibility of RECs in connection with the site, and to fulfill the user's responsibilities in accordance with Section 6 of ASTM Practice E 1527-13. Ninyo & Moore received an All Appropriate Inquiries (AAI) Questionnaire, completed by Mr. William Jones, representative of the user. The questionnaire is included in Appendix C.

3.1. Current Title Information

Title information was not provided by the user.

3.2. Environmental Liens or Activity and Use Limitations (AULs)

Mr. Jones indicated he was not aware of environmental liens or AULs for the site. Ninyo & Moore requested an environmental lien search, which is summarized in Section 5.7.

3.3. Specialized Knowledge

Mr. Jones indicated that there is an abandoned oil well on site, and soils tested in advance of demolition activities were conducted at the southern end of the property.

3.4. Commonly Known or Reasonably Ascertainable Information

Mr. Jones indicated he has no commonly known or reasonably ascertainable information regarding the environmental conditions of the site.

3.5. Valuation Reduction for Environmental Issues

Mr. Jones indicated the relationship of the purchase price to the fair market value of the property was unknown.

3.6. Presence or Likely Presence of Contamination

Mr. Jones indicated that there is likely to be contamination on the property due it former use as an oil production site.

3.7. Other User Provided Information

The user provided Ninyo & Moore with previous documents relating to the environmental integrity of the site. The first set of documents provides information on a geotechnical investigation conducted at the site in 2006. The second set of documents provides information on the abandonment of a formerly active oil well on the site. Both of these documents are summarized in Section 5.8. The user also provided a Phase I Questionnaire completed by the former occupant, Mr. Jones of the City of Los Angeles Bureau of Engineering. This questionnaire is summarized in Section 9.

4. PHYSICAL SETTING

The following sections include discussions of topographic, geologic, hydrogeologic conditions, and wetlands characterization in the vicinity of the site, based upon our document review and our visual reconnaissance of the site and adjacent areas.

4.1. Topographic Conditions

Based on a review of the United States Geological Survey (USGS), 7.5-Minute Topographic Quadrangle Map Series, Venice, California, 1981 photorevised from 1978, the site is situated at an elevation of approximately 5 feet above mean sea level. The site and immediate vicinity are relatively flat.

4.2. Geologic and Soil Conditions

The site is located at the northwest edge of the Peninsular Ranges Geomorphic Province of California. Landmarks in the vicinity of the site include the Los Angeles Basin to the east, the Santa Monica Bay to the southwest, and the Santa Monica Mountains to the northwest.

According to a previous subsurface investigation conducted at the site in 2006 (LADPW, 2006), the site is underlain by fill consisting primarily of brown silty sand with fragments of

broken glass and concrete. The site vicinity is expected to be underlain primarily by fill due to the filling and grading of former La Ballona Wetlands estuary in the Marina del Rey area.

4.3. Site Hydrology

The following sections discuss the site hydrology in terms of surface water and groundwater.

4.3.1. Surface Waters

Natural surface water bodies, including ponds, streams, or other bodies of water, are not present on the site. The Ballona Lagoon lies south and adjacent to the site. The Pacific Ocean is approximately 0.22 mile south and west of the site. Marina del Rey is approximately 0.22 mile east of the site.

4.3.2. Wetlands

Based on information obtained from the United States Fish and Wildlife Service webpage (http://www.fws.gov/wetlands/data/Mapper.html), portions of the Ballona Lagoon, south and adjacent to the site, are considered estuarine and marine wetland habitat.

4.3.3. Groundwater

The site is within the Santa Monica Subbasin of the Coastal Plain of Los Angeles Groundwater Basin. Groundwater information for the site was not readily available. Ninyo & Moore reviewed the State Water Resources Control Board's (SWRCB's) GeoTracker website (GeoTracker) for groundwater information in the site vicinity. One facility with groundwater data was located 0.72 mile southeast of the site: Del Rey Fuel, LLC at 13800 Bora Bora Way. According to GeoTracker, groundwater was measured on November 6, 2015 at approximately 6.9 to 7.5 feet below ground surface (bgs). Groundwater is expected to flow to the southwest, towards the Pacific Ocean (McAlister GeoScience, 2016).

5. HISTORICAL USE INFORMATION

Ninyo & Moore conducted a historical record search for both the site and surrounding areas. This review included one or more of the following sources that were found to be both reasonably

ascertainable and useful for the purposes of this Phase I ESA: historical aerial photographs, historical fire insurance maps, historical city directories, building permits, topographic maps, and zoning/land use records. The following table lists the historical data types reviewed for this Phase I ESA, their source, their respective dates, and data failures encountered during our review, if any.

Table 2 – Summary of Historical Records Reviewed

Data Type	Source	Source Dates	Data Limitation
Historical Aerial Photographs	Environmental Data Resources, Inc.	1928-2012	None
City Directories	Environmental Data Resources, Inc.	1920-2013	No listings for the site
Sanborn Fire Insurance Maps	Environmental Data Resources, Inc.	1918-1970	None
Topographic Map	Environmental Data Resources, Inc., USGS 7.5-Minute Topographic Quadrangle Map Series, Venice, California	1896-2012	None
Note: USGS – United States Geological Survey			

Although one or more of the sources listed above provided limited information with regards to the historical use of the site, the information gathered from the sources reviewed as a whole is adequate to develop a history of the previous uses of the site and the surrounding area in accordance with Section 8.3 of ASTM Practice E 1527-13.

5.1. Historical Aerial Photographs

Historical aerial photographs dated 1928 to 2012 were provided by Environmental Data Resources, Inc. (EDR). Table 3 presents a summary of our review (Appendix D).

Table 3 – Aerial Photograph Review

Photograph Date	Subject Property	Site Vicinity	
1928	The site appeared undeveloped.	North	Hurricane Street and other roads were present.
		East	A canal was present.
		West	Residential structures were present along the coastline.
		South	Ballona Lagoon and residential structures were present.

Table 3 – Aerial Photograph Review

Photograph Date	Subject Property	Site Vicinity	
1938, 1947, 1952	The site appeared similar to that observed in the 1928 aerial photograph.	North	An oil derrick was present to the northwest. Facilities related to oil production were present to the northeast. A crude oil AST was present adjacent to the west.
		East	
		West	
		South	An off-shore oil derrick was present in the estuary adjacent to the south.
1963	The site appeared similar to that observed in the 1952 aerial photograph.	North	Residential structures were under construction.
		East	The Venice Pumping Plant was present adjacent to the site.
		West	The site vicinity was similar to that observed in the 1952 aerial photograph.
		South	
1972, 1983, 1989, 1994	The site appeared similar to that observed in the 1963 aerial photograph.	North	Additional residential structures were present.
		East	The site vicinity was similar to that observed in the 1963 aerial photograph
		West	Additional residential structures were present adjacent to the site.
		South	The site vicinity was similar to that observed in the 1963 aerial photograph
2002, 2005, 2009, 2010, 2012	The site appeared similar to that observed in the 1989 aerial photograph, with a trailer appearing in the 2002 and 2010 photographs.	North	The site vicinity was highly developed with residential properties. The canal (Ballona Lagoon) remained along the same trajectory.
		East	
		West	
		South	

Based on aerial photograph review, the site was vacant from at least 1928 through 2012. The site vicinity was mostly vacant land in 1928. The site vicinity was developed with oil production facilities from at least 1938 through 1952, and with residential properties from at least 1963 through 2012. The Venice Pumping Plant was present adjacent to the east of the site by at least 1963. Hurricane Street and Canal Court were in their current location by 1938. The historic presence of oil production facilities in the site vicinity is further discussed in Section 5.3.

5.2. Sanborn Fire Insurance Rate Maps

Ninyo & Moore requested Sanborn Fire Insurance Rate Maps for the site from EDR. Sanborn Fire Insurance Map reports were provided from EDR dating from 1918, 1950, and 1970. The Certified Sanborn Map Report is provided in Appendix D. A summary of our review of the Sanborn Fire Insurance Maps is as follows:

1918 Sanborn Map – The site was not depicted in the 1918 Sanborn map. The Sanborn Map depicts areas to the south and west of the site. The site vicinity was lightly developed with residential properties. A lagoon appeared to the south. Hurricane Street was formerly named Progress Club Avenue and trended along its current path.

1950 Sanborn Map – The site was not depicted in the 1950 Sanborn map, and included the same area shown in the 1918 Sanborn map. The site vicinity was developed with additional residential structures. Hurricane Street was formerly named 39th Avenue and trended along its current path. Oil derricks appeared to the southeast of the site.

1970 Sanborn Maps – The site was not depicted in the 1970 Sanborn map, and included the same area shown in the 1918 and 1950 Sanborn maps. Additional residential structures were present in the site vicinity. Hurricane Street was named as it is currently.

Based on the review of historical Sanborn Fire Insurance Maps, the site vicinity was successively more developed with residential properties from 1918 through 1970. The Ballona Lagoon remained relatively unchanged from 1918 through 1970. The site, as well as areas to the north and east of the site, was not depicted in the Sanborn maps provided. RECs were not found for the site from reviewing the available Sanborn Maps.

5.3. Oil and Gas Maps and Methane

According to the State of California, Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR), Well Finder website (DOGGR, 2016), the site lies within the administrative boundaries of the Playa Del Rey Oil Field. One oil well was observed on site, with American Petroleum Institute (API) number 03713842. The well is plugged and abandoned. Numerous oil wells, most of which are plugged and abandoned, were observed within one mile of the site. The presence of a historical oil well on site represents a REC. The oil well is discussed in more detail in Section 5.8.

Based on the City of Los Angeles Zoning Information and Map Access System (ZIMAS) website, the site lies within a methane zone. This is considered a REC for the site.

5.4. City Directories

EDR provided a historical city directory report for the site and site vicinity from 1920 through 2013. The site was not listed under the city directory. Adjacent properties were listed as primarily residential properties. The city directories are provided in Appendix D.

Based on information from the city directories, the site was not occupied from at least 1920 to 2013. RECs were not identified in the city directories reviewed.

5.5. Building Permits

Ninyo & Moore reviewed records on file for the site at the City Los Angeles Department of Building and Safety (LADBS). The following is a summary of our review.

An electrical permit for a 200 amp temporary power pole was issued by the LADBS on June 19, 2013, but was withdrawn the same day. Additional building permits were not found for the site. The review of building permits for the site was not indicative of a REC for the site.

