SUBJECT: DRAFT ENVIRONMENTAL IMPACT REPORT

This is to advise that the Kern County Planning and Community Development Department has prepared an Environmental Impact Report (EIR) for the project identified below. As mandated by State law, the minimum public review period for this document is 45 days. The document and documents referenced in the Draft EIR are available for review at the Planning and Community Development Department, 2700 "M" Street, Suite 100, Bakersfield, CA 93301 or on the Departmental website (**http://pcd.kerndsa.com/planning/oil-gas-zoning-amendment**).

The Kern County Planning and Community Development Department will host a joint public briefing workshop with the Kern County Board of Supervisors and the Kern County Planning Commission to receive comments on the document on: **July 27, 2015** at 9:00 a.m., at the Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

Comments can be also be submitted at one of our additional public workshops that will be held at **6:00 p.m.** at the following locations and dates:

Shafter Veterans Building, Room 2, 309 California Avenue, Shafter CA	**August 10, 2015**
Taft Veterans Hall, Room 1, 218 Taylor Street, Taft, CA	**August 17, 2015**

A public hearing has been scheduled with the Kern County Planning Commission to receive comments on the document on: **October 5, 2015** at 5:00 p.m or soon thereafter, Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

The comment period for this document closes on **August 24, 2015**. Testimony at future public hearings may be limited to those issues raised during the public review period either orally or submitted in writing by 5:00 p.m. the day the comment period closes.

Project Title: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting.

Project Location: The Project Boundary (Local Permitting Boundary Area) encompasses 3,110 square miles and generally includes the San Joaquin Valley Floor portion of Kern County up to an elevation of 2,000 feet. The boundary includes: west side-the San Luis Obispo County line, north side- the Kings and Tulare county lines, east and south sides-the 2,000-foot elevation contours, squared off to the nearest section line.

Project Description: The proposed Project consists of revisions to various Chapters of Title 19 Kern County Zoning Ordinance to implement a new permit process for oil and gas activities. The revisions include new site development standards and review processes for all oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County by:

(a) Removing the "Unrestricted Drilling" Section in Chapter 19.98 and updated "Drilling by Ministerial Permit" and "Drilling by Conditional Use Permit" Sections;

(b) Establishing a new "Tier Area" maps to address different land uses and zone districts where oil and gas activities occur and are proposed to occur in the future;

(c) Establishing an Oil and Gas Conformity Review and Minor Activity Review, as part of the "Drilling by Ministerial Permit" Section in Chapter 19.98, to ensure compliance with all applicable Development and Implementation Standards and Conditions;

(d) Establishing new Development and Implementation Standards and Conditions Section in Chapter 19.98;

(e) Establishing new requirements for site plan sign-off by owners of the surface and minerals for split estate ownership;

(f) Revising additional Chapters of the Zoning Ordinance to ensure consistency with the new requirements of this EIR. These Chapters include: 19.08 – Interpretations and General Standards, 19.48 – Drilling Island (DI) District, 19.50 – Floodplain Primary District, 19.66 – Petroleum Extraction (PE) Combining District, 19.81 - Outdoor Lighting (Dark Skies Ordinance), 19.88 – Hillside Development, 19.102 – Permit Procedures, and 19.108 – Nonconforming Uses, Structures, and Lots.

REVISED
DRAFT ENVIRONMENTAL IMPACT REPORT
NOTICE OF AVAILABILITY FOR PUBLIC REVIEW

This is to advise that the Kern County Planning and Community Development Department has prepared an Environmental Impact Report (EIR) for the project identified below. The document and documents referenced in the Draft EIR are available for review at the Planning and Community Development Department, 2700 "M" Street, Suite 100, Bakersfield, CA 93301 or on the Departmental website (**http://pcd.kerndsa.com/planning/oil-gas-zoning-amendment**).

The Kern County Planning and Community Development Department will host a joint public briefing workshop with the Kern County Board of Supervisors and the Kern County Planning Commission to receive comments on the document on: **July 27, 2015** at 9:00 a.m., at the Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

Comments can be also be submitted at one of our additional public workshops that will be held at **6:00 p.m.** at the following locations and dates:

Shafter Veterans Building, Room 2, 309 California Avenue, Shafter CA	**August 10, 2015**
Taft Veterans Hall, Room 1, 218 Taylor Street, Taft, CA	**August 17, 2015**

A public hearing has been scheduled with the Kern County Planning Commission to receive comments on the document on: **October 5, 2015** at 5:00 p.m or soon thereafter, Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

The comment period for this document closes on **September 11, 2015**. Testimony at future public hearings may be limited to those issues raised during the public review period either orally or submitted in writing by 5:00 p.m. the day the comment period closes.

Project Title: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting.

Project Location: The Project Boundary (Local Permitting Boundary Area) encompasses 3,110 square miles and generally includes the San Joaquin Valley Floor portion of Kern County up to an elevation of 2,000 feet. The boundary includes: west side-the San Luis Obispo County line, north side- the Kings and Tulare county lines, east and south sides-the 2,000-foot elevation contours, squared off to the nearest section line.

Project Description: The proposed Project consists of revisions to various Chapters of Title 19 Kern County Zoning Ordinance to implement a new permit process for oil and gas activities. The revisions include new site development standards and review processes for all oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County by:

(a) Removing the "Unrestricted Drilling" Section in Chapter 19.98 and updated "Drilling by Ministerial Permit" and "Drilling by Conditional Use Permit" Sections;

(b) Establishing a new "Tier Area" maps to address different land uses and zone districts where oil and gas activities occur and are proposed to occur in the future;

(c) Establishing an Oil and Gas Conformity Review and Minor Activity Review, as part of the "Drilling by Ministerial Permit" Section in Chapter 19.98, to ensure compliance with all applicable Development and Implementation Standards and Conditions;

(d) Establishing new Development and Implementation Standards and Conditions Section in Chapter 19.98;

(e) Establishing new requirements for site plan sign-off by owners of the surface and minerals for split estate ownership;

Revising additional Chapters of the Zoning Ordinance to ensure consistency with the new requirements of this EIR. These Chapters include: 19.08 – Interpretations and General Standards, 19.48 – Drilling Island (DI) District, 19.50 – Floodplain Primary District, 19.66 – Petroleum Extraction (PE) Combining District, 19.81 - Outdoor Lighting (Dark Skies Ordinance), 19.88 – Hillside Development, 19.102 – Permit Procedures, and 19.108 – Nonconforming Uses, Structures, and Lots;

(f) Several sites within the Project Area are listed by CalEPA on the Cortese List, as identified in the DEIR.

Anticipated Significant Impacts on Environment: Aesthetics, Agricultural Resources, Air Quality; Biological Resources; Cultural Resources, Greenhouse Gas, Energy, Hydrology and Water Quality, and Utilities and Services

Document can be viewed online at: http://pcd.kerndsa.com/planning/oil-gas-zoning-amendment

For further information, please contact: Christopher B. Mynk, AICP Supervising Planner at (661) 862-8607 or MynkC@co.kern.ca.us

AMERICANS WITH DISABILITIES ACT
(Government Code Section 54953.2)

Disabled individuals who need special assistance to attend or participate in a meeting of the Kern County Planning Commission may request assistance at the Kern County Planning and Community Development Department, 2700 "M" Street, Suite 100, Bakersfield, California 93301, or by calling Allison Molina at (661) 862-8615. Every effort will be made to reasonably accommodate individuals with disabilities by making meeting materials available in alternative formats. Requests for assistance should be made five (5) working days in advance whenever possible.

Volume II - Appendices

A	Notice of Preparation
B	Responsible Agencies and DOGGR [Reserved]
C	Scoping Meeting Materials
D	Scoping Comments
E	Update and Report on Joint ARB/CAPCOA AB 8 Carl Moyer Program Evaluation
F	Land Use Disturbance Report
G	Visual Resources Technical Report
H	Farmland Conversion Study
I	Emissions Tables
J	Greenhouse Gas Emissions Table
K	List of Equipment
L	San Joaquin Valley Air Pollution Control District Documents
M	Health Risk Assessment Proposed Drilling and Oil and Gas Operations
N	Biological Resources Species Modeled Figures and Category 3 Species Review
O	Cultural Resources Technical Report
P	Paleontological Resources Technical Report
Q	Soil and Geology Study
R	Hazardous Materials Supporting Tables
S	Water Quality Assessment Report
T	Water Supply Assessment Report
U	Kern County Drilling and Hydraulic Fracturing Comparison Memo
V	Environmental Noise Assessment
W	Traffic Impact Study and Roadway Assessment

Chapter 1

Executive Summary

Chapter 1
Executive Summary

1.1 Introduction

The proposed Project consists of an Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance and related sections of the Kern County Zoning Ordinance to include updated procedures, development standards, and conditions for future oil and gas exploration, development, and production activities in unincorporated Kern County. Representatives of the oil and gas industry associations—specifically the California Independent Petroleum Association (CIPA), the Independent Oil Producers Agency (IOPA), and the Western States Petroleum Association (WSPA) (collectively, "Project Applicant")—requested an amendment to Chapter 19.98 (Oil and Gas Production) and related chapters of the Kern County Zoning Ordinance to include additional provisions for local permitting of oil and gas activities. Under Chapter 19.112, amendments to the text of the Zoning Title of the Kern County Zoning Ordinance can only be initiated by the Kern County Board of Supervisors. The request was considered in a public hearing before the Board of Supervisors on January 22, 2013, and the Board directed Planning and Community Development Staff to proceed with processing the requested amendments. This revision of the Zoning Ordinance for local permitting also requires that other relevant references in the Zoning Ordinance be reviewed and revised for consistency. The Amended Zoning Ordinance, together with the implementation of future oil and gas activities expected to be undertaken pursuant to the Amended Zoning Ordinance, is the "Project" considered in this EIR (hereafter referred to as the "Project").

This Draft Environmental Impact Report (EIR) has been prepared by Kern County as the Lead Agency under the California Environmental Quality Act (CEQA). The EIR provides information about the environmental setting and impacts of the Project and alternatives. It informs the public about the Project and its impacts and provides information to meet the needs of local, state, and federal permitting agencies that are required to consider the Project. The EIR will be used by Kern County to determine whether to approve the proposed amendment to Chapter 19.98 and related chapters of the Kern County Zoning Ordinance.

This Executive Summary summarizes the requirements of the CEQA Statute and Guidelines, provides an overview of the Project and alternatives, identifies the purpose of the Draft EIR, outlines the potential impacts of the Project and the recommended mitigation measures, and discloses areas of controversy and issues to be resolved.

1.2 Project Summary

The Project is to amend Chapter 19.98 and related chapters of the Kern County Zoning Ordinance. The Project also includes a potential future oil and gas development scenario with oil and gas activities that are expected to be undertaken pursuant to the amendment to the Zoning Ordinance. The Draft EIR, once certified, will be used to satisfy the CEQA requirements for the following discretionary approvals:

1. Amendment of Kern County Zoning Ordinance Chapter 19.98 and related chapters for consistency with amended Chapter 19.98;
2. California Division of Oil, Gas & Geothermal Resources permitting of oil and gas activities, including well stimulation, in the Project Area;
3. San Joaquin Valley Air Pollution Control District permitting for oil and gas-related equipment/facilities, including, for example, boilers, steam generators, process heaters, flares, tanks, and portable equipment;
4. Central Valley Regional Water Quality Control Board Waste Discharge Requirements (WDRs) and Clean Water Act section 401 Water Quality Certifications and WDR waivers;
5. California Department of Fish and Wildlife incidental take permits;
6. California Department of Toxic Substances Control oversight of routine management and cleanup of non-petroleum spills and releases;
7. California Department of Transportation encroachment permits;
8. Central Valley Flood Protection Control Board encroachment permits;
9. Kern County Water Agency and other water districts' permits for water-related uses;
10. Approval of the proposed Project Mitigation Measure Monitoring Program;
11. Approval of the CEQA Findings pursuant to CEQA Guidelines Sections 15091 and 15093; and
12. Approval of a Statement of Overriding Consideration.

1.3 Purpose and Use of the Draft EIR

An EIR is a public informational document used for planning and decision-making purposes. The Kern County Planning Commission and Board of Supervisors will consider the information in the EIR, including the public comments and staff response to those comments, during the public hearing process. As a legislative action, the final decision is made by the Board of Supervisors, who may approve, conditionally approve, or deny the Project. The purpose of an EIR is to identify:

- The significant potential impacts of the Project on the environment and indicate the manner in which those significant impacts can be avoided or mitigated;
- Any unavoidable adverse impacts that cannot be mitigated; and
- Reasonable and feasible alternatives to the Project that would eliminate any significant adverse environmental impacts or reduce the impacts to a less-than-significant level.

An EIR also discloses growth-inducing impacts; impacts found not to be significant; and significant cumulative impacts of past, present, and reasonably anticipated future projects. CEQA requires an EIR be prepared that reflects the independent judgment of the lead agency regarding the impacts, the level of significance of the impacts both before and after mitigation, and mitigation measures proposed to reduce the impacts. A Draft EIR is circulated to responsible agencies, trustee agencies with resources affected by the Project, and interested agencies and individuals. The purposes of public and agency review of a Draft EIR include sharing expertise, disclosing agency analyses, checking for accuracy, detecting omissions, discovering public concerns, and soliciting counterproposals. Reviewers of a Draft EIR are requested to focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the Project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate significant environmental effects.

This Draft EIR is being distributed directly to agencies, organizations, and interested groups and persons for comment during a 45-day formal review period in accordance with Section 15087 of the CEQA Guidelines. The EIR process, including means by which members of the public can comment on the EIR, is discussed further in Chapter 2, Introduction.

1.4 Project Overview

This section describes the local and regional setting, surrounding land uses, Project objectives, and Project characteristics. The Project is described in further detail in Chapter 3, Project Description. The Amended Zoning Ordinance is also included as Attachment A at the end of this Executive Summary for ready reference.

1.4.1 Local and Regional Setting

Kern County is California's third-largest county in terms of land area, encompassing 8,202 square miles. Located at the southern end of the Central Valley, Kern County serves as the gateway to southern California, the San Joaquin Valley, and California's high desert. The geography of Kern County is diverse, containing mountainous areas, agricultural lands, and desert areas.

Kern County is bounded by Kings, Tulare, and Inyo counties on the north, San Bernardino County on the east, Los Angeles and Ventura counties on the south, and Santa Barbara and San Luis Obispo Counties on the west. Kern County includes eight incorporated cities within the

portion of the county located in the San Joaquin Valley including Arvin, Bakersfield, Delano, Maricopa, McFarland, Shafter, Taft, and Wasco. Oil and gas exploration and development activities have historically occurred in the San Joaquin Valley Floor portion of the County and are likely to continue to occur in the same vicinity. For this reason, the EIR evaluates potential impacts of future oil and gas exploration and production activities within a defined boundary.

The Kern County General Plan describes the San Joaquin Valley region as "the southern San Joaquin Valley below an elevation of 1,000 feet mean sea level (MSL)" within Kern County. The San Joaquin Valley portion is characterized by relatively low rainfall, averaging less than 10 inches per year. Average temperatures are relatively high, and total evaporation exceeds total precipitation. Summers are relatively cloudless, hot, and dry. Winter is generally mild, but an occasional freeze does occur and may cause substantial agricultural damage. Average length of the growing season is 265 days. The San Joaquin Valley region is within the southern end of the San Joaquin Valley Air Basin (SJVAB) managed by the San Joaquin Valley Air Pollution Control District (SJVAPCD). This district encompasses Fresno, Kings, Madera, Merced, San Joaquin, Stanislaus, and Tulare counties, as well as the San Joaquin Valley portion of Kern County. Further, the San Joaquin Valley region is within the Tulare Lake Groundwater Basin, which includes the Kern River Hydrographic Unit and the Poso Hydrographic Unit. These are subject to Regional Water Quality Control Board (RWQCB) oversight.

1.4.2 Surrounding Land Uses

The Project Area is bordered on the west by San Luis Obispo County. The border between the two counties approximates the San Andreas Fault line. The Temblor Range forms a general barrier between the more industrial oil drilling operations on the Kern County side of the border verses the more rural and agricultural nature of neighboring San Luis Obispo County, with the exception of the Midway Sunset Oilfield, which crosses into neighboring San Luis Obispo County. The portion of the Midway Sunset Oilfield located within San Luis Obispo County is outside of the Project Area and is not subject to Kern County jurisdiction. Other oil and gas uses exist to the west of the Project Area; however, such activities are less intensive in nature and dispersed throughout a rural area.

To the south, the Project Area is bordered by the San Emigdo Mountains and the Tehachapi Mountains. The Project Area extends to the border of the Los Padres National Forest. The unincorporated community of Frazier Park is located in the uplands several miles south of the Project Area and west of I-5.

To the north, the Project Area is bordered by Kings and Tulare counties. The bordering areas of these two counties contain agricultural and oil and gas operations, as well as dispersed rural residences. The incorporated City of Delano is located on the northern border of Kern County, and adjacent land uses in Tulare County consist of large lot residential, agriculture, and industrial uses.

To the east, the Project Area is bordered by the foothills of surrounding mountain ranges, such as the Greenhorn Mountains and Tehachapi Mountains, as well as the Tejon Hills southeast of the

incorporated City of Arvin. The Project Area also borders the Sequoia National Forest northeast of Bakersfield. Land uses along the border are generally rural in nature.

1.4.3 Project Objectives

County Objectives

The County has defined the following objectives for the Project:

- Update the County's Zoning Ordinance to include additional procedures and compliance standards that address changes in laws and regulations by other agencies, and technological advancements within the oil and gas industry, for the purpose of reducing or eliminating potential significant adverse environmental impacts, to the extent feasible, of future oil and gas activities, and thereby ensure that current County ordinances reflect the County's interest in protecting the health, safety, and general welfare of residents and visitors.
- Encourage ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County, which enables the County to invest in capital improvement projects and social programs, which benefit County residents, retail businesses, and capital industries which ensures the County's fiscal stability.
- Continue Kern County's ongoing commitment to consult and cooperate with federal, state, regional, and local agencies by periodically reviewing adopted regulations to ensure the long-term viability of Kern County's resources.
- Continue to improve and streamline current energy regulations and increase County monitoring and involvement in state and federal energy legislation.
- Protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting sustainability and encouraging best management practices, which are mutually beneficial, through strategic short- and long-range planning.
- Ensure the protection of environmental resources by emphasizing the conservation of productive agricultural lands, the encouragement of planned urban growth, the promotion of clean air strategies to address existing air quality issues, and the promotion of long-term water conservation strategies which will ensure the quality and adequacy of surface and groundwater supplies for future growth of all of Kern County's industries.
- Contain new development within an area large enough to meet generous projections of foreseeable need, but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County.

Applicant Objectives

The Project Applicants have defined the following objectives for the Project:

- Create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County of Kern, as well as the California Division of Oil, Gas and Geothermal Resources and other responsible agencies.
- Achieve an efficient and streamlined environmental review and permitting process for all oil and gas operations covered by the proposed Project.
- Provide for economically feasible and environmentally responsible growth of the Kern County oil and gas industry.
- Develop industry-wide best practices, performance standards, and mitigation measures that ensure adequate protection of public health and safety and the environment.
- Increase oil and gas exploration and production in Kern County as a means of reducing California's dependence upon foreign sources of energy.
- Increase oil and gas exploration and production in Kern County as a means of increasing employment opportunities and economic prosperity to Kern County's residents, businesses, and local government.

1.4.4 Project Characteristics

The proposed Project consists of an amendment to Title 19 of the Kern County Zoning Ordinance, Chapter 19.98 (Oil and Gas Production), and related sections of the Kern County Zoning Ordinance to include updated procedures, development standards and conditions for future oil and gas exploration, and development and production activities in unincorporated Kern County. In addition, the proposed Project includes the implementation of future oil and gas development activities expected to be undertaken pursuant to the amended ordinances.

Proposed Zoning Code Amendment

The requested amendment to Title 19 of the Kern County Zoning Ordinance would incorporate a comprehensive update to all sections of the Zoning Ordinance related to oil and gas exploration and production. The amendment would establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling, and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging, and abandonment. The requested amendment would also establish a new "Oil and Gas Conformity Review" ministerial permit procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. The requested amendment to Title 19 of the Kern County Zoning Ordinance contains provisions that:

- Require all new oil and gas wells for exploration or production obtain approval from the Kern County Planning and Community Development Department prior to drilling commencement.
- Implement the Tier System to address the different land uses and Zone Districts where oil and gas activities occur.
- Require an Oil and Gas Conformity Review as part of the Drilling by Ministerial Permit Section, which would require consistent and comprehensive mitigation based on surrounding land uses.
- Update the Development Standards and Conditions Section to include mitigation measures in this EIR as well as other regulatory requirements.
- Require a signature block and set a review schedule for all Oil and Gas Conformity Review Site Plans submitted to the County.
- Set a specific application processing procedure and timeline for applications on split estate lands without a signature block signed by the Land/Surface Owner.
- Outline a new fee structure to support mitigation compliance and County application review costs.

Chapter 3, Project Description, includes a complete listing of all the text changes to the zoning ordinances (collectively, "Amended Zoning Ordinance") as proposed and analyzed in this EIR. The Amended Zoning Ordinance is also included at the end of this Executive Summary for ready reference.

Potential Future Oil and Gas Development Scenario

Over the next 25 years, this EIR conservatively assumes that an average of 2,697 new producing wells per year could be drilled in the Project Area as part of the potential future oil and gas development scenario included in the proposed Project. The level of well drilling in any given year may be higher or lower than this average, consistent with the variations in well drilling activities that have historically occurred due to market and other conditions.

Each of the wells drilled may be associated with a number of oil and gas activities. For purposes of this EIR, oil and gas activities have been divided into two sets of components: (1) construction activities, which may include but would not be limited to geophysical surveys, access road and well pad construction, drilling, well completion and testing, distribution line construction, well re-working and workovers, well decommissioning, and well abandonment; and (2) operational activities, which may include but would not be limited to geophysical monitoring, produced fluids and natural gas treatment, water management, well stimulation treatment, enhanced oil recovery activities, and water and waste gas injection via injection well.

For more detailed information regarding the potential future oil and gas development scenario, see Chapter 3, Project Description.

1.5 Environmental Impacts

Section 15128 of the CEQA Guidelines requires that an EIR contain a statement briefly indicating the reasons that various, possible, new significant effects of a project were determined not to be significant, and were therefore not discussed in detail in the EIR. The County has engaged the public to participate in the scoping of the environmental document.

The contents of this Draft EIR were established based on a Notice of Preparation/Initial Study (NOP/IS) prepared in accordance with the CEQA Guidelines, as well as public and agency input that were received during the scoping process. The comments to the NOP/IS are found in Appendix D of this document. Based on the findings of the NOP/IS and the results of scoping, a determination was made that this EIR must contain a comprehensive analysis of all environmental issues identified in Appendix G of the CEQA Guidelines.

1.5.1 Impacts Not Further Considered in this EIR

All impacts are discussed in this Draft EIR. No resource areas were eliminated from discussion through the Initial Study.

1.5.2 Impacts of the Proposed Project

No Potential for Impacts to Occur

Potential environmental effects of the Project and mitigation measures are discussed in detail in Chapter 4, Environmental Settings, Impacts, and Mitigation Measures, of this EIR. The following effects were determined to have no potential for impacts to occur:

Agriculture and Forestry Resources

- Impact 4.2-3: Conflict with Existing Zoning For, Or Cause Rezoning Of, Forest Land or Timberland
- Impact 4.2-4: Result in the Loss of Forest Land or Conversion of Forest Land to Non-Forest Use
- Impact 4.2-6: Result in the Cancellation of an Open Space Contract Made Pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for Any Parcel of 100 or More Acres

Hydrology and Water Quality

- Impact 4.9-7: Place Housing within a 100-year Flood Hazard Area as Mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or Other Flood Hazard Delineation Map
- Impact 4.9-10: Contribute to Inundation by Seiche, Tsunami, or Mudflow

Population and Housing

- Impact 4.13-2 Displace Substantial Numbers of Existing Housing, Necessitating the Construction of Replacement Housing Elsewhere
- Impact 4.13-3 Displace Substantial Numbers of People, Necessitating the Construction of Replacement Housing Elsewhere

Less than Significant with Incorporation of Mitigation Measures

Potential environmental effects of the Project and mitigation measures are discussed in detail in Chapter 4, Environmental Settings, Impacts, and Mitigation Measures, of this EIR. After full analysis, the following effects were determined to be less than significant with the incorporation of mitigation measures.

Agriculture and Forestry Resources

- Impact 4.2-1: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to Non-Agricultural Use
- Impact 4.2-5: Involve Other Changes in the Existing Environment Which, Because of Their Location or Nature, Could Result in Conversion of Farmland to Non-agricultural Use or Conversion of Forest Land to Non-forest Use

Air Quality

- Impact 4.3-1: Conflict With or Obstruct Implementation of the Applicable Air Quality Plan
- Impact 4.3-2: Violate Any Air Quality Standard as Adopted in (c)i or (c)ii, or Established by United States Environmental Protection Agency or Air District or Contribute Substantially to an Existing or Projected Air Quality Violation
- Impact 4.3-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations

Biological Resources

- Impact 4.4-1: Have a Substantial Adverse Effect, either Directly or through Habitat Modifications, on any Species Identified as a Candidate, Sensitive, or Special Status Species in Local or Regional Plans, Policies, or Regulations or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service
- Impact 4.4-2: Have a Substantial Adverse Effect on Any Riparian Habitat or Other Sensitive Natural Community Identified in Local or Regional Plans, Policies, Regulations, or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service

- Impact 4.4-3: Have a Substantial Adverse Effect on Federally Protected Wetlands as Defined by Section 404 of the Clean Water Act (Including, but Not Limited to, Marsh, Vernal Pool, Coastal, etc.) through Direct Removal, Filling, Hydrological Interruption, or Other Means
- Impact 4.4-4: Interfere Substantially with the Movement of any Native Resident or Migratory Fish or Wildlife Species, or with Established Native Resident or Migratory Wildlife Corridors, or Impede the Use of Native Wildlife Nursery Sites
- Impact 4.4-5: Conflict with Any Local Policies or Ordinances Protecting Biological Resources, Such as a Tree Preservation Policy or Ordinance
- Impact 4.4-6: Conflict with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or Other Approved Local Regional, or State Habitat Conservation Plan

Cultural Resources

- Impact 4.5-1: Cause a substantial adverse change in the significance of a historical resource
- Impact 4.5-2: Cause a substantial adverse change in the significance of an archaeological resource
- Impact 4.5-3: Directly or indirectly destroy a unique paleontological resource or site
- Impact 4.5-4: Disturb any human remains, including those interred outside of formal cemeteries

Geology and Soils

- Impact 4.6-1: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving the Rupture of a Known Earthquake Fault
- Impact 4.6-2: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Strong Seismic Ground Shaking
- Impact 4.6-3: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Seismic-Related Ground Failure, Including Liquefaction
- Impact 4.6-4: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Landslides
- Impact 4.6-5: Result in Substantial Soil Erosion or the Loss of Topsoil
- Impact 4.6-6: Be Located on a Geological Unit or Soil That is Unstable, or That Would Become Unstable as a Result of the Project, and Potentially Result in On- or Off-site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse
- Impact 4.6-7: Be Located on Expansive Soil, as Defined in Table 18-1-B of the Uniform Building Code (1994), Creating Substantial Risks to Life or Property

- Impact 4.6-8: Have Soils Incapable of Adequately Supporting the Use of Septic Tanks or Alternative Wastewater Disposal Systems Where Sewers Are Not Available for the Disposal of Wastewater
- Impact 4.6-9: Cumulative Impacts to Geologic and Soil Resources

Greenhouse Gas Emissions

- Impact 4.7-1: Generate Greenhouse Gas Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment

Hazards and Hazardous Materials

- Impact 4.8-1: Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials
- Impact 4.8-2: Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment
- Impact 4.8-3: Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within One-Quarter Mile of Existing or Proposed School.
- Impact 4.8-4: Create a Hazard to the Public or the Environment as a Result of Being a Site that is Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Code Section 65962.5
- Impact 4.8-5: For a Project Located within the Adopted Airport Land Use Compatibility Plan, Result in a Safety Hazard for People Residing or Working in the Area
- Impact 4.8-8: Expose People or Structures to a Significant Risk of Loss, Injury, Or Death Involving Wildland Fires, Including Where Wildlands are Adjacent to Urbanized Areas or Where Residences are Intermixed with Wildlands
- Impact 4.8-9: Generate Vectors or Have a Component that Includes Agricultural Waste Exceeding Adopted Qualitative Thresholds
- Impact 4.8-10: Contribute to Cumulative Hazards and Hazardous Materials Impacts

Hydrology and Water Quality

- Impact 4.9-1: Violate Any Water Quality Standards or Waste Discharge Requirements
- Impact 4.9-3: Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, in a Manner That Would Result in Substantial Erosion or Siltation On-site or Off-site
- Impact 4.9-4: Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially

Increase the Rate or Amount of Surface Runoff in a Manner That Would Result in Flooding On-site or Off-site

- Impact 4.9-5: Create or Contribute Runoff Water That Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Substantial Additional Sources of Polluted Runoff
- Impact 4.9-6: Otherwise Substantially Degrade Water Quality
- Impact 4.9-8: Place Within a 100-year Flood Hazard Area Structures that Would Impede or Redirect Flood Flows
- Impact 4.9-9: Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Flooding, Including Flooding as a Result of the Failure of a Levee or Dam

Land Use and Planning

- Impact 4.10-1: Physically Divide an Established Community

Noise

- Impact 4.12-1: Exposure of Persons to, or Generate, Noise Levels in Excess of Standards Established in the Local General Plan or Noise Ordinance or Applicable Standards of Other Agencies
- Impact 4.12-3: A Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project
- Impact 4.12-4: A Substantial Temporary or Periodic Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing without the Project
- Impact 4.12-5: For a Project Located within the Kern County Airport Land Use Compatibility Plan, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels
- Impact 4.12-6: For a project located within the vicinity of a private airstrip, would the Project expose people residing or working in the Project Area to excessive noise levels
- Impact 4.12-7: Cumulative Impact on Noise Receptors

Public Services

- Impact 4.14-1: Result in Substantial Adverse Physical Impacts Associated with the Provision of New or Physically Altered Government Facilities, Need for New or Physically Altered Government Facilities, the Construction of Which Could Cause Significant Environmental Impacts, in Order to Maintain Acceptable Service Ratios, Response Times, or Other Performance Objectives for Any of the Public Services, which Include: Fire Protection, Police Protection, Schools, Parks, and Other Public Facilities
- Impact 4.14-2: Contribute to Cumulative Public Service Impacts

Transportation and Traffic

- Impact 4.16-1: Conflict with an Applicable Plan, Ordinance, or Policy Establishing Measures of Effectiveness for the Performance of the Circulation System, Including but Not Limited to Intersections, Streets, Highways and Freeways, Pedestrian and Bicycle Paths, and Mass Transit
- Impact 4.16-2: Conflict with an Applicable Congestion Management Program, including, but not limited to Level of Service Standards and Travel Demand Measures, or Other Standards Established by the County Congestion Management Agency or Adopted County Threshold for Designated Roads or Highways
- Impact 4.16-3: Result in a Change in Air Traffic Patterns, including Either An Increase in Traffic Levels or a Change in Location that Results in Substantial Safety Risks
- Impact 4.16-4: Substantially Increase Hazards due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses
- Impact 4.16-5: Result in Inadequate Emergency Access
- Impact 4.16-6: Conflict with Adopted Policies, Plans, or Programs regarding Public Transit, Bicycle, or Pedestrian Facilities, or Otherwise Decrease the Performance or Safety of Such Facilities
- Impact 4.16-7: Cumulative Impacts on Transportation and Traffic

Utilities and Service Systems

- Impact 4.17-1: Exceed Wastewater Treatment Requirements of the Applicable Regional Water Quality Control Board
- Impact 4.17-2: Require or Result in the Construction of New Water or Wastewater Treatment Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects
- Impact 4.17-3: Require or Result in the Construction of New Stormwater Drainage Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects
- Impact 4.17-5: Result in a Determination by the Wastewater Treatment Provider that Serves or May Serve the Project that it has Adequate Capacity to Serve the Project's Projected Demand in Addition to the Provider's Existing Commitments
- Impact 4.17-6: Be Served by a Landfill with Insufficient Permitted Capacity to Accommodate the Project's Solid Waste Disposal Needs
- Impact 4.17-7: Fail to Comply with Federal, State, and Local Solid Waste Statutes and Regulations

Unavoidable Significant Adverse Impacts

Section 15126.2(b) of the CEQA Guidelines requires that the EIR describe any significant impacts, including those that can be mitigated but not reduced to less-than-significant levels. Potential environmental effects of the Project and proposed mitigation measures are discussed in detail in Chapter 4, Environmental Settings, Impacts, and Mitigation Measures, of this EIR. The following environmental impacts were determined to be significant and unavoidable impacts (refer to Table 1-1, Summary of Significant Impacts of the Project).

Table 1-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
Aesthetics and Visual Resources	Although implementation of mitigation measures would reduce the adverse visual changes experienced at individual key observation point locations, there are no mitigation measures that would preserve the existing character and quality of the Project Area and its surroundings. Project-related oil and gas activities would continue to produce visible changes to the existing environment and the resultant visual impact is considered **significant and unavoidable**. The Project has the potential to create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. After implementation of MM 4.1-6, this impact would remain **significant and unavoidable.**	The oil and gas industry has a visible presence on the landscape of the San Joaquin Valley Floor and, the Project in combination with the implementation of other reasonably foreseeable oil and gas projects will continue to result in adverse visible changes within Kern County. Therefore, the Project's cumulative contribution after implementation of the recommended mitigation measures would remain cumulatively **significant and unavoidable** as a result of these changes in visual character and quality.
Air Quality	The Project would continue to generate odors. With implementation of MM 4.3-7, impacts would still be **significant and unavoidable**.	The construction and operational activities of oil and gas activities that would be authorized under the Project would result in an increase of criteria pollutants (oxides of nitrogen [NOx], volatile organic compounds [VOC], carbon monoxide [CO], particulate matter less than 10 microns and less than 2.5 microns in diameter [PM_{10} and $PM_{2.5}$, respectively]) in excess of the recommended criteria pollutant significance threshold adopted by the SJVAPCD Board. Emission sources in Kern County contribute between 11% and 21% of criteria pollutant emissions in the San Joaquin Valley Air Basin. The Project would contribute between

Table 1-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
		2% and 14% of these pollutants in the San Joaquin Valley Air Basin or between 19% and 97% of Kern County's contribution. This analysis indicates that most sulfur dioxide (SO_2) emissions in Kern County would originate from oil and gas activities and the majority of NO_X emissions. Therefore, the proposed Project would have a **cumulatively considerable** contribution of criteria pollutant (NO_X, PM_{10}, $PM_{2.5}$, CO and SO_2) emissions to the Kern County portion of the SJVAB.
Agricultural Resources	None.	The geographic scope for cumulative impacts to agricultural and forest resources encompasses the whole of Kern County. The oil and gas exploration and production activities that would be authorized through implementation of the proposed Project along with projected population growth could result in **significant and unavoidable** cumulative impacts on farmland conversion.
Biological Resources	None.	Future oil and gas exploration and production activities related to the proposed Zoning Ordinance amendment could contribute to a significant cumulative impact on Project Area biological resources because future use and development of federal, state, and incorporated urban lands are not within the County's jurisdiction or control. Future land uses and development could affect biological resources in each of these jurisdictions and would be undertaken as independent actions with associated impacts, avoidance and minimization requirements, and mitigation, if required, under applicable federal, state, regional and local agency law. Impacts would remain **significant and unavoidable** with mitigation.
Cultural Resources	None.	The geographic scope for cumulative impacts to cultural and paleontological resources includes

Table 1-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
		the area within a one-mile radius from the Project Area. Cumulative impacts could result when paleontological, historical, and archaeological resources or human remains cannot be avoided by future projects. For paleontological and archaeological resources, it is important to recover a scientifically significant sample so the information can be preserved. For historic buildings and structures, detailed recordings, including measured drawings and photographs, can preserve the information. For human remains, reburial in a location not slated for future development can protect those remains from future disturbance. There could be **significant cumulative impacts** to paleontological, historical, and archaeological resources or human remains as a result of the oil and gas exploration and production activities that would be authorized under the Project. Implementation of best professional practices would reduce many impacts to a less than significant level. However, buried archaeological and paleontological resources could be damaged or destroyed. Direct mitigation using the measures above would reduce most of these impacts to a **less than significant level**.
Greenhouse Gases	The Project has the potential to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. With the implementation of MM 4.7-5, the impact would remain **significant and unavoidable.**	The geographic scope for cumulative impacts for GHGs includes the area within 6 miles of the external Project Area boundary, and areas (e.g., incorporated cities) within the Project Area. Climate change impacts are inherently global and cumulative, and not Project specific. While implementation of MM 4.7-1 through MM 4.7-3 and the 2014 Regional Transportation Plan mitigation measures would encourage reduction in GHG

Table 1-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
		emissions at a regional level, they do not provide a mechanism that guarantees GHG emission reductions on a cumulative basis. The Project's cumulative contribution after implementation of the recommended mitigation measures would remain **cumulatively significant and unavoidable** as a result of the GHG emissions associated with the Project.
Hydrology and Water Quality	As discussed in Section 4.17, Utilities and Service Systems, while MM 4.17-2 through MM 4.17-4 would encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease M&I demand is uncertain. As a result, potential impacts to groundwater levels and aquifer volumes would be **significant and unavoidable with mitigation**.	Project impacts could result in cumulatively considerable impacts that would be considered significant. Implementation of MM 4.9-1 through MM 4.9-6 would reduce potential cumulative impacts to water quality, erosion risks, flooding and other hydrologic resources to less than significant with mitigation. As discussed in Section 4.17, Utilities and Service Systems, although MM 4.17-2 through MM 4.17-4 encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease municipal and industrial (M&I) demand is uncertain. As a result, cumulative impacts to groundwater would be significant and unavoidable. The County lacks jurisdiction and control over land conversions, and actions or approvals by other agencies that may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly, this impact remains **significant and unavoidable**.
Utilities and Service Systems	Implementation of MM 4.17-2 to MM 4.17-4 could reduce water supply impacts, but the allocation of water supplies and water demands, the complex laws affecting water rights, the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the varied technical feasibility	The geographic scope for cumulative impacts to utilities and service systems includes the area within 6 miles of the external Project Area. Cumulative impacts would be **significant and unavoidable with respect to water supply**. For other

Table 1-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
	of treating produced water, and the produced water reuse opportunities all present complex variables that fall outside the scope of the County's jurisdiction or control under CEQA. Although mitigation measures would reduce water use impacts, water quality impacts would be **significant and unavoidable**.	public utilities, including municipal wastewater treatment, stormwater management, or landfills with mitigation, impacts would be **less than significant** with mitigation measures.

1.5.3 Significant Cumulative Impacts

According to Section 15355 of the CEQA Guidelines, the term cumulative impacts "refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." Individual effects that may contribute to a cumulative impact may be from a single project or a number of separate projects. Individually, the impacts of a project may be relatively minor, but when considered along with impacts of other closely related or nearby projects, including newly proposed projects, the effects could be cumulatively considerable.

This EIR has considered the potential cumulative effects of the proposed Project. Impacts for the following issue areas have been found to be cumulatively considerable:

- Aesthetics
- Agriculture and Forest Resources
- Air Quality
- Greenhouse Gases
- Biology
- Cultural
- Hydrology
- Utilities

Each of these significant cumulative impacts is discussed in the applicable section of Chapter 4, Environmental Settings, Impacts, and Mitigation Measures, of this EIR.

1.5.4 Growth Inducement

The KCGP recognizes that certain forms of growth are beneficial, both economically and socially. Section 15126.2(d) of the CEQA Guidelines provides the following guidance on growth-inducing impacts: a project is identified as growth inducing if it "could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment."

Growth inducement can be a result of new development that requires an increase in employment, removes barriers to development, or provides resources that lead to secondary growth. With respect to employment, 16,752 workers in Kern County were employed in the oil and gas extraction industry in 2012. Of this total, 14,067 were estimated to be "oilfield" employees. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance would result in 2,697 new production wells being drilled annually, while 2,231 wells would be plugged and abandoned. Additionally, it is anticipated that 1,200 wells would receive some type of well stimulation treatment during this same timeframe. Given the long history of oil and gas development within Kern County, implementation of the Project would not result in a large increase in employment that would significantly induce growth.

With respect to removing barriers to development, such as through providing access to previously undeveloped areas, the oil and gas development activities would involve constructing temporary and permanent access roads. Some roads may be removed and restored after initial construction; some may be reduced in size; and others may be maintained at their construction size for the life of the associated oil and gas operation. In general, these roads would provide for access to oil and gas construction and operation areas and would not provide access into other areas thereby promoting growth-inducing development. No other development would be anticipated as a result of these roads, and oil and gas development would tend to preclude other development from occurring.

While the Project would contribute to energy supply, which supports growth, the development of additional oil and gas resources is a response to increased market demand and is not a factor that induces new growth. Kern County planning documents already permit and anticipate a certain level of growth in the area of the Project and in the state as a whole, along with attendant growth in energy demand. It is this anticipated growth that drives energy-production projects and development, not vice versa. The Project would supply oil and gas to accommodate and support existing demand and projected growth, but it would not foster any new growth. Therefore, any link between the Project and growth in Kern County would be speculative.

In Kerncrest Audubon Society v. Los Angeles Department of Water and Power, the analysis of growth-inducing effects contained in the EIR for the Pine Tree Wind Development Project was challenged. Plaintiffs argued that the discussion was too cursory to provide adequate information about how additional electricity generated by the Project would sustain further growth in the Los Angeles area. The court held that the additional electricity that the Project would produce was intended to meet the current forecast of growth in the Los Angeles area. As such, the wind

development project would not cause growth, and so it was not reasonable to require a detailed analysis of growth-inducing impacts. In addition, EIRs for similar energy projects have contained similarly detailed analyses of growth-inducing impacts. Their conclusions that increasing the energy supply would not create growth has been upheld, because: (1) the additional energy would be used to ease the burdens of meeting existing energy demands within and beyond the area of the Project; (2) the energy would be used to support already-projected growth; or (3) the factors affecting growth are so varied that any potential connection between additional energy production and growth would necessarily be too speculative and tenuous to merit extensive analysis. Thus, as has been upheld in the courts, this level of analysis is sufficient to inform the public and decision makers of the growth-inducing impacts of the Project.

1.5.5 Irreversible Impacts

Section 15126.2(c) of the CEQA Guidelines defines an irreversible impact as an impact that uses nonrenewable resources during the initial and continued phases of the Project. Irreversible impacts can also result from damage caused by environmental accidents associated with the Project. Irretrievable commitments of resources should be evaluated to ensure that such consumption is justified. Oil and gas development and operational activities associated with the implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance would commit nonrenewable resources during construction and operation activities. During these activities, oil, gas, and other nonrenewable resources would be consumed. Therefore, an irreversible commitment of nonrenewable resources would occur as a result of the ongoing production of oil and gas in the Project Area as is authorized by the current and proposed Amended Zoning Ordinance. However, assuming that those commitments occur in accordance with the adopted goals, policies, and implementation measures of the Kern County General Plan (KCGP), as a matter of public policy, those commitments have been determined to be acceptable. The KCGP ensures that any irreversible environmental changes associated with those commitments will be minimized.

1.6 Alternatives to the Proposed Project

Section 15126.6 of the CEQA Guidelines states that an EIR must address "a range of reasonable alternatives to the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the comparative merits of the alternatives." Based on the significant and unavoidable impacts related to aesthetics, agricultural resources, air quality, greenhouse gases, biology, cultural, hydrology and utilities, along with the proposed Project objectives, several alternatives were considered as summarized below and discussed in detail in Chapter 6, Alternatives.

1.6.1 Alternatives Eliminated from Further Consideration

The following alternatives were initially considered but were eliminated from further consideration in this EIR because they do not meet Project objectives and/or were infeasible.

- **No Drilling on Agriculturally Productive Lands:**
    - *Example:* The ordinance could require the conformity review process within a smaller area, which would not include land that is currently being used to produce agricultural products.
    - This alternative would accomplish some County Project objectives by increasing County oversight while reducing administrative burdens. It would accomplish Oil Applicant objectives of continued, projected development. However, it may not reduce environmental impacts of the oil development as much as the proposed Project.
- **Ban on all drilling:**
    - *Example:* The ordinance would ban all drilling.
    - *Rejected as Infeasible*: This alternative is legally infeasible because of takings issues. Such an ordinance would infringe on operators' rights to develop mineral resources. It would also frustrate most, if not all, of the Project's stated objectives.
- **Larger Project Area boundary:**
    - *Example*: The ordinance would apply to a larger area than in the proposed Project.
    - *Rejected because Will Not Reduce Significant Impacts:* Analysis of this alternative would be meaningless. The Project boundary as currently defined is where oil occurs and drilling is expected. If no drilling is expected outside this area, no purpose is served by expanding the Project scope.
- **More wells within the proposed Project footprint:**
    - *Example*: As currently conceived, the ordinance will not have a limit on the number of future wells; therefore, this "alternative" has more to do with the assumptions used in the EIR rather than the Project/ordinance definition.
    - *Rejected because Will Not Reduce Significant Impacts:* A larger number of wells would not reduce significant impacts.
- **Fewer wells within the proposed Project footprint:**
    - *Example:* The ordinance would limit/constrain the number of wells drilled annually over the life of the Project.
    - *Feasibility:* This alternative should be rejected as legally infeasible because it may illegally restrict someone's rights to develop their resources. In addition, it does not accomplish basic Project objectives of the oil applicants.
- **Alternative location:**
    - *Feasibility:* This is not a feasible alternative because the development facilities need to be in proximity to the resources (Guidelines 15126.6(f)(2)(B)).
- **Alternative resource:**
    - *Example:* The ordinance would require alternative mineral extraction or energy production.
    - *Feasibility:* This is not a feasible alternative because it does not accomplish the Project objectives of increasing gas and oil exploration and production to reduce dependence of foreign sources. Also, not feasible because the amount of mineral

extraction and energy production needed to compare to oil and gas extraction would not likely have any reduced significant impacts.

- **Zero net gain:**
    - *Example:* The ordinance would require zero net gain of all future exploration and production activities/operations.
    - *Feasibility:* This is not a feasible alternative because it does not accomplish the Project objectives of increasing gas and oil exploration and production to reduce dependence of foreign sources. Also, not feasible because the Project would not likely have any reduced significant impacts.

1.6.2 Alternatives Analyzed in this EIR

Alternatives that would avoid or substantially lessen any of the significant effects of the Project and that would feasibly attain most of the basic Project objectives are discussed below. Each alternative is discussed with respect to its relationship to the Project objectives.

Alternative 1: No Project

Alternative 1, the "No Project" Alternative, assumes that the Project's proposed amendment to Title 19 of the Kern County Zoning Ordinance will not be approved. Accordingly, Alternative 1 assumes that Chapter 19.98 of the Kern County Zoning Ordinance will not be amended to establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging and abandonment. Moreover, Alternative 1 assumes that Chapter 19.98 of the Kern County Zoning Ordinance will not be amended to establish a new "Oil and Gas Conformity Review" ministerial permit procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. Moreover, under Alternative 1, the Zoning Ordinance would not be updated to incorporate the Project's relevant proposed development standards into the County's Dark Skies Ordinance or the Zoning Ordinance provisions governing the Floodplain Primary District, the Petroleum Extraction (PE) Combining District, and Hillside Development.

Alternative 2: Conditional Use Permit

Under Alternative 2, the Conditional Use Permit (CUP) Alternative, all new oil and gas exploration, development, and production activities would be permitted in the Project Area only upon County's issuance of a conditional use permit that authorizes such activities. Under Alternative 2, Chapter 19.98 of the Kern County Zoning Ordinance would be amended to eliminate its Sections 19.98.020 (Unrestricted Drilling) and 19.98.030 (Drilling By Ministerial Permit), and amend Section 19.98.040 to require a conditional use permit for new oil and gas development and production activities in the following zoning districts: Exclusive Agriculture (A); Limited Agriculture (A-1); Medium Industrial (M-2); Heavy Industrial (M-3); Natural

Resource (NR); Light Industrial (M-1); Recreation-Forestry (RF); Estate District (E); Low, Medium, and High-Density Residential (R-1, R-2, R-3); Commercial Office (CO); Neighborhood Commercial (C-1); General Commercial (C-2); Highway Commercial (CH); Platted Lands (PL); Floodplain Primary (FPP); and Special Planning (SP). Conforming amendments would also be made to the Zoning Ordinance chapters applicable to each of the above zoning districts to clarify that oil and gas exploration, development, and production activities are conditionally permitted uses within such districts. In effect, Alternative 2 would amend the Zoning Ordinance to eliminate all unrestricted, and ministerial approval of, oil and gas exploration, development, and production activities. Under Alternative 2, such activities would only be permitted upon issuance of a conditional use permit in all zoning districts, except the Mobile Home Park District (MP) and the Open Space District (OS), were new oil and gas development and production activities would continue to be prohibited.

Alternative 3: Reduced Ground Disturbance Alternative

Alternative 3, the Reduced Ground Disturbance Alternative, is identical to the Project, except that it would prohibit all new well drilling activities outside existing DOGGR-designated "Administrative Boundary" areas and would require subsurface oil and gas to be extracted from surface equipment located within such Administrative Boundary areas. This alternative would also limit the disturbance footprint on existing agricultural lands to requiring clustering of new wells in locations immediately adjacent to existing oil and gas equipment. The vast majority of future oil and gas production in Kern County will occur in and adjacent to Administrative Boundary areas. Accordingly, this alternative assumes that subsurface oil and gas resources located outside of existing Administrative Boundary areas could still be accessed from inside existing Administrative Boundary areas through use of directional and horizontal drilling techniques. Thus, Alternative 3's restrictions on oil and gas exploration and development are assumed to be legally feasible.

Alternative 4: No Hydraulic Fracturing Alternative

Pursuant to its police power, the County has broad discretion to regulate oil and gas exploration and production activities within its jurisdiction. However, a local government's legal authority to regulate every step in the hydraulic fracturing process is the subject of legal disputes currently pending in certain California courts. Assuming the County has sufficient legal authority to regulate subsurface oil and gas exploration and development activities as contemplated by this alternative, Alternative 4, the No Hydraulic Fracturing Alternative, would implement the Project as proposed, except that it would amend Zoning Ordinance Chapter 19.98 to ban all hydraulic fracturing activities, a form of well stimulation, within the Project Area. In all other respects, the Alternative 4 is the same as the Project.

Alternative 5: Low-Emission Enhanced Oil Recovery Technology Alternative

Alternative 5, the Low-Emission Enhanced Oil Recovery (EOR) Alternative, is identical to the proposed Project, except that the updated development standards and conditions required by the Project's proposed Zoning Ordinance amendment would be expanded to require oil and gas well permit applicants to implement low-emission "enhanced oil recovery" (EOR) technology as a condition of permit approval for new and replacement steam generators, and to replace existing steam generators constructed prior to 1990 within five years of enactment of the amended Ordinance. The EOR is a production technique used to increase the mobility of oil, most commonly through steam injection techniques that reduce the viscosity of the hydrocarbons and allow produced fluids to flow. There are four major types of EOR operations: waterflood; thermal (i.e., steamflood, cyclic steam and in-situ combustion); carbon dioxide or other gas (miscible and immiscible); and chemical/polymer flooding (i.e., alkaline flooding or micellar-polymer flooding). With thermal EOR, steam is injected into a well, which necessitates the installation of steam generators at the well. Steam generators are large heaters that generate steam, usually from produced groundwater. Under Alternative 5, all new and replacement steam generators for thermal EOR activities would be required to implement low-emission steam generation technology, such as the ClearSign Duplex Tile combustion technology or the equivalent. In all other respects, Alternative 5 would be identical to the Project.

Alternative 6: Recycled Water Alternative

Under Alternative 6, the Recycled Water Alternative, the Applicants would be required to treat an amount of produced water that is currently being disposed of via underground injection wells which is equivalent to the amount of municipal and industrial (M&I) water used in Applicant's operations. The produced water reuse goal is 30,000 acre-feet per year, which would offset more than the current use of imported water and groundwater from non-oil bearing zones by the oil and gas industry. Such produced water would be required to be treated, recycled, and put to an alternate use, such as agricultural irrigation to the extent feasible. As explained in Section 4.9, Hydrology and Water Quality, oil-bearing formations in the Project Area include a mixture of usually saline or other poor-quality groundwater and hydrocarbons. Production wells extract a mixture of water and hydrocarbons that is separated in surface facilities, typically a series of tanks or "tank batteries," where lighter oil and gas compounds are isolated and skimmed from the heavier water. Residual water generated by the hydrocarbon separation process is generally referred to as "produced water" in the context of oil and gas exploration and production. Under current practices, much of this produced water is used in future oil and gas recovery operations (e.g., steam and water flooding) and for oil and gas maintenance activities, and the remainder is disposed of primarily through underground injection wells. In some portions of the Project Area, produced water is also treated and reused for agricultural irrigation purposes, as explained in Section 4.9.

Table 1-2, Comparison of Alternatives, provides a summary of the alternatives impact analysis. A more detailed alternatives analysis is provided in Chapter 6, Alternatives.

1.6.3 Environmentally Superior Alternative

An EIR must identify the environmentally superior alternative to the Project. Alternative 5 would be environmentally superior to the Project on the basis of the minimization or avoidance of physical environmental impacts. However, Section 15126.6(e)(2) of the CEQA Guidelines states that if the no Project alternative is found to be environmentally superior, "the EIR shall also identify an environmentally superior alternative among the other alternatives." The environmentally superior alternative is Alternative 5, the Low-Emission EOR Technology Alternative. Compared to the Project, Alternative 5 would have less environmental effects related to air quality, greenhouse gasses, and transportation and traffic. Moreover, Alternative 5 would not result in any environmental impacts that are greater than those of the Project.

1.7 Areas of Controversy

Areas of controversy were identified through written agency and public comments received during the scoping period. Public comments received during scoping are provided in Appendix D. In summary, the following issues were identified during scoping and are addressed in the appropriate sections of Chapter 4, Environmental Setting, Impacts, and Mitigation Measures:

- Aesthetics
    - Light pollution
- Agriculture and Forest Resources
    - Conflict with Williamson Act contracts
    - Water use conflicts between oil and gas development and agricultural operations
- Biological Resources
    - Noise impacts to birds
    - Restoration of well pads after use
    - Spread of invasive species due to road and pipeline construction and operation
    - Road construction and impacts to species, including avoidance, mortality, and composition changes
    - Pipeline corridor effects on species dispersal
    - Habitat fragmentation
- Geology and soils
    - Induced seismicity due to injection of wastewater
- Greenhouse gases
    - Fugitive methane emissions from wells

- Hazards and Hazardous Materials
    - Health impacts due to proximity to petroleum operations
- Hydrology and Water Quality
    - Well casing failure
    - Oil spills
    - Surface runoff
    - Drinking water contamination
    - Groundwater contamination
- Noise
    - Compressor noise over the long-term
- Utilities and Service Systems
    - Cumulative impacts of freshwater use
    - Disposal of hazardous waste

1.8 Issues to Be Resolved

Section 15123(b) (3) of the CEQA Guidelines requires that an EIR contain issues to be resolved, which includes the choices among alternatives and whether or how to mitigate significant impacts. The major issues to be resolved regarding the Project include decisions by the lead agency as to whether or not:

- The Draft EIR adequately describes the environmental impacts of the Project;
- The recommended mitigation measures should be adopted or modified; or
- Additional mitigation measures need to be applied.

1.9 Summary of Environmental Impacts and Mitigation

The following is a summary of the environmental impacts of the Project, mitigation measures, and unavoidable significant impacts identified and analyzed in Chapter 4, Environmental Settings, Impacts, and Mitigation Measures, of this EIR. Refer to the appropriate EIR section for additional mitigation.

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Aesthetics				
Impact 4.1-1 Have a Substantial Adverse Effect on a Scenic Vista	Less than significant	No mitigation measures are proposed.	Less than significant	All Tiers
Impact 4.1-2 Substantially Damage Scenic Resources, Including, but Not limited to, Trees, Rock Outcroppings, and Historic Buildings within a State Scenic Highway	Less than significant	No mitigation measures are proposed.	Less than significant	All Tiers
Impact 4.1-3 Substantially Degrade the Existing Visual Character or Quality of the Site and its Surroundings	Potentially Significant	**MM 4.1-1** The Applicant shall use existing roads whenever possible. If use of existing roads is not feasible, construction of new roads should be routed to minimize the amount of disturbance without impeding existing surface use. **MM 4.1-2** All derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any well with oil, gas, or other hydrocarbon shall be removed from the drill site within 90 days after completion of production tests or after abandonment of any well. Earthen sumps used in drilling shall be filled within 90 days after any well has been placed in production (unless such sumps are to be used within six months for the drilling of another well), and any sump used in productions shall be filled after its abandonment and restored to a uniform grade within ninety days. **MM 4.1-3** Sumps and ponds shall be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and shall comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evaporation ponds for produced water. **MM 4.1-4** Oil or gas tanks located within 200 feet of any sensitive receptor shall be partially screened from public view by shrubs, trees or solid screen fencing. Similarly, pump sites (including multiple well pump sites) within 500 feet of any dwelling must be surrounded by a fence, at least 6 feet in height, constructed of dark-colored chain-link with wood or metal slates, dark green or brown fabric material, or other more visually restrictive fencing material. The height of all pumping units shall not exceed 80 feet, and shall be painted in accordance with the Kern County Zoning Ordinance. **MM 4.1-5** Project signage is limited to directional, warning, safety, security and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations in accordance with Chapter 19.84.135 of the Kern County Zoning Ordinance. For any signage necessary for wayfinding, safety, or security, the Applicant shall use the minimum necessary to adequately communicate the required information.	Significant and unavoidable	All Tiers
Impact 4.1-4 Create a New Source of Substantial Light or Glare that Would Adversely Affect Day or Nighttime Views in the Area	Potentially significant	**MM 4.1-6** Permanent nighttime lighting that will be installed for facilities operations will only be lighting required for safety or security. During operations when the lighting is in use, lighting for safety and security will be shielded and oriented downward, bare bulbs will be fully screened from view from sensitive viewing receptors such as residences, and on-demand lighting and/or timers will be used to minimize visual impacts of lighting. In doing so, the Applicant shall comply with the standards in the amended Chapter 19.81 – Outdoor Lighting "Dark Sky Ordinance."	Significant and unavoidable	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.1-5 Contribute to Cumulative Aesthetic Impacts	Cumulatively considerable	Implement MM 4.1.1 through 4.1.6, as described above. No additional feasible mitigation measures exist to avoid or reduce significant adverse cumulative impacts to aesthetics to a less than significant level.	Significant unavoidable	All Tiers
Agricultural Resources				
Impact 4.2-1 Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to Non-Agricultural Use	Potentially significant	**MM 4.2-1** For future oil and gas exploration and extraction activities that are: 1) on land designated Prime, Farmland of Statewide Importance or Unique Farmland; and 2) that have been actively farmed 5 years or more out of the last 10 years, agricultural land mitigation is required at a ratio of 1:1. The 1:1 ratio is applied to actual ground disturbance area for oil and gas activities (inclusive of temporary construction and permanent operational impact areas), but excludes non-farmed existing areas such as roads, and tank and maintenance areas, and lands for which agricultural mitigation has previously been provided at a 1:1 ratio. Prior to ground disturbing activity, the Applicant shall submit to the County written evidence of completion of one or more of the following measures to achieve this 1:1 mitigation ratio: a. Funding and/or purchasing agricultural conservation easements or similar instrument acceptable to the County (to be managed and maintained by an appropriate entity). b. Purchasing of credits for conservation of agricultural lands from an established agricultural farmland mitigation bank or an equivalent agricultural farmland preservation program managed by the County. c. Restoring agricultural lands to productive use through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment. d. Participating in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation than the measures listed above. Mitigation lands shall meet the definition of Prime Farmland, Farmland of Statewide Importance, and/or Unique Farmland, and be of similar or higher agricultural quality as the lands, as established by the California Department of Conservation. Completion of the selected measure or, with the Kern County Planning and Community Development Director's approval, a combination of measures, are to occur on qualifying land in Kern County. If qualifying lands cannot be found in Kern County, upon written application to the County, the mitigation lands may be located within the San Joaquin Valley (San Joaquin, Stanislaus, Merced, Fresno, Madera, Kings, Tulare, or Kern County) or outside the San Joaquin Valley with written evidence that the same or equivalent crops can be produced on the mitigation land.	Less than significant	All Tiers
Impact 4.2-2 Conflict with Existing Zoning For Agricultural Use or a Williamson Act Contract	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.2-3 Conflict with Existing Zoning for, or Cause Rezoning of, Forest Land or Timberland	No impact	No mitigation measures are required.	No impact	All Tiers
Impact 4.2-4 Result in the Loss of Forest Land or Conversion of Forest Land to Non-Forest Use	No impact	No mitigation measures are required.	No impact	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.2-5 Involve Other Changes in the Existing Environment Which, Because of Their Location or Nature, Could Result in Conversion of Farmland to Non-agricultural Use or Conversion of Forest Land to Non-Forest Use	Potentially significant	**MM 4.2-2** To protect crops and structures adjacent to oil and gas activities on active agricultural lands, each Applicant/operator shall comply with the following mitigation measures set forth in other chapters of this Environmental Impact Report: a. Surface water runoff and drainage on the well pads shall be mitigated as described in mitigation measures for Hydrology and Water Quality. b. A Spill Prevention Countermeasure and Contingency Plan or Division of Oil Gas and Geothermal Resources Assembly Bill 1960 spill plan, as applicable, shall be prepared for the site and oil and chemical spills treated in accordance with the Division of Oil Gas and Geothermal Resources Senate Bill 4 Regulations for the site to protect adjacent farmland, as described in Mitigation Measure for Hazards. c. Speed limits for oil and gas trucks shall be posted on unpaved roads to reduce dust generation; in the absence of signage, speed limits shall be limited to 25 miles per hour (or an alternate, more stringent dust suppression standard as adopted by the San Joaquin Valley Air Pollution Control District), and Applicants shall attest that employees have been trained in the appropriate speed limits. d. Unpaved roads shall be watered or otherwise treated for dust suppression and control as described in Mitigation Measure for Air Quality. e. Vehicle tracking control shall be installed where unpaved roads intersect with paved roads, to prevent tracking of mud, dust, and weed seeds off site. This shall consist of a 50-foot length of a 3 inch-thick layer of gravel one inch or larger in diameter (or an alternate, more stringent dust suppression technique as approved by the San Joaquin Valley Air Pollution Control District). f. Stormwater control shall be required at construction sites during well drilling, reworking, and/or decommissioning as described in mitigation measures for Hydrology. g. Hazardous materials shall be stored within secondary containment as described in mitigation measures for Hazards. h. Overhead electrical or communication lines shall be shown on the Site Plan, and shall be aligned to the greatest extent feasible with existing access roads and the minimum distance between the access road and the well installation or other oil and gas facility, parallel to tree or row crops, described further in mitigation measures for Public Utilities. If the use of existing roads is not feasible, lines shall be routed to minimize surface disturbance and minimize the impacts to surface activity i. Underground pipelines serving the Project shall be shown on the Site Plan with locations marked and recorded with USAA, and periodically inspected and maintained as described in mitigation measures for Hazards.	Less than significant	All Tiers
Impact 4.2-6 Result in the Cancellation of an Open Space Contract Made Pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for Any Parcel of 100 or More Acres	No impact	No mitigation measures are required.	No impact	All Tiers
Impact 4.2-7 Cumulative Impacts to Agricultural or Forest Resources	Potentially significant	Implement mitigation measure MM 4.2-1 and MM 4.2-2.	Significant and unavoidable	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Air Quality				
Impact 4.3-1 Conflict With or Obstruct Implementation of the Applicable Air Quality Plan	Potentially significant	**MM 4.3-1** Consistent with the requirements of the San Joaquin Valley Air Pollution Control District Regulation II-Permits, the Applicant shall obtain an Authority to Construct permit and a Permit to Operate for any facility or equipment requiring a permit from the San Joaquin Valley Air Pollution Control District, such as stationary sources required to obtain permits pursuant to District Rule 2010. All emissions increases from permitted equipment shall comply with District Rule 2201. **MM 4.3-2** The Applicant shall develop and implement a Fugitive Dust Control Plan in compliance with San Joaquin Valley Air Pollution Control District fugitive dust suppression regulations to further reduce emissions, during construction, of particulate matter that is 10 microns or less and 2.5 microns or less in diameter. The Fugitive Dust Control Plan shall include: a. Name(s), address(es), and phone number(s) of person(s) responsible for the preparation, submission, and implementation of the plan. b. Description and location of operation(s). c. Listing of all fugitive dust emissions sources included in the operation. d. The following dust control measures shall be implemented: 1. All on-site unpaved roads shall be effectively stabilized using water or chemical soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board approved soil stabilizers, and that shall not increase any other environmental impacts including loss of vegetation. 2. All material excavated or graded will be sufficiently watered to prevent excessive dust. Watering will occur as needed with complete coverage of disturbed areas. The excavated soil piles will be watered as needed to limit dust emissions to less than 20% opacity or covered with temporary coverings. 3. Construction activities that occur on unpaved surfaces will be discontinued during windy conditions when winds exceed 25 miles per hour and those activities cause visible dust plumes. Construction activities may continue if dust suppression measures are used to minimize visible dust plumes. 4. Track-out debris onto public paved roads shall not extend 50 feet or more from an active operation and track-out shall be removed or isolated such as behind a locked gate at the conclusion of each workday. 5. All hauling materials should be moist while being loaded into dump trucks. 6. All haul trucks hauling soil, sand, and other loose materials on public roads shall be covered (e.g., with tarps or other enclosures that would reduce fugitive dust emissions). 7. Soil loads should be kept below 6 inches or the freeboard of the truck. 8. Drop heights should be minimized when loaders dump soil into trucks. 9. Gate seals should be tight on dump trucks. 10. Traffic speeds on unpaved roads shall be limited to 25 miles per hour. 11. All grading activities shall be suspended when visible dust emissions exceed 20%. 12. Other fugitive dust control measures as necessary to comply with San Joaquin Valley Air Pollution Control District Rules and Regulations.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

<table>
<tr><th>Impact</th><th>Level of Significance before Mitigation</th><th>Mitigation Measure(s)</th><th>Level of Significance after Mitigation</th><th>Applicable Tier</th></tr>
<tr><td></td><td></td><td>13. Disturbed areas should be minimized.
14. Disturbed areas should be re-vegetated as soon as possible after disturbance if area is no longer needed for oil and gas activities.
MM 4.3-3 All off-road construction diesel engines not registered under California Air Resources Board’s Statewide Portable Equipment Registration Program, which have a rating of 50 horsepower or more, shall meet, at a minimum, the Tier 3 California Emission Standards for Off-road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, section 2423(b)(1) unless that such engine is not available for a particular item of equipment. In the event a Tier 3 engine is not available for any off-road engine larger than 100 horsepower, that engine shall be equipped with retrofit controls that would provide nitrogen oxides and particulate matter emissions that are equivalent to Tier 3 engine.
a. All equipment shall be turned off when not in use. Engine idling of all equipment shall be limited to five minutes, except under exemptions specified in California Code of Regulations Title 13 Section 2449(d)(2)(A).
b. All equipment engines shall be maintained in good operating condition and in proper tune per manufacturers’ specifications.
MM 4.3-4 To further reduce emissions of oxides of nitrogen from on-road heavy-duty diesel haul vehicles:
a. 2007 engines or pre-2007 engines shall comply with California Air Resources Board retrofit requirements set forth in California Code of Regulations Title 13 Section 2025.
b. All on-road construction vehicles, except those meeting the 2007/California Air Resources Board-certified Level 3 diesel emissions controls, shall meet all applicable California on-road emission standards and shall be licensed in the State of California. This does not apply to worker personal vehicles.
c. All on-road construction vehicles shall be properly tuned and maintained in accordance with the manufacturers’ specifications.</td><td></td><td></td></tr>

c. If the above setbacks cannot be met, the Applicant shall implement the following risk minimization measures, or other such measures that are demonstrated by the Applicant to achieve a level of risk less than the threshold risk level:
1. Placement of engines in the potential impact area away from the sensitive receptors.
2. Utilize directional drilling to locate rig away further from the sensitive receptor(s).
3. Use of late-model engines, low-emission diesel products, alternative cleaner fuels (e.g., natural gas or liquefied petroleum gas), engine retrofit technology, add-on devices such as diesel particulate filters or oxidation catalyst, and/or other options as such become available to reduce emissions from off-road and other equipment.
4. Utilize electricity line power if available.
5. Shutdown all equipment when not in use, and otherwise minimize engine idling by limiting idling to 15 minutes.
6. Use of automatic rigs.
7. Assist and pay to relocate residents to an area hotel during well construction, drilling, and completion activities.
MM 4.3-6 Applicants shall include in their Worker Environmental Awareness Program information on how to recognize the symptoms of Valley Fever and to promptly report suspected symptoms of work-related Valley Fever to a supervisor. Workers exposed to fugitive dust shall be provided with the option of using a filter fitted over their nose and mouth, secured by a strap, including training for appropriate mask practices as part of the Worker Environmental Awareness Training Program.</td><td></td><td></td></tr>
<tr><td>Impact 4.3-4
Create Objectionable Odors Affecting a Substantial Number of People</td><td>Potentially significant</td><td>MM 4.3-7 Applicant shall submit an Odor Complaint Management Plan to the County prior to receiving its first Site Plan conformity review approval. The Plan shall include a designated contact for odor complaints, creation of a log for odor complaints, and protocol for handling odor complaints. The Odor log and report files shall be available for public review upon request.</td><td>Significant and unavoidable</td><td>All Tiers</td></tr>
</table>

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.3-5 Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant for which the project Region is Nonattainment under an Applicable Federal or State Ambient Air Quality Standard (Including Releasing Emissions which Exceed Quantitative Thresholds for Ozone Precursors)	Potentially significant	Implement MM 4.3-1 through MM 4.3-4, as described above. **MM 4.3-8** For Project facilities or equipment that are not required to offset emissions under a District rule as described in MM 4.3-1, and for Project vehicle and other mobile source emissions, the County will enter into emission reduction agreement with the San Joaquin Valley Air Pollution Control District, pursuant to which the Applicant shall pay fees to fully offset Project emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive reductions of particulate matter of 10 microns or less in diameter) (collectively, "designated criteria emissions") to avoid any net increase in these pollutants. The air quality mitigation fee shall be paid to the County as part of the Site Plan review and approval process, and shall be used to reduce designated criteria emissions to fully offset Project emissions that are not otherwise required to be fully offset by District permit rules and regulations. As an alternative to paying the fee, an Applicant may reduce emissions for one or more designated criteria emissions through actual reductions in air emissions from other Applicant sources, as submitted to the County and validated by the District. This Project offset requirement shall be enforced by the County and verified by San Joaquin Valley Air Pollution Control District. If a voluntary emission reduction agreement is not executed by the County and San Joaquin Valley Air Pollution Control District, then each Applicant must mitigate for the full amount of designated criteria pollutants as verified by the San Joaquin Valley Air Pollution Control District, with evidence of such District-verified offsets presented as part of the Site Plan Conformity Review application documentation. Examples of feasible air emission reduction activities that may be funded by air quality fees paid by Applicant or proposed and implemented by the Applicant under the emission reduction agreement include, but are not limited to, the following: a. Replacing or retrofitting diesel-powered stationary equipment such as motors on generators, pumps and wells with electric or other lower-emission engines that are not subject to Title V reductions. b. Replacing or retrofitting diesel-powered school, transit, municipal and other community mobile sources such as buses, car fleets, and maintenance equipment, with electric or other lower-emission engines. c. Reducing emissions from public infrastructure sources such as water and wastewater treatment and conveyance facilities, and reducing water-related emissions through water conservation and reclamation. d. Funding lower-emission equipment and processes for local businesses, schools, non-profit and religious institutions, hospitals, city and county facilities.	Significant and unavoidable	All Tiers
Biological Resources				
Impact 4.4-1 Have a Substantial Adverse Effect, either Directly or through Habitat Modifications, on any Species Identified as a Candidate, Sensitive, or Special Status Species in Local or Regional Plans, Policies, or Regulations or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service	Potentially significant	**MM 4.4-1** With the exception of focused surveys that are seasonally restricted, special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities. The purpose of the pre-disturbance surveys is to confirm the presence or absence of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act, or designated as fully-protected in the California Fish and Game Code (collectively, "Protected Species"), and to confirm the presence or absence of any other species considered "sensitive" under California Environmental Quality Act ("Sensitive Species"), and to identify and implement feasible avoidance and minimization measures for such species. The surveys shall be conducted in accordance with all currently-applicable presence and absence survey and/or species protocols established by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife ("Species Protocols"). In the absence of any approved protocols, the survey shall extend for a minimum of 250 feet from all areas where any ground disturbance activities would occur, provided that permission to access has been obtained. As an alternative to individual pre-disturbance surveys for each application, and after consultation with and concurrence by the California Department of Fish and Wildlife and the United	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		States Fish and Wildlife Service, multiple parcels or areas of oil and gas production lands (including lands which may have multiple surface or mineral ownership) may be consolidated for the purpose of more efficiently managing pre-disturbance surveys and determinations regarding the absence of protected species in areas of proposed new ground disturbance activities. **MM 4.4-2** No incidental take of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act , or designated as fully-protected in the California Fish and Game Code (Protected Species) may occur unless the incidental take is authorized by applicable state and federal wildlife agencies in the form of a permit or other written authorization, an approved state or federal conservation plan, or in accordance with an approved regional plan such as the Draft Valley Floor Habitat Conservation Plan and/or Natural Community Conservation Plan. **MM 4.4-3** Exclusion barriers or buffers may be used, where effective and feasible in the opinion of the qualified biologist, to avoid any unauthorized incidental take of Protected Species, and to minimize any incidental take of Sensitive Species, by separating the planned disturbance area from any locations where pre-disturbance surveys or previously conducted focused surveys have detected the presence of Protected Species or Sensitive Species. All buffers must extend for a minimum of 50 feet from the nearest point of disturbance unless a smaller avoidance buffer has been established by either the United States Fish and Wildlife Service or the California Department of Fish and Wildlife as the minimum to avoid unauthorized take of protected species, and the barriers must prevent the potential migration of wildlife into the construction area and unlawful incidental take of any Protected Species during ground disturbance activities. The minimum buffer distance shall be increased if required to avoid unauthorized incidental take of any Protected Species as determined by a qualified biologist. Exclusion barriers, buffer distances, and other avoidance measures that may be implemented to avoid impacts to Protected Species or Sensitive Species must be consistent with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, and shall be implemented and overseen by the qualified biologist. **MM 4.4-4** Occupied burrowing owl burrows shall not be disturbed during the species nesting season (February 1 through August 31). The following distances shall be maintained between all disturbance areas and burrowing owl nesting sites (Table 4.4-84).		

Table 4.4-84: Setback Distances for Burrowing Owl Nesting Sites by Level of Proposed Project Impacts

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)		Level of Significance after Mitigation	Applicable Tier
			Burrowing owls present in proposed disturbance areas or within 500 feet or as specified under an approved Habitat Conservation Plan (as identified during pre-disturbance surveys) outside of the breeding season (between September 1 and January 31) may be moved away from the disturbance area using passive relocation techniques approved by the California Department of Fish and Wildlife. Passive relocation techniques in the California Department of Fish and Wildlife *Staff Report on Burrowing Owl Mitigation Guidelines* (California Department of Fish and Game 2012) include installing one-way doors in burrow entrances for 48 hours, to ensure the owl(s) have left the burrow, daily monitoring during the passive relocation period, and collapsing existing burrows to prevent reoccupation. A minimum of one or more weeks will be required to relocate the owl(s) and allow for acclimatization to alternate off-site burrows. Prior to burrow exclusion or eviction, a burrowing owl management plan shall be prepared and approved by the California Department of Fish and Wildlife. Destruction of burrows shall occur only pursuant to a management plan for the species approved by the California Department of Fish and Wildlife; burrow excavation shall be conducted by hand whenever possible. As an alternative to passive relocation, occupied burrows identified off-site within 500 feet of construction activities may be buffered with hay bales, fencing (e.g. sheltering in place), or as directed by the qualified biologist and the California Department of Fish and Wildlife, to avoid disturbance of burrows.		
		MM 4.4-5	The pre-disturbance surveys shall determine whether active bat maternity roosts are located in or within 250 feet of any disturbance area. All active bat maternity roosts shall be avoided during breeding periods, including postponing disturbance activities if required, and to the maximum extent feasible at other times. If an active bat maternity roost location cannot feasibly be avoided by disturbance, the United States Fish and Wildlife Service and California Department of Fish and Wildlife must be contacted to identify appropriate impact minimization measures prior to initiating any disturbance that would affect the roost.		
		MM 4.4-6	Any potential San Joaquin kit fox dens (as defined in United States Fish and Wildlife Service 2011) detected during pre-disturbance surveys shall be reevaluated for species activity no more than 14 days prior to the commencement of ground disturbance. Potential kit fox dens shall be marked and a 50-foot avoidance buffer shall be delineated using stakes and flagging or similar materials to prevent inadvertent damage to the potential den. If a potential den cannot feasibly be avoided, the den may be hand excavated in accordance with the United States Fish and Wildlife Service *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance* (United States Fish and Wildlife Service 2011). If species activity is detected, the location shall be identified as a "known" kit fox den in accordance with the U.S. Fish and Wildlife Service species guidelines (United States Fish and Wildlife Service 2011). A minimum 100-foot buffer from any disturbance area shall be maintained for known dens and a minimum 500-foot buffer from any disturbance area shall be maintained for natal dens. No excavation of a known or natal den shall occur without prior authorization from the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. For activities occurring on land covered under an approved Habitat Conservation Plan, the requirements set forth in those documents shall be implemented. Other standard measures to protect San Joaquin kit fox, including capping pipes, covering trenches, adding exit ramps to excavated areas, shall be implemented in accordance with MM 4.4-19.		
		MM 4.4-7	Occupied American badger dens detected during pre-disturbance surveys shall be flagged and ground-disturbing activities avoided within 50 feet of the den. Maternity dens shall be avoided and a minimum 200-foot buffer from disturbance shall be maintained during pup-rearing season (February 15 through July 1). Maternity dens must be avoided to the maximum extent feasible. If a maternity den cannot feasibly be avoided, the California Department of Fish and Wildlife must be contacted to identify appropriate impact minimization measures prior to initiating any disturbance that would affect the den, including potential passive relocation by excavation before or after the rearing season.		
		MM 4.4-8	Pre-disturbance surveys for all sites located above 2,000 feet in elevation, or within 200 feet down gradient from the 2,000-foot elevation contour line, shall specifically survey for any golden eagle nests located within 2 miles of the site. If golden eagle nests are detected by the surveys, the qualified biologist shall conduct a nest-specific viewshed analysis. No disturbance may occur within 0.25 mile, or within 0.5 mile of the viewshed of an active golden eagle nest. The United States Fish and Wildlife Service and California Department of Fish and		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		Wildlife must be notified prior to the commencement of any disturbance activities within 1 mile of an active golden eagle nest to avoid golden eagle take. **MM 4.4-9** All sites located above 2,000 feet in elevation, or within 200 feet down gradient from the 2,000-foot elevation contour line, shall implement the following measures to avoid and minimize potential adverse impacts to the California condor: a. The site shall, at all times, be maintained to avoid any trash, debris, food sources and microtrash, such as bottle caps, that could be ingested by or attract California condor. Trash shall be disposed in animal-proof containers as required in BIO 4.4-19. b. The Worker Environmental Awareness Program described in BIO MM 4.4-18 shall include information about microtrash and potential effects to California condor, and shall prohibit the disposal of trash (and microtrash) on the site of oil and gas activities. c. If a condor is observed in a proposed construction site, all disturbance activities must immediately cease within 500 feet of the condor until the animal has moved from the site. If condor occurrence persists, the United States Fish and Wildlife Service and the California Department of Fish and Wildlife must be contacted to identify appropriate avoidance measures prior to initiating or resuming any disturbance activity. d. All condor observations shall be reported within 24 hours to the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. e. All tanks, liquid storage facilities, and any open area containing water or other liquid materials, including drilling sumps, must be covered or otherwise shielded in a manner that prevents condor intrusion and potential entrapment. f. No overhead transmission lines may be used at the site without the prior approval of the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. **MM 4.4-10** Pre-disturbance surveys for active bird nests must be conducted no more than 10 days prior to the commencement of disturbance. Surveys shall follow United States Fish and Wildlife and California Department of Fish and Wildlife guidance and/or protocols, as applicable. If no active nests or nesting birds are identified, then Project construction activities may proceed and no further mitigation measures for nesting birds are required. If active nest(s) are identified, the active nest(s) should be continuously surveyed for the first 24 hours after detection, to establish a behavioral baseline prior to any construction-related activities. Once construction commences, all nests shall be continuously monitored to detect any behavioral changes as a result of the Project (i.e., nest avoidance or abandonment). If behavioral changes are observed, the work causing that change should cease and the California Department of Fish and Wildlife and the United States Fish and Wildlife should be consulted for additional avoidance and minimization measures. If continuous monitoring of identified nests by a qualified wildlife biologist is not feasible, a minimum no-disturbance buffer of 250 feet will be established around active nests and a 500-foot no-disturbance buffer around the nests of raptors until the breeding season has ended, or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival, and any adult birds are no longer occupying the nest. Variance from these no-disturbance buffers may be implemented a qualified biologist concludes that work within the buffer area would not cause nest avoidance or abandonment (e.g., when the disturbance area would be concealed from a nest site by topography). The California Department of Fish and Wildlife and the United States Fish and Wildlife must be notified in advance of implementing of a variance in the no-disturbance buffer. **MM 4.4-11** The following measures will be implemented to avoid take of blunt-nosed leopard lizard and to ensure protection of these animals during Project activities: a. Project activities will avoid all potential burrows that may be occupied by blunt-nosed leopard lizards. Suitable burrows within and adjacent to potential habitat for the species should be avoided by a minimum distance of 50-feet in all areas where ground-disturbing Project activities will occur.		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		b. No more than one year prior to ground disturbing activities, focused surveys following current California Department of Fish and Wildlife and United States Fish and Wildlife protocols for detection of this species or other methods approved by both agencies shall be conducted in all potential blunt-nosed leopard lizard habitat within the work site and a 250-foot buffer area. If no individual blunt-nosed leopard lizards are observed during focused surveys, and surveys are current (e.g., completed in the same calendar year), then Project activities may proceed. c. If blunt-nosed leopard lizards are detected during focused surveys, a blunt-nosed leopard lizard avoidance plan shall be prepared for the Project that will result in avoidance of incidental take of this species unless take is separately authorized under a Natural Communities Conservation Plan and appropriate federal authorization is obtained. At a minimum, the blunt-nosed leopard lizard avoidance plan shall contain the following elements: 1. A Worker Environmental Awareness Program shall be implemented for all construction personnel before construction begins (see MM 4.4-18). 2. During periods that are optimal for blunt-nosed leopard lizard activity (early spring through late fall), a qualified biologist will be present during all ground disturbing activities. The qualified biologist will check the Project site(s) and access route(s) daily during the blunt-nosed leopard lizard active season to determine presence or absence of lizards in or near the work areas. Monitoring by a qualified biologist is not required during periods of inactivity (the winter season). 3. All open trenches or excavations shall be covered at the end of each workday or protected with the use of exclusion fencing to prevent wildlife entrapment. If an excavation is too large to cover, escape ramps shall be installed at an incline ratio of no greater than 2:1. All trenches and pipes shall be inspected for the presence of wildlife each day prior to the commencement of work. If blunt-nosed leopard lizards are observed at the work site during construction, construction shall cease within a 250-foot radius and the United States Fish and Wildlife Service and the California Department of Fish and Wildlife shall be consulted to determine what additional measures would be necessary to prevent take of this species. 4. Offsite locations where blunt-nosed leopard lizards have been observed or are likely to occur shall be clearly marked to prevent workers from driving off the road and to prevent inadvertent destruction of burrows. Barriers, such as exclusionary fencing may be installed. All construction equipment and construction personnel vehicles will be checked prior to moving to ensure no blunt-nosed leopard lizard are under equipment/vehicles. 5. A speed limit of 10 miles per hour shall be posted and observed within 0.25 miles of any reported blunt-nosed leopard lizard observation. 6. Construction activities shall avoid burrows that may be used by blunt-nosed leopard lizards. Any location of proposed construction activity with potential to collapse or block burrows (i.e., stockpile storage, parking areas, staging areas, trenches) will be identified prior to construction in the blunt-nosed leopard lizard avoidance plan and approved by the qualified biologist. The qualified biologist may allow certain activities in burrow areas if the combination of soil hardness and activity impact is not expected to collapse burrows and no blunt-nosed leopard lizards have been found during pre-Project surveys in the impact area. 7. All individual blunt-nosed leopard lizards observed above-ground will be avoided. Any individual blunt-nosed leopard lizard that may enter the Project site(s) would be allowed to leave unobstructed, and on its own accord. If a blunt-nosed leopard lizard is detected during biological monitoring or observed at any other point, the California Department of Fish and Wildlife and the United States Fish and Wildlife Service shall be notified to determine what additional measures would be necessary to prevent take of the species. **MM 4.4-12** The Applicant shall comply with the following: a. Plant surveys for Protected Species and Sensitive Species must be completed by a qualified biologist during the appropriate blooming		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		periods for species identification and detection. Plant surveys shall be conducted in accordance with all applicable protocols established by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife for particular plant species ("Plant Survey Protocol"), and shall extend 50 feet from areas where any new disturbance would occur unless a greater survey distance is specified in the Plant Survey Protocol. All detected plant populations of Protected Species and Sensitive Species shall be identified in the field during the surveys with temporary flags or other appropriate materials to avoid and minimize impacts to the plant populations from any disturbance activities. b. No incidental take or relocation of any plant listed under the California Endangered Species Act may occur unless the incidental take is authorized by the California Department of Fish and Wildlife in a permit or other authorization, or in an approved Natural Communities Conservation Plan. If pre-construction surveys detect the presence of any California Endangered Species Act Plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the California Department of Fish and Wildlife. Projects covered under incidental take authority shall conduct activities in accordance with the take authorization. The California Department of Fish and Wildlife may be contacted to determine the appropriate buffer required to prevent incidental take of a California Endangered Species Act Plant if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable California Endangered Species Act Plant buffers have been implemented prior to the commencement of any disturbance activity. c. If any non-listed sensitive plant species are identified that may be impacted by new ground disturbing activities, populations must be avoided by a 50-foot buffer. **MM 4.4-13** No incidental take or relocation of any plant listed under the California Endangered Species Act may occur unless the incidental take is authorized by the California Department of Fish and Wildlife in a permit or other authorization, or in an approved Natural Communities Conservation Plan. If pre-construction surveys detect the presence of any California Endangered Species Act Plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the California Department of Fish and Wildlife, unless incidental take authority is obtained. Projects covered under incidental take authority shall minimize disturbance in accordance with the take authorization. The California Department of Fish and Wildlife shall be contacted to determine the appropriate buffer required to prevent incidental take of a California Endangered Species Act Plant if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable California Endangered Species Act Plant buffers have been implemented prior to the commencement of any disturbance activity. If any non-listed sensitive plant species are identified that may be impacted by new ground disturbing activities, populations must be avoided by a 50-foot buffer. **MM 4.4-14** A Worker Environmental Awareness Program shall be developed and implemented for all personnel that could access the site prior to commencing any disturbance activities. The program shall consist of an on-site or center presentation that will describe the locations and types of sensitive plant, wildlife, and sensitive natural communities (collectively, "Biological Resources") on and near the site, an overview of the laws and regulations governing the protection of Biological Resources, the reasons for protecting the Biological Resources, the specific protection and avoidance measures that are applicable to the site, and the identity of designated points of contact should questions or issues arise, including the qualified biologist. The program shall provide training to recognize, avoid and report to applicable qualified biologists any Biological Resources on the site. a. The Worker Environmental Awareness Program shall emphasize the need to avoid contact with onsite wildlife, and avoid entry into areas where Biological Resources have been identified based on pre-disturbance field surveys and to implement the buffer avoidance or other protection measures established by the United States Fish and Wildlife Service shall be identified California Department of Fish and Wildlife or required by the Biological Resource mitigation measures. The training shall emphasize the importance of not feeding or domesticating wildlife and the need to avoid any trash, microtrash, or potential food disposal onsite except in animal-proof containers emptied daily to avoid attracting, or causing adverse impacts to special status wildlife.		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		b. All onsite personnel must sign a statement verifying that they have completed the Worker Environmental Awareness Program, and that they understand and agree to implement the biological requirements for the worksite. If signed employee statements are not available, documentation may be provided by Worker Environmental Awareness Program training records, which shall be kept by the Applicant for a minimum of 5 years. Each Applicant shall maintain a list of all persons who have completed the training program, and shall provide the list to the County or to state and federal wildlife agency representatives upon request. **MM 4.4-15** The following additional measures shall be implemented to avoid and minimize potential significant adverse impacts to Protected and Sensitive Species: a. All vehicles shall observe a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved roads unless otherwise posted. Off-road traffic outside of designated access routes is prohibited. Speed limit signs shall be posted in visible locations at the point of site entry and at regular intervals on all unpaved access roads. b. All disturbance activities, except emergency situations or drilling that may require continuous operations, shall only occur during daylight hours. Night time disturbance activity for drilling purposes shall use directed lighting, shielding methods, or reduced lumen intensity to avoid unnecessary visual disturbance to wildlife and to comply with applicable lighting mitigation measures. c. All food-related trash items and all forms of microtrash, such as wrappers, cans, bottles, bottle tops, and food scraps shall be disposed of in closed, animal proof containers and removed daily from the site. d. Excavations, spoils piles, access roadways, and parking and staging areas shall subject to dust control as set forth in the dust control mitigation measures. e. The use of herbicides for vegetation control shall be restricted to those approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. No rodenticides shall be used on any site unless approved by the United States Fish and Wildlife Service, and the California Department of Fish and Wildlife, and shall observe label and other restrictions mandated by the United States Environmental Protection Agency, California Department of Food and Agriculture, and state and federal laws and regulations. For split estates, no herbicides for vegetation control may occur in Tier 2 areas without surface owner approval. f. No plants or wildlife shall be collected, taken, or removed from the site or any adjacent locations except as necessary for Project-related vegetation removal or wildlife relocation by a qualified biologist and subject to all applicable permits and authorizations. g. All open trenches or excavations shall be covered at the end of each workday to prevent wildlife entrapment. If an excavation is too large to cover, escape ramps shall be installed at an incline ratio of no greater than 2:1 to. All trenches and pipes shall be inspected for the presence of wildlife each day prior to the commencement of work. h. To enable San Joaquin kit foxes and other wildlife to pass through the Project site, any perimeter fencing shall include a 4- to 8-inch opening between the fence mesh and the ground or the fence shall be raised 4 inches above the ground except blunt-nosed leopard lizard exclusion fencing. The bottom of the fence fabric shall be knuckled (wrapped back to form a smooth edge) to protect wildlife. i. All vertical tubes used in Project construction and chain link fencing poles, shall be temporarily or permanently capped to avoid the entrapment and death of special-status wildlife and birds. j. All dead or injured special status wildlife shall be left in place and reported to the United States Fish and Wildlife Service and the California Department of Fish and Wildlife within 48 hours of discovery for rescue or salvage. Discovery of state or federal listed species that are injured or dead shall also be reported immediately via telephone and within 24 hours in writing, and with a copy to Kern County Planning and Community Development. k. All drilling installations and operations will comply at all times with the applicable federal, State, county, and local law ordinances and		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		regulations. l. All activity shall use previously disturbed areas to the maximum extent feasible to minimize the amount of new disturbance. m. Vehicle, equipment, and material storage must be limited to previously disturbed areas. No construction or operational materials may be placed or stored outside of the planned disturbance area or stockpiled for future disposal. All concrete and asphalt debris should be removed from the site for recycling or proper disposal. n. No vehicles or construction equipment shall be parked within a wetland or waterbody/dry wash. o. Tracked vehicles and other construction equipment must be washed or maintained to be weed-free prior to entering and working within areas of new disturbance. p. All washing of trucks, paint, equipment, or similar activities should occur in areas where runoff is fully contained for collection and offsite disposal. Wash water may not be discharged from the site and shall be located at least 100 feet from any water body, or sensitive Biological Resources. q. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from wetland boundaries or waterbody, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land. r. All areas that must be avoided as result of the pre-disturbance surveys, and areas where new disturbance will occur, shall be clearly delineated by fencing or staking and flagging and/or rope or cord. s. No firearms shall be allowed on any site. t. No pets shall be allowed on any site. u. No smoking may occur except in designated areas. v. If ground disturbance is intended to be temporary, perform topsoil segregation during construction activities to preserve the seed bank for restoration efforts. Store the segregated topsoil separate from the subsoil and restore segregated topsoil to its original location.		
		MM 4.4-16 Ground disturbance shall be mitigated at a 1.0 to 1.0 ratio (one-acre of new disturbance shall require one-acre of mitigation) except in Tier 1 areas that contain existing disturbance of 70% or greater which shall be mitigated at a 1.0 to 0.5 ratio (one-acre of new disturbance shall require one-half acre of mitigation). This compensatory mitigation requirement does not apply to construction on ground for which compensatory mitigation has already been provided, or on ground that has been previously disturbed (e.g., cleared of vegetation for other oil and gas extraction uses, existing unpaved roads, and existing unvegetated well pads). Ground disturbance activities that are authorized by permits or other written authorizations approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife, which include avoidance and compensatory mitigation acreage requirements, may be used to satisfy this County compensatory mitigation ratio. Compensatory mitigation shall be required for the actual acreage of ground disturbance documented during the site plan review and completion process. New disturbance mitigation may be satisfied by one or a combination of the following measures: a. The recordation of a conservation easement or similar permanent, long-term conservation management agreement in a form acceptable to the County for land within the Project Area on land that has mitigation value. The easement lands may be owned by an Applicant or a third party under contract with an Applicant. Larger land areas may be placed under a conservation easement or similar agreement, and an Applicant may "draw down" the conserved land as needed to satisfy the acreage mitigation requirements for multiple site plan review conformity permits or other authorizations from the County for oil and gas activities. b. Acquisition of land preservation credits from a mitigation bank located within the Project Area which is owned by the County, on other lands approved by the County, or on lands approved for mitigation or conservation purposes by the United States Fish and Wildlife		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		Service or the California Department of Fish and Wildlife. c. Removal of legacy oil and gas equipment, inclusive of compliance with applicable legal requirements (e.g., well plugging and abandonment requirements under state or federal regulations), restoration of the surface grade to be consistent with surrounding lands, complete a reseeding effort using native species, and notification of the site owner (if not the Applicant) of the completion of the removal and grading restoration work. d. Enhancement or restoration of existing habitat on lands already subject to a conservation easement or similar agreement, or which become subject to a conservation easement or similar agreement subsequent to the certification of this Environmental Impact Report, provided that such activities are covered in a permit or authorization, conservation plan, Habitat Conservation Plan, or Natural Community Conservation Plan, approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife. e. Payment of a biological resources mitigation fee for the acquisition and management of mitigation lands, legacy equipment removal, and/or land enhancement already subject to conservation easements or a similar agreements under the terms of any biological resource mitigation program that is adopted by Kern County and approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife. The County shall coordinate with the United States Fish and Wildlife Service or the California Department of Fish and Wildlife to identify priority conservation areas and potential conservation partners and funding sources to increase the efficiency and effectiveness of mitigation fee expenditures.		
Impact 4.4-2 Have a Substantial Adverse Effect on Any Riparian Habitat or Other Sensitive Natural Community Identified in Local or Regional Plans, Policies, Regulations, or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service	Potentially significant	Implement MM 4.4-1 through 4.4.18, described above, and dust control, spill and hazardous material avoidance and containment, and surface and subsurface water quality and hydrology mitigation measures. **MM 4.4-17** Pre-disturbance surveys shall be conducted by a qualified biologist during the appropriate periods for detecting Sensitive Natural Communities that could occur within the Project Area. The surveys shall be completed consistent with applicable protocols approved by the United States Fish and Wildlife Service and/or the California Department of Fish and Game, including the Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (California Department of Fish and Wildlife 2009). The qualified person shall map and identify all sensitive natural communities, including riparian communities that occur in or within 100 feet of any new disturbance area. The site plan for the proposed activity shall identify waters, wetlands and other riparian habitats that occur in and within 100 feet of the disturbance area. **MM 4.4-18** No land disturbance activity in any Sensitive Natural Community that requires a state or federal permit, including state or federally regulated wetlands and waters, shall occur unless the activity is specifically authorized by the issuance of permits or approvals as required by state and federal law. This provision is not intended to restrict survey activities.	Less than significant	All Tiers
Impact 4.4-3 Have a Substantial Adverse Effect on Federally Protected Wetlands as Defined by Section 404 of the Clean Water Act (Including, but Not Limited to, Marsh, Vernal Pool, Coastal, etc.) through Direct Removal, Filling, Hydrological Interruption, or Other Means	Potentially significant	Implementation of the Biological Resources mitigation measures would ensure that oil and gas activities would not disturb state or federally regulated wetlands and waters unless the activity is specifically authorized by the issuance of permits or approvals as required by state and federal laws and that activities in the vicinity of wetlands and water bodies would not adversely disturb them. Other mitigation measures identified in this Environmental Impact Report would further reduce potential state or federally jurisdictional wetland and waters, including dust control, spill and hazardous material avoidance and containment, surface and subsurface water quality and hydrology, mitigation measures.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.4-4 Interfere Substantially with the Movement of any Native Resident or Migratory Fish or Wildlife Species, or with Established Native Resident or Migratory Wildlife Corridors, or Impede the Use of Native Wildlife Nursery Sites	Potentially significant	Implementation of the Biological Resources mitigation measures would reduce wildlife movement impacts. Other mitigation measures identified in this Environmental Impact Report to further reduce wildlife movement impacts, include dust control, nighttime lighting, noise controls, spill and hazardous material avoidance and containment,, and surface and subsurface water quality and hydrology (including but not limited to Kern River and Poso Creek channels), measures.	Less than significant	All Tiers
Impact 4.4-5 Conflict with Any Local Policies or Ordinances Protecting Biological Resources, Such as a Tree Preservation Policy or Ordinance	Potentially significant	**MM 4.4-19** In the event that new disturbance would occur at a site within an oak woodland area as defined in Section 1.10.10 of the Kern County General Plan Land Use, Open Space and Conservation Element (10% or greater oak tree cover), the Applicant shall comply with the minimum 30% canopy retention standard in Section 1.10.10 KK (a). Impacts to oak trees in other locations, and in locations that meet the criteria for an oak woodland area, shall be avoided to the maximum extent practicable, including modification of the disturbance area, if feasible, to avoid existing oak trees within a site.	Less than significant	All Tiers
Impact 4.4-6 Conflict with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or Other Approved Local, Regional, or State Habitat Conservation Plan	Potentially significant	**MM 4.4-20** Applicants shall fund through the Site Conformity Review administrative fee, preparation by Kern County of, an annual report describing the Project's ground disturbance acreage, and the acreage of compensatory mitigation lands, in each sub-area.	Less than significant	All Tiers
Impact 4.4-7 Cumulative Impact to Biological Resources	Potentially significant	Implement MM 4.4-1 through MM 4.4-20, as described above.	Significant and unavoidable	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Cultural Resources				
Impact 4.5-1 Cause a Substantial Adverse Change in the Significance of a Historical Resource as Defined in Section 15064.5	Potentially significant	**MM 4.5-1** Prior to initiating ground disturbance activities for an activity for which a conformity review is required, the Applicant shall: a. Have an archival records search completed by a qualified archaeologist. This shall include an examination of the California Historical Resources Information Files at the Southern San Joaquin Valley Information Center, California State University, Bakersfield, and a search of the Native American Heritage Commission Sacred Lands Files, Sacramento. The Applicant may rely on a previously performed records search for subsequent ground disturbing activities. b. If an application location has been previously surveyed and no cultural resources have been recorded on it, no further cultural resources studies shall be required. c. Implement either: 1. If an application site plan is within a section that has experienced 100% previous ground-surface disturbance, as indicated by 300 or more existing oil wells or other agricultural, industrial or urban uses, and the records searches indicate that the parcel has been previously surveyed and no cultural or Native American resources are known on it, no further cultural resources studies shall be required. All other application locations shall be subject to intensive (100%) pedestrian ground-surface survey (Phase I survey/Class III inventory) by qualified archaeologists. The Applicant may rely on a previously performed ground surface survey for subsequent ground disturbing activities; or 2. If an application location has not been previously surveyed based on the records search information, an intensive (100%) pedestrian ground-surface survey (Phase I survey/Class III inventory) by qualified archaeologists shall be required. d. All prehistoric/Native American archaeological sites, whether identified during the records searches or during the intensive survey, shall be demarcated by a qualified archaeologist, fenced by the Applicant, and preserved in place. e. Historical (Euro-American) archaeological sites that are potentially eligible for listing in the National Register of Historic Places shall be evaluated by a qualified archaeologist and must meet the requirements of the National Historic Preservation Act of 1966 in order to qualify. Qualifying sites, structures and equipment that are identified during the records search or field survey shall be fenced and preserved in open-space, removed and curated, or treated using appropriate data recovery procedures. f. Historical (Euro-American) archaeological site types relating to oil and gas activities that have been determined Not Significant/Unique shall require no archaeological study or treatment. g. All oil and gas industry employees conducting work in the area identified on the Conformity Site Plan shall complete Worker Environmental Awareness Program training including training dedicated to cultural resources protection.	Less than significant	All Tiers
Impact 4.5-2 Cause a Substantial Adverse Change in the Significance of an Archaeological Resource as Defined in Section 15064.5	Potentially significant	Implement MM 4.5-1, as described above.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.5-3 Directly or Indirectly Destroy a Unique Paleontological Resource or Site or Unique Geologic Feature	Potentially significant	**MM 4.5-2** As part of any Worker Environmental Awareness Program training, all construction personnel shall be trained regarding the recognition of possible buried paleontological resources and protection of paleontological resources during construction, prior to the initiation of construction or ground-disturbing activities. Training shall inform construction personnel of the procedures to be followed upon the discovery of paleontological materials. All personnel shall be instructed that unauthorized collection or disturbance of fossils is unlawful. **MM 4.5-3** All well permits that use Enhanced Oil Recovery or Well Stimulation methods shall pay a mitigation fee of $50 per well shall be paid to the Buena Vista Museum to fund the continued education and curation of paleontological resources and provide educational support regarding the paleontological history of the region.	Less than significant	All Tiers
Impact 4.5-4 Disturb any Human Remains, Including Those Interred Outside of Formal Cemeteries	Potentially significant	**MM 4.5-4** In the event archaeological materials are encountered during the course of ground disturbance or construction, the Project operator/contractor shall cease any ground disturbing activities within 50 feet of the find. The qualified archaeologist shall evaluate the significance of the resources and recommend appropriate treatment measures. Per California Environmental Quality Act Guidelines Section 15126.4(b)(3), Project redesign and preservation in place shall be the preferred means to avoid impacts to significant historical resources. Consistent with California Environmental Quality Act Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures in consultation with the County, which may include data recovery or other appropriate measures. The Planning and Community Development Department shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. If after consultation it is deemed appropriate, archaeological materials recovered during any investigation shall be curated at an accredited curation facility. The qualified archaeologist shall prepare a report documenting evaluation and/or additional treatment of the resource. A copy of the report shall be provided to the Kern County Planning and Community Development Department and to the Southern San Joaquin Valley Information Center. **MM 4.5-5** If human remains are uncovered during Project construction, the Applicant shall immediately halt all work, contact the Kern County Coroner to evaluate the remains, and follow the procedures and protocols set forth in Section 15064.4 (e)(1) of the California Environmental Quality Act Guidelines. The Kern County Planning and Community Development Department shall be notified concurrently. If the County Coroner determines that the remains are Native American, the Project proponent shall contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by Assembly Bill 2641). The Native American Heritage Commission shall designate a Most Likely Descendant for the remains per Public Resources Code 5097.98. Per Public Resources Code 5097.98, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred with the most likely descendant regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. If the remains are determined to be neither of forensic value to the Coroner, nor of Native American origin, provisions of the California Health and Safety Code (7100 et. seq.) directing identification of the next-of-kin will apply.	Less than significant	All Tiers
Impact 4.5-5 Cumulative Impacts to Historical, Archaeological, or Paleontological Resources and Human Remains	Potentially significant	Implement MM 4.5-1 through MM 4.5-5, as described above.	Significant and unavoidable	

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Geology and Soils				
Impact 4.6-1 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving the Rupture of a Known Earthquake Fault	Potentially significant	**MM 4.6-1** Prior to beginning a ground disturbance activity, the Applicant shall comply with the following regulations (as applicable) and confirm compliance in its Site Plan Conformity Review application documentation: a. Alquist-Priolo Earthquake Fault Zoning Act. b. California Building Code. c. Division of Oil Gas and Geothermal Resources regulations, as identified in the California Code of Regulations, Title 14, Division 2, Chapter 4, including regulations implementing Senate Bill 4 as applicable. If hydraulic fracturing is conducted for any well associated with the Site Plan Conformity Review, the Applicant shall comply with requirements to monitor the California Integrated Seismic Network for indication of an earthquake of magnitude 2.7 or greater for the period of 10 days following the end of hydraulic fracturing. The earthquake search radius shall be consistent with Division of Oil Gas and Geothermal Resources Senate Bill 4 regulations. The data will be submitted to Division of Oil Gas and Geothermal Resources for an evaluation of the risks and actions consistent with the Division of Oil Gas and Geothermal Resources Senate Bill 4 regulations. d. Additionally, the Applicant shall: 1. Avoid placement of structures intended for human occupancy on or within 50 feet of any active faults designated and mapped pursuant to the Alquist-Priolo Earthquake Fault Zoning Act where the fault breaks the surface. 2. Have a professional geologist prepare a fault rupture hazard evaluation according to guidelines in California Geological Survey Special Publication 42, 2007 for new developments with structures that are intended for human occupancy. 3. All Class II injection wells shall be authorized, and shall comply with all applicable legal requirements, Underground Injection Control Program Approval permit conditions, and be operated according to the California Code of Regulations Title 14 requirements, as described in the mitigation measures for Hydrology and Water Quality. 4. Ensure that active fault trace placement restrictions are in place for all permanent tanks and storage reservoirs used to store, treat, or transport hazardous materials or materials that are considered pollutants to surface water and groundwater, located in an Earthquake Fault Zone. Ensure that all pipelines designated for the transportation of hazardous materials are engineered and constructed in compliance with the requirements of the pipeline safety regulations, 49 Code of Federal Regulations Parts 192 and 195.f) Ensure that all new pipelines designated for or water used for fire suppression are engineered and constructed in compliance with the requirements of California Building Code Chapter 9, Fire Protection Systems, and the California Fire Code to address potential fault rupture displacements. **MM 4.6-2** All structures designed for human occupancy shall be designed to withstand substantial ground shaking in accordance with applicable California Building Code seismic design standards and Kern County Building Code.	Less than significant	All Tiers
Impact 4.6-2 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Strong Seismic Ground Shaking	Potentially significant	Implement MM 4.6-1 and MM 4.6-2, as described above.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.6-3 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Seismic-Related Ground Failure, Including Liquefaction	Potentially significant	Implement MM 4.6-1 and MM 4.6-2, as described above.	Less than significant	All Tiers
Impact 4.6-4 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Landslides	Potentially significant	**MM 4.6-3** Operators shall avoid siting structures on slopes greater than 30% unless the Applicant determines that mineral recovery is infeasible from a different location, and site-specific Professional Engineering certification is submitted concluding that the new equipment will not cause landslides.	Less than significant	All Tiers
Impact 4.6-5 Result in Substantial Soil Erosion or the Loss of Topsoil	Potentially significant	Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Impact 4.6-6 Be Located on a Geological Unit or Soil That is Unstable, or That Would Become Unstable as a Result of the Project, and Potentially Result in On- or Off-site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse	Potentially significant	Implement MM 4.6-3and MM 4.6-4, as described above, and the following: **MM 4.6-4** The Applicant shall confirm compliance with, and shall implement, a Division of Oil Gas and Geothermal Resources approved re-pressuring plan as required by Division 3, Chapter 1, Article 5.5 of the Public Resources Code, commencing with Section 3315. In developed areas where subsidence is confirmed or suspected, subsidence monitoring shall be required using Synthetic Aperture Radar studies and/or other methods as approved by the Division of Oil Gas and Geothermal Resources to quantify and evaluate the potential effect on the area.	Less than significant	All Tiers
Impact 4.6-7 Be Located on Expansive Soil, as Defined in Table 18-1-B of the Uniform Building Code (1994), Creating Substantial Risks to Life or Property	Potentially significant	**MM 4.6-5** The Applicant shall avoid building infrastructure on expansive soils unless the Applicant determines that mineral recovery is infeasible from a different location, and site-specific Professional Engineering certification is submitted concluding that the new equipment will not cause substantial risks to life or property.	Less than significant	All Tiers
Impact 4.6-8 Have Soils Incapable of Adequately Supporting the Use of Septic Tanks or Alternative Wastewater Disposal Systems Where Sewers Are Not Available for the Disposal of Wastewater	Less than significant	Implement MM 4.6-1, as described above.	Less than significant	All Tiers
Impact 4.6-9 Cumulative Impacts to Geologic and Soil Resources	Potentially significant	Implement MM 4.6-1 through MM 4.6-5, as described above.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Green House Gas Emissions				
Impact 4.7-1 Generate Greenhouse Gas Emissions, Either Directly Or Indirectly, that may have a Significant Impact on the Environment	Potentially significant	**MM 4.7-1** An Applicant with permitted stationary sources shall comply with the Cap-and-Trade regulation (e.g., by reducing greenhouse gas emissions within their facilities or by surrendering greenhouse gas allowances, offset credits, or other compliance instruments to offset the greenhouse gas increases), and implement Best Performance Standards applicable to greenhouse gas reduction for Components at Light Crude Oil and Natural Gas Production, Natural Gas Processing Facilities, Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants (San Joaquin Valley Air Pollution Control District 2010), Thermally Enhanced Oil Recovery Wells (San Joaquin Valley Air Pollution Control District 2010a), Steam Generators (San Joaquin Valley Air Pollution Control District 2010b), and Front-line Organic Liquid Storage Tanks (San Joaquin Valley Air Pollution Control District 2011). **MM 4.7-2** Each Applicant shall comply with applicable Cap and Trade regulations, and other applicable greenhouse gas emission control and reduction regulations as these may be adopted or amended over time, to reduce, avoid, mitigate and/or sequester greenhouse gas emissions from Project-related air emissions. **MM 4.7-3** Each Applicant shall implement methods to recover for reuse or destroy methane existing in associated gas and casinghead gas, as follows: a. Recover all associated gas produced from the reservoir via new wells, regardless of the well type, except for gas produced from wildcat and delineation wells or as a result of start-up, shutdown and maintenance activities (whether planned or unplanned), system failures, and emergencies in accordance with San Joaquin Valley Air Pollution Control District regulations (Rule 4401 and 4409), as this may be amended over time. b. Compliance with the expected California Air Resources Board methane regulation. **MM 4.7-4** Each Applicant shall offset all greenhouse gas emissions not covered by the Cap-and-Trade program or other mandatory greenhouse gas emission reduction measures through Applicant reductions of greenhouse gas emissions as verified by the San Joaquin Valley Air Pollution Control District, through acquisition of offset credits from the California Air Pollution Control Officers Association Exchange Register or other third party greenhouse gas reductions as verified by the San Joaquin Valley Air Pollution Control District, or through inclusion in an Emission Reduction Agreement, to offset Project-related greenhouse gas emissions that are not included in the Cap and Trade program to assure that no net increase in greenhouse gas emissions from the Project.	Less than significant	All Tiers
Impact 4.7-2 Conflict with any Applicable Plan, Policy, or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases	Potentially significant	Implement MM 4.7-3, as described above.	Significant and unavoidable	All Tiers
Impact 4.7-3 Cumulative Greenhouse Gas Emissions Impacts	Potentially significant	Implement MM 4.7-4, as described above.	Significant and unavoidable	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Hazards and Hazardous Materials				
Impact 4.8-1 Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials	Potentially significant	**MM 4.8-1** The Applicant shall provide a comprehensive Worker Environmental Awareness Program to the County with its first Site Plan Conformity Review permit application in each calendar year. The program shall include all training requirements identified in Applicant Best Management Practices and mitigation measures, and include training for all field personnel (including Applicant employees, agents and contractors). The Worker Environmental Awareness Program shall include hazardous materials and hazardous waste management, and emergency preparedness, release reporting, and response requirements. **MM 4.8-2** The Applicant shall arrange for transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act. Drivers transporting hazardous materials or wastes should follow the measures recommended by the Federal Motor Carrier Safety Administration for avoiding roll-over accidents. To avoid roll-over accidents involving cargo tank trucks: a. Avoid sudden movements that may lead to roll-overs. b. Control your load in turns and on straight roadways. c. Identify high risk areas on roads. d. Remain alert and attentive behind the wheel. e. Control speed and maintain proper "speed cushions." **MM 4.8-3** The Applicant shall implement the following practices: a. Construction activities shall be conducted to allow for easy clean-up of spills. Construction crews shall have sufficient tools, supplies, and absorbent and barrier materials to contain and recover spilled materials. b. Fuels and lubricants shall be stored only at designated staging areas. Fuel and lubricant tanks shall have appropriate secondary spill containment (e.g., curbs). c. Storage of fuel and lubricants in the staging area shall be at least 100 feet away from the edge of water bodies. Refueling and lubrication of equipment shall be restricted to upland areas at least 100 feet away from stream channels and wetlands. d. Any fuel truck shall carry an oil spill response kit and spill response equipment at all times. e. Applicants shall be required to perform all routine equipment maintenance at the well pad, and promptly collect and lawfully dispose of wastes at an authorized recycling, treatment or disposal facility. f. Berms and/or dikes (secondary containment) shall be constructed around the permanent above-ground bulk tanks and the foundations shall be installed with a passive leak detection system, so that potential spill materials shall be contained and collected in specified areas isolated from any water bodies. Tanks shall not be placed in areas subject to periodic flooding or washout. g. A sufficient supply of sorbent and barrier materials shall be maintained on construction sites, and sorbent and barrier materials shall also be utilized to contain runoff from contaminated areas. 1. Shovels and drums shall be stored at each well pad or readily available. If small quantities of soil become contaminated, shovels shall be used to collect the soil and the material shall be stored in 55-gallon drums. Large quantities of contaminated soil may be bio-remediated on-site or at a designated remediation facility, subject to government approval, or collected utilizing heavy equipment, and stored in drums or other suitable containers prior to disposal. Should contamination occur adjacent to staging areas as a result of runoff, shovels and/or heavy equipment shall be utilized to collect the contaminated material. Contaminated soil shall	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		be disposed of in accordance with state and federal regulations. 2. Above-ground tanks, valves and other equipment shall be visually inspected monthly and when the tank is refilled. Inspection records shall be maintained. Applicants shall periodically check tanks for leaks or spills. 3. Drain valves on temporary tanks shall be locked to prevent accidental or unauthorized discharges from the tank. 4. Equipment maintenance shall be conducted in staging areas to the extent practical. 5. The Applicant shall maintain equipment in operating condition to reduce the likelihood of fuel or oil line breaks and leakage. Any vehicles with chronic or continuous leaks shall be removed from the construction site and repaired before being returned to operation.		
		MM 4.8-4 The Applicant shall implement the following measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations. a. The Applicant shall identify gas, oil and produced water pipelines to be used for each new or reworked well site in its Site Review Plan, and shall show the location of any sensitive receptor located within 200 feet of any such pipeline. For any pipeline located within 200 feet of a sensitive receptor, the Applicant shall present evidence that each such pipeline has been integrity tested using pressure testing or other accepted test methods by a qualified professional within a two-year period prior to submittal of the Site Review Plan, and shall provide a copy of the test result to the County. For all waste gas lines less than or equal to 4 inches in diameter, a Pipeline Management Plan shall be developed and implemented in accordance with Division of Oil Gas and Geothermal Resources regulations Title 14, Division 2, Chapter 4, Section 1774.2. The Pipeline Management Plan shall include: 1. A listing of information on each pipeline including, but not limited to: i. Pipeline type. ii. Grade. iii. Installation date of pipeline. iv. Design and operational pressure. v. Any leak, repair, inspection and testing history. 2. A description of the testing method and schedule for all pipelines. b. The Applicant shall notify the County of reportable quantities of fuel, gas, petroleum or hazardous materials leaks to the County within 48 hours of discovery, and to other applicable agencies as required by other laws. The Applicant shall immediately contain the leak (e.g., by isolating or shutting down the leaking equipment), clean up contaminated media (e.g., soils), and repair the leak prior to recommencing operations. The Applicant shall report the status and progress of the leak repair and remediation work to the County on monthly intervals until the repair has been completed, and any contaminated media has been remediated.		
		MM 4.8-5 If, during grading or excavation work, the Applicant observes visual or olfactory evidence of contamination or if soil contamination is otherwise suspected, work near the excavation site shall be terminated, the work area cordoned off and appropriate health and safety procedures implemented for the location by the contractor's Health and Safety Officer. Samples shall be collected by a trained and qualified individual. Analytical data from suspected contaminated material shall be reviewed by the contractor's Health and Safety Officer. If the sample testing determines that contamination is not present, work may proceed at the site; however, if contamination is detected above regulatory limits, the Kern County Public Health Services Department shall be notified. All actions related to encountering unanticipated		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		hazardous materials at the site shall be documented and submitted to the Kern County Public Health Services Department. **MM 4.8-6** The Applicant shall implement the most up-to-date best management practices as part of their normal operations. Specifically, operators and/or their contractors shall implement measures to prevent the release or accidental spillage of solid waste, garbage, construction debris, sanitary waste, industrial waste, naturally occurring radioactive materials, oil and other petroleum products, and other wastes into water bodies or water sources. The best management practices in the most up-to-date versions of the following documents shall be followed: *Exemption of Oil and Gas Exploration and Production Wastes From Federal Hazardous Waste Regulations (EPA 2002).* a. Classify the various oil and gas exploration and production wastes for proper disposal as described in United States Environmental Protection Agency 2002. b. Size reserve pits properly to avoid overflows. c. Use closed loop mud systems when practical, particularly with oil-based muds. d. Review safety data sheets of materials used, and select less toxic alternatives when possible. e. Minimize waste generation, such as by designing systems with the smallest volumes possible (e.g., drilling mud systems). f. Reduce the amount of excess fluids entering reserve and production pits. g. Keep non-exempt wastes out of reserve or production pits. h. Design the drilling pad to contain stormwater and rigwash. i. Recycle and reuse oil-based muds and high density brines, when practical. j. Perform routine equipment inspections and maintenance to prevent leaks or emissions. k. Reclaim oily debris and tank bottoms when practical. l. Minimize the volume of materials stored at facilities. m. Construct adequate berms around materials and waste storage areas to contain spills. n. Perform routine inspections of materials and waste storage areas to locate damaged or leaking containers. o. Train personnel to use sensible waste management practices. **MM 4.8-7** Conduct exploration and development activities as described in *Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book* (Bureau of Land Management 2007). The following specific measures should be undertaken at a minimum: a. Sufficiently impervious secondary containment, such as containment dikes, containment walls, and drip pans, should be constructed and maintained around all qualifying petroleum facilities, including tank batteries and separation and treating areas consistent with the Environmental Protection Agency's Spill Prevention, Control, and Countermeasures regulation (40 Code of Federal Regulations 112). The containment structure must have sufficient volume to contain, at a minimum, the content of the largest storage tank containing liquid hydrocarbons within the facility/battery and sufficient freeboard to contain precipitation, unless more stringent protective requirements are deemed necessary by the authorized officer. Drip pans should be routinely checked and cleaned of petroleum or chemical discharges and designed to prevent access by wildlife and livestock. b. Chemical containers should not be stored on bare ground, exposed to the sun and moisture. Containers and labels are subject to		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		degradation and punctured drums could leak contents on the ground. c. Chemicals containers should be maintained in good condition and placed within secondary containment in case of a spill or high velocity puncture. d. Containment dikes are not to be constructed with topsoil or coarse, insufficiently impervious spoil material. Containment is strongly suggested for produced water tanks. Chemicals should be placed within secondary containment and stored so that the containers are not in contact with soil or standing water and product and hazard labels are not exposed to weathering. e. Maintain a clean well location. Remove trash, junk, and other materials not in current use **MM 4.8-8** Applicants shall use the appropriate American Petroleum Institute Standards, or other recognized sources imposing the same or equivalent standards, for their facility, such as the following: a. Use cements and well materials in well completions as described in Specifications for Cements and Materials for Well Cementing (American Petroleum Institute 2011). b. Prior to start-up of all new facilities, verify and prove the construction, installation, integration, testing, and preparation of systems have been completed as designed following the practices described in Facilities Systems Completion Planning and Execution (American Petroleum Institute 2013a). c. When the use of centralizers and stop-collars are required during well completion activities, follow the installation and testing requirements described in Recommended Practice for Centralizer Placement and Stop-collar Testing (American Petroleum Institute 2010a). d. Limit the environmental footprint of oil and gas exploration and production and reduce the incidence of releases of hazardous substances following the practices described in Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009). e. Minimize improper disposal by following the practices described in American Petroleum Institute Order No. G00004, Guidelines for Commercial Exploration and Production Waste Management Facilities (American Petroleum Institute 2001) or other recognized methods. These guidelines discuss the relevant regulations and permitting requirements; siting, construction, and technical consideration for various waste disposal options; as well as mitigation options. f. Minimize the environmental footprint of exploration and production activities following the practices described in Land Drilling Practices for Protection of the Environment (American Petroleum Institute 2010b) or other recognized sources. g. Prior to pressurizing or re-pressurizing petroleum product pipelines, ensure the integrity of pipelines following the practices described in Recommended Practice for the Pressure Testing of Steel Pipelines for the Transportation of Gas, Petroleum Gas, Hazardous Liquids, Highly Volatile Liquids, or Carbon Dioxide (American Petroleum Institute 2013b) or other recognized sources. h. To minimize releases of hazardous substances during oilfield construction, pit and sump operations shall be conducted in accordance with State Water Resources Control Board General Orders or appropriate Regional Water Quality Control Board waste discharge requirements or general orders. **MM 4.8-9** For all operations subject to the Oil and Gas Conformity Review, the Applicant shall comply with the pipeline management plan, including inspection and maintenance requirements, as administered by the Division of Oil Gas and Geothermal Resources pursuant to 14 California Code of Regulations 1774.		

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.8-2 Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment	Potentially significant	Implement MM 4.8-1 through MM 4.8-9, as described above, and **MM 4.8-10** The Applicant shall incorporate annual maintenance checks for leaks and corrosion that cause releases into current operations, maintenance, and inspection schedules as provided by the Division of Oil Gas and Geothermal Resources pursuant to 14 California Code of Regulations Sections 1774.1 and 1774.2, the Applicant shall visually inspect all above-ground pipelines for leaks and corrosion at least once per year, comply with the pipeline testing requirements included therein, shall maintain records of such inspections and testing; and shall make inspection and testing records available to the County for review upon request. **MM 4.8-11** As part of the Hazardous Materials Business Plan and the spill prevention, control, And countermeasures Plan, the Applicant shall require annual worker training requirements to: increase awareness of the most common types of failures and methods to avoid mistakes, shall maintain records of employee training, and shall make such records available to the County for review upon request. **MM 4.8-12** An Applicant who plans to perform cyclic steam injection activities above reservoir fracture levels shall conduct such activities in accordance with the requirements set forth in the Division of Oil Gas and Geothermal Resources site-specific Project Approval Letter for the injection project. The following requirements from a Project Approval Letter for an injection project are examples of the types of conditions that would be triggered if a surface expression were to occur, though such conditions may be modified by the Division of Oil Gas and Geothermal Resources to reflect site-specific conditions and changing regulatory requirements. a. Cease cyclic steaming operations in accordance with the site-specific Project Approval Letter. Streaming can resume following the Division of Oil Gas and Geothermal Resources specifications outlined in the Project Approval Letter. b. All new or reactivated surface expressions that discharge oil in a reportable quantity shall be reported as an oil spill to the California Emergency Management Agency at (800) 852-7550. c. Any measures to address surface expressions from the well and associated Project shall be reviewed by the Division of Oil Gas and Geothermal Resources prior to initiating. d. Immediately control any water, steam, or oil flowing from a surface expression and contained. All discharged material shall be removed and disposed of in a manner approved by all state and local agencies. e. Cordon off and clearly mark all surface expressions to prevent inadvertent access. f. Conduct air sampling of any emissions associated to a recent surface expression in accordance to the local air board requirements to ensure a health hazard condition does not exist. g. Report immediately to the Division of Oil Gas and Geothermal Resources all surface expressions within 300 feet of the Project site. If the surface expression continues to flow after five days, all wells within a 300-foot radius shall cease steaming until the surface expression ceases to flow. If the surface expression continues to flow, the damage will be evaluated at the Supervisor's discretion, as assigned by Section 3106 of the Public Resources Code and existing laws and regulations. **MM 4.8-13** The Applicant shall comply with the Division of Oil Gas and Geothermal Resources requirements for assuring safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements, and all other provisions of 14 California Code of Regulations 1744 and other applicable Division of Oil Gas and Geothermal Resources regulations. The Applicant shall also reduce the incidence of well control loss by following the practices described in Recommended Practice for Well Control Operations (American Petroleum Institute 2012). **MM 4.8-14** The Applicant shall report contamination caused by oil and gas activities, including previously unknown injection wells, of a reportable quantity of hazardous substances, as specified in the Code of Federal Regulations Title 40 and/or the California Code of Regulations Titles 22 and 23, which is discovered during Project construction activities and operations. Notification must be made to Kern County	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		Environmental Health and the appropriate implementing regulatory agency that has responsibility or oversight of the specific contamination conditions. The Applicant shall remediate such contamination outside Tier 1 areas as required by the Kern County Environmental Health and the appropriate implementing regulatory agency.		
Impact 4.8-3 Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within One-Quarter Mile of an Existing or Proposed School	Potentially significant	Implement toxic air contaminant setback mitigation measures, as described in Section 4.3, Air Quality, and **MM 4.8-15** The Applicant who intends to use acutely hazardous chemicals, including chemicals at or above the specified threshold quantities or a process which involves a Category 1 flammable gas or a flammable liquid with a flashpoint below 100 degrees Fahrenheit (37.8 degrees Celsius) on site in one location, in a quantity of 10,000 pounds (4535.9 kilograms) or more according to 8 California Code of Regulations Section 5189, Appendix A, within 0.25 mile from a school must: a. Evaluate whether other alternative chemicals that are less hazardous could be used. b. Ensure that the smallest quantity of necessary acutely hazardous materials are stored on site. c. Notify the occupants of the buildings when and where acutely hazardous materials would be used. d. Notify Kern County Fire Department about the details of the use of acutely hazardous materials (e.g., when, where, how much). e. Ensure that all employees who would contact the acutely hazardous materials are trained on the handling, transport, storage, and disposal of the materials. f. Ensure that all employees who would contact the acutely hazardous materials are trained and are provided the proper personal protective equipment. g. Ensure that all employees who would contact the acutely hazardous materials are trained and have exercised on the Spill Prevention, Control, and Countermeasures P Plan that addresses these chemicals.	Less than significant	All Tiers
Impact 4.8-4 Create a Hazard to the Public or the Environment as a Result of Being a Site that is Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Code Section 65962.5	Potentially significant	Implement MM 4.8-14, as described above, and MM 4.8-17 and MM 4.8-18, as described under Impact 4.8-5.	Less than significant	All Tiers
Impact 4.8-5 For a Project Located within the Adopted Airport Land Use Compatibility Plan, Result in a Safety Hazard for People Residing or Working in the Area	Potentially significant	**MM 4.8-17** The Applicant shall determine whether any proposed construction or alteration meets requirements for notification of the Federal Aviation Administration. If a proposed construction or alteration is found to require notification, the Applicant shall notify the Federal Aviation Administration and request that the Federal Aviation Administration issue a Determination of No Hazard to Air Navigation. If the Federal Aviation Administration determines that the construction or alteration would result in a potential hazard to air navigation, the Applicant would be required to work with the Federal Aviation Administration to resolve any adverse effects or airport operations. The Applicant shall notify the Federal Aviation Administration and the nearest Airport, by completing and submitting Federal Aviation Administration Form 7460-1 if oil and gas related exploration, production, or associated development activities are planned that meet one or more of the following criteria: a. Any construction or alteration exceeding 200 feet above ground level. b. Any construction or alteration within 20,000 feet of all public use airports except Poso-kern Airport which exceeds a 100:1 surface from any point on the runway.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		c. Any construction or alteration within 10,000 feet of the Poso-Kern Airport which exceeds a 50:1 surface from any point on the runway. d. Any construction or alteration within 5,000 feet of a public use heliport which exceeds a 25:1 surface. e. When requested by the Federal Aviation Administration. f. Any construction or alteration located on a public use airport or heliport regardless of height or location. **MM 4.8-18** The Applicant shall determine the distance from the proposed operation to the nearest boundary of the Joint Service Restricted R-2508 Complex, using a map of this Complex provided by the County. The Applicant shall notify the Joint Service Restricted R2508 Complex representative identified by the County if oil and gas related exploration, production, or associated development activities are planned that meet one or more of the following criteria: a. Any structure within 75 miles of the R-2508 Complex that is greater than 50 feet tall. b. Any project within 50 miles of the R-2508 Complex that emit radio and communication frequencies. c. Any project that would create environmental impacts such as visibility or elevated obstructions within 25 miles of the R-2508 Complex. **MM 4.8-19** All oil and gas related development activities shall review the Kern County Airport Land Use Compatibility Plan for compliance with all applicable policies.		
Impact 4.8-6 Result in Safety Hazard for People Residing or Working in Project Area within Vicinity of a Private Airstrip	Less than significant	None required.	Less than significant	All Tiers
Impact 4.8-7 Impair Implementation of, or Physically Interfere with, an Adopted Emergency Response Plan or Emergency Evacuation Plan	Less than significant	None required.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.8-8 Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Wildland Fires, Including Where Wildlands are Adjacent to Urbanized Areas or Where Residences are Intermixed with Wildlands	Less than significant	**MM 4.8-20** The Applicant is required to implement the following measures: a. Comply with Kern County Fire Codes. b. Maintain firefighting apparatus and supplies required by the Kern County Fire Department. c. Maintain of a list of all relevant fire-fighting authorities for each work site. d. Have available equipment to extinguish incipient fires and or construction of a fire break, such as: chemical fire extinguishers, shovels, axes, chain saws, etc. e. Carry water or fire extinguishers and shovels in non-passenger vehicles in the field. f. Have and maintain an adequate supply of fire extinguishers for welding, grinding, and brushing crews. g. Protect individual safety to contain any fire that occurs and notify local emergency response personnel. h. Remove any flammable wastes generated during oil and gas activities regularly. i. Store all flammable materials used in oil and gas activities away from ignition sources and in approved containers. j. Allow smoking only in designated smoking areas. k. Prohibit smoking where flammable products are present and when the fire hazard is high. Train personnel regarding potential fire hazards and their prevention. l. All internal combustion engines, stationary and mobile, shall be equipped with spark arresters. Spark arresters shall be in good working order. m. Light trucks and cars with factory-installed (type) mufflers shall be used only on roads where the roadway is cleared of vegetation. Said vehicle types shall maintain their factory-installed (type) muffler in good condition. n. Fire rules shall be posted on the Project bulletin board at the contractor's field office and areas visible to employees. o. Equipment parking areas and small stationary engine sites shall be cleared of all extraneous flammable materials. p. Personnel shall be trained in the practices of the Fire Safety Plan relevant to their duties. Construction and maintenance personnel shall be trained and equipped to extinguish small fires in order to prevent them from growing into more serious threats. **MM 4.8-21** The Applicant should restrict the use of chainsaws, chippers, vegetation masticators, grinders, tractors, torches, and explosives at its locations, and ensure the sites where this equipment is used are equipped with portable or fixed fire extinguishers and/or a water tank, with hoses, fire rakes, and other tools to extinguish and or control incipient stage fires. The Worker Environmental Awareness Program shall include fire prevention and response training for workers using these tools.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.8-9 Generate Vectors or Have a Component that Includes Agricultural Waste Exceeding Adopted Qualitative Thresholds	Less than significant	Implement dust control and Valley Fever education and mask measures as described in Section 4.3, Air Quality, and **MM 4.8-22** Applicants shall ensure that trash is stored in closed containers and removed from the site at regular intervals. Open containers shall be inverted and construction ditches shall not be allowed to accumulate water. Construction and maintenance operations shall not generate standing water. Naturally occurring depressions, drainages, or pools at the site shall not be drained or filled without consulting with the appropriate resource agency (Kern County, United States Army Corps of Engineers, United States Fish and Wildlife Service, California Department of Fish and Wildlife) as applicable, and obtaining the appropriate permits.	Less than significant	All Tiers
Impacts 4.8-10 Contribute to Cumulative Hazards and Hazardous Materials Impacts	Potentially significant	Implement MM 4.8-1 through MM 4.8-22, as described above, and dust control and toxic air contaminant setback mitigation measure, as described in Section 4.3, Air Quality, risk reduction measures, as described in Section 4.6, Geology and Soils, and mitigation measures to maintain water quality, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Hydrology and Water Quality				
Impact 4.9-1 Violate any Water Quality Standards or Waste Discharge Requirements	Potentially significant	**MM 4.9-1** The Applicant shall comply with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) obtaining coverage under the stormwater construction general permit and industrial general permit issued by the State Water Resources Control Board and complying with industry stormwater management standards for construction and operational activities. **MM 4.9-2** For any oil and gas activity that is not subject to state or federal stormwater management laws, regulations or general permits, the Applicant shall prepare a drainage plan that is designed to minimize runoff and minimize the potential for impeding or redirecting 100-year flood flows. The drainage plan shall be prepared in accordance with the Kern County Grading Code, the Green Code and approved by the Kern County Engineering, Surveying and Permit Services Department, Floodplain Management Section. The plan shall specify best management practices to prevent all construction pollutants from contacting stormwater, with the intent of keeping sedimentation or any other pollutants from moving offsite and into receiving waters. The requirements of the Plan shall be incorporated into design specifications. Recommended best management practices for the construction phase shall include the following: a. Erosion Control - 1. Scheduling of construction activities to avoid rain events. 2. Limiting vegetation removal to the maximum extent practicable. b. Sediment Control - 1. Secure stockpiling of soil. 2. Installation of a stabilized construction entrance/exit and stabilization of disturbed areas. c. Non-stormwater Control - 1. Proper fueling and maintenance of equipment and vehicles. 2. Proper concrete handling techniques. d. Waste and Material Management - 1. Properly managing construction materials, designating construction staging areas in or around the Project site.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		2. Stockpiling and disposing of demolition debris, concrete, and soil properly. 3. Aggressive control of litter. 4. Proper disposal of demolition debris, concrete and soil. 5. Proper protections for fueling and maintenance of equipment and vehicles. e. Post-Construction Stabilization - 1. Ensuring the stabilization of all disturbed soils per revegetation or application of a soil binder. **MM 4.9-3** All drilling operations must either use a closed loop system to avoid discharges of drilling muds and fluids, or obtain coverage under the State Water Resources Control Board low threat discharge General Order (Waste Discharge Requirements General Order 2003-0003-DEW), obtain individual Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board for the unit, or obtain coverage under a general order issued by the Central Valley Regional Water Quality Control Board applicable to drilling ponds. Any surface ponds or sumps must be cleared of fluids and muds in accordance with the State Water Resources Control Board general order, applicable Water Discharge Requirements and Division of Oil Gas and Geothermal Resources regulations. Compliance with the State Water Resources Control Board or Central Valley Regional Water Quality Control Board low-threat discharge orders or Water Discharge Requirements, if closed-loop systems are not used, and applicable laws, regulations and standards will reduce potential surface water quality impacts from contact with drilling muds or fluids during drilling and construction to less than significant levels. **MW 4.9-4** For any activity for which Chapter 19.98 applies, the Applicant shall not conduct any injection activity regulated by the Underground Injection Control program, including enhanced oil recovery activities that discharge into any underground source of drinking water unless the aquifer has been exempted by the United States Environmental Protection Agency or injection has otherwise been authorized by the U.S. Environmental Protection Agency or by Division of Oil Gas and Geothermal Resources under delegated authority under the Safe Drinking Water Act. **MW 4.9-5** For any activity for which Chapter 19.98 applies, the Applicant shall not discharge produced water into any surface disposal facility unless the facility has received the Waste Discharge Requirements from the Central Valley Regional Water Quality Control Board, or the need for Water Discharge Requirements has been waived by the Central Valley Regional Water Quality Control Board. **MM 4.9-6** For any oil and gas activity within a mapped 100-year floodplain, the Applicant shall ensure that all constructed facilities are protected from the maximum potential elevation of flooding during a 100-year flood by elevating structures or by implementing containment berms or other protective measures in compliance with the standards in the Kern County Floodplain Management Code and Chapters 19.50 and 19.70 of the Kern County Zoning Code.		
Impact 4.9-2 Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge such that There Would be a Net Deficit In Aquifer Volume or a Lowering of the Local Groundwater Table Level (e.g., the Production Rate of Pre-Existing Nearby Wells Would Drop to a Level That Would Not Support Existing Land Uses or Planned Uses for Which Permits Have Been Granted)	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Significant and unavoidable	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.9-3 Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, in a Manner That Would Result in Substantial Erosion or Siltation On-site or Off-site	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-4 Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner That Would Result in Flooding On-site or Off-site	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-5 Create or Contribute Runoff Water That Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Substantial Additional Sources of Polluted Runoff	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above.	Less than significant	All Tiers
Impact 4.9-6 Otherwise Substantially Degrade Water Quality	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-7 Place Housing within a 100-year Flood Hazard Area as Mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or Other Flood Hazard Delineation Map	No impact	No mitigation measures are required since the Project does not include housing development.	No impact	All Tiers
Impact 4.9-8 Place Within a 100-Year Flood Hazard Area Structures That Would Impede or Redirect Flood Flows	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.9-9 Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Flooding, Including Flooding as a Result of the Failure of a Levee or Dam	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-10 Contribute to Inundation by Seiche, Tsunami, or Mudflow	No impact	No mitigation measures are required.	No impact	All Tiers
Impact 4.9-11 Contribute to Cumulative Hydrology and Water Quality Impacts	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems. The County lacks jurisdiction and control over land conversions, and actions or approvals by other agencies that may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly this impact remains significant and unavoidable.	Significant and unavoidable	All Tiers
Land Use and Planning				
Impact 4.10-1 Physically Divide an Established Community	Less than significant	Implement specified mitigation measures, including those that are applicable from Section 4.1, Aesthetics and Visual Resources, Section 4.3, Air Quality, Section 4.4 Biological Resources, Section 4.12, Noise, Section 4.15, Recreation, and Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.10-2 Conflict with Any Applicable Land Use Plan, Policy, or Regulation of an Agency with Jurisdiction Over the Project	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.10-3 Conflict with Any Applicable Habitat Conservation Plan or Natural Community Conservation Plan	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.10-4 Contribute to Cumulative Land Use Impacts	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Minerals				
Impact 4.11-1 Result in the Loss of Availability of a Known Mineral Resource that Would be of Value to the Region and the Residents of the State	Less than significant	No mitigation measures are required.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.11-2 Result in the Loss of Availability of a Locally Important Mineral Resource Recovery Site Delineated on a Local General Plan, Specific Plan, or Other Land Use Plan	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.11-3 Contribute to Cumulative Mineral Resources Impacts	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Noise				
Impact 4.12-1 Exposure of Persons to, or Generate, Noise Levels in Excess of Standards Established in the Local General Plan or Noise Ordinance or Applicable Standards of Other Agencies	Potentially significant	**MM 4.12-1** The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines). This Figure need not be prepared for Tier 1 areas unless a sensitive receptor is located within 3,000 feet of a construction site inside the Tier 1 area. a. If there are no sensitive noise receptors within this potential impact area, then no construction mitigation measures shall be required. b. If there are sensitive human noise receptors within the potential impact area, then additional information must be provided showing the type of equipment being used and the noise contours with levels not exceeding 65 dBA at the nearest exterior wall of the sensitive receptor or more than 1 dBA higher than the ambient noise levels, if in excess of 65 dBA. If noise levels are shown to exceed 65 dBA or more than 1 dBA higher than the ambient noise levels in excess of 65 dBA, then one or more of the following mitigation measures shall be taken: 1. Placement of a temporary sound attenuation wall(s) shall be placed at the optimal distance to the sensitive receptor, as determined by an acoustical expert. 2. Construction of a temporary berm shall be placed at the optimal distance to the sensitive receptor, as determined by an acoustical expert. 3. Modification of equipment to reduce noise impacts. 4. Implementation of a quiet mode drilling plan or other sound reduction technology or practices as documented in a report submitted to the County. 5. Arranging for the voluntary, temporary relocation of the occupants of the sensitive receptor during the construction period. 6. Use the following setback distances for the activities specified: **Construction Noise Setbacks** Activity / Setback Distance (feet) Well Pad Preparation / 800 Drilling (Well Advancement) / 1,420 Drilling (Pull Out Of Well/Borehole) / 750	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		<table><tr><td>Large-Scale Exploratory Drilling[1]</td><td>3,000</td></tr><tr><td>Well Workover</td><td>850</td></tr></table> Source: Brown-Buntin 2015 Note: [1]Kenai Drill Rig #7 Information submitted with the Site Plan Application must detail the combination and methods used to determine the level of reduction and shall not exceed 65 dBA or any ambient levels in excess of 65 dBA or more than 1 dBA higher than the ambient noise levels, if in excess of 65 dBA. **MM 4.12-2** New oil and gas wells shall be a minimum 190 feet from the closest sensitive receptor.		
Impact 4.12-2 Exposure of Persons to, or Generate, Excessive Groundborne Vibration or Groundborne Noise Levels	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.12-3 A Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project	Potentially significant	Implement MM 4.12-2, as described above.	Less than significant	All Tiers
Impact 4.12-4 A Substantial Temporary or Periodic Increase in Ambient Noise Levels in the project Vicinity Above Levels Existing Without the Project	Potentially significant	Implement MM 4.12-1, as described above.	Less than significant	All Tiers
Impact 4.12-5 For a Project Located Within the Kern County Airport Land Use Compatibility Plan, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels	Potentially significant	Implement MM 4.12-1 and MM 4.12-2, as described above.	Less than significant	All Tiers
Impact 4.12-6 For a Project Located Within the Vicinity of a Private Airstrip, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels	Potentially significant	Implement MM 4.12-1 and MM 4.12-2, as described above.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.12-7 Cumulative Impact on Noise Receptors	Potentially significant	Implement MM 4.12-1 and MM 4.12-2, as described above.	Less than significant	All Tiers
Population and Housing				
Impact 4.13-1 Induce Substantial Population Growth in an Area, Either Directly or Indirectly	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.13-2 Displace Substantial Numbers of Existing Housing, Necessitating the Construction of Replacement Housing Elsewhere	No Impact	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.13-3 Displace Substantial Numbers of People, Necessitating the Construction of Replacement Housing Elsewhere	No impact	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.13-4 Cumulative Impact on Population and Housing	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Public Services				
Impact 4.14-1 Result in Substantial Adverse Physical Impacts Associated with the Provision of New or Physically Altered Governmental Facilities, Need for New or Physically Altered Governmental Facilities, the Construction of which could Cause Significant Environmental Impacts, in Order to Maintain Acceptable Service Ratios, Response Times, or Other Performance Objectives for Any of the Public Services, which Include: Fire Protection, Police Protection, Schools, Parks, and Other Public Facilities	Potentially significant	**MM 4.14-1** Applicant shall contribute to funding the acquisition of a Combination Walk-in/Non-Walk-in Industrial Firefighting vehicle capable of responding with a minimum of five firefighters with the tools and equipment necessary for industrial firefighting and rescue. Each Applicant shall pay $150 per well on each Oil and Gas Conformity Review permit until the total cost of the vehicle purchase is reached, not to exceed $850,000, to be paid through mitigation fees on Oil and Gas Conformity Review permits. Subsequent Applicants shall not be subject to this mitigation measure. **MM 4.14-2** Applicant shall provide funding in the amount of $425 per Oil and Gas Conformity Review permit issued for the Sheriff's Rural Crime Unit. Funding shall be used for one Sergeant, two Senior Deputies (investigators), three Deputies, One Support Technician (clerical), and helicopter usage, based on the amount of funding provided by this permit mitigation fee. The Sheriff's department shall annually report on the expenditure of funds for the Rural Crimes Unit, including incident reports and response times. If other sources of funding for the Rural Crimes Unit are secured, then the mitigation fee amount shall be adjusted to pay only the gap between actual costs and funding provided from other sources.	Less than significant	All Tiers
Impact 4.14-2 Contribute to Cumulative Public Service Impacts	Potentially significant	Implement MM 4.14-1 and MM 4.14-2, as described above.	Less than significant	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Recreation				
Impact 4.15-1 Increase the Use of Existing Neighborhood and Regional Parks or Other Recreational Facilities Such That Substantial Physical Deterioration Would Occur or Be Accelerated	Less than significant	No mitigation measures required.	Less than significant	All Tiers
Impact 4.15-2 Include Recreational Facilities or Require Construction or Expansion of Recreational Facilities That Might Have an Adverse Physical Effect on the Environment	Less than significant	No mitigation measures required.	Less than significant	All Tiers
Impact 4.15-3 Cumulative Impact on Recreational Facilities	Less than significant	No mitigation measures required.	Less than significant	All Tiers
Transportation and Traffic				
Impact 4.16-1 Conflict with an Applicable Plan, Ordinance, or Policy Establishing Measures of Effectiveness for the Performance of the Circulation System, Including, but Not Limited to, Intersections, Streets, Highways and Freeways, Pedestrian and Bicycle Paths, and Mass Transit	Potentially significant	**MM 4.16-1** The Applicant shall pay a road maintenance mitigation fee of $1,500 per permit for new wells to pay for roadway maintenance and related improvements to address wear and tear on roads caused by oil and gas industry traffic. The Roads department shall annually report on the expenditure of funds from the Oil and Gas Roadway Maintenance Fee. Expenditures from the fund shall be as determined by the Roads Commissioner, using as a reference the list of roadways identified in the Environmental Impact Report as being used for traffic by the oil and gas industry. If Kern County secures funding from a sales tax dedicated to transportation funding, then the amount of the traffic mitigation fee shall be re-evaluated at the time the County becomes a self-help county. **MM 4.16-2** Applicants who are using an arterial or collector, or Caltrans route, for access to a construction site, shall consult with the Kern County Public Works Department – Roads Division to determine if a Construction Traffic Control Plan is required based on the timing and volume of larger vehicle rigs and the volume of traffic to address public safety and congestion management. If a Plan is required, the Applicant shall prepare and submit a Construction Traffic Control Plan to the Kern County Roads Department and to the California Department of Transportation (District 9 office) for approval. The Construction Traffic Control Plan must be prepared in accordance with both the California Department of Transportation Manual on Uniform Traffic Control Devices and Work Area Traffic Control Handbook and shall include, but not be limited to, the following issues: a. Timing of deliveries of heavy equipment and building materials. b. Placing temporary signing, lighting, and traffic control devices as necessary to indicate the presence of heavy vehicles and construction traffic. c. Determining the need for construction work hours and arrival/departure times outside peak traffic periods. d. Ensuring access for emergency vehicles to the Project site.	Less than significant after mitigation	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		e. Any temporary closure of travel lanes or disruptions to street segments and intersections during well development. f. Maintaining access to adjacent property.		
Impact 4.16-2 Conflict with an Applicable Congestion Management Program, Including, but Not Limited to Level of Service Standards And Travel Demand Measures, or Other Standards Established by the County Congestion Management Agency for Designated Roads or Highways -Metropolitan Bakersfield General Plan Level of Service "C" -Kern County General Plan Level of Service "D" -Caltrans Endeavors to Maintain a Target Level of Service at the Transition between Level of Service "C" and Level of Service "D"	Less than significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Impact 4.16-3 Result in a Change in Air Traffic Patterns, including Either an Increase in Traffic Levels or a Change in Location that Results in Substantial Safety Risks	Potentially significant	Implement airport-related mitigation measures, as described in Section 4.8, Hazards and Hazardous Materials.	Less than significant after mitigation	All Tiers
Impact 4.16-4 Substantially Increase Hazards due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses	Potentially significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Impact 4.16-5 Result in Inadequate Emergency Access	Potentially significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Impact 4.16-6 Conflict with Adopted Policies, Plans, or Programs regarding Public Transit, Bicycle, or Pedestrian Facilities, or Otherwise Decrease the Performance or Safety of Such Facilities	Potentially significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
4.16-7 Cumulative Impacts on Transportation and Traffic	Potentially significant	Implementation of MM 4.16-1 and MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Utilities and Service Systems				
Impact 4.17-1 Exceed Wastewater Treatment Requirements of the Applicable Regional Water Quality Control Board	Less than significant	Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Impact 4.17-2 Require or Result in the Construction of New Water or Wastewater Treatment Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects	Potentially significant	**MM 4.17-1** Prior to the issuance of building permits for an operations and maintenance building, the method of sewage disposal shall be as required and approved by the Kern County Public Health Services Department. Compliance with this requirement will necessitate that the Project proponent obtain the necessary approvals for the design of the septic system from the Kern County Engineering, Surveying and Permit Services Department. The septic system disposal field shall be located a minimum of 100 feet from a classified stream or 25 feet from a non-classified stream and shall not be located where it would impact State wetlands or special-status plant species.	Less than significant	All Tiers
Impact 4.17-3 Require or Result in the Construction of New Stormwater Drainage Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects	Less than significant	Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Impact 4.17-4 Not Have Sufficient Water Supplies Available to Serve the Project from Existing Entitlements and Resources, or New or Expanded Entitlements Would Be Needed	Potentially significant	**MM 4.17-2** Applicant shall increase the re-use of produced water, and reduce its use of municipal and industrial-quality ground or surface water use to the extent feasible. By the end of 2016, the Applicants shall review water use data submitted to Division of Oil Gas and Geothermal Resources under Senate Bill 1281 and identify the five biggest oil industry users of municipal and industrial water by volume. The five biggest oil industry users of municipal and industrial water shall work together to develop and implement a plan identifying new measures to reduce municipal and industrial water use by 2020. The plan shall address the following activities, as appropriate: steam generation; drilling and completions (including hydraulic fracturing); dust control; compaction activities related to construction; and landscaping. Through the KernFLOWS initiative or other efforts (e.g., Groundwater Sustainability Agency), the five biggest oil industry users of municipal-and-industrial water shall also work with local agricultural producers and water districts to identify new opportunities to increase the use of produced water for agricultural irrigation and other activities, as appropriate. Any produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for such agricultural irrigation or other uses. **MM 4.17-3** In the County's required participation for the formulation of a Groundwater Sustainability Agency, the Applicant shall work with the County to integrate into the Groundwater Sustainability Plan for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the re-use of produced water from oil and gas activities, and (with appropriate treatment) to produce new water supplies for other uses such as agricultural irrigation and groundwater recharge. The produced water re-use goal is 30,000 acre-feet per year, which would offset more than the current use of imported water and groundwater from non-oil bearing zones by the oil and gas industry.	Significant and unavoidable	All Tiers