5.6. Historical Topographic Maps

Historical topographic maps dated 1896, 1923, 1924, 1934, 1947 photorevised 1950, 1963 photorevised 1964, 1972, 1978 photorevised 1981, and 2012 were provided by EDR. The historical topographic maps from 1896 showed the site vicinity as being a part of the La Ballona Wetlands, which was more extensive than it is today. The historical topographic maps from 1923 through 1934 showed a harbor was built. The historical topographic maps from 1964 to 2012 showed Marina del Rey in its current configuration. Structures were not observed on the site. The review of historical topographic maps was not indicative of a REC for the site. Copies of the historical topographic maps are included in Appendix D.

5.7. Environmental Liens Search

An environmental liens search was provided by EDR and dated April 15, 2016. According to the EDR Environmental LienSearch™ report, environmental liens or other AULs were not found for the site address. The current legal owner was listed as Sharon R McQueen and Daniel P Whalen Trustees of the McQueen-Whalen Revocable Trust. A copy of the EDR Environmental LienSearch™ report is included in Appendix D.

5.8. Previous Report and Documents

Previous reports and documents were provided to Ninyo & Moore for review by the user, the LADWP. The reports and documents are included in Appendix C. The following is a summary of our review.

A Geotechnical Investigation Summary Report, dated July 24, 2006, and prepared by the City of Los Angeles, Bureau of Engineering, Geotechnical Services Division (GSD) was provided to Ninyo & Moore for review. During the geotechnical investigation, two hand auger borings (B-1 and B-2) were advanced within the vicinity of two concrete vaults to determine the extent of contamination, if any, from the vaults. The purpose of the vaults was not provided. Obvious visual evidence of contamination from the vaults was not observed. The borings encountered fill consisting of brown silty sand with some fragments of broken glass up to the maximum depth explored of 2 feet bgs. Samples were analyzed for petroleum hydrocarbons, polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), and Title 22 Metals. The sample from B-1 was found to contain concentrations of petroleum hydrocarbons at 6,500 parts per million (ppm), and the sample from B-2 was found to contain concentrations of petroleum hydrocarbons at 100 ppm. GSD recommended disposing of the concrete vaults and contaminated soil at a landfill. GSD also recommended confirmation sampling after removal of the contaminated soil. According to information provided by the City, the two concrete vaults were removed as part of the Ballona Lagoon Enhancement Phase IIIA project. The City also indicated requests were not made to GSD to observe the removal, mixing, stockpiling, testing and/or disposal of the contaminated soil, and a follow-up report was not made. The presence of petroleum hydrocarbon-impacted soil on site represents a REC.

Various documents concerning the abandonment of former oil production well on site were also provided to Ninyo & Moore for review. The well is named “McDonald 2” and last was producing at an approximate daily rate of 50 barrels of oil and 200 barrels of water in January 1931. The well went dry, and was abandoned in May 1932. The bottom of the hole was plugged at 2,018 feet bgs. Various cement plugs were emplaced in the hole, from 1996 to 1929 feet and 729 to 675 feet. All other spaces were filled with heavy mud. The hole had been cemented at deeper depths prior to this final abandonment. In May 2002, the DOGGR approved the re-abandonment of McDonald 2. The owner at the time wished to have the well abandoned according to present day abandonment standards so that the property could be sold. The reabandonment of McDonald 2 entailed having new cement plugs from 1,200 to 1,100 feet bgs, 980 to 880 feet bgs, and 696 to 596 feet bgs. All portions of the well not

plugged with cement were to be filled with clay-based mud. The permit to conduct well operations was subsequently renewed annually from 2004 to 2008. In each case, the site owner had not yet completed the reabandonment activities described in the initial reabandonment permit. According to the City, a representative of the City spoke with Jack Collinder of the DOGGR Cypress Division 1 on April 28, 2016, and was informed that the abandonment of McDonald 2 was not performed. Mr. Collinder also indicated the well is required to be re-abandoned if the site is to be used for other purposes than a laydown area. As described in Section 5.3, the presence of an abandoned oil well on site represents a REC.

6. ENVIRONMENTAL DATABASE REPORT REVIEW

EDR performed an environmental information database search dated April 13, 2016 (Appendix E). The EDR report included federal, state, and local databases. The following paragraphs describe the databases that contain noted properties of environmental concern, and include a discussion of the regulatory status of the facilities and potential environmental impact to the subject site. Based on hydrologic information obtained from the SWRCB *GeoTracker* website, groundwater within the site vicinity is estimated between 6.9 and 7.5 feet bgs. Groundwater in the site vicinity is expected to flow to the southwest towards the Pacific Ocean.

6.1. National Priorities List (NPL): Distance Searched – 1 mile

The NPL is the United States Environmental Protection Agency (EPA) database of uncontrolled or abandoned hazardous waste properties listed for priority remedial actions under the Superfund program.

Neither the site nor properties located within the searched distance were listed on this database.

6.2. Proposed and Delisted NPL: Distance Searched – 1 mile

The Proposed NPL database lists properties that are currently being evaluated for priority remedial actions for the Superfund program. The Delisted NPL database includes properties that are deleted from the NPL database based upon the National Oil and Hazardous Substances Pollution Contingency Plan. This deletion takes place after no further response to the NPL is appropriate.

Neither the site nor properties located within the searched distance were listed on this database.

6.3. Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) List: Distance Searched – ½ mile

The CERCLIS database contains properties which are either proposed or on the NPL and properties which are in the screening and assessment phase for possible inclusion on the NPL.

Neither the site nor properties located within the searched distance were listed on this database.

6.4. CERCLIS/No Further Remedial Action Planned (NFRAP) List: Distance Searched – ½ mile

CERCLIS sites designated as NFRAP have been removed from the CERCLIS database following an initial investigation where no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.

Neither the site nor properties located within the searched distance were listed on this database.

6.5. Corrective Action Report: Distance Searched – 1 mile

The EPA maintains this database of *Resource Conservation and Recovery Act* (RCRA) facilities that are undergoing corrective action. A corrective action order is issued when a release of hazardous waste or constituents into the environment from a RCRA facility has occurred.

Neither the site nor properties located within the searched distance were listed on this database.

6.6. RCRA Treatment, Storage and Disposal (TSD) Facilities List: Distance Searched – ½ mile

The RCRA TSD database is a compilation by the EPA of facilities that report generation, storage, transportation, treatment, or disposal of hazardous waste.

Neither the site nor properties located within the searched distance were listed on this database.

6.7. RCRA Generators List: Distance Searched – Site and Adjacent

This list identifies facilities that generate hazardous waste as defined by RCRA. Inclusion on this list is for permitting purposes and is not indicative of a release.

The Los Angeles Pumping Plant #46 at 140 Hurricane Street, adjacent to the northeast and up-gradient of the site, was listed as a small-quantity hazardous materials generator. No violations were found for the Los Angeles Pumping Plant. This is not considered a REC for the site.

6.8. Emergency Response Notification System (ERNS) List: Distance Searched – Site

The ERNS database contains information of reported releases of oil and hazardous substances and is maintained by the EPA.

The site was not listed on this database.

6.9. United States Engineering Controls: Distance Searched – ½ mile

This database is an EPA listing of sites with engineering controls in place, such as various forms of caps, building foundations, liners, and treatment methods intended to eliminate pathways for regulated substances to enter environmental media or affect human health.

Neither the site nor properties located within the searched distance were listed on this database.

6.10. United States Institutional Controls: Distance Searched – ½ mile

This database is an EPA listing of sites with institutional controls in place, such as administrative measures, groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements, intended to prevent exposure to contaminants remaining on site.

Neither the site nor properties located within the searched distance were listed on this database.

6.11. State Sites: Distance Searched – 1 mile

The State Sites database consists of potential or confirmed hazardous substance release properties. Ninyo & Moore reviewed the EnviroStor database for this information.

The site was not listed on this database. The following three facilities located within the searched distance are listed on the EnviroStor database:

Facility and Address	Distance (feet)/ Direction from Site	Groundwater Gradient (General for Vicinity Flow)	Regulatory Status	Date of Last Action	REC (Yes/No)
Western Circuits Inc. 4138 Del Rey Avenue	0.38 mile north-northwest	Cross-gradient	Inactive	01/01/2008	N
Nike Bty 70	0.70 mile southeast	Cross-gradient	Inactive – Needs Evaluation	07/01/2005	N
Marina del Rey 13837 Fiji	0.95 mile east	Up to cross-gradient	Refer: Other Agency	03/22/1984	N
Notes: N – No					

Based on the distance, direction (relative to groundwater flow), and/or their current regulatory status, it is unlikely that activities at these facilities have impacted the environmental integrity of the site. This information is not indicative of a REC.

6.12. Solid Waste Landfill Sites (SWL): Distance Searched – ½ mile

The SWL database consists of open and closed solid waste disposal facilities and transfer stations. The data comes from the Integrated Waste Management Unit Database.

Neither the site nor properties located within the searched distance were listed on this database.

6.13. State Leaking Underground Storage Tank (LUST) Lists: Distance Searched – ½ mile

Databases of the LUST information system are maintained by the Regional Water Quality Control Board (RWQCB).

Neither the site nor properties located within the searched distance were listed on this database.

6.14. Statewide Spills, Leaks, Investigations and Cleanup (SLIC) Lists: Distance Searched – ½ mile

The SLIC program, a state listing, is designed to protect and restore water quality from spills, leaks, and similar discharges. The program is maintained by the Regional Water Quality Control Board (RWQCB).

The site was not listed on this database. The following five facilities located within the searched distance are listed on the SLIC database:

Facility, Address	Distance/ Direction from Site	Groundwater Gradient (General for Vicinity Flow)	SLIC Case Number	Regulatory Status	Closure Date (if applicable)	Environ-mental Concern (Y/N)
Timberlake Group International 4100-5000 Pacific	0.12 mile south	Down to crossgradient	0485A	No further action	NA	N
Via Dolce Acquisition Area 3 3700-3706 Canal	0.14 mile north-northwest	Crossgradient	0485D	Completed – Case Closed	10/02/1999	N
Via Dolce Acquisition Area 1 3602 Pacific Avenue	0.15 mile northwest	Crossgradient	0485B	Completed – Case Closed	10/02/1999	N
Via Dolce Acquisition Area 2 3600-3615 Canal	0.15 mile north-northwest	Crossgradient	0485C	Completed – Case Closed	10/02/1999	N
Baron's Cleaners 510 Washington	0.48 mile north	Up-to-Crossgradient	1120	Completed – Case Closed	06/11/2012	N
Notes: N – No NA – not available						

Based on their distance, direction, and regulatory status, the identified SLIC cases do not represent a REC for the site.

6.15. Underground Storage Tank (UST) Registration List: Distance Searched – Site and Adjacent

UST records are provided by the SWRCB's Hazardous Substance Storage Container Database. Inclusion of facilities on this list does not necessarily indicate a release.