Table 1-3: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		MM 4.17-4 The Applicant shall work with the County on the Groundwater Sustainability Plan to increase Applicant use of reclaimed water and reduce the Applicant's use of municipal-and-industrial quality imported surface water or groundwater.		
Impact 4.17-5 Result in a Determination by the Wastewater Treatment Provider that Serves or May Serve the Project that it has Adequate Capacity to Serve the Project's Projected Demand in Addition to the Provider's Existing Commitments	Less than significant	Implement MM 4.17-1, as described above.	Less than significant	All Tiers
Impact 4.17-6 Be Served by a Landfill with Insufficient Permitted Capacity to Accommodate the Project's Solid Waste Disposal Needs	Potentially significant	Implement MM 4.17-2 and MM 4.17-3, as described above, and the following: **MM 4.17-5** During construction activities for Project facilities, the Applicant shall not store construction waste onsite for longer than the duration of the construction activity, or transport any waste to any unpermitted facilities. The Applicant shall also reduce construction waste transported to landfills by recycling solid waste construction materials, such as taking materials to recycling and reuse locations listed in the brochure on recycling construction and demolition materials available on the Kern County Waste Management Department website.	Less than significant	All Tiers
Impact 4.17-7 Fail to Comply with Federal, State, and Local Solid Waste Statutes and Regulations	Potentially significant	Implement MM 4.17-5, as described above.	Less than significant	All Tiers
Impact 4.17-8 Cumulative Impacts on Utilities and Service Systems	Potentially significant	Implement MM 4.17-1 through MM 4.17-5, as described above.	Significant and unavoidable	All Tiers

APPENDIX A - DEFINITIONS

19.98.010 PURPOSE AND APPLICATION

The purpose of this chapter is to promote the economic and streamlined recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety by establishing reasonable limitations, safeguards, and controls on exploration, drilling, and production of hydrocarbon resources. The procedures and standards contained in this chapter shall apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out within the unincorporated San Joaquin Valley portion of Kern County (See Figure 19.98.015). This effective date of this version of Chapter 19.98 is MONTH, DAY, YEAR.

19.98.020 DEFINITIONS OF OIL AND GAS PRODUCTION ACTIVITIES

Oil and Gas exploration and operations contain many highly technical activities. For the purposes of this Chapter 19.98, definitions of activities are located in Appendix A.

19.98.030 TIER AREAS

The Oil and Gas Production Boundary Area is divided into five (5) Tier Areas and depicted in Figure 19.98.015. Changes to the boundries of Figure 19.98.015 shall be through the procedures in Chapter 19.112. The Tier Areas are generally, described as follows:

A. Tier 1 Area is defined as all areas in which oil and gas activity is the primary land use. The existing well and activity densities preclude almost all other uses.

B. Tier 2 Area is defined as all land that is classified with the Exclusive Agriculture (A) or Limited Agriculture (A-1) Districts and has agriculture as the primary land use not already included in Tier 1.

C. Tier 3 Area is defined as other areas not within the Tier 1 Area and in one of the following zone districts:

- Natural Resource (NR)
- Recreation Forestry (RF)
- Light Industrial (M-1)
- Medium Industrial (M-2)
- Heavy Industrial (M-3)
- Floodplain Primary (FPP)
- Drilling Island (DI)
- Zone Districts that have the Petroleum Extraction (PE) Combining District

D. Tier 4 Area is defined as areas not within Tier 3, containing at least one of the following zone districts:

- Estate (E)
- Low–Density Residential (R-1)
- Medium-Density Residential (R-2)
- High-Density Residential (R-3)
- Commercial Office (CO)
- Neighborhood Commercial (C-1)
- General Commercial (C-2)
- Highway Commercial (CH)
- Platted Lands (PL)
- Mobilehome Park (MP)

Authorized oil and gas activities in Tier 4 are subject to approval of a conditional use permit in accordance with 19.104 of this Title. The Open Space (OS) District are those areas where oil or gas exploration and production activities are prohibited, but ancillary facilities are an allowable use.

E. Tier 5 are areas including all current and future Specific Plan boundaries either adopted with a Special Planning (SP) District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities would be allowed with a conditional use permit or as permitted by the regulations contained within the adopted Specific Plan in Tier 5 areas.

F. All other areas not defined as Tier 1-5 Areas are considered Non-Jurisdictional. These areas include lands under the administration of the United States, State of California or an incorporated city. The regulations set forth in this chapter do not pertain to these areas.

19.98.040 OIL AND GAS ACTIVITIES BY MINISTERIAL PERMIT

A. No well for use as an injection well and no well for the exploration for or development or production of oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in Tier 1, 2, 3 and 5 Areas

until an application for Oil and Gas Conformity Review or Minor Activity Review has been submitted to and approved by the Planning Director as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the procedures set out in Sections 19.98.070 through 19.98.120 of this chapter.

B. Disposal of nonhazardous oilfield fluid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oilfield fluid waste or production water is produced and disposed of within the same designated oilfield; or

2. The nonhazardous oilfield fluid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

19.98.050 OIL AND GAS ACTIVITIES BY CONDITIONAL USE PERMIT

A. No well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in any zoning district described in this title in which such uses are permitted as conditional uses until an application for a conditional use permit, which includes the information specified in Section 19.98.080, has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.060 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact.

B. No well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility, outside the boundaries as defined in Figure 19.98.015, may be installed in any zoning district described in this title in which such uses are permitted until an application for a conditional use permit, which includes the information specified in Section 19.98.080, has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.060 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact.

C. Should any activity requiring approval of an Oil and Gas Conformity Review or Minor Activity Review pursuant to Sections 19.98.070 through 19.98.120 of this chapter, not be able to comply with the Implementation Standards and Conditions set forth in Section 19.98.060, an application for a conditional use permit, which includes the information specified in Section 19.98.080, shall be submitted to and approved by the Planning Commission in accordance with the standards and procedures set out in

Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive/modify any condition set out in Section 19.98.060 of this chapter if it determines that such waiver or modification will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact.

D. If a producing well or service well is not completed upon land subject to a conditional use permit issued pursuant to this chapter and Chapter 19.104 of this title within twelve (12) months from the date of issuance of the permit, or within any extended period thereof, the conditional use permit shall expire and the premises shall be restored as nearly as practicable to their original condition. No permit shall expire while the permittee is continuously conducting drilling, redrilling, completing or abandoning activities, or related operations, in a well on the lands covered by such permit, which activities were commenced while said permit was otherwise in effect. Continuous activites are those suspended not more than thirty (30) consecutive days. If, at the expiration of the twelve- (12-) month period, the permittee has not completed his drilling program on the lands covered by such permit, the decision making authority, upon a written request of the permittee, may extend the permit for the additional time requested by permittee for the completion of such drilling program, in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180.

19.98.060 IMPLEMENTATION STANDARDS AND CONDITIONS

Pursuant to this chapter, all activities for the exploration for or development or production of oil, gas, and other hydrocarbon substances and related facilities and activities shall comply with the following standards, unless otherwise provided in this chapter:

A. No oil or gas well shall be drilled within:

1. One hundred (100) feet of any public highway or building not necessary to the operation of the well;
2. One hundred and ninety (190) feet of any dwelling unit (single or multifamily);
3. Three hundred (300) feet of any building used as a place of public assembly, institution, or school; or
4. One hundred (100) feet of any building utilized for commercial purposes, not used for oil and gas operations.

B. All drilling and production activities shall conform to all applicable fire and safety regulations. Firefighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.

C. All required federal, State, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:

1. California Division of Oil and Gas (DOGGR)
2. Kern County Fire Department
3. Kern County Public Health Department
4. Regional Water Quality Control Board
5. San Joaquin Valley Air Pollution Control District
6. Kern County Public Works Department

D. The applicant shall demonstrate compliance with all applicable Mitigation Measures as listed in the approved Mitigation Monitoring and Reporting Program (MMRP) for the Revisions to the Zoning Ordinance (C) - 2015.

19.98.070 OIL AND GAS CONFORMITY REVIEW AND APPROVAL — REQUIRED

Except as provided in this section, no permitted use shall be established, no permitted development shall occur, and no building permit or grading permit shall be issued for any permitted use or development subject to this chapter until an Oil and Gas Conformity Review or Minor Activities Review has been submitted to and approved by the Planning Director in accordance with the procedures set out in Sections 19.102.040 through 19.102.060 of this title.

Note: All activities denoted with a check mark in multiple columns, above, are subject to Oil and Gas Conformity Review only when in conjunction with another activity subject to only Oil and Gas Conformity Review; otherwise are only subject to Minor Activity Review. These activities shall be considered incidental to the Oil and Gas conformity Review for fee purposes.			

19.98.080 OIL AND GAS CONFORMITY REVIEW — APPLICATION CONTENTS

Applications for an Oil and Gas Conformity Review within Tiers 1-3 or Tier 5 Areas, pursuant to Section 19.98.040 of this chapter, or a conditional use permit, for oil and gas activities within a Tier 4 Area, pursuant to Section 19.98.050 of this chapter, shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all existing and proposed wells.

D. Preliminary Title Report, not over ninety (90) days old.

E. Legal description of the project area located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities in aliquot format, unless a more precise legal description is determined to be needed by the Planning Director.

F. A site plan drawn to scale no larger than 11x17, which includes the following information: All information required in Tier 2, 3, 4 and 5. Tier 1 information to be determined based on density of pre-ordinance oilfield development, as determined by the Director.

1. Topography and proposed grading of the site plan.

2. Project boundary lines and dimensions, including lease lines and property lines.

3. Location and coordinates of all proposed well holes and related accessory equipment. Location of all roadways, pipelines, tanks, treatment or other structures and facilities to be installed, and any existing or abandoned wells if such are known to exist .

4. Location of all existing dwellings and structures, located within three thousand (3000) feet of the proposed well holes, identification of the use of each structure, and distances between well holes and existing buildings. Location of existing property lines and distance from well site to property line.

5. Location of all new flare gas production lines, lines for production, electrical lines, and location of tank farms to be used.

6. North arrow, date the site plan was prepared, and scale.

7. Location of all recorded easements onsite, roads, section/midsection lines, located within ½ mile of the proposed wells.

8. Location of all accessory/ancillary facilities (including trucking parking, onsite storage, etc.) to be installed with the proposed wells.

9. Description of parcel in relation to Tier areas as indicated in Figure 19.98.015.

10. DOGGR permit application number, if available.

11. Identify the 100-year floodplain.

12. Identify the proposed source of water (domestic or production), if applicable.

13. Show location of all proposed underground pipelines. Identify if pipelines connect to a Gas Distribution System.

14. Location of any existing Oil and Gas Conformity Review boundaries within and/or contiguous to the proposed boundary.

G. Signature Block and Statement (Land/Surface Owner, Mineral Owner and Operator.
The following statement shall be included to the first page of the site plan. In Tier 1 Areas it shall be signed by both the Mineral Owner and the Operator. In Tier 2, 3, 4 and 5 Areas it shall be signed by all parties, irrespective of ownership relationship. Multiple lines may be added for multiple ownership signatures. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the signature on the site plan be waived.

REQUIRED STATEMENT

The undersigned Land/Surface Owner is the owner of APN#_____. The undersigned is the Mineral Owner and/or Operator or Lessee of the Mineral Owner. The Land/Surface Owner and the Mineral Owner and/or the Operator or Lessee have come to an agreement regarding the use of the surface of the property in connection with the Kern County permit that is being issued with this site plan.

Land/Surface Owner:	Mineral Owner:	Operator:
_____	_____	_____
Print Name	Print Name	Print Name
_____	_____	_____
Title/Company	Title/Company	Title/Company
_____	_____	_____
Signature	Signature	Signature
_____	_____	_____
Date	Date	Date

H. Notification Requirements - Tier 1, 2, 3, 4 and 5 Areas.

1. A physical letter of notification of application that requires a signature for delivery shall be sent by the applicant to all Land/Surface Owners of the property for which the Conformity Review is being requested, if the Land/Surface Owners are different from the mineral owners providing the notice required by State law and including an official County handout explaining the conformity review process. The package shall be sent 30 days before submittal of the application. The application shall include evidence that the letter was sent and the signatures received. Any letter returned or failure to obtain a signature shall provide evidence that the Land/Surface Owner of the property cannot be located through normal means such as tax records. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the notification be waived as allowed by State law.

2. Within a Tier 1 Area only, a second letter shall be sent, by the applicant, when the application is submitted to the County. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner, addressed to the County of Kern, may be submitted asking that the notification of application submitted be waived.

19.98.090 OIL AND GAS CONFORMITY REVIEW – WITH REQUIRED SURFACE OWNER SIGNATURE

A. An applicant for a ministerial permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable section of this chapter. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title. For Tier 2, 3 and 5 Areas, a copy of the application shall be provided to the Land/Surface owner per the requirements of 19.98.080.F above. The application must contain the signature block and statement pursuant to Section 19.98.080.F, or shall contain a letter from the Land/Surface Owner waiving the need for said signature on the specified parcel of the proposed application. The waiver letter must be dated and provide specific language as to the length of time the letter is valid if to be used for future Oil and Gas Conformity Reviews.

B. The Planning Director shall make reasonable efforts to inform the applicant in writing within seven (7) business days of receipt that the application is complete and shall issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

C. Within three (3) business days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

D. Within seven (7) business days of reviewing the third submittal to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of chapter. If additional information is needed, a mandatory in person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. Any reviews beyond three (3) shall require additional fees to be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be conducted within thirty (30) days.

F. Prior to conducting any drilling activity the operator must have received and have on file both the approved Permit to Conduct Well Operations from DOGGR and an approved Oil and Gas Conformity Review unless the activity involves facility placement not subject to DOGGR permit approval.

G. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

19.98.100 OIL AND GAS CONFORMITY REVIEW - WITHOUT REQUIRED SURFACE OWNER SIGNATURE

The provisions contained in this section apply only to applications submitted within Tier 2, 3 and 5 Areas, which do not contain the surface owner signature as required by Section 19.98.070, above:

A. An applicant for a ministerial permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable provisions of this chapter. A copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080.F above. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title.

B. The Planning Director shall make reasonable efforts to inform the applicant in writing within thirty (30) calendar days of receipt that the application is complete or that additional information is needed to complete the application. No sooner than thirty (30) calendar days from issuance of the Kern County Oil and Gas Conformity Review and any other necessary state or federal permits, the applicant may begin construction of the facility. The Planning and Community Development Department shall notify the Surface/Land Owner that the permit has been issued.

C. Within thirty (30) calendar days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

D. Within thirty (30) calendar days of reviewing the third submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application. If additional information is needed, a mandatory in-person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. At any time during the review periods in Sections 19.98.100.A or B the applicant submits proof of the required surface owner signature on the site plan, the application will be deemed acceptable to be processed under the provisions set forth in Section 19.98.090.

F. Prior to conducting any drilling activity the operator must have received and have on file both the approved Permit to Conduct Well Operations, from DOGGR and an approved Oil and Gas Conformity Review unless the activity involves facility placement not subject to DOGGR permit approval.

G. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

19.98.110 MINOR ACTIVITY REVIEW — APPLICATION CONTENTS

An application for Minor Activity Review for Tier 1-3 and 5 Areas, pursuant to Section 19.98.040 of this chapter, shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all wells.

D. Preliminary Title Report, not over ninety (90) days old.

E. Description of proposed oil and gas activity and documentation of compliance with applicable Mitigation Measures (see incorporated Mitigation Monitoring and Reporting Program).

F. Sufficient number of photographs to identify the extent of existing ground disturbance.

G. For Tier 2, 3 and 5 Areas only, documentation of letter submitted to the Land/Surface Owner(s), if different, informing the owner of the Minor Activity Review application, mailed and received a minimum of thirty (30) days prior to application being submitted to the County for review.

19.98.120 MINOR ACTIVITY REVIEW

A. An applicant for a ministerial permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable section of this chapter. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title. For Tier 2, 3 and 5 Areas, a copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080.F above.

B. The Planning Director shall make reasonable efforts to inform the applicant in writing within seven (7) business days of receipt that the application is complete and shall issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

C. Within three (3) business days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

D. Within seven (7) business days of reviewing the third submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she

determines that the proposed use meets the development standards and conditions specified in the applicable provisions of Title. If additional information is needed, a mandatory in-person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. Any reviews beyond three shall require additional fees be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be conducted within thirty (30) days.

F. Prior to conducting any activity the operator must have received and have on file both approved applicable DOGGR permit(s), if necessary, and an approved Minor Activity Review pursuant to the chapter.

G. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

19.98.130 SELF-CERTIFICATION

Upon issuance of Oil and Gas Conformity Review or Minor Activity Review, as specified in Sections 19.98.090 and 19.98.120 of this chapter, and any other necessary state or Federal permits, the applicant may begin construction of the facility. The provisions of this section do not apply to issuance of an Oil and Gas Conformity Review pursuant to 19.98.100 of this chapter. The applicant must self-certify compliance with Chapter 19.98 during the construction and operation process. Once the project applicant has completed the construction of the oil and gas facilities, as indicated on the approved site plan, the project applicant will provide a self-certified statement, in writing, to the County, in a format specified by the Director.

During construction and continued operations of the activities specified by the approved site plan, the applicant will be responsible for complying with the issued Oil and Gas Conformity Review, and all applicable implementation standards as outlined in this chapter. Should a violation of a permit issued under this chapter occur on-site, a Certification and Finalization process for the Oil and Gas Conformity Review will be conducted by the County Oil and Gas Inspector, and self-certification for the permit will no longer be permitted for the applicant for the next issued permit, as a probationary period. Once the applicant has demonstrated compliance on the following permit, any subsequent permit may be self-certified.

19.98.140 INSPECTION COMPLIANCE

Upon receipt of an issued permit pursuant to Section 19.98.100, the applicant must contact the Planning and Community Development Department and the Public Works Department to schedule an inspector to be present during all activities related to the Oil and Gas Conformity Review. During construction and continued operations of the activities specified by the approved site plan, the applicant will be responsible for complying with the issued Oil and Gas Conformity Review, and all applicable standards and conditions as outlined in the permit.

19.98.150 PLUGGED AND ABANDONED

Any permit issued pursuant to this chapter must plug and abandon all wells per the following procedures:

A. The applicant shall plug and abandon all facilities in accordance with DOGGR.

B. Within thirty (30) days from completion of the plugged and abandoned procedures for any well constructed after the amendment of this Chapter 19.98, the applicant shall submit to

the Planning and Community Development Department a letter stating which facilities have been abandoned, including the unique well identification number for each well.

19.98.160 PERMIT REVOCATION AND MODIFICATION

Any permit issued pursuant to this chapter may be revoked or modified pursuant to Section 19.102.020 of this Title.

OTHER SECTIONS OF THE ZONING ORDINANCE NEEDED REVISIONS (Revisions in Underline and ~~Strikethrough~~)

CHAPTER 19.48

DRILLING ISLAND (DI) DISTRICT

19.48.080 HEIGHT LIMITS

Height limits in the DI District are as follows:

A. None on derricks and other equipment used during the exploration and drilling phase of development.

B. Pumping units shall not exceed ~~thirty-five (35)~~ eighty (80) feet in height.

19.48.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

A. All drilling and other hydrocarbon development activity in the DI District shall be carried out in accordance with the standards and procedures set out in Section 19.98.~~050~~060 of this title. All activities subject to an Oil and Gas Conformity Review or Minor Activity Review shall comply with the provisions of Section 19.98.060 of the title.

B. Development in the DI District shall comply with the interpretations and provisions of Chapter 19.08 of this title.

CHAPTER 19.81

OUTDOOR LIGHTING

"DARK SKIES ORDINANCE"

19.81.050 EXEMPTIONS

The following are permanently exempt from the provisions of this chapter:

1. Outdoor lighting specifically approved in conjunction with a discretionary permit.

2. Federal and State Facilities: Outdoor light fixtures on, in, or in connection with facilities and land owned or operated by the government of the United States of America or the State of California; however, these agencies are encouraged to comply with the provisions of this ordinance.

3. Airports and Other Lighting Required by the Federal Aviation Administration: Outdoor lighting for public and private airports and any other uses that are regulated by the Federal Aviation Administration.

4. Correctional Institutions: Outdoor lighting for federal, State, and County-owned or operated correctional institutions; however, voluntary compliance with the intent and provisions of this chapter is encouraged.

5. Emergency Light: Temporary emergency lighting needed by the sheriff's department, police department, fire department, public utility, rescue operation or in conjunction with any other emergency service.

6. Temporary Construction: All temporary lighting used for the construction or repair of roadways, utilities, and other public infrastructure.

7. Internally Illuminated Signs: All internally illuminated signs, including those used for on-site and off-site advertising purposes. Such signs are regulated by the provisions of Chapter 19.84 (Signs) of the Kern County Zoning Ordinance.

8. Neon, Argon, or Krypton: All fixtures illuminated solely by neon, argon, or krypton.

9. United States Flag and State of California Flag: Lighting used to illuminate a properly displayed United States Flag and/or the State of California Flag.

10. Lighting Required by Building Codes or other Regulations: Communication towers, exit signs, lighting for stairs/ramps, lighting for points of ingress/egress to buildings, and all other illumination required by air navigation safety provisions, building codes, OSHA standards, and other permitting requirements from State or federal agencies.

11. Fossil Fuel Light: All outdoor light fixtures producing light directly by the combustion of fossil fuels (such as kerosene lanterns, gas lamps, etc.)

12. Street Lighting: Lighting equipment within a public or private right-of-way or easement for the principal purpose of illuminating streets, roadways, and/or other areas open to transport by vehicle or pedestrian traffic.

13. Seasonal Displays: Displays using multiple low wattage bulbs or lasers, provided that they do not constitute a fire hazard, create a nuisance, and are maintained in a safe condition. Such displays shall not be illuminated for more than forty-five (45) days per calendar year.

14. Water Features: Lighting in swimming pools and other water features governed by Article 680 of the National Electrical Code.

~~15. Oil and Gas Exploration and Production: Outdoor lighting in association with oil and gas exploration and production operations and related facilities shall be exempt from this chapter and are regulated by the provisions of Chapter 19.98 of the Kern County Zoning Ordinance.~~

~~16.~~ 15. Temporary Event Lighting: Temporary lighting for special events that does not conform to this chapter shall be reviewed as part of an application for a Temporary Event Permit (TEP), pursuant to Chapter 19.08.340 of the Kern County Zoning Ordinance. Any temporary lighting exemption approved via the TEP process shall be utilized for a period of time that exceeds a combined total of twelve (12) combined days on any one (1) parcel during a calendar year. Exemptions are renewable for a period of not more than twelve (12) additional combined days. Requests for renewal of a temporary exemption shall be processed in the same manner as the original request. No outdoor light fixtures shall be exempted from this chapter for more than twenty-four (24) days combined during a calendar year.

~~17.~~ 16. Steeples: Lighting used to illumination the tall ornamental tower that forms the superstructure of a church, temple, office building, etc., shall be exempt from this chapter.

~~18.~~ 17. Temporary Agricultural Activities: Lighting used to illuminate temporary agricultural activities such as harvesting on property zoned A (Exclusive Agriculture) or A-1 (Limited Agriculture) and lasting no more than twelve (12) consecutive days and no more than twenty four (24) combined days on any one parcel during a calendar year.

CHAPTER 19.50

FLOODPLAIN PRIMARY (FPP) DISTRICT

19.50.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

A. All development within the FPP District is subject to the requirements of the Flood Damage Prevention Ordinance, Chapter 17.48 of this code.

B. Development in the FPP District shall comply with the interpretations and provisions of Chapter 19.08 of this title.

C. Oil or gas exploration and production shall comply with Section 19.98.~~050~~060 and the following standards:

1. The following uses are permitted within the FPP District if they will not obstruct flows, will not cause peripheral flooding of other properties, will not cause any increase in flood levels during the occurrence of the base flood discharge, will be

resistant to floatation and immune to extensive damage by flooding, and will not endanger life or property:

(a) All oil or gas wells, including pumps and all other associated equipment.

(b) Feasible remedial work, improvements, and flood-proofing of facilities.

2. No oil or gas well shall be drilled on the slope or within ten (10) feet of the top or toe of the bank of a river or stream located within the FPP District. The required setback on the top of bank shall be measured from an imaginary plane on a slope two (2) horizontal to one (1) vertical projected upward from the toe of the existing bank.

3. All oil or gas wells in the FPP District, including pumps and all other associated equipment, shall be designed such that they are resistant to damage by flooding.

4. All pipelines in the FPP District shall be flood-proofed by burial to sufficient depth to prevent rupture during flood conditions or by suspension at least two (2) feet above the surface of the base flood. Supports for elevated pipelines shall also carry a catwalk to facilitate removal of debris caught by supports during floods.

5. The location of all buried pipelines shall be recorded on appropriate maps by the company that owns said pipelines, and the maps shall be made available to any public agency that shall request a copy.

6. All drilling, redrilling, and producing, including remedial work, well pulling, work-overs, and deepening, shall conform to all applicable fire, safety, spacing, and environmental State law and regulations.

7. Proven technological improvements generally accepted and used in drilling and production methods shall be adopted as they may from time to time become available, if capable of reducing factors of nuisance and annoyance.

8. Prior to the commencement of any drilling, a copy of a Spill Prevention Control and Countermeasure Plan, as required by the United States Environmental Protection Agency, shall be filed with the Kern County ~~Engineering and Survey Services~~ Public Works Department.

9. All pumps expected to be inaccessible during times of flood shall be equipped with an accessible remote switch to shut off the pumps during emergencies.

10. The derrick, all boilers, and all other drilling equipment used pursuant to this chapter to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derrick, boilers, and drilling equipment are to be used within a reasonable time limit, determined by the Kern County

~~Engineering and Survey Services~~ Public Works Department, for the drilling of another well or wells on the premises.

11. After any well has been placed in production, no earthen sumps shall be used for the storage of petroleum or gas.

12. Within ninety (90) days after any well has been placed in production or after its abandonment, earthen sumps used in drilling or production or both shall be emptied by vacuum truck or other approved means, then filled, and the drilling site restored as nearly as practicable to a uniform grade, unless such sumps are to be used within a reasonable time limit, as determined by the Kern County ~~Engineering and Survey Services~~ Public Works Department.

13. Any derrick used for servicing operations shall be of the portable type; provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable-type derrick will not properly service such well, the Kern County ~~Engineering and Survey Services~~ Public Works Department may approve the use of a standard type of derrick.

14. Directional and warning signs, and those required for identification of the well, shall be constructed, erected, placed, or maintained on the premises, except those required by law to be displayed in connection with the drilling or maintenance of the well.

15. If a producing or service well is not secured twelve (12) months from the date of commencement of drilling operations or any extended period granted by the Kern County ~~Engineering and Survey Services~~ Public Works Department, the premises shall be restored to the original condition as nearly as practicable to do so. If at the expiration of the twelve- (12-) month period, the drilling program has not been completed, the Kern County ~~Engineering and Survey Services~~ Public Works Department may, upon a written request, grant an additional period of time as requested for the completion of such drilling program.

CHAPTER 19.66

PETROLEUM EXTRACTION (PE) COMBINING DISTRICT

19.66.080 HEIGHT LIMITS

Height limit requirements in a PE District are as follows:

A. No height limit on derricks and other equipment used during the exploration and drilling phase of development.

B. Pumping units shall not exceed ~~thirty-five (35)~~ eighty (80) feet in height.

C. All other uses permitted by the base district shall conform to the height limits of the base district with which the PE District is combined.

19.66.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

All drilling and hydrocarbon development activities in a PE District shall be carried out in accordance with the standards and procedures set out in Section 19.98.~~050~~060 of this title. All activities subject to an Oil and Gas Conformity Review or Minor Activity Review shall comply with the provisions of Section 19.98.060 of the title.

C H A P T E R 19.102

PERMIT PROCEDURES
ARTICLE II. MINISTERIAL PERMITS ISSUED BY THE PLANNING DIRECTOR

19.102.040 GENERAL REQUIREMENTS — PERMIT TYPES

The ministerial permits specified in this title for review pursuant to this article shall be issued by the Planning Director upon submission of an application containing the information specified in applicable sections of this title and a determination by the Planning Director that the proposed use or development meets the development standards and conditions specified in the applicable section or sections of this title. These permits include:

A. CRV recycling center permit (Section 19.08.480)

B. Temporary animal permit plot plan review (Sections 19.14.130 and 19.60.130 through 19.60.160)

C. Extensions for temporary mobilehomes and recreational vehicles (Sections 19.16.130 and 19.18.160)

D. Mobilehome park plot plan review (Sections 19.26.130 through 19.26.190)

E. Minor plan modifications (Section 19.52.130 through 19.52.180, 19.56.130 through 19.52.180, 19.56.130 through 19.56.200, 19.58.130 through 19.58.180, and 19.100.050

F. Commercial wind farm plot plan review (Section 19.64.130 through 19.64.150)

G. Geologic hazard plot plan review (Section 19.68.130 through 19.68.150)

H. Special development standards plot plan review (Sections 19.80.040 through 19.80.070)

I. Off-street parking plot plan review not in conjunction with a ministerial permit (Sections 19.82.100 through 19.82.130)

J. Landscaping plot plan review not in conjunction with a ministerial permit (Sections 19.86.070 through 19.86.100)

K. Density bonus permit (Sections 19.92.030 through 19.92.060)

L. Home occupation permit (Sections 19.94.050 through 19.94.080)

M. Production water injection wells for the purpose of disposing of production wastewater produced in the same oilfield in which the injection well is located (Section 19.98.030)

N. ~~Oil and gas plot plan review (Section 19.98.030)~~ Oil and Gas Conformity Review and Minor Activity Review (Section 19.98.070 through 19.98.120)

O. Large family day-care permit - no hearing (Sections 19.96.030 through 19.96.060)

P. Temporary batch plant (thirty (30) days or less) plot plan review (Section 19.08.290)

Q. Secondary residential unit plot plan review (Section 19.90.040 through 19.90.060)

R. Truck parking as accessory to residential use permit (Section 19.08.252)

C H A P T E R 19.108

NONCONFORMING USES, STRUCTURES, AND LOTS

19.108.040 NONCONFORMING USES OF LAND

A. A nonconforming use of land shall not be expanded, extended, or intensified in any way with respect to scope, duration, or frequency of the use, except as follows:

The Planning Commission may authorize the expansion or intensification of legal, nonconforming uses if, after consideration at a public hearing noticed pursuant to Section 19.102.150, both of the following findings can be made:

1. The proposed expansion will not create any significant adverse impacts to surrounding properties.

2. The only other remedy to bring the use into conformance would require an amendment to the applicable General Plan.

Public hearing notification shall consist of mailing notices to property owners having property within three hundred (300) feet from the exterior boundaries of the subject property. Published notice in a local newspaper shall not be required, unless the Planning Director determines that such additional notice is warranted. In consideration of a

request to expand or intensify a legal, nonconforming use, the terms and conditions for any approval shall be as specified in Section 19.104.050.

B. A nonconforming use of land shall not be changed to or replaced by any other use except a use that complies with the regulations of the zoning district in which the subject property lies.

C. Any nonconforming use of land that has been discontinued or abandoned for a period of one (1) year or more shall not be reestablished. In instances where the assessed value of improvements on the property exceeds fifty thousand dollars ($50,000), as determined by the County Assessor, the nonconforming use shall not be reestablished if the use has been discontinued or abandoned for a period of two (2) years or more.

D. The exploration for or development or production of oil, gas, or other hydrocarbon substances ~~shall not be considered nonconforming uses of land~~ lawfully constructed prior to MONTH, DAY, YEAR shall be considered nonconforming uses of land. Any subsequent alteration or expansion of these facilities is subject to Chapter 19.98 of this Title.

E. A legal nonconforming dwelling in any zone district may be replaced with the approval of the Planning Director, provided that all applicable requirements of this title, other than density or conditional use permit requirements, can be satisfied.

F. Any use of land continuously in existence for a period of twenty (20) years or more may qualify as a legal, nonconforming use pursuant to Section 19.108.080, irrespective of when zoning requirements became effective for that property, provided that the Planning Director determines that the use is not significantly incompatible with surrounding land uses and that there is no significant threat to the public health, safety, and welfare in allowing the use to continue.

Chapter 2

Introduction

Chapter 2
Introduction

2.1 Intent of California Environmental Quality Act

The Kern County Planning and Community Development Department (KCPCDD), as Lead Agency, has determined that an Environmental Impact Report (EIR) is the appropriate environmental analysis document, pursuant to the California Environmental Quality Act (CEQA), for the proposed Amendment to Title 19 – Kern County Zoning Ordinance, focused on Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance for Oil and Gas Local Permitting, and related provisions of the Kern County Zoning Ordinance ("Project" or "proposed Project"), as described in detail in Section 3.1.1 (see Chapter 3, Project Description). This EIR has been prepared in accordance with requirements of the following documents:

- CEQA (California Public Resources Code [PRC] Section 21000 et seq.);
- State CEQA Guidelines, Title 14, California Code of Regulations (CCR), Chapter 3, Section 15000 et seq.; and
- Kern County CEQA Implementation Document.

The overall purposes of the CEQA process are as follows:

- Inform governmental decision makers and the public about the potential significant effects, if any, of proposed activities;
- Provide opportunities for other agencies and the public to review and comment on draft environmental documents;
- Ensure that the environment and public health and safety are protected in the face of discretionary projects initiated by public agencies or private concerns;
- Identify the significant effects to the environment of a project, identify alternatives, and indicate the manner in which those significant effects can be avoided or mitigated; and
- Provide for full disclosure of the project's environmental effects to the public, the agency decision makers who will approve or deny the project, and responsible and trustee agencies charged with managing resources (e.g., wildlife, air quality) that may be affected by the project.

2.2 Purpose of this Environmental Impact Report

An EIR is a public informational document used in the planning and decision making process. This EIR will analyze the environmental impacts of the proposed Project. The Kern County Planning Commission and Board of Supervisors will consider the information in the EIR, including public comments and staff responses to those comments, during the public hearing process. As amending the Zoning Ordinance is a legislative action, the final decision will be made at the Board of Supervisors' public hearing, where the Project may be approved, conditionally approved, or denied.

The purpose of an EIR is to identify:

- The significant potential impacts of a proposed project on the environment and the manner in which those significant impacts can be avoided or mitigated;
- Any unavoidable adverse impacts that cannot be mitigated; and
- Reasonable and feasible alternatives to the project that would eliminate any significant adverse environmental impacts or reduce the impacts to a less than significant level.

An EIR also discloses growth-inducing impacts, impacts found not to be significant, and significant cumulative impacts of past, present, and reasonably anticipated future projects.

CEQA requires an EIR to reflect the independent judgment of the lead agency regarding the impacts, the level of significance of the impacts both before and after mitigation, and mitigation measures proposed to reduce the impacts. A Draft EIR (DEIR) is circulated to public agencies, special districts, responsible and trustee agencies who manage resources affected by the project, and interested agencies and individuals. The purposes of public and agency review of a DEIR include sharing expertise, disclosing agency analyses, checking for accuracy, detecting omissions, discovering public concerns, and soliciting counterproposals.

Reviewers of a DEIR should focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Comments are most effective when they suggest additional and specific alternatives or mitigation measures that would provide better ways to avoid or mitigate significant environmental effects.

Issues to Be Resolved

Section 15123(b) (3) of the CEQA Guidelines requires that an EIR contain issues to be resolved, which include the choices among alternatives and whether or how to mitigate significant impacts. The major issues to be resolved regarding a project include decisions by the lead agency as to whether or not:

- The DEIR adequately describes the environmental impacts of the project;

- The recommended mitigation measures should be adopted or modified;
- The alternatives evaluated should be adopted or rejected; or
- Additional mitigation measures need to be required.

2.3 Terminology

To assist readers in understanding this EIR, terms used are defined in the following manner:

- "**Project**" means the whole of an action that has the potential for resulting in a physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.
- "**Project Area"** means the area within which the proposed amendment to Title 19 – Kern County Zoning Ordinance, focused on Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance for Oil and Gas Local Permitting would apply and generally includes most of the San Joaquin Valley Floor portion of Kern County up to an elevation of 2,000 feet. The Project Area includes all unincorporated lands within the 409-square-mile Metropolitan Bakersfield General Plan (MBGP); but excludes portions of Metropolitan Bakersfield that are within the jurisdiction of the City of Bakersfield, and excludes all other city jurisdictions, including Taft, Delano, Shafter, Arvin, McFarland, Maricopa, and Wasco. Lands under the jurisdiction of various state and federal agencies, including the Bureau of Land Management (BLM), the U.S. Fish and Wildlife Service (USFWS), and the California State Lands Commission (CSLC) are also excluded.
- "**Environment**" means the physical conditions that exist within the area that will be affected by the proposed Project, including, but not limited to, land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance. The area involved is the locale in which significant direct or indirect impacts would occur as a result of the Project. The environment includes both natural and man-made conditions.
- "**Impacts**" analyzed under CEQA are changes to the physical environment anticipated from a development proposal. Impacts are:
    - Direct or primary – Impacts that are caused by the proposed Project and occur at the same time and place of project implementation; or
    - Indirect or secondary – Impacts that are caused by the proposed Project at a later time or farther removed in distance but are still reasonably foreseeable. Indirect or secondary impacts may include growth-inducing impacts and other effects related to induced changes in the pattern of land use, population density or growth rate, or related effects on air, water, and other natural systems, including ecosystems.
- "**Significant impact on the environment**" means a substantial, or potentially substantial, adverse change in any of the physical conditions in the Project vicinity affected by the proposed Project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance. An economic or social change resulting

from a project by itself is not considered a significant impact on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

- "**Mitigation**" consists of measures to avoid or substantially reduce the proposed Project's significant environmental impacts by:
  - Avoiding the impacts altogether by not taking a certain action or parts of an action;
  - Minimizing impacts by limiting the degree or magnitude of the action and its implementation;
  - Rectifying the impact by repairing, rehabilitating, or restoring the affected environment;
  - Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the actions; or
  - Compensating for the impacts by replacing or providing substitute resources or environments.
- **"Cumulative Impacts"** are two or more individual impacts that, when considered together, are considerable or that compound or increase other environmental impacts. The following statements also apply when considering cumulative impacts:
  - The individual impacts may be changes resulting from a single project or separate projects; and
  - The cumulative impact from several projects is the change in the environment that results from the incremental impact of the Project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor, but collectively significant, projects taking place over time.

This EIR uses a variety of terms to describe the level of significance of adverse impacts. These terms are defined as follows:

- **Less than significant**: An impact that is adverse but that does not exceed the defined thresholds of significance. Less than significant impacts do not require mitigation.
- **Significant**: An impact that exceeds the defined thresholds of significance and would or could cause a substantial adverse change in the environment. Mitigation measures are recommended to eliminate the impact or reduce it to a less than significant level.
- **Significant and unavoidable**: An impact that exceeds the defined thresholds of significance and cannot be eliminated or reduced to a less than significant level through the implementation of mitigation measures.

A glossary, including acronyms, abbreviations, and specific technical terms used throughout the EIR, is provided in Chapter 11 of this EIR.

2.4 Decision-Making Process

CEQA requires lead agencies to solicit and consider input from other interested agencies, citizen groups, and individual members of the public. CEQA also requires the project to be monitored after it has been permitted to ensure that mitigation measures are carried out.

CEQA requires the lead agency to provide the public with a full disclosure of the expected environmental consequences of the project and with an opportunity to provide comments. In accordance with CEQA, the following is the process for public participation in the decision-making process:

- **Initial Study (IS)/Notice of Preparation (NOP).** Kern County prepared and circulated an IS/NOP to the State Clearinghouse, public agencies, special districts, responsible and trustee agencies, and other interested parties for review and comment on August 30, 2013. In conjunction with this public notice, four scoping meetings and community workshops were held by Kern County at the locations and dates identified in Table 2-1. The purpose of these workshops/meetings was to introduce the Project and to solicit input from agencies, organizations, and other interested parties regarding the proposed Project, alternatives, mitigation measures, and environmental impacts to be analyzed in the EIR. The IS/NOP, scoping meeting and community workshop materials, comment letters received, and a complete summary of all written and verbal comments are included in Appendix A of this EIR.

Table 2-1: Scoping Meetings and Community Workshops

Location	Date	Time
Lost Hills Recreation Building, Lost Hills Park Hwy. 46, Lost Hills, CA	Sept. 16, 2013	6:30 p.m.
Taft Veterans Hall, Room 1 218 Taylor St., Taft, CA	Sept. 18, 2013	6:30 p.m.
Kern County Board Chambers, 1st Floor Board Chambers 1115 Truxtun Ave., Bakersfield, CA	Sept. 23, 2013	6:30 p.m.
Shafter Veterans Building, Room 2 309 California Ave., Shafter, CA	Sept. 25, 2013	6:30 p.m.

- **Preparation of DEIR/Notice of Completion (NOC)**. A DEIR will be prepared, incorporating public and agency responses to the IS/NOP and scoping process. The DEIR will be circulated for review and comment to appropriate agencies and additional individuals and interest groups who have requested to be notified of EIR projects. Per Section 15105 (Public Review Period for a DEIR or a Proposed Negative Declaration or Mitigated Negative Declaration) of the State CEQA Guidelines, Kern County will provide for a 45-day public review period on the DEIR. The NOC will be prepared with the DEIR in accordance with Section 15085 (Notice of Completion) of the CEQA

Guidelines. The purpose of the NOC is to notify reviewing agencies and the public that a DEIR has been prepared and completed for public review.

- **Preparation of Final EIR (FEIR)**. In accordance with Section 15088 (Evaluation of and Response to Comments) of the CEQA Guidelines, following completion of the 45-day public review period, Kern County will respond to each comment on the DEIR through a "Response to Comments" chapter in the FEIR. Written responses will be provided to each commenting agency, organization, or person at least two weeks before the scheduled Kern County Planning Commission hearing.
- **Certification of FEIR**. Acting as an advisory body to the Kern County Board of Supervisors, the Kern County Planning Commission will consider and make recommendations on the FEIR and proposed Zoning Ordinance amendment. Upon receipt of the Planning Commission's recommendations, the Board of Supervisors will consider the FEIR, all public comments, and the proposed Zoning Ordinance amendment before taking final action on the Project. At least one public hearing will be held by the Planning Commission and by the Board of Supervisors to consider the FEIR, take public testimony, and either approve, conditionally approve, or deny the proposed Project.
- **Preparation of Notice of Determination (NOD)**. In accordance with Section 15094 (Notice of Determination), within five working days following certification of the FEIR, Kern County shall prepare and file the NOD with the State Clearinghouse. The NOD, which notifies the public that Kern County has certified the FEIR, will be posted for at least 30 days.

2.4.1 Initial Study/Notice of Preparation

In accordance with CEQA Guidelines Section 15082 (a) (Notice of Preparation) and the County's Guidelines, KCPCDD circulated an IS/NOP for a 30-day public review. The IS/NOP was sent to the State Clearinghouse, public agencies, special districts, responsible and trustee agencies, and other interested parties for a public review period that began on August 30, 2013 and ended on September 30, 2013. The purpose of the IS/NOP is to formally covey that Kern County, as the lead agency, solicited input regarding the scope and proposed content of the EIR. The IS/NOP, scoping meeting and community workshop materials, comment letters received, and a complete summary of all scoping comments are included as Appendices A, C, and D, respectively.

IS/Notice of Preparation Written Comments

The County received 43 letters with substantive comments in response to the IS/NOP. The comments are summarized in Table 2-2.

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
State	
California Governor's Office of Planning and Research (OPR) State Clearinghouse and Planning Unit Letter dated August 28, 2013	Provided transmittal of the NOP to reviewing agencies and reminded the agencies to comment in a timely manner. Issued SCH No. 2013081079. No comments were made on the content of the NOP.
California Department of Conservation Division of Oil, Gas, & Geothermal Resources (DOGGR) Letter dated September 30, 2013	Requests that the EIR quantify the amount of oil and gas production activities reasonably contemplated with the Zoning Ordinance Amendment and explain how the quantifications and other assumptions are used in the EIR. Requests that the EIR clearly explain the significance of impacts and identify mitigation measures and Project alternatives to reduce or eliminate significant impacts. Requests the EIR describe and analyze activities subject to the ministerial permit procedure and how qualifying for approval under the Conformity Review process will result in ministerial action by the County. Also requests the EIR take into account the statutory provisions of Senate Bill 4 (Pavley) or "SB-4," signed by Governor Brown on September 20, 2013.
California Department of Fish and Wildlife (CDFW), Central Region Letter dated September 26, 2013	Indicates the Project Area contains thousands of acres of protected conservation lands, core population areas for multiple state and federally listed plant and animal species, and supports rare natural communities. Further indicates the Project Area includes the only known habitat for many special status species and important geographic and topographic habitat areas identified as critical to meet the recovery goals for many state and federally listed species. Indicates the CDFW's concern that future oil and gas project activities could result in impacts to these resources and recommends that their suggested avoidance, minimization, and mitigation measures be included in the DEIR as enforceable mitigation measures, as appropriate.
California Department of Transportation (Caltrans) Planning South Branch, District 6 Letter dated September 18, 2013	Indicates that the Project would have significant impacts to the state facilities and impacts on Interstate 5 and State Routes (SR) 33, 43, 46, 58, 65, 99, 119, 155, 166, 204, and 223. Requests that the DEIR evaluate impacts to state highways and identify mitigation. Also indicates that any future oil and gas exploration, extraction, operations, and production activities adjacent to or requiring access to a State Route should be sent to Caltrans for review.
California State Lands Commission (CSLC) Letter dated September 26, 2013	Indicates the proposed Project may involve school lands, sovereign lands, and State parks, including current CSLC leases within the Project Area. Requests the EIR include a thorough and complete Project description and that mitigation be presented as specific, feasible, enforceable obligations, or as formulas

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
	containing "performance standards." Requests the EIR consider the Project's potential to encourage the establishment or proliferation of invasive plant and animal species and recommends actions to prevent their release and spread. Requests that the EIR describe results of cultural resource surveys and consultation and/or outreach with Native American communities. Also requests the EIR include calculations or estimates of potential air and greenhouse gas (GHG) emissions from Project-related activities and address potential impacts of hydraulic fracturing as well as restricted or diminished use and enjoyment of recreational lands.
Native American Heritage Commission Letter dated September 3, 2013	Advises of the State and federal statutes relating to Native American historic properties and cultural significance. Requests that known archaeological resources recorded on or adjacent to the Project are listed in the EIR. Further recommends early consultation with Native American tribes, contacting the California Office of Historic Preservation for pertinent archaeological data, and notes historic properties of religious or cultural significance may be subject to confidentiality. A contact list of Kern County tribes is also provided.
Local Agencies	
Eastern Kern Air Pollution Control District Letter dated September 3, 2013	Verified receipt of the NOP by the Eastern Kern Air Pollution Control District. No comments were made on the content of the NOP.
Kern County Airports Department Letter dated September 3, 2013	Verified receipt of the NOP by the Kern County Airports Department. No comments were made on the content of the NOP.
Kern County Department of Agriculture and Measurement Letter dated August 30, 2013	Verified receipt of the NOP by the Kern County Department of Agriculture and Measurement. No comments were made on the content of the NOP.
Kern County Development Services Agency Roads Department Letter dated September 10, 2013	Verified receipt of the NOP by the Kern County Development Services Agency Roads Department. No comments were made on the content of the NOP.
Kern County Engineering and Survey Department Letter dated September 3, 2013	Verified receipt of the NOP by the Kern County Engineering and Survey Department. No comments were made on the content of the NOP.
Kern County Library - Local History Room Letter dated September 12, 2013	Verified receipt of the NOP by the Kern County Library - Local History Room. No comments were made on the content of the NOP.
Kern County Library Letter dated September 3, 2013	Verified receipt of the NOP by the Kern County Library. No comments were made on the content of the NOP.
Kern County Roads Department	Verified receipt of the NOP by the Kern County Roads

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
Letter dated September 4, 2013	Department. No comments were made on the content of the NOP.
Kern County Sheriff's Office Letter dated September 9, 2013	Verified receipt of the NOP by the Kern County Sheriff's Office. No comments were made on the content of the NOP.
Kern County Waste Management Department Letter dated September 3, 2013	Verified receipt of the NOP by the Kern County Waste Management Department. No comments were made on the content of the NOP.
Kern County Water Agency Letter dated September 27, 2013	Indicates development of oil and gas facilities under the Project has the ability to negatively impact groundwater levels and quality. The DEIR should include an analysis of the Project's potential impacts to groundwater resources and groundwater quality and quality.
Kern County Engineering, Surveying, and Permit Services Letter dated September 3, 2013	Verified receipt of the NOP by the Kern County Engineering, Surveying, and Permit Services. No comments were made on the content of the NOP.
North of the River Recreation and Park District Letter dated September 12, 2013	Indicates the Project could have a significant impact on the North of the River Recreation and Park District's services and facilities due to a potential increase of population, resulting in the possible expansion of services and facilities.
San Joaquin Valley Air Pollution Control District Letter dated September 30, 2013	Indicates existing and post-Project emissions for individual oil and gas emissions should be identified and quantified. Recommends stationary sources and mobile sources be analyzed separately and construction emissions mitigation include the use of off-road construction fleets. Recommends the California Emissions Estimator Model (CalEEMod) be used to analyze equipment emissions and those nuisance odors and health impacts of toxic air contaminants are evaluated. Also recommends the EIR include: information on the methodology, model assumptions, and inputs used; Project components, Project phases and associated emissions; and cumulative impact assessment along with mitigation measures, including a Voluntary Emissions Reduction Agreement (VERA) for non-permitted source emissions.
Stanislaus County Environmental Review Committee (ERC) Letter dated September 30, 2013	Indicates Stanislaus County ERC reviewed the subject Project and had no comments.
Interested Parties	
Association of Irritated Residents (AIR) Letter dated September 8, 2013	Indicates the County needs to define the type and extent of activities that would be regulated. Recommends the EIR include: number of wells and total land requirements; impacts on important farmland/farmland conversion; water demand, sources and disposal options; facility's proximity to homes and schools; air

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
	and GHG; fuel requirements for co-generation or steam production; environmental justice analysis; evaluation of health impacts; well testing of all irrigation wells and/or domestic water wells within one mile of drilling site(s); and notification of residents within one mile of any drilling or other similar activity.
Center for Biological Diversity Letter dated September 27, 2013	Indicates unconventional extraction methods multiply and intensify impacts from oil and gas activities. Indicates expansion of oil and gas operations creates dangers inherent to oil and gas operations, in general. Recommends the County impose prohibition on the use of unconventional oil and gas extraction techniques.
Center on Race, Poverty, and the Environment Letter dated September 30, 2013	Recommends the County place a moratorium on all new well development until amendments to the Zoning Ordinance are finalized. Recommends the County reconsider ministerial permitting for new wells and look at comprehensive, project-by-project review.
Citizens Coalition for a Safe Community Letter dated September 30, 2013	Stated that the IS/NOP included numerous inconsistencies in terminology and recommends the County provide revised Scoping documents. Recommends industry technical terms be included in a glossary. Indicates that if the County's CEQA process is to be used by DOGGR for their considerations, then the DEIR must include an assessment of all aspects of subsurface oil and gas exploration and production within the Project Boundary Area. Indicates the DEIR must include a statement of purposes and needs and recommends the EIR include the following alternatives: No Project; Project Expansion for All Exploration and Production Facilities and Activities; Project Expansion with All Future Exploration and Production Facilities and Activities Beyond and Beneath Existing Facilities and Activities; an alternative for the proposed amendment to apply to all existing and future oil and gas exploration and production facilities, equipment, and activities, including those abandoned (e.g., orphan wells and abandoned well blowouts); and Project Expanded and Conducted as a Programmatic EIR. Indicates the DEIR must evaluate all impacts, direct, cumulative, and indirect, on agriculture, air quality, biological resources, cultural resources, geology and soils, GHG emissions, hazards and hazardous materials, hydrology and water quality (including flooding), land use and planning, mineral resources, noise, public services, recreation, transportation and traffic, utilities and service systems, and growth inducement. Further indicates that the DEIR and Zoning Ordinance

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
	Amendment must require oil and gas projects to generate their own clean electricity during production using photovoltaic (PV) solar, direct line power, or both, to eliminate all needs for operational power diesel generator onsite. Also recommends the EIR include a full and comprehensive fiscal and economic analysis, including employment and jobs. In addition, indicates the DEIR must include mitigation monitoring and reporting requirements to improve and ensure compliance and, as needed, penalize non-compliance. Also requests that the Mitigation, Monitoring, and Reporting Program (MMRP) be included with the DEIR.
Earthworks, Oil and Gas Accountability Project Letter dated September 30, 2013	Indicates a comprehensive analysis is required, including cumulative impacts, to ensure the protection of public health and the environment and to mitigate any potentially significant effects. Recommends no new wells be allowed in the County until a FEIR is completed and the permitting process is updated. Indicates impacts could include: conversion of farmland to non-agricultural uses; regional air quality impacts, GHG emissions; depletion of surface and groundwater supplies and quality and increased seismic activity. Indicates the County should consider all possible alternatives. Requests a full economic analysis, a health impact study, and an extensive public review period prior to amending the Zoning Ordinance.
Environmental Working Group Letter dated October 1, 2013	Indicates a comprehensive analysis is required, including cumulative impacts, to ensure the protection of public health and the environment and to mitigate any potentially significant effects. Recommends no new wells be allowed in the County until a FEIR is completed and the permitting process is updated. Indicates impacts could include: conversion of farmland to non-agricultural uses; regional air quality impacts, GHG emissions; depletion of surface and groundwater supplies and quality and increased seismic activity. Indicates the County should consider all possible alternatives. Requests a full economic analysis, a health impact study, and an extensive public review period prior to amending the Zoning Ordinance.