Neither the site nor adjacent properties were listed on this database.

6.16. Permitted Aboveground Storage Tank (AST) List: Distance Searched – Site and Adjacent

According to EDR, AST records are provided by the Department of Building and Fire Safety. Inclusion of facilities on this list does not necessarily indicate a release.

Neither the site nor properties located within the searched distance were listed on this database.

6.17. Voluntary Cleanup Program (VCP) Sites: Distance Searched – ½ mile

This database is a California Environmental Protection Agency listing of properties involved in the voluntary remediation program.

Neither the site nor properties located within the searched distance were listed on this database.

6.18. Brownfields: Distance Searched – ½ mile

This database is a Department of Toxic Substances Control (DTSC) tracking system of California Brownfields sites.

Neither the site nor properties located within the searched distance were listed on this database.

6.19. Indian Reservation: Distance Searched – 1 mile

USGS map layer portrays Indian administered land within the United States with an area equal to or greater than 640 acres.

Indian reservation land was not found to be within the searched distance.

6.20. Indian LUST: Distance Searched – ½ mile

This is a database maintained by the EPA of LUSTs on Indian land in Arizona, California, New Mexico, and Nevada.

Neither the site nor properties located within the searched distance were listed on this database.

6.21. Indian UST: Distance Searched – ¼ mile

This is a database maintained by the EPA of USTs on Indian land.

Neither the site nor properties located within the searched distance were listed on this database.

6.22. Drycleaners: Distance Searched – ¼ mile

EDR provided a list of drycleaner related facilities that have EPA identification numbers. These facilities with certain Standard Industrial Classification codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; dry cleaning plants except rugs; carpet and upholstery cleaning; industrial launderers; laundry and garment services.

The site was not listed on this database. Baron's Cleaners at 510 Washington, approximately 0.48 mile north and up-to-crossgradient of the site, was listed on the database for a tetrachloroethylene (PCE) and trichlorethyelene (TCE) spill. Due to the regulatory status and distance from the site, this listing is not considered a REC for the site.

7. SITE RECONNAISSANCE

As stated in Section 1.7, Ninyo & Moore was not granted access to the site by the site owner to perform a site reconnaissance. Therefore, Ninyo & Moore performed the site reconnaissance from public ROWs. Ninyo & Moore's inability to visually observe the site is considered a significant physical limitation and data gap and may impede our ability to effectively identify RECs for the site. The information regarding the site stated by Ninyo & Moore in the following sections and in this report is based on historical and online references and observations from public ROWs. This information may not accurately reflect the current conditions of the site. Photographs taken during the site reconnaissance are included in Appendix B.

7.1. Use and Storage of Hazardous Substances and Petroleum Products

Evidence of the use and storage of hazardous substances and petroleum products was not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.2. Storage and Disposal of Hazardous Waste

Evidence of storage or disposal of hazardous waste was not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.3. Unidentified Substance Containers

Unidentified substance containers were not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.4. Evidence of Releases

Evidence of releases was not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.5. Aboveground Storage Tanks (ASTs) and Underground Storage Tanks (USTs)

Evidence of USTs (e.g., fill pipes, vent pipes, and emergency power generators) or ASTs were not observed on or adjacent to the boundaries of the site based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.6. Polychlorinated Biphenyls (PCBs)

Potential sources of PCBs, like transformers, were not observed on the site based on a review of aerial photographs, Google Earth, and visual observations from public ROWs. One pole-mounted transformer was observed adjacent to the east of the site. Staining or signs of release were not observed.

7.7. Wastewater Systems

Wastewater systems provided to the site were not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.8. Stormwater Systems

Stormwater systems provided to the site were not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.9. Wells

Wells, such as water supply wells and groundwater monitoring wells, were not observed on the site based on a review of aerial photographs, Google Earth, and visual observations from public ROWs. As stated in Section 5.8, an abandoned oil well is present on the site and is considered a REC. Two groundwater monitoring wells were observed on Hurricane Street, adjacent to the north and northeast of the site.

7.10. Surface/Subsurface Structures

Surface structures or evidence of subsurface structures (e.g., sumps, vaults, oil/water separators, and other surface impoundments) were not observed based on a review of aerial photographs, Google Earth, and visual observations from public ROWs. As stated in Section 5.8, two concrete vaults were present on the site prior to 2006 and were removed.

7.11. On-Site Records

On-site records were not available for the site.

7.12. Controlled Substances Production

Evidence of controlled substance production, such as methamphetamine laboratories, was not noted within or adjacent to the boundaries of the site based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

7.13. Other Environmental Issues

Other environmental issues were not noted on the site based on a review of aerial photographs, Google Earth, and visual observations from public ROWs.

8. ENVIRONMENTAL REGULATORY AGENCY INQUIRIES

Based on the site reconnaissance, historical research, and environmental database review, information regarding the site and relevant surrounding properties requests for records were made to local government agencies and, if available, reviewed by Ninyo & Moore. Based on information obtained from local government agencies, it was judged that interviews of regulatory officials would not provide additional meaningful information to the Phase I ESA. The following information for the site was found during our regulatory agency review for this Phase I ESA. Agency responses are provided in Appendix F.

8.1. Regional Water Quality Control Board (RWQCB)

Ninyo & Moore made requests to the Spills, Leaks, Investigation and Cleanup, Well Investigation Program Case List and UST units of the Los Angeles RWQCB to review records that may be available for the site. According to the RWQCB, records are not available for the site address.

8.2. California Department of Toxic Substances Control

Ninyo & Moore made requests to the DTSC – Cypress and Chatsworth offices to review records that may be available for the site. According to the DTSC – Cypress and Chatsworth offices, no such records exist for the site.

8.3. South Coast Air Quality Management District (SCAQMD)

Ninyo & Moore reviewed the SCAQMD's Facility Information Detail Search (FINDS) website for permits regarding the site address. According to the FINDS website, no records are available for the site address.

8.4. Los Angeles County Fire Department (LAFD) – Haz-Mat Division

Ninyo & Moore made requests to the LAFD – HazMat Division to review records that may be available for the site. According to the LAFD, no files were found for the site address.

8.5. Los Angeles County Fire Department (LAFD) – UST Division

Ninyo & Moore made requests to the LAFD – UST Division to review records that may be available for the site. According to the LAFD – UST Division, no files were found for the site address.

8.6. Los Angeles County Public Health Investigation (LAPHI)

Ninyo & Moore made requests to the LAPHI Hazardous Materials Division to review records that may be available for the site. According to the LAPHI Hazardous Materials Divisions, files for the site were not found.

9. INTERVIEW

Ninyo & Moore submitted a questionnaire for completion by the owners, Sharon R McQueen and Daniel P Whalen Trustees. To date, Ninyo & Moore has not received the owner questionnaire from Sharon R McQueen and Daniel P Whalen Trustees. This is considered a data gap. If information from the owner alters the conclusions and recommendations of this report, an addendum will be prepared.

Ninyo & Moore was provided a questionnaire completed by the former occupant of the site, Mr. William Jones of the City of Los Angeles Bureau of Engineering. According to Mr. Jones, it is unknown if hazardous materials are stored on site, or if USTs or ASTs are currently or formerly present on the site. Mr. Jones indicated that there potentially have been releases of hazardous materials or petroleum products on the site due to an oil production well located on the property, which has been abandoned. Mr. Jones indicated he had the following documents of interest

pertaining to the site: environmental permits, geotechnical investigations or studies, and other reports. Mr. Jones was not aware of the following regarding the site: past, threatened, or pending litigation or administrative proceedings; government notices of violation; or government notices of possible liability. Documents pertaining to a former geotechnical investigation, as well as the abandoned oil production well, are summarized in Section 5.8. A copy of the questionnaire is provided in Appendix C.

10. VAPOR MIGRATION

Ninyo & Moore conducted a preliminary vapor encroachment screen (pVES) for potential chemicals of concern (COCs) that may migrate as vapors onto the site as a result of contaminated soil and/or groundwater near the site. The purpose of the pVES is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of COC vapors in subsurface soils at the site caused by the release of vapors from contaminated soil or groundwater either on or near the site. The potential for VEC beneath the site was evaluated using a Vapor Encroachment Screening Matrix (VESM). The VESM included performing a Search Distance Test to identify if there are any known or suspect contaminated sites surrounding or upgradient of the site within specific search radii, a COC Test (for those known or suspect contaminated sites identified within the Search Distance Test) to evaluate whether or not COCs are likely to be present, and a Critical Distance Test to evaluate whether or not COCs in a contaminated plume may be within the critical distance of the site (100 feet for non-petroleum contaminants, and 30 feet for petroleum hydrocarbon contaminants). Based on the concentration of petroleum hydrocarbons detected in soil on the site in 2006, the presence of a historical oil-production well (Section 5.8), and the presence of the site within a methane zone, it is likely that a VEC exists beneath the site. A copy of the VESM is included in Appendix G.

11. FINDINGS, OPINIONS, AND CONCLUSIONS

Based upon the results of this Phase I ESA, the following findings, opinions, and conclusions are provided.

11.1. Findings and Opinions

Ninyo & Moore conducted a Phase I Environmental Site Assessment (ESA) of the approximately 3,400 square-foot property at 128 Hurricane Street in the community of Venice, Los Angeles, California (site; Figure 1). Ninyo & Moore was contracted by Brown and Caldwell to conduct this assessment on behalf of the City of Los Angeles (the user) in general accordance with our proposal dated April 8, 2016. Historical research, document review, and site assessment activities were conducted in April and May, 2016. In general, the following items were noted.

- The site is assigned the Los Angeles County APN 422-5010-016. Based on the environmental lien search, the site is currently owned by Sharon R McQueen and Daniel P Whalen Trustees of McQueen-Whalen Revocable Trust, and is not occupied.

- The site has not been developed with structures from at least 1928 through the time of this report.

- The area surrounding the site was developed with oil production facilities from at least 1938 through 1952, and with residential properties from at least 1963 through the time of this report. The Venice Pumping Plant appeared adjacent to the east of the site by at least 1963.

- The site address was not listed on searched environmental databases.

- Site access was not granted; therefore, a site reconnaissance was conducted from public ROWs. This is considered a significant physical limitation and data gap. Two groundwater monitoring wells were observed on Hurricane Street, adjacent to the north and northeast of the site. One pole-mounted transformer was observed adjacent to the east of the site.

- To date, Ninyo & Moore has not received an owner questionnaire from the site owners, Sharon R McQueen and Daniel P Whalen Trustees. This is considered a data gap. If information from the completed owner questionnaire is received that alters the conclusions and recommendations of this report, an addendum will be prepared.