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
Kern Audubon Society Letter dated September 27, 2013	Indicates the EIR needs to include a statement that counties are agents of the state and are required to enforce state law. Further indicates that a revised amendment must include a statement that state law supersedes County ordinances when a conflict appears. Indicates the proposed amendment should reflect SB-4. Further indicates the EIR must discuss the relationship between DOGGR and the KCPCDD relative to permitting of petroleum/gas exploration and production. Indicates the EIR must identify the added work duties of current KCPCDD staff and if additional staff will be required, the EIR must include a list of potential funds. Indicates that permitting of oil drilling should be reviewed by a community-based Review Group as well as an Oversight Panel for drilling permits that are to be considered significant, either by size (acres) or location (farming operations, housing). Indicates the EIR needs to consider factors that will 'trigger' the Oversight Review Panel process.
Natural Resources Defense Council Letter dated September 30, 2013	Indicates that an update to the County's development standards and conditions must consider a broad range of environmental and human health impacts. Also indicates that the EIR must analyze all potential environmental impacts related to the oil and gas activities contemplated by the Project and meet other CEQA requirements, including consideration of feasible mitigation, reasonable alternatives, environmental baselines, cumulative impacts, and a health risk assessment. Indicates the EIR must include a full life cycle analysis of all methods of extraction. Indicates the EIR must present reasonable alternatives "capable of avoiding or substantially lessening any significant effects of the Project, even if these alternatives would impede attainment of Project objectives, or would be more costly." In addition, indicates a ministerial permit would be problematic because CEQA does not apply to ministerial permits.
Sierra Club, Kern-Kaweah Chapter Letter dated September 8, 2013	Indicates the EIR must contain the proposed language of the amendment to the Zoning Ordinance and complete information regarding the physical location and description of activities anticipated during all Project phases. Indicates the Zoning Ordinance should include: specific requirements for advanced notification of the intent to use well stimulation techniques; public disclosure on an agency-run website; disclosure of sources, composition, volumes and disposition of water; notification of well casing failures; groundwater testing prior to any well stimulation operations; monitoring to establish baseline ground movement and seismic activity and post-fracturing seismicity; air quality

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
	protections; a prohibition on fracking confidential/exploratory wells; disclosure of all well reworks; prohibition on fracking in or around sensitive areas; requirement for projects to generate their own clean electricity during production using PV solar; and elimination of trade secret protections. Indicates the EIR must address the impacts of oil and gas development and include an adequate, complete, and enforceable MMRP. Indicates the EIR's alternatives evaluation should include an alternative that focuses on clean, renewable energy rather than increased dependence on fossil fuels. Also indicates that if the EIR is to be used by DOGGR, it must include assessment of subsurface oil and gas exploration and production within the Project Area.
Tejon Indian Tribe Letter dated September 9, 2013	Indicates the Tejon Indian tribe has no conflict with this Project nor do they know of any cultural resources that might be impacted at this site. Requests immediate notification if any site(s) and/or artifacts are discovered in the area.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated September 30, 2013	Indicates the maximum number of wells, well pads, roads and other infrastructure should be analyzed and potentially limited. Indicates the EIR should consider a No Project Alternative of not permitting an increase in drilling as the baseline. Indicates the EIR should discuss the rate of oil well casing failures within 1 year, 5 years, and 25 years of drilling and whether stimulation techniques increase rate of casing failures. Indicates the EIR should identify all instances where oil and gas development have caused water contamination in California. Indicates the EIR should discuss: whether density of oil development (i.e. oil wells per acre) increases or decreases chances of a spill; why oil and gas development does not conflict with "Williamson Act Contracts;" the reasons that oil and gas development is/is not compatible with agriculture; if there is a conflict between water needs for agriculture and for oil and gas development; if there should be a limit on the amount of water resources devoted to oil and gas development; and if recycling (instead of re-injection) of produced or recovered water should be mandated. Requests the EIR identify jobs related to oilfield development, including workers necessary for drilling, oilfield maintenance, and refinement, as well as average wages for such workers. Requests the EIR clarify whether GHG emissions can be reduced to a level of significance by requiring the capture of methane from

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
	the well heads. Questions whether a ministerial permit process for oil and gas development should be approved.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated October 3, 2013	Requests an article by Ellen M Gilmer, E&E reporter, "*Geologists link Okla.'s largest quake to injection wells,*" published March 27, 2013, be included in the administrative record for the Oil and Gas Zoning Amendment.
Nossaman, LLP Letter dated September 30, 2013	Requests inclusion of a discussion in the IS/NOP of the basis for a project-level EIR rather than a program EIR. Indicates the final Project description should include: a statement of the Project's objectives; a general description of the Project's technical, economic, and environmental characteristics; a statement of the intended uses of the EIR; and a list of related environmental review and consultation requirements. Indicates the KCPCDD should consult with DOGGR and other state agencies involved in implementation of SB-4 and those federal agencies involved in the study of hydraulic fracturing in California. Indicates all impacts from loss of farmland should be considered in the EIR, including assessment of the provision of adequate turnarounds for farm equipment. Indicates the EIR must identify all constituent elements found in produced water to properly assess impacts, including potential groundwater impacts.
Smith, Mark A. Letter dated September 3, 2013	Indicates the Independent Oil Producers Agency's name is referred to in the NOP as the "Independent Oil Producers Association" but it is an "Agency." Notices that the IS/NOP mailing list does not include many oil operators. Thinks the KCPCDD should obtain the list of active operators from DOGGR and send the NOP to those addressees.
Smith, Mark A. Letter dated September 9, 2013	Requests consideration of "economic factors." Requests the EIR discuss alternatives to the Project, including a No Project Alternative. The implication of this alternative is that it would have an unacceptable impact on the local and statewide economy and jobs. The impact on the economy and jobs must be explored and detailed. Requests other alternatives be explored, especially those with the potential to impact the economy, jobs, and small businesses. Requests clarification on information required to demonstrate compliance with the ordinance and clarification of KCPCDD's authority as it relates to future and ongoing DOGGR regulations and responsibilities. Requests the Kern County Valley Floor Habitat Conservation Plan be drafted in time for information in the Plan to be incorporated into the Chapter 19 Amendments.

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated October 16, 2013	Requests inclusion of Microsoft Power Point slides regarding fracking in Pennsylvania: "*Ecological Risks of Shale Gas Development Department of Ecosystem Science and Management*," Penn State University, into the administrative record. Notes that, while the Power Point presentation is specific to Pennsylvania, it provides some areas of analysis for the Oil and Gas Zoning Amendment EIR.
Lebec County Water District Letter dated October 7, 2013	Had no specific comments regarding the scope of the DEIR, and recognizes it may be outside of the Project Area. However, the District urges the County to rigorously review all potential impacts to groundwater levels and quality in the DEIR. The District notes their concern about potential impacts to groundwater resulting from the increased oil and gas exploration and development activities and urges the County to require designs and procedures to provide maximum protection.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated October 31, 2013	Requested an article by Mike Lee, E&E reporter, entitled "*Gas Production More Water-Intensive Than Expected, Research Shows,*" published Thursday, October 31, 2013, be included in the administrative record for the EIR. Indicates the article demonstrates that the cumulative impacts of freshwater use must be carefully considered for fracking and other types of well stimulation.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated November 4, 2013	Requests an article by Mark Grossi, entitled "*Fracking Probe Expands In Central Valley,*" published in the Fresno Bee, November 2, 2013, regarding fracking flowback and waste discharge, be included in the administrative record for the EIR.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated December 17, 2013	Provided an article on the discovery of elevated endocrine disruptor chemicals (EDC) in water supplies surrounding fracked wells, by Neela Banerjee, entitled "*Hormone-Disrupting Chemicals Found In Water At Fracking Sites*," published in the Los Angeles Times, December 16, 2013. Also provided an abstract of the study to the article. Indicates that he does not have access to the actual study. Requests that the EIR consider the potential impacts caused by EDCs and include the article and the study in the administrative record for the EIR.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated December 18, 2013	Requests the study on endocrine disruptor chemicals (EDCs) in groundwater near fracking, entitled "Estrogen and Androgen Receptor Activities of Hydraulic Fracturing Chemicals and Surface and Ground Water in a Drilling-Dense Region," by Christopher D. Kassotis et al., published online in Endocrinology Journal, Volume 155, Issue 3, published December 16, 2013, be provided to the consultants

Table 2-2: Summary of Written Comments on the Initial Study/Notice of Preparation

Commenter	Summary of Comment
	preparing the EIR for the Amendment of Title 19.98 (Oil and Gas regulation) and be included in the administrative record.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated December 20, 2013	Requests an article by Gayathri Vaidyanathan, E&E reporter, entitled *"'Frack Hit' Is Possible Culprit In Leaking Colo. Well,"* published Thursday, December 19, 2013, be included in the administrative record for the amendment to the Oil and Gas Regs. EIR. States that the article indicates that there is phenomena called "Frack Hits" whereby fracking a well near another well may result in a casing failure and leaking.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated February 6, 2014	Requests EIR investigate the pattern of birth defects in hydraulic fracturing communities and consider how the Zoning Ordinance can mitigate the potential impacts to pregnant women and unborn children.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated April 16, 2014	Requests EIR investigate potential impact to health and the environment and consider how the Kern County Zoning Ordinance can mitigate the impacts caused by radioactive waste associated with fracking The article attached reports that North Dakota is having a problem with disposal of "radioactive socks" used to filter frackwater. North Dakota regulators have discovered illegal dumping of such radioactive waste.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated October 9, 2014	Requested a press release from the American Chemical Society, entitled "*'Fracking' wastewater that is treated for drinking produces potentially harmful compounds,*" released September 24, 2014, be included in the administrative record and be discussed in the EIR.
Law Office of Todd T. Cardiff, Citizens Coalition for a Safe Community Letter dated November 17, 2014	Requests EIR include a map of all injection wells in the County, all protected and unprotected aquifers, and all aquifers known to be contaminated. Requested an article by Stephen Stock, Liza Meak, Mark Villarreal, and Scott Pham, NBC Bay Area website, entitled "*Waste Water from Oil Fracking Injected into Clean Aquifers,"* published Friday, November 14, 2014, be included in the administrative record for the Project.

2.4.2 Scoping Meetings/Community Workshops

Pursuant to Section 15206 (Projects of Statewide, Regional, or Area-Wide Significance) of the State CEQA Guidelines, the lead agency is required to conduct at least one scoping meeting for all projects of State-wide, regional, or area-wide significance. The scoping meeting is for jurisdictional agencies and interested persons or groups to provide comments regarding, but not limited to, the range of actions, alternatives, mitigation measures, and environmental effects to be analyzed. Kern County hosted four scoping meetings and community workshops at the locations and dates identified in Table 2-1.

Scoping Meetings/Community Workshops Results

Verbal comments were received at the scoping meetings and community workshops. Specific environmental concerns raised in the comments received during the meetings are presented in Table 2-3. The IS/NOP, scoping meeting and community workshop materials, comment letters received, and a complete summary of all scoping comments are included as Appendices A, C, and D, respectively.

Table 2-3: Summary of Verbal Comments from the Scoping Meetings and Community Workshops

Lost Hills Scoping Meeting/Community Workshop – September 16, 2013
– The commenter is in support of the Project and will submit more specific comments to the KCPCDD in writing. – The commenter would like to see an amendment that maintains the County's streamlining process for oil and gas activities.
Taft Scoping Meeting/Community Workshop – September 18, 2013
– The commenter is in support of the Project and will submit more specific comments to the KCPCDD in writing. – The commenter asked "Will a scoping report be available?" – The commenter asked "Will Kern County be addressing both surface and subsurface activities?" – The commenter stated the Project description should include a discussion of preemption and why the County cannot permit the down-hole oil and gas activities. – The commenter applauds the County for taking the initiative to pursue this EIR and Project. – The commenter stated it is important that a local agency address these issues because they understand the local conditions better. The County understands its waterways better than a larger government body. For example, Sandy Creek in Taft is better understood by local governments. The commenter appreciates the County's work to look for a "local solution" and raise awareness of local issues. – The commenter stated that, regarding the economy potential significant impact section, the NOP should be expanded to include the consideration of jobs and fiscal impacts. – The commenter suggests a single industry-recognized glossary be used for the oil and gas terms used in the report. – The commenter stated that, as a farmer, he looks forward to finding an equitable compromise to the oil and gas solution.
Bakersfield Scoping Meeting/Community Workshop – September 23, 2013
– The commenter is in support of the Project and will submit more specific comments to the KCPCDD in writing. – The commenter asked the County to consider whether the EIR is a project-level or programmatic-level EIR. The commenter would like to see this resolved in the EIR. – The commenter stated that employment, social economics, and fiscal economics are missing in the Economy section of the IS. The commenter would also like to see the revenues received by the County from the oil and gas industries' activities. – The commenter stated that the IS did not include Environmental Justice. Is the Project just? – The commenter stated that the IS did not include how subsurface properties are going to be regarded. The commenter would like to see this included in the EIR. – The commenter would like to see orphan wells and their issues addressed in the EIR. – The commenter requested the issue of abandoned wells on properties be included in the EIR. – The commenter asked "Will the subsurface rights holder be responsible for any down-hole information?"

Table 2-3: Summary of Verbal Comments from the Scoping Meetings and Community Workshops

– The commenter stated the Project description should include a discussion of preemption and why the County cannot permit the down-hole oil and gas activities. – The commenter suggested all existing fields should be restricted to existing pools. – The commenter noted the EIR should consider the issue of exploratory wells and confidentiality. – The commenter request that the EIR not refer to fracfocus.org because there is no penalty for fraud. If the County does refer to the website, they should specify the liability of perjury. – The commenter stated the Federal Government requires a scoping report and highly recommends a scoping document be released between now and the release of the DEIR. – The commenter supports the County's efforts to streamline permits and increase economic growth – The commenter stated that hydraulic fracturing practices surprise people [sic] in and they cannot find information about hydraulic fracturing. There should be rules for the oil companies to inform the public about hydraulic fracturing practices. – The commenter would like a moratorium on hydraulic fracturing until the issues are resolved. – The commenter stated that oil companies need to disclose "trade secrets." The commenter fears environmental consequences and that communities are damaged by oil activities, and the commenter wants to prepare for this. – The commenter supports local control. – The commenter wants to ensure that the final Zoning Ordinance create an understandable process so it will not hurt the contract workers employed by the oil and gas industry. – The commenter supports Kern County's efforts and hopes this process is speedy and reduces unemployment. – The commenter stated that streamlining and certainty are very important. It is good to establish rules for industries, especially resource industries. – The commenter asked that, while the County is going through this process, will oil permitting for wells be stopped? How many wells will be drilled between now and the end of the process? Will the County consider having a moratorium between now and then so we can understand the environmental impacts?
Shafter Scoping Meeting/Community Workshop – September 25, 2013
– The commenter is in support of the Project and will be submitting more specific comments to the KCPCDD in writing. – The commenter asked, in regards to below surface activities, where will the County differ from DOGGR? Is the County going to extend past the regulations that DOGGR has established? Is it theoretically possible for the County to go beyond what DOGGR regulates? – The commenter would like the County to go beyond what DOGGR and the San Joaquin Air District require. – The commenter stated that hydraulic fracturing companies have been working without regulations. The commenter is afraid of fraudulent practices. – The commenter stated, "We have a community garden behind Sequoia School," and asked if the garden will be safe from the chemicals, hydraulic fracturing, and oil and gas activities? – The commenter asked, "Is my house safe from hydraulic fracturing?" – The commenter stated concern about oil and gas activities affecting the health of the commenter's family (Asthma and Valley Fever). – The commenter would like to stop hydraulic fracturing. – The commenter stated concern after hearing about the drilling factory, in regard to the community garden and the impact it will have on vegetables. – The commenter is against oil and gas. – The commenter stated that farming and oil/gas production do not work well together. – The commenter stated there is an overdraft in our water supply and we already do not have enough water to farm. Yet, oil and gas production companies receive water from the Friant Kern Water canal, "It bothers me to see pristine water being used for injection and immediate water contamination."

Table 2-3: Summary of Verbal Comments from the Scoping Meetings and Community Workshops

- The commenter stated, regarding water, oil companies should be required to clean produced water.
- The commenter stated the EIR and permitting process needs to look at well permitting cumulatively.
- The commenter would like to see mitigation measures address the amount of water oil and gas companies use because these companies use a lot of water cumulatively.
- The commenter stated that, cumulatively, oil and gas activities use a lot of prime agriculture land. The commenter would like to see mitigation measures that address this and cumulative air impacts.
- The commenter stated that flaring is a problem, and that it is the burning of unclean gas which releases nitrogen oxide and volatile organic compound emissions that gives us "air problems." The commenter also stated that the current permit says oil and gas companies should minimize flaring and that there needs to be "teeth" in that regulation. The regulation should include a percent limit on the amount of time they can flare gas. (In 2012, a flare burned 22 million cubic feet of gas a half a mile north of a Shafter elementary school and community garden). The commenter stated that flaring is a problem and Shafter has worse air quality than Edison.
- The commenter has seen drilling activities that use diesel engines for drilling activities. The commenter stated that this pollutes our air. Wells could be hooked to electricity rather than diesel trucks.
- The commenter stated that pipeline leaks are an issue.
- The commenter wants to protect public health.
- The commenter stated that regulations need to be proactive rather than reactive.
- The commenter stated that abandoned wells need to be removed and fully rehabilitated so that the land can be farmed again.
- The commenter stated that there needs to be enforcement of the rules. Strict rules need to be established and enforcement needs to be employed so that the rules are followed.
- The commenter stated the County should charge the oil and gas companies enough money so that they can afford to do the enforcement.
- The commenter stated they would like to see enforcement on the proximity of wells to schools.
- The commenter stated they think the permitting process should be more complicated rather than streamlined.
- The commenter stated the County should consider human needs over business needs, and health needs over economy needs.
- The commenter stated, regarding cattle, "I am concerned about the cattle traffic through our city. There are cattle on one side of the freeway which are being driven through to the other side of town for the milk factory."

2.5 Availability of the DEIR

This DEIR is being distributed directly to agencies, organizations, and interested groups and persons for comment during a 45-day formal review period, in accordance with Section 15087 (Public Review of DEIR) of the State CEQA Guidelines. This DEIR and the full administrative record for the Project, including all studies, are available for review during normal business hours, Monday through Friday, at the Kern County Planning Department, located at:

Kern County Planning and Community Development Department
2700 M Street, Suite 100
Bakersfield, California 93301-2370
Phone: (661) 862-8600, Fax: (661) 862-8601

2.6 Format and Content

This DEIR addresses the potential environmental effects of the proposed Project and was prepared following input from the public and the responsible and affected agencies through the EIR scoping process, as discussed previously. The contents of this DEIR were established based on the findings in the IS/NOP and public and agency input. Based on this input, a determination was made that an EIR was required to address potentially significant environmental effects on the following resources:

- Aesthetics;
- Agriculture and Forest Resources;
- Air Quality;
- Biological Resources;
- Cultural Resources;
- Geology and Soils;
- Greenhouse Gas Emissions;
- Hazards and Hazardous Materials;
- Hydrology and Water Quality;
- Land Use and Planning;
- Mineral Resources;
- Noise;
- Population and Housing;
- Public Services;
- Recreation;
- Transportation/Traffic; and
- Utilities and Service Systems.

2.6.1 Required EIR Contents

This DEIR includes all of the sections required by CEQA. Table 2-4 contains a list of sections required under CEQA, along with a reference to the chapter in which they can be found in this document.

Table 2-4: Required EIR Contents

Requirement (CEQA Section)	Location in EIR
Table of Contents (Section 15122)	Table of Contents
Summary (Section 15123)	Chapter 1
Issues to be Resolved (Section 15123(b))	Chapter 2
Project Description (Section 15124)	Chapter 3
Environmental Setting (Section 15125)	Chapter 4
Significant Environmental Impacts (Section 15126.2)	Chapter 4
Mitigation Measures (Section 15126.4)	Chapter 4
Cumulative Impacts (Section 15130)	Chapter 4
Effects Found not to be Significant (Section 15128)	Chapters 1, 4, and 5
Unavoidable Significant Environmental Impacts (Section 15126.2(b))	Chapters 4 and 5
Significant Irreversible Changes (Section 15126.2(c))	Chapter 5
Growth-Inducing Impacts (Section 15126.2(d))	Chapter 5
Alternatives to the Proposed Project (Section 15126.6)	Chapter 6
Organizations and Persons Consulted (Section 15129)	Chapter 8
List of Preparers (Section 15129)	Chapter 9
References (Section 15148)	Chapter 10

2.6.2 Baseline

The CEQA Guidelines state that "An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant" (CEQA Guidelines 15125(a)). The NOP for this EIR was published on August 30, 2013. However, "[n]either CEQA nor the CEQA Guidelines mandates a uniform, inflexible rule for determination of the existing conditions baseline. Rather, an agency enjoys the discretion to decide, in the first instance, exactly how the existing physical conditions without the project can most realistically be measured, subject to review, as with all CEQA factual determinations, for support by substantial evidence." (Communities for a Better Environment v. South Coast Air Quality Management District [2010] 48 Cal.4th 310, 327-238 [CBE v. SCAQMD])

For purposes of this EIR, one component of existing conditions is the current level of oil and gas activity. The existing conditions, with respect to oil and gas activity at the time that the NOP was published, are best represented by activity data from 2012. At the time that the environmental analysis for this EIR commenced, 2012 was the last year for which complete data were available from California Department of Conservation Division of Oil, Gas, & Geothermal Resources (DOGGR) and other regulatory agencies. 2012 is a reasonable choice for existing conditions because it reflects the current state of the oilfields in the County, as well as the cumulative technological developments and the regulatory factors that influence activity levels.

DOGGR data from 1985 through 2012 demonstrate wide fluctuations in activity. The number of new well completions in the County dropped from a peak of 3,005 new well completions in 1985 to a low of 730 new well completions in 1992. Since that time, drilling activity gradually increased again, peaking in 2007 with 2,896 wells drilled. In late 2008 through 2009, fluctuating oil prices and general economic conditions resulted in another drop in activity. From 2010 through 2012, activity levels increased again, reaching 2,619 wells drilled in 2012.

As this data set indicates, oil and gas exploration and production activity has fluctuated considerably over time. The shifts reflect four primary drivers: changes in available technology; available reserves; regulatory requirements; and the price of oil. Many of the oilfields in the County are mature fields that are experiencing declining oil production and increasing production of associated water. In recent decades, drilling and production technologies have steadily advanced, as the industry developed and implemented cost-effective technologies that allowed operators to maintain production levels even as reserves have declined in established oilfields. New technologies are occasionally sudden "breakthroughs," but more often there is a general trend of incremental developments that are gradually adopted by the industry. For example, hydraulic fracturing commenced in California in the 1940s, and the first successful steam flood occurred in 1968, each prompting rapid changes in the industry. But more recent technological changes have spread incrementally. Changes in regulatory requirements (discussed in the "Regulatory Setting" sections of this EIR) also have affected overall industry activity levels, in particular DOGGR requirements on abandonment of idle wells and air emission regulations requiring installation of pollution control equipment and use of cogeneration and electric engines. Data from the 2012 baseline year incorporate all of these technology- and regulation-induced changes in activity.

In the context of an industry that experiences fluctuations and trends, courts have concluded that "the date for establishing baseline cannot be a rigid one. Environmental conditions may vary from year to year and in some cases it is necessary to consider conditions over a range of time periods" (CBE v. SCAQMD at 327-28, citing Save Our Peninsula Committee v. Monterey County Bd. of Supervisors [2001] 87 Cal.App.4th 99, 125). "In some circumstances, peak impacts or recurring periods of resource scarcity may be as important environmentally as average conditions" (Save Our Peninsula at 125-26). Moreover, in light of the past fluctuations in activity, an alternative baseline consisting of average activity levels over a range of prior years would tend to underrepresent the amount of activity under existing conditions.

Accordingly, conditions reflected in the 2012 data set, which was the best available complete data set at the time, are considered to best represent baseline conditions existing at the time of the NOP.

2.6.3 Project Level EIR

Based on the comprehensive analyses, mitigation measures, and performance standards included in the EIR and revised ordinance, it is anticipated that in the vast majority of future oil and gas production activities, implementation of the new ordinance will not result in the need for the County, or for responsible agencies with ministerial or discretionary review and approval processes, to prepare additional CEQA documents for individual well or field development proposals. For discretionary approval processes, additional CEQA review would be required only if the criteria for supplemental CEQA review under CEQA Section 21166 are met (14 CCR §§ 15096(e)(3), 15162). Such streamlined permitting is a permissible objective reflecting land use policy decisions within the authority of a county board of supervisors (San Diego Citizenry Group v. County of San Diego, 219 Cal.App.4th 1 [2013]).

Ministerial projects, on the other hand, are those where the governmental approval sought requires "little or no personal judgment by the public official as to the wisdom or manner of carrying out the project (and the public official merely applies the law to the facts as presented but uses no special discretion or judgment in reaching a decision" (14 CCR § 15369). CEQA does not apply to ministerial projects (PRC § 21080(b)(l)).

The CEQA Guidelines encourage public agencies to identify, in their implementing regulations or ordinances, the types of projects and actions which are deemed ministerial under the applicable laws and ordinances (14 CCR § 15268(c)). Under the amended Zoning Ordinance, the County's implementation of the Oil and Gas Conformity Review provides a ministerial permitting process for new oil and gas activities that incorporate the mitigation measures and development standards identified in this EIR.

Because the ordinance incorporates impact avoidance measures and provides a method for determining whether such measures have been met without the exercise of the County's discretion, the ordinance properly sets forth a ministerial permitting process. See Sierra Club v. Napa County Board of Supervisors, 205 Cal. App. 4th 162 (2012) [certain lot line adjustments in ordinance were properly identified as ministerial where the lot line application was required to comply with specified standards]; San Diego Citizenry Group v. County of San Diego, supra [upholding an EIR for a Zoning Ordinance amendment to allow by-right wineries, where the EIR identified impact avoidance measures built into the Zoning Ordinance]; Health First v. March Joint Powers Authority, 174 Cal. App. 4th 1135 (2009) [where a design plan for a development project complied with conditions set forth by specific plan that had been approved pursuant to CEQA, approval of the design plan via a 125-question checklist was ministerial and the project was exempt from CEQA review.]

The proposed Project establishes new procedures and additional compliance requirements for oil and gas exploration, production, and related activities the County. The County's current ordinance

currently authorizes "by right" oil and gas activities in certain areas provided that specified requirements are met, and requires conditional use permits in other Zoning Districts. The ordinance amendments strengthen environmental protection mitigation measures and development standards, and add further procedural and notice requirements, for oil and gas activities.

The degree of specificity in this EIR corresponds to the degree of specificity in the proposed Project, and serves as a "project-level" EIR for CEQA purposes. For example, for the new ministerial site plan review process for formerly "by right" oil and gas activities, the County will review site plans for compliance with required measures, and once compliance is verified thereafter will issue ministerial permits (e.g., for individual wells) which would not trigger the need for further CEQA review. The County's inspection and enforcement resources are also increased with a mandatory permit fee program.

A project-level EIR is appropriate for three primary reasons. First, by examining both the broad implications of the ordinance changes and the detailed site-specific impacts, this approach facilitates identification of the most effective development standards and mitigation requirements to be incorporated into the site plan review process. Second, a project-level EIR allows the Board of Supervisors and the public to be informed by a comprehensive analysis of impacts at the time the Board considers whether and how to modify existing County ordinances. Finally, a project-level EIR provides responsible agencies with the level of completed CEQA process required to inform and reach final decisions regarding subsequent discretionary approvals and other actions regarding these County oil and gas activities. If the criteria for supplemental CEQA review are triggered for a particular activity regulated by the revised County ordinances, additional CEQA review would be necessary (14 CCR §§ 15096(e)(3), 15162).

The County's long experience with oil and gas exploration and development allows it to identify and analyze reasonably foreseeable actions and impacts associated with the ordinance amendment at a project level review. Oil exploration, drilling, and production activities have been conducted in Kern County for more than 100 years. In the late nineteenth and early twentieth century, massive oilfields were discovered in the San Joaquin Valley using simple hand-auger drills, followed by rotary drilling rigs. The first commercial oilfield in Kern County, the McKittrick Field, was established in 1898. The Kern River Field near Bakersfield was discovered the following year. By 1903, the Kern River Field had been developed with 800 wells and had produced nearly 17 million barrels of oil. As the industry developed in California, so did the governing state regulatory regimes.

The primary state regulating entity, DOGGR, was established in 1915. The County Zoning Ordinances addressed oil and gas development as early as 1957. Other responsible and trustee agencies also have a long history regulating the activities and infrastructure associated with oil and gas production and development, and both oil and gas technologies, and the laws and regulations affecting that technology (and the oil and gas industry as a whole) continue to evolve. Kern County currently contains approximately 76 active oil and gas production fields, and over 2,500 wells are drilled in the County every year.

In preparing this EIR, the County has drawn on its own extensive experience with oil and gas development, and has also reviewed information compiled for decades by other public agencies. In addition, oil and gas industry associations representing current producers and future permit applicants provided the County with forecasts of their estimated future well drilling activity. Finally, the designation of Subareas, Tiers, and Core Areas further facilitated the completion of the Project-level analysis included in this EIR. These detailed classifications, based on environmental characteristics, existing land uses, and existing and planned oil and gas production activities, allow this EIR to efficiently forecast reasonably foreseeable future development and the location and magnitude of environmental impacts.

2.6.4 State Preemption of Subsurface Oil and Gas Activities

CEQA defines the term "project" to mean the whole of the action that has a potential for resulting in either a direct physical change or a reasonably foreseeable indirect physical change in the environment (CEQA Guidelines § 15378). An EIR must consider potential impacts from the entire project (see, e.g., CEQA Guidelines§§ 15126, 15126.2). Therefore, this EIR evaluates all impacts from the proposed ordinance amendments, including the surface and subsurface aspects of future oil and gas activities carried out pursuant to the amended ordinances. However, DOGGR is the state agency responsible for regulating the subsurface operations from oil and gas activities. This EIR describes DOGGR regulatory requirements, and the regulatory requirements of other agencies, in the "Regulatory Setting" portion of each resource section of the EIR. The EIR also describes how applicable regulatory requirements avoid or reduce significant adverse impacts on the environment as relevant to each resource section of the EIR.

As explained in the CEQA Guidelines, CEQA "supplements" the discretionary power of a lead agency "to mitigate or avoid significant effects on the environment when it is feasible to do so with respect to projects subject to the powers of the agency" (CEQA § 15040(c), emphasis added). The CEQA Guidelines also clarify that CEQA is "intended to be used in conjunction with discretionary powers granted to public agencies by other laws."

Under CEQA, lead agencies may enforce only "feasible" mitigation measures. "Feasibility" is defined in the CEQA Guidelines to include "legal feasibility" (i.e., can the mitigation be lawfully enforced by the lead agency). In general, the County lacks the legal authority to regulate subsurface oil and gas activities. As the California Attorney general has explained:

> State laws on drilling and production activities of oil, gas and geothermal resources wells for the purpose of conserving and protecting those resources take precedence over local regulations, particularly where the State law approves of or specifies plans of operation, methods, materials, procedures, or equipment to be used by the well operator or where activities are to be carried out under direction of the State Supervisor. With regard to state regulation for other purposes, such as land use control and environmental protection, the State has not fully occupied the field, and more stringent, supplemental regulation by cities and counties is valid to the extent that it does not conflict or interfere with state regulation (59 Ops. Cal. Atty. Gen. 461, Opinion No. SO 76-32 [1976]).

The Attorney General further reasoned that "the State has so fully occupied [the underground phases of oil and gas activities] that there is no room left for local regulation" (Id at 477-478). This basic law has not changed over the past 50 years.

With respect to Class II injection wells, the U.S. Environmental Protection Agency (EPA) implements the Underground Injection Control program, but may delegate enforcement responsibility to a state (a designation known as "primacy") (40 Code of Federal Regulations [CFR] Part 145). Therefore, the EPA has delegated primacy for Class II injection wells to the State of California, through DOGGR (48 CFR § 6336 [Feb. 4, 1983], as described in greater detail in Section 4.9, Hydrology and Water Quality). DOGGR's implementing regulations set forth detailed requirements for well design, construction, equipment, ancillary pipelines, and abandonment (14 CCR, Div. 2, Ch. 4. DOGGR's jurisdiction includes the regulation of production wells and "Class II" injection wells under the Underground Injection Control ("UIC") Program of the federal Safe Drinking Water Act, 42 United States Code [U.S.C.] § 300f et seq.). The term Class II refers to injection, disposal, and storage wells associated with oil and gas exploration (40 CFR § 144.6). DOGGR issues permits and establishes conditions, including as to the design, construction, and operation, for Class II well activity (14 CCR § 1712 et seq.). In addition, California recently passed SB-4, which directs DOGGR to adopt regulations governing well stimulation treatment activities (PRC § 3150 et seq.). SB-4 regulations similarly address design, construction, and operations.

This EIR does, however, explain the applicable federal and state legal requirements of other agencies, including DOGGR. Where compliance with these requirements would avoid or lessen a potentially significant environmental impact, this EIR operates in conjunction with these other requirements to identify these as mitigation measures for EIR purposes. The process for assuring implementation of mitigation measures is described in the Mitigation, Monitoring, and Reporting Program (MMRP); for mitigation measures based on compliance with other regulatory programs, the MMRP provides a mechanism by which the County, in its lead agency role, will work with responsible agencies, such as DOGGR, to track implementation of mitigation measures that require compliance with the regulatory requirements of responsible agencies.

2.6.5 Organization of the EIR

The content and organization of this EIR are designed to meet the requirements of CEQA, State CEQA Guidelines, and the Kern County CEQA Implementation Document, as well as to present issues, analysis, mitigation, and other information in a logical and understandable way. This EIR is organized into the following sections:

- **Chapter 1, "Executive Summary,"** provides a Project description and a summary of the environmental impacts and mitigation measures.
- **Chapter 2, "Introduction,"** provides CEQA compliance information, an overview of the decision-making process, organization of the EIR, and a list of responsible and trustee agencies.

- **Chapter 3, "Project Description,"** provides a description of the location, characteristics, objectives, and relationship of the Project to other plans and policies.
- **Chapter 4, "Environmental Setting, Impacts, and Mitigation Measures,"** contains a detailed environmental analysis of the existing conditions, Project impacts, mitigation measures, and unavoidable adverse impacts.
- **Chapter 5, "Consequences of Project Implementation"** (Mandatory CEQA Sections), presents an analysis of the Project's cumulative and growth-inducing impacts and other CEQA requirements, including significant and unavoidable impacts and irreversible commitments of resources.
- **Chapter 6, "Alternatives,"** describes a reasonable range of alternatives to the Project that could avoid or reduce the significant environmental effects of the Project.
- **Chapter 7, "Responses to Comments,"** is reserved for responses to comments on this DEIR.
- **Chapter 8, "Organizations and Persons Consulted,"** lists the agencies, organizations, and persons contacted during preparation of this DEIR.
- **Chapter 9, "List of Preparers,"** identifies persons involved in the preparation of the DEIR.
- **Chapter 10, "Bibliography,"** identifies reference sources for the DEIR.
- **Chapter 11, "Acronyms, Abbreviations, and Glossary,"** lists all acronyms, abbreviations, and technical terms mentioned in the DEIR with corresponding definitions.
- **"Appendices,"** provide information and technical studies that support the environmental analysis contained within the DEIR.

The analysis of each environmental category in Chapter 4, Environmental Setting, Impacts, and Mitigation Measures, is organized as follows:

- **"Introduction"** provides a brief overview on the purpose of the resource being analyzed with regard to the Project.
- **"Environmental Setting"** describes the physical conditions that exist at this time and that may influence or affect the resource being analyzed.
- **"Regulatory Setting"** provides state and federal laws, and the Kern County General Plan (KCGP) goals, policies, and implementation measures that apply to the resource being analyzed.
- **"Impacts and Mitigation Measures"** discusses the impacts of the Project in each category, including direct, indirect, and cumulative impacts, presents the determination of the level of significance, and provides a discussion of feasible mitigation measures to reduce any impacts.

2.7 Responsible and Trustee Agencies

Projects or actions undertaken by the lead agency, in this case Kern County, may require subsequent oversight, approvals, or permits from other public agencies in order to be implemented. Other such agencies are referred to as "responsible agencies" and "trustee agencies." Pursuant to Sections 15381 (Responsible Agency) and 15386 (Trustee Agency) of the State CEQA Guidelines, as amended, responsible agencies and trustee agencies are defined as follows:

- A "responsible agency" is a public agency that proposes to carry out or approve a project, for which a lead agency is preparing or has prepared an EIR or Negative Declaration. For the purposes of CEQA, the term "responsible agency" includes all public agencies other than the lead agency that have discretionary approval power over the project (Section 15381).
- A "trustee agency" is a state agency having jurisdiction by law over natural resources affected by a project that are held in trust for the people of the State of California (Section 15386).

The various public, private, and political agencies and jurisdictions with a particular interest in the Project include, but are not limited to, the following:

Federal Agencies

- U.S. Fish and Wildlife Service (USFWS);
- U.S. Army Corps of Engineers (USACE);
- U.S. Environmental Protection Agency (EPA);
- U.S. Department of the Interior, Bureau of Land Management (BLM), Bakersfield Field Office;
- Federal Aviation Administration (FAA); and
- U.S. Department of Agriculture (USDA).

State Agencies

- California Air Resources Board (CARB);
- California Department of Conservation Division of Oil, Gas, & Geothermal Resources (DOGGR);
- California Department of Fish and Wildlife (CDFW);
- California Department of Public Health (DTSC);
- California Department of Toxic Substance Control;

- California Energy Commission (CEC);
- California Highway Patrol (CHP);
- California Public Utilities Commission (CPUC);
- California Native American Heritage Commission (NAHC);
- California Office of Historic Preservation;
- California State Lands Commission (CSLC);
- Governor's Office of Planning and Research (OPR);
- Regional Water Quality Control Board, Central Valley District (RWQCB); and
- State Water Resources Control Board (SWRCB).

Local Agencies

- San Joaquin Air Pollution Control District (SJAPCD);
- Kern Council of Governments (COG);
- Kern County Waste Management Department (KCWMD);
- Kern County Engineering, Surveying, and Permit Services Department;
- Kern County Fire Department (KCFD);
- Kern County Planning and Community Development Department (KCPCDD);
- Kern County Public Health Services Department, Environmental Health Division;
- Kern County Roads Department;
- Kern County Planning Commission; and
- Kern County Board of Supervisors.

2.8 Incorporation by Reference

In accordance with Section 15150 (Incorporation by Reference) of the State CEQA Guidelines, to reduce the size of the report, the following documents are hereby incorporated by reference into this DEIR and are available for public review at the KCPCDD. A brief synopsis of the scope and content of these documents is provided below.

Kern County General Plan

The KCGP is a policy document with planned land use maps and related information and is designed to give long-range guidance to those County officials making decisions affecting the growth and resources of the unincorporated Kern County jurisdiction, excluding the Metropolitan Bakersfield Planning Area. This document, adopted on June 14, 2004, and last amended on

September 22, 2009, helps to ensure that day-to-day decisions conform to the long-range program designed to protect and further the public interest as related to the County's growth and development and to mitigate environmental impacts. The KCGP also serves as a guide to the private sector of the economy in relating its development initiatives to the County's public plans, objectives, and policies.

Kern County Zoning Ordinance

According to Chapter 19.02.020, Purposes, Title 19 was adopted to promote and protect the public health, safety, and welfare through the orderly regulation of land uses throughout the unincorporated area of the County. Further, the purposes of this title are to:

- Provide the economic and social advantages resulting from an orderly planned use of land resources;
- Encourage and guide development consistent with the KCGP;
- Divide Kern County into Zoning Districts of a number, size, and location deemed necessary to carry out the purposes of the KCGP and this title;
- Regulate the size and use of lots, yards, and other open spaces;
- Regulate the use, location, height, bulk, and size of buildings and structures;
- Regulate the intensity of land use;
- Regulate the density of population in residential areas;
- Establish requirements for off-street parking;
- Regulate signs and billboards; and
- Provide for the enforcement of the regulations of Chapter 19.02.

2014 Regional Transportation Plan/Sustainable Community Strategy

The 2014 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS), was adopted in 2014 and is a 26-year blueprint that establishes a set of establishes a set of regional transportation goals, objectives, policies, and actions intended to guide development of the planned multimodal transportation systems in the County. The RTP/SCS has been developed through a continuing, comprehensive, and cooperative planning process, and provides for effective coordination between local, regional, state, and federal agencies. New to the 2014 RTP, California's Sustainable Communities and Climate Protection Act, or SB-375, calls for the Kern RTP to include a SCS that reduces greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 5% per capita by 2020 and 10% per capita by 2035, as compared to 2005. In addition, SB-375 provides for closer integration of the RTP/SCS with the Regional Housing Needs Allocation (RHNA), ensuring consistency between low income housing need and

transportation planning. The 2014 RTP/SCS exceeds SB-375 reduction targets for the region and is consistent with the RHNA.

Kern County Airport Land Use Compatibility Plan (2008)

The Kern County Airport Land Use Compatibility Plan (ALUCP) was originally adopted in 1996 and has since been amended to comply with Aeronautics Law, Public Utilities Code (Chapter 4, Article 3.5) regarding public airports and surrounding land use planning. As required by that law, proposals for public or private land use developments that occur within defined airport influence areas are subject to compatibility review. The principle airport land use compatibility concerns addressed by the ALUCP are: (1) exposure to aircraft noise; (2) land use safety with respect to both people and property on the ground and the occupants of aircraft; (3) protection of airport air space; and (4) general concerns related to aircraft overflights.

The ALUCP identifies policies and compatibility criteria for influence zones or planning area boundaries. The ALUCP maps and labels these zones as A, B1, B2, C, D, and E, ranging from the most restrictive (A – airport property runway protection zone) to the least restrictive (D – disclosure to property owners only), while the E zone is intended to address special land use development. As required by law, the following affected cities have adopted the ALUCP for their respective airports: Bakersfield, California City, Delano, Shafter, Taft, Tehachapi, and Wasco.

County of Kern Housing Element (2008–2013)

The development and preservation of adequate and affordable housing is important to the well-being of the residents and the economic prosperity of the County. To plan for the development of adequate housing for all income segments, a housing element was prepared as a part of the KCGP. This document constitutes the Housing Element, which specifically addresses housing needs and resources in the County's unincorporated areas. The Housing Element must maintain consistency with the other elements of the KCGP.

2.9 Sources

This DEIR is dependent upon information from many sources. Some sources are studies or reports that have been prepared specifically for this document. Other sources provide background information related to one or more issue areas that are discussed in this document. The sources and references used in the preparation of this DEIR are listed in Chapter 10, Bibliography, and are available for review during normal business hours at the:

Kern County Planning and Community Development Department
2700 "M" Street, Suite 100
Bakersfield, California 93301-2370

Section 15123(b)(3) of the CEQA Guidelines requires that an EIR contain issues to be resolved, which include the choices among alternatives and whether or how to mitigate significant impacts.

The major issues to be resolved regarding the Project include decisions by the lead agency as to whether or not:

- The DEIR adequately describes the environmental impacts of the Project;
- The recommended mitigation measures should be adopted or modified; or
- Additional mitigation measures need to be applied.

Chapter 3

Project Description

Chapter 3
Project Description

3.1 Project Overview

Kern County, California (County) is one of the richest oil-producing counties in the United States. The valley floor area of the County and the lower elevations of the surrounding mountain ranges contain numerous deposits of oil and gas resources, a major economic resource for the County.

Oil and natural gas exploration and extraction has occurred for more than 100 years in California, and specifically in Kern County. In 2012, Kern County produced 80% of the on-shore oil and gas produced in California. In 2012 and 2013, California produced 197.5 and 199.6 million barrels of oil annually, respectively, making California the third largest state in terms of daily production (DOGGR 2014b).

Representatives of the oil and gas industry associations, specifically the California Independent Petroleum Association (CIPA), the Independent Oil Producers Agency (IOPA), and the Western States Petroleum Association (WSPA), (collectively, "Project Proponents"), have requested an amendment to Chapter 19.98 (Oil and Gas Production) and related chapters of the Kern County Zoning Ordinance to include additional provisions for local permitting of oil and gas activities. Under Chapter 19.112, amendments to the text of the Zoning Title of the Kern County Zoning Ordinance can only be initiated by the Kern County Board of Supervisors. The request was considered in a public hearing before the Board of Supervisors on January 22, 2013, and the Board directed Planning and Community Development Staff to proceed with processing the requested amendments. This revision of the Zoning Ordinance for local permitting also requires that other relevant references in the Zoning Ordinance be reviewed and revised for consistency. Section 3.2.4 describes the text changes to the Zoning Ordinance, and the complete listing of all the text changes to the Zoning Ordinances (collectively, "Amended Zoning Ordinance") as proposed and analyzed in this Environmental Impact Report (EIR) are appended to the end of this chapter. The Amended Zoning Ordinance, together with the implementation of future oil and gas activities expected to be undertaken pursuant to the Amended Zoning Ordinance, is the "Project" considered in this EIR (hereafter referred to as the "Project"). The development standards and conditions contained in the Zoning Ordinance modifications would apply throughout the unincorporated County. However, for purposes of this EIR, the "Project Area" is defined as the portion of unincorporated Kern County that is depicted in Figure 3-1 (Project Area). The Project Area represents the geographic scope of foreseeable environmental impacts from the Project in the oil and gas producing zones of the County, primarily consisting of the Valley Floor area. In the unlikely event that oil and gas production activities are proposed outside the defined Project Area, supplemental environmental review under CEQA would be required.

This EIR has been prepared to identify and evaluate potential environmental impacts associated with future oil and gas exploration, development, and production activities in the Project Area expected to be undertaken pursuant to the Amended Zoning Ordinance.

The Board of Supervisor's referral to the Kern County Planning and Community Department of the proposed Project would amend the Kern County Zoning Ordinance to include additional provisions to protect human health and safety and the environment as part of the permitting process for oil and gas activities under the jurisdiction of the Kern County.

Kern County has determined that consideration of the Amended Zoning Ordinance requires a project-level EIR under the California Environmental Quality Act (CEQA), with Kern County as the Lead Agency, to cover implementation of the Project for the future Kern County oil and gas exploration and production activities described below. The EIR impact and mitigation analysis has also resulted in the inclusion, into the amended text, of the ordinance of development standards and conditions, including required implementation of applicable mitigation measures for oil and gas activities, which will allow for a streamlined surface use permitting process for oil and gas activities.

As described in Chapter 2, Introduction, the Kern County Planning Commission and Board of Supervisors will consider the information in this EIR, including public comments and Staff responses to those comments, during the public hearing process. As approval of amended ordinances is a legislative action, the final decision will be made at the Board of Supervisors' public hearing, where the Project may be approved, conditionally approved, or denied.

The EIR will also be utilized by state, regional, and local agencies and departments with discretionary approval authority for some component of the oil and gas activities covered by this EIR (Responsible Agencies). The primary Responsible Agencies for oil and gas activities in Kern County include:

- The California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR), which oversees: surface and subsurface operations of oil, gas, and injection wells; well exploration, drilling, and construction; well testing; well completion, stimulation, and workovers; oil and gas operations and maintenance; and well removal, plugging, and abandonment. DOGGR is completing a programmatic EIR for statewide well stimulation activities, as required by Senate Bill (SB) 4 (Pavley). However, this EIR, which is not limited to well stimulation, is broader in scope and independent of, not "tiered" under, DOGGR's SB 4 EIR. This EIR provides project-level CEQA coverage on which DOGGR can rely, as a Responsible Agency, for permitting of oil and gas activities, including well stimulation treatment, in the Project Area within Kern County.

- The San Joaquin Valley Air Pollution Control District (SJVAPCD), which oversees air quality permitting, as well as regional air quality planning and regulatory programs to attain regional and localized ambient air quality standards. While the SJVAPCD does not issue individual permits for wells, it oversees permitting for oil- and gas-related equipment/facilities, including boilers, steam generators and process heaters, flares,

tanks, and portable equipment. In addition, SJVAPCD permits thermally enhanced oil recovery (TEOR) operations. This EIR provides project-level CEQA coverage for most future oil and gas air permits issued by SJVAPCD, and also requires additional air quality mitigation for oil and gas activities pursuant to a new Voluntary Emission Reduction Agreement (VERA), as described in Section 4.3, Air Quality. This EIR does not provide CEQA coverage for new or expanded cogeneration facilities, which likely would not be required as part of the Project.

- The Central Valley Region of the Regional Water Quality Control Board (RWQCB) oversees permitting for discharges of wastewater and stormwater, as well as water basin planning and regulatory programs to attain and maintain compliance with applicable water quality standards and objectives. The RWQCB is responsible for permitting discharge of produced water to percolation and evaporation ponds, drilling sumps and wastewater disposal sumps, through issuance of waste discharge requirements (WDRs), or other forms of discharge authorization such as Clean Water Act Section 401 water quality certification and WDR waivers. In addition, the RWQCB also oversees the cleanup of petroleum-related spills and releases, as well as spills and releases of other chemicals. This EIR provides project-level CEQA coverage for future oil and gas WDRs or other water quality authorizations, and basin plan amendments for oil and gas activities in Kern County, including discharges of stormwater, produced water, and well stimulation fluids, and wastewater treatment, storage, and disposal activities. This EIR does not provide project-level CEQA coverage for specific remediation activities requiring RWQCB approval (e.g., either offsite removal, onsite treatment, or onsite capping and management) for accidental spills or releases of petroleum or hazardous substances from oil and gas activities.

- The California Department of Fish and Wildlife (CDFW) oversees permitting for activities that could result in the incidental take of protected wildlife and plant species, as well as regional and sub-regional habitat conservation planning and permitting, and serves as the natural resources trustee under CEQA. CDFW is also responsible for the conservation, protection, and management of fish, wildlife, and native plant resources under the lake and streambed alteration program. This EIR provides project-level CEQA coverage for CDFW permits and approvals, including incidental take permits (ITPs) and habitat conservation plan and natural community plans, for oil and gas activities in Kern County. Several such permits and plan approval applications are pending before CDFW, including, for example, habitat conservation plans and related CDFW approvals for Lokern and Elk Hills, as described in further detail in Section 4.4, Biological Resources. This EIR does not provide project level CEQA coverage for site specific remediation activities (described above), or for habitat enhancement, or restoration activities, other than oil and gas activities, that occur in the San Joaquin Valley, and which may also require permits or approvals from CDFW.

- The California Department of Toxic Substances Control (DTSC) oversees hazardous waste management, as well as the cleanup of non-petroleum spills and releases. This EIR

provides project-level CEQA coverage for the routine management of hazardous substances and wastes, but does not provide CEQA coverage for remediation activities (described above), or for new solid or hazardous waste landfills.

- The California Department of Resources Recycling and Recovery (CalRecycle) oversees certain types of solid waste management and recycling programs. This EIR does not provide CEQA coverage for new or expanded solid waste landfills for solid wastes generated by oil and gas activities; no such new or expanded landfills would be anticipated as part of the Project.

- The California Department of Transportation (Caltrans) oversees construction and maintenance of state highways. While no new or expanded state highway facilities would be anticipated as part of the Project, Caltrans may issue encroachment permits for ancillary facilities, such as pipelines/distribution lines and pipe bridges. This EIR provides project-level CEQA coverage for such encroachment permits.

- The Central Valley Flood Protection Board (CVFPB) administers activities affecting designated floodways, including Kern River and the Outlet Canal/Buena Vista Slough. These features bisect several oil and gas fields, and CVFPB may issue encroachment permits for ancillary facilities, such as pipelines/distribution lines and pipe bridges. This EIR provides project-level CEQA coverage for such encroachment permits.

- The Kern County Water Agency and other water districts in the Project Area oversee the distribution and use of surface and groundwater resources in the Project Area. Although almost all water produced, used, and disposed of by the oil and gas industry is from the same geologic formation that contains oil and gas, additional water is used, treated, re-used, and/or disposed of, as discussed in Section 4.9, Hydrology and Water Quality, and Section 4.17, Utilities and Services. This EIR provides project-level CEQA coverage for these ongoing water-related uses, but does not provide CEQA coverage for new diversions or distributions of local surface waters for uses not addressed in Section 4.9.

This EIR may also be used as an informational resource by other federal, state, and local agencies. For example, federal agencies are encouraged to use CEQA documents as part of the National Environmental Policy Act (NEPA) review process for: federally regulated activities, such as the potential for incidental take of, and habitat conservation planning for, federally protected species, as regulated by the U.S. Fish and Wildlife Service (USFWS); the discharge of dredged materials or fill into federally jurisdictional waters, as permitted by the U.S. Army Corps of Engineers (USACE); compliance with applicable federal standards and requirements for air and water quality, waste and wastewater management, and cleanup of contamination as overseen by the U.S. Environmental Protection Agency (EPA); protection of archaeological and historic resources by the State Historic Preservation Office (SHPO); oversight of certain floodplain activities by the Federal Emergency Management Agency (FEMA); and management of, and access to, federal lands and mineral resources within Kern County by the U.S. Department of Interior, Bureau of Land Management (BLM).

Federal and state agencies that are not Responsible Agencies but engage in planning or management activities that could be informed by the Project may use this EIR, including, for example: the California Department of Water Resources (DWR), Bureau of Reclamation, and related entities in the management of surface water supplies from the Sacramento Delta, which has historically supplied a small portion of the water used by the oil and gas industry; the Native American Heritage Commission (NAHC), which coordinates consultation with tribal representatives; and the Kern County Council of Governments (Kern COG), which coordinates certain federal highway and transportation funding activities and engages in regional transportation and greenhouse reduction planning. Local agencies, including but not limited to cities and districts located within outer boundaries of the Project Area, may also use the information included in this EIR for local planning and other activities.

3.2 Environmental Setting

3.2.1 Regional Location

Kern County is California's third-largest county in terms of land area, encompassing 8,202 square miles. Located at the southern end of the Central Valley, Kern County serves as the gateway to southern California, the San Joaquin Valley, and California's high desert. The geography of Kern County is diverse, containing mountainous areas, agricultural lands, and desert areas.

Kern County is bounded by Kings, Tulare, and Inyo counties on the north, San Bernardino County on the east, Los Angeles and Ventura counties on the south, and Santa Barbara and San Luis Obispo counties on the west. Kern County includes eight incorporated cities within the portion of the County located in the San Joaquin Valley, including Arvin, Bakersfield, Delano, Maricopa, McFarland, Shafter, Taft, and Wasco. Oil and gas exploration and development activities have historically occurred in the San Joaquin Valley Floor portion of the County and are likely to continue to occur in the same vicinity. For this reason, this EIR evaluates potential impacts of future oil and gas exploration and production activities in a defined boundary. For the purposes of this EIR, the area depicted in Figure 3-1 defines the Project Area. The regional location of the Project is shown on Figure 3-2 (Regional Location).

The Kern County General Plan (KCGP) describes the San Joaquin Valley region as "the southern San Joaquin Valley below an elevation of 1,000 feet mean sea level (MSL)" within Kern County. The San Joaquin Valley portion is characterized by low rainfall, averaging less than 10 inches per year. Average temperatures are relatively high, and total evaporation exceeds total precipitation. Summers are generally cloudless, hot, and dry. Winter is generally mild, but an occasional freeze does occur and may cause substantial agricultural damage. The average length of the growing season is 265 days. The San Joaquin Valley region is within the southern end of the San Joaquin Valley Air Basin (SJVAB) managed by the SJVAPCD. This district encompasses Fresno, Kings, Madera, Merced, San Joaquin, Stanislaus, and Tulare counties, as well as the San Joaquin Valley portion of Kern County. Further, the San Joaquin Valley region is within the Tulare Lake

Groundwater Basin, which includes the Kern River Hydrographic Unit and the Poso Hydrographic Unit. These are subject to RWQCB oversight.

3.2.2 Project Area

The Project Area is defined on Figure 3-1 and encompasses 3,700 square miles, which generally includes most of the San Joaquin Valley Floor portion of Kern County and additional areas in the southern portion of the Project Area. The boundary includes: west side – the San Luis Obispo, Monterey, and Santa Barbara county lines; north side – the Kings and Tulare county lines; east side – the 2,000-foot elevation contours, squared off to the nearest section line; and south side – the northern boundary of the Los Padres National Forest and portions of the San Emigdo and Tehachapi Mountains. The Project Area boundary is based on information regarding areas with potential or confirmed oil and gas resources within the County's jurisdiction.

Although the Project Area encompasses 3,700 square miles, the EIR impact analysis includes only unincorporated County land. Therefore, the analysis includes unincorporated County land within the 409-square-mile Metropolitan Bakersfield Planning Area (a joint planning area containing both County and City land), but excludes all adjacent City of Bakersfield land. The EIR analysis also excludes all other city jurisdictions, such as Taft, Delano, Shafter, Arvin, McFarland, Maricopa, and Wasco. Lands under the jurisdiction of various state and federal agencies, including the BLM, USFWS, and the California State Lands Commission, are also included within the 3,700-square-mile Project Area but are excluded from the EIR impact analysis. Ancillary equipment and land uses (e.g., pipelines and access roads on unincorporated County lands are included in the Project Area, and analyzed in the EIR, and regulated by the County even though such equipment and land uses may serve wells on non-jurisdictional County lands (e.g., incorporated cities or federal/state lands). By conservatively assuming that all new well activities in Kern County would occur in the Project Area of the County's jurisdictional lands, this EIR presents a conservative analysis of likely impacts in the Project Area. This EIR also addresses non-jurisdictional areas as part of the cumulative impacts analysis.

In order to facilitate detailed analysis, the Project Area is divided into three Subareas, as depicted in Figure 3-1 (Project Area). In general, the Project Subareas are divided along the major transportation corridors.

Western Subarea

The Western Subarea consists of 1,714 square miles (1,096,840 acres) and is generally bounded by the Kern County border on the north and west, Los Padres National Forest on the south, and by Interstate 5 (I-5) on the east. The Western Subarea contains many of the large-scale oil and gas extraction-level operations. The Western Subarea contains 37 active oil and gas fields, including five of California's largest producing oilfields (by volume). The area also includes dispersed agricultural operations. The Western Subarea contains unincorporated areas around the cities of Taft and Maricopa that are located in the Western Subarea.

Central Subarea

The Central Subarea consists of 1,025 square miles (656,003 acres) and is generally bounded by the Kern County border on the north, by I-5 on the west, and State Route 65 and State Route 223 on the East. The Central Subarea contains 21 active oil and gas fields, some with large-scale production activity. The Central Subarea contains some of the County's deepest wells, with oil operations co-locating with predominant agricultural activities in this Subarea. The Central Subarea contains parts of the unincorporated Metropolitan Bakersfield area and includes unincorporated areas around the cities of Shafter, Delano, Wasco, and McFarland.

Eastern Subarea

The Eastern Subarea consists of 953 square miles (over 600,000 acres) and is generally bounded by the County border on the north, State Route 65 and State Route 223 on the west, and mountain ranges on the east and the south. The Eastern Subarea contains 20 active oil and gas fields along with several large-scale oil and gas production areas, such as the Kern River Oilfield north of the City of Bakersfield, in the Oildale area. The Eastern Subarea includes parts of the unincorporated Metropolitan Bakersfield area and unincorporated areas around the city of Arvin.

3.2.3 Land Uses Surrounding the Project Area

The Project Area is bordered on the west by San Luis Obispo County. The border between the two counties approximates the San Andreas Fault line. The Temblor Range forms a general barrier between the more industrial oil drilling operations on the Kern County side of the border versus the more rural and agricultural nature of neighboring San Luis Obispo County, with the exception of the Midway Sunset Oilfield, which crosses into neighboring San Luis Obispo County. The portion of the Midway Sunset Oilfield located within San Luis Obispo County is outside of the Project Area and is not subject to Kern County jurisdiction. Other oil and gas uses exist to the west of the Project Area; however, such activities are less intensive in nature and dispersed throughout a rural area.

Similarly, in the southwest, the Project Area extends to the border of the Los Padres National Forest, and in the southeast includes portions of the San Emigdo Mountains and the Tehachapi Mountains. The unincorporated community of Frazier Park is located in the uplands several miles south of the Project Area and west of I-5.

To the north, the Project Area is bordered by Kings and Tulare Counties. The bordering areas of these two counties contain agricultural and oil and gas operations, as well as dispersed rural residences. The incorporated City of Delano is located on the northern border of Kern County and adjacent land uses in Tulare County consist of large lot residential, agriculture, and industrial uses.

To the east, the Project Area is bordered by the foothills of surrounding mountain ranges, such as the Greenhorn Mountains and Tehachapi Mountains, as well as the Tejon Hills southeast of the

incorporated City of Arvin. The Project Area also borders the Sequoia National Forest northeast of Bakersfield. Land uses along the border are generally rural in nature.

3.2.4 Areas Not Subject to Kern County Land Use Jurisdiction Located Within Project Area

As described above and in Figure 3-1, there are several incorporated cities, as well as lands and minerals owned by the federal or state government, that fall within the Project Area. Although the Project does not directly affect these areas outside the County's land use jurisdiction, the EIR assumes that oil and gas activities that occur in these areas will continue to occur in the future, and this EIR addresses County jurisdictional activities that occur as ancillary activities in support of oil and gas production in these areas, including, for example, electric transmission lines, pipelines, and access roads. Oil and gas activities in these areas are also considered in the cumulative impacts analysis of this EIR. However, well count projections, which are used to assess many types of impacts in this EIR, exclude anticipated development that would occur in these areas (i.e., incorporated cities and BLM lands) within the Project Area.

In the event that future changes to municipal boundaries result in the removal of a portion of the Project Area from Kern County's jurisdiction, municipal zoning would apply rather than the County's Amended Zoning Ordinance. As noted above, cities and other local agencies within the Project Area may use the information included in this EIR for local planning and other activities, while federal agencies may use information included in this EIR in their NEPA review. Conversely, in the event that future changes to municipal boundaries result in a transfer of current municipal lands to the County's jurisdiction, the Amended Zoning Ordinance would apply to those lands.

3.2.5 Kern County Zoning Ordinance

Section 19.98.020 of the existing Kern County Zoning Ordinance currently authorizes "unrestricted drilling," with no County permit required, in County lands zoned for Exclusive Agriculture (A), Limited Agriculture (A-1), Medium Industrial (M-2), Heavy Industrial (M-3), and Natural Resource (NR), subject to compliance with specified conditions and standards that augment DOGGR, the SJVAPCD, and applicable fire and safety ordinances and regulations of the County of Kern. In these Zoning Districts, no County review or permit is required for the drilling of any steam injection well, steam drive well, service well, or any well intended for the exploration for, or development or production of, oil, gas, and other hydrocarbon substances, or for any related ancillary equipment, structure, or facility used as part of the oil and gas production process. The existing ordinance further requires that drilling cannot occur within 100 feet of any existing residence without the written consent of the owner thereof.

Oil or gas exploration or production is allowed within the Floodplain Primary District (FPP), subject to the Special Review Procedures and Development Standards in Section 19.50.130. Oil or gas exploration or production is permitted within a Special Planning District (SP), provided it

is consistent with the KCGP land use designation applicable to the subject property and does not create a conflict with the public health, safety, and welfare.

Section 19.98.030 provides for drilling by "ministerial permit" in several other Zoning Districts. A "ministerial" permit requires an application and review process, but the County does not impose site-specific conditions in such permits and the applicant is entitled to receive the permit once it demonstrates that relevant standards are met. Ministerial permits are required in the Light Industrial (M-1) and Recreation-Forestry (RF) districts, subject to specified development standards, which also apply in Drilling Island (DI) zone districts and Petroleum Extraction (PE) combining districts. Under this ministerial permit provision, no injection well and no well for the exploration for, or development or production of, oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in the above-referenced zone categories, until an application for a plot plan review has been submitted to and approved by the Kern County Planning Director; the application must show consistency with the development standards set out in Section 19.98.050. These development conditions and standards are presented below.

A Conditional Use Permit (CUP), which is a discretionary permit process allowing the County to establish site-specific conditions and, under appropriate circumstances, deny an application, is required for oil or gas exploration or production in all residential districts, including the Estate District (E), as well as in the Low-, Medium-, and High-Density Residential Districts (R-1, R-2, and R-3, respectively). A CUP is also required in commercial districts, including the Commercial Office District (CO), Neighborhood Commercial District (C-1), General Commercial District (C-2), and the Highway Commercial District (CH), as well as in the Platted Lands District (PL). The CUP provisions are set out in Section 19.104.

Oil or gas exploration or production is prohibited in the Mobile Home Park District (MP) (Section 19.26.040) and in the Open Space District (OS) Zoning Districts (Section 19.44.040).

Table 3-1 summarizes the type of County approvals required for oil or gas exploration or production activities, as well as required setback distances from designated types of nearby land uses, for each type of zone district under the existing County ordinance.

Table 3-1: Kern County Zoning Ordinance – Existing County Approval Procedure and Setback Requirements for New Oil and Gas Production

Zone Districts		Type of County Approval Required				Set Back Required (in feet)			
		Unrestricted [1]	Ministerial Permit [2]	CUP	Prohibited	Dwelling	Public Highway or Building	Buildings Used as Place of Assembly, Institution or School	Any Building Used for Commercial Purposes

Table 3-1: Kern County Zoning Ordinance – Existing County Approval Procedure and Setback Requirements for New Oil and Gas Production

Zone Districts	Type of County Approval Required				Set Back Required (in feet)			
	Unrestricted (1)	Ministerial Permit (2)	CUP	Prohibited	Dwelling	Public Highway or Building	Buildings Used as Place of Assembly, Institution or School	Any Building Used for Commercial Purposes

Notes:

N/A = Not Applicable

(1) "Unrestricted Drilling" requires no County review or County permit, subject to compliance with specified conditions and standards that augment DOGGR, SJVAPCD, and other agency regulations.

(2) Ministerial Permit requires submittal of an Application for Plot Plan Review to Kern County Planning Director.

(3) A well is not permitted within 50 feet of any building used for commercial purposes without written consent of structure owner prior to the commencement of such drilling

(4) Subject to Special Review Procedures and Development Standards in Section 19.50.130, including Flood Damage Prevention Ordinance, Chapter 17.48 of the Code.

(5) Allowed if use is consistent with General Plan Land Use designation and will not conflict with public health, safety, or welfare.

(6) No minimum setback required. Building and structures are not allowed.

(7) Zone districts that require a CUP for new oil and gas production wells Per Section 19.98.050 and 19.98.040, allows for standards such as setbacks to be reduced or waived as part of the CUP approval process if it is determined that it would not be detrimental to public welfare and/or adjacent property owners.

(8) Per Section 19.66.020(A), new wells are to be more than 300 feet from an existing dwelling. Section 19.66.030(A) specifies that wells located closer than 300 feet to an existing residence or buildings used for commercial purposes can be authorized through the issuance of a CUP.

Existing Development Standards and Conditions

Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance currently contains the procedures and standards that apply to the exploration for development or production of oil, gas, and other hydrocarbon substances and related facilities carried out in unincorporated Kern County pursuant to Section 19.48.020, 19.98.030, and 19.98.040 of the Zoning Ordinance. Existing development standards and conditions included in Chapter 19.98 were designed to address various environmental and public health and welfare concerns, and are summarized below. These existing standards and conditions would be modified and/or supplemented by the Amended Zoning Ordinances:

- **Specific well setback distances from public highways and buildings** (19.98050.A) – No oil or gas well shall be drilled within one hundred (100) feet of any public highway or building not necessary to the operation of the well, or within one hundred and fifty (150) feet of any dwelling, or within three hundred (300) feet of any building used as a place of public assembly, institution, or school, or within fifty (50) feet of any building utilized for commercial purposes constructed prior to the commencement of such drilling, without the written consent of the owner of such structure. The required setbacks in various zone districts are presented on Table 3-1.
- **Fire and safety regulations** (19.98.050.B) – All drilling and production activities shall conform to all applicable fire and safety regulations, and firefighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.
- **Limitations on project signage** (19.98.050.C) – No signs, other than directional and warning signs and those required for identification of the well, shall be constructed, erected, maintained, or placed on the premises or any part thereof, except those required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.
- **Sanitary toilet and washing facilities** (19.98.050.D) – Sanitary toilet and washing facilities, if required by the Kern County Health Department or other governmental agencies, shall be installed and maintained in a clean and sanitary condition during drilling operations, and at such other times as specified by these agencies.
- **Proven technological improvements** (19.98.050.E) – Proven technological improvements generally accepted and used in drilling and production methods shall be employed as they may become available if they are capable of reducing nuisances or annoyances.
- **Timely removal of drilling equipment** (19.98.050.F) – All derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen, or redrill any completed or drilling well must be removed within 90 days after completion of production tests or after abandonment of any well, unless such derricks, boilers, and drilling equipment are to be used within a reasonable time for the drilling of another well or on the premises.

- **Filling of earthen sumps and restoration of drilling sites** (19.98.050.G) – Within ninety (90) days after any well has been placed in production, or after its abandonment, earthen sumps used in drilling or production or both (unless such sumps are to be used within a reasonable time as determined by the Planning Director for the drilling of another well or wells) shall be filled and the drilling site restored as nearly as practicable to a uniform grade. Temporary earthen sumps may be used for cleanout or remedial work on an existing well or other production facility. However, these sumps shall be filled and the site restored as nearly as practicable to uniform grade within ninety (90) days after the cleanout or other remedial work is completed. Such restoration work shall comply with all applicable regulations of the California Division of Oil and Gas.
- **Portable derricks** (19.98050.H) – Any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Planning Director may approve the use of a standard type of derrick.
- **Tank setbacks, landscaping and fencing** (19.98.050.I) – Whenever oil or gas is produced into and shipped from tanks located on the premises, such tanks, whenever located within five hundred (500) feet of any dwelling or commercial building, shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping or shall be fenced in such a manner as to, insofar as practicable, screen such tanks from public view. Such fencing shall comply with the requirements of the California Division of Oil and Gas (promulgated in California Code of Regulations [CCR], Title 14, Division 2, Chapter 4, Subchapter 2, Section 1778).
- **Material delivery restrictions** (19.98.050.J) – Whenever a well is located within five hundred (500) feet from an existing dwelling unit, except in case of an emergency, no materials, equipment, tools, or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of eight (8:00) a.m. and eight (8:00) p.m., unless otherwise required by the California Division of Oil and Gas.
- **Electric motors/muffled engines** (19.98.050.K) – Pumping wells shall be operated by electric motors or muffled internal combustion engines.
- **Height restrictions and paint requirements for pumping units** (19.98.050.L) – The height of all pumping units shall not exceed thirty five (35) feet and shall be painted and kept in neat order.
- **Dust abatement requirements for parking areas** (19.98.050.M) – All vehicle parking and maneuvering areas must be treated and maintained with oiled sand or a similar dust binding material.
- **Landscaping and fencing requirements for oil tanks** (19.98.050.N) – After production begins and a pump is installed on the wellhead, a fence at least six (6) feet in height shall be installed around the pump site or drilling island for public safety. This fence shall be constructed of chain link with wood or metal slats or other screening fence as may be

approved by the Planning Director. This fencing and screening requirement shall apply only to those pump sites located within five hundred (500) feet of any dwelling. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

- **Compliance with federal, state, and County rules** (19.98.050.O) – All required federal, state, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:
    1. California Division of Oil and Gas
    2. Kern County Fire Department
    3. Kern County Health Department
    4. Regional Water Quality Control Board
    5. Air Pollution Control District
    6. Kern County Engineering and Survey Services Department
- **Dark skies ordinance** (19.51) – The existing dark skies ordinance does not apply to oil and gas activities.

3.3 History, Existing Operations, and Background

Oil drilling in Kern County has a long history. The first commercially developed oilfield in Kern County was the McKittrick Field, which was developed in 1898. Development was facilitated by existence of the Southern Pacific Railroad from Bakersfield to McKittrick. The Kern River Field, north of Bakersfield, was established in 1899 with the discovery of oil at that time. By 1903, 796 wells produced almost 17 million barrels of oil from the Kern River Field.

In the mid-1930s, several valley oilfields were found in large anticlines in Miocene oil sands beneath the valley floor. These discoveries were made following the advent of the reflection seismograph. Discoveries included Ten Section, Greeley, Rio Bravo, North Coles Levee, South Coles Levee, and Strand.

Kern County is the largest oil producing county in the state. According to the DOGGR, in 2012, Kern County, with nearly 43,000 active oil and gas, dry gas, and gas storage wells, contained 78% of all active wells in California (DOGGR 2013a). In addition, 80% of all oil and natural gas produced in California came from wells in Kern County.

Kern County is located within District #4 of DOGGR. All resources produced in the District listed in state publications are from Kern County, except for about 1% that comes from Tulare, Kings and San Luis Obispo counties. Table 3-2 presents a summary of oil and gas production statistics for Kern County, from 2002 to 2013.

Table 3-2: Kern County/Oil and Gas Production Statistics (2002 through 2013)

Year	Well Count		Oil Production (bbl)	Total Gas Production (Mcf)	Produced Water (bbl)
	Active	Inactive			
2013 [1] [2]	43,568	15,863	141,642,659	137,775,170	1,794,103,912

Surface and Mineral Rights

Petroleum exploration and extraction involves the use of surface land for the establishment of well drilling and associated activities. The "surface rights"—that is, the right to use the surface of the land—are distinct from the "mineral rights," which pertain to minerals beneath the surface. The rights to use the land surface for these activities are governed by applicable laws, regulations, court orders, and agreements that oil and gas operators have established with various landowners. In some cases, the surface rights and the mineral rights to the same area of land may be owned by two different parties. This is referred to as a "split estate."

Although the reservoir that contains the oil and gas may be under land that has businesses, parks, and residences on them, the minerals can be extracted because an oil or gas operator owns the "mineral rights" to the minerals beneath the land surface. A mineral right is an interest in real property and may be sold, transferred, leased, or retained separately from the surface rights, in which case the mineral rights are said to be "severed". Mineral rights are distinct from "surface rights," or the right to the use of the surface of the land for residential, agricultural, recreational, commercial, or other purposes.

A person may own all of the mineral rights for a parcel or any fraction of the rights. A person may also own rights to only one kind of mineral, such as oil and gas, or to only one formation or depth interval. The ownership of the producing mineral rights in a parcel can usually be determined by examining the deed abstract for the property. The rights of the mineral owner to use of the surface of the real property are dominant to the rights of the owner of the surface estate, meaning that the mineral owner has an appurtenant right to reasonable access to develop its mineral right. The rights of a mineral owner to use of the surface estate can only be restricted by an express grant of such rights from the mineral owner to the surface owner. Mineral rights are, in all respects, real property rights. Real property rights are those rights primarily established under the common law of California and generally governed by the California Civil Code, Division 2, Part 2.

3.3.1 Administrative Oilfields

A total of 100 active or abandoned "Administrative Oilfields" (AOFs), which are delineated by DOGGR under applicable state regulations, are located on County jurisdictional lands within the Project Area. As shown in Table 3-3, these DOGGR delineated AOFs vary widely in size, from the smallest being the Kernsumner and Temblor East wellfields at 0.2 square mile, to the largest being Midway Sunset Oilfield at 99.7 square miles. The boundaries of these AOFs are referred to as "Administrative Boundaries." Oil and gas production also occurs outside of DOGGR delineated oilfield Administrative Boundaries. Table 3-3 notes whether each oilfield is within the Western, Central, or Eastern Subarea, as proposed by the Project and as shown on Figure 3-3, and whether the field is active or has been abandoned.

Table 3-3: Oilfields Currently Delineated by DOGGR within the Project Area

Count	Administrative Oilfield [Alpha Order]	Square Miles *	Acres *	W/C/E

Notes:
* Numbers are approximate.
** Oilfield is located on the border of Kern County and an adjacent county; acreages within Kern County are approximate.
Key:
Abd = Abandoned.

The locations of AOFs within the Project Area are shown on Figure 3-3.

3.4 Project Description

3.4.1 Proposed Project/Proposed Zoning Code Amendment

The proposed Project consists of an amendment to Title 19 of the Kern County Zoning Ordinance, Chapter 19.98 (Oil and Gas Production), and related sections of the Kern County Zoning Ordinance to include updated procedures, development and implementation standards, and conditions for future oil and gas exploration, development, and production activities in unincorporated Kern County. In addition, the proposed Project includes the implementation of future oil and gas development activities expected to be undertaken pursuant to the amended ordinances.

The proposed Project would amend sections of the Kern County Zoning Ordinance relating to oil and gas drilling, including but not limited to Chapter 19.98 (Oil and Gas Production), to address oil and gas exploration and operation activities in greater detail, by:

a) Establishing updated development, implementation standards and conditions to address environmental impacts of pre-drilling exploration, well drilling, and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring, and plugging and abandonment;

b) Establishing new "Oil and Gas Conformity Review" and "Minor Activity Review" ministerial permit procedures for County approval of future well drilling and operations to ensure compliance with the updated development and implementation standards and conditions and provide for ongoing tracking and compliance monitoring.

The Amended Zoning Ordinance incorporates a comprehensive update to all sections of the Zoning Ordinance related to oil and gas exploration and production. The following description outlines the proposed changes to the Zoning Ordinance. (Note: A complete copy of the amendments to the Zoning Ordinance is provided at the end of this chapter as Attachment A.)

a) A comprehensive overhaul of Chapter 19.98 would be made to remove the "Unrestricted Drilling" section and to update the "Drilling by Ministerial Permit" and "Drilling by Conditional Use Permit" sections. This update would require all new oil and gas wells for exploration or production to obtain approval from the Kern County Planning and Community Development Department prior to commencing drilling.

b) The Tier System, described fully in Section 3.4.4 of this EIR, would be incorporated into Chapter 19.98 to address the different land uses and zone districts where oil and gas activities occur. The Tier system is made up of 5 distinct Tiers, including, Tier 1 Areas – primarily existing oil and gas activities, Tier 2 Areas – primarily existing agricultural activities, Tier 3 Areas – primarily existing industrial development, Tier 4 Areas – primarily existing urban development (CUP Required), and Tier 5 Areas –consisting of

existing and future adopted Specific Plans. The Tier Areas within the Project Area are depicted on Figure 3-4.

c) An Oil and Gas Conformity Review would be required as part of the "Drilling by Ministerial Permit" Section, noted above. This review will allow for comprehensive review of all drilling activities and will require consistent, comprehensive mitigation based on defined Tiers of surrounding land uses, as specified in the Amended Zoning Ordinance. An application package must be submitted that includes a site plan and written documentation assuring compliance with all applicable Development and Implementation Standards and Conditions.

d) A Minor Activity Review would be required as part of the "Drilling by Ministerial Permit" Section, noted above. This review will allow for comprehensive review of minor oil and gas activities and will require consistent, comprehensive mitigation based on defined Tiers of surrounding land uses, as specified in the Amended Zoning Ordinance. An application package must be submitted with written documentation assuring compliance with all applicable Development and Implementation Standards and Conditions.

e) The Development and Implementation Standards and Conditions Section would be updated to require compliance with all applicable mitigation measures and additional regulatory requirements as set forth in this EIR. Some of these new standards include: setbacks from sensitive receptors, reductions in overall footprint of drilling areas, new screening requirements, and measures to avoid or reduce impacts to resources such as biological and cultural areas, ground water and air quality, as specified in the Amended Zoning Ordinance.

f) For all Oil and Gas Conformity Review Site Plans submitted to the County, the Applicant would be required to submit a signature block and statement as part of the Application package. The signature block will provide for the signatures of the Applicant and, if different, the Mineral Owner. In addition, for activities occurring on split estate lands, where the Land/Surface Owner is different from the Mineral Owner, the signature block will provide for the signature of the Land/Surface Owner. For applications submitted with the required signature block and statement, the first review by the County will take place within seven business days. If the County finds the application to be incomplete and requests additional information, the second review will take place within three business days upon receipt of the requested information.

g) The new ordinance also includes a separate application processing procedure for applications on split estate lands that are lacking a signature block signed by the Land/Surface Owner. For applications submitted without the required signature block and statement, the review process will take 30-days to allow time for surface owner consultation, with an automatic 30-day second review period. Should the applicant obtain the Land/Surface Owner's signature during either 30-day review period, the application

will be processed within seven days. However, an application will not be rejected for lack of a signature by the Land/Surface Owner.

h) A new fee structure would be included to ensure that all mitigation is complied with and that the County will be sufficiently staffed to review all new applications.

i) Other Sections of the Zoning Ordinance would be updated to ensure consistency with the new requirements of this EIR. These Sections include: 19.08 – Interpretations and General Standards, 19.48 – Drilling Island (DI) District, 19.50 – Floodplain Primary District, 19.66 – Petroleum Extraction (PE) Combining District, 19.81 - Outdoor Lighting (Dark Skies Ordinance), 19.88 – Hillside Development, 19.102 – Permit Procedures, and 19.108 – Nonconforming Uses, Structures, and Lots.

Section 3.4.5 provides a more detailed description of the Oil and Gas Conformity Review Process.

3.4.2 Geographic Scope

For purposes of this EIR, the Project Area is defined as shown on Figure 3-1. The updated development standards and conditions would apply to all oil and gas activities throughout unincorporated Kern County, including but not limited to those that fall within the Project Area. However, the proposed geographic scope of the environmental evaluation considered in this EIR is limited to the Project Area, which represents the portion of the County in which oil and gas development has historically occurred and is reasonably foreseeable to occur in the coming decades. In the unlikely event that oil and gas production activities are proposed outside the Project Area, supplemental environmental review under CEQA would be required.

3.4.3 Core Areas

DOGGR requires oil and gas production wells to be reported, and each is ultimately included in an "Administrative Boundary" area for DOGGR's regulatory oversight purposes. However, oil and gas exploration and production does take place outside of existing Administrative Boundaries. If a new well is drilled outside the Administrative Boundary, the boundary may be adjusted by DOGGR upon written request of the operator once the new well reaches a sustained and documented production output for a minimum of six months.

For purposes of this EIR, DOGGR's existing Administrative Boundaries were useful in predicting where the vast majority of future oil and gas production activity would occur (i.e., in and adjacent to areas within Administrative Boundaries). This EIR uses the term "Core Area" to describe locations within and immediately adjacent to DOGGR's Administrative Boundary areas. Figure 3-5 depicts Core Areas in relation to DOGGR's Administrative Boundaries.

The County's zoning and land use planning procedures are designed to remain stable for orderly administration over time; therefore, the DOGGR Administrative Boundary adjustment process did not provide a useful framework for zoning purposes. For purposes of administering zoning

requirements within and adjacent to DOGGR's Administrative Boundaries, Core Areas were defined by making the following adjustments, as applicable, to each DOGGR Administrative Boundary, to administratively manage County zoning requirements in oil and gas production areas:

1. Each area within DOGGR Administrative Boundaries was first defined as a "Core Area" for oil and gas production purposes;

2. Adjacent areas within DOGGR Administrative Boundaries were combined into a single Core Area;

3. Consistent with County zoning practice, the irregular boundaries of each Core Area were then "squared off" and defined by the nearest Section and quarter Section lines;

4. To accommodate the probability of continued expansion at the edges of these known producing areas, the Core Area was then extended at least one-half Section from the DOGGR Administrative Boundary;

5. To accommodate known oil production activities that were adjacent to but not yet within a DOGGR Administrative Boundary, the Core Area was expanded to include adjacent Sections that either contained at least two wells in the Section, or contained two wells within a 640-acre area of the Section; and

6. Where the Core Area mapping process described above left isolated islands or narrow strips of lands between Core Areas, the Core Area was combined to eliminate these orphaned areas.

Historically, more than 95% of oil and gas production occurs within DOGGR's Administrative Boundaries. This EIR anticipates that this same percentage of production would occur in the designated "Core Areas."

3.4.4 Tiers

Oil and gas production in Kern County varies in intensity, depending on historic uses, surrounding land uses and zoning designation, and quality of other potential land uses (e.g., agricultural land). As part of this project-level EIR process, both Core and non-Core areas within the overall Project Area were further categorized based on existing and zoned land uses. The Project Area was divided into five Tier Areas (Figure 3-4), a description of which is provided below:

Tier 1

Tier 1 is defined as the area in which current oil and gas activity is the primary land use. The well and activity densities preclude almost all other uses. According to DOGGR well information,

87% of all active oil and gas wells within the Project Area in 2014 were located within Tier 1 Areas.

The Tier 1 areas were developed through the use of well location database and oilfield Administrative Boundary geographic information system (GIS) shape files for District 4 obtained from DOGGR. Tier 1 areas generally include all quarter-quarter Sections (40 acres) that contained a minimum of four wells.

Tier 1 does not include sensitive land uses, such as schools, daycare centers, hospitals, cemeteries, etc. It should also be noted that the quarter-quarter Sections that contained Important Farmlands, as identified by the Department of Conservation's (DOC's) Farmland Mapping and Monitoring Program for Kern County, are included in Tier 2, rather than Tier 1, as described below.

Tier 2

Tier 2 includes all lands within the following agricultural zone districts that are not within Tier 1:

- All land that is zoned Exclusive Agriculture (A); and
- All land that is zoned Limited Agriculture (A-1).

Tier 2 also includes the following Important Farmlands identified by the DOC Farmland Mapping and Monitoring Program for Kern County 2012, which is the most recent available data:

- Prime Farmland;
- Farmland of Statewide Importance;
- Unique Farmland; and
- Confined Animal Agriculture.

Tier 3

Tier 3 is defined as zone districts where historic drilling activity has been or could have been approved as "Unrestricted" or "Ministerial" under the existing Zoning Ordinance, and those areas that are not categorized as Tiers 1 or 2. These Zone Districts include:

- Natural Resource (NR);
- Recreation Forestry (RF);
- Light Industrial (M-1);
- Medium Industrial (M-2);
- Heavy Industrial (M-3);
- Floodplain Primary (FPP);

- Drilling Island (DI); and
- Zone districts that have a Petroleum Extraction (PE) combining district.

Tier 4

Tier 4 consists of all zone districts where oil or gas exploration and production activities are currently or proposed to be allowed with a CUP. These zone districts include:

- Estate District (E);
- Low-density Residential (R-1);
- Medium-density Residential (R-2);
- High-density Residential (R-3);
- Commercial Office (CO);
- Neighborhood Commercial (C-1);
- General Commercial (C-2);
- Highway Commercial (CH);
- Platted Lands (PL); and
- Mobile Home Park (MP).

Authorized oil and gas activities in Tier 4 are subject to approval of a CUP in accordance with 19.104 of this Title. The Open Space (OS) zone district includes those areas where oil or gas exploration and production activities are prohibited, but ancillary facilities are an allowable use.

Tier 5

Tier 5 are areas including current and future Specific Plan boundaries either adopted with a Special Plan Zone District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities would be allowed with a CUP or as permitted by the regulations contained within the adopted Specific Plan(s) in Tier 5 areas.

Non-Jurisdictional Areas

Non-Jurisdictional Areas are those areas where Kern County currently does not have land use authority or zone districts where oil or gas exploration and production are prohibited. These areas include lands under the administration of the Federal Government, State of California, and incorporated cities.

The land area within each Tier (in acres) is provided on Table 3-4.

Table 3-4: Summary of Tier Acreages

Tier	Acreage [1]	
Tier 1		206,747
Tier 2		1,791,303
Tier 3		16,203
Tier 4		34,450
Tier 5		2,512
Non Jurisdictional Land		283,828
Federal	117,138	
State	25,548	
Incorp. Cities [2]	141,142	
Other [3]		27,691
TOTAL [4]		2,362,734

Source: Prepared by Ecology and Environment, January 28, 2015.
Notes:
(1) Rounded to nearest 10th of an acre.
(2) Arvin, Bakersfield, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi, and Wasco.
(3) Includes schools, cemeteries, hospitals, and road/freeway rights-of-way.
(4) Total area based on GIS acreage of 3,692 mi^2 rounded up to 3,700 mi^2 for Project Area.

The new five-Tier zoning structure allows for project-level analysis and mitigation for oil and gas impacts in relation to differing existing and planned land uses.

3.4.5 Oil and Gas Conformity Review and Minor Activity Review Process

Oil and Gas Conformity Review

The following Oil and Gas Conformity Review process would become a mandatory process for all new oil and gas production activities occurring within Kern County (Figure 3-6). The general process is described below.

a) The applicant would submit an Oil and Gas Conformity Review application and site plan to the County with evidence of surface/Land Owner notification. Concurrently, if needed, the Applicant would submit a Notice of Intention (NOI) to DOGGR, together with a copy of the Notice of Determination for this EIR as documentation of CEQA compliance.

b) County Staff would review the Oil and Gas Conformity Application. At the conclusion of a seven business days, the County would issue either:

1) Transmit a copy of the permit issuance to the Applicant, DOGGR, the Mineral Owner, and the Surface/Land Owner, or

2) A memo indicating outstanding items that require additional documentation to the applicant.

If an Applicant receives a Kern County Oil and Gas Conformity Review Issuance, they must still obtain any other necessary State or federal permits, prior to commencing construction of the facility. The Applicant must self-certify their project's compliance with the Zoning Ordinance and applicable mitigation measures during the construction and operation process. The County would provide a County Well Identification number and the Applicant would be required to place a sticker/sign on the wellhead to identify the well. Once the Applicant has completed construction of the oil and gas facilities, as indicated on the approved site plan, they would provide a self-certified statement to the County. Then, the County would "finalize" the Oil and Gas Conformity Review in the Planning and Community Development Department's records. This permit would be active for up to one year. The Applicant may request a one year extension through the Planning Director. If an Applicant wishes to change the approved site plan in the future, they must provide a description of the new oil and gas activities or facilities and submit a new site plan with the proposed change(s), including updated signatures from all requires parties.

If an Applicant receives an outstanding items memo, they must submit evidence documenting compliance with the items addressed in the memo. County Staff would review the submitted information and provide a response to the Applicant within three business days of the documentation submittal. The County will conduct up to three reviews. After the third submittal, if outstanding items are still not submitted, the County will require an in-person meeting with the Applicant, and any consultant processing the application to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived. The County may request additional fees to supplement the County review process which will be shown in the Ordinance for any reviews past three total (initial application submittal and two reviews).

Surface/Land Owner Sign-Off Process

Surface/Land owners who are not mineral owners must receive notification of the intention to drill at least 30 days prior to submittal to County of Oil and Gas Conformity Review application, unless they have waived the need for written notification. The written notification must include the County's handout explaining the process and full contact information for the Surface/Land Owner (name, address for contact, phone number and email (if known). The Surface/Land Owner can choose to sign-off or not. If they do sign-off, the conformity process described above would occur. If the surface owner chooses not to sign off, then the following process would occur.

a) The Kern County Planning and Community Development Department would conduct a review of the submitted application.

b) The County would contact the Surface/Land Owner and offer an in-person meeting to review the county process, development and implementation standards, Mitigation

Monitoring and Reporting Program (MMRP) and answer any questions. The Applicant would not be present and no facilitation of the negotiations would be offered or provided.

c) One of the following responses would be provided to the Applicant 30 business days after application submittal.

   1) The County would provide zoning issuance of the Oil and Gas Conformity Review for the proposed Oil and Gas land use activity(s);

   2) The County would provide a memo to the Applicant indicating outstanding items that require documentation prior to zoning issuance, then the process described in item (b) of the previous section would be followed; or

   3) Should the Applicant receive Surface/Land Owner sign off and provide the County with a site plan that includes the surface owner's signature(s), then the process described item (b) in the Oil and Gas Conformity Review section would be followed.

Minor Activity Review

The following Minor Activity Review process would become a mandatory process for all minor activities occurring within Kern County (Figure 3-6). The general process is described below.

a) The applicant would submit a Minor Activity Review application to the County with evidence of surface owner notification.

b) County Staff would review the Application. At the conclusion of a seven business days, the County would issue either:

   1) Transmit a copy of the Minor Activity Review Issuance to the Applicant, Mineral Owner, and the Surface/Land Owner, or

   2) A memo indicating outstanding items that require additional documentation to the Applicant.

If an Applicant receives issuance, they must still obtain any other necessary State or federal permits, prior to commencing construction of the facility. The Applicant must self-certify their project's compliance with the Zoning Ordinance and applicable mitigation measures during the construction and operation process. Once the Applicant has completed construction of the oil and gas facilities, they would provide a self-certified statement to the County. Then, the County would "finalize" the Oil and Gas Conformity Review in the Planning and Community Development Department's records. This permit would be active for up to one year. The Applicant may request a one-year extension through the Planning Director. If the Applicant wishes to change the approved permit in the future, they must provide a description of the new oil and gas activities or facilities and must submit a new site plan with the proposed change(s), including updated signatures from all requires parties.

If an Applicant receives an outstanding items memo, they must submit evidence documenting compliance with the items addressed in the memo. County Staff will review the submitted information and provide a response to the project applicant within 3 business days of the

documentation submittal. The County will conduct up to three reviews. After the third submittal, if outstanding items are still not submitted, County will require an in person meeting with the Applicant, and any consultant processing the application to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived. The County may request additional fees to supplement the County review process which will be shown in the Ordinance for any reviews past 3 total. (Initial application submittal and two reviews.)

3.5 Potential Future Oil and Gas Development Scenario

This section provides a description of the potential future drilling and operational activities that could occur within the Project Area. For analytical purposes, as described in Chapter 2, Introduction, this EIR assumes that 2,697 new producing wells per year—a relatively high level of new oil and gas production activity—would be projected to occur each year for the next 20 years. In practice, annual activity levels would likely be lower. There is no scheduled expiration date for a Zoning Ordinance, and the development standards and conditions specified in the Amended Zoning Ordinance would continue to apply unless and until the Zoning Ordinance is amended again. Further environmental review would not likely be needed for annual oil and gas activities that qualify for ministerial permits under the Conformity Review Process, so long as the annual projected activity level is not exceeded (e.g., no more than 2,697 new producing wells are drilled in a single calendar year) and the total projected activity level assumed to occur over the next 25 years is not exceeded (e.g., no more than 67,425 wells are drilled). However, at the point that either the annual Project activity level or total projected activity level is exceeded, the County will need to consider whether the exceedance triggers further CEQA review in accordance with the criteria provided in CEQA (Pub. Res. Code) Section 21166 and CEQA Guidelines Section 15162 (e.g., due to new or substantially more severe significant environmental impacts than those considered in this EIR). If the criteria for subsequent or supplemental CEQA review are met, further review would be required for continued reliance on the Conformity Review Process.

By amending the existing Zoning Ordinance to provide a new review process and site development standards, the Proposed Project would provide for the continuation of existing oil and gas activity, which would have continued even if there were no project, under current zoning. As such, the Potential Future Oil Development Scenario represents a continuation of existing oil and gas activities that, in conventional CEQA analysis, would be considered baseline conditions. If anything, the Proposed Project's impacts on the existing environment would be beneficial by imposing new site development standards which incorporate more stringent, environmentally protective conditions than exist in the current Zoning Ordinance.

This Draft EIR takes a more environmentally conservative approach to the impact analysis. The future environmental impacts associated with new oil and gas activities subject to approval by the County, utilizing the new Oil and Gas Conformity Review process, are considered impacts of the Proposed Project.

For example, air emissions associated with construction and operation of new wells or new wellbore re-entry activities (e.g., deepening, redrilling, workovers, reworking etc.), all subject to Oil and Gas Conformity Review under the amended Zoning Ordinance, are attributed to the

Proposed Project even though these emissions have occurred in the past and are likely to occur at the same levels in the future whether or not the ordinance is amended. In addition, emissions from operation of ancillary facilities are attributed to the wells that receive Oil and Gas Conformity Review, on a per-well basis, even though a specific well may utilize existing ancillary facilities that have emitted in the past and are likely to continue emitting at the same levels in the future, whether or not the ordinance is amended. Thus, all construction and operational emissions from, and associated with, wells that are subject to Oil and Gas Conformity Review are treated as new emissions of the Proposed Project, regardless of whether or not County-wide emissions would change from historic baseline levels as a result of the amended ordinance.

It should be emphasized that this approach differs from the conventional use of baselines in CEQA impact analysis. In the conventional analysis, the anticipated County-wide emissions after the Proposed Project zoning amendments take effect would be estimated, and then the baseline emissions from existing oil and gas activities would be subtracted from post-Project emissions, in order to determine the extent of impacts attributable to the Proposed Project. As a simplistic example, assuming that the average historic levels of oil and gas activities that generate air emissions do not change at all after the Zoning Ordinance amendments take effect, emissions would remain constant at the baseline, or perhaps even decline due to implementation of the performance standards that would be required by the amended ordinance. By definition, so long as the baseline standards were not exceeded, there would be no air quality impacts, even if thousands of new wells were drilled and began operating. By contrast, in the analytic approach in this Draft EIR, post-Project emissions have been evaluated to identify impacts without subtracting baseline emissions. Thus, even if County-wide emissions remain constant at the baseline, the air quality impacts of the Proposed Project would be determined by the total operational emissions of the new wells and ancillary activities approved under the amended Zoning Ordinance.

This analysis is more conservative than the conventional approach, by capturing ongoing environmental effects that otherwise would come under the baseline. Moreover, the conventional approach would not serve the objective of providing an environmental analysis that can be relied on by DOGGR and other responsible agencies in their own permitting and approval processes, as well as by Kern County.

The Draft EIR applies a similar approach to other categories of environmental impacts, although the details vary for some impact categories. For example, land disturbance, habitat loss and biological resource impacts associated with construction and operation of wells (and related ancillary facilities) that receive Oil and Gas Conformity review would be considered impacts of the Proposed Project. However, land disturbance, habitat loss and other biological resource impacts associated with pre-existing wells, constructed under the current Zoning Ordinance, are part of the baseline and not impacts of the Proposed Project. Unlike air emissions, which are emitted anew each day even if just due to continuing a pre-existing activity, land that has been disturbed remains in its disturbed state unless it is restored. As Communities for a Better Environment v. South Coast Air Quality Management District (2010) 48 Cal. 4th 310 emphasized, EIRs should not use a hypothetical baseline of conditions that do not actually exist;

therefore, this EIR does not assume a pristine, pre-oil and gas landscape where none currently exists. Similarly, the analysis of aesthetics/visual impacts takes into account existing permanent installed facilities and existing disturbed landscapes.

3.5.1 Potential Future Drilling of New Wells

Over the next 25 years, this EIR conservatively assumes that an average of 2,697 new producing wells per year could be drilled in the Project Area. Table 3-5 through 3-8 provide an annual breakdown of potential drilling activities for years 2015 through 2040 for the Western, Central and Eastern Subareas, and for the Tiers. The level of well drilling in any given year may be higher or lower than this average, consistent with the variations in well drilling activities that have historically occurred due to market and other conditions.

Table 3-5: Annual Well Forecast - Project Subareas [1]

Well Type	Subarea			Total
	Western	Central	Eastern	
New Producing Wells [2]	1,730	131	836	**2,697**
Water Disposal	30	5	13	48

(1) Source = CATC (with County team modifications)
(2) Producing Wells = Oil and Gas, Dry Gas, Dry Hole and Liquid Petroleum Gas Wells
(3) Tier Distribution of SB-4 Activities is assumed to be the same percentage as Distribution of New Producing Wells

While it is not possible to identify the exact location of each of these future wells, these locations have been grouped into the three Subareas described above. Within each Subarea, future well locations are further predicted to occur by Core Area, since over 95% of historic oil and gas activities occurred within Core Areas and this pattern is assumed to continue in the future.

3.5.2 Oil and Gas Activities

As described above, the proposed Project consists of both an amendment to Kern County Zoning Ordinance, Chapter 19.98 (Oil and Gas Production), and related sections of the Kern County Zoning Ordinance, and the implementation of future oil and gas development activities expected to be undertaken pursuant to the amended ordinances. Oil and gas activities are comprised of a number of different components, beginning with geophysical exploration, and ending with well plugging and abandonment. The early stages of well drilling and testing are of short duration, lasting a few days up to a month or more at any specific location, while production may last for many years. Well plugging and abandoning lasts only a few days and the site is reclaimed or repurposed.

For the purposes of this EIR, oil and gas activities have been divided into two sets of components: (1) construction activities, which include both initial construction activities (e.g., well pad construction, drilling, and installation of new wells or construction of new ancillary equipment facilities, modification of existing wells and equipment through "reworking" or re-drilling

existing wells, and dismantling or removal of equipment and well abandonment); and (2) operational activities, including the routine maintenance and operation of equipment. Construction activities have a limited duration in any one location (e.g., a particular well pad); however, due to the volume of oil and gas activity in Kern County, these construction activities routinely occur throughout the Project Area. The purpose of this methodology is not to imply a specific chronological sequence of events, but rather to group together short-term activities with similar potential impacts for analysis purposes as distinct from long-term activities during production.

Overview of Construction Activities

Exploration and development involves geophysical testing and drilling test (exploration) wells to assess the quality and quantity of oil and natural gas present in a previously undeveloped location either inside or outside the administrative boundaries of an existing wellfield. Assuming successful testing, additional wells are drilled until the extent of the reservoir is determined. The field is then further developed by constructing additional wells and installing gas and oil processing equipment and transportation facilities.

Wells may also need to be "re-worked" during the operating life span of the well, to adjust for evolving field conditions or new technologies (e.g., well stimulation). Finally, decommissioning and abandonment involves well abandonment and plugging activities. Accordingly, while construction activities are considered separately from operational activities because of their limited duration, activities categorized as "construction" occur continually throughout exploration, development, production, and closure.

Itemized Construction Activities

Exploration, development, production, and closure involve the following short-term construction activities. At a particular site, these activities may take place in the order listed below or in a different sequence:

- Geophysical Surveys;
- Well Pad Preparation;
- Testing;
- Access Road Construction;
- Electrical Distribution Line and Substation Construction;
- Drilling;
- Well Completion;
- Construction of Oil, Gas Treatment Facilities;
- Construction of Water Treatment Facilities;
- Steam Generator Construction;

- Construction of Tankage and Containment Structures;
- Pipeline Installation;
- Construction of Sumps, Evaporation Ponds and Percolation Ponds;
- Installation of Produced Water Injection Wells;
- Construction of Fencing;
- Administrative Facility Construction;
- Well Re-Working and Workovers;
- Well Stimulation;
- Decommissioning and Abandonment; and
- Reactivation of Idle Wells.

Itemized Operational Activities

During well operations, when oil is being produced, the following routine operations and maintenance activities occur at well locations:

- Geophysical Monitoring;
- Treatment of Produced Water, Oil and Gas;
- Water Management;
- Enhanced Oil Recovery (EOR) Activities;
- Injection Wells (Class II Fluids);
- Sumps;
- Percolation and Evaporation Ponds;
- Vegetation Control;
- Spill Prevention, Control, and Countermeasure (SPCC) Procedures;
- Non-Hazardous Solid Waste Management;
- Well, Pipeline, Tank and Vessel Testing and Maintenance;
- Centralized Oil/Water Separation;
- Steam Generators;
- Electric Distribution Line and Substation Maintenance;
- Access Road Maintenance;
- Distribution of Crude Oil; and
- Administrative Building and Personnel Housing.

In addition to oil and gas wells, installation and operation of ancillary equipment and facilities are integral components of oil and gas exploration and production. All wells, for example, are connected by pipelines to tanks that separate oil from the other extracted liquids (primarily "produced water" from the same geologic strata as the oil or gas, along with water and additives that may be injected as steam or liquid to help extract the oil). Wells also have monitoring devices, and may have electric and telecommunication equipment, and waste gas collection lines.

"Tank farms" that include tanks for separating oil and water, and storing both, typically serve several wells and vary in size and distance from wells. Produced water collected in tanks is typically re-used for further extraction purposes, stored in surface impoundments where it percolates into groundwater and/or evaporates, or disposed of by injection well. Some produced water requires treatment prior to reuse for extraction, or disposal, and some produced water is treated and reclaimed for other purposes, as discussed further in Section 4.9, Hydrology and Water Quality, and Section 4.17, Utilities and Services.

Extraction technologies also include injecting large volumes of water (water flooding) or steam (steam flooding) into production strata, and managing the time that each well is active and idle to maximize the recovery efficiency. Additional ancillary equipment and facilities required for these enhanced recovery methods include producing steam, and pressurizing steam or water, typically through larger cogeneration plants serving the wellfields where these techniques are utilized.

Personnel conducting wellfield construction, maintenance and operating activities are typically dispatched from centralized facilities (most located in Bakersfield), although some workers are staffed onsite, especially at larger oilfields.

More information about each of these Project activities is provided below.

3.5.3 Construction Activities in Detail

Exploration and Development

The purpose of exploratory wells is to find new deposits of hydrocarbons or to define the lateral limits of hydrocarbons outside of a known producing area and then develop the site for production. Activities that occur during this exploration and development process include geophysical surveys, access road and well pad construction, drilling, well completion, and testing, and distribution line construction. In addition, temporary equipment, such as storage tanks and other equipment, are placed in the drilling area.

Once the reservoir boundaries have been established, infield wells may be drilled within the field boundaries to fully develop the reservoir. Activities for infield wells may include well pad construction, access road construction, and flowline construction.

Geophysical Surveys

Geophysical surveys may be conducted to determine the extent of natural gas and oil reserves present, and whether such resources warrant additional development. Geophysical surveys generate low-frequency sound waves by various means, and the data are recorded by small geophones that have been strategically placed within the survey area. The energy source is applied using specialized trucks to vibrate the ground (vibroseis), or detonating charges underground (shothole). Both of these methods include the deployment and recovery of geophone receivers that are connected by cables to a recording station (seismograph) mounted on a specialized truck. The vibroseis technique utilizes truck-mounted vibroseis units to generate vibrations. The shothole technique utilizes holes drilled in a variable spacing pattern, usually less than 60 feet deep with a diameter of 3 to 5 inches. Explosive charges are placed in the holes and detonated to generate seismic waves that are recorded by the seismograph. Explosive charges are required in areas of steep terrain where a vibroseis source cannot safely operate or where farmers indicate a preference (i.e., orchards where low branches cannot accommodate vibroseis units or tilled fields where vibration will damage crops). Electronic encoded detonation caps and biodegradable charges are used to ensure the safety of shothole operations.

Well Pad Preparation

Preparation of both the exploratory and development well pads begins with clearing and grading an area to accommodate the well and any drilling activities or ancillary facilities that may be required. After the well pads are developed, the drilling rig is moved onto the well pad and set up. Temporary facilities, equipment, and materials necessary for the drilling operation may also be set up and stored on the well pad (i.e., drilling mud supplies, water, drilling materials and casing, crew support trailers, pumps and piping, portable generators, field flares, fuels and lubricants, etc.). Containments (temporary pits, operations sumps and/or portable tanks) may be set up to store drilling fluids, wellbore cuttings, and drilling wastes. Portable tanks may also be set up to mix and store other needed liquids or slurries, such as drilling fluids and completion fluids.

The size of the well pad is dependent upon the size of the drilling rig footprint, the number of wells anticipated to be drilled on the pad, the type of equipment that would be placed on the well during production, the depth of the well, and the number of additional wells (if any) from this well pad. The drilling support equipment is dependent upon the depth of the well and the type of activities required for production. For example, a deeper well requiring hydraulic fracturing would necessitate a larger well pad because more space would be needed for vehicles, pumps, and storage equipment. In contrast, a shallower well would require less equipment and, therefore, a smaller well pad.

Because the depth to formation varies throughout the Project Area, the amount of land required for well pad construction varies accordingly. In general, the deepest wells are located in the Central Subarea, and the shallowest wells are located in the Eastern Subarea. As discussed in Appendix F, existing land use disturbance associated with oil and gas exploration and production activity in each Subarea was analyzed by dividing the total observed disturbance acreage by the number of production wells in the 10 largest oil fields located in each Subarea. This methodology

accounts for well pad size and ancillary disturbance variability—such as tanks, roads, and administrative facilities—that reflects construction and operational conditions in each Subarea. The observed average disturbance per production well in each Subarea was further increased to provide a conservative assessment of potential Project impacts. The disturbance acreage that is assumed to occur for each new production well in the Project Area varies by Subarea as follows:

- Western Subarea: 2 acres
- Central Subarea: 3 acres
- Eastern Subarea: 1.2 acres

These estimates assume that each new well would require new land disturbance for well pad construction, ancillary facilities, access, infrastructure and other construction and operational activities. The actual level of new disturbance associated with each production well would be lower in the event that, as is likely to occur in more developed oil fields, existing disturbed areas, such as existing roads, ancillary facilities, and infrastructure, are used under future conditions. The calculation of potential future disturbance by Subarea is discussed in detail in Appendix F.

Testing

After an exploratory or other well is completed, monitoring and sampling is initiated to determine whether the area should be further developed for production. For an exploratory well, oil and water are typically produced into temporary tanks, while any associated gas may be burned off using a permitted temporary flare at the well site, or used to power the artificial lift for the well. For a development well or in-fill activities, the well is connected to the field infrastructure that pipes the production to a centralized facility during the testing phase. These facilities have equipment to separate and process all of the production (oil, gas and water) for sale. The produced oil/water mixture is then separated via gravity or centrifugal separation, and the oil-to-water ratio is recorded.

Access Road Construction

If an existing road cannot be used to access a new well location, a new road would be extended from adjacent existing roads. Access roads are typically 16 to 20 feet in width and vary in length, depending upon the distance from an existing roadway. The potential new land disturbance that could be associated with future access road construction is included in the disturbance acreage estimates discussed above and in Appendix F. Access road construction typically includes clearing of vegetation and grading to provide a flat surface. Dust suppression and soil compaction activities would also be conducted. Although some access roads may be paved, it is assumed that almost all (95%) of new access roads would be unpaved dirt roads.

Exploratory wells generally would require the construction of new roads, rather than the extension of an existing road. By contrast, for development of in-fill wells, extension of an existing road up to several hundred feet would be typical. Both the roadbed and shoulder areas of all roads would be maintained during drilling and production to provide a smooth surface and

adequate drainage. Repairs, such as culvert repairs and replacements, would also correct normal wear and tear or storm damage.

Electrical Distribution Lines and Substations

Distribution lines are used to supply power to individual wells. During exploration, if an electrical distribution line is not readily available, a diesel-powered generator may be used to provide power to a well in a remote location. Depending upon the commercial success of the exploration well and the extent of the oil and gas reservoir, if additional wells are drilled, electrical distribution lines would be extended to the new wells. If the existing electrical distribution system is not adequate, additional electrical facilities and distribution system may be constructed.

Electrical distribution lines would be connected to the public utility transmission grid via a local electrical substation. The California Public Utilities Commission (CPUC) defines distribution lines as electrical lines under 50 kilovolts (kV). CPUC General Order 131-D exempts distribution lines from CPUC review; however, utility companies need approval from local jurisdictions regarding land use.

For the purposes of this analysis, it was assumed that for each well 467 feet of distribution line would be constructed. Distribution lines are assumed to be suspended from wooden poles 30 feet tall. Electrical conductor (wire that conducts electricity) is 12 kV and is stepped down to 480 volts before being connected to individual motors. Electrical distribution poles are typically approximately 200 feet apart and would be scattered throughout the site, depending upon the number of wells or other equipment requiring electricity. Distribution poles are assumed to be constructed along the existing access road rights-of-way (ROWs) or within the well pad area. Therefore, ground disturbance for distribution line construction was assumed to be included in the new oil and gas well disturbance acreages.

Activities associated with distribution lines include the installation, use, maintenance, modification, repair, replacement, and removal of subsurface, surface, and aboveground lines. Switching and transformer facilities are also typical oilfield infrastructure to manage electrical distribution facilities. In contrast to onsite "distribution lines" (i.e., below 50 kV), which are extended, as necessary, to supply power to individual wells and equipment, "transmission lines" are defined by the CPUC as 50 kV and above and are used to transport large amounts of power from the source of electricity generation (a power plant) to industrial, commercial, and population centers. Extending existing high-voltage electric transmission lines (i.e., lines above 50 kV) to provide a permanent supply of electricity to a new well pad or facility may be required. However, transmission lines above 50 kV are regulated by the CPUC and would require separate project-level CEQA review. Construction of new transmission lines is not within the scope of this EIR.

Drilling and Well Completion

Drilling

Well drilling is the process of drilling a hole in the ground for the purpose of extracting crude oil or natural gas resources or for the injection of a fluid from the surface into a subsurface oil or gas reservoir. Drilling may be "exploratory" or "development" (sometimes referred to as "in-fill" drilling. Exploratory drilling is intended to verify where hydrocarbon deposits exist, or to define the lateral limits of hydrocarbons outside of a known producing area (referred to as a "step-out zone"). Development or in-fill drilling is intended to maximize recovery of oil and natural gas within the defined and known subsurface reserves as established during the exploratory phase. Development drilling consists of drilling wells to extract known hydrocarbon resources to efficiently maximize the development of the reservoir or field. Most current drilling projects are classified as development or in-fill within existing administrative boundaries of oilfields. In addition to exploratory wells, production wells, and injection wells, other wells may include observation wells, which are used to monitor reservoir temperatures, or water monitoring wells, which are used to observe and monitor water quality.

After the well pad is prepared, the drilling rig and associated equipment would be brought to the site and assembled. While the number of workers required for drilling may vary, it is anticipated that 12 workers would be required per well. Due to the complexity of drilling and the hazards associated with leaving a well unattended during the drilling process, drilling operations are conducted 24 hours a day. Night lighting is required in order to maintain continuous drilling operations.

During a standard hydraulic fracturing operation, there are up to approximately eight to 15 employees on each shift, and usually no more than one shift is needed per day. Additional personnel from the owner/operator may be onsite to observe and run ancillary equipment, as necessary.

Although the depth of each well varies, wells in the Western Subarea average 2,305 feet, wells in the Central Subarea average 10,414 feet, and wells in the Eastern Subarea average 2,220 feet. Depending upon the depth of the formation, some wells may take less than 24 hours to drill, while some wells in deeper formations may take more than 60 days to drill. For the purposes of the EIR, it is assumed that wells take 23 days to drill on average, ranging from a minimum of 18 days to a maximum of 28 days, depending on well depth. While drilling continues, temporary oil, water, and gas handling equipment, such as tanks, vessels, pumps, and compressors, would be located onsite, as needed. Depending upon the location of the operation and the intensity of activities in the area, drill rigs would be powered by diesel- or gasoline-fueled generators or by local electrical service, where available, as described above in the "Distribution Lines" subsection.

All drilling activities would occur on the well pad.

Well Completion

After a well has been drilled, well completion activities are conducted. Well completion activities include the following:

- **Casing and Cementing:** Production casing (metal pipe) is set into the wellbore at the appropriate depth in compliance with DOGGR requirements. Drilling mud is first pumped through the casing to ensure consistent and unrestricted circulation of fluids in the wellbore. Cement is then pumped into the casing via a cement truck, the volume of which depends upon the specific requirements of that well. When the cement reaches the bottom of the casing, it flows out of the casing and up into the space between the wellbore and casing until it reaches the surface. This process encapsulates the casing in a cement sheath, isolating the casing from the surrounding geologic formation. The hydraulic isolation formed by the hardened cement protects groundwater by preventing oil and gas reservoirs and the groundwater from contaminating each other and seals the hydrocarbon zone. This seal allows the drilling crew at the surface to control the fluid extraction process. Casing and cementing is completed as stipulated by DOGGR regulations and in accordance with Title 14 CCR, Division 2, Chapter 4, Subchapter 1, Article 3, Sections 1722, 1722.2, 1722.3, 1722.4, 1722.5 and 1722.6. DOGGR engineers are required to be present for tests and other operations, and additional casing is required in freshwater zones to protect water quality, as well as to seal off anomalous pressure zones and isolate production.
- **Open-Hole vs. Cased-Hole Completion:** An "open-hole" completion refers to a well that is drilled to the top of the hydrocarbon reservoir. The well is then cased and cemented with the only hole in the casing being at the bottom. Also known as "top sets" and "barefoot" completions, open-hole completions are used to reduce the cost of casing where the reservoir is consolidated (e.g., where a reservoir is encapsulated in a solid geologic formation, such as a larger reservoir encased in bedrock). In contrast, a "cased-hole" completion requires casing to be run farther into the reservoir. Special tools, such as perforation guns, are then lowered into the casing until they reach reservoir level, and used to perforate the casing and cement, thereby creating holes into the reservoir. The holes in the casing and cement allow hydrocarbons to flow into the casing and up to the surface. Cased-hole completion is effective when the reservoir is less consolidated (e.g., when there are dispersed pockets of hydrocarbons throughout the reservoir).
- **Sand Control Techniques:** Depending upon the formation, a filtration system may be required to allow production of formation fluids while restricting the entry and production of formation sand. If necessary, a casing liner, which is a type of casing with holes or slots placed opposite a producing formation, is used to prevent sand from entering the well. Additionally, gravel packing is a method used in which a slotted or perforated liner, often wire-wrapped, is placed in the well and surrounded by gravel. If open-hole, the well is sometimes enlarged by underreaming at the point where the gravel is packed. The mass of gravel acts as a filter, which excludes sand from entering the wellbore, but allows the continued flow of hydrocarbons.

- **Wellhead Installation:** Wellhead installation (also known as a "production tree" or "Christmas tree") and pumping unit installation are the final steps in the well completion process. The wellhead device includes casing heads and a tubing head and allows operators to control subsurface conditions from the surface of the well.
- **Flowline Installation:** Flowlines are typically built for new wells and are installed aboveground on concrete or wooden sleepers or metal pipe supports. The pipeline runs from the nearest gauge station to the edge of the well location. Gauge stations serve as collection points for production fluids from nearby wells and allow for the flow testing (oil and water) of each well. The final section of flowline connecting to the wellhead is installed after the drilling rig finishes drilling the well and moves off the location.
- **Artificial Lift System:** Most wells require some form of artificial lift to bring produced fluids from the reservoir to the surface and move the fluids to a tank farm. The most common type of artificial lift is the pumping unit working in conjunction with a sucker rod pump system. These systems consist of a prime mover (usually an electric motor), a gear reducer, the pumping unit that translates the rotating motion of the electric motor into reciprocating motion, the sucker rod string that extends down the well bore inside a production tubing string, and the subsurface pump located near the bottom of the well. A production rig is usually required to install the downhole components of the system (tubing, rod string, and pump). The pumping unit is installed immediately adjacent to the wellhead such that the reciprocating motion will alternate between lifting and lowering the rod string. A column of production fluid will be further lifted inside the tubing string with each stroke of the pumping system. Artificial lifts may be powered by electrical power or in remote locations where electrical infrastructure does not exist, by internal combustion engines. Other types of artificial lifts employed are electrical submersible pumps and gas jacks.
- **Electrical Power**: Electrical power to operate the pumping unit motor is required at each well. Power is distributed throughout the oilfield at the 12kV level and then stepped down to 480v before connection to individual motors. The appropriate motor starter equipment is installed near each well.
- **Workover Rig**: Well completions may occur with the drilling rig onsite or the drilling rig may be removed. A workover rig could replace the drilling rig or the completion design may be rigless.

Oil and Gas Treatment Facility Construction

Production fluids from the wells must be separated into the individual components prior to sale or custody transfer to pipeline systems. In larger oil fields, produced gas is typically first separated from the oil and water liquids at a centralized gas treatment plant. The liquid oil and water (typically a mixture composed of 3 to 10% oil and 90 to 97% water) are further separated at oil treatment facilities, such as tanks in smaller operations, or in treatment plants in larger oil fields. The oil, gas and produced water separation and treatment process and related facilities area described in more detail below. The potential new land disturbance that could be associated with

future oil, gas and produced water treatment plants and facilities is included in the disturbance acreage estimates discussed above and in Appendix F.

Water Treatment Facility Construction

Water treatment facilities are generally used to treat produced water for reuse in enhanced oil recovery (EOR) activities. EOR treatment generally involves water softening or removal of salts and other constituents for steam generation purposes. As discussed in Section 4.9, produced water is also treated and blended with other water sources by the Cawelo Water District in the Eastern Subarea for agricultural irrigation purposes. Depending on facility design and intensity of the treatment process, the facilities can also provide for reuse of the produced water, including but not limited to, agricultural irrigation, land restoration, and animal stock drinking water. It was assumed that for every 27 wells, a centralized water treatment plant would be constructed, and the average water treatment plant would require 0.11 acres of disturbance. The potential new land disturbance that could be associated with future EOR and agricultural reuse produced water treatment plants and facilities is included in the disturbance acreage estimates discussed above and in Appendix F.

Steam Generator Construction

Thermal enhanced oil recovery production techniques may require the use of steam, which may necessitate the installation of steam generators. Steam generators are large heaters that generate steam, usually from produced groundwater. These generators are typically powered by electricity or natural gas. A thermal generator may be installed at an individual injection site or built in a centralized location to reach multiple injection sites. A water storage tank would be connected to the thermal generator, and aboveground pipelines would connect the thermal generator to the injection sites. The decision to construct a centralized steam generator would be based on whether cogeneration facilities were or were not located nearby, and whether it is more economically viable to build a centralized steam generator rather than a cogeneration facility. The number of wells that can be served by a single steam generator is determined by the amount of steam required to effectively heat the reservoir and the size of the generator unit itself. For the purposes of this EIR, it was assumed that for every 30 to 60 wells, a centralized steam generator would be constructed. The average industrial boiler system would require 1 acre of disturbance per generator. Generators may be co-located with other equipment (e.g., separation tanks, etc.).

Some existing oil and gas production operations utilize cogeneration facilities to provide the steam required for enhanced oil recovery. However, it has been more than 10 years since the last cogeneration facility was proposed and approved. In the intervening years, the electricity markets have changed substantially in ways that make it less attractive to construct new cogeneration facilities in many locations. Due to these changes, it is uncertain whether any new cogeneration facilities would be proposed, and any estimate regarding the number or technology for future cogeneration facilities would be entirely speculative. For these reasons, cogeneration facilities proposed in the future, if any, will require a CUP and separate CEQA review, as appropriate.

Construction of Tankage and Containment Structures

In compliance with EPA SPCC requirements and DOGGR facilities regulations, secondary containment structures would be constructed around tanks, chemical containers, etc., to ensure that oil or chemicals are not discharged into natural drainage ditches and the environment. Corrugated pipe filled with concrete, concrete berms, and earthen berms are typically used and are designed and constructed to contain a minimum of 110% of the volume of the largest tank that is located within the facility. Various sizes of tanks typically are utilized to store oil prior to offsite transport. Such storage facilities can range in size from small to large tank arrangements with supportive piping and conveyance facilities.

Pipeline Installation

Pipeline installation activities include new construction and maintenance of pipelines, access roads, related support facilities (e.g., aerial and ground markers, spans, meter sites, etc.), storage tanks, valve stations, regulators, and compressor stations. Pipelines are installed to transport produced oil, water, and natural gas into storage tanks or separation tanks for further processing. Pipelines are also required to pump water, steam, or other substances into the reservoir during well stimulation and enhanced oil recovery procedures. Construction of the following types of pipelines is considered within the scope of this Project:

- **Flowline or Injection Line**: any pipeline that connects the wellhead to a manifold (header) or to production facilities.
- **Gathering Line**: a pipeline (independent of size) that transports liquid hydrocarbons between any of the following: multiple wells, a testing facility, a treating and production facility, a storage facility, or a custody transfer facility.
- **Header**: a pipe arrangement that connects flowlines from several wellheads into a single gathering line. A header has production and testing valves to control the flow of each well, thus directing the produced fluids to production or testing vessels. Individual gas/oil ratios and well production rates of oil, gas, and water can be assigned by opening and closing selected valves in a header and using individual metering equipment or separators.
- **Pipeline**: a tube or system of tubes used for transporting crude oil and natural gas from the field or gathering system.

In general, most onsite pipelines, such as those described above, are installed aboveground but may also be installed underground, if necessary (e.g., to cross a roadway). Some portions of pipelines are installed aboveground on the surface of the well pad and do not require further ground disturbance if production facilities are not co-located at the well pad. However, additional clearing and grading would be required for pipeline segments that cross outside of the well pad area. In these cases, the pipeline would generally run along the existing roadway, if possible. Permanent disturbance would occur from sleepers, pipe racks, and any new access roads that may need to be constructed. If the pipeline runs under a roadway or is required to be placed

underground, the construction process would involve clearing, trenching, shoring (as appropriate), pipe laying, pipe zone backfill, trench backfill, and final grading. Although buried pipelines would create more temporary disturbance than aboveground installations and require more earthmoving, disturbance would be temporary. For excavation, repair, or replacement of transmission lines, a width of 100 feet or less is typically required for pipelines. Equipment may include a crane, backhoe, flatbed trucks, welding equipment, pick-up trucks, and additional personnel. The duration varies with the length and size of the transmission line being replaced or repaired. Cathodic devices may also be installed and maintained to protect pipelines from corrosion as a result of low pipe to soil electrical potential.

A pipeline corridor width of 20 feet or less is typically required for pipeline installation. Depending upon the size and nature of the pipeline, construction equipment may include a crane, backhoe, flatbed trucks, welding equipment, pick-up trucks, and additional personnel. For the purposes of the EIR, it was assumed that the workers required for pipeline installation activities are included in the workforce numbers for well pad construction, drilling, and completion activities. The potential new land disturbance that could be associated with future pipeline construction is included in the disturbance acreage estimates discussed above and in Appendix F.

Construction of distribution pipelines (i.e., pipelines intended to transport crude oil to an oil refinery) was not included in these estimates. Distribution pipelines were assumed to be existing and would not be constructed under this proposed Project.

Cathodic protection systems may also be installed and maintained to protect pipelines and well casings from corrosion. Cathodic protection is carried out by including the metal to be protected as part of a low voltage electrical circuit (as the cathode) along with a separate sacrificial metal (as the anode). The anode material is more easily corroded and prevents the pipeline or well casing from degradation by soil side corrosion.

The type of cathodic protection used varies by location and field conditions. Typical groundbed designs include both impressed current and galvanic/sacrificial anodes. Common impressed current anodes are tubular and solid rod shapes or continuous ribbons of various materials, including high silicon cast iron, graphite, mixed metal oxide, platinum and niobium coated wire, and other materials. The most common galvanic/sacrificial anode used is magnesium. Primarily used for pipeline cathodic protection, the magnesium anodes are manufactured in various sizes and are prepackaged in gypsum backfill to maintain low resistance to earth. Anodes may be arranged in vertical or horizontal/distributed groundbeds. Typical vertical groundbed installations vary in depth from 10 to 420 feet and are installed by use of auger or drilling equipment with a diameter of <12 inches. Typical horizontal/distributed groundbed installations vary in depth from 8 to 10 feet and may be installed by use of trenching equipment adjacent to the pipeline within the pipeline corridor.

Construction of Sumps, Evaporation Ponds and Percolation Ponds

A sump is a lined or unlined excavated depression in the ground which collects crude oil, produced water, or solids, such as drilling muds or cuttings, in oil producing fields. Drilling sumps are utilized to collect drilling fluids and cuttings (collectively known as "drilling muds"), which are produced during drilling operations. Operations sumps are utilized to store fluids and solids, which are produced during the life of the operational well as well as potential workover activities. Sumps are used in combination with other separation and treatment facilities and may be in greater or lesser use depending upon the size of the operation. For example, larger operators rely more heavily on aboveground tank systems, while smaller operators rely more heavily on sumps due to the dispersed nature of production

A percolation pond is used to dispose of water associated with hydrocarbon production by percolation into the soil. A natural or artificial evaporation pond is a pond with a large surface area that is designed to efficiently evaporate water by exposure to sunlight. Percolation and evaporation ponds vary in size, but are typically between 2 and 5 acres and can be as shallow as 5 feet deep. Drilling sumps and operations sumps and ponds are subject to state and, where applicable, federal permit requirements. In general, the use of drilling sumps has been reduced in the Project Area as well field operators increasingly utilize closed-loop drilling systems that avoid mud or fluid discharges to land during the well drilling process.

Installation of Produced Water Injection Wells

Injection wells used for disposing produced water are sited in underground formations, such as sandstone, that are porous and permeable enough to accept injected fluids or gas. Rock formations in the zones that are utilized for injection are covered by impermeable formations, such as shale, in order to isolate the injected liquids from potential migration to other formations.

Injection wells are drilled, cased, and cemented similar to production wells, or in some cases, production wells are converted into injection wells. Several tests are then run to make sure the injection well is operating properly and the injected fluids are confined to the intended injection zone. As discussed in Section 4.9, all injection wells must be permitted by DOGGR in accordance with federal requirements under a primacy agreement with the EPA.

Fencing

Fencing may be installed around the perimeter of a site to provide for security, health and safety, as well as for environmental protection to prevent unauthorized access that could cause habitat disturbance, such as off-highway vehicle (OHV) activity. Various types of fences are utilized. Use of existing roads and some off-road travel would be required to access the perimeter fence or for fence installation. In larger extraction-level operations, fencing may not be required because wells are in remote locations and operations are conducted over 24 hours. Therefore, there are

fewer security issues in these areas. In contrast, in more urban settings, such as areas within the Metropolitan Bakersfield Planning Area, fencing is required for security and aesthetics.

Administrative Building Construction

Most employees doing construction and maintenance work on wells and oilfield equipment are dispatched from central contracting facilities located in Bakersfield. Some staffed administrative offices are located in wellfields, particularly in more established Tier 1 areas. Administrative offices typically range from 1,000 to 10,000 square feet, depending on the size of the development and number of day-to-day personnel. Future development would rely mostly on existing employee and administrative staffing infrastructure. In addition to office space, an administrative office in an oilfield could include control and monitoring equipment, material storage, an equipment warehouse, restrooms, and a kitchen.

The area for the administrative office would be cleared and graded. An administrative office would also require the installation of a septic system (or connection to sewer service if available), water connection, electrical and telecommunication hook-ups, parking lot, and access roads.

Equipment List

Section 4.3, Air Quality, includes an estimate of equipment type, quantity, and hours per day required for grading, earthwork, and facility construction.

Well Re-Working and Workovers

During production, construction activities include well re-working and workovers. Well re-working and workover construction activities are implemented on existing well pads. A re-work or workover operation generally consists of a rig, support trucks, portable tanks, pumps, and various other equipment (depending on the complexity of the planned work). Most of the portable engines used in these operations are regulated by the California Air Resources Board's (CARB's) portable engine program. Well re-work typically lasts for a period of a few days; however, some large-scale jobs can take a week or more. Well re-working requires filing an NOI with DOGGR for well changes, such as changing the well casing, re-perforating, plugging to produce from shallower levels, and redrilling including deepening and side-tracking. Well workovers are more routine well maintenance activities including liner replacement, casing repairs, pump repair or replacement, well stimulation, and well clean-out (the removal of sand, sediment, or debris build-up or equipment). In an effort to reduce habitat disturbances, existing well pads are used, or sometimes extended, to perform remedial well work. Extensions are only performed if it is necessary to provide a safe well-workover environment.

Ancillary Facility Expansion or Replacement

Over time, existing ancillary facilities may need to be expanded or replaced in order to process production fluids. Expansion may be needed to support drilling of additional wells or because older wells mature changing the oil/water mixtures causing changes to the handling capacity of

the ancillary facilities. Ancillary facilities may also need to be replaced due to age of the equipment which can diminish efficiency and reduce overall processing capacity. The expansion or replacement activities may include expanding the footprint of an existing plant to install new equipment such as tanks, vessels, electrical distribution systems, liquid and gas gathering pipeline systems, and oil/water/gas separation and treatment facilities. A typical expansion or replacement would result in temporary and permanent disturbances of varying extent depending on the site circumstances and size of the expansion project.

Site preparation activities for expansion or replacement projects would be very similar to activities for building a new plant or facility and would include activities such as clearing, grading, construction of tanks, piping, vessels, steam generators, and utilities. Construction of an expansion or replacement facility could result in new land disturbance, which is conservatively assumed in this EIR to be permanent.

The potential new land disturbance that could be associated with future expansion or replacement facility construction is included in the disturbance acreage estimates discussed above and in Appendix F.

Well Stimulation Treatment

Well stimulation can be conducted as part of the well completions process or as part of a well work-over process. This EIR presents the well stimulation practices, including hydraulic fracturing, used in Kern County and as managed by DOGGR. Hyrdaulic fracturing as conducted in other states has different characteristics and, therefore, different environmental impacts. Practices utilized in other states are summarized in Appendix U.

Decisions on whether a well stimulation operation is required are generally dictated by the geologic characteristics of the reservoir. Stimulation is performed on a well to increase or restore production from new or under-producing existing wells. Public Resources Code Section 3157 of Division 3, Chapter 1, as amended, defines oil and gas well stimulation as "any treatment of a well designed to enhance oil and gas production or recovery by increasing the permeability of the formation. Well stimulation treatments include, but are not limited to, hydraulic fracturing treatments and acid well stimulation treatments. Well stimulation treatments do not include steam flooding, water flooding, or cyclic steaming. Likewise, well stimulation treatments do not include routine well cleanout work, routine well maintenance, routine removal of formation damage due to drilling, bottom hole pressure surveys, or routine activities that do not affect the integrity of the well or the formation. Depending on the type of formation and the current state of the wellbore, only one of the following common well stimulations treatment methods may be required on any given well:

Hydraulic Fracturing

Hydraulic fracturing is a type of well stimulation process conducted as part of the well completion process used after drilling and before production. It is designed to open permeable fracture pathways in the hydrocarbon-bearing geologic formation and entails the injection of

"fracture fluid," which is generally comprised of water, a proppant (usually sand or ceramic beads) and carrier fluids (typically proprietary chemicals designed to enhance recovery yields), into a well bore and into the geologic formation to increase the flow of hydrocarbons. Prior to conducting a hydraulic fracturing job, a model is developed that provides guidance on how much fluid and pressure is needed to generate a fracture of a specific desired length. Hydraulic fracturing is then performed in three steps. First, a large amount of hydraulic fracturing fluids are pumped into the well. The high-pressure of the hydraulic fracturing fluids and the continual pumping increases the pressure in the well, eventually clearing or reopening the pore space of the reservoir rocks. This process is carried out until the fracture reaches the desired length. Second, fracturing fluid and propping agents are introduced into the well to extend the breaks and pack them with proppants, or small spheres composed of quartz sand grains, ceramic spheres or aluminum oxide pellets, that hold the fractures open after pumping has ceased. This prevents the geologic overburden from forcing the newly induced fractures closed and allows the hydrocarbons to flow through the open cracks in the reservoir rocks into the well. Third, the well is backflushed to remove the hydraulic fracturing fluids. The hydraulic fracturing fluids are either treated and recycled or disposed along with other oil production by-products. Other well stimulation techniques place various chemicals in the well to react with well bore scale or the productive formation to allow increased well production. Well stimulation can occur multiple times during the well's productive life.

Kern County completed a study in June of 2015 with the following objectives:

- Identify differences in the most prominent plays across the nation;
- Identify the subsequent drilling and stimulation techniques that would apply to wells being drilled in Kern County as compared to those in other shale plays and conventional oil and gas operations conducted across the nations; and
- Highlight the impact differences between them.

One key factor identified in the study was that drilling in Kern County associated with hydraulic fracturing is vertical (or follows conventional methods). The study is attached as Appendix U and is associated with Section 4.9, Hydrology and Water Quality.

Frac-Packing

Frac-packing is another type of operation that can be defined as a well stimulation treatment, depending on how the operation is designed. The frac-packing treatment combines a hydraulic fracturing process with a gravel pack process.

Conventional gravel pack operations are not classified as well stimulation. A gravel pack is a sand control method used to prevent the flow of formation sand into the producing well. In gravel pack operations, a steel screen is placed in the wellbore and the surrounding annulus is packed with prepared gravel of specific size designed to prevent the passage of formation sand. The gravel is circulated into place at pressures below the fracture gradient of the formation. The gravel pack helps prevent formation sand from obstructing the well bore. This method also helps

to prevent damaging equipment and having to dispose of the formation sand after it is separated out of the hydrocarbons produced from the well.

By contrast, in frac-packing operations, the gravel pack is pumped in under pressures high enough to fracture the formation. The operation can be used to create a wider radius screen in formations with unconsolidated or poorly consolidated sands. Depending on how the operation is designed, the frac-packing operation can generate reservoir stimulation effects.

Acid Fracturing and Acid Matrix Stimulation

The primary type of acid-based well stimulations consist of acid fracturing and matrix acidizing. Acid fracturing is the pumping of acid at pressures that exceed the reservoir fracture gradient into the well to dissolve limestone, dolomite, and calcite cement within the reservoir rocks. A matrix acid job involves pumping acid into the well so that it fills the pores of the reservoir rocks. The acids then modify the permeability of the formation by dissolving natural solids that are inhibiting the permeability of the rock. The process enlarges the pores of the reservoir and stimulates the flow of hydrocarbons. Matrix acidizing is regulated as a form of well stimulation under SB 4 if the volume of acid used exceeds the Acid Volume Threshold (as defined in DOGGR regulations, 14 CCR 1761 (a)(3)), unless the treatment as designed does not enhance production or recovery by increasing the permeability of the formation. (Note: Acid may also be injected at lower volumes for well maintenance, which does not increase formation permeability and is not considered a form of well stimulation.) The difference between matrix acidizing and fracture acidizing is that matrix acidizing is done at a low enough pressure such that the reservoir rock is not fractured. In contrast, fracture acidizing involves pumping highly pressurized acid into the well, such that the reservoir rock is physically fractured. Fracturing the reservoir rock dissolves the impermeable sediments, thus creating channels through which hydrocarbons flow.

Hydrochloric acid is a common type of acid used during matrix and fracture acidizing, which removes carbonate reservoirs, or limestones and dolomites, from the rock. Also, when hydrochloric acid is combined with a mud acid, or hydrofluoric acid, the mixture can be used to dissolve quartz, sand, and clay.

In order to protect well integrity, inhibitor additives are introduced to the completed well to prohibit the acid from breaking down the steel casing. Also, a sequestering agent can be added to block the formation of gels or precipitate of iron, which can clog the reservoir pores during an acid job.

After an acid job is performed, the used acid and sediments removed from the reservoir, known as flowback fluid, are washed out of the well. Flowback fluid from well stimulation operations can be handled in several ways. In mature, developed field operations, the most likely scenario is that the well is connected to the field's water handling system, which would pipe the flowback fluid directly into this system. Once it is co-mingled with other fluids and treated, it is disposed of using the common disposal practice of that field. As discussed elsewhere in this document, fluid disposal could be facilitated through waste injection wells or percolation ponds.

Based on data compiled from FracFocus, in 2012, a total of 936 wells in Kern County were subjected to well stimulation treatment regulated under SB-4 (i.e., hydraulic fracturing, acid fracturing, and acid matrix stimulation), including 900 wells in the Western Subarea, 35 wells in the Central Subarea, and 1 well in the Eastern Subarea. The levels and distribution of SB 4 regulated activity in the County would likely be similar in future years. However, to be conservative, an average of 1,200 wells subjected to well stimulation treatment was assumed in the future activity projections (see Table 3-5).

Decommissioning and Abandonment

Wells undergo plugging and abandonment once they can no longer perform their intended purpose and are no longer otherwise needed. Idle wells that are not yet plugged and abandoned must also be maintained in compliance with DOGGR regulations.

In decommissioning a formerly producing oil well, equipment such as pumping units, well cellars, pipelines, and other associated infrastructure would be disassembled and salvaged or appropriately disposed of. Plugs of cement are placed across specified intervals in the well casing to isolate oil and gas zones and to prevent degradation of useable waters. The well casing is cut off below the surface, sealed with a cement plug, and a steel plate is welded across the top of the casing. The well pad location is then restored to grade and allowed to revegetate. Typical construction equipment, such as bulldozers, motor graders, front end loaders, cement and dump trucks, and well workover rigs, would be utilized to accomplish this work. Work is typically restricted to the pre-disturbed areas of the well pad, but some well plugging and abandonments require expansion of the existing well pads to accommodate equipment. Re-abandonment of a well may be required when there is evidence that the original plugging abandonment no longer retains its integrity.

Facilities such as production test setting, including pipe headers, tank farms, valve stations, or pipelines that are no longer needed for operations are dismantled and removed. The length of time necessary to decommission a facility depends on the size.

Decommissioning and abandonment includes closure of sumps when no longer required. Two types of sumps are used in typical oilfield operations, drilling sumps and operations sumps. Their respective uses and closure are described below:

1) Drilling sumps are utilized to collect drilling fluids and cuttings, collectively known as "drilling muds," which are produced during drilling operations. Drilling sumps are typically located adjacent to the well pad and can vary in size, depending on the depth of the well. Drilling sumps are regulated by DOGGR pursuant to 14 CCR Chapter 4, Subchapter 2, Article 3, Section 1770(c) and 1776(a) and (b). The disposal of drilling muds to land is covered under the State Water Resources Control Board State General Order 2003-0003-DWQ for low threat discharges to land and requires sumps covered under this order to be constructed in uncontaminated soils. The drilling muds are non-hazardous and do not contain halogenated solvents. Drilling muds must first be dried prior to back-filling, and the bottom of the sump must be at least 5 feet above

groundwater levels. Fluids must be removed from the drilling sumps within 30 days of completion pursuant to DOGGR sump requirements. Drilling sumps must be restored to pre-construction state within 60 days of completion or abandonment of a well pursuant to DOGGR well site and lease restoration requirements.

2) Operations sumps are utilized to store fluids and solids, which are produced during the life of the operational well as well as potential workover activities. Operations sumps can range from small pits located next to the well, to centralized sumps that collect workover fluids at the well site and for transfer to centralized sumps for processing. In accordance with DOGGR Assembly Bill 1960 regulations, fluids from operations sumps must be removed from the sump within 14 days of completion of workover activities.

Decommissioning and abandonment also includes removal of cathodic protection systems, when no longer required. Cathodic protections systems, such as sacrificial anode beds or deep cathodic protection wells, are located throughout Kern County oilfields. Eventually, these systems become depleted and no longer function. When these systems are no longer functional, the cathodic protection wells must be properly abandoned to protect the environment. Kern County Ordinance G-5006 regulates abandonment of deep cathodic protection wells (>50 feet) and permits to abandon these wells are obtained from the Kern County Environmental Health Services Division. Abandonment activities include those actions typically associated with plugging and abandonment of an oil well and site restoration.