- According to the DOGGR well finder website, a historical oil production well is present on the site (McDonald 2, API 03713842). Based on a review of documents provided by the user, the "McDonald 2" well was abandoned in 1932. A permit to re-abandon the well was issued in 2002 and renewed annually from 2004 to 2008. According to DOGGR, the well has not been re-abandoned. This represents a REC.

- According to the ZIMAS website, the site lies within a methane zone. This is considered a REC.

- Based on a review of documents provided by the user, a geotechnical investigation conducted on the site in 2006 found two concrete vaults and concentrations of petroleum hydrocarbons in the upper 2 feet of soil at up to 6,500 parts per million (ppm). Records indicating the removal, mixing, stockpiling, testing, and/or disposal of the contaminated soil were not found. This is considered a REC.

- Based on historical research and results of the VESM conducted by Ninyo & Moore, a VEC is likely to currently exist beneath the site.

- Off-site concerns were not observed based on historical documents review.

11.2. Conclusions

Ninyo & Moore has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 of property at 128 Hurricane Street in the community of Venice, California, the site. Any exception to, or deletions from, this practice are described in Section 1.4 of this report. This assessment has revealed the following RECs in connection with the property:

- The presence of an abandoned oil well (McDonald 2, API 03713842) on the site.

- The site lies within a methane zone.

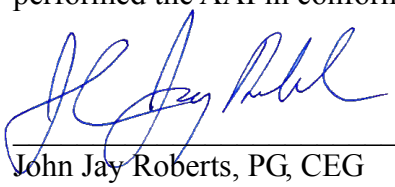
- The results of geotechnical investigation in 2006 indicate high concentrations of petroleum hydrocarbons in soil on site.

- The results of the VESM indicate that a possible VEC currently exists beneath the site.

Ninyo & Moore recommends a limited subsurface investigation to evaluate the RECs and VEC.

12. ENVIRONMENTAL PROFESSIONAL STATEMENT

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined by §312.10 of 40 Code of Federal Regulations (CFR) 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the AAI in conformance with the standards and practices set forth in 40 CFR Part 312.



John Jay Roberts, PG, CEG
Senior Geologist

National Groundwater Association

As a Senior Geologist, Mr. Jay Roberts has extensive experience performing environmental and geotechnical investigations of commercial and industrial properties and environmental site assessments of school sites, including Initial Site Assessments (ISAs), Hazardous Materials Assessments (HMAs), Phase Is, Phase IIs, PEA, SSI, RAW, RAP, and O&M plans. Mr. Roberts has completed characterization, remediation, and human health assessments on numerous properties. He has prepared successful applications for Brownfields clean-up grants and managed and performed hydrogeologic investigations, groundwater resource evaluations, and water supply studies. He also provides expert witness and litigation support for environmental, geotechnical, and mining matters.

REPRESENTATIVE PROJECT EXPERIENCE

Initial Site Assessment Ball Road Grade Separation, Anaheim, California: Technical Director for an ISA for the Ball Road Grade Separation Project in Anaheim. The project includes evaluation of alternatives for Ball Road at the interchange with the Metrolink/SCRRA Railroad rail crossing. The ISA included review of historical sources for previous uses iinvolvi9ng hazardous wastes, regulatory agency databases research, and site reconnaissance to view for indications of potential hazardous waste impact on facilities along the proposed alignments.

Initial Site Assessment Raymond Avenue Grade Separation, Fullerton, California: Technical Director for an ISA and ADL for the Raymond Avenue Grade Separation Project in Fullerton. The project includes the lowering of Raymond Avenue to create an underpass at the Burlington Northern Santa Fe (BNSF) rail crossing. The Project in-progress will include an ADL Survey and subsurface investigation for suspected impacts in the exposed soil areas along Raymond and Valencia Avenues.

Initial Site Assessment State College Boulevard Separation and ADL Survey, Fullerton, California: Technical Director for an ISA and ADL for the State College Boulevard Separation Project in Fullerton. The project involves the lowering of State College Boulevard to create an underpass at the Burlington Northern Santa Fe (BNSF) rail crossing. The Project includes an ADL Survey in the exposed soil areas along State College Boulevard.

Initial Site Assessment Mount Vernon Avenue Bridge Expansion, San Bernardino, California: Technical Director for an ISA for the Mount Vernon Bridge Expansion project. The Project involved research and review of historical documents into property uses dealing back into the early 1900's due to long history of the site usage as a railroad hub. The records reviewed consisted of environmental investigations, remedial activities, and contaminated groundwater. Regulatory agencies representatives were also contacted for specifics on current states of remedial activities at impacted sites within the influence of the Project.

Initial Site Assessment Milliken Avenue, Mission Boulevard, and Philadelphia Street, Ontario, California: Technical Director for an ISA and ADL for the proposed grade separation at the existing at-grade crossing of South Milliken Avenue and the Union Pacific Railroad (UPRR) in Ontario, California. The Project includes an ADL survey to be performed adjacent to Milliken Avenue, Mission Boulevard, and Philadelphia Street to evaluate surface and subsurface soil for the presence and concentration of ADL in proposed roadway improvement areas.

Phase I Environmental Site Assessments, Tehachapi Renewable Transmission Project, Kern County, California for Southern California Edison (SCE): Project Manager for Phase I Environmental Site Assessments (ESAs) for 10 separate Sites in Kern County, California for Southern California Edison (SCE) for the Tehachapi Renewable Transmission Project. The Phase I ESAs were performed in accordance with the ASTM International (ASTM), Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process Designation E 1527-05 and Practices for All Appropriate Inquiries (AAI) as set forth in the Code of Federal Regulations (CFR), Title 40, Part 312. In order to meet the accelerated schedule for the project, the 10 separate Phase I ESA reports were completed within approximately three weeks from authorization. In accordance with the ASTM and AAI requirements, Ninyo & Moore reviewed readily available historical documents, including historical aerial photographs, Sanborn Fire Insurance Rate maps, building department records, historical topographic maps, and city directories, as applicable. Ninyo & Moore conducted a review of federal, state, tribal, and local regulatory agency databases for each Site and for properties located within the specified radius (by the ASTM Standard) of each Site for locations of known hazardous waste sites, landfills, leaking underground storage tanks (LUSTs), and permitted facilities with USTs.

REPRESENTATIVE PROJECT EXPERIENCE (continued)

The Phase I ESAs included a reconnaissance of each Site to document existing hazardous materials handling, storage, and disposal practices, areas of possibly contaminated surficial soil or surface water, possible sources of polychlorinated biphenyls (PCBs), USTs and ASTs, and possible sources of contamination from activities at the Site and adjacent properties, and an interview of each Site property representative. The results of each Phase I ESA were presented in a comprehensive report, which included a summary whether or not recognized environmental conditions (RECs) were found on the any of the 10 Sites.

Environmental Site Assessments and Hazardous Building Materials Survey, Beverly Hills Post Office Building, California: Project Manager for a Preliminary Environmental Site Assessment/Phase I ESA of the proposed Wallis Annenberg Cultural Center of Beverly Hills. The site consisted of the existing historic Beverly Hills Post Office building and surrounding parking lots proposed to be converted to a new cultural center, including an underground parking structure proposed to be constructed beneath existing street rights of way and portions of the adjacent Beverly Hills City Hall property. Ninyo & Moore reviewed historical and regulatory records, conducted a site reconnaissance, and interviewed property representatives in order to prepare a comprehensive report summarizing potential environmental concerns associated with redevelopment of the site. Potential environmental concerns (PECs) included the historical development of the site as lumber storage yard, a train depot, and railroad right-of-ways, the former presence of an underground storage tank, and releases associated with off-site fire station and gas station facilities. Also, due to the age of the building the presence of the potential presence of asbestos-containing materials (ACMs), lead-based paints (LBPs), and other hazardous building materials was suspected.

Environmental Assessments for 12 School Sites, Western Riverside County, California: Project Manager for Phase I studies through complete environmental investigations and site closure status granted by DTSC, the lead regulatory agency. All 12 sites required DTSC's rigorous PEA investigations, including soil gas and/or soil matrix sampling. One site required a soil RAW and implementation. Public participation services in accordance with DTSC requirements were also provided.

Environmental Assessments for 10 School Sites, Western San Bernardino County, California: Project Manager for Phase I studies through complete environmental investigations and site closure status granted by DTSC, the lead regulatory agency. All 10 sites required DTSC's rigorous PEA investigations, including soil gas and/or soil matrix sampling. Sampling and analyses was conducted on the sites primarily for past agricultural activities. One site required an additional investigation for an on-site burn dump. Public participation services in accordance with DTSC requirements were also provided to the client school district.

Environmental Consulting Services for Commercial, Industrial, and Residential Properties Throughout California, Oregon, and Washington: Project Manager for Phase I studies throughout the western United States. Mr. Roberts managed, directed, coordinated a staff conducting Phase Is, and reviewed and signed each report. These services were performed for a variety of fiduciary institutions, attorneys, and school districts. These services included complete investigations to meet ASTM standards, as well additional studies required by the client. In order to fully characterize conditions, Phase II investigations were recommended and completed, ranging from additional historical research through soil and/or groundwater sampling.

EXPERIENCE HIGHLIGHTS

Phase I Environmental Site Assessments
Sampling Surveys
1166 Soil Monitoring
Preliminary Environmental Assessment

Mr. Patrick Cullip has over three years experience performing environmental remediation, operations and maintenance (O&M), remediation system installation, groundwater/soil vapor sampling, well installation, underground storage tank (UST) removal, soil contamination removal, dual-phase extractions, aerially-deposited lead (ADL) sampling, geological and geotechnical logging, quarterly groundwater monitoring reports, pilot test reports, design, and oversight projects; conducting environmental site assessments (ESAs) and feasibility testing; and evaluating regulatory compliance.

REPRESENTATIVE PROJECT EXPERIENCE

Port of Los Angeles, Wilmington, California: Senior Staff Environmental Engineer, conducted groundwater monitoring on numerous existing monitoring wells, using hand bailers.

Long Beach Unified School District, Long Beach, California: Senior Staff Environmental Engineer, collected soil samples using hand-auger and direct-push methods, to assess lead and pesticide contamination from lead based paint and termiticides along the edges of classroom and administrative buildings at Jordan High School, and prepared reports for government agencies. Sample results were used to determine the extent of contamination and potential associated health risks to field personnel participating in planned remodeling/demolition activities. Prepared the preliminary environmental assessment (PEA) report for sampling and associated remedial action work plan (RAW) for required soil remediation.

City of Los Angeles, Temescal Canyon Park Storm Water Project, Pacific Palisades, California: Senior Staff Environmental Engineer, conducted South Coast Air Quality Management District Rule 1166 air monitoring of soil being excavated for future storm water holding tank. The soil consists of undocumented fill found to contain petroleum hydrocarbons.

Caltrans, Various Locations, Southern California: Senior Staff Environmental Engineer, collected soil samples, using hand-auger methods, of roadside soils to assess aerially deposited lead (ADL) impacts of soil from years of contamination from leaded gasoline. Sample results were used to determine the waste classification for proper disposal and handling of road and highways improvements.

Phase I ESAs – Various Sites, Southern California: Field Manager, performed numerous Phase I ESAs of commercial, industrial, and residential properties throughout Southern California for various financial institutions, land developers, and government agencies. The Phase I ESAs included reviewing regulatory files of various government agencies to evaluate the extent and type of impacts at sites, conducting site walks and owner/operator interviews, and preparing reports.

Los Angeles Unified School District (LAUSD), Los Angeles, California: Oversaw groundwater/soil vapor extraction tests at various sites to determine extent of contamination. Field Manager for a complex site excavation for future school; tasks included lead/hydrocarbon soil testing, hazardous/non-hazardous soil removal, and air quality monitoring. Directed cleaning/removal of USTs, soil contamination chase-out, and removal. Supervised installation of groundwater/soil vapor monitoring wells. Directed maintenance on groundwater/soil vapor systems. Organized, managed, and operated numerous dual-phase extraction tests to remove site contaminants. Executed various O&M visits for existing soil vapor and groundwater remediation systems. Tracked effluent readings for various sites to ensure permitting compliance. Prepared dozens of environmental reports including quarterly groundwater monitoring reports, pilot tests, site assessments, remedial action plans, and RECAPs.

USER AND OWNER PROVIDED INFORMATION

PHASE I ESA QUESTIONNAIRE

Purpose: The property described below is referred hereafter as the "Site". The purpose of this questionnaire is to facilitate the Environmental Professional in conducting an Environmental Assessment of the Site on behalf of its Client. Please answer this questionnaire to the best of your ability by providing your personal as well as the institutional knowledge of your organization regarding the Site.

Site description: Property located at 128 Hurricane Street, Venice, CA.

Form Completed By:

Name: William Jones

Organization: City of Los Angeles, Bureau of Engineering

Address: 1149 S Broadway, #600

Telephone Number: 485-5760

Email: william.jones@lacity.org

PHASE I ESA/AAI REQUIREMENTS

According to the All Appropriate Inquiry (AAI, 40 CFR 312) requirements and ASTM (E 1527-05) guidance on conducting Phase I Environmental Site Assessments, the "user" of the assessment must provide the following information, if available, to the environmental professional in order to qualify for Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001. Please check yes or no and provide any additional information you may have regarding the site. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

(1) Environmental cleanup liens that are filed or recorded against the site (40 CFR 132.25).
Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state, or local law?

☐ Yes ☑ No

If yes, please explain:

(2) Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).
Are you aware of any activity use limitations (AULs), such as engineering controls, land use restrictions, or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

☐ Yes ☑ No

If yes, please explain:

(3) Specialized knowledge or experience of the person/department requesting the Phase I ESA and seeking to qualify for the landowner liability protections (40 CFR 312.28).
As the user of this ESA, do you have any specialized knowledge or experience related to the property or adjoining properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

☑ Yes ☐ No

If yes, please explain: Abandoned oil well onsite. Soils tested in avance of demolition activities at southerly end of property.

(4) Relationship of the purchase price to the fair market value of the property, if it were not contaminated (40 CFR 312.29).
Does the purchase price offered for this property reasonably reflect the fair market value of the property? If there is a difference between the purchase price and the fair market value, have you considered whether the lower purchase price is because contamination is known or believed to be at the property?

Please discuss: unknown

(5) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).
Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,
(a) Do you know the past uses of the property? oil production; staging area for construction.
(b) Do you know of specific chemicals that are present or once were present at the property? unknown
(c) Do you know of spills or other chemical releases that have taken place at the property? unknown
(d) Do you know of any environmental cleanups that have taken place or are ongoing at the property?

☐ Yes ☑ No

If yes, please explain:

(6) The degree of obviousness of the presence or likely presence of contamination at the property and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).
As the user of this ESA, based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?

☑ Yes ☐ No

If yes, please explain: former use as an oil production site.

SUMMARY OF FIELD INVESTIGATION

Location:	128 Hurricane Street
Thomas Guide:	Page 701 H-1
Requested By:	William Jones (BOE/EMG)
In Attendance:	Morton Price and (GED), Lisette Ramos, Tania Christo (GSD)
Date of Investigation:	June 28, 2006

DESCRIPTION AND REMARKS

At the request of William Jones of the Environmental Management Group, the Geotechnical Engineering Division (GED) has completed a field investigation regarding soil characterization near two concrete vaults in the Marina Del Rey area of the City.

This field investigation has been prepared to summarize the observations made.

Summary of Observations

As depicted by Figure 1, 128 Hurricane Street is located at the intersection of Hurricane Street and Canal Court in the Marina Del Rey area of the City.

The Site is an empty lot occupied by two concrete vaults. The site is adjacent to the Grand Canal. One of the vaults has wooden siding around the perimeter, but neither had any access hatches. A hole was observed in one of the vaults, but not enough to allow inspection of the interior of the vaults. There was no obvious visual or olfactory evidence of contamination from the vaults.

GED representatives met Department of General Services, Standards Division staff and collected two soil samples from two different hand auger borings; B-1 (2 ft below ground surface (bgs)) and B-2 (1 ft bgs). Figure 2 shows a plot with boring locations.

The borings consisted of brown silty sand (fill) with some fragments of broken glass. Boring B-1 encountered concrete fragments at 2 ft bgs, B-2 encountered concrete fragments at 1 ft bgs. Boring B-2 had an odor of animal waste. Water was not encountered in the borings.

The soil samples were analyzed for Petroleum Hydrocarbons (EPA 1664), Polychlorinated Byphenols (PCBs), VOCs (EPA 8260) and Title 22 metals. Results of EPA 1664 indicated a high level 6,500 ppm of petroleum hydrocarbons at 2 ft in B-1. Boring B-2 at 1 ft bgs was fund to be 100 ppm.

PCBs were not detected at the method detection limit; VOCs were also not detected at the method detection limits. Title 22 metals were not detected at hazardous levels.

A copy of the Standards report is attached at the end of this Field Investigation.

Conclusions and Recommendations

GED is of the opinion that the heavy hydrocarbons may be degraded heavy hydrocarbons from previous oil drilling activity at the site, or a naturally occurring degraded stringer of heavy hydrocarbons. There is also a possibility the heavy hydrocarbons may be a result of peat material in the soil.

As for disposal, the concrete vaults can go to a Class III Landfill. As for the heavy hydrocarbon impacted soils, GED recommends contacting Class III disposal facilities to see if any will accept soil with this concentration of hydrocarbons. Some Class III facilities may not accept such a high concentration of heavy hydrocarbons, so there is a possibility of this soil requiring disposal at a Class II facility. GED recommends sampling the soil again after it has been removed and stockpiled, after it has been mixed with other soils. The concentration of heavy hydrocarbon concentration may drop below 1000 ppm due to soil mixing, at which point most Class III Landfills will accept the soil, assuming there is no visual or olfactory signs of contamination.

Additionally, if the area around the vaults is to be developed into residential property in the future, the heavy hydrocarbon impacted soil should be removed to a concentration of less than 100 ppm heavy hydrocarbons.

Questions regarding this field investigation should be directed to Morton Price at (213) 847-0466.

BALLONA CREEK ENH.
W.O. E1903240

Received: June 28, 2006
Reported: July 19, 2006

To: Chris Johnson, Division Engineer
Bureau of Engineering/Geotechnical Services Division

Attn: Morton Price, Engineering Geologist Associate III
Bureau of Engineering/Geotechnical Services Division

SAMPLE ANALYSIS RESULTS

At the request of the Bureau of Engineering's Geotechnical Services Division, two soil samples from Ballona Creek Enhancement were collected and analyzed for possible contamination.

Neither sample exceeded the total threshold limit concentration (TTLC) or soluble threshold limit concentrations (STLC) specified in the California Administrative Code Title 22 regulations for any heavy metal. The B1 @ 2' sample contained a high level of petroleum hydrocarbon contamination (6500 ppm).

The samples were analyzed in accordance with the State of California Department of Health Services' Environmental Laboratory Accreditation Program (ELAP) approved methods. The specific methods are listed on the data sheets.

The chain of custody and data sheets are attached.

PERMIT TO CONDUCT WELL OPERATIONS

Daniel P. Whalen
3011 Thatcher Ave.
Marina Del Rey, CA 90292

Cypress, California
May 28, 2008

Your **supplementary** proposal to **reabandon** well **McDonald Petroleum , Ltd./"Mcdonald" 2**, A.P.I. No. **037-13842**, Section **21**, T. **2S**, R. **15W**, **S.B.** B. & M., **Playa Del Rey** Field, **Venice** area, -- pool, **Los Angeles** County, dated **5/13/2008**, received **5/28/2008** has been examined in conjunction with records filed in this office.

THE PROPOSAL IS APPROVED PROVIDED:

1. The permit to **reabandon** this well is extended through **May 28, 2009**.
2. In all other respects the well shall be **reabandoned** in accordance with the provisions set forth in our report No. **P 107-0277**, dated **May 9, 2007**.
3. This Division shall be consulted and a Supplementary Notice may be required before making any changes in the proposed program.

NOTE:

This is the final renewal of this notice. If work has not commenced on this well by May 28, 2009, this permit will be summarily cancelled.

PERMIT TO CONDUCT WELL OPERATIONS

Daniel P. Whalen
3011 Thatcher Ave.
Marina Del Rey, CA 90292

Cypress, California
May 9, 2007

Your proposal to **reabandon** well **McDonald Petroleum, Ltd./"Mcdonald" 2**, A.P.I. No. **037-13842**, Section **21**, T. **2S**, R. **15W**, **S.B.** B. & M., **Playa Del Rey** Field, **Venice** area, -- pool, **Los Angeles** County, dated **4/16/2007**, received **4/17/2007** has been examined in conjunction with records filed in this office.