Reactivation of Idle Wells

DOGGR defines an idle well as a well that has not been injected into or produced for six consecutive months. Idle wells are created when a well is uneconomical to operate due to the cost of needed repairs, low production rates, or a low price of oil. However, depending on economic conditions, an idle well may become economically viable in the future. Reactivation of an idle well may range from simple activities, such as replacement of a well pump, to well deepening, sidetracking, or re-working.

Project Operational Activities

Project operational activities may include: geophysical monitoring; operation of EOR facilities and production facilities (e.g., tanks, compressors, generators, heater treaters, free water knockout facilities, etc.); water, extraction, use and disposal combustion, steam, gas, and chemical flood projects; pipeline replacement or repair; operation, maintenance, demolition, and removal of equipment, buildings, warehouses, storage yards, offices, and other structures, berms, percolation ponds, fences, distribution lines, and other facilities; production activities; responses to and remediation of spills or emergencies; hydrotesting and other non-destructive testing of pipelines, tanks, and vessels; expansion of active well locations to provide safe well-workover activity; brush and weed removal around production equipment; maintenance of pipeline ROWs; and access road maintenance and use.

Geophysical Monitoring

Geophysical monitoring wells are used to monitor the orientation (azimuth and dip), volume, complexity, and approximate location of fractures in the earth's crust (both natural and man-made). The equipment used is a highly sensitive electric level, containing an electrically amplified fluid filled with bubbles. When the instrument tilts, the bubble shifts to one side and to indicate the direction of the shift. These wells are typically installed on the corner of existing well pads and do not result in any new surface disturbance.

Treatment Processes, Equipment, and Facilities

A variety of surface facilities support oil and natural gas processing and storage. Depending upon the intensity of development and the location of a wellfield, centralized treatment facilities may or may not be constructed. Various sizes of tanks, which are utilized to store oil prior to offsite transport, can range in size from small to large tank arrangements with supportive piping and conveyance facilities.

In addition, the nature of a produced substance dictates the type of facilities required. For example, in many areas in Kern County, an oil/water mixture is produced. The ratio of oil to water differs and is determined during testing. The oil and water must be treated (i.e., separated) so that each substance can undergo further treatment in order to prepare the oil or water for sale, or to prepare the water for reuse in further production operations, for other recycling uses or for disposal. If natural gas is present in the produced oil/water mixture, the gas may be burned off, re-injected into DOGGR-approved gas disposal wells or treated for sale or used as fuel for various production activities. Although the majority of the extraction operations in Kern County are oil production, many wells produce some quantity of natural gas, which may be made available for sale or other use.

Treatment of Produced Fluids

Produced fluids from multiple wells are piped to a centralized production header into a gathering line before entering a separator. In some cases, a test header allows the diversion of fluids from a single well through a well test station. The well test station allows the testing of the well quality and flow characteristics. Once the fluid passes through the well test station, it is typically directed back to the gross line and commingled with the other fluids. Fluids from the gross line are then piped into separators to perform an initial separation of the oil, gas and water. Gas is typically separated earlier in the process by using a larger tank to drop the pressure, thus allowing the gas to break out of the mixture. The remaining oil and water separate from each other as they settle in the "knock out" vessel or tank. Oil is lighter than water, so it rises to the top of the oil/water mixture (referred to as gravity separation). The water can be removed from the bottom of the tank and the oil emulsion skimmed from the top of the tank.

Water Treatment

As described above, the produced oil, gas, and water are separated from each other before the produced water to be used for EOR or agricultural reuse undergoes further treatment. To further

separate the oil and water, the water flows through or is transferred between a series of separator tanks. As the water passes from one tank to the other, it passes through filters, often manufactured out of sand, diatomaceous earth or walnut shells. The oil molecules are larger than water, such that most of the oil adheres to the filters, and the water passes through to the next tank. Air or dissolved oxygen also may be added to produced fluids to encourage separation of oil and water. This process is repeated until the water is treated to the desired level, depending upon its final disposition – either reuse of disposal. Different types of facilities are required depending on the final use of the water. These facilities typically consist of a series of tanks, filters and gathering systems to collect and transport the produced water that is removed from oil. Produced water may also be transported, via truck, to other, existing produced water treatment facilities. These other types of water treatment facilities may require additional capacity to treat produced water prior to reuse or disposal. This could involve expansion of the existing facilities, such as waterflood or steamflood plants which supply injection water or steam for EOR operations, drilling additional EOR injection wells, modifications to increase the pumping capacity, pipeline and distribution systems, as well as converting existing wells from production to injection. Depending on the facility design, the facilities can also provide for the reuse of treated produced water, including but not limited to, agricultural irrigation, land restoration and animal stock drinking water. For more information on produced water reuse and disposal, see the Water Management section, below.

There are four basic physical/chemical treatment processes that allow produced water to be reused in Kern County and surrounding areas with the following end uses: (1) steam generation; (2) agricultural irrigation; (3) aquifer recharge; and (4) surface discharge. These processes increase in complexity and cost from (1) to (4) in accordance with operational and regulatory standards. Although generalized here, produced water treatment processes are based on field-specific characteristics (e.g., water quality parameters of produced water, its possible use considering the treatment available, and end user availability, agreements, and regulatory concerns) so it should not be assumed that the same treatment processes can be adopted uniformly throughout Kern County.

There are multiple ways of treating produced water for steam generation, which can involve the following steps:

1) Collection of water from the bottom of primary, secondary, and tertiary oil/water separation tanks and vessels. This is usually accomplished by gravity flow.

2) Water, nominally containing 200 ppm of free oil content, is fed to various types of flotation systems. Such systems rely on gas bubble creation and injection into the water. These bubbles assist small droplets of free oil to accumulate, and rise to the surface, where they are skimmed off. A polymer chemical may be injected, to aid this process.

3) The water, now containing nominally 20 ppm of free oil, is then sent to an oil removal filter. These often include ground walnut shells, or a walnut/pecan mixture, but multimedia (anthracite/ garnet) and other types of filters can be utilized. These filters will reduce free oil content down to less than 5 ppm.

4) The de-oiled water is now sent to ion exchange softener vessels, which usually include both a primary, and secondary (polisher) softening step. The primary will usually be a Strong Acid Cation softener, which is regenerated using concentrated salt brine. The polisher can be either another Strong Acid Cation softener, or a Weak Acid Cation softener. Weak Acid Cation softeners are regenerated using acid and caustic.

5) The softened water is stored in tanks, ready to be pumped to steam generator or cogeneration sites.

Treatment of produced water for agricultural irrigation (e.g., Chevron's Kern River field) includes steps 1) – 3) above, but not steps 4) – 5) because produced water from this field is often low in mineral content. Even so, the permit to discharge this water to Cawelo Water District relies upon dilution of certain mineral constituents with fresh water provided by the District Dilution takes place in Cawelo Reservoir B.

Treatment of produced water for aquifer recharge (e.g., Chevron's San Ardo Field in Monterey County) generally involves the following steps:

6) Collection, flotation, and filtering, as per steps 1), 2), and 3) above;

7) Cooling;

8) Degasification, through the addition of acid;

9) A chemical precipitation softener, operating at elevated pH (>10);

10) Further cooling;

11) Multi-Media filtration;

12) Weak Acid Cation softeners;

13) Cartridge filtration;

14) A two-pass Reverse Osmosis system;

15) Neutralization with sulfuric acid, and carbon dioxide (CO_2);

16) Calcium chloride injection, to control sodium adsorption ratio;

17) Post-treatment constructed wetlands;

18) Percolation through recharge basins

Treatment of produced water for surface discharge (e.g., Freeport McMoRan's Arroyo Grande field in San Luis Obispo County) is similar to the aquifer recharge scenario described above, but utilizes ceramic membranes to reduce the size of the chemical precipitation softener.

Oil Treatment

When the oil leaves the separator, it is directed to a tank or goes through further separation. Separation may include additional separation time in a knock out vessel or tank, or utilizing a heater treater for the addition of heat, which allows excess water to drop from the oil. Further separation of the oil and the remaining, smaller amount of water is accomplished in a wash tank. Chemicals are usually added to enhance the separation of the oil from the water and increase the efficiency of the system. Typically, saleable oil can be skimmed from the wash tank and moved to a shipping tank. Once the oil meets sale specifications, it is sold and transported primarily by pipeline, but also by truck.

Gas Treatment

Natural gas is usually produced along with the liquid oil and water mixture and separated in the field from the liquids. Some natural gas treatment systems can be extremely simple, such as gas sent from a separation vessel straight to permitted combustion sources, such as flares, generators, or gas disposal wells. If the natural gas is intended for sale to a transportation pipeline, it is typically moved to a central gas treatment plant containing more complex equipment to treat the gas to a desired specification for use or sale to a pipeline system. Separation and compression are typically required. Once the natural gas leaves the separator, it may be compressed to increase the pressure of the gas for treatment. If hydrogen sulfide (H_2S) or other impurities are present, they are removed by scrubbers utilizing a non-hazardous amine system. The natural gas may be further processed at gas plants to remove water and natural gas liquids such as propane, butane and natural gasoline. These natural gas liquids are stored and sold via an adjacent natural gas liquids tanker truck loading facility or sales pipelines. A natural gas liquids loading facility typically consists of tank storage and tanker truck loading racks for delivery to offsite purchasers. Natural gas is delivered to these facilities via pipelines from the gas processing facilities. Processed natural gas is then either transported through sales pipelines to sales metering stations to natural gas purchasers, or may be combusted as fuel for gas-fired equipment, or re-injected in oilfield operations for reservoir pressure maintenance.

Gas gathering, gas sales and gas reinjection systems utilize field compressors and pipelines to transport the natural gas to its intended use. Field gas compression facilities typically consist of an electric or natural gas-fired compressor engines. To the extent practicable, existing systems are used. Staging and installation activities occur on adjacent existing disturbed areas when possible. As gas operations vary over time in the field, relocation of these units is sometimes necessary to optimize gas operations. Natural gas pipelines would be extended along existing ROWs when possible to minimize new disturbances.

In certain instances, the produced gas stream associated with oil production may contain constituents that make it unsuitable for resale or use in onsite facilities. In these instances, the produced gas stream is gathered via small pipelines using a system of vapor recovery units. The gas is then transported via pipeline to a dedicated "waste gas" injection well that disposes of the gas into depleted oil reservoirs. Waste gas injection wells are permitted as Class II injection wells by DOGGR. Among other requirements, the permitting process involves calculating the

estimated gas storage volume of the depleted reservoir and evaluating the integrity of any existing wellbores within a quarter-mile of the proposed injection well before the well is authorized. Monitoring requirements for H2S and limitations on injection pressures are commonly attached to the permit conditions. Quarterly reports are filed with DOGGR that summarize the content of the waste gas stream being injected.

Water Management

Water is required for a variety of purposes related to oil and gas extraction activities, including the following:

- Drilling operations;
- Well Stimulation (including hydraulic fracturing);
- Workover activities;
- EOR (such as water and steam flooding);
- Hydrostatic Testing (to test pipeline and well integrity);
- Dust Suppression (during well pad and access road construction);
- Sanitary Purposes (associated with ancillary facilities, including for domestic purposes related to office and field facilities); and
- Reinjection to arrest surface subsidence.

Water required for oil and gas extraction activities, including the production of steam, can come from a variety of sources. Depending upon the well's proximity to the water source, water can be transported to the wells via truck and/or pipeline. Common sources include:

- Recycled water from hydrocarbon-bearing formations (produced groundwater), which has been treated as described above;
- Non-potable water from private onsite groundwater wells belonging to the operators;
- Existing surface water entitlements; and
- Public or private water storage districts, which may use water from reservoirs, groundwater, or surface water.

As discussed in Section 4.9, in 2012 the total water demand for oil and gas operations in the Project Area was about 97,590 acre-feet. Produced water was used to meet 88,812 acre-feet, or 91% of the total oil and gas water demand. Other sources, which this EIR conservatively assumes to consist of water suitable for municipal and industrial purposes, accounted for about 8,778 acre-feet, or 9% total oil and gas water demand in 2012.

Oil producers in the southern San Joaquin Valley currently extract about 12 to 13 barrels (42 gallons) of produced water for every barrel of oil produced. Produced water is non-potable because it is produced as an oil/water mixture from a hydrocarbon-bearing formation, generally

contains high salinity, and must undergo treatment before it can be reused for other purposes. The fluid produced from the well dictates the type of production facility required. For wells that produce oil, gas, and water, separation and treatment of these fluids allows the oil and gas to be sold and the water to be disposed of, reused, or re-injected.

Produced Water Reuse for Oil and Gas Activities

As discussed in Section 4.9, about 234,949 acre-feet of produced water was generated in the Project Area during 2012. About 38% of the produced water (88,812 acre-feet) was treated in the manner described above in "Water Treatment" and recycled for well completion operations or EOR activities. About 14% of the produced water (32,771 acre-feet) was treated and supplied to the Cawelo Water District in the Eastern Subarea for agricultural reuse. About 48% of the produced water was disposed into Class II injection wells permitted by DOGGR (84,571 acre-feet) or discharged to surface facilities (30,223 acre-feet). As discussed above, about 91% of oil and gas water demand in the Project Area is met by treating and reusing produced water. In addition to water conservation concerns, operators generally prefer to use produced water as opposed to freshwater in the event that any clays are encountered during drilling. When freshwater contacts clay, the clay swells, effectively blocking any further hydrocarbon production and requiring remedial action to re-stimulate the flow of hydrocarbons. About 9% of the oil and gas water demand, primarily for drilling and steam production activities that require higher-quality water supplies, is met by using municipal and industrial water.

For a description of how water is used in EOR activities, see the Enhanced Oil Recovery (EOR) Activities section, below. For a description of water use during well stimulation activities, such as hydraulic fracturing, see the Well Stimulation Treatment section, below.

Produced Water Reuse for Agricultural Irrigation

Produced water from certain oil fields in the Eastern Subarea is treated and sold to water districts, such as the Cawelo Water District, which sell the water to agricultural operators for use in crop production. The treated produced water is blended with other supplies and subject to water quality requirements under permits issued by the CVRWQCB. As discussed in Section 4.17, of the 2.7 million acre-feet of water used for crop production in Kern County, 32,771 acre-feet (1.2%) in 2012 was derived from produced groundwater that had undergone treatment processes similar to those listed above. Injection wells are described below.

Cogeneration facilities may also use de-mineralized (softened) fresh water for evaporative cooling to increase power output when ambient temperatures are elevated and untreated fresh water for steam condensation, pump seal flushing and other process uses requiring fresh water.

Water Disposal

Water treatment and disposal facilities consist of pipeline gathering systems to collect and transport produced water removed from oil. Excess produced water that is not injected into disposal wells, used for EOR operations or other drilling or well completion activity, may be disposed of in wastewater disposal ponds (also known as percolation or evaporation ponds).

These are regulated under WDRs issued by the RWQCB. The ponds must be maintained in good condition and in accordance with the conditions and monitoring program established in the WDR. The ponds may require periodic renovation to restore their percolation capabilities, by dredging out the ponds bottoms and restoring the original grade of the ponds.

Disposal facilities handle produced groundwater not otherwise utilized and transport water via pipeline to wastewater disposal ponds or to disposal injection wells where the produced water is reinjected into zones, permitted and regulated by the DOGGR underground injection control program. Some of the water sent to disposal wells is also wastewater generated by other oilfield processes, such as brine regeneration in the water softening system.

Enhanced Oil Recovery (EOR) Activities

EOR is a production technique used to increase the mobility of oil, most commonly through steam injection techniques, which reduce the viscosity of the hydrocarbons and allow produced fluids to flow. EOR operations should not be confused with well completion and well stimulation operations as defined by DOGGR. There are three major types of EOR operations: thermal (i.e., steamflood, cyclic steam and in-situ combustion); CO_2 or other gas (miscible and immiscible); and chemical/polymer flooding (i.e., alkaline flooding or micellar-polymer flooding). While cyclic steam operations have been used in California since the 1950s and steamflood operations since the 1960s, EOR operations have increased since the early 1980s as a result of a 1979 Presidential Order that exempted most heavy crude oil from federal price controls in order to stimulate the nation's declining oil production. EOR facilities typically include the same infrastructure as required for oil and gas production: including pipeline distribution, pumps, and compression systems to supply and deliver the material being utilized for EOR to the reservoir, injection wells and observation wells, and production wells, as well as the associated oil, gas and water separation and processing equipment and facilities. Process water for EOR activities is typically composed of treated produced water. Treatment of produced water is described under the Water Management section, above.

DOGGR overseas the state's Underground Injection Control Program, which permits and regulates injection wells for waste disposal and wells for increasing oil recovery through EOR. Wastewater injection wells are described in the Injection Wells section, below.

Thermal

With thermal EOR, steam is injected on either a continuous ("steam-flood") or an intermittent ("cyclic steam") basis. Depending on the geologic properties of the formation being steamed, different types of cyclic steam operations may be designed. The injected steam may also include proprietary chemical additives to enhance the thermal recovery of heavy oil. These differences are explained in further detail below. Steam may be produced via steam generators or cogeneration facilities. Cogeneration facilities are used to produce heat for thermal process use, thermal EOR, and the generation of electric power for use by the oilfield operator, or for sale to other operators.

- **Steam-Flood:** Steam-flooding involves injecting a continuous rate of steam into the reservoir through dedicated wells (steam injectors) to heat up heavier oil to the point it can flow to the wellbore. For production zones using a continuous steam-flood EOR method, injection and observation wells may be placed into the intended reservoir in a specific pattern to sweep the reservoir so as to displace oil and gas to an adjacent ring of producing wells for recovery. These wells can be an existing wellbore converted to an injection or observation well or new wells can be installed for these purposes, which would be constructed as described above under the Construction Activities section. Once established, the EOR pattern is typically developed outwards in a concentric fashion to sweep a larger portion of the reservoir. Pipeline and infrastructure expansions are conducted to support the EOR from the new portion of the reservoir.

- **Cyclic Steam:** Cyclic steam or intermittent injection of steam into producing wells can be one of three types: (1) maintenance cyclic steam; (2) cyclic steam injected below the reservoir fracture pressure; or (3) cyclic steam injected above the reservoir fracture pressure. Maintenance cyclic steam refers to steam used on an infrequent basis on heavy oil producing wells within a steam-flood where there are dedicated injectors. Steam is injected below formation fracture pressure to clean the wellbore or provide near wellbore heating to allow better reservoir fluid influx from the reservoir to the wellbore through perforated casing or slotted liner.

  Cyclic steam can also be used in areas where the reservoir is cold and there are no dedicated steam injectors. This technique involves alternating steam injection and production in the same wellbore. In this method steam is not continuously injected but, instead, a pre-determined rate of steam is injected into an oil-producing well on an intermittent basis. In these types of operations, the steam typically is applied on a predetermined basis (e.g., every several weeks) or can be applied as determined by the production trends of the individual well. The operation is designed to lower the viscosity of oil and produce the reservoir fluids from the same wellbore. After steaming, the well is shut-in for a period of time to allow the steam to condense and transfer heat to the reservoir (referred to as the soak period). After the soak period, which varies per well and formation, the well is opened up, hydrocarbons begin flowing into the well casing, and production continues.

  Cyclic steam injected below the reservoir fracture pressure is used where the reservoir has moderate to high permeability to lower the viscosity of the heavy oil. Cyclic steam injected at or above the reservoir fracture pressure is conducted in reservoirs characterized by low permeability to create and improve connectivity in the reservoir, lower the viscosity of oil and produce the reservoir fluids from the same wellbore. For cyclic steam operations, the depth of the formation and geologic properties of the over laying formations determine whether site specific mitigations are required to ensure that that the injection fluid is confined to the permitted zone or zones of injection. These determinations are made by DOGGR based on the site-specific geologic characteristics.

DOGGR is in the process of developing regulations that will apply to various types of thermal steam production operations. This EIR is intended to cover all activities that will fall within the scope of the new DOGGR regulations once they have been adopted.

Gas Injection

Gas injection EOR techniques use gases to enhance production. Gases that expand in a reservoir without mixing with the oil are called immiscible gases. Immiscible gases effectively push the reservoir oil toward a producing well where it is recovered to the surface. In contrast, gases that mix with the oil are called miscible gases. Miscible gases lower the oil's viscosity thus enabling the oil to flow easier to the well bore for recovery. Examples of immiscible gases that could be used in these operations include natural gas, nitrogen, or CO_2. Miscible gases include propane, methane enriched with other light hydrocarbons, methane under high pressure, and CO_2 under pressure.

Water Flooding (Water Injection)

Water flooding is the process of injecting water into the reservoir via an injection well for the purposes of "sweeping" the hydrocarbons to a nearby production well where it can be recovered to the surface.

Chemical Injection

Chemical injection involves the use of long-chained molecules called polymers to increase the effectiveness of water floods or the use of detergent-like surfactants to help lower the surface tension that often prevents oil droplets from moving through a reservoir. Chemical techniques are rarely used in the United States for EOR operations; however, there are three types of chemical injection techniques used in Kern County:

- **Polymer Flooding:** Polymer flooding involves mixing polymers with injection-water to increase water viscosity. Increasing the viscosity puts pressure on the reservoir, pushing the oil from the injection well to the producing well.
- **Surfactant Flooding:** Surfactant flooding involves pushing a "soap" through the reservoir to reduce the surface tension of oil droplets. Reducing the surface tension increases the mobility of the oil, stimulating production.
- **Surfactant Polymer Flooding:** Similar to Surfactant Flooding except that no alkali is used. Used in reservoirs where more saline water is present.

Injection Wells

Injection wells used for disposing produced water are sited in underground formations, such as sandstone, that are porous and permeable enough to accept injected fluids or gas. Rock formations in the zones that are utilized for injection are covered by impermeable formations, such as shale, in order to isolate the injected liquids from potential migration to other formations.

Injection wells are drilled, cased, and cemented similar to production wells, or in some cases, production wells are converted into injection wells. Several tests are then run to make sure the injection well is operating properly and the injected fluids are confined to the intended injection zone. As discussed in Section 4.9, all injection wells must be permitted by DOGGR in accordance with federal requirements under a primacy agreement with the EPA.

Injection wells are used to increase oil recovery and to safely dispose of the water associated with oil and natural gas production and waste gas. Injection wells are classified by the EPA into six classes according to the type of fluid they inject and where the fluid is injected. The Project, for purposes of this EIR, includes only "Class II injection wells," which include wells that inject brines and other fluids associated with oil and gas production, or storage of hydrocarbons. Class II well types include salt water disposal wells, enhanced recovery wells, and hydrocarbon storage wells (EPA 2012). As of January 1, 2013, there were more than 42,000 Class II wells in Kern County, including production wells that are temporarily idled for steam or water EOR injection.

All Class II injection wells are regulated by DOGGR, under provisions of the state Public Resources Code and the federal Safe Drinking Water Act (DOGGR 2013d). (Note: The Project does not include hazardous and non-hazardous waste injection wells into the lowermost source of drinking water, or any other regulated category of injection well.)

Injection wells may be located within the wellfield or fluids may be trucked from treatment tanks onsite to commercial injection facilities located apart from the oilfield operations.

Sumps

As discussed above, a sump is a lined or unlined excavated depression in the ground which collects crude oil, produced water, or solids, such as drilling muds or cuttings, in oil producing fields. For example, a sump allows oil producers to store oil temporarily if a storage tank needs to be drained and repaired. Sumps are also used in tank overflow situations. In other cases, the sump collects water and allows the water to percolate into the ground in lieu of a disposal well in areas where groundwater is absent or compromised (i.e., where groundwater formations are saline or contain high levels of dissolved solids, making the groundwater non-potable prior to oil and gas development in the area). Sumps are used in combination with other separation and treatment facilities and may be in greater or lesser use depending upon the size of the operation. For example, larger operators rely more heavily on aboveground tank systems, while smaller operators rely more heavily on sumps due to the dispersed nature of production. The following types of operational sumps typically have been associated with oil and gas production in Kern County:

- **First Stage Production Sump:** A sump that receives a stream of crude oil and produced water directly from an oil production well(s) or a field gathering system(s). This type of sump is no longer in service. First stage fluid production is sent to tanks.

- **Second Stage Sump:** A sump that receives produced water from one or more upstream first stage separation processes, including sumps, free water knockout vessels, wash tanks, etc.
- **Third Stage Sump:** A sump that receives produced water from one or more upstream second stage sumps, or subsequent separation processes.

The SWRCB has issued general WDRs for discharges to land with a low threat to water quality (Water Quality Order No. 2003-0003-DWQ), which covers evaporation and percolation ponds for the following:

- Wells/Boring Waste, Well Development Discharge, Monitoring Well Purge Water Discharge, Boring Waste Discharge;
- Clear Water Discharges, Water Main/Water Storage Tank/Water Hydrant Flushing, Pipelines/Tank Hydrostatic Testing Discharge, Commercial and Public Swimming Pools;
- Small/Temporary Dewatering Projects (such as excavations during construction); and
- Miscellaneous, Small Inert Solid Waste Disposal Operations and Cooling Discharge.

Percolation and Evaporation Ponds

Similar to a sump, a percolation pond acts as a holding facility while gravity allows the water to percolate or seep through the soils. A percolation pond is used to dispose of water associated with hydrocarbon production. A natural or artificial evaporation pond is a pond with a large surface area that is designed to efficiently evaporate water by exposure to sunlight. Percolation and evaporation ponds vary in size, but are typically between 2 and 5 acres and can be as shallow as 5 feet deep. Some facilities contain multiple ponds totaling as much as 80 acres. The CVRWQCB adopts site-specific WDRs for percolation and evaporation ponds.

Vegetation Control

Vegetation along roadsides and critical facilities such as tank settings and compressor stations is controlled as needed through the use of mowing, grading, weed-whacking, and spot treatments of herbicides approved by USFWS and CDFW. This activity typically occurs in previously disturbed sites. Application of herbicides to prevent re-growth of vegetation in and around facilities is limited and only certified applicators and licensed firms are used.

Spill Prevention, Control, and Countermeasure (SPCC) Procedures

Assembly Bill 1960, passed in 2008, required DOGGR to prescribe, by regulation, standards for oil and natural gas production facilities. These regulations were developed to ensure that industry operations remain protective of the environment and reduce the risk associated with leaks and spills through a comprehensive regulatory program, and address the following areas:

- Life of well/life of facility bonding requirements;
- Facility maintenance standards including:
  - Requirements for secondary containment around permanent facilities,
  - Maintenance, testing, and leak detection standards for tanks and tank bottoms,
  - Pipeline installation and testing standards,
  - Requirements for idle and out-of-service facilities;
- Spill Contingency Plan; and
- Inspection and document retention requirements.

In addition, in accordance with EPA SPCC rule (40 CFR part 112), facilities storing, processing, refining, using, or consuming oils must prevent a discharge of oil into navigable waters or adjoining shorelines. Facilities that qualify under this rule must prepare and implement a SPCC Plan. Although each SPCC Plan is unique to the facility, there are certain elements that must be described in every SPCC Plan including:

Prevention Measures: Steps that a facility owner/operator can take to prevent oil spills could include:

- Using containers designed for the oil stored;
- Providing overfill prevention for oil storage containers (e.g., a high-level alarm or audible vent);
- Periodically inspecting and testing pipes and containers. Visually inspecting aboveground pipes and oil containers according to industry standards; leak testing buried pipes when they are installed or repaired, and including a written record of inspections;
- Implementing security measures to prevent acts of vandalism, including locks, motion activated lights, and enclosed storage; and
- Providing annual trainings and briefings regarding revisions to the SPCC for trained personnel.

Control Measures: Steps that a facility owner/operator can take to control oil spills could include:

- Providing sized secondary containment for bulk storage containers, such as a dike or a remote impoundment. The containment needs to hold the full capacity of the container plus possible rainfall. The dike may be constructed of earth or concrete;
- Providing general secondary containment to catch the most likely oil spill where oil is transferred to and from containers and for mobile refuelers and tanker trucks (e.g., sorbent materials, drip pans or curbing for these areas); and

- Detailing response measures, including shutting down pumps or equipment, identifying and securing source of the discharge and containing the discharge with sorbents, sandbags, or other material from the spill kits, if safe to do so.

Countermeasures: Steps that a facility owner/operator can take to clean and mitigate oil spills could include:

- Identifying the reporting requirements of regulatory authorities and other response personnel and organizations after the discovery of a discharge (including DOGGR's San Joaquin Valley Oil Spill Reporting Criteria; Assembly Bill 1376). The reporting requirement should detail the reportable quantity requirements for each contact, contact information, and a list of information to be provided to the contacts regarding the discharge;
- Identifying contaminated soil through visual and olfactory senses and soil sampling (testing);
- Monitoring air quality during excavation of contaminated soil;
- Collecting water from decontamination procedures and treating or disposing of it at an appropriate disposal site;
- Identifying appropriate transportation and disposal facilities. Procuring all necessary permits and pay necessary fees, for the transport and disposal of contaminated soils;
- Excavating contaminated soil. If temporary stockpiling of contaminated soil is necessary, implementing control measures to prevent discharge; and
- Defining discharges that can be remediated by onsite personnel (e.g., managed with shovels) and discharges that required assistance from a cleanup contractor (e.g., mobilization of heavy equipment, construction of berms, and excavation of contaminated soils).

In compliance with EPA SPCC requirements and DOGGR facilities regulations, secondary containment structures are required to be constructed around tanks, chemical containers, etc., to ensure that oil or chemicals are not discharged into natural drainage ditches and the environment. Corrugated pipe filled with concrete, concrete berms, and earthen berms are typically used and are designed and constructed to contain a minimum of 110% of the volume of the largest tank that is located within the facility. Periodic inspections of secondary containment berms would be conducted to ensure that the integrity has not been compromised, and maintenance work is conducted as necessary.

Oil spill prevention and cleanup measures are required at bulk storage tanks, facility transfer operations, loading and unloading racks, production facilities, and oil drilling facilities. Mechanical containment, chemical and biological methods, and physical methods are used. Some spills can require minimal efforts to remediate (i.e., managed with shovels), however, larger spills may require mobilization of heavy equipment, construction of berms, and excavation of

contaminated soils. All of the related oil spills prevention measures and the cleanup plans must be in accordance with EPA and DOGGR regulations.

Releases from unplanned events, such as power outages, wildfires, extreme weather, etc., equipment failures, and emergencies have the potential for impacting the environment during and after the response to the release. In addition, unknown contaminated sites, either related or not related to oil and gas activities, could be discovered that would require investigation, characterization and remedial action. Remedial activities normally involve site sampling to characterize the magnitude and extent of the contamination. Risk-based corrective measures are then developed, and contaminants such as hydrocarbons or other chemicals above action levels would be excavated, removed from the site and properly disposed of. Environmental restoration could also be required at some locations that were heavily impacted.

Non-Hazardous Solid Waste Management

During production, a number of waste management activities are conducted, depending upon the type of waste. The oil industry typically divides oil development non-hazardous solid wastes into two categories: (1) drilling and other wastes associated with exploration and production; and (2) other wastes.

Drilling and Other Associated Wastes

Drilling wastes include drilling muds, drill cuttings, wash water, and other related wastes. The actual amount differs based on the depth of the well. EPA regulations exempt drilling fluids, produced waters, and other wastes associated with the exploration, development, or production of crude oil and natural gas (oilfield wastes) from hazardous waste requirements under the RCRA. California regulations exempt oilfield wastes from designation as a California non-RCRA hazardous waste based on toxicity characteristics. However, California did not adopt state regulations that provide exemptions similar in scope to the federal RCRA exemption and does not offer a blanket exemption from state hazardous waste requirements. Oilfield wastes in California may be considered state hazardous waste and potentially subject to regulation, depending on how they are managed. The generator of the waste has an obligation to properly characterize the waste, either based on generator knowledge of the waste stream or waste-generator process, or by testing representative samples of the waste.

Oilfield-related wastes that exhibit hazardous waste characteristics or that are listed hazardous wastes (e.g., spent solvents), and that are not otherwise excluded or exempt, are typically sent offsite for disposal at facilities authorized by the DTSC or are sent out of state for disposal. However, most drilling and production wastes, including oily dirt from spill cleanup operations and produced water, are nonhazardous and, thus, not subject to regulation by DTSC. Allowable methods for managing these wastes include the following:

- Underground injection such as in disposal wells;
- Onsite burial such as in pits, and landfills;

- Land treatment such as by land spreading, land farming, and road spreading;
- Evaporation;
- Discharge to percolation ponds;
- Offsite disposal; or
- Recycling.

Other Waste

Other types of waste generated in the course of oilfield operations include wood, metal equipment parts, damaged tools, construction debris, excess soil and vegetation generated from cutting and grading, wood, concrete residue, pallets, cardboard boxes, papers, plastics, banding materials, scrap steel, scrap aluminum, scrap wire, and general trash. These wastes are collected at specially permitted in-field solid waste transfer stations or disposed of in onsite permitted facilities, or transported to offsite landfills or recycling facilities as appropriate on a regular basis. Transfer stations consist of containers where waste is collected for transfer to Kern County landfills or other approved sites. It is estimated that 11 cubic feet of road mix would be generated per well. Excess soil and vegetation (mulched) found to be nonhazardous could be used as ground cover.

Land farms accept biodegradable non-hazardous oily materials and are permitted by the RWQCB. Daily operations at permitted land farms in the Project Area include, but are not limited to, the discharge, spreading and discing of the biodegradable non-hazardous oily wastes. Other activities within or adjacent to the pre-disturbed land farms area might include: (1) vacuum truck washouts and sumps; (2) portable tank staging; and (3) drainage control grading maintenance.

Well, Pipeline, Tank and Vessel Testing and Maintenance

Well Mechanical Integrity and Standard Annular Pressure Testing

If a well has been idle for several years, prior to resuming production, DOGGR requires that the well be tested to determine the integrity of the well casings and to ensure that casings effectively isolate the well from the surrounding formations. A pressure test is conducted using a fluid to fill the annular space between the casing, tubing and packer. Pressure is maintained for a specified period of time at a specified pressure. If the closed system retains pressure after the pressure source is removed, the well is determined to have mechanical integrity. Loss of test pressure during the procedure indicates a lack of mechanical integrity in which case downhole components are leaking and require corrective action prior to returning the well to service. The tests are conducted by well servicing equipment that is restricted to the existing well pad.

Pipeline, Tank and Vessel Testing and Maintenance

Pipelines, tanks, and vessels are hydrostatically tested to meet regulatory pressure requirements. To conduct a hydrostatic test, a section of a pipeline is filled with fresh water, and the pressure is increased to determine whether there are any leaks. If pressure is lost during the test, then the pipeline is repaired before being put back into service. The hydrostatic test water can be stored in

tanks, released in sumps, or collected for transport to existing wastewater disposal facilities. Fluid disposal complies with the requirements of the RWQCB.

Other types of non-destructive testing include radiography, ultrasonic testing, and electromagnetic testing. These methods monitor thickness of pipe walls or coatings, identify cracks in joints, welds or pipeline components, or detect other defects and anomalies. Areas of potential weakness caused by corrosion, erosion, or stress are then identified so that corrective action can be taken.

Pipeline maintenance also includes pigging, which is a method of using a mechanical device called a "pig" to scour the inside of a pipeline. Pigging helps keep the line clean and protects it from erosion. Pigs are introduced into a section of pipeline to be cleaned or tested at a "pig launcher" facility and removed from the pipeline at a "pig receiver" facility. These launching and receiving facilities typically have secondary containment structures such as lined or concrete pits to contain liquids generated from the cleaning and testing. "Smart pigs" containing electronic instruments are used to conduct surveillance and testing of pipelines.

Steam Generators

As described above, steam generators are used to generate steam for thermal enhanced oil recovery. Steam generators are large heaters that generate steam, usually from produced groundwater. These generators are typically powered by electricity or natural gas. A thermal generator and water storage tank may be installed at an individual injection site or built in a centralized location to reach multi-injection sites. Aboveground pipelines would connect the thermal generator and water storage site to the injection sites. Generators may be co-located with other equipment (e.g., separation tanks), etc.

Electric Distribution Line and Substation Maintenance

Electrical distribution networks and substations require periodic maintenance, repairs, and upgrades. For electrical distribution lines, this work requires a bucket truck and pick-up trucks that drive to individual pole locations. These activities utilize existing roads and occasional cross country travel. No new roads are created for these activities. Substation repairs and upgrades are infrequent. These activities involve replacement or upgrades of switches, transformers, and conductors within the footprint of the substation. Due to the size of some of the equipment, delivery could be required by semi-truck. Cranes, bucket trucks, and crew pick-ups trucks are typically used in these activities, as well.

Access Road Maintenance

Both the roadbed and shoulder areas may be maintained to provide a smooth surface and adequate drainage. Repairs will occur, as needed, to correct normal wear and tear or storm damage such as culvert repairs and replacements

Distribution of Crude Oil

Crude oil produced in Kern County is shipped to offsite storage facilities or refineries to be processed into gasoline and other products via distribution pipelines, and/or tanker trucks. Railcars are not used for crude oil transportation of crude produced in Kern County. There are 22 refineries and about 52 related storage distribution facilities operating in California (CEC 2008); only three refineries and 23 storage distribution facilities are located within the Bakersfield area of Kern County (CEC 2012). However, no improvements, expansions, or modifications to existing refineries or storage distribution facilities in Kern County are anticipated as part of the proposed Project.

Transmission Pipelines

Transmission pipelines are used to transport produced crude oil to refineries or to offsite storage facilities. The vast majority of crude oil produced in Kern County is transported via transmission pipelines (95 to 98%). Produced crude oil is pumped into each oil production operation's onsite storage facility. transmission pipelines from the operation's onsite storage facility. All three refineries and storage transmission facilities operating in Kern County are connected to the existing produced crude oil distribution pipeline network.

Newly constructed transmission pipelines (e.g., from new wells) are generally connected to the existing network of transmission pipelines which already serve established wellfields, rather than directly to the intended destination.

Transmission pipelines can range in size from 6 inches to 42 inches in diameter and are typically located underground. Twenty-inch transmission pipelines can move crude oil at a rate of about 4,000 barrels per/hour. Due to the viscosity and inertia of the crude oil, some transmission pipelines systems require external heating. Booster stations are placed at intervals on the line where heating and or pumping units facilitate the flow of the crude oil through the line (CEC 2006).

Distribution pipelines are regulated by the State Fire Marshal's office pursuant to California Government Code Section 51010 et seq. The State Fire Marshal ensures that all intrastate non gravity-fed (or at a stress level above 20%) pipelines transporting crude oil meet the requirements of the Hazardous Liquid Pipeline Safety Act (49 United States Code [U.S.C.] Sec. 2001 et seq.) and federal pipeline safety regulations, as necessary to obtain annual federal certification. The construction of distribution pipelines requires several approvals by federal, state, and local agencies, depending on the location, in addition to certification and decisions on state and federal environmental documents.

Tanker Trucks

Crude oil is also distributed to refineries or to offsite storage facilities using tanker trucks. Two to 5% of crude oil produced in Kern County is transported via tanker trucks to central facilities. At times the trucks carry crude to local refineries, other times trucks carry crude to a facility where it is placed into a pipeline system. In either case, crude oil would be loaded into tanker trucks

directly from the operation's onsite storage facility. All three refineries and related storage distribution facilities in Kern County are equipped to accept oil from tanker trucks. The crude oil delivered to storage distribution facilities would later be pumped into a distribution pipeline or tanker trucks to transport the crude oil to offsite locations.

A typical tanker truck is able to transport 9,000 gallons of crude oil. The transportation of crude oil via tanker truck is regulated by Caltrans and U.S. Department of Transportation (USDOT) motor carrier regulations.

Administrative Building and Personnel Housing

As described in the Construction Activities section, above, some staffed administrative offices are located in wellfields, particularly in more established Tier 1 areas. Administrative offices typically range from 1,000 to 10,000 square feet, depending on the size of the development and number of day-to-day personnel. In addition to office space, an administrative office in an oilfield could include control and monitoring equipment, material storage, equipment warehouse, restrooms, and a kitchen. Personnel would be present in the administrative office during business hours, generally from 6:30 a.m. to 4:30 p.m., five days a week.

Sanitary wastewater for administrative offices in communities such as Bakersfield are managed through the municipal wastewater treatment systems, and for offices in oilfields wastewater is managed with septic systems. Existing septic systems are maintained by pumping on a regular schedule by approved septic pumper subcontractors. The wastes are hauled offsite to an approved disposal site. Repairs to existing septic systems or installation of new systems require a building permit from the Kern County Building Department. Septic systems must comply with the Uniform Plumbing Code unless the system size/soil conditions require an engineered septic system. Engineered septic systems are designed by a civil engineer and plans are submitted to Kern County Building Department for approval.

Oilfield personnel may also utilize mobile housing facilities. These facilities provide up to 50 spaces for recreational vehicles or travel trailers to house onsite oilfield personnel on a rotating basis. Such facilities provide living quarters for personnel of the oil company owning the property and are accessory and incidental to existing oilfield operations. Additional RVs/travel trailers travel with drilling rigs and are used as living quarters for drill crew members.

3.5.4 Truck Trips

A description of round-trips associated with the Project is provided in Section 4.16, Transportation and Traffic. The Applicant's Traffic Study (see Appendix W) includes more details regarding vehicle trips. For purposes of this EIR, truck trips include both construction vehicles and the light-duty pick-up trucks and automobiles used most frequently by staff servicing oilfield equipment.

3.5.5 Best Management Practices

The following Best Management Practices (BMPs) were submitted by the Project Applicant on October 30, 2013. These BMPs were considered in preparing this EIR, and in many instances are already required by applicable law and regulations. For purposes of analyzing the potential significance of an environmental impact, the EIR does not assume that any of these BMPs will be implemented. Many of these BMPs (or measures that are similar to or more protective than these BMPs) have been included in this EIR as Mitigation Measures, which are enforceable obligations of Applicants and are included in the MMRP.

Operational Provisions

1. All drilling installations and operations shall comply with the requirements of state law and with applicable fire and safety ordinances and regulations of the County of Kern.
2. Proven technological improvements generally accepted and used in drilling and production methods shall be employed as they may become available if they are capable of reducing nuisances or annoyances.
3. All derricks, boilers, and other drilling equipment employed pursuant to this section to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well shall be removed within 90 days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derricks, boilers, and drilling equipment are to be used within a reasonable time, as determined by the Planning Director, for the drilling of another well or wells on the premises.
4. Any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Planning Director may approve the use of a standard type of derrick.
5. Whenever a well is located within 500 feet from an existing dwelling unit, except in case of an emergency, no materials, equipment, tools, or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 a.m. and 8:00 p.m., unless otherwise required by DOGGR to protect the integrity of the well bore or to protect public health, safety, and the environment.

Compliance with Other Regulatory Agency Requirements

1. All applicable federal, state, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:
   - California Division of Oil and Gas and Geothermal Resources;
   - Kern County Fire Department;
   - Kern County Health Department;
   - USFWS;

- CDFW;
- DTSC;
- RWQCB;
- SJVAPCD; and
- Kern County Engineering, Survey and Permitting Services Department.

Land Use

1. Drilling shall not be commenced within 100 feet of any existing residence without the written consent of the owner of such structure.
2. No oil or gas well shall be drilled within 100 feet of any public highway or building not necessary to the operation of the well (or within 150 feet of any dwelling,), or within 300 feet of any building used as a place of public assembly, institution, or school, or within 50 feet of any building utilized for commercial purposes constructed prior to the commencement of such drilling, without the written consent of the owner of such structure. This provision does not apply to administrative and other buildings that are ancillary to oil and gas operations.
3. Whenever oil or gas is produced into and shipped from tanks located on the premises, such tanks, whenever located within 500 feet to any dwelling or commercial building, shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping or shall be fenced in such a manner as to, insofar as practicable, screen such tanks from public view. Such fencing shall comply with the requirements of DOGGR.

Agricultural Resources

1. When the applicant/operator is conducting operations on land that has surface co-users, it shall engage the other user(s) and ensure principles/guidelines are established for work in the area (gate closures, potential crop damage and subsequent management, safety of workers in the area, etc.).
2. Fugitive dust emissions from un-surfaced access roads and construction sites shall be managed as per SJVAPCD regulations or as needed to ensure worker/receptor safety.

Biological Resources

1. Within 14 days before any ground disturbance activities on previously undisturbed property, a qualified biologist shall conduct a focused survey to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential impacts to sensitive species onsite. The survey shall be conducted in accordance with the standard protocol of USFWS and CDFW.
2. If take of covered endangered or threatened species has the potential to occur, the appropriate USFWS and CDFW Endangered Species Act compliance provisions shall be followed.

3. Operator shall, by appropriate design, maintain ground openings in order to protect wildlife from becoming entrapped within them. Leakage from facilities which may impact wildlife shall be minimized.
4. If the operator, its employees, contractors, or agents kills or injures a state or federally listed species, or finds any such animal dead, injured, or entrapped, operator shall notify the CDFW and USFWS immediately. The operator shall also contact the local CDFW warden. A qualified biologist shall document all circumstances of death, injury, or entrapment of state or federally listed species. The biologist shall: (1) take all reasonable steps to enable the individual animal to escape, if it is entrapped; (2) contact CDFW or other appropriate authorities to identify an approved rehabilitation center and appropriate capture and transport techniques, if the animal is injured; and (3) if the animal is dead, document circumstances of death in writing and photograph the dead animal in situ.
5. All vehicles shall observe a speed limit of 25 miles per hour or less on non-public roads during construction, operation and maintenance activities. When necessary, a lower speed limit may be implemented.
6. All pipe 3-inch or greater in diameter stored overnight on a location must have end caps that prevent wildlife from entering the pipe.
7. All food-related trash such as wrappers, cans, bottles and food scraps shall be disposed of in closed containers only, and regularly removed from the Project site. Feeding of wildlife is prohibited.
8. An educational briefing shall be conducted for all Project personnel on previously undisturbed property prior to the start of the covered Project/activity. The briefing shall include a discussion of all sensitive species that may be encountered in the Project Area, the laws and codes that affect protected species and the protection measures that must be followed to avoid and minimize impacts.
9. The Applicant/Operator shall consult with the CDFW as necessary to determine if a Section 1600 Streambed Alteration Agreement will be required for Project implementation.
10. Prior to construction in any potential wetland drainage feature, a wetland delineation report shall be prepared by a qualified consultant and any recommendations implemented.

Soils and Geological Resources

1. Design runoff control features related to oilfield structures and activities to minimize soil erosion.
2. Minimize ground disturbance and control erosion by avoiding steep slopes and by minimizing the amount of surface disturbance needed for roads, well pads, pipelines, and electrical lines. Keep equipment and vehicles within the limits of the initially disturbed areas to the extent possible.

Water Resources

1. Avoid streams, wetlands, and drainages, where possible. Locate access roads to minimize stream crossings and to minimize impacts where crossings cannot be avoided. Obtains CDFW Streambed Alteration Agreement prior to any work in a state jurisdictional waterway.
2. The Applicant/Operator shall obtain coverage under and comply with the terms of the appropriate storm water permit and shall develop a storm water management plan to ensure compliance with state regulations and prevent offsite migration of contaminated storm water or increased soil erosion.

Flooding

1. Well pads should be developed outside 100-year floodplains, where possible.

Fire Safety

1. Drilling and production activities shall conform to all applicable fire and safety regulations, and firefighting apparatus and supplies required by the Kern County Fire Department shall be maintained onsite at all times during drilling and production operations.
2. Applicant/Operator shall minimize human-caused wildfires by carrying water or fire extinguishers and shovels in non-passenger vehicles in the field. The use of shields, protective mats and other fire prevention methods shall be used during grinding and welding to minimize the potential for fire. Personnel shall be trained regarding potential fire hazards and their prevention.

Odor Management

1. When adjacent to residential uses, the Operator shall undertake an odor minimization measure to reduce or eliminate odors from oilfield equipment, including wells and drilling operations.

Noise

1. Operate pumping wells by electric motors or muffled internal combustion engines.
2. Locate all stationary construction equipment (i.e. compressors and generators) and exploratory and production wells as far as practicable from nearby residences and other sensitive receptors. If drilling equipment will be placed near residences or other sensitive receptors, sound walls should be installed during drilling activities.
3. Route heavy truck traffic supporting construction and drilling activities away from adjacent residences and other sensitive receptors.

Aesthetics/Visual

1. The height of all pumping units shall not exceed 60 feet measured from the base of the pumping unit, unless required to lift reservoir fluids, and shall be painted and kept in neat condition.

Health Safety

1. Sanitary toilet and washing facilities, if required by the Kern County Environmental Health Services or other governmental agencies, shall be installed and maintained in a clean and sanitary condition during drilling operations, and at such other times as specified by these agencies.

Public Safety

1. After production begins and a pump is installed on the wellhead, a fence at least 6 feet in height shall be installed around the pump site or drilling island for public safety. This fence shall be constructed of chain link with wood or metal slats or other screening fence as may be approved by the Planning Director. This fencing and screening requirement shall apply only to those pump sites located within 500 feet of any dwelling. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

Air Quality

1. Development and operation of stationary source facilities shall comply with all SJVAPCD rules and regulations.
2. Fugitive dust emissions from un-surfaced access roads, maneuvering (turn-arounds), parking areas, and construction sites shall be managed as per SJVAPCD regulations, or as needed to ensure worker/receptor safety.
3. Minimize the amount of well site disturbance and areas cleared of vegetation.
4. Use dust abatement techniques, in accordance with SJVAPCD regulations, on unpaved surfaces where adjacent to residential use to minimize airborne dust during earthmoving activities.
5. Post and enforce speed limits to reduce airborne fugitive dust caused by vehicular traffic.

Cultural and Paleontological Resources

1. During all phases of the Project, keep equipment and vehicles within the limits of the disturbed well site areas as much as possible.
2. Should cultural, archaeological or paleontological resources be identified on the Project site during any ground disturbing activities related to the Project, ground disturbing activities proximate to the Project shall cease. Operator shall notify and retain a qualified archaeologist or paleontologist to provide an evaluation of the find in conformance with CEQA Guidelines Section 15064.5.
3. If human remains are found during construction, further work or disturbance of the site will be halted. The discovery will be inspected and the remains handled in a manner consistent with California Public Resources Code Section 5097.98-99, Health and Safety Code 7050.5 and CEQA Section 15064.5.

Lighting

1. The Applicant/Operator shall ensure that any exterior night lighting installed within 500 feet of residences utilize low intensity, low glare design, minimum height, and be hooded to direct light downwards.

Spill Prevention and Remediation Measures

1. Oil and chemical spills shall be cleaned up in accordance with the EPA SPCC Plan for the site to protect personnel, wildlife, and habitat provided, however, that nothing herein contained shall be construed to alter operator's obligations under existing laws and regulations. When a spill occurs, emergency actions to stop the spill or leak as soon as possible and ensure the safety of personnel shall be taken.

Oilfield Waste Management

1. Oilfield waste (hazardous and non-hazardous) shall be managed as required by rules and regulations and shall be properly disposed of at an appropriate facility.

Signage

1. Signs shall be limited to directional, warning, and identification in connection with oil, gas, or other hydrocarbon drilling and development operations.
2. No signs, other than directional and warning signs and those required for identification of the well, shall be constructed, erected, maintained, or placed on the premises or any part thereof, except those required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.

Abandonment/Reclamation

1. Within 60 days after any well has been placed in production, or after its abandonment, earthen sumps used in drilling or production or both (unless such sumps are to be used within a reasonable time as determined by the Planning Director for the drilling of another well or wells) shall be filled and the drilling site restored as nearly as practicable to a uniform grade. Temporary earthen sumps may be used for cleanout or remedial work on an existing well or other production facility. However, these sumps shall be filled and the site restored as nearly as practicable to uniform grade within 60 days after the cleanout or other remedial work is completed. Such restoration work shall comply with all applicable regulations of DOGGR. Centralized drilling sumps serving multiple drilling locations are allowed provided: (1) the existence of the centralized facility reduces the number of sumps used by the operator; (2) the sump remains in active use and has not been idle for more than 60 days; (3) appropriate steps have been taken to screen the sump for protection of wildlife; and (4) the sump is maintained and operated in accordance with all applicable rules and regulations of DOGGR and the Central Valley RWQCB (CVRWQCB).

2. Reclamation and re-vegetation of abandoned or disturbed areas no longer needed for oil and gas activities shall be implemented to minimize erosion and reduce air pollution from disturbed areas. Re-vegetation shall be in accordance with native vegetation in the immediate area.

3.6 Project Objectives

3.6.1 County Objectives

The County has defined the following objectives for the Project:

- Update the County's Zoning Ordinance to include additional procedures and compliance standards that address changes in laws and regulations by other agencies, and technological advancements within the oil and gas industry, for the purpose of reducing or eliminating potential significant adverse environmental impacts, to the extent feasible, of future oil and gas activities and, thereby, ensure that current County ordinances reflect the County's interest in protecting the health, safety and general welfare of residents and visitors.
- Encourage ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County, which enables the County to invest in capital improvement projects and social programs, which benefit County residents, retail businesses, and capital industries, which ensures the County's fiscal stability.
- Continue Kern County's ongoing commitment to consult and cooperate with federal, state, regional, and local agencies by periodically reviewing adopted regulations to ensure the long-term viability of Kern County's resources.
- Continue to improve and streamline current energy regulations and increase County monitoring and involvement in state and federal energy legislation.
- Protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting sustainability and encouraging BMPs, which are mutually beneficial, through strategic short and long range planning.
- Ensure the protection of environmental resources by emphasizing the conservation of productive agricultural lands, the encouragement of planned urban growth, the promotion of clean air strategies to address existing air quality issues, and the promotion of long-term water conservation strategies which will ensure the quality and adequacy of surface and groundwater supplies for future growth of all of Kern County's industries.
- Contain new development within an area large enough to meet generous projections of foreseeable need but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County.

3.6.2 Applicant Objectives

The Project proponents have defined the following objectives for the Project:

- Create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County of Kern, as well as the DOGGR and other responsible agencies.
- Achieve an efficient and streamlined environmental review and permitting process for all oil and gas operations covered by the proposed Project.
- Provide for economically feasible and environmentally responsible growth of the Kern County oil and gas industry.
- Develop industry-wide best practices, performance standards, and mitigation measures that ensure adequate protection of public health and safety and the environment.
- Increase oil and gas exploration and production in Kern County as a means of reducing California's dependence upon foreign sources of energy.
- Increase oil and gas exploration and production in Kern County as a means of increasing employment opportunities and economic prosperity for Kern County's residents, businesses, and local government.

3.7 Cumulative Projects

CEQA requires that an EIR evaluate a project's cumulative impacts. Cumulative impacts are the project's impacts combined with the impacts of other related past, present, and reasonably foreseeable future projects. As set forth in the CEQA Guidelines, the discussion of cumulative impacts must reflect the severity of the impacts, as well as the likelihood of their occurrence; however, the discussion need not be as detailed as the discussion of environmental impacts attributable to the project alone. As stated in CEQA, Public Resources Code, Section 21083(b)(2), "a project may have a significant effect on the environment if the possible effects of a project are individually limited but cumulatively considerable."

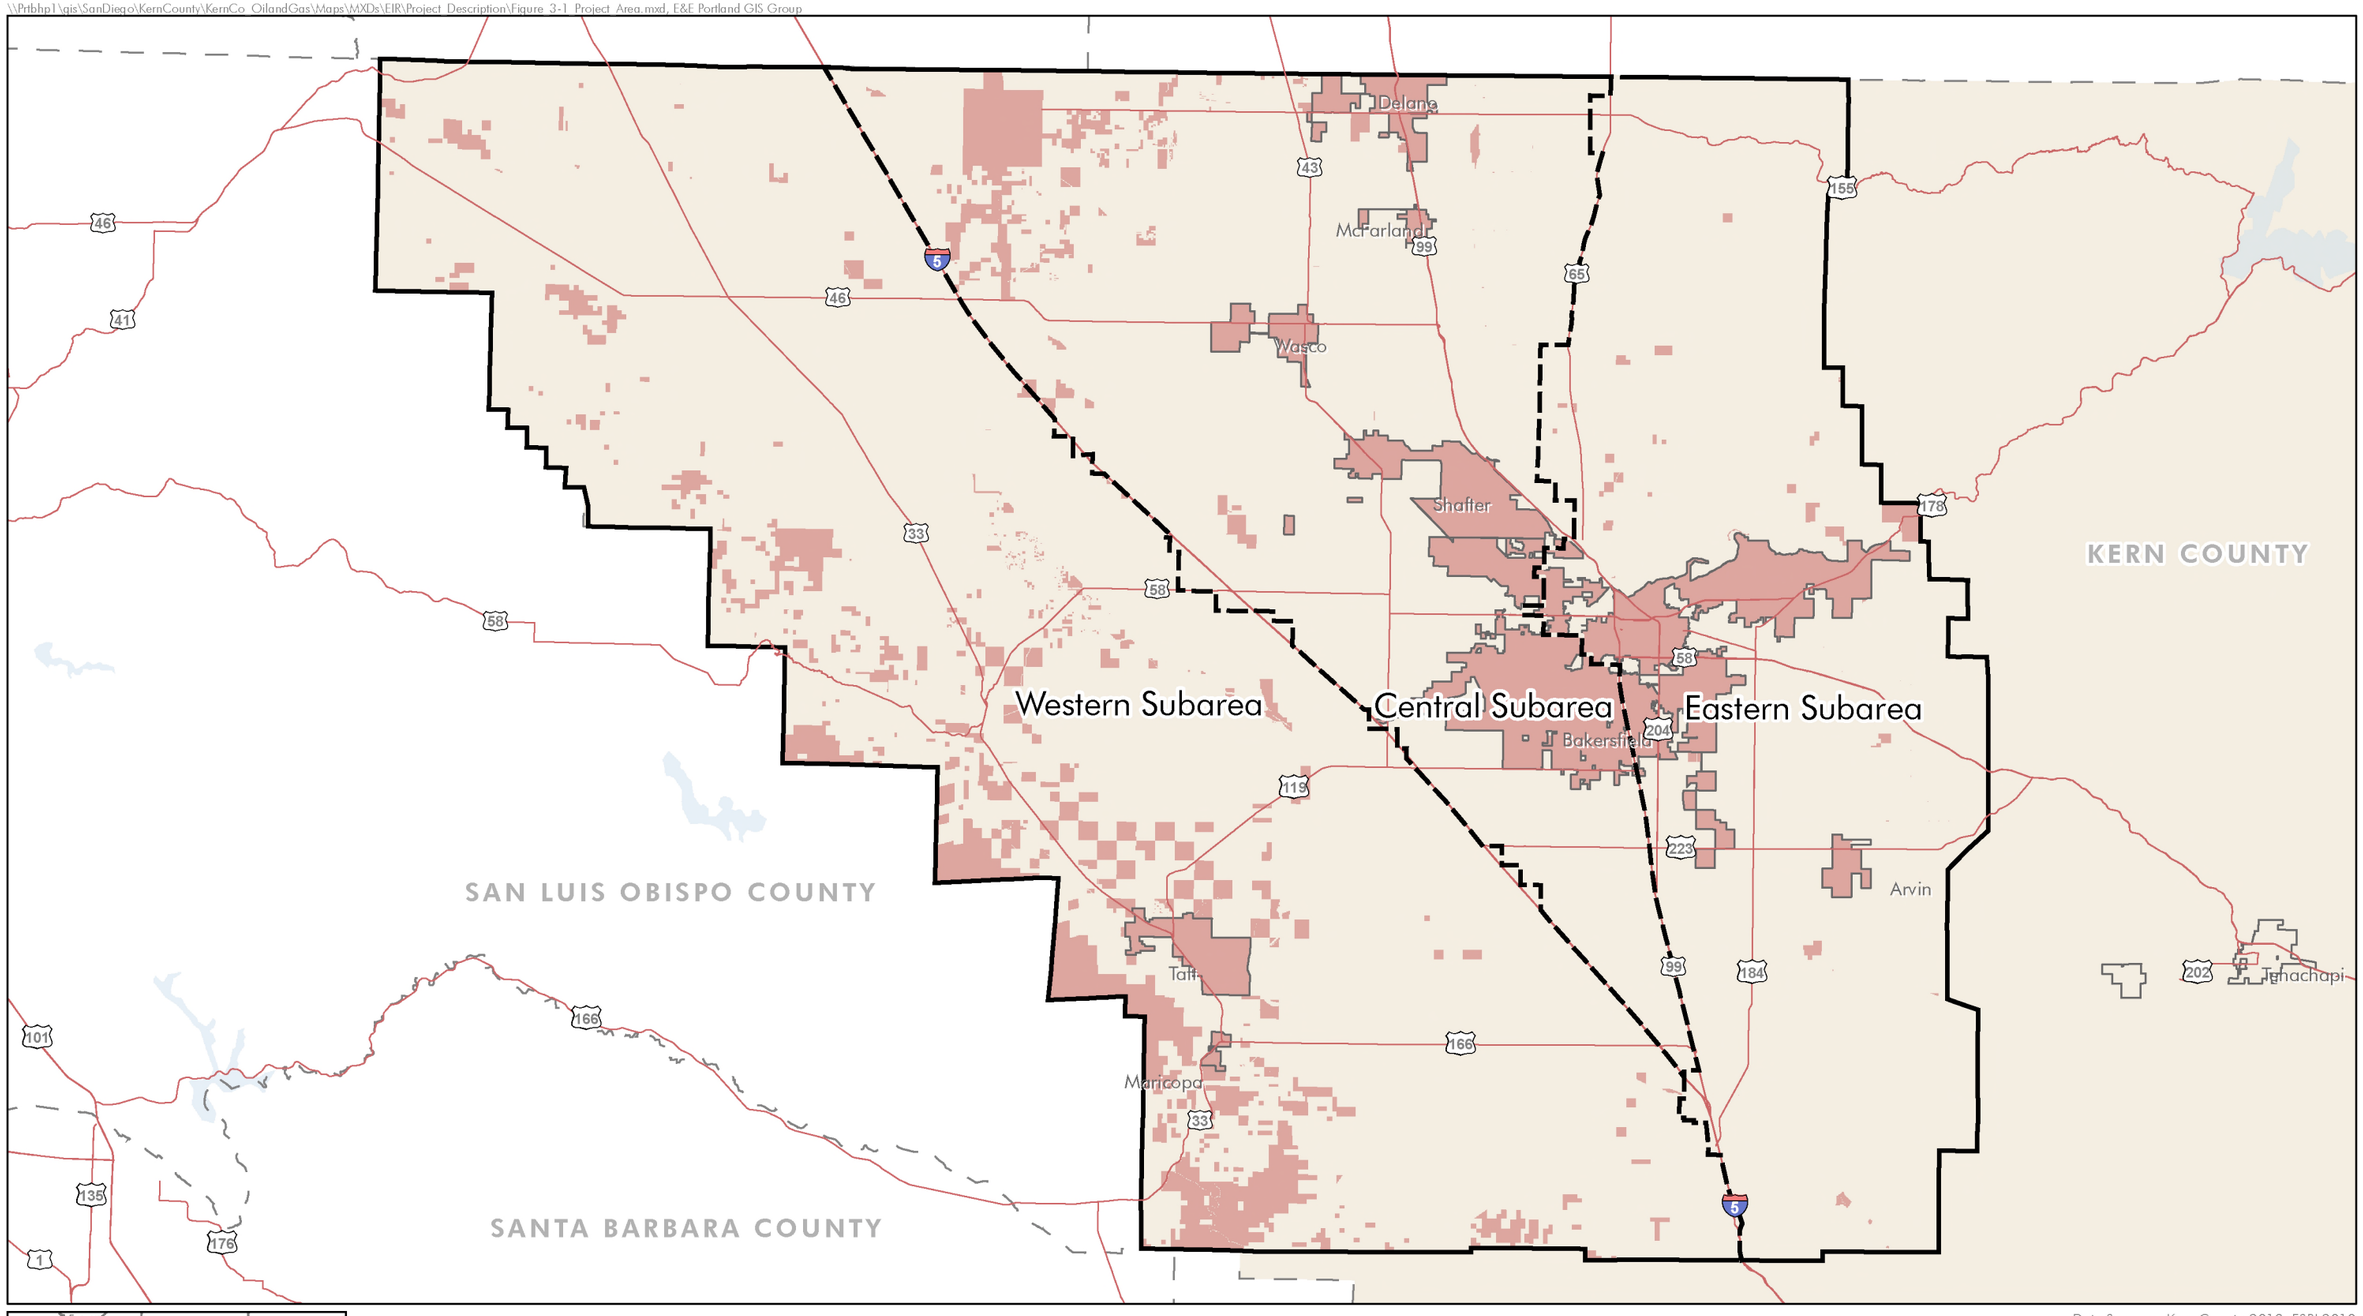
According to Section 15355 of CEQA Guidelines:

Cumulative impacts refer to two or more individual effects, which, when considered together, are considerable and which compound or increase other environmental impacts.

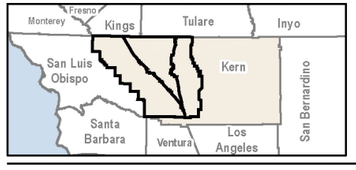
(a) The individual effects may be changes resulting from a single project or a number of separate projects.

(b) The cumulative impact from several projects is the change in the environment, which results from the incremental impact of the project when added to other closely related past, present, and reasonable foreseeable probable future projects. Cumulative impacts can result from

> individually minor but collectively significant projects taking place over a period of time (CCR, Title 14, Division 6, Chapter 3, §15355).



In addition, as stated in the CEQA Guidelines, it should be noted that:



> The mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable (CCR, Title 14, Division 6, Chapter 3, Section 15064[h][4]). "Cumulatively considerable" means that the incremental effects of an individual projects are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.

Cumulative impact discussions for each environmental topic area are provided at the end of each technical analysis contained within Chapter 4, under "Impacts and Mitigation Measures." As previously stated, and as set forth in the CEQA Guidelines, related projects consist of "closely related past, present, and reasonable foreseeable probable future projects that would likely result in similar impacts and are located in the same geographic area" (CCR, Title 14, Division 6, Chapter 3, Section 15355).

An adequate discussion of significant cumulative impacts must include either a list of past, present, and probable future projects producing related or cumulative effects, or a summary of projections from an adopted local, regional, or statewide plan, related planning document, or related environmental document that describes conditions contributing to the cumulative effect (CEQA Guidelines Section 15130(b)(1)). This cumulative analysis uses the plan/projection approach, and includes both the KCGP and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) approved in 2014.

APPENDIX A - DEFINITIONS

19.98.010 PURPOSE AND APPLICATION

The purpose of this chapter is to promote the economic and streamlined recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety by establishing reasonable limitations, safeguards, and controls on exploration, drilling, and production of hydrocarbon resources. The procedures and standards contained in this chapter shall apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out within the unincorporated San Joaquin Valley portion of Kern County (See Figure 19.98.015). This effective date of this version of Chapter 19.98 is MONTH, DAY, YEAR.

19.98.020 DEFINITIONS OF OIL AND GAS PRODUCTION ACTIVITIES

Oil and Gas exploration and operations contain many highly technical activities. For the purposes of this Chapter 19.98, definitions of activities are located in Appendix A.

19.98.030 TIER AREAS

The Oil and Gas Production Boundary Area is divided into five (5) Tier Areas and depicted in Figure 19.98.015. Changes to the boundries of Figure 19.98.015 shall be through the procedures in Chapter 19.112. The Tier Areas are generally, described as follows:

A. Tier 1 Area is defined as all areas in which oil and gas activity is the primary land use. The existing well and activity densities preclude almost all other uses.

B. Tier 2 Area is defined as all land that is classified with the Exclusive Agriculture (A) or Limited Agriculture (A-1) Districts and has agriculture as the primary land use not already included in Tier 1.

C. Tier 3 Area is defined as other areas not within the Tier 1 Area and in one of the following zone districts:

- Natural Resource (NR)
- Recreation Forestry (RF)
- Light Industrial (M-1)
- Medium Industrial (M-2)
- Heavy Industrial (M-3)
- Floodplain Primary (FPP)
- Drilling Island (DI)
- Zone Districts that have the Petroleum Extraction (PE) Combining District

D. Tier 4 Area is defined as areas not within Tier 3, containing at least one of the following zone districts:

- Estate (E)
- Low–Density Residential (R-1)
- Medium-Density Residential (R-2)
- High-Density Residential (R-3)
- Commercial Office (CO)
- Neighborhood Commercial (C-1)
- General Commercial (C-2)
- Highway Commercial (CH)
- Platted Lands (PL)
- Mobilehome Park (MP)

Authorized oil and gas activities in Tier 4 are subject to approval of a conditional use permit in accordance with 19.104 of this Title. The Open Space (OS) District are those areas where oil or gas exploration and production activities are prohibited, but ancillary facilities are an allowable use.

E. Tier 5 are areas including all current and future Specific Plan boundaries either adopted with a Special Planning (SP) District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities would be allowed with a conditional use permit or as permitted by the regulations contained within the adopted Specific Plan in Tier 5 areas.

F. All other areas not defined as Tier 1-5 Areas are considered Non-Jurisdictional. These areas include lands under the administration of the United States, State of California or an incorporated city. The regulations set forth in this chapter do not pertain to these areas.