THE PROPOSAL IS APPROVED PROVIDED:

1. Blowout prevention equipment with hydraulic controls, equivalent to this Division's Class **II2M** requirements, or better, shall be installed and maintained in operating condition.
2. All portions of the well not plugged with cement shall be filled with clay base mud having a minimum density of 72 lb/cu ft and a minimum gel-shear strength of 25 lb/100 sq ft.
3. The well shall be plugged with cement from **1896'** to **1840'**.
4. For the isolation of the freshwater sands a cavity shot shall be detonated at **1200'** and the well shall be plugged with cement from **1200' to 1090'**.
5. The cement plug proposed to be placed to **596'**, shall extend from **746'** to **596'**.
6. The well shall be plugged with cement from at least **55'** to **5'**.
7. This division shall be consulted and a Supplementary Notice may be required before making any changes in the proposed program.
8. **THIS DIVISION SHALL BE NOTIFIED TO:**
   a. Inspect the installed blowout prevention equipment prior to commencing downhole operations.
   b. Witness the mudding of the well.
   c. Witness the location and hardness of the cement plugs at **1840'**, **1090'** and **880'**.
   d. Witness the placing, location and hardness of the cement plugs from **746'** to **596'** and **55'** to **5'**.
   e. Inspect and approve the cleanup of the well site.

NOTE:

1. The base of the freshwater sands is at **1200'**±.
2. This division does not pass upon your right to enter the property, but merely approves the proposal as conforming to our requirements.

SUPPLEMENTARY NOTICE

A notice to the Division of Oil, Gas, and Geothermal Resources, *dated* _____, stating the intention to

Re ABANDON (Drill, rework, abandon) well MCDONALD PETROLEUM LTD. "MCDONALD" #2 (Well designation), API No. 037-13842

Sec. 21, T (2S-5) 15, R. 15W, SB B.&M., PLATA DEL REY Field,

LOS ANGELES County, should be amended because of changed conditions.

1. The complete casing record of the well (present hole), including plugs and perforations, is as follows:

14" CEM 696'; 8 5/8" CEM. 3,526', WSO, CAVITY SHOT @ 1950' CUT AND PULLED FROM 980', DAMAGED @ 2,000', TD 5,860. PLUGGED WITH CEMENT 4,642'- 4,500', 2,018'-1,896', 729'-675', ?-5'?

2. The total depth is: 5,860 feet. The effective depth is: — feet.

3. Present completion zone (s): — (Name). Anticipated completion zone (s): — (Name).

4. Present zone pressure: — psi. Anticipated/existing new zone pressure: — psi.

We now propose: *(A complete program is preferred and may be attached.)*

SUPPLEMENTARY NOTICE TO ABANDON:

1. DRILL OUT SURFACE PLUG
2. CLEAN OUT WELL TO 1200' +/-. PROVIDE CAVITY SHOT AT 1200'
3. PLUG WELL WITH CEMENT FROM 1,200'-1100', 980'-880', AND 696'-596'.
4. PROVIDE CLAY BASE MUD HAVING A DENSITY OF 72 lb/cf (MIN.) AND A GEL-SHEAR STRENGTH OF 25 lb/100sf (MIN) AT ALL PORTIONS OF THE WELL ABOVE 1,100' NOT FILLED WITH CEMENT.
5. DIVISION SHALL BE NOTIFIED PRIOR TO PLACING CEMENT PLUGS AT 1200'-1100', 880' 596', AND AT SURFACE.
6. DIVISION SHALL BE NOTIFIED PRIOR TO MUDDING OF THE WELL AND INSPECT/APPROVE THE CLEAN UP OF THE WELL SITE.
7. PLEASE NOTE ADDITIONAL REQUIREMENTS (IF ANY) ON PERMIT.

Note: If the well is to be redrilled, show proposed bottom-hole coordinates and estimated true vertical depth.
The Division must be notified if changes to this plan become necessary.

October 22, 1999

Mr. Ed Santiago
Department of Conservation
Division of Oil, Gas & Geothermal Resources
5816 Corporate Avenue, Suite 200
Cypress, CA 90630

Dear Ed:

I have some additional information on the property with the abandoned well that I spoke to you about recently on the telephone. Here is what I have:

Address: 138 Hurricane Los Angeles, CA 90292 a vacant fenced corner lot.

Legal Description: County of Los Angeles, Lot 2, Block 5, Silver Strand Tract, As per map recorded in Book 7, Page 86 of Maps, in the office of the County Recorder of Said County.

General Description: Southwest corner of Hurricane and Canal Court.

I am assisting the Trustor for the estate, a Mr. Louis Pearson. He went to the L. A. County Recorder's Office and all they were going to give him for a map were copies of the oilfield Munger Map which I already had and are enclosed. The well involved is the McDonald Petroleum Ltd McDonald No. 2. Mr. Pearson contacted your office and was furnished the DOGGR documents on the present condition of the well, copies of which are enclosed. I would very much appreciate information on what the DOGGR requirements are to bring McDonald No. 2 into compliance with present day abandonment standards so the property can be sold. If you need more information let me know. During the day I can be reached at (805) 899-3144 Ext. 28.

Thanks for your help. It was a pleasure talking with you the other day and getting caught up a bit on who was still around.

Sincerely,

John H. Kramer

Special Report on Operations Witnessed

No. T-1-24110

Los Angeles, Cal. June 3, 1932.

Mr. W. H. Graham,
Long Beach, Cal.

~~Agent for~~ SMITH & GRAHAM, CONTRACTORS. ~~Company~~

DEAR SIR: Hubert F. Laugharn, Receiver for McDonald Petroleum, Ltd.
Operations at ~~your~~ well No. "McDONALD" 2 Section 21, T. 2-S., R. 15-W., S. B. B. & M., Playa del Rey Oil Field, in Los Angeles County, were witnessed by R. P. Phillips, representative of the supervisor, on May 24, 1932. There was also present J. C. Ayres, Driller, and H. H. Davis, Helper.

Casing Record 14" S.P. cem. 696'; 8-5/8" cem. 3526'. W.S.O., reported bad at about 2000', shot at 1950', pulled from 980'; T.D. 5860', plugged with cement 4642'-4500', 2018'-1896' and 729'-675'.

The operations were performed for the purpose of testing the location and hardness of a cement plug proposed to be placed on the stub of the 8-5/8" casing in the process of abandonment.

and the data and conclusions are as follows:

ON MAY 23, 1932, THE INSPECTOR ARRIVED AT THE WELL AT 2:10 P.M. AND MR. AYRES REPORTED THE FOLLOWING:

1. The 8-5/8" casing was shot at 980' with a collar shot and pulled from that depth.
2. The hole was cleaned out to 729'.

THE INSPECTOR NOTED THAT 30 sacks of Victor cement was dumped at 729'.

The operations were completed at 4:05 p.m.

ON MAY 24, 1932, THE INSPECTOR ARRIVED AT THE WELL AT 3:35 P.M. AND NOTED THAT the bailer could not be spudded below 675' and brought up a sample of set cement.

The test was completed at 4:15 p.m.

THE LOCATION AND HARDNESS OF THE CEMENT PLUG AT 675' ARE APPROVED.

cc-Hubert F. Laugharn, Receiver

DEAR SIR:

Operations at ~~your~~ well No. HUBERT F. LAUGHARN, RECEIVER FOR MCDONALD PETROLEUM, LTD. "MCDONALD" 2 Section 21, T. 2 S, R. 15 W., S.B. B. & M., Playa del Rey Oil Field, in Los Angeles County, were witnessed by J. B. Witty, representative of the supervisor, on May 16, 1932. There was also present J. C. Ayres, Driller, Gordon Graham, Contractor.

Casing Record 14" S.P. cem. 696'; 8-5/8" cem. 3526', W.S.O., reported bad at about 2000'; shot at 1950'. T.D. 5860', plugged with cement 4642'-4500', and 2018'-1896'.

The operations were performed for the purpose of testing the location and hardness of a cement plug required to be placed from 2000' to 1970' in the process of abandonment.

and the data and conclusions are as follows:

INSPECTOR JOHNSON VISITED THE WELL ON MAY 13, 1932, AND MR. GRAHAM REPORTED THE FOLLOWING:
1. The hole could not be cleaned out below 2018'.
2. On May 12, 1932, 350 bbls. of mud was dumped in the hole in an attempt to fill it to the surface. At no time did the fluid level rise above 30'.

INSPECTOR JOHNSON NOTED THE FOLLOWING:
1. The hole was open to 2018'.
2. The 8-5/8" casing was shot at 1950' with a 4"x5' shell containing 30 lb. of 80% gelatin.
3. The shot could not be run lower than 1950' due to the heavy mud in the hole.
4. The shot cavity was cleaned out and 30 sacks of Victor cement was dumped at 2018'.

INSPECTOR JOHNSON AGAIN VISITED THE WELL ON MAY 14, 1932, AND NOTED THE FOLLOWING:
1. The bailer was spudded to a depth of 1929' and brought up a sample of set cement.
2. 8 sacks of Victor cement was dumped at 1929'.

THE INSPECTOR ARRIVED AT THE WELL AT 9:40 A. M., AND NOTED THE FOLLOWING: The bailer could not be spudded below 1896' and brought up a sample of set cement.

The test was completed at 10:00 a. m.

THE LOCATION AND HARDNESS OF CEMENT PLUG AT 1896' ARE APPROVED.

Report on Proposed Operations

No. P -1-24279

Los Angeles, Cal. May 13, 19 32.

MR. W. H. Graham,

Long Beach, Cal.

~~Agent~~ for SMITH & GRAHAM ~~Company~~

DEAR SIR:

HUBERT F. LAUGHARN, RECEIVER FOR MCDONALD PETROLEUM, LTD.

Your proposal to abandon / Well No. "MCDONALD" 2,

Section 21, T. 2 S., R. 15 W., S.B. B. & M., Playa del Rey Oil Field, Los Angeles County,

dated May 10, 19 32, received May 12, 19 32, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

Records in addition to, or at variance with those shown in the notice:
The 8-5/8" shut-off was approved.
Total depth 5860'; bridged with cement 4642'-4500'.
This well last produced during January 1931 at the average daily rate of 50 bbl. of oil and 200 bbl. of water.

THE NOTICE STATES:
"The present condition of the well is as follows:
14" Surface Casing set at 696'
8 5/8" Casing set at 3526'
Reported bad at about 2000'
Bottom of hole plugged at 4500'"

PROPOSAL:
"The proposed work is as follows:
To clean out hole to bad place in casing.
Shoot cavity shot at this point. Clean out cavity and fill with 20' cement plug.
Remove 8 5/8" casing, fill hole with heavy mud and Cap the surface casing with a metal seal."

DECISION:
THE PROPOSAL IS APPROVED PROVIDED THAT:

1. The hole shall be cleaned out to the bad place in the casing at about 2000' and shot with 10' shell containing 50 lb. of 80% gelatin.
2. The shot cavity shall be cleaned out and plugged with a cement plug at least 30' long.
3. The 8-5/8" casing shall not be pulled from below 676'.
4. The stub of the 8-5/8" casing shall be capped with a cement plug at least 20' long.
5. All portions of the hole not plugged with cement shall be filled with heavy mud.
6. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
   (a) The depth to which the hole is cleaned out.
   (b) The shooting operations at about 2000'.
   (c) The placing of the cement plug in the shot cavity.
   (d) The location and hardness of the cement plug at about 1970'.
   (e) The cutting or shooting of the 8-5/8" casing at 676'.
   (f) The placing of the cement plug on the stub of the 8-5/8" casing.
   (g) The location and hardness of the cement plug at 656'.

NOTE: A complete report in duplicate on our form 102 shall be filed with this Division after the completion of the above work.
In approving the above proposal this Division does not pass upon your right to enter upon this property, but merely approves the work as conforming to our requirements for abandonment.

This notice must be given at least five days before work is to begin

Long Beach, Cal. May 10th 1932

MR. E.Huguenin,

Deputy State Oil and Gas Supervisor

Los Angeles, Calif. Cal.

DEAR SIR:

In compliance with Section 16, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to abandon well No. McDonald No.2, Sec. 21, T. 2 S, R. , B. & M., Venice, Playa Del Rey, Oil Field, Los Angeles, County, commencing work on the 10th day of May 1932

The present condition of the well is as follows:

14" Surface Casing set at 696'
8 5/8" Casing set at 3526'
Reported bad at about 2000'
Bottom of hole plugged at 4500'

The proposed work is as follows:

To clean out hole to bad place in casing.
Shoot cavity shot at this point. Clean out cavity and fill with 20' cement plug.
Remove 8 5/8" casing, fill hole with heavy mud and Cap the surface casing with a metal seal.

Approved

ADDRESS NOTICE TO DEPUTY STATE OIL AND GAS SUPERVISOR IN CHARGE OF DISTRICT WHERE WELL IS LOCATED

629 South Hill Street
Los Angeles
February 25, 1932

Hubert F. Laugharn, Receiver
for McDonald Petroleum Company
621 Subway Terminal Building
Los Angeles, California

Dear Sir:

Please refer to my letter of November 13, 1931, regarding your well No. "McDonald" 2, which has now been standing idle over a year in bad mechanical condition. Engineer Barton discussed this matter some months ago with your Mr. Smith, who stated that the well at that time was in process of going into bankruptcy and that a trustee would undoubtedly be appointed at that time. Will you please advise me whether this well is still under your receivership, and if not, who was appointed trustee in bankruptcy?

Yours truly,

Deputy Supervisor.

cc-R. D. Bush

Report on Proposed Operations

No. P-1-23717

Los Angeles, Cal. October 17, 1931.

MR. B. D. Owens,
Compton, Cal.
~~Agent for~~ OWENS & OWENS ~~Company~~

DEAR SIR:

Your HUBERT F. LAUGHARN, RECEIVER proposal to abandon / Well No. "MCDONALD" 2,
Section 21, T2 S., R.15 W., S.B. B. & M., Playa del Rey Oil Field, Los Angeles County,
dated Oct. 15, 1931, received Oct. 15, 1931, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

Records in addition to, or at variance with those shown in the notice:
Casing: 14" S. P. cem. 696'
8-5/8" cement 3526', W. S. O.
T. D. 5860'; cement bridge from 4642' to 4500'.
This well was last produced in January, 1931, and at that time made approximately 50 bbl. per day of oil and 200 bbl. per day of water from the upper zone.

THE NOTICE STATES:
"The present condition of the well is as follows:
14" S. P. cem. 696'
8 5/8" cem. 3526 (36#) W.S.X.O.
Liner ?
Scout Report 5841' Bottom
" " Pluged back 4550'"

PROPOSAL:
"The proposed work is as follows:
Abandon well in accordance with your requirements"

DECISION:
THE PROPOSAL IS APPROVED PROVIDED THAT:
1. The hole shall be cleaned out to depth of 3546' or 20' below the shoe of the 8-5/8" casing.
2. A solid cement bridge shall be placed from 3546' up to 3506' or to a point 20' above the shoe of the 8-5/8" casing.
3. The 8-5/8" casing shall not be removed from below 676'.
4. A 20' cement plug shall be placed on top of the stub of the 8-5/8" casing from approximately 676' up to 656'.
5. All portions of the hole not filled with cement shall be filled with heavy mud fluid.
6. The 14" S.P. casing shall be securely capped at the surface.
7. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
   (a) The placing of the cement from 3546' up to 3506'.
   (b) The shooting or cutting of the 8-5/8" casing at 676'.
   (c) The location and hardness of the cement plug at 656'.

NOTE: In approving the above proposal this Division does not pass upon your right to enter upon this property, but merely approves the work as conforming to our requirements for abandonment.

Report on Test of Water Shut-off
(BAILING)

No. T -1-22268

Los Angeles, Cal. December 3, 1930.

Mr. C. C. Boatright,
Los Angeles, Cal.

Agent for McDONALD PETROLEUM, LTD. ~~Company~~

DEAR SIR:

Your well No. 2, Sec. 21, T. 2-S., R. 15-W., S. B. B. & M.,
Playa del Rey Oil Field, in Los Angeles County, was tested for
shut-off of water on November 23 (Time and date), 1930. Mr F. C. Hodges,
designated by the supervisor, was present as prescribed in Section 19, Chapter 718, Statutes 1915, as amended, and there were also present M. P. Boatright, Driller,
and T. B. Turner, Operator.

Location of water tested above 3526' and normal fluid level not reported

Depth and manner of water shut-off: { 3526 ft. of 8-5/8 in. 36 lb. / ~~ft. of in. lb.~~ } casing was re{ cemented / 11-17-30 / ~~landed~~ } in shale Formation

at 3526 ft. with 60 sacks Blue Diamond cement by casing method.

Water string was landed in 10½" rotary (Size, rotary or cable tool) hole.

Casing record of well 14" S.P. cem. 696'; 8-5/8" as above.

with cement from 4642' to 4500' and

Reported total depth of hole 5860 ft. Hole bridged from 3552 ft. to 3531 ft. Hole cleaned out to 3531 ft. for this test.

At time of test depth of hole measured 3525 ft. and bailer brought up sample of sand and set cement

At 3:00 p.m., Nov. 22, 1930 (Time and date) oil bailed to showing ft., drilling fluid { bailed / ~~swabbed~~ } to 1500 ft.

At 2:30 p.m., Nov. 23, 1930 (Time and date) top of oil found at showing ft., top of fluid found at 1455 ft.

Result of test:

MR. BOATRIGHT REPORTED THE FOLLOWING:

1. 3526' of 8-5/8" 36-lb. casing was first cemented on October 31, 1930, with 350 sacks of Blue Diamond cement by the casing method.
2. No casing test was made.
3. 25' of set cement was drilled out of the 8-5/8" casing, equivalent to 7 sacks.
4. The last 100 sacks of cement was treated with quick setting chemical.
5. The shut-off was not effective and the 8-5/8" casing was re-cemented on November 4, 1930, with 40 sacks of Blue Diamond cement by the tubing method.
6. No casing test was made.
7. 125' of set cement was drilled out of the 8-5/8" casing, equivalent to 35 sacks.
8. The 8-5/8" casing was again re-cemented on November 17, as noted above.
9. No fluid entered the well when bailed to 1500' and allowed to stand 2 hr. for a casing test.
10. 139' of set cement was drilled out of the 8-5/8" casing, equivalent to 39 sacks.

DEAR SIR:

Operations at your well No. 2 Section 21, T. 2 S., R. 15 W., S.B. B. & M., Playa del Rey Oil Field, in Los Angeles County, were witnessed by R. W. Walling, representative of the supervisor, on 10:27 a.m. Sept. 5, 19 30. There was also present C. C. Boatright, Superintendant.

Casing Record 14" S. P. cemented 696'.

The operations were performed for the purpose of inspecting blow-out prevention equipment.

and the data and conclusions are as follows:

Mr. Boatright reported the following:
1. Bottom of hole at 3708'.
2. Changing from 6" to 5" drill pipe.
3. Will reduce size of hole.

Thoroguh investigation showed equipment as installed at the time of this inspection to be satisfactory.

Report on Proposed Operations

No. P-1-21912

Los Angeles, Cal. June 30, 1930.

MR. C. C. Boatright,
Los Angeles, Cal.
Agent for McDONALD PETROLEUM, LTD. Company

121

DEAR SIR:

Your proposal to drill Well No. 2,
Section 21, T2-S., R.15-W., S.B. B. & M., Playa del Rey Oil Field, Los Angeles County,
dated May 31, 1930, received June 3, 1930, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

THE NOTICE STATES:

"The well is 28 feet S. and 19 feet W. from N.E. cor. Lot #2, Block #5, Silverstrand Tr. The elevation of the derrick floor above sea level is 12 feet. We estimate that the first productive oil or gas sand should be encountered at a depth of about 6100 feet, more or less."

PROPOSAL:

"We propose to use the following strings of casing, either cementing or landing them as here indicated:

Size of Casing	Weight	New or Second Hand	Depth	Landed or Cemented
14"	S.P.	New	700	Cemented
8-5/8"	36#	2nd hand	6100	"
6-5/8"	28#	2nd hand	6200	Landed

It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing."

DECISION:

THE PROPOSAL IS APPROVED PROVIDED THAT:

1. (a) Mud fluid of not less than 70 lb. per cubic foot shall be used in the drilling of the well and the column of mud fluid shall be maintained at all times to the surface, particularly while pulling the drill pipe.
   (b) Adequate blow-out prevention equipment shall be provided and ready for operation at all times.
2. Any hole to be sidetracked at any time during the drilling of this well shall be completely filled with cement.
3. The upper oil zone shall be cored continuously from 3400' to 3900' and a solid string of casing cemented over this zone.
4. The formations to be left back of the 8-5/8" casing shall be mudded by open circulation until the loss is not more than 5.0 bbl. per hr.
5. The exact cementing depth for the 8-5/8" casing shall be determined by careful coring, beginning not lower than 5950'.
6. The column of mud fluid back of the first water string shall be maintained to the surface for at least 30 days after cementing this water string.
7. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
   (a) Final mudding operations before cementing the 8-5/8" casing.
   (b) Bailing tests of the first water string and 8-5/8" shut-off.