19.98.040 OIL AND GAS ACTIVITIES BY MINISTERIAL PERMIT

A. No well for use as an injection well and no well for the exploration for or development or production of oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in Tier 1, 2, 3 and 5 Areas

until an application for Oil and Gas Conformity Review or Minor Activity Review has been submitted to and approved by the Planning Director as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the procedures set out in Sections 19.98.070 through 19.98.120 of this chapter.

B. Disposal of nonhazardous oilfield fluid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oilfield fluid waste or production water is produced and disposed of within the same designated oilfield; or

2. The nonhazardous oilfield fluid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

19.98.050 OIL AND GAS ACTIVITIES BY CONDITIONAL USE PERMIT

A. No well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in any zoning district described in this title in which such uses are permitted as conditional uses until an application for a conditional use permit, which includes the information specified in Section 19.98.080, has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.060 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact.

B. No well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility, outside the boundaries as defined in Figure 19.98.015, may be installed in any zoning district described in this title in which such uses are permitted until an application for a conditional use permit, which includes the information specified in Section 19.98.080, has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.060 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact.

C. Should any activity requiring approval of an Oil and Gas Conformity Review or Minor Activity Review pursuant to Sections 19.98.070 through 19.98.120 of this chapter, not be able to comply with the Implementation Standards and Conditions set forth in Section 19.98.060, an application for a conditional use permit, which includes the information specified in Section 19.98.080, shall be submitted to and approved by the Planning Commission in accordance with the standards and procedures set out in

Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive/modify any condition set out in Section 19.98.060 of this chapter if it determines that such waiver or modification will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact.

D. If a producing well or service well is not completed upon land subject to a conditional use permit issued pursuant to this chapter and Chapter 19.104 of this title within twelve (12) months from the date of issuance of the permit, or within any extended period thereof, the conditional use permit shall expire and the premises shall be restored as nearly as practicable to their original condition. No permit shall expire while the permittee is continuously conducting drilling, redrilling, completing or abandoning activities, or related operations, in a well on the lands covered by such permit, which activities were commenced while said permit was otherwise in effect. Continuous activites are those suspended not more than thirty (30) consecutive days. If, at the expiration of the twelve- (12-) month period, the permittee has not completed his drilling program on the lands covered by such permit, the decision making authority, upon a written request of the permittee, may extend the permit for the additional time requested by permittee for the completion of such drilling program, in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180.

19.98.060 IMPLEMENTATION STANDARDS AND CONDITIONS

Pursuant to this chapter, all activities for the exploration for or development or production of oil, gas, and other hydrocarbon substances and related facilities and activities shall comply with the following standards, unless otherwise provided in this chapter:

A. No oil or gas well shall be drilled within:

1. One hundred (100) feet of any public highway or building not necessary to the operation of the well;
2. One hundred and ninety (190) feet of any dwelling unit (single or multifamily);
3. Three hundred (300) feet of any building used as a place of public assembly, institution, or school; or
4. One hundred (100) feet of any building utilized for commercial purposes, not used for oil and gas operations.

B. All drilling and production activities shall conform to all applicable fire and safety regulations. Firefighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.

C. All required federal, State, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:

1. California Division of Oil and Gas (DOGGR)
2. Kern County Fire Department
3. Kern County Public Health Department
4. Regional Water Quality Control Board
5. San Joaquin Valley Air Pollution Control District
6. Kern County Public Works Department

D. The applicant shall demonstrate compliance with all applicable Mitigation Measures as listed in the approved Mitigation Monitoring and Reporting Program (MMRP) for the Revisions to the Zoning Ordinance (C) - 2015.

19.98.070 OIL AND GAS CONFORMITY REVIEW AND APPROVAL — REQUIRED

Except as provided in this section, no permitted use shall be established, no permitted development shall occur, and no building permit or grading permit shall be issued for any permitted use or development subject to this chapter until an Oil and Gas Conformity Review or Minor Activities Review has been submitted to and approved by the Planning Director in accordance with the procedures set out in Sections 19.102.040 through 19.102.060 of this title.

These activities shall be considered incidental to the Oil and Gas conformity Review for fee purposes.			

19.98.080 OIL AND GAS CONFORMITY REVIEW — APPLICATION CONTENTS

Applications for an Oil and Gas Conformity Review within Tiers 1-3 or Tier 5 Areas, pursuant to Section 19.98.040 of this chapter, or a conditional use permit, for oil and gas activities within a Tier 4 Area, pursuant to Section 19.98.050 of this chapter, shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all existing and proposed wells.

D. Preliminary Title Report, not over ninety (90) days old.

E. Legal description of the project area located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities in aliquot format, unless a more precise legal description is determined to be needed by the Planning Director.

F. A site plan drawn to scale no larger than 11x17, which includes the following information: All information required in Tier 2, 3, 4 and 5. Tier 1 information to be determined based on density of pre-ordinance oilfield development, as determined by the Director.

1. Topography and proposed grading of the site plan.

2. Project boundary lines and dimensions, including lease lines and property lines.

3. Location and coordinates of all proposed well holes and related accessory equipment. Location of all roadways, pipelines, tanks, treatment or other structures and facilities to be installed, and any existing or abandoned wells if such are known to exist .

4. Location of all existing dwellings and structures, located within three thousand (3000) feet of the proposed well holes, identification of the use of each structure, and distances between well holes and existing buildings. Location of existing property lines and distance from well site to property line.

5. Location of all new flare gas production lines, lines for production, electrical lines, and location of tank farms to be used.

6. North arrow, date the site plan was prepared, and scale.

7. Location of all recorded easements onsite, roads, section/midsection lines, located within ½ mile of the proposed wells.

8. Location of all accessory/ancillary facilities (including trucking parking, onsite storage, etc.) to be installed with the proposed wells.

9. Description of parcel in relation to Tier areas as indicated in Figure 19.98.015.

10. DOGGR permit application number, if available.

11. Identify the 100-year floodplain.

12. Identify the proposed source of water (domestic or production), if applicable.

13. Show location of all proposed underground pipelines. Identify if pipelines connect to a Gas Distribution System.

14. Location of any existing Oil and Gas Conformity Review boundaries within and/or contiguous to the proposed boundary.

G. Signature Block and Statement (Land/Surface Owner, Mineral Owner and Operator.
The following statement shall be included to the first page of the site plan. In Tier 1 Areas it shall be signed by both the Mineral Owner and the Operator. In Tier 2, 3, 4 and 5 Areas it shall be signed by all parties, irrespective of ownership relationship. Multiple lines may be added for multiple ownership signatures. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the signature on the site plan be waived.

REQUIRED STATEMENT

The undersigned Land/Surface Owner is the owner of APN#_____. The undersigned is the Mineral Owner and/or Operator or Lessee of the Mineral Owner. The Land/Surface Owner and the Mineral Owner and/or the Operator or Lessee have come to an agreement regarding the use of the surface of the property in connection with the Kern County permit that is being issued with this site plan.

_____	_____	_____
Date	Date	Date

H. Notification Requirements - Tier 1, 2, 3, 4 and 5 Areas.

1. A physical letter of notification of application that requires a signature for delivery shall be sent by the applicant to all Land/Surface Owners of the property for which the Conformity Review is being requested, if the Land/Surface Owners are different from the mineral owners providing the notice required by State law and including an official County handout explaining the conformity review process. The package shall be sent 30 days before submittal of the application. The application shall include evidence that the letter was sent and the signatures received. Any letter returned or failure to obtain a signature shall provide evidence that the Land/Surface Owner of the property cannot be located through normal means such as tax records. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the notification be waived as allowed by State law.

2. Within a Tier 1 Area only, a second letter shall be sent, by the applicant, when the application is submitted to the County. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner, addressed to the County of Kern, may be submitted asking that the notification of application submitted be waived.

19.98.090 OIL AND GAS CONFORMITY REVIEW – WITH REQUIRED SURFACE OWNER SIGNATURE

A. An applicant for a ministerial permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable section of this chapter. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title. For Tier 2, 3 and 5 Areas, a copy of the application shall be provided to the Land/Surface owner per the requirements of 19.98.080.F above. The application must contain the signature block and statement pursuant to Section 19.98.080.F, or shall contain a letter from the Land/Surface Owner waiving the need for said signature on the specified parcel of the proposed application. The waiver letter must be dated and provide specific language as to the length of time the letter is valid if to be used for future Oil and Gas Conformity Reviews.

B. The Planning Director shall make reasonable efforts to inform the applicant in writing within seven (7) business days of receipt that the application is complete and shall issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

C. Within three (3) business days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

D. Within seven (7) business days of reviewing the third submittal to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of chapter. If additional information is needed, a mandatory in person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. Any reviews beyond three (3) shall require additional fees to be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be conducted within thirty (30) days.

F. Prior to conducting any drilling activity the operator must have received and have on file both the approved Permit to Conduct Well Operations from DOGGR and an approved Oil and Gas Conformity Review unless the activity involves facility placement not subject to DOGGR permit approval.

G. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

19.98.100 OIL AND GAS CONFORMITY REVIEW - WITHOUT REQUIRED SURFACE OWNER SIGNATURE

The provisions contained in this section apply only to applications submitted within Tier 2, 3 and 5 Areas, which do not contain the surface owner signature as required by Section 19.98.070, above:

A. An applicant for a ministerial permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable provisions of this chapter. A copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080.F above. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title.

B. The Planning Director shall make reasonable efforts to inform the applicant in writing within thirty (30) calendar days of receipt that the application is complete or that additional information is needed to complete the application. No sooner than thirty (30) calendar days from issuance of the Kern County Oil and Gas Conformity Review and any other necessary state or federal permits, the applicant may begin construction of the facility. The Planning and Community Development Department shall notify the Surface/Land Owner that the permit has been issued.

C. Within thirty (30) calendar days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

D. Within thirty (30) calendar days of reviewing the third submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application. If additional information is needed, a mandatory in-person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. At any time during the review periods in Sections 19.98.100.A or B the applicant submits proof of the required surface owner signature on the site plan, the application will be deemed acceptable to be processed under the provisions set forth in Section 19.98.090.

F. Prior to conducting any drilling activity the operator must have received and have on file both the approved Permit to Conduct Well Operations, from DOGGR and an approved Oil and Gas Conformity Review unless the activity involves facility placement not subject to DOGGR permit approval.

G. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

19.98.110 MINOR ACTIVITY REVIEW — APPLICATION CONTENTS

An application for Minor Activity Review for Tier 1-3 and 5 Areas, pursuant to Section 19.98.040 of this chapter, shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all wells.

D. Preliminary Title Report, not over ninety (90) days old.

E. Description of proposed oil and gas activity and documentation of compliance with applicable Mitigation Measures (see incorporated Mitigation Monitoring and Reporting Program).

F. Sufficient number of photographs to identify the extent of existing ground disturbance.

G. For Tier 2, 3 and 5 Areas only, documentation of letter submitted to the Land/Surface Owner(s), if different, informing the owner of the Minor Activity Review application, mailed and received a minimum of thirty (30) days prior to application being submitted to the County for review.

19.98.120 MINOR ACTIVITY REVIEW

A. An applicant for a ministerial permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable section of this chapter. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title. For Tier 2, 3 and 5 Areas, a copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080.F above.

B. The Planning Director shall make reasonable efforts to inform the applicant in writing within seven (7) business days of receipt that the application is complete and shall issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

C. Within three (3) business days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application.

D. Within seven (7) business days of reviewing the third submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she

determines that the proposed use meets the development standards and conditions specified in the applicable provisions of Title. If additional information is needed, a mandatory in-person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. Any reviews beyond three shall require additional fees be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be conducted within thirty (30) days.

F. Prior to conducting any activity the operator must have received and have on file both approved applicable DOGGR permit(s), if necessary, and an approved Minor Activity Review pursuant to the chapter.

G. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

19.98.130 SELF-CERTIFICATION

Upon issuance of Oil and Gas Conformity Review or Minor Activity Review, as specified in Sections 19.98.090 and 19.98.120 of this chapter, and any other necessary state or Federal permits, the applicant may begin construction of the facility. The provisions of this section do not apply to issuance of an Oil and Gas Conformity Review pursuant to 19.98.100 of this chapter. The applicant must self-certify compliance with Chapter 19.98 during the construction and operation process. Once the project applicant has completed the construction of the oil and gas facilities, as indicated on the approved site plan, the project applicant will provide a self-certified statement, in writing, to the County, in a format specified by the Director.

During construction and continued operations of the activities specified by the approved site plan, the applicant will be responsible for complying with the issued Oil and Gas Conformity Review, and all applicable implementation standards as outlined in this chapter. Should a violation of a permit issued under this chapter occur on-site, a Certification and Finalization process for the Oil and Gas Conformity Review will be conducted by the County Oil and Gas Inspector, and self-certification for the permit will no longer be permitted for the applicant for the next issued permit, as a probationary period. Once the applicant has demonstrated compliance on the following permit, any subsequent permit may be self-certified.

19.98.140 INSPECTION COMPLIANCE

Upon receipt of an issued permit pursuant to Section 19.98.100, the applicant must contact the Planning and Community Development Department and the Public Works Department to schedule an inspector to be present during all activities related to the Oil and Gas Conformity Review. During construction and continued operations of the activities specified by the approved site plan, the applicant will be responsible for complying with the issued Oil and Gas Conformity Review, and all applicable standards and conditions as outlined in the permit.

19.98.150 PLUGGED AND ABANDONED

Any permit issued pursuant to this chapter must plug and abandon all wells per the following procedures:

A. The applicant shall plug and abandon all facilities in accordance with DOGGR.

B. Within thirty (30) days from completion of the plugged and abandoned procedures for any well constructed after the amendment of this Chapter 19.98, the applicant shall submit to

the Planning and Community Development Department a letter stating which facilities have been abandoned, including the unique well identification number for each well.

19.98.160 PERMIT REVOCATION AND MODIFICATION

Any permit issued pursuant to this chapter may be revoked or modified pursuant to Section 19.102.020 of this Title.

OTHER SECTIONS OF THE ZONING ORDINANCE NEEDED REVISIONS (Revisions in Underline and ~~Strikethrough~~)

CHAPTER 19.48

DRILLING ISLAND (DI) DISTRICT

19.48.080 HEIGHT LIMITS

Height limits in the DI District are as follows:

A. None on derricks and other equipment used during the exploration and drilling phase of development.

B. Pumping units shall not exceed ~~thirty-five (35)~~ eighty (80) feet in height.

19.48.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

A. All drilling and other hydrocarbon development activity in the DI District shall be carried out in accordance with the standards and procedures set out in Section 19.98.~~050~~060 of this title. All activities subject to an Oil and Gas Conformity Review or Minor Activity Review shall comply with the provisions of Section 19.98.060 of the title.

B. Development in the DI District shall comply with the interpretations and provisions of Chapter 19.08 of this title.

CHAPTER 19.81

OUTDOOR LIGHTING

"DARK SKIES ORDINANCE"

19.81.050 EXEMPTIONS

The following are permanently exempt from the provisions of this chapter:

1. Outdoor lighting specifically approved in conjunction with a discretionary permit.

2. Federal and State Facilities: Outdoor light fixtures on, in, or in connection with facilities and land owned or operated by the government of the United States of America or the State of California; however, these agencies are encouraged to comply with the provisions of this ordinance.

3. Airports and Other Lighting Required by the Federal Aviation Administration: Outdoor lighting for public and private airports and any other uses that are regulated by the Federal Aviation Administration.

4. Correctional Institutions: Outdoor lighting for federal, State, and County-owned or operated correctional institutions; however, voluntary compliance with the intent and provisions of this chapter is encouraged.

5. Emergency Light: Temporary emergency lighting needed by the sheriff's department, police department, fire department, public utility, rescue operation or in conjunction with any other emergency service.

6. Temporary Construction: All temporary lighting used for the construction or repair of roadways, utilities, and other public infrastructure.

7. Internally Illuminated Signs: All internally illuminated signs, including those used for on-site and off-site advertising purposes. Such signs are regulated by the provisions of Chapter 19.84 (Signs) of the Kern County Zoning Ordinance.

8. Neon, Argon, or Krypton: All fixtures illuminated solely by neon, argon, or krypton.

9. United States Flag and State of California Flag: Lighting used to illuminate a properly displayed United States Flag and/or the State of California Flag.

10. Lighting Required by Building Codes or other Regulations: Communication towers, exit signs, lighting for stairs/ramps, lighting for points of ingress/egress to buildings, and all other illumination required by air navigation safety provisions, building codes, OSHA standards, and other permitting requirements from State or federal agencies.

11. Fossil Fuel Light: All outdoor light fixtures producing light directly by the combustion of fossil fuels (such as kerosene lanterns, gas lamps, etc.)

12. Street Lighting: Lighting equipment within a public or private right-of-way or easement for the principal purpose of illuminating streets, roadways, and/or other areas open to transport by vehicle or pedestrian traffic.

13. Seasonal Displays: Displays using multiple low wattage bulbs or lasers, provided that they do not constitute a fire hazard, create a nuisance, and are maintained in a safe condition. Such displays shall not be illuminated for more than forty-five (45) days per calendar year.

14. Water Features: Lighting in swimming pools and other water features governed by Article 680 of the National Electrical Code.

~~15. Oil and Gas Exploration and Production: Outdoor lighting in association with oil and gas exploration and production operations and related facilities shall be exempt from this chapter and are regulated by the provisions of Chapter 19.98 of the Kern County Zoning Ordinance.~~

~~16.~~ 15. Temporary Event Lighting: Temporary lighting for special events that does not conform to this chapter shall be reviewed as part of an application for a Temporary Event Permit (TEP), pursuant to Chapter 19.08.340 of the Kern County Zoning Ordinance. Any temporary lighting exemption approved via the TEP process shall be utilized for a period of time that exceeds a combined total of twelve (12) combined days on any one (1) parcel during a calendar year. Exemptions are renewable for a period of not more than twelve (12) additional combined days. Requests for renewal of a temporary exemption shall be processed in the same manner as the original request. No outdoor light fixtures shall be exempted from this chapter for more than twenty-four (24) days combined during a calendar year.

~~17.~~ 16. Steeples: Lighting used to illumination the tall ornamental tower that forms the superstructure of a church, temple, office building, etc., shall be exempt from this chapter.

~~18.~~ 17. Temporary Agricultural Activities: Lighting used to illuminate temporary agricultural activities such as harvesting on property zoned A (Exclusive Agriculture) or A-1 (Limited Agriculture) and lasting no more than twelve (12) consecutive days and no more than twenty four (24) combined days on any one parcel during a calendar year.

CHAPTER 19.50

FLOODPLAIN PRIMARY (FPP) DISTRICT

19.50.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

A. All development within the FPP District is subject to the requirements of the Flood Damage Prevention Ordinance, Chapter 17.48 of this code.

B. Development in the FPP District shall comply with the interpretations and provisions of Chapter 19.08 of this title.

C. Oil or gas exploration and production shall comply with Section 19.98.~~050~~060 and the following standards:

1. The following uses are permitted within the FPP District if they will not obstruct flows, will not cause peripheral flooding of other properties, will not cause any increase in flood levels during the occurrence of the base flood discharge, will be

resistant to floatation and immune to extensive damage by flooding, and will not endanger life or property:

(a) All oil or gas wells, including pumps and all other associated equipment.

(b) Feasible remedial work, improvements, and flood-proofing of facilities.

2. No oil or gas well shall be drilled on the slope or within ten (10) feet of the top or toe of the bank of a river or stream located within the FPP District. The required setback on the top of bank shall be measured from an imaginary plane on a slope two (2) horizontal to one (1) vertical projected upward from the toe of the existing bank.

3. All oil or gas wells in the FPP District, including pumps and all other associated equipment, shall be designed such that they are resistant to damage by flooding.

4. All pipelines in the FPP District shall be flood-proofed by burial to sufficient depth to prevent rupture during flood conditions or by suspension at least two (2) feet above the surface of the base flood. Supports for elevated pipelines shall also carry a catwalk to facilitate removal of debris caught by supports during floods.

5. The location of all buried pipelines shall be recorded on appropriate maps by the company that owns said pipelines, and the maps shall be made available to any public agency that shall request a copy.

6. All drilling, redrilling, and producing, including remedial work, well pulling, work-overs, and deepening, shall conform to all applicable fire, safety, spacing, and environmental State law and regulations.

7. Proven technological improvements generally accepted and used in drilling and production methods shall be adopted as they may from time to time become available, if capable of reducing factors of nuisance and annoyance.

8. Prior to the commencement of any drilling, a copy of a Spill Prevention Control and Countermeasure Plan, as required by the United States Environmental Protection Agency, shall be filed with the Kern County ~~Engineering and Survey Services~~ Public Works Department.

9. All pumps expected to be inaccessible during times of flood shall be equipped with an accessible remote switch to shut off the pumps during emergencies.

10. The derrick, all boilers, and all other drilling equipment used pursuant to this chapter to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derrick, boilers, and drilling equipment are to be used within a reasonable time limit, determined by the Kern County

~~Engineering and Survey Services~~ Public Works Department, for the drilling of another well or wells on the premises.

11. After any well has been placed in production, no earthen sumps shall be used for the storage of petroleum or gas.

12. Within ninety (90) days after any well has been placed in production or after its abandonment, earthen sumps used in drilling or production or both shall be emptied by vacuum truck or other approved means, then filled, and the drilling site restored as nearly as practicable to a uniform grade, unless such sumps are to be used within a reasonable time limit, as determined by the Kern County ~~Engineering and Survey Services~~ Public Works Department.

13. Any derrick used for servicing operations shall be of the portable type; provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable-type derrick will not properly service such well, the Kern County ~~Engineering and Survey Services~~ Public Works Department may approve the use of a standard type of derrick.

14. Directional and warning signs, and those required for identification of the well, shall be constructed, erected, placed, or maintained on the premises, except those required by law to be displayed in connection with the drilling or maintenance of the well.

15. If a producing or service well is not secured twelve (12) months from the date of commencement of drilling operations or any extended period granted by the Kern County ~~Engineering and Survey Services~~ Public Works Department, the premises shall be restored to the original condition as nearly as practicable to do so. If at the expiration of the twelve- (12-) month period, the drilling program has not been completed, the Kern County ~~Engineering and Survey Services~~ Public Works Department may, upon a written request, grant an additional period of time as requested for the completion of such drilling program.

CHAPTER 19.66

PETROLEUM EXTRACTION (PE) COMBINING DISTRICT

19.66.080 HEIGHT LIMITS

Height limit requirements in a PE District are as follows:

A. No height limit on derricks and other equipment used during the exploration and drilling phase of development.

B. Pumping units shall not exceed ~~thirty-five (35)~~ eighty (80) feet in height.

C. All other uses permitted by the base district shall conform to the height limits of the base district with which the PE District is combined.

19.66.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

All drilling and hydrocarbon development activities in a PE District shall be carried out in accordance with the standards and procedures set out in Section 19.98.~~050~~060 of this title. All activities subject to an Oil and Gas Conformity Review or Minor Activity Review shall comply with the provisions of Section 19.98.060 of the title.

C H A P T E R 19.102

PERMIT PROCEDURES
ARTICLE II. MINISTERIAL PERMITS ISSUED BY THE PLANNING DIRECTOR

19.102.040 GENERAL REQUIREMENTS — PERMIT TYPES

The ministerial permits specified in this title for review pursuant to this article shall be issued by the Planning Director upon submission of an application containing the information specified in applicable sections of this title and a determination by the Planning Director that the proposed use or development meets the development standards and conditions specified in the applicable section or sections of this title. These permits include:

A. CRV recycling center permit (Section 19.08.480)

B. Temporary animal permit plot plan review (Sections 19.14.130 and 19.60.130 through 19.60.160)

C. Extensions for temporary mobilehomes and recreational vehicles (Sections 19.16.130 and 19.18.160)

D. Mobilehome park plot plan review (Sections 19.26.130 through 19.26.190)

E. Minor plan modifications (Section 19.52.130 through 19.52.180, 19.56.130 through 19.52.180, 19.56.130 through 19.56.200, 19.58.130 through 19.58.180, and 19.100.050

F. Commercial wind farm plot plan review (Section 19.64.130 through 19.64.150)

G. Geologic hazard plot plan review (Section 19.68.130 through 19.68.150)

H. Special development standards plot plan review (Sections 19.80.040 through 19.80.070)

I. Off-street parking plot plan review not in conjunction with a ministerial permit (Sections 19.82.100 through 19.82.130)

J. Landscaping plot plan review not in conjunction with a ministerial permit (Sections 19.86.070 through 19.86.100)

K. Density bonus permit (Sections 19.92.030 through 19.92.060)

L. Home occupation permit (Sections 19.94.050 through 19.94.080)

M. Production water injection wells for the purpose of disposing of production wastewater produced in the same oilfield in which the injection well is located (Section 19.98.030)

N. ~~Oil and gas plot plan review (Section 19.98.030)~~ Oil and Gas Conformity Review and Minor Activity Review (Section 19.98.070 through 19.98.120)

O. Large family day-care permit - no hearing (Sections 19.96.030 through 19.96.060)

P. Temporary batch plant (thirty (30) days or less) plot plan review (Section 19.08.290)

Q. Secondary residential unit plot plan review (Section 19.90.040 through 19.90.060)

R. Truck parking as accessory to residential use permit (Section 19.08.252)

C H A P T E R 19.108

NONCONFORMING USES, STRUCTURES, AND LOTS

19.108.040 NONCONFORMING USES OF LAND

A. A nonconforming use of land shall not be expanded, extended, or intensified in any way with respect to scope, duration, or frequency of the use, except as follows:

The Planning Commission may authorize the expansion or intensification of legal, nonconforming uses if, after consideration at a public hearing noticed pursuant to Section 19.102.150, both of the following findings can be made:

1. The proposed expansion will not create any significant adverse impacts to surrounding properties.

2. The only other remedy to bring the use into conformance would require an amendment to the applicable General Plan.

Public hearing notification shall consist of mailing notices to property owners having property within three hundred (300) feet from the exterior boundaries of the subject property. Published notice in a local newspaper shall not be required, unless the Planning Director determines that such additional notice is warranted. In consideration of a

request to expand or intensify a legal, nonconforming use, the terms and conditions for any approval shall be as specified in Section 19.104.050.

B. A nonconforming use of land shall not be changed to or replaced by any other use except a use that complies with the regulations of the zoning district in which the subject property lies.

C. Any nonconforming use of land that has been discontinued or abandoned for a period of one (1) year or more shall not be reestablished. In instances where the assessed value of improvements on the property exceeds fifty thousand dollars ($50,000), as determined by the County Assessor, the nonconforming use shall not be reestablished if the use has been discontinued or abandoned for a period of two (2) years or more.

D. The exploration for or development or production of oil, gas, or other hydrocarbon substances ~~shall not be considered nonconforming uses of land~~ lawfully constructed prior to MONTH, DAY, YEAR shall be considered nonconforming uses of land. Any subsequent alteration or expansion of these facilities is subject to Chapter 19.98 of this Title.

E. A legal nonconforming dwelling in any zone district may be replaced with the approval of the Planning Director, provided that all applicable requirements of this title, other than density or conditional use permit requirements, can be satisfied.

F. Any use of land continuously in existence for a period of twenty (20) years or more may qualify as a legal, nonconforming use pursuant to Section 19.108.080, irrespective of when zoning requirements became effective for that property, provided that the Planning Director determines that the use is not significantly incompatible with surrounding land uses and that there is no significant threat to the public health, safety, and welfare in allowing the use to continue.

MOBILEHOME PARK (MP) DISTRICT

19.26.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

The following uses are permitted in the MP District with a conditional use permit:

A. RECREATION, ENTERTAINMENT, AND TOURIST FACILITIES

— Recreational vehicle park, except as permitted by Subsection 19.26.020.B

B. MISCELLANEOUS USES

— Drainage sump
— Water system, large

— Water treatment plant

C. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

Chapter 4

Environmental Setting, Impacts, and Mitigation Measures

Section 4.1

Aesthetics

Section 4.1

Aesthetics

4.1.1 Introduction

This section describes the affected environment and regulatory setting for aesthetic and visual resources. It also describes the impacts on aesthetic and visual resources that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance, future oil and gas development activities pursuant to the Amended Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

This analysis is primarily based on the information provided in the Visual Resources Technical Report prepared by Ecology and Environment, Inc. (E & E) in May 2015 (E & E 2015), provided in Appendix G and incorporated by reference herein. Where additional information has been used to evaluate the potential impacts, the information has been referenced. Regulatory standards were also investigated, including the Kern County General Plan (KCGP) and the Kern County Zoning Ordinance.

Degradation of the visual character of a site is usually addressed through a qualitative evaluation of the changes to the aesthetic characteristics of the existing environment and the project-related modifications that would alter the visual setting.

Aesthetics, as addressed in the California Environmental Quality Act (CEQA), refers to visual considerations in the physical environment. Because a person's reaction and attachment to a given viewshed are subjective, visual changes inherently affect viewers differently. Accordingly, aesthetics analysis, or visual resource analysis, is a systematic process to logically assess visible change in the physical environment and the anticipated viewer response to that change. The Aesthetics section of this Environmental Impact Report (EIR) describes the existing landscape character of the Project Area, existing views of the area from various on-the-ground vantage points, the visual characteristics of the proposed Project, and the landscape changes that would be associated with the oil and gas extraction and production activities, as seen from various vantage points.

Visual Resource Terminology and Concepts

When viewing the same landscape, people may have different responses to that landscape and any proposed visual changes, based upon their values, familiarity, concern, or expectations for that landscape and its scenic quality. Because each person's attachment to and value for a particular landscape is unique, visual changes to that landscape inherently affect viewers differently. However, generalizations can be made about viewer sensitivity to scenic quality and visual changes. Recreational users (e.g., hikers, equestrians, tourists, and people driving and cycling for pleasure) are expected to have high concern for scenery and landscape character.

People who are commuting daily through the same landscape generally have a moderate concern for scenery, while people working at industrial sites generally have a lower concern for scenic quality or changes to existing landscape character. The visual sensitivity of a landscape is affected by the viewing distances at which it is seen, such as close-up or far away. The visual sensitivity of a landscape also is affected by the travel speed at which a person is viewing the landscape (high speeds on a highway, low speeds on a hiking or cycling trail, or stationary at a residence).

The same feature of a project can be perceived differently by people depending on the distance between the observer and the viewed object. This distance is defined as "viewing distance" or "distance zones." For the purpose of this analysis, distance zones are delineated as foreground, middleground, and background. When a viewer is closer in proximity to a viewed object in the landscape (foreground), more detail can be seen, and there is greater potential influence of the object on visual quality because of its form or scale (relative size of the object in relation to the viewer). When the same viewed object is viewed at background distances, details may be imperceptible but overall forms of terrain and vegetation are evident, and the horizon and skyline are dominant. In the middleground, some detail is evident (like the foreground) and landscape elements are seen in context with landforms and vegetation patterns (like the background). For this analysis, the following three viewing distances were used, based on distance zones described and defined by the United States Forest Service (USFS 1995):

- Foreground (0 to 0.5 mile);
- Middleground (0.5 mile to 4 miles);
- Background (4 miles to the horizon);

In addition, the following terms and concepts are used in the discussion below to describe and assess the aesthetics setting and impacts from the Project:

- **Color**: The hue (e.g., red, brown) and value (e.g., light, dark) of the light reflected by objects in the visual landscape.
- **Contrast**: The opposition or unlikeness of different forms, lines, colors, or textures in a landscape.
- **Form**: The visual mass, bulk, or shape of an object or objects in the visual landscape that appear unified. This element of visual character is usually the strongest.
- **Key Observation Point** (KOP): One or a series of points on a travel route or at a use area or potential use area where the view of a management activity (project) would be the most revealing.
- **Line**: The well-defined edges of shapes or masses created in the visual landscape by horizons, silhouettes, or human-made features. This element of visual character is usually the second strongest.

- **Texture**: The apparent surface coarseness of the visual landscape caused by the aggregation or density of surface features and vegetation (e.g., fine, medium, coarse). This element of visual character is usually the least dominant.
- **Viewshed**: The landscape that can be directly seen under favorable atmospheric conditions from a viewpoint or along a transportation corridor.
- **View Corridor**: A view corridor is typically defined as the line of sight of an observer from a public viewpoint, looking toward an object of significance to the community (e.g., ridgeline, river, historic building) or as the route that directs the viewers' attention.
- **Visual (Sensitive) Receptor**: Any scenic vista, designated scenic highway, residence, or public recreational area located within the project viewshed that provide people with views of a site.

Visual character typically consists of the landforms, vegetation, water features, and cultural modifications that impart an overall visual impression of an area's landscape. Scenic areas typically include open space, landscaped corridors, and viewsheds. Visual character is influenced by many different landscape attributes including color contrasts, landform prominence, repetition of geometric forms, and uniqueness of textures among other characteristics.

4.1.2 Environmental Setting

Regional Character

The Project Area is defined in the Project Description, Figure 3-1, and encompasses 3,700 square miles, which generally includes most of the San Joaquin Valley Floor portion of Kern County up to an elevation of 6,000 feet. The boundary includes: west side – the San Luis Obispo and Santa Barbara County lines; north side – the Kings and Tulare County lines; east side – the 6,000-foot elevation contours, squared off to the nearest section line; and south side – the northern boundary of the Los Padres National Forest.

The Project Area also includes all unincorporated County lands within the 409-square-mile Metropolitan Bakersfield General Plan (MBGP). In addition, the Project Area, as defined in Figure 3-1, includes portions of Metropolitan Bakersfield that are within the jurisdiction of the City of Bakersfield, and includes all other city jurisdictions, including: Taft, Delano, Shafter, Arvin, McFarland, Maricopa, and Wasco. The Project Area is based on generally available information regarding areas with potential or confirmed oil and gas resources within the County's jurisdiction.

The KCGP Update describes the San Joaquin Valley region as "the southern San Joaquin Valley below an elevation of 1,000 feet mean sea level (MSL)" within Kern County. The San Joaquin Valley portion is characterized by relatively low rainfall, averaging less than 10 inches per year. Average temperatures are relatively high, and total evaporation exceeds total precipitation. Summers are relatively cloudless, hot, and dry. Winter is generally mild, but an occasional freeze does occur and may cause substantial agricultural damage. Average length of the growing season

is 265 days. The San Joaquin Valley region is within the southern end of the San Joaquin Valley Air Basin (SJVAB) managed by the San Joaquin Valley Air Pollution Control District (SJVAPCD). This district encompasses Fresno, Kings, Madera, Merced, San Joaquin, Stanislaus, and Tulare counties, as well as the San Joaquin Valley portion of Kern County. Further, the San Joaquin Valley region is within the Tulare Lake Groundwater Basin, which includes the Kern River Hydrographic Unit and the Poso Hydrographic Unit.

The Project Area contains a range of visual resources and areas with differing visual character. Most of the terrain within the Project Area is flat to gently rolling with some hilly and steeply rolling terrain near the west, south, and east boundaries of the Project Area (Figure 4.1-1). The central part of the Project Area is mostly flat and contains a variety of wetlands with natural vegetation. Several stream corridors, including the Kern River, that descend into the valley from the east also contain natural riparian vegetation. However, most of the Project Area consists of diverse agricultural croplands, orchards, and grazing lands or oil and gas development and oil and gas facilities are often interspersed in the agricultural areas. In the more urbanized portions of the Project Area, a combination of residential, commercial, and industrial scenes dominate the views, with smaller amounts of recreational, open space, and other typical urban structures and activities. Urban land uses and associated views occur in a small portion (approximately 2%) of the overall Project Area. Outside of the urbanized areas, the predominant land uses and associated views are agricultural, oil and gas-related uses, and recreational and other open space. Within agricultural lands, views include irrigated and non-irrigated lands, row crops and orchards, rangeland, and support and processing facilities. Views of agricultural lands are considered an important attribute of the County's visual character and quality. Within Tier 2, existing views are predominantly of agricultural activities. Areas with existing oil and gas development likewise can include a variety of land disturbance, facilities, uses, and intensities, with corresponding views. In Tier 1 and Core Areas, views are dominated by intensive oil and gas-related structures and activities.

State Scenic Highways

Regional access to wellfields in the Project Area could be obtained via the numerous highways that traverse the area including, Interstate 5 and State Routes (SR) 33, 46, 58, 65, 99, 119, 155, 166, 178, 204, and 223. According to the California Department of Transportation's (Caltrans') California Scenic Highway Mapping System, there are no Designated State Scenic Highways or scenic resources in the Project Area (Caltrans 2011). One Eligible State Scenic Highway, Highway 41, crosses through the extreme northwest corner of the Project Area. This segment of the highway is approximately 5 miles long. Two other Eligible State Scenic Highway sections, SR 14 and 58, are located 30 miles east of the Project Area and the Project Area is not visible from these highway segments.

Light and Glare

Existing sources of light and glare occur throughout much of the Project Area and are more concentrated in developed areas. Glare is reflective light that can be visually unpleasant or possibly unsafe due to the potential for temporary blindness. Glare may be caused by light from artificial sources or the sun reflecting off of light-colored or smooth surfaces such as metal, glass,

water, or polished stone. Glare intensity varies depending on the source and intensity of the light, time of day, time of year, angle of reflectance, weather, atmospheric conditions, the reflectivity, color, and texture of material surface finish, length of exposure, nature and sensitivity of receptors, and other factors. Nighttime lighting in oil and gas production areas also occurs, as does the use of a limited number of flares (which are more visible at night). Table 4.1-1 provides information on 66 oil and gas flares in the Project Area. Most are used either for emergencies or for limited uses under specified circumstances, and only four are in continuous use. Two of the four have no visible flames, and the remaining two are located more than 3000 feet away from sensitive receptors.

4.1.3 Regulatory Setting

This section describes the federal, state, and local statutes, ordinances, or policies that govern the light, glare, viewshed, and scenic character that must be considered by Kern County during the decision-making process for projects that have the potential to affect aesthetics.

Federal

U.S. Department of Agriculture, Forest Service

The National Trails System Act (NTSA) of 1969 seeks to preserve scenic and natural qualities along trails and recognizes the rights of private landowners and provides that "full consideration shall be given to minimizing the adverse effects upon the adjacent landowner or user and his operation" in the development and use of a trail (USFS 2009). The NTSA assigns management responsibility for trails to various federal resource agencies, depending on which agency holds jurisdiction over the public lands on which the trail is located in a given area (U.S. Forest Service [USFS], National Park Service [NPS], or the Bureau of Land Management [BLM]).

The Pacific Crest Trail was created under the NTSA to provide for outdoor recreation opportunities and the conservation of significant scenic, historic, natural, or cultural qualities. The Pacific Crest Trail stretches 2,650 miles from Mexico to Canada through California, Oregon, and Washington and is designated in the KCGP as a scenic feature. The USFS administers the Pacific Crest Trail in the vicinity of the Project. The Pacific Crest Trail is located 10 miles beyond the Project Area at its closest point. Therefore, Project compliance with the NTSA was considered in this analysis and no regulations would be applicable for development of oil and gas facilities in the Project Area because the Project Area would not be visible from the Pacific Crest Trail.

State

California Department of Transportation

The California's Scenic Highway Program was created by the State Legislature in 1963. The purpose of this program is to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of lands adjacent to highways. The state laws governing the Scenic Highway Program are found in the Streets and Highways Code, Section 260 et seq. Caltrans manages the State Scenic Highway Program, provides guidance, and assists local government agencies, community organizations, and citizens with the process to officially designate scenic highways (Caltrans 2008).

A highway may be designated as scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view. The California Scenic Highway System includes a list of highways that are either eligible for designation as scenic highways or have been so designated. The status of a state scenic highway changes from eligible to officially designated when the local jurisdiction adopts a scenic corridor protection program, applies to Caltrans for scenic highway approval, and receives notification from Caltrans that the highway has been designated as a scenic highway (Caltrans 2008).

A number of highways and state routes are located within the Project Area. The Project Area does not contain Designated State Scenic Highways or scenic resources. However, the Project Area does include a segment of one Eligible State Scenic Highway consisting of an approximately 5-mile-long segment of Highway 41, which crosses through the extreme northwest corner of the Project Area.

Kern County

Kern County General Plan

The Project Area is located within the KCGP area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element, the Circulation Element, and the Energy Element of the KCGP include goals, policies, and implementation measures related to aesthetics that apply to the Project, as described below.

The Land Use, Conservation, and Open Space Element of the KCGP evaluates the visual and aesthetic setting of Kern County and assesses the potential for visual impacts. The KCGP Circulation Element provides guidelines for development near Scenic Routes. A Scenic Route is defined in the KCGP as any freeway, highway, road, or other public right-of-way (ROW) that traverses an area of exceptional scenic quality. A roadway can only be designated as a Scenic Route by direct action of the Kern County Board of Supervisors or the State of California. A route may not be selected as scenic until a visual assessment has been conducted to determine if the route meets the current scenic highway criteria as mentioned above, and to what extent development has encroached on the scenic views. In addition, the County must prepare and adopt

a plan and program for the protection and enhancement of adjacent roadside viewshed land. No Scenic Routes have been designated in the Project Area.

Chapter 1. Land Use, Conservation, and Open Space Element

1.10.7. Light and Glare

Policies

Policy 47. Ensure that light and glare from discretionary new development projects are minimized in rural as well as urban areas.

Policy 48. Encourage the use of low-glare lighting to minimize nighttime glare effects on neighboring properties.

Implementation Measure AA. The County shall utilize CEQA Guidelines and the provisions of the Zoning Ordinance to minimize the impacts of light and glare on adjacent properties and in rural undeveloped areas.

Chapter 2. Circulation Element

2.3.9. Scenic Route Corridors

None of the goals, policies, or implementation measures contained in Section 2.3.9 are applicable to the proposed Project.

Chapter 5. Energy Element

5.3.5. Reuse of Nonproductive Petroleum Resource Areas

Policies

Policy 3. The County shall promote and encourage the safe reuse of former petroleum production lands by developments compatible with surrounding land use designations. The guidelines for site reestablishment include the following:

a. Removal of oil-laden soil

b. Shaping of disturbed lands back to natural grade and the elimination of pad areas, settling ponds, and similar disturbances.

c. Stabilization of sites by seedlings and plantings as appropriate.

d. Other measures as may be stipulated by the State Division of Oil, Gas and Geothermal Resources.

e. Proper identification and abandonment of all oil and natural gas wells.

5.4.7. Transmission Lines

Policies

Policy 5. The County should discourage the siting of aboveground transmission lines in visually sensitive areas.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to aesthetics.

Chapter II. Land Use Element

Policies

Policy 35. Encourage upgrading of visual character of heavy manufacturing industrial areas through the use of landscaping or screening-of visually unattractive buildings and storage areas (I-1, I-6, I-8).

Policy 36. Require that industrial uses provide design features, such as screen walls, landscaping and height, setback and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound and vibration (I-1, I-6, I-8).

Policy 37. Street frontages along all new industrial development shall be landscaped (I-1, I-6, I-8).

Chapter V. Conservation Element

B. Mineral Resources

Goals

Goal 4. Protect land, water, air quality and visual resources from environmental damage resulting from mineral and energy resource development.

Policies

Policy 15. Require petroleum production sites in urban areas which are subject to discretionary permits, to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways (I-4).

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern River Plan Element (Chapter XII of the Kern County General Plan)

The Kern River Plan Element, which is included in both the KCGP and the MBGP, was prepared as a joint effort by the City of Bakersfield and Kern County. The following Kern River Plan Element policies and implementation measures are applicable to the proposed Project with respect to aesthetics for all unincorporated County lands within the Kern River Planning Area.

3.2. Open Space Versus Development

Policies

Policy 11. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, areas designated as A.4 (Mineral and Petroleum) and electrical power lines to oil wells, water wells, and water control devises in areas designated as 8.5 (Resource Management) unless otherwise required by law, and at River crossings, or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

4.8. Industrial

Policies

Policy 5. Industrial areas should be separate from residential areas to protect both homes and factories.

Policy 6. Industrial areas adjacent to the Kern River primary or secondary floodway should be buffered by landscaping or vegetation to provide the least possible conflict with open space values of the River.

B. Open Space and Development

Implementation Policies

Implementation Policy 2. Any new non-open space development, including projects by public agencies, shall not occur without prior City or County approval of a "Development Plan." The "Development Plan" shall be reviewed for completeness and consistency with the following guidelines:

b. Landscaping plan which provides for screening of obnoxious uses and respects existing views of the Kern River channel.

c. Grading and Revegetation Plan

Implementation Policy 5. In order to preserve views of the River, reasonable height limits will be imposed through the "Development Plan" review process on any new non-open space development within any floodway. Criteria for height limits shall be based on existing site factors, such as surrounding land use, vegetation, and distance to the Kern River course.

C. Riparian Vegetation

Implementation Policies

Implementation Policy 1. The City and County shall develop a master list of plant species for criteria to approve "Development Plans." This list shall be considered for incorporation into this plan by General Plan Amendment. Revegetation or landscaping with native or compatible shrubs and trees shall be required as part of all public and private projects. Areas of unique habitat value, such as the Mesquite-Saltbush Association in the vicinity of Enos lane, shall be preserved in accordance with the City's approved plan for use of the 2,800-acre recharge area and River channel maintenance.

Implementation Policy 2. Prior to any development within the Kern River Plan boundaries, including residential, commercial, industrial, recreational, water recharge, channel improvement, and resource recovery projects, a landscaping plan shall be submitted to the respective City or County Planning Department for review and approval.

Implementation Policy 3. For all new development in residentially, commercially, and industrially zoned properties within the plan boundaries, the River setback area shall be either landscaped or revegetated. Except as might be required by the City or County Fire Department, no clearing of shrubs or tree cutting will be allowed unless otherwise provided for by this plan.

F. Mineral and Petroleum Extraction

Implementation Policies

Implementation Policy 1. The City and County shall revise. within two years from adoption of this plan, mineral and petroleum extraction regulations and provisions of their respective floodplain Zoning Ordinances consistent with all plan policies and incorporate the following features:

b. Restrictions on the removal of riparian vegetation.

d. Requirements for aesthetic treatment (painting, landscaping, screening) of production facilities (i.e., oil pump units, tanks, gravel crushers, etc.) located within the plan boundaries.

Kern County Zoning Ordinance

Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance contains the procedures and standards that apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County. At present, general development standards and conditions in Chapter 19.98 that are relevant to visual and/or aesthetic resources require the following:

- **Specific well setback distances from various structures** (19.98050.A) – Required setbacks in various Zone Districts are presented on Table 4.1-2;
- **Limitations on project signage**: Signs are limited to directional, warning, and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations (19.98.020.C);
- **Timely removal of drilling equipment**: All derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any completed or drilling well must be removed within 90 days after completion of production tests or after abandonment of any well, unless such derricks, boilers, and drilling equipment are to be used within a reasonable time for the drilling of another well or on the premises (19.98050.F);
- **Filling of earthen sumps and restoration of drilling sites**: Earthen sumps used in drilling or production or both must be filled and the drilling site restored as nearly as practicable to a uniform grade within 90 days after any well has been placed in production, or after its abandonment, (19.98050.G);
- **Landscaping and fencing requirements for oil tanks**: Oil or gas tanks located within 500 feet of any dwelling or commercial building must be screened from public view by shrubs, trees or fencing that comply with DOGGR requirements (19.98050.I). Similarly, pump sites within 500 feet of any dwelling must be surrounded by a fence, at least six feet in height, constructed of chain-link with wood or metal slates, or other screening fencing that complies with the requirements of DOGGR (19.98050.N);
- **Height restrictions and paint requirements for pumping units:** The height of all pumping units shall not exceed 35 feet and shall be painted and kept in neat order (19.98.050.L); and
- **Dust abatement requirements for parking areas:** All vehicle parking and maneuvering areas must be treated and maintained with oiled sand or a similar dust binding material (19.98.050.M).

The Kern County Zoning Ordinance includes a number of setback requirements for oil and gas wells, as provided in Table 4.1-2.

Table 4.1-2: Kern County Existing Setback Requirements for Oil and Gas Wells

Zone Districts		Required Setbacks (in feet)			
		Dwelling(2)	Public Highway or Building	Buildings Used as Places of Assembly, Institution or School	Any Building Used for Commercial Purposes
A	Exclusive Agriculture	100	N/A	N/A	N/A
A-1	Limited Agriculture	100	N/A	N/A	N/A
M-2	Medium Industrial	100	N/A	N/A	N/A
M-3	Heavy Industrial	100	N/A	N/A	N/A
NR	Natural Resource	100	N/A	N/A	N/A
RF	Recreation Forestry	150	100	300	50 (1)
M-1	Light Industrial	150	100	300	50 (1)
PE	Petroleum Extraction	150	100	300	50 (1)
DI	Drilling Island	150	100	300	50 (1)
Zone Districts where CUPs are required		150	100	300	50 (1)

Notes:
(1) For wells within 50 feet of a building used for commercial purposes, written consent must be obtained from the structure's Owner prior to the commencement of drilling.
(2) Fencing and screening is required for pumps sites within 500 feet of any dwelling. (19.98.050.N Development Standards).
Key:
N/A = Not applicable

Chapter 19.81, Dark Skies Ordinance (Outdoor Lighting)

This chapter of the Kern County Zoning Ordinance provides requirements for outdoor lighting within specified unincorporated areas of Kern County in order to accomplish the following objectives:

1. Encourage a safe, secure, and less light-oriented nighttime environment for residents, businesses, and visitors.
2. Promote a reduction in unnecessary light intensity and glare, and to reduce light spillover onto adjacent properties.
3. Protect the ability to view the night sky by restricting unnecessary upward projections of light.
4. Promote energy conservation and a reduction in the generation of greenhouse gases by reducing wasted electricity that can result from excessive or unwanted outdoor lighting.

In accordance with Chapter 19.81.050 of the Kern County Zoning Ordinance, outdoor lighting in association with oil and gas exploration and production operations and related facilities are exempt from this chapter and are regulated by the provisions of Chapter 19.98, described above.

4.1.4 Impacts and Mitigation Measures

This section describes the impact analysis relating to aesthetics for the proposed Project. It describes the methods used to determine the impacts of the Project and lists the thresholds used to conclude whether an impact would be significant. Measures to mitigate (i.e., avoid, minimize, rectify, reduce, eliminate, or compensate for) significant impacts accompany each impact discussion, where applicable.

Methodology

The methodology used for this aesthetic assessment is based on the Federal Highway Administration's (FHWA's) visual impact assessment system (FHWA 1981) in combination with other established visual assessment systems. The FHWA's methodology for Visual Impact Assessment for Highway Projects (FHWA 1981) is often used to assess the potential aesthetic impacts of proposed development projects with a variety of different landscape settings. The visual impact assessment process involves identification of the following:

- Visual resources (i.e., visual character and quality) of the region and the immediate Project Area;
- Important viewing locations (e.g., roads, trails, and overlooks) and the general visibility of the Project Area and the site using descriptions and photographs;
- Viewer groups and their sensitivity;
- Relevant federal, state, and local government policies and concerns for protection of visual resources;
- Impacts and the levels of significance of visual impacts of the proposed Project; and
- Mitigation measures that would reduce significant impacts to less than significant levels.

As part of the visual assessment, KOPs were selected to represent a range of typical views within the Project Area where oil and gas development could occur. Concept plans and photosimulations have been prepared for each KOP to illustrate potential changes that could occur due to oil and gas development within the area visible in the view. The concept plans and photosimulations illustrate potential likely oil and gas development that could occur during construction and operation. Factors used to evaluate the photosimulations include:

- Visual sensitivity and impacts are affected by the distance and/or the travel speed at which something is viewed in the landscape. Features viewed in close proximity tend to take on greater importance.
- Visual sensitivity is based on people's awareness of and concern for the visual quality of the landscape and changes to it and is generally highest for viewers such as residents and people engaging in recreation or leisure activities and lower for people engaged in or commuting for work or conducting personal business.

- A feature is described as "noticeable" if it has the potential to attract viewer attention because it introduces substantial visual change in form, line, color and/or texture in the landscape.

In addition, photosimulations have been prepared to illustrate the application of best management practices that would help reduce aesthetic impacts and mitigation measures that would help reduce potentially significant aesthetic impacts to less than significant levels.

Visual Characteristics

The visual character and quality of the environmental setting of the Project Area are described using criteria established by the FHWA for visual landscape relationships. The criteria for describing visual quality include vividness, intactness, and unity, as defined below:

- Vividness is the visual power or memorability of landscape components as they combine in striking or distinctive visual patterns.
- Intactness is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements; this factor can be present in well-kept urban and rural landscapes, as well as in natural settings.
- Unity is the visual coherence and compositional harmony of the landscape considered as a whole; it frequently attests to the careful design of individual components in the landscape. (FHWA 1981)

The appearance of the landscape is described below using these criteria and descriptions of the dominance elements of form, line, color, and texture as appropriate. These dominance elements are the basic components commonly used to describe visual character and quality for many visual assessments (USFS 1995; FHWA 1981).

Sensitive Viewers

Viewer sensitivity or concern is based on the visibility of resources in the landscape, the proximity of viewers to visual resources, the elevational position of viewers relative to visual resources, the frequency and duration of views, the number of viewers, and the type of expectations of individuals and viewer groups.

The criteria for identifying importance of views are related in part to the viewer's position relative to the resource. An area of the landscape that is visible from a particular location (e.g., a park or overlook) or series of points (e.g., a road or trail) is defined as a viewshed. To identify the importance of views of resources, a viewshed may be broken into distance zones of foreground, middleground, and background. Generally, the closer a resource is to the viewer, the more dominant it is and the greater its importance to the viewer. Although distance zones in viewsheds may vary between different geographic regions or types of terrain, a commonly used set of criteria identifies the foreground distance zone as within one half mile from the viewer, the middleground distance zone as extending from one half mile to 4 miles from the viewer, and the background zone as extending from 4 miles to the horizon (USFS 1995). Also, resources that are

higher in elevation than the viewer tend generally to take on greater visual importance than resources located at a lower elevation than the viewer.

Viewer sensitivity also depends on the number and types of viewers and the frequency and duration of views. Generally, viewer sensitivity increases with an increase in total numbers of viewers, the frequency of viewing (e.g., daily or seasonally), and the duration of views (i.e., how long a scene is viewed). Viewer sensitivity is also higher for views seen by people who are driving for pleasure; people engaging in recreational activities, such as hiking, biking, or camping; and homeowners. Viewer sensitivity tends to be lower for views seen by people driving to and from work or as part of their work (USFS 1995; FHWA 1981; U.S. Soil Conservation Service 1978). Views from recreation trails and areas, scenic highways, and scenic overlooks are generally assessed as having high viewer sensitivity.

In many areas of the County, oil and gas development activities would be visible to sensitive viewer groups with moderately high to high concern for aesthetic impacts because it would be visible from residences, parks, and open space areas. In other more remote and less populated areas of the County where there is little public access, the proposed Project would have little or no effect on sensitive viewers because the volume, frequency, and duration of views of the proposed Project would be low and viewers primarily would be people driving to and from work or as part of their work. Within the environmental setting of the proposed Project, KOPs have been selected that represent typical views within the County where oil and gas development is likely to occur. Viewer sensitivity is described below for these KOPs using criteria established by the FHWA.

Sensitive Viewing Areas and Key Observation Points

Following is a description of ten KOPs selected by the County in 2013. The KOPs were selected to represent typical views of the Project components and views from sensitive locations. Figure 4.1-1 shows the location of KOPs within the Project Area Figures 4.1-2 through 4.1-6 show existing views from each of the selected KOPs. The representative KOP locations include views of and from Tier 1, 2, 3 and 4 areas.

KOP 1 – Panorama Park, Bakersfield (Tier 1)

KOP 1 (Figure 4.1-2) represents the view looking north from Panorama Park in north Bakersfield. The linear park extends 1.5 miles along the top of a steep bluff and borders Panorama Drive. Views north from the bluff-top park are expansive. The foreground of the view is dominated by scattered trees and grassland on a mostly flat and gently sloping plain below the bluff. Beyond this area and extending through the middleground and background to the horizon, the view is dominated by a very high density of oil and gas development facilities, including pump jacks, tanks, power lines, pipes, roads, and related facilities. Colors of facilities are mostly grays, tans, browns, and similar earth-tone colors. Patches of yellow grass and barren ground are interspersed among the facilities.

Intactness and unity for this view are low because of the presence of extensive encroaching elements and lack of visual coherence and compositional harmony due to the presence of numerous elements of various forms and lines scattered throughout the landscape. Vividness is moderately high because of the visual power and memorability of the view overlooking extensive oil and gas facilities sprawling across the expansive landscape.

Viewer sensitivity is high for views from this and other locations along the linear, bluff-top Panorama Park because the view is experienced on a regular basis by a large number of viewers with high sensitivity who use the park for recreation and leisure activities.

KOP 2 – Night - Panorama Park, Bakersfield (Tier 1)

KOP 2- Night (Figure 4.1-2) represents the nighttime view looking north from Panorama Park in north Bakersfield. The linear park extends 1.5 miles along the top of a steep bluff and borders Panorama Drive. Views north from the bluff-top park are expansive. The nighttime view is dominated by lights of varying colors and brightness scattered throughout the mostly flat and gently sloping plain extending northward below the bluff. Lights are associated with the oil and gas development facilities described above for KOP 1A and housing below the bluff. Colors vary from bright white to various shades of yellow and orange with a few red lights interspersed.

Intactness and unity for this view are low because of the presence of extensive encroaching elements and lack of visual coherence and compositional harmony due to the scattered and uneven pattern of lights and their reflectance off of scattered and irregular forms in the landscape. Vividness is moderately high to high because of the visual power and memorability of the panoramic view of scattered and various colored lights contrasting against the dark expanse of the landscape and night sky.

Viewer sensitivity is high for views from this and other locations along the linear, bluff-top Panorama Park because the nighttime view is experienced on a regular basis by a large number of viewers with high sensitivity using the park for recreation and leisure activities, especially nighttime gathering, socializing, and viewing. During summer months, high numbers of viewers use the park after dark when temperatures are cooler and outdoor activities are more enjoyable.

KOP 3 – Comanche Road, South of SR 58 (Tier 2)

KOP 3 (Figure 4.1-3) represents the view looking west from Comanche Road south of SR 58 in the eastern part of the Project Area. This view is typical of views within this area of predominately flat agricultural lands and scattered oil and gas development facilities. The view from KOP 3 consists of the following features: a broad, tilled agricultural field in the foreground; a small complex of tan-colored tanks and other oil and gas facilities at the far end of the tilled field; dark green orchards beyond the open field; and various low vertical wood power poles extending above the tops of orchard trees along the horizon. The roadway and a portion of a wood power pole are also visible in the foreground. Although the field in this view consists of yellowish-tan bare earth, the appearance of this and other agricultural fields throughout the area changes regularly depending on the season and crop types planted.

Intactness for this view is moderate because the predominant elements are orderly agricultural fields and orchards with some encroaching elements (i.e., oil and gas facilities and vertical wood power poles). Also, unity is moderate due to the presence of the forms and lines of the oil and gas facilities and power poles contrasting with the otherwise orderly and visually coherent patterns of the agricultural landscape.

Vividness is low because this and similar views in this area lack striking visual components or distinctive patterns that would produce visual power or memorability.

Viewer sensitivity is generally low for views from this and other locations in the vicinity because these views are primarily experienced by moderate numbers of viewers with low sensitivity who are working or travel this and other local roads largely for purposes of work or commuting rather than for recreation or leisure activities.

KOP 4 – Hwy 223, East of Arvin (Tier 2)

KOP 4 (Figure 4.1-3) represents the view looking west from an overlook along Highway 223 east of the community of Arvin in the eastern portion of the Project Area. This KOP represents views for motorists travelling westbound on Highway 223 and descending into the San Joaquin Valley through the transitional foothills of the southern Sierra Nevada. The foreground of this view consists of the following features: tall grasses and a low shrub; a portion of barbed wire fencing; rocky outcrops; and yellow grass-covered slopes of the lower foothills merging into open, yellow, grass-covered fields. Beyond the open fields, the landscape transitions to flat agricultural fields and orchards of various colors in rectilinear patterns extending west into the distance across the broad San Joaquin Valley. Several small communities, rural residences, and agricultural operations are visible interspersed in the predominantly agricultural landscape.

Intactness and unity for this view are high because there are no noticeable encroaching elements detracting from the visual coherence of the natural and rural landscape setting. Vividness is moderately high due to the distinctive transition from undulating, yellow, grass-covered foothills to flat, green and tan agricultural lands laid out in rectilinear, straight-edged patterns.

Viewer sensitivity is moderately high for views in this area because these views are experienced by moderately high numbers of motorists and others traveling through this area for pleasure and recreation. Viewer awareness is heightened for views in this area because it functions as a visual ecotone, or area of landscape character transition, and has virtually no encroaching elements.

KOP 5 – SR 99 and I-5 Junction, West of SR 99 (Mix of Tier 3 and Tier 4)

KOP 5 (Figure 4.1-4) represents the view looking southwest near the junction of SR 99 and I-5 in the southern portion of the Project Area. This KOP is located on a frontage road adjacent to and just west of SR 99 and represents views for motorists travelling southbound on SR 99 and I-5. The foreground of this view consists of the following features: low, rolling hills covered with yellow grasses and a few scattered shrubs; a graded road extending up the hillslope; low wood-post fences; low, vertical wood power poles and sweeping power lines; and a short pole and sign adjacent to the roadway. The background is dominated by low, rugged mountains covered

predominantly with yellow grasses and dark patches of trees and shrubs. This view represents a substantial and abrupt transition from the predominantly flat agricultural fields of the broad San Joaquin Valley to the rugged and varied mountains and canyons of the San Emigdio Mountains that anchor the south end of the valley and Kern County.

Intactness and unity for this view are moderately high because there are only a few encroaching elements which detract slightly from the visual coherence of the rural and natural landscape setting. Vividness is also moderately high due the somewhat dramatic and distinctive backdrop of rugged mountains contrasting with the smooth and low rolling hills in the foreground.

Viewer sensitivity is moderate to high for views from this area because these views are experienced by very high numbers of motorists traveling on two major highways that serve as major north-south conduits for people traveling both for pleasure and work. Viewer awareness is heightened for views in this area because it functions as a visual ecotone, or area of landscape character transition, and has few encroaching elements.

KOP 6 – Wind Wolves Preserve, Spring Wildflowers Trailhead (South of SR 166) (Tier 2)

KOP 6 (Figure 4.1-4) represents the view looking northeast from the Spring Wildflowers Trailhead in the Wind Wolves Preserve in the southern portion of the Project Area. This KOP represents views for visitors to this open space preserve who are engaged in recreation and leisure activities. Visible features in the foreground of this view include: a narrow, asphalt-surfaced road; a gravel-covered parking area; a wood rail fence with several rock support monuments; fields of tall yellow grasses sloping gently northward; and cattle grazing in the grassy field. Visible near the edge of the yellow grassy fields are an entry gate to the preserve and several low wood power poles spaced regularly along the field edge. Beyond the gently sloping grassy fields, the landscape transitions to flat, mostly dark green orchards and green and tan agricultural fields extending northward into the distance across the broad San Joaquin Valley. A few small isolated structures are barely visible in the green orchards and in the distance.

Intactness and unity for this view are high because there are no noticeable encroaching elements detracting from the visual coherence of the natural and agricultural landscape setting. The parking area, narrow road, wood rail fence, and rock structures are in scale and character with the preserve's purpose and function as a place for leisure and recreation activities. Vividness is moderately high due to the distinctive transition from gently sloping, yellow, grass-covered fields to flat, green, and tan agricultural lands.

Although views are experienced by low to moderate numbers of visitors to the preserve, viewer sensitivity is high because viewers are engaged in activities for leisure and recreation. Viewer awareness is heightened for views in this area because it functions as a visual ecotone, or area of landscape character transition, between the rugged and natural San Emigdio Mountains to the south and the broad, predominantly agricultural San Joaquin Valley to the north.

KOP 7 – Sunnybank Avenue, West of Renfro Road (Tier 4)

KOP 7 (Figure 4.1-5) represents the view looking north from Sunnybank Avenue, west of Renfro Road, in the central portion of the Project Area west of the City of Bakersfield. This KOP represents views within predominantly residential areas where oil and gas facilities occur in close proximity to residences development. This view is of a small undeveloped parcel with adjacent oil and gas facilities and residences. Visible in the immediate foreground of this view are an undeveloped parcel of land consisting of bare gray soil, sparse yellow grasses, several large green shrubs, short wood posts, and a hedge of mounding, dark green shrubs and taller trees lining its north edge. A portion of a residence and dark wood fence are visible on the right side of the view and several large, light-colored tanks and two pump jacks are visible on the left side of and near the center of the view.

Intactness and unity for this view are low because of the presence of encroaching elements of pump jacks and rusting tanks and lack of visual coherence and compositional harmony due to the various forms scattered throughout the view. Vividness is also low because this and similar views in this area lack striking visual components or distinctive patterns that would produce visual power or memorability.

Viewer sensitivity is moderately high to high for views from this and other locations in the vicinity because these views are primarily experienced by local residents from in and around their homes in this predominantly residential area. Viewer sensitivity is somewhat reduced by the presence in the view and surrounding area of existing oil and gas facilities, which may somewhat reduce viewer concern.

KOP 8 – SR 58 (Lokern Road) at SR 43 (Enos Road) Intersection (Tier 2)

KOP 8 (Figure 4.1-5) represents the view looking southwest from the intersection of SR 58 (Lokern Road) and SR 43 (Enos Road) in the central portion of the Project Area west of the City of Bakersfield. This view is typical of views within this area of predominately flat agricultural lands and scattered rural residences and oil and gas development facilities. The view from KOP 6 consists of the following features: a broad, green, agricultural field dominating the foreground; a small cluster of tan-colored tanks, dark-colored residences and other single-story structures, and large dark green trees beyond the field to the left in the view; dark green orchards beyond the open field to the right in the view; and various vertical power poles extending above the tops of trees along the horizon. Although the field in this view consists of dark green crops, the appearance of this and other agricultural fields throughout the area changes regularly depending on the season and crop types planted.

Intactness for this view is moderately high because the predominant elements are orderly agricultural fields, orchards, and a few low-profile rural buildings with associated tall trees with only a few encroaching elements (i.e., the small cluster of tanks and some vertical power poles). Also, unity is moderately high due to the predominance of agricultural and rural character elements, with only a few contrasting elements that reduce the otherwise orderly and visually coherent patterns of the landscape.

Vividness is low because this and similar views in this area lack striking visual components or distinctive patterns that would produce visual power or memorability.

Viewer sensitivity is generally low for views from this and other locations in the vicinity because these views are primarily experienced by moderate numbers of viewers with low sensitivity who are working or traveling through this area largely for purposes of work or commuting rather than for recreation or leisure activities.

KOP 9 – SR 58, West of McKittrick (Mix of Tier 1 and Tier 2)

KOP 9 (Figure 4.1-6) represents the view looking west along SR 58 in the western portion of the Project Area. This KOP represents views for motorists travelling westbound on SR 58 toward the Carrizo Plain and Central Coast region in San Luis Obispo County. The foreground of this view consists of the roadway, fences, several wood power poles, and predominantly flat to gently undulating fields covered with tan and yellow grasses. Beyond the open fields, the landscape transitions to low, rolling, grass-covered hills with gentle draws, a small patch of medium green trees and shrubs, a few wood power poles, a light-colored structure, and several widely scattered pump jacks near the base of the hills. Barely visible in the background along the ridge line to the right in the view are several tall, metal, lattice, high-voltage transmission structures. This view is representative of views for motorists and others traveling west in the transitional foothills of the rugged Temblor Range separating the broad and predominantly flat San Joaquin Valley from the narrower, more enclosed Carrizo Plain and coastal hills.

Intactness and unity for this view are moderately high because there are only a few encroaching elements which detract slightly from the visual coherence of the rural and natural landscape setting. Vividness is moderate due to the somewhat varied terrain and rural and natural character of the view. The low rolling hills, open grazing lands, and stark openness provide a somewhat distinctive character to the view.

Viewer sensitivity is moderately high for views in this area because these views are experienced by moderate numbers of motorists and others traveling through this area for pleasure and recreation, often to recreation destinations in the Carrizo Plain, Los Padres National Forest, and coastal communities in the Central Coast Region. Viewer awareness is heightened for views in this area because it functions as a visual ecotone, or area of landscape character transition, and has few encroaching elements.

KOP 10 – Lost Hills County Park (Tier 2)

KOP 10 (Figure 4.1-6) represents the view looking northeast from Lost Hills County Park near the edge of the small community of Lost Hills in the northwestern portion of the Project Area. This view of open lands northeast of the developed park is typical of views of predominately flat and open lands within this general area. Although not visible in this view, the area contains widely scattered rural residences and oil and gas development facilities. The foreground view from KOP 10 consists of a portion of a green, turf-covered playfield, a metal goal post, light poles topped with photovoltaic panels, a par course sign and station, a few large green shrubs, and a chain link fence bordering the park. Beyond the park perimeter are open fields with yellow

grasses and dense stands of mounded light-green shrubs. A large group of low, dark-colored posts are visible in the fields to the right of the view. Barely visible in the background is a line of tall, metal lattice, high-voltage transmission structures extending above the horizon.

Intactness for this view is moderately high because the predominant elements are somewhat orderly recreation facilities and open fields of natural appearing grasslands and fields with few encroaching elements (i.e., the low posts and distant transmission structures). Also, unity is moderately high due to the predominance of orderly recreation facilities and natural appearing vegetation with only a few contrasting elements that reduce the visually coherent patterns of the landscape. Vividness is low because this and similar views in this area lack striking visual components or distinctive patterns that would produce visual power or memorability.