Note: This report supersedes and nullifies report No. P-1-21810, dated June 6, 1930, for the reason that present developments in the immediate area indicate a productive zone between 3400' and 3900' at this location.

DEAR SIR:

In compliance with Section 17, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to commence the work of drilling well No. 2, Sec. 21, T. 2 S., R. 15 W., S.B. B. & M., (Venice) Playa del Rey Oil Field, Los Angeles County.

The well is 28 feet X or S., and 19 feet X or W. from N.E. cor. Lot #2, Block #5, Silverstrand Tr.
(Give location in distance from section corners or other corners of legal subdivision)

The elevation of the derrick floor above sea level is 12 feet.

We propose to use the following strings of casing, either cementing or landing them as here indicated:

Size of Casing, Inches	Weight, Lb. Per Foot	New or Second Hand	Depth	Landed or Cemented
14"	S.P.	New	700	Cemented
8-5/8"	36#	2nd hand	6100	"

EDR Inquiry # 4591455.3	Contact: Dennis Fee

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Sanborn® Library search results

Certification #: FD59-4C18-9DF0

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Ninyo & Moore (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

EDR Historical Topo Map Report

04/13/16

Site Name:	Client Name:
128 Hurricane Street	Ninyo & Moore
128 Hurricane Street	475 Goddard
Marina Del Rey, CA 90292	Irvine, CA 92618
EDR Inquiry # 4591455.4	Contact: Dennis Fee

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

128 HURRICANE STREET
MARINA DEL REY, CA 90292

COORDINATES

Latitude (North):	33.9757360 - 33° 58' 32.64''
Longitude (West):	118.4613320 - 118° 27' 40.79''

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2015 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
LA PUMPING PLANT #46	140 HURRICANE ST	NNE 0 - 1/8 (0.004 mi.)	1	8

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 02/01/2016 has revealed that there are 3 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

State and tribal leaking storage tank lists

SLIC: SLIC Region comes from the California Regional Water Quality Control Board.

A review of the SLIC list, as provided by EDR, and dated 12/14/2015 has revealed that there are 5 SLIC sites within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

HWP: Detailed information on permitted hazardous waste facilities and corrective action ("cleanups") tracked in EnviroStor.

A review of the HWP list, as provided by EDR, and dated 02/22/2016 has revealed that there is 1 HWP site within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Notify 65: Listings of all Proposition 65 incidents reported to counties by the State Water Resources Control Board and the Regional Water Quality Control Board. This database is no longer updated by the reporting agency.

A review of the Notify 65 list, as provided by EDR, and dated 09/10/2015 has revealed that there is 1 Notify 65 site within approximately 1 mile of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/30/2015
Date Data Arrived at EDR: 11/07/2015

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/30/2015

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/30/2015

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 03/26/2015

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 12/09/2015

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Data Release Frequency: Varies

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

UTM Y (Meters):	3760233.5
Elevation:	8 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5640438 VENICE, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

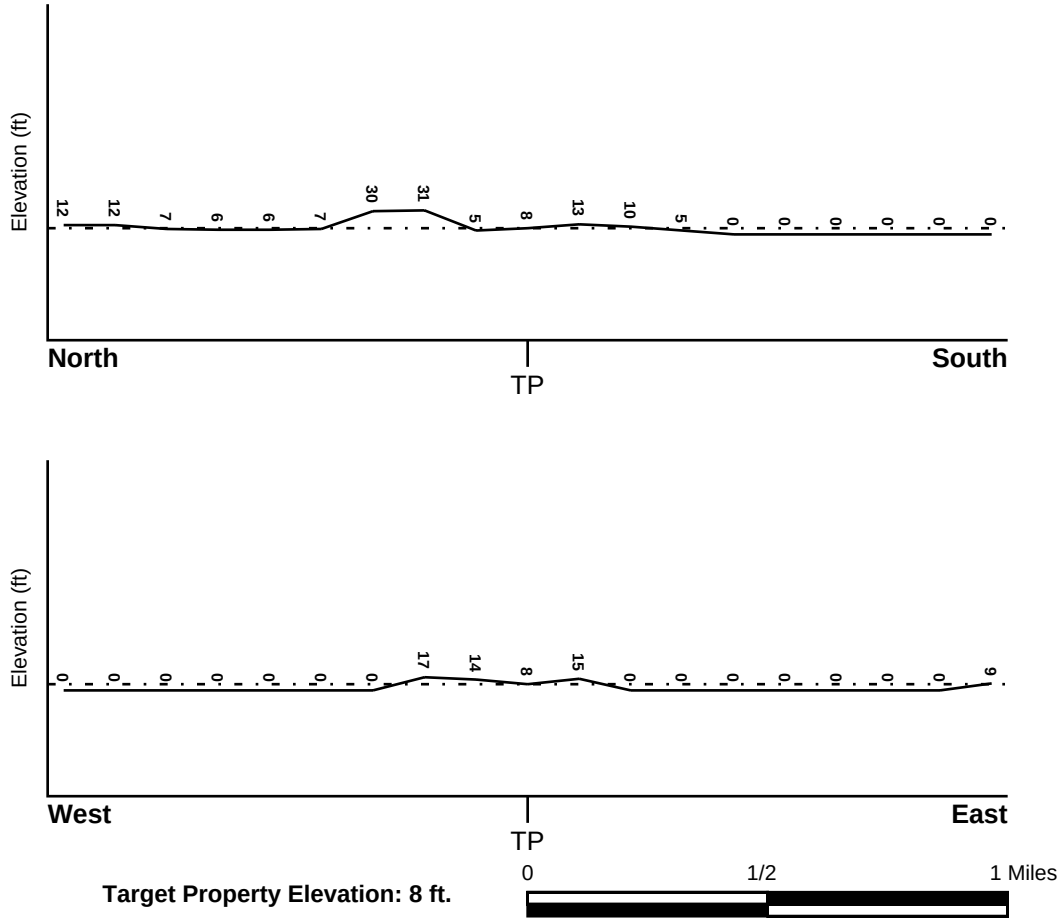
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06037C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
VENICE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
2	1/2 - 1 Mile North	S

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	DELHI
Soil Surface Texture:	sand
Hydrologic Group:	Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.
Soil Drainage Class:	Somewhat excessive. Soils have high hydraulic conductivity and low water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 60 inches
Depth to Bedrock Max:	> 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	10 inches	sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 20.00 Min: 6.00	Max: 7.80 Min: 6.10
2	10 inches	30 inches	sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 20.00 Min: 6.00	Max: 7.80 Min: 6.10
3	30 inches	50 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 20.00 Min: 6.00	Max: 7.80 Min: 6.10
4	50 inches	70 inches	sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 20.00 Min: 6.00	Max: 7.80 Min: 6.10

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: coarse sand
silt loam
sandy loam
gravelly - sand
loamy sand
clay

Surficial Soil Types: coarse sand
silt loam
sandy loam
gravelly - sand
loamy sand

clay

Shallow Soil Types: fine sandy loam
gravelly - loam
sandy clay loam
sandy clay

Deeper Soil Types: coarse sand
silty clay loam
gravelly - fine sandy loam
stratified
gravelly - sandy loam
weathered bedrock
clay loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

Dear Mr. Fee:

We have received your Public Records Act Request for records from the Department of Toxic Substances Control.

After a thorough review of our files we have found that no such records exist at this office pertaining to the site/facility referenced above.

We would also like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. Envirostor can be accessed at: http://www.envirostor.dtsc.ca.gov/public. Also, a computer is available in the Central Files of each DTSC Regional Office for use by community members to view Envirostor.

If you have any questions or would like further information regarding your request, please contact me at (818) 717-6521.

Sincerely,

Vivien Tutaan/rh

RE: 128 Hurricane St., Marina Del Rey, CA 90292

I, the undersigned, being the Custodian or the Keeper of Records, certify that a thorough search for the records you requested was carried out under my direction and control.

This search revealed no records.

It should be understood that this does not mean that the records you requested do not exist. It is possible that such records may be misfiled; exist under another spelling, another name, or under another classification. However, with the information furnished to our office, and to the best of our knowledge, no records were located.

If you have any questions regarding your request, please contact our office at (323) 890-7806.

Sincerely,

Jorge Perez, Deputy Health Officer
Public Health Investigation

COR ID No.162531

APPENDIX G

VAPOR ENCROACHMENT SCREENING

Phase I Environmental Site Assessment (ESA) Vapor Encroachment Conditions (VEC) matrix includes a (1) Search Radius Test, (2) Chemicals of Concern (COC) Test, and (3) a Critical Distance Test [1].

(1) Search Radius Test: Are there known or suspect contaminated properties in the primary area of concern within the corresponding search radii?

☒ Yes ☐ No — If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(2) Chemicals of Concern Test: Are COCs likely to be present within the area of concern for those known or suspect contaminated sites identified based on the Search Distance Test?

☒ Yes ☐ No — If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(3) Critical Distance Test: A plume test to determine whether or not COCs in the contaminated plume(s) may be within the critical distance.

☐ Yes ☒ No — (3a) Is information related to the contaminated plume(s) available (i.e. isoconcentration maps, site drawings, etc.)?
(3b) If ***No***, then a VEC cannot be ruled out; check ***Yes*** in #4 below indicating it is likely a VEC exists. If ***Yes***, then:

☐ Yes ☐ No — (3c) Is the site less than 100 feet to the nearest edge of a contaminated [non-petroleum hydrocarbon] plume(s)? If ***Yes***, then check ***Yes*** in #4 below indicating it is likely a VEC exists.

☐ Yes ☐ No — (3d) Is the site less than 30 feet to the nearest edge of a dissolved petroleum hydrocarbon plume(s)? If ***Yes***, then check ***Yes*** in #4 below indicating it is likely a VEC exists.

If the distance from the nearest edge of a contaminated plume to the nearest existing or planned structure on the site is less than 100 feet for non-petroleum hydrocarbon COC, or less than 30 feet for dissolved petroleum hydrocarbons, then it is presumed that a VEC *currently* exists beneath the site. If the distance from the nearest edge of the contaminated plume is greater than or equal to 100 feet for non-petroleum hydrocarbons, or 30 feet for dissolved petroleum hydrocarbon chemicals of concern, then it is presumed unlikely that a VEC *currently* exists beneath the site.

(4) Is it likely that a VEC *currently* exists beneath the site?

☒ Yes ☐ No — If ***No***, then the VEC screening is complete and no further investigation is recommended at this time. If ***Yes***, Ninyo & Moore recommends performing additional assessment, such as a Tier 2 VEC assessment according to ASTM E 2600-10.

[1] Based on guidance presented in the ASTM E 2600-10 Standard.