Viewer sensitivity is generally high for views from this developed park because these views are primarily experienced by moderate to high numbers of viewers with high sensitivity who are engaged in recreation or leisure activities at the park. In addition, this view represents similar views from residences in the community by viewers with high viewer sensitivity.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would have a significant impact on recreation if it would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrade the existing visual character or quality of the site and its surroundings; or
- Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

Based on these standards, the effects of the Project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

For each of the representative KOPs, the amount of potential visual change in unity, intactness, and vividness that would be introduced into the existing landscape and the degree to which viewers are likely to be impacted and react to the change are described below for each applicable threshold of significance. Impacts are assessed for likely potential scenarios of oil and gas development that may occur within the view from each representative KOP during construction, operation, well stimulation, and decommissioning/abandonment. Figures AES-CP1 – AES-CP9

(Appendix G) illustrate concepts for likely potential scenarios of oil and gas development that could occur within the view from each representative KOP during operation. Photo simulations described below are based on these concept diagrams.

Impact 4.1-1: Have a Substantial Adverse Effect on a Scenic Vista

There are currently no designated scenic vistas within the Project Area. Therefore, future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance would not result in significant impacts related to having a substantial adverse effect on a scenic vista during construction, operation, well stimulation, or decommissioning/abandonment. Impacts to non-designated scenic vistas are evaluated in detail for each KOP under Impact 4.1-3, below.

Mitigation Measures

No mitigation measures are proposed.

Level of Significance

Impacts would be less than significant.

Impact 4.1-2: Substantially Damage Scenic Resources, including, but Not Limited to, Trees, Rock Outcroppings, and Historic Buildings within a State Scenic Highway

There are currently no Designated State Scenic Highways within the Project Area. However, an approximately 5-mile-long segment of Highway 41, which is identified as an Eligible State Scenic Highway, crosses through the northwest corner of the Project Area. With the exception of a short portion near the far eastern end of this segment, near its crossing of the County boundary, this segment of Highway 41 travels through a valley bounded by low hills. Almost all views south and east from the highway toward the central portion of the Project Area are screened by the hills. The short eastern segment of the highway in the flat valley east of the hills has open views of the northern portion of the Project Area to the east and southeast. The nearest Core Area to this segment of Highway 41 is approximately 5 miles east. At this distance, oil and gas facilities would not be noticeable during operation. Although very tall drilling rigs may be visible at this distance, they also would not be noticeable to travelers when viewed from the highway in this area. For these reasons, intactness, vividness, and unity would not be reduced for views from this segment of Highway 41.

Therefore the Project would not substantially damage any scenic resources within a Designated or Eligible State Scenic Highway within the Project Area, and there would be no aesthetic impacts for construction, operation, well stimulation, or decommissioning/abandonment. Aesthetic impacts of the Project under this criterion would be less than significant.

Mitigation Measures

No mitigation measures are proposed.

Level of Significance

Impacts would be less than significant.

Impact 4.1-3: Substantially Degrade the Existing Visual Character or Quality of the Site and Its Surroundings

Impacts on aesthetic resources due to construction, operation, well stimulation, or decommissioning/abandonment of oil and gas development facilities would result from changes to existing views of the landscape by viewers with high visual sensitivity (i.e., people with high interest and concern for the visual quality of the landscape and changes to it, such as residents from the vicinity of their homes or people engaging in recreation or leisure activities). Aesthetic impacts may include a substantial change to the landscape character (e.g., from rural, agricultural, or natural to more developed or industrial-appearing) or reduction in scenic quality (e.g., substantially altering views of agricultural, agrarian, or natural landscapes that characterize the area or are valued by local or regional residents for their scenic quality).

For each of the representative KOPs, the amount of potential visual change in unity, intactness, and vividness that would be introduced into the existing landscape and the degree to which viewers are likely to be impacted and react to the change is described below for each applicable threshold of significance. Impacts are assessed for likely potential scenarios of oil and gas development that may occur within the view from each representative KOP during construction, operation, well stimulation, and decommissioning/abandonment. Figures AES-CP1 – AES-CP9 (Appendix G) illustrate concepts for likely potential scenarios of oil and gas development that could occur within the view from each representative KOP during operation. Photo simulations described below are based on these concept diagrams.

Construction Impacts

Short-term impacts on the existing visual character or quality of a site and its surroundings may occur during construction of oil and gas facilities. Construction activities include geophysical surveys, well pad construction, drilling, well completion, testing and ancillary facility construction. Short-term impacts could result from land clearing and grading for pads and work areas, temporary construction access roads, temporary construction areas, and vehicle and equipment operations for facility construction. Some construction phase activities, such as access road construction and placement of temporary construction areas (e.g., construction yards and staging and laydown areas) would involve grading and removal of vegetation, which would later be restored following construction. Some access roads would be wider during construction to accommodate larger construction vehicles, such as drill rigs, thereby resulting in a greater impact during construction than operation. Likewise, some access roads would be temporary and fully restored at the end of construction. Clearing of land may also involve removal of vegetation in some areas that would later be restored. Short-term aesthetic impacts could result from a reduction in unity, intactness, or vividness created by vegetation removal, grading that noticeably alters existing landforms, and materials, equipment, vehicles, structures, fences, and other elements that would be present during construction.

Vehicle and equipment operations may produce visible dust during land-clearing operations and from traveling on unpaved existing and new roadways. Drill rigs, and possibly cranes, are likely to be visible from long distances silhouetted against the sky, especially in the flatter and more open landscapes within the County. Ground-level activities, such as land clearing and site preparation, require equipment such as bulldozers, excavators, loaders, and dump trucks. Foundation and facility construction activities would require large delivery vehicles and concrete trucks. The local increase in general vehicle traffic could be a source of visual impact, depending upon the number of trips to and from a specific area. Onsite parking could be noticeable during construction if certain sites require a larger number of workers and, consequently, their vehicles. Nighttime lighting for construction or safety and security in construction areas may also result in short-term aesthetic impacts; these impacts associated with creating new sources of substantial light or glare are addressed separately under Impact 4.1-4.

The severity of construction-related aesthetic impacts would depend not only on the reduction in unity, intactness, and vividness produced by the construction activities, but also on the visibility and proximity of these activities to viewers and the sensitivity of viewers to changes in the landscape's character and quality. Although construction activities for a particular well, group of wells, or storage tank area may be temporary and somewhat brief (i.e., on the order of a several weeks to several months), staggered development of multiple wells or other oil and gas facilities within a particular area could occur over the course of several years. Because of this, construction activities that substantially reduce unity, intactness, or vividness in areas with high visual sensitivity and persist for a month or longer would result in significant aesthetic impacts.

Construction-related aesthetic impacts would occur during exploration and initial development in areas that do not currently contain oil and gas development facilities as well as areas that contain remnant facilities no longer in operation. Construction-related aesthetic impacts would also occur in areas with existing oil and gas operations where construction activities would occur at the same time as operation activities (e.g., new wells would be being drilled in areas where existing wells are operating). Figures AES-C1 – AES-C10 (Appendix G) show views of construction activities that would include drilling rigs, grading activities, trailers, vehicles, laydown areas, and other work areas.

Eastern Subarea

Figures AES-C1 and AES-C2 (Appendix G) show existing and potential views for KOPs 1 and 2 with construction activities for expanding oil and gas development in the area north of Panorama Park in north Bakersfield where there is extensive existing oil and gas development. With the exception of the immediate foreground that includes the Kern River, the area within the view from this KOP is of Tier 1 lands. This KOP is representative of other views in the Project Area where there is existing extensive oil and gas development. Although vividness is moderately high for the existing view of expansive oil and gas development, unity and intactness are low. Construction activities would introduce new tall drill rigs, extensive grading activities, equipment storage and laydown areas, vehicles, equipment, and dust in foreground and middleground views with high visual sensitivity. These activities would introduce new forms and lines in an area in the foreground of the view that currently is not developed for oil and gas. Although these new

features would be noticeable in foreground views, they would be similar to numerous existing features in the view and would not substantially reduce intactness or unity for views for sensitive viewers. For these reasons, aesthetic impacts of construction activities for oil and gas development for KOPs 1 and 2 would be less than significant.

Figure AES-C3 (Appendix G) shows existing and potential views for KOP 3 with construction activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 3 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where construction activities for oil and gas development may occur with some existing oil and gas development in the view. Some of the existing oil and gas facilities, such as the wells, are somewhat distant and not easily noticeable in the view. However, the existing tanks are large and dominant elements in the view. Intactness and unity are moderate and vividness is low for this KOP. Construction activities would introduce new tall drill rigs, extensive grading activities, equipment storage and laydown areas, vehicles, equipment, and dust in foreground and middleground views. These construction activities would introduce new, dominant, and highly noticeable elements in foreground views; however, due to the presence of the large and dominant tanks in the existing view, intactness and unity would be only somewhat reduced. Although visual sensitivity is low because most viewers are traveling for work or working in the area, views of agricultural lands in the County are considered an important attribute of the County's visual character and quality. Because introducing new elements of construction activities would only somewhat reduce the intactness and unity of the view, the visual character and quality of the site and its surroundings would be only somewhat degraded in this view. However, as a visible change on the landscape, this degradation in visual character is considered significant for construction activities for oil and gas development for KOP 3 and similar views of predominately agricultural areas in the Project Area with some existing dominant oil and gas development operations present.

Figure AES-C4 (Appendix G) shows existing and potential views for KOP 4 with construction activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 4 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness, unity, and vividness are high or moderately high for this KOP. Although visual sensitivity is high and construction activities would introduce some new elements in the view, these elements would not be noticeable due to their distance and construction activities would not substantially reduce intactness, unity, or vividness in this view. For these reasons, aesthetic impacts would be less than significant for construction activities for oil and gas development for KOP 4 and similar views in the Project Area where existing oil and gas operations are not present or are so distant that they are not noticeable.

Figure AES-C5 (Appendix C) shows existing and potential views for KOP 5 with construction activities occurring in an area that does not contain existing oil and gas operation activities. The area within the view from this KOP is a mix of Tier 3 and Tier 4 lands, with Tier 1 land immediately to the north. This KOP is representative of similar areas in the Project Area where

construction activities for oil and gas development may occur without existing oil and gas development in the view. Intactness, unity, and vividness are moderately high for this KOP. Construction activities would introduce new tall drill rigs, extensive grading activities, equipment storage and laydown areas, vehicles, equipment, and dust in foreground and middleground views with high visual sensitivity. These activities would introduce new forms and lines that would substantially reduce intactness, unity, and vividness in an area that currently is not developed for oil and gas. These construction activities would be noticeable in foreground views to high numbers of sensitive viewers traveling the two major highways. For these reasons, aesthetic impacts would be significant for construction activities for oil and gas development for KOP 5 and similar views in the Project Area without existing oil and gas development operations.

Central Subarea

Figure AES C7 (Appendix G) shows existing and potential views for KOP 7 with construction activities for expanding oil and gas development in a residential area where there are some existing oil and gas facilities. The view for KOP 7 is of Tier 4 land. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur in close proximity to residences with some existing oil and gas development in the view. Intactness, unity, and vividness for this KOP are low due to the presence of oil and gas and other industrial facilities in the view. Construction activities would introduce a new tall drill rig, some grading activities, equipment, materials, vehicles, and dust in immediate foreground views with moderately high to high visual sensitivity. These activities would introduce new forms and lines that would further reduce intactness, unity, and vividness in the view. Although the view currently includes oil and gas facilities, these existing elements are partially screened and more distant in view than the elements associated with construction activities. The construction activities would be dominant and highly noticeable in immediate foreground views to sensitive residential viewers and would further degrade the visual character and quality of the site and surrounding residential neighborhood. For these reasons, aesthetic impacts would be significant for construction activities for oil and gas development for KOP 7 and similar views in the Project Area where residences are in proximity to some existing oil and gas development operations.

Figure AES-C8 (Appendix G) shows existing and potential views for KOP 8 with construction activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 8 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where construction activities for oil and gas development may occur with some existing oil and gas development in the view. The existing oil and gas facilities in the view are partially screened, blend somewhat with other structures in the background, and, though noticeable, are not dominant elements in the view. Intactness and unity are moderately high and vividness is low for this KOP. Construction activities would introduce new tall drill rigs, extensive grading activities, equipment storage and laydown areas, vehicles, equipment, and dust in immediate foreground and foreground views. These construction activities would introduce new, dominant, and highly noticeable elements in foreground views that would substantially reduce the intactness and unity of a predominately agricultural area with some oil and gas facilities present. Although visual sensitivity is low because most viewers are traveling for work or working in the area, views of agricultural lands in

the County is considered an important attribute of the County's visual character and quality. Introducing new elements of construction activities in foreground views of the predominantly agricultural area would degrade the visual character and quality of the site and its surroundings. For these reasons, aesthetic impacts would be significant for construction activities for oil and gas development for KOP 8 and similar views of predominantly agricultural lands in the Project Area.

Western Subarea

Figure AES-C6 (Appendix G) shows existing and potential views for KOP 6 with construction activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 6 is Tier 2 lands. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness, unity, and vividness are high or moderately high for the existing view for this KOP. Construction activities would introduce new tall drill rigs, grading activities, equipment storage and laydown areas, vehicles, equipment, and dust in views with high visual sensitivity. These activities, in particular the tall drill rigs, would introduce new forms and lines that would be noticeable in middleground views for sensitive viewers visiting the preserve and would reduce intactness, unity, and vividness in an area that currently is not developed for oil and gas. For these reasons, aesthetic impacts would be significant for construction activities for oil and gas development for KOP 6 and similar views in predominantly agricultural areas without existing oil and gas development operations in the Project Area.

Figure AES-C9 (Appendix G) shows existing and potential views for KOP 9 with construction activities for expanding oil and gas development in an agricultural grazing area with some existing oil and gas facilities present. The area within the view from KOP 9 is of Tier 1 and Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where construction activities for oil and gas development may occur with some existing oil and gas development in the view. The existing oil and gas facilities in the view are somewhat distant and, though noticeable, are not dominant elements in the view. Intactness and unity are moderately high and vividness is moderate for the existing view for this KOP. Construction activities would introduce new tall drill rigs, extensive grading activities, equipment storage and laydown areas, vehicles, equipment, and dust in immediate foreground, foreground, and middleground views with high visual sensitivity. These construction activities would introduce new, dominant, and highly noticeable elements that would substantially reduce the intactness, unity, and vividness of a predominately agricultural area with some oil and gas facilities present. For these reasons, aesthetic impacts would be significant for construction activities for oil and gas development for KOP 9 and similar views of agricultural lands with some existing oil and gas development operations in the Project Area.

Figure AES-C10 (Appendix G) shows existing and potential views for KOP 10 with construction activities for expanding oil and gas development in an area with agricultural, recreation, and industrial uses land where existing oil and gas facilities are either not present or not noticeable. The area within the view from KOP 10 is of Tier 2 lands. This KOP is representative of similar

areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness and unity are moderately high and vividness is low for this KOP. Although visual sensitivity is high and construction activities would introduce some new elements in the view that would be noticeable, these elements would not be dominant due to the presence of other more dominant vertical elements in the foreground of the view, and these construction activities would not substantially reduce intactness, unity, or vividness in this view. For these reasons, aesthetic impacts would be less than significant for construction activities for oil and gas development for KOP 10 and similar views in the Project Area where existing oil and gas operations are either not present or not noticeable.

Operation Impacts

Following completion of the well, the drilling equipment would be removed. Long-term impacts on the existing visual character or quality of a site and its surroundings may occur primarily during operation of oil and gas facilities. Long-term impacts for these facilities could occur due to strong contrast with existing landscape conditions produced by a mix of irregular vertical and geometric forms and lines, irregular and often haphazard layout and spacing, or colors and textures that do not blend with their surroundings. Where introduced, these structures, particularly large storage tanks, may be silhouetted against the sky above the horizon line, which draws viewer attention and increases their contrast in open landscapes. The presence of other structures of similar form nearby tends to somewhat reduce their level of contrast. However, increased numbers of structures, especially ones with different forms or colors, may add to the texture of existing structures and increase contrast in the landscape. New oil and gas facilities introduced into the landscape, particularly storage tanks, where other similar structures are not present, would tend to be dominant and create strong contrast. Where new facilities are adjacent to or in the vicinity of existing facilities of similar type and height, or other structures (e.g., industrial facilities, metal warehouses, and processing plants) are common features, the new structures are more likely to be co-dominant with the existing ones and produce less contrast.

New vertical elements, such as gas flare pipes and power lines consisting of a series of poles or lattice structures, and horizontal elements, such as access roads, well pads, and collection and distribution pipes, may produce contrast in form, line, color, or texture with the existing landscape character. Long-term aesthetic impacts could result from the following: a reduction in unity, intactness, or vividness created by loss of vegetation cover; landform changes that noticeably contrast with existing landforms; pumpjacks, vertical pumps, or other well types and associated ancillary facilities; storage tanks; pipes; and materials, equipment, vehicles, structures, fences, and other elements that would be present during operation. In addition to their form, line, and texture, oil and gas facilities may also produce strong contrast due to the reflectivity or color of the finish of elements, especially is they have a shiny, metallic galvanized finish or are painted with bright or contrasting colors. Nighttime lighting for safety and security or intermittent flaring of excess natural gas as a byproduct of production during operation may also result in long-term aesthetic impacts; these impacts associated with creating new sources of substantial light or glare are addressed separately under Impact 4.1-4, below.

The severity of operation-related aesthetic impacts would depend not only on the reduction in unity, intactness, and vividness produced by the operation activities, but also on the visibility and proximity of these activities to viewers and the sensitivity of viewers to changes in the landscape's character and quality. Because of this, operation activities that substantially reduce unity, intactness, or vividness in foreground views with high visual sensitivity would result in significant aesthetic impacts. Aesthetic impacts during operation of oil and gas development facilities are most likely to occur in areas that have no or very few noticeable existing oil and gas facilities or where existing facilities are visible but not dominant contrasting elements in the landscape. Because views of agricultural lands in the County are considered an important attribute of the County's visual character and quality, introducing new oil and gas facilities or substantially expanding these facilities in predominantly agricultural areas, particularly in foreground views, are likely to degrade the visual character and quality of the site and its surroundings and result in significant aesthetic impacts.

Figures AES-O1 – AES-O10 (Appendix G) show existing and potential views of operation activities that would include wells and well pads, graded areas, storage tanks, pipes, and other storage and operation areas.

Eastern Subarea

Figures AES-O1 and AES-O2 (Appendix G) show existing and potential views for KOPs 1 and 2 with operation activities for expanding oil and gas development in the area north of Panorama Park in north Bakersfield where there is extensive existing oil and gas development. With the exception of the immediate foreground that includes the river, the area within the view from this KOP is of Tier 1 lands. This KOP is representative of other views in the Project Area where there is existing extensive oil and gas development. Although vividness is moderately high for the existing view of expansive oil and gas development, unity and intactness are low. Operation activities would introduce numerous new well pads with wells of varying types and sizes, extensive new access roads, large storage tanks and ancillary facilities, numerous power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, vehicles, and occasional dust in foreground and middleground views with high visual sensitivity. These activities would introduce new forms and lines in an area in the foreground of the view that currently is not developed for oil and gas. Although these new features would be noticeable in foreground views, they would be similar to numerous existing features in the view and would not substantially reduce intactness or unity for views for sensitive viewers. For these reasons, aesthetic impacts of operation activities for oil and gas development for KOPs 1 and 2 would be less than significant.

Figure AES-O3 (Appendix G) shows existing and potential views for KOP 3 with operation activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 3 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where operation activities for oil and gas development may occur with some existing oil and gas development in the view. Some of the existing oil and gas facilities, such as the wells, are somewhat distant and not easily noticeable in the view. However, the existing tanks are large and dominant elements in the view. Intactness

and unity are moderate and vividness is low for this KOP. Operation activities would introduce new well pads with wells of varying types and sizes, new access roads, large storage tanks and ancillary facilities, power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, vehicles, and occasional dust in foreground and middleground views. These operation activities would introduce new, dominant, and highly noticeable elements in foreground views; however, due to the presence of the large and dominant tanks in the existing view, intactness and unity would be only somewhat reduced. Although visual sensitivity is low because most viewers are traveling for work or working in the area, views of agricultural lands in the County are considered an important attribute of the County's visual character and quality. Because introducing new elements of operation activities would only slightly reduce the intactness and unity of the view, the visual character and quality of the site and its surroundings would be only somewhat degraded in this view. For these reasons, aesthetic impacts would be less than significant for operation activities for oil and gas development for KOP 3 and similar views of predominately agricultural areas in the Project Area with some existing dominant oil and gas development operations present.

Figure AES-O4 (Appendix G) shows existing and potential views for KOP 4 with operation activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 4 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness, unity, and vividness are high or moderately high for the existing view for this KOP. Although visual sensitivity is high and operation activities would introduce some new elements in the view, these elements would not be noticeable due to their distance and operation activities would not substantially reduce intactness, unity, or vividness in this view. For these reasons, aesthetic impacts would be less than significant for operation activities for oil and gas development for KOP 4 and similar views in the Project Area where existing oil and gas operations are not present or are so distant that they are not noticeable.

Figure AES-O5 (Appendix G) shows existing and potential views for KOP 5 with operation activities occurring in an area that does not contain existing oil and gas operation activities. The area within the view from this KOP is a mix of Tier 3 and Tier 4 lands, with Tier 1 land immediately to the north. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development in the view. Intactness, unity, and vividness are moderately high for the existing view for this KOP. Operation activities would introduce new well pads with wells of varying types and sizes, new access roads, large storage tanks and ancillary facilities, power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, vehicles, and occasional dust in foreground and middleground views with high visual sensitivity. These activities would introduce new forms and lines that would substantially reduce intactness, unity, and vividness in an area that currently is not developed for oil and gas. These operation activities would be noticeable in foreground views to high numbers of sensitive viewers traveling the two major highways. For these reasons, aesthetic impacts would be significant for operation activities

for oil and gas development for KOP 5 and similar views in the Project Area without existing oil and gas development operations.

Central Subarea

Figure AES-O7 (Appendix G) shows existing and potential views for KOP 7 with operation activities for expanding oil and gas development in a residential area where there are some existing oil and gas facilities. The view for KOP 7 is of Tier 4 land. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur in close proximity to residences with some existing oil and gas development in the view. Intactness, unity, and vividness for the existing view for this KOP are low due to the presence of oil and gas and other industrial facilities in the view. Operation activities would introduce a new well pad and well, some ancillary facilities, a new access road, a new power pole and line, and occasional vehicles and dust in immediate foreground views with moderately high to high visual sensitivity. These activities would introduce new forms and lines that would further reduce intactness, unity, and vividness in the view. Although the view currently includes oil and gas facilities, these existing elements are partially screened and more distant in view than the elements associated with the new operation activities. The operation activities would be dominant and highly noticeable in immediate foreground views to sensitive residential viewers and would further degrade the visual character and quality of the site and surrounding residential neighborhood. For these reasons, aesthetic impacts would be significant for operation activities for oil and gas development for KOP 7 and similar views in the Project Area with existing oil and gas development operations.

Figure AES-O8 (Appendix G) shows existing and potential views for KOP 8 with operation activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 8 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where operation activities for oil and gas development may occur with some existing oil and gas development in the view. The existing oil and gas facilities in the view are partially screened, blend somewhat with other structures in the background, and, though noticeable, are not dominant elements in the view. Intactness and unity are moderately high and vividness is low for the existing views for this KOP. Operation activities would introduce new well pads with wells of varying types and sizes, new access roads, large storage tanks and ancillary facilities, power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, vehicles, and occasional dust in immediate foreground and foreground views. These operation activities would introduce new, dominant, and highly noticeable elements in foreground views that would substantially reduce the intactness and unity of a predominately agricultural area with some oil and gas facilities present. Although visual sensitivity is low because most viewers are traveling for work or working in the area, views of agricultural lands in the County are considered an important attribute of the County's visual character and quality. Introducing new elements of operation activities in foreground views of the predominantly agricultural area would degrade the visual character and quality of the site and its surroundings. For these reasons, aesthetic impacts would be significant for operation activities for oil and gas development for KOP 8 and similar views of predominantly agricultural lands in the Project Area.

Western Subarea

Figure AES-O6 (Appendix G) shows existing and potential views for KOP 6 with operation activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 6 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness, unity, and vividness are high or moderately high for the existing view for this KOP. Operation activities would introduce new well pads with wells of varying types and sizes, new access roads, power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, and occasional vehicles and dust in views with high visual sensitivity. These activities would introduce new forms and lines that would be noticeable in middleground views for sensitive viewers visiting the preserve and reduce intactness, unity, and vividness in an area that currently is not developed for oil and gas. For these reasons, aesthetic impacts would be significant for operation activities for oil and gas development for KOP 6 and similar views without existing oil and gas development operations in the Project Area.

Figure AES-O9 (Appendix G) shows existing and potential views for KOP 9 with operation activities for expanding oil and gas development in an agricultural grazing area with some existing oil and gas facilities present. The area within the view from KOP 9 is of Tier 1 and Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where operation activities for oil and gas development may occur with some existing oil and gas development in the view. The existing oil and gas facilities in the view are somewhat distant, and, though noticeable, are not dominant elements in the view. Intactness and unity are moderately high and vividness is moderate for the existing view for this KOP. Operation activities would introduce new well pads with wells of varying types and sizes, new access roads, large storage tanks and ancillary facilities, power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, and occasional vehicles and dust in immediate foreground, foreground, and middleground views with high visual sensitivity. These operation activities would introduce new, dominant, and highly noticeable elements that would substantially reduce the intactness, unity, and vividness of a predominately agricultural grazing area with some oil and gas facilities present. For these reasons, aesthetic impacts would be significant for operation activities for oil and gas development for KOP 9 and similar views with some existing oil and gas development operations in the Project Area.

Figure AES-O10 (Appendix G) shows existing and potential views for KOP 10 with operation activities for expanding oil and gas development in an area with agricultural, recreation, and industrial uses land where existing oil and gas facilities are either not present or not noticeable. The area within the view from KOP 10 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness and unity are moderately high and vividness is low for the existing view for this KOP. Although visual sensitivity is high and operation activities would introduce some new elements (e.g., power poles and wells of different types) in the view that would be noticeable, these elements would not be

dominant due to the presence of other more dominant vertical elements in the foreground of the view and these operation activities would not substantially reduce intactness, unity, or vividness in this view. For these reasons, aesthetic impacts would be less than significant for operation activities for oil and gas development for KOP 10 and similar views in the Project Area where existing oil and gas operations are not present or are not noticeable.

Well Stimulation Impacts

Well stimulation entails enhancing oil or gas production for new wells or restoring or enhancing production for existing wells by increasing the permeability of the subsurface oil-bearing formation. Well stimulation processes primarily consist of hydraulic fracturing treatments and acid well stimulation treatments. Most often, well stimulation is part of the completion of a well when it is initially drilled, and the stimulation is included in the time estimates for initial well development described above. Occasionally, existing wells will be stimulated, in which case, generally, no additional ground disturbance (i.e., clearing or grading to expand well pads or access roads) is required for these treatments. Equipment used for these treatments varies somewhat from that used for construction, but is generally similar in size and appearance. For example, production rigs, which are sometimes used for well stimulation, may be up to about 90 feet in height, while mobile drilling rigs used during the construction phase for well drilling may be up to about 120 feet in height. Well stimulation may also involve more vehicles and equipment at a particular well site than during construction. Equipment used for hydraulic fracturing may include mobile water tanks, truck-mounted blending units, sand storage trailers, truck-mounted pumps, generators, control vans, other vehicles, pipes, hoses, and other equipment. Up to 20 truck-mounted pumps may be present at a well site for a large operation. Acid well stimulation treatments may require a similar amount of equipment and numbers of vehicles, although the types of equipment and vehicles may vary.

Because the equipment, vehicles, and materials used for well stimulation operations would appear similar to those used for construction and drilling activities and would be in place onsite for a short time period (i.e., several days to several weeks), changes in intactness, unity, or vividness in the views from KOPs 1 through 10 would be similar to those described for construction and drilling. For these reasons, aesthetic impacts during well stimulation operations are considered similar to aesthetic impacts for construction of oil and gas development facilities.

Decommissioning/Abandonment Impacts

Well decommissioning and abandonment entails plugging and abandoning wells once they are no longer productive. Decommissioning is also performed for tanks, valve stations, pipes, sumps, cathodic protections systems, and other ancillary facilities associated with oil and gas production. Well decommissioning and abandonment involves removal, disassembly, and salvage or disposal of pumping units, well cellars, pipelines, and associated infrastructure; plugging the well with concrete and steel plates; and restoration of the well pad. Decommissioning and abandonment of other facilities involves similar removal, disassembly, salvage or disposal of equipment, and site restoration. Equipment used for decommissioning and abandonment varies somewhat from that used for construction, but is generally similar in size and appearance. Typical equipment used

onsite for decommissioning and abandonment may include bulldozers, motor graders, front end loaders, cement and dump trucks, and well workover rigs. Although the work is usually restricted to the existing well pad or facility site, occasionally it requires temporary expansion beyond the existing disturbed area of the well pad or facility site to accommodate equipment.

Because the equipment, vehicles, and materials used for decommissioning and abandonment would appear similar to those used for construction and generally would be in place onsite for a short time period (i.e., several days to several weeks), changes in intactness, unity, or vividness in the views from KOPs 1 through 10 would be similar to those described for construction. For these reasons, aesthetic impacts during decommissioning and abandonment are considered similar to aesthetic impacts during construction of oil and gas development facilities. After the completion of equipment and site restoration, the long-term effect on visual resources would be beneficial.

Summary of Project Aesthetic Impacts

While the aesthetic impacts of most single wells or associated facilities could be mitigated, the annual addition of as many as approximately 2,700 wells and the associated ancillary facilities could change the landscape in Kern County. Although most future oil and gas activities would occur in Tier 1 and Tier 2, and more than 2,000 wells could also be removed annually from these areas, there is the potential that areas that are currently primarily agricultural or open space and that have a predominantly rural or natural aesthetic character could be converted to a predominantly industrial developed character with the addition of large numbers of highly visible and noticeable construction and exploratory equipment, materials, vehicles, and construction activities including well stimulation, and decommissioning/abandonment. While less visible, visible facilities during routine operations including well pads, pumping facilities, storage tanks, access roads, and ancillary facilities could also intensify in these areas. The addition of large amounts of new industrial elements in areas where they currently do not occur or are a minor element in the landscape could substantially reduce the intactness, unity, and vividness of existing views of the landscape throughout the Project Area. Accordingly, the overall aesthetic effects of oil and gas development for this Project could be significant.

Mitigation Measures

MM 4.1-1 The Applicant shall use existing roads whenever possible. If use of existing roads is not feasible, construction of new roads should be routed to minimize the amount of disturbance without impeding existing surface use.

MM 4.1-2 All derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any well with oil, gas, or other hydrocarbon shall be removed from the drill site within 90 days after completion of production tests or after abandonment of any well. Earthen sumps used in drilling shall be filled within 90 days after any well has been placed in production (unless such sumps are to be used within six months for the drilling of another well), and any sump used in productions shall be filled after its abandonment and restored to a uniform grade within ninety days.

MM 4.1-3 Sumps and ponds shall be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and shall comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evaporation ponds for produced water.

MM 4.1-4 Oil or gas tanks located within 200 feet of any sensitive receptor shall be partially screened from public view by shrubs, trees or solid screen fencing. Similarly, pump sites (including multiple well pump sites) within 500 feet of any dwelling must be surrounded by a fence, at least 6 feet in height, constructed of dark-colored chain-link with wood or metal slates, dark green or brown fabric material, or other more visually restrictive fencing material. The height of all pumping units shall not exceed 80 feet, and shall be painted in accordance with the Kern County Zoning Ordinance.

MM 4.1-5 Project signage is limited to directional, warning, safety, security and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations in accordance with Chapter 19.84.135 of the Kern County Zoning Ordinance. For any signage necessary for wayfinding, safety, or security, the Applicant shall use the minimum necessary to adequately communicate the required information.

Level of Significance After Mitigation

With mitigation, impacts would be reduced; however, since some oil and gas activities would continue to produce visible changes to the existing environment, aesthetic impacts would remain significant and unavoidable after mitigation.

Impact 4.1-4: Create a New Source of Substantial Light or Glare That Would Adversely Affect Day or Nighttime Views in the Area

Sources of light and glare may be short-term or long-term. Short-term lighting is most often associated with temporary activities occurring during nighttime hours, such as providing safety, security, or temporary visibility for construction, farming, processing, or similar intermittent or temporary activities. Short-term glare may occur from temporary facilities supporting construction or other activities, such as areas for storage of materials or equipment, construction staging areas, and vehicle parking areas. Long-term sources of light or glare are most often associated with providing safety, security, or visibility for established development and operations. Impacts resulting from introducing new sources of substantial light or glare into the landscape were assessed. Because of the high number of variables, light and glare are not measured quantitatively but, instead, are assessed qualitatively in this visual assessment.

Impacts on aesthetic resources due to construction, operation, well stimulation, or decommissioning/abandonment of oil and gas development facilities would result from activities

that create a new source of substantial light or glare that would adversely affect day or nighttime views in the vicinity of the activities. Currently, outdoor lighting associated with oil and gas development facilities is exempt from the County's regulations for promoting light intensity and glare and reducing light spillover and upward projection of light. Introducing new sources of substantial light or glare where it may affect viewers with high visual sensitivity (i.e., people with high interest and concern for the visual quality of the landscape and changes to it, such as residents from the vicinity of their homes or people engaging in recreation or leisure activities) is of particular concern. However, due to the County's interest in protecting views of the night sky, promoting energy conservation and a reduction in the generation of greenhouse gases by reducing excessive or unwanted outdoor lighting, and encouraging a less light-oriented nighttime environment, introducing new sources of substantial light and glare is of concern for all viewers throughout all Tiers and Subareas during all phases of oil and gas development.

Construction Impacts

Aesthetic impacts of introducing new sources of substantial light and glare may result from any of the various activities described for construction impacts under Impact 4.1-3, described above. Most construction activities would primarily occur during daytime hours. Construction activities that are likely to occur at night and require artificial illumination would include drilling activities, vehicle and equipment activities supporting drilling, and safety and security lighting for areas such as construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. The primary purposes of nighttime lighting would be to protect the safety of the construction workers and the security of equipment, materials, and vehicles. Once drilling operations begin, they typically run continuously, 24 hours a day, due to the complexity of drilling and the hazards associated with leaving a well unattended during the drilling process. The length of time required for drilling, and thus the time that drilling operations would require nighttime lighting, would vary depending on the depth of the well being drilled. Drilling may require from less than 24 hours up to 60 days, depending on the depth of the formation. Average well depths are similar in the Western and Eastern Subareas and substantially deeper in the Central Subarea. Thus, nighttime operations are more likely to occur over longer periods in the Central Subarea than in the Western and Eastern Subareas.

Construction activities generally occur during daytime hours, and may generate glare from construction equipment, materials, and vehicles. Impacts from glare would be dependent upon the location of the sun and orientation of the construction equipment and vehicles relative to viewers. Substantial glare would primarily result from reflectance of sunlight off of glass, polished metal surfaces, and smooth or light-colored finishes on construction vehicles, equipment, and materials.

Figures AES-C1 – AES-C10 (Appendix G) show views of construction activities for KOPs 1-10 that would include drilling rigs, grading activities, trailers, vehicles, laydown areas, and other work areas that may introduce new sources of substantial light and glare that would adversely affect day or nighttime views in the vicinity of the activities. For each of these KOPs, the greatest sources of glare during construction would be from light-colored vehicles and equipment such as those visible in the vicinity of each of the drilling rigs in the views. The greatest sources of new

lighting would be associated with drilling rigs and safety and security lighting for various facilities.

Eastern Subarea

Figures AES-C1 and AES-C2 (Appendix G) show existing and potential views for KOPs 1 and 2 with construction activities for expanding oil and gas development in the area north of Panorama Park in north Bakersfield where there is extensive existing oil and gas development. With the exception of the immediate foreground that includes the river, the area within the view from these KOPs is of Tier 1 lands. These KOPs are representative of other views in the Project Area where there is existing extensive oil and gas development. Because of the extensive existing oil and gas development with numerous glare-producing elements in KOP 1 (Appendix G, Figure AES-C1), the addition of new elements during construction would not introduce new sources of substantial glare in the view. Figure AES-C2 (Appendix G) shows nighttime views of existing and potential conditions for KOP 2 with construction activities for expanding oil and gas development for the same location as KOP 1. Because of the numerous and varied lights throughout this view, the addition of new lighting during construction would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the vicinity of the activities. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOPs 1 and 2 would be less than significant.

Figure AES-C3 (Appendix G) shows existing and potential views for KOP 3 with construction activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 3 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where construction activities for oil and gas development may occur with some existing oil and gas development in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because existing facilities in the area would be lighted at night, the addition of new, temporary lighting for construction would not introduce a new source of substantial light and glare for construction facilities. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 3 would be less than significant.

Figure AES-C4 (Appendix G) shows existing and potential views for KOP 4 with construction activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 4 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development noticeable in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because there are very few existing facilities in the area that would be lighted at

night, the addition of new, temporary lighting for tall drilling rigs would introduce a new source of substantial light and glare during construction. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 4 would be significant.

Figure AES-C5 (Appendix G) shows existing and potential views for KOP 5 with construction activities occurring in an area that does not contain existing oil and gas operation activities. The area within the view from this KOP is a mix of Tier 3 and Tier 4 lands, with Tier 1 land immediately to the north. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because there are very few existing facilities in the area that would be lighted at night, the addition of new, temporary lighting for tall drilling rigs would introduce a new source of substantial light and glare during construction. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 5 would be significant in the Tier 3 and Tier 4 areas.

Central Subarea

Figure AES-C7 (Appendix G) shows existing and potential views for KOP 7 with construction activities for expanding oil and gas development in a residential area where there are some existing oil and gas facilities. The view for KOP 7 is of Tier 4 land. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur in close proximity to residences with some existing oil and gas development in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting. Because there are no other tall, brightly-lit elements in the vicinity and there are residences in close proximity, the addition of new, temporary lighting for the tall drilling rig and safety and security lighting would introduce a new source of light and glare that would be substantial during construction. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 7 would be significant.

Figure AES-C8 (Appendix G) shows existing and potential views for KOP 8 with construction activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 8 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where construction activities for oil and gas development may occur with some existing oil and gas development in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because there are few existing facilities in the area that would be brightly lighted at night, the addition of new,

temporary lighting for tall drilling rigs would introduce a new source of substantial light and glare during construction. In addition, this KOP is within the Central Subarea where wells are likely to be relatively deep, drilling periods may last for a long period of time, and drilling rigs would be brightly lighted continuously during drilling periods. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 8 would be significant.

Western Subarea

Figure AES-C6 (Appendix G) shows existing and potential views for KOP 6 with construction activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 6 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development noticeable in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because there are very few existing facilities in the area that would be lighted at night, the addition of new, temporary lighting for tall drilling rigs would introduce a new source of substantial light and glare during construction. However, views from this KOP primarily would be by sensitive viewers visiting the preserve during daylight hours and very few people would have nighttime views of drilling rigs or other construction facilities from this location. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 6 would be less than significant.

Figure AES-C9 (Appendix G) shows existing and potential views for KOP 9 with construction activities for expanding oil and gas development in an agricultural grazing area with some existing oil and gas facilities present. The area within the view from KOP 9 is of Tier 1 and Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where construction activities for oil and gas development may occur with some existing oil and gas development in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because there are very few existing facilities in the area that would be lighted at night, the addition of new, temporary bright lighting for tall drilling rigs would introduce a new source of substantial light and glare during construction. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 9 would be significant.

Figure AES-C10 (Appendix G) shows existing and potential views for KOP 10 with construction activities for expanding oil and gas development in an area with agricultural, recreation, and industrial uses land where existing oil and gas facilities are either not present or not noticeable. The area within the view from KOP 10 is of Tier 2 lands. This KOP is representative of similar

areas in the Project Area where construction activities for oil and gas development may occur without existing oil and gas development noticeable in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime lighting of drilling rigs and safety and security lighting for construction yards, work areas, vehicle and equipment parking areas, and staging and laydown areas. Because existing facilities in the area would be lighted at night, the addition of new, temporary lighting for construction would not introduce a new source of substantial light and glare for construction facilities. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for construction activities for oil and gas development for KOP 10 would be less than significant.

Operation Impacts

Aesthetic impacts of introducing new sources of substantial light and glare may result from any of the various activities and elements described for operation impacts under Impact 4.1-3, discussed above. Operation activities and elements that are likely to create new sources of substantial light that would adversely affect nighttime views in the area include nighttime safety and security lighting of storage tank facilities and nighttime flaring of natural gas as a byproduct of production. Flaring would be intermittent and only occur for limited periods in a few locations. Typically, pumping units would not have nighttime lighting during operation except during brief periods of maintenance. Safety and security lighting reflecting off the surfaces of large or tall storage tanks or other facilities, tall light standards with exposed bulbs, or light sources that cast light widely or upward may be visible across a broad area. Where new lighted facilities are sited near other existing similarly lighted facilities of other structures, aesthetic impacts may be less severe than when they are located in areas with few existing light sources.

Operation activities or elements that are likely to create new sources of substantial glare that would adversely affect daytime views in the area include elements such as pipes, pumping units, tanks, and other facilities with polished metal surfaces or smooth or light-colored finishes. Impacts from glare would primarily result from reflectance of sunlight off of highly reflective surfaces and be dependent upon the location of the sun and orientation of the operation elements relative to viewers. Aesthetic impacts due to substantial glare during operation of oil and gas development facilities are most likely to occur in areas that have very few or no noticeable existing oil and gas or other facilities in the area.

Figures AES-O1 through AES-O10 (Appendix G) show existing and potential views of operation activities and elements for KOPs 1 to 10, including pumping units, storage tanks, pipes, and other facilities, that may introduce new sources of substantial light or glare that would adversely affect day or nighttime views in the vicinity of the activities. For each of these KOPs, the greatest sources of new light during operation would be associated with safety and security lighting for various facilities and the greatest sources of glare during operation would be from light-colored and polished metal finishes on pipes, tanks, and pumping units.

Eastern Subarea

Figures AES-O1 and AES-O2 (Appendix G) show existing and potential views for KOPs 1 and 2 with operation activities for expanding oil and gas development in the area north of Panorama Park in north Bakersfield where there is extensive existing oil and gas development. With the exception of the immediate foreground that includes the river, the area within the view from this KOP is of Tier 1 lands. This KOP is representative of other views in the Project Area where there is existing extensive oil and gas development. Because of the extensive existing oil and gas development with numerous glare-producing elements in KOP 1 (Appendix G, Figure AES-O1), the addition of new elements, such as large light-colored tanks, during operation will not introduce new sources of substantial glare in the view. Figure AES-O2 (Appendix G) shows nighttime views of existing and potential conditions for KOP 2 with operation activities for expanding oil and gas development for the same location as KOP 1. Because of the numerous and varied lights throughout this view, the addition of new lighting during operation would not create a new source of substantial light in the area. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOPs 1 and 2 would be less than significant.

Figure AES-O3 (Appendix G) shows existing and potential views for KOP 3 with operation activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 3 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where operation activities for oil and gas development may occur with some existing oil and gas development in the view. For this KOP, the primary sources of light and glare during construction would be associated with nighttime safety and security lighting for the large storage tanks. Because existing storage tank facilities in the area would be lighted at night, the new storage tanks and the addition of new lighting for these facilities would not introduce a new source of substantial light or glare in the area. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 3 would be less than significant.

Figure AES-O4 (Appendix G) shows existing and potential views for KOP 4 with operation activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 4 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Because the new elements in the view would not be noticeable due to their distance and these elements would not be brightly lighted during operation, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 4 would be less than significant.

Figure AES-O5 (Appendix G) shows existing and potential views for KOP 5 with operation activities occurring in an area that does not contain existing oil and gas operation activities. The

area within the view from this KOP is a mix of Tier 3 and Tier 4 lands, with Tier 1 land immediately to the north. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development in the view. For this KOP, the primary sources of glare during operation would be light-colored tanks, metal pipes with highly reflective surfaces, galvanized poles and fences, and metallic-colored pumping units. The primary sources of light during operation would be nighttime safety and security lighting for the storage tanks associated. Because there are very few existing facilities in the area that would produce glare or be lighted at night, the addition of the tanks and other glare-producing facilities and the lighting for the tanks would introduce new sources of substantial light and glare during operation. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 5 could be significant.

Central Subarea

Figure AES-O7 (Appendix G) shows existing and potential views for KOP 7 with operation activities for expanding oil and gas development in a residential area where there are some existing oil and gas facilities. The view for KOP 7 is of Tier 4 land. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur in close proximity to residences with some existing oil and gas development in the view. Because the drilling unit would be partially screened it is unlikely to produce substantial glare and there would not be any continuous nighttime lighting during operation of this facility. Although the galvanized finish on the chain link screening fence would produce some glare, it would not be substantial. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 7 would be less than significant.

Figure AES-O8 (Appendix G) shows existing and potential views for KOP 8 with operation activities for expanding oil and gas development in an agricultural area where there are some existing oil and gas facilities. The area within the view from KOP 8 is of Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where operation activities for oil and gas development may occur with some existing oil and gas development in the view. For this KOP, the primary sources of light during operation would be associated with nighttime safety and security lighting for the storage tanks. Because there are few existing facilities in the area that would be brightly lighted at night, the addition of new lighting for the storage tanks would introduce a new source of substantial light during operation. In addition, the light-colored tanks and reflective finishes of metal pipes and some elements of the pumping units would produce new sources of glare. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 8 could be significant.

Western Subarea

Figure AES-O6 (Appendix G) shows existing and potential views for KOP 6 with operation activities for expanding oil and gas development in an agricultural area where existing oil and gas facilities are either not present or so distant that they are not noticeable. The area within the view from KOP 6 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Because the new elements in the view would not typically be lighted during operation and sources of glare would be minimal due to the distance of the facilities from this KOP, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 6 would be less than significant.

Figure AES-O9 shows existing and potential views for KOP 9 with operation activities for expanding oil and gas development in an agricultural grazing area with some existing oil and gas facilities present. The area within the view from KOP 9 is of Tier 1 and Tier 2 lands. This KOP is representative of similar agricultural areas in the Project Area where operation activities for oil and gas development may occur with some existing oil and gas development in the view. The oil and gas facilities in the existing view are somewhat distant and would not be substantial sources of light or glare. For this KOP, the primary sources of light during operation would be associated with nighttime safety and security lighting for the storage tanks. Because there are few existing facilities in the area that would be brightly lighted at night, the addition of new lighting for the storage tanks would introduce a new source of substantial light during operation. In addition, the light-colored tanks and reflective finishes of metal pipes and some elements of the pumping units would produce new sources of glare. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 9 would be significant within Tier 2 lands.

Figure AES-O10 (Appendix G) shows existing and potential views for KOP 10 with operation activities for expanding oil and gas development in an area with agricultural, recreation, and industrial uses land where existing oil and gas facilities are either not present or not noticeable. The area within the view from KOP 10 is of Tier 2 lands. This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Because the new elements in the view typically would not be lighted during operation and sources of glare would be minimal, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for operation activities for oil and gas development for KOP 10 would be less than significant.

Well Stimulation Impacts

Because the equipment, vehicles, and materials used for well stimulation would appear similar to those used for construction and drilling, the new sources of substantial light and glare in the views from KOPs 1 through 10 would be temporary and similar to those described for

construction. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for oil and gas development during well stimulation are considered similar to aesthetic impacts for construction of oil and gas development facilities.

Decommissioning/Abandonment Impacts

Because the equipment, vehicles, and materials used for decommissioning and abandonment would appear similar to those used for construction, the new sources of substantial light and glare in the views from KOPs 1 through 10 would be similar to those described for construction. For these reasons, aesthetic impacts of creating a new source of substantial light or glare that would adversely affect day or nighttime views in the area for oil and gas development during decommissioning and abandonment are considered similar to aesthetic impacts for construction of oil and gas development facilities.

Mitigation Measures

MM 4.1.6 Permanent nighttime lighting that will be installed for facilities operations will only be lighting required for safety or security. During operations when the lighting is in use, lighting for safety and security will be shielded and oriented downward, bare bulbs will be fully screened from view from sensitive viewing receptors such as residences, and on-demand lighting and/or timers will be used to minimize visual impacts of lighting. In doing so, the Applicant shall comply with the standards in the amended Chapter 19.81 – Outdoor Lighting "Dark Sky Ordinance."

Level of Significance After Mitigation

Impacts would be significant and unavoidable.

4.1.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to aesthetic and visual resources includes the area within 6 miles of the external Project Area, as well as areas (e.g., incorporated cities) within the overall Project Area. While projects in a larger area may affect some of the same aesthetic impacts as the Project, by focusing on reasonably foreseeable implementation of land use plan implementation activities that may occur in and within 6 miles of the Project Area, the analysis of cumulative impacts includes those aesthetic resources that are also impacted by the Project.

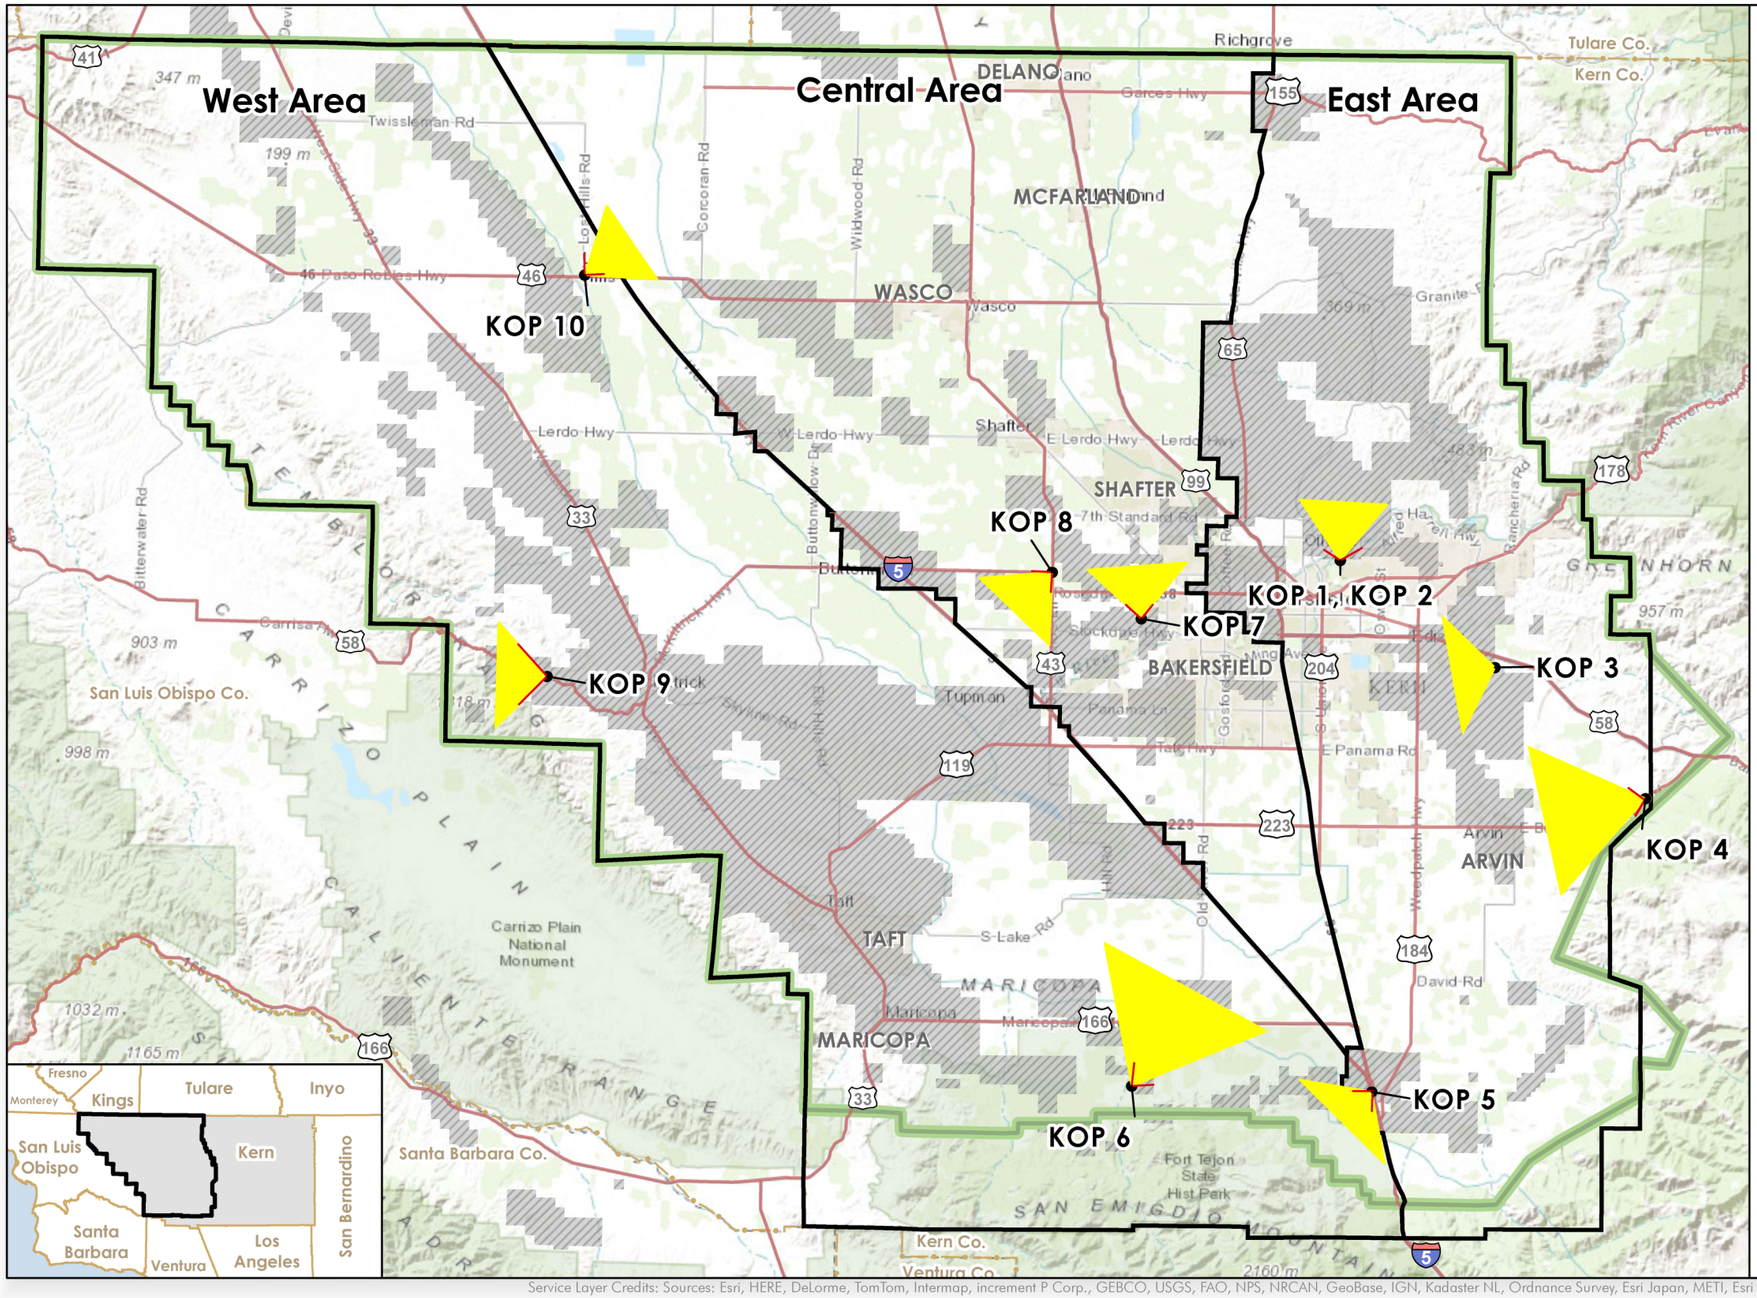
Impact 4.1-5: Contribute to Cumulative Aesthetic Impacts

The plans evaluated in this cumulative analysis are described in Section 3.7, Cumulative Plans and Projections. Implementation of these plans, and any projects undertaken pursuant to these plans would be required to comply with the goals, policies, and implementation measures of

applicable federal and local laws and land use standards imposed by the respective jurisdictions within with each related project is located. This includes the possibility of being required to undergo environmental review, in compliance with the requirements of the CEQA and/or the National Environmental Policy Act. Should potential impacts to public services be identified, appropriate mitigation would be prescribed.

Kern County is a growing community, and the cities within Kern County are likewise planning for continued growth. While the Project will continue to allow, with more stringent mitigation measures as well as expanded substantive and procedural Ordinance mandates, the County's 100+-year industry of oil and gas production activities, this industry does have a visible presence on the landscape and, in combination with the implementation of other reasonably foreseeable plans, will continue to result in visible changes within Kern County. Visible changes to the landscape will occur even with implementation of the mitigation measures and other goals, policies, implementation policies, and mitigation measures for these other General Plans and regional plans, and some may view these visual changes as adverse aesthetic impacts.

Accordingly, cumulative impacts to aesthetic impacts are considered significant, and the Project's incremental contribution to this cumulative impact is considered cumulatively considerable.



Mitigation Measures

Implement MM 4.1.1 through 4.1.6, as described above. No additional feasible mitigation measures exist to avoid or reduce significant adverse cumulative impacts to aesthetics to a less than significant level.

Level of Significance After Mitigation

Impacts would be significant and unavoidable.

Section 4.2

Agricultural and Forest Resources

Section 4.2

Agricultural and Forest Resources

4.2.1 Introduction

This section describes the affected environment and regulatory setting for agricultural and forestry resources. This section also describes the impacts to agricultural and forestry resources that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance, and future development of oil and gas resources pursuant to the Amended Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

This section is based on the Farmland Conversion Study California Environmental Quality Act (CEQA) Analysis prepared by Ecology and Environment, Inc., and presented in Appendix H of this Environmental Impact Report (EIR).

4.2.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north, Santa Barbara and San Luis Obispo counties to the west, the Tehachapi Mountains and the Sierra Nevada Mountains to east, and the northern boundary of the Los Padres National Forest to the south.

Regional

Kern County has a long history of agricultural operations and contains approximately 1,373 square miles of harvested agricultural land and 2,317 square miles of range land. Agriculture in Kern County makes a significant contribution to the economy of the state. According to the Kern County Agricultural Crop Report, in 2012, agriculture in Kern County accounted for a gross value of $6 billion (Table 4.2-1). According to the U.S. Department of Agriculture (USDA) 2012 Census of Agriculture, in Kern County in 2012, the average farm size was 1,202 acres (USDA 2012).

Table 4.2-1: Agricultural Product Values for Kern County in 2012

Product	Total Value
Fruit and Nut Crops	$3,650,049,000
Seed Crops	$7,742,000
Field Crops	$539,370,000
Vegetable Crops	$714,490,000

Table 4.2-1: Agricultural Product Values for Kern County in 2012

Product	Total Value
Nursery Crops	$100,824,100
Industrial and Wood Crops	$15,717,000
Livestock and Poultry	$395,078,000
Livestock and Poultry Products	$732,385,000
Apiary Products	$56,707,000
TOTAL	**$6,212,362,100**

The top agricultural commodities in the County in 2012 were grapes, almonds, milk, citrus, and pistachios, which together had a gross value of more than $4 billion (Table 4.2-2). The majority of Kern County's agricultural production is located in the San Joaquin Valley within the Project Area.

Table 4.2-2: Top Twenty Commodities and Value of Products Sold in Kern County, 2012

Rank	Commodity	Value
1	Grapes, All	$1,498,987,000
2	Almonds, Including By-Products	$821,857,000
3	Milk, Market & Manufacturing	$690,062,000
4	Citrus, Fresh & Processing	$620,350,000
5	Pistachios	$486,213,000
6	Cattle & Calves	$382,913,000
7	Carrots, Fresh & Processing	$350,439,000
8	Hay, Alfalfa	$213,466,000
9	Cotton, Including Processed Cottonseed	$147,637,000
10	Potatoes, Fresh & Processing	$85,102,000
11	Silage & Forage	$75,149,000
12	Pomegranates, Fresh & Processing	$58,781,000
13	Nursery, Fruit and Nut Trees & Vines	$57,555,000
14	Apiary Products	$56,707,000
15	Tomatoes, Fresh & Processing	$53,657,000
16	Eggs & Egg Product	$40,343,000
17	Bell Peppers, Fresh & Processing	$40,143,000
18	Wheat	$35,294,000
19	Nursery, Roses	$33,346,000

Table 4.2-2: Top Twenty Commodities and Value of Products Sold in Kern County, 2012

Rank	Commodity	Value
20	Onions, Fresh & Dehydrated	$28,350,000

Table 4.2-3 displays a breakdown of crop types within the Project Area, grouped into general categories and by Subarea. In the Project Area, orchards and vineyards comprise the majority of general crop types (approximately 52%), followed by row crops (approximately 38%).

Table 4.2-3: General Categories of Crop Types Within the Project Area, 2012

Crop Type	Western Subarea	Central Subarea	Eastern Subarea
Orchard/Vineyard	50%	59%	48%
Pasture/Sod	<1%	<1%	1%
Row Crops	34%	37%	43%
Uncultivated	16%	4%	8%

Local

The Project Area (shown on Figure 3-1) encompasses 2,362,734 acres and is generally bounded on the north and west by the Kern County line, on the south by the San Emigdio Mountains, and on the east by the Greenhorn Mountains. The Western Subarea extends from the western boundary of the County to Interstate 5; the Central Subarea lies between Interstate 5 and State Highway 99 north to Bakersfield and then generally following State Highway 65 to the northern county line (with some exceptions); the Eastern Subarea extends from this eastern boundary of the Central subarea to the foothills of the Greenhorn Mountains.

Zoning within the Project Area is a combination of: Exclusive Agriculture (A), Limited Agriculture (A-1); Estate (E), Low-Density Residential (R-1), Medium-Density Residential (R-2), High-Density Residential (R-3) Mobile home Park (MP); Commercial Office (CO), Neighborhood Commercial (C-1), General Commercial (C-2), Highway Commercial (CH); Light Industrial (M-1), Medium Industrial (M-2), Heavy Industrial (M-3), and Special Purpose Districts including Recreation-Forestry (RF), Open Space (OS), Natural Resource (NR), Drilling Island (DI), Floodplain Primary (FPP), Special Planning (SP) and Platted Lands (PL). Table 4.2-4 provides the number of acres of lands zoned as either A or A-1 in each subarea.

Table 4.2-4: Acreages of Lands Zoned for Agricultural Use in the Project Area - (2014)

Zone	Western Subarea	Central Subarea	Eastern Subarea	Project Area Total
Exclusive Agriculture (A)	954,885	556,520	480,923	1,992,327
Limited Agriculture (A-1)	105,364	8,144	27,552	141,060
TOTAL	**1,060,248**	**564,664**	**508,475**	**2,133,387**

According to the most recent report available from the California Department of Conservation (DOC 2012), in the Project Area, there are 582,856 acres of Prime Farmland, 210,957 acres of Farmland of Statewide Importance, and 86,512 acres of Unique Farmland as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP) of the California Resources Agency (Table 4.2-5). Figure 4.2-1 depicts the FMMP mapping categories within the Project Area and Subareas.

Table 4.2-5: Acreages of FMMP Agricultural Land in the Project Area

FMMP Mapping Category	Western Subarea	Central Subarea	Eastern Subarea	Project Area Total
Prime Farmland	188,558	286,511	107,786	582,856
Farmland of Statewide Importance	55,308	115,701	39,949	210,957
Unique Farmland	34,288	29,032	23,192	86,512
FARMLAND SUBTOTAL	**278,154**	**431,244**	**170,927**	**880,326**
Confined Animal Agriculture	1,047	5,159	1,256	7,462
Grazing Land	585,011	58,655	338,500	982,166
TOTAL	**864,212**	**495,059**	**510,683**	**1,869,954**

Source: DOC 2012
Note: acres may not total exactly, due to rounding.

Not all of the Prime Farmland, Farmland of Statewide Importance, and Unique Farmland (collectively referred to in this section as "Farmland") are actively farmed. Geographic Information System (GIS) analysis of annual actively farmed land from records spanning from 2005 to 2014 provides a ten-year average of the acreage of land in the Project Area that has been farmed for five out of the last ten years, which averages 91.5% of the total amount of Farmland.

Kern County's agricultural areas are facing increasing pressure to convert productive farmland to housing, industrial, and commercial development. During 2013, the County approved amendments that re-designated 1,165 net acres of agricultural lands to non-agricultural use. The

total loss of agricultural lands in the unincorporated area of the County from 1998 to 2013 was 16,273 acres. The net average annual conversion rate over the 15-year period was 1,085 acres. However, the majority of converted agricultural lands during this period have been used as a solid waste buffer and continue to be farmed.

The Kern Council of Governments (COG) projects that Kern County's population will grow from its 2010 Census population of 839,600 to more than 1,441,000 million in 2040 (Kern COG 2014). This growth in population could increase the amount of agricultural land conversion to non-agricultural uses in Kern County even further.

Agricultural Preserves and Williamson Act Land Use Contracts

An agriculture preserve defines the physical boundary of an area within which Kern County could enter into agricultural contracts with landowners, such as Williamson Act contracts (described below), to ensure agricultural lands remain used for agricultural purposes. The boundary of an agricultural preserve is designated by resolution of the County's Board of Supervisors. Agriculture preserves must generally be at least 100 acres in size. The Project Area includes a total of 17 agricultural preserves (Preserve Nos. 1- 14, 17, 18 and 19) (Figure 4.2-2).

The Williamson Act (officially the California Land Conservation Act of 1965) is a California law that provides property tax relief to owners of farmland and open-space land in exchange for a ten-year agreement that the land would not be developed or otherwise converted to another use. The purposes of the Williamson Act are to protect agricultural resources, to preserve open space, and to promote efficient development patterns. Lands under a Williamson Act contract are taxed at a rate based on the actual use of the land for agricultural purposes, as opposed to its unrestricted market value. The landowner commits the parcel to a 10-year period wherein no conversion out of agricultural use is permitted. The contracts are automatically renewed each year unless a notice of non-renewal is filed by the landowner with the County Clerk. Non-renewal or immediate cancellation does not change the zoning of the property. As of 2013, it is estimated that 16 million of the state's 30 million acres of farm and ranch land are currently protected under the Williamson Act (DOC 2013).

Soil quality is not the only factor in qualifying for Williamson Act protection. For example, lesser quality soils support grazing and livestock production and these land uses meet Williamson Act objectives. A provision of the Williamson Act is that land use compatibility of agricultural lands is determined by the local government (see Section 4.2.3, Regulatory Setting).

A Farmland Security Zone (FSZ) is an area created within an agricultural preserve upon request by a landowner or group of landowners. FSZs function similarly to Williamson Act contracts; however, the length of the contract is 20 years rather than 10 years. As with land covered by a Williamson Act Contract, FSZs offer landowners a significant property tax reduction.

The California Land Conservation Act 2012 Status Report (DOC 2013) presents statewide statistics for Williamson Act and Farmland Security Zone contracts, broken down by county. The most recent report available covers the years 2010 and 2011. According to this report, Kern

County was fourth in the state in new Williamson Act enrollments in both 2010 and 2011, with 2,400 and 2,113 acres, respectively. Kern County was ranked first in the state in Nonrenewal Initiations in 2010, and third in 2011, totaling 12,339 acres for those two years (DOC 2013). Section 4.2.3, Regulatory Setting, provides additional information about the Williamson Act.

The locations and acreages of Williamson Act and Farmland Security Zone contract lands within the Project Area are shown in Table 4.2-6. There are 1,136,193 acres of land within the Project Area that are within Williamson Act or Farmland Security Zone Act renewal parcels.

Table 4.2-6: Acreages of Williamson Act and Farmland Security Zone Contracts in the Project Area – County Jurisdiction (2011)

Contract Category	Western Subarea	Central Subarea	Eastern Subarea	Project Area Total
Williamson Act	371,488	305,206	321,221	997,916
Farmland Security Zone Contracts	101,154	33,278	3,845	138,277
TOTAL	**472,642**	**338,484**	**325,066**	**1,136,193**

Forest Lands and Timberlands

Public Resources Code Section 12220 (g) defines "forest land" as "land that can support 10% native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits."

Public Resources Code Section 12220 (l) defines "woodlands" as "forest lands composed mostly of hardwood species such as oak."

Government Code Section 51104 (f) defines "timberland" as "privately owned land, or land acquired for State forest purposes, which is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, and which is capable of growing an average annual volume of wood fiber of at least 15 cubic feet per acre."

The Project Area does not support woodlands or forest lands. According to the California Department of Forestry and Fire Protection's Fire and Resource Assessment Program, there are no Timberland Production Zones in Kern County (CAL FIRE 2010). Therefore, forest and timberlands are not analyzed in this section.

4.2.3 Regulatory Setting

Federal

Farmland Protection Policy Act (7 U.S.C. Section 4201)

The purpose of the Farmland Protection Policy Act (FPPA) is to minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses. The FPPA additionally directs federal programs to be compatible with state and local policies for the protection of farmlands. Congress passed the Agriculture and Food Act of 1981 (Public Law 97-98) containing the FPPA—Subtitle I of Title XV, Section 1539-1549. The final rules and regulations were published in the Federal Register on June 17, 1994.

The FPPA is intended to minimize the impact federal programs have on the unnecessary and irreversible conversion of farmland to nonagricultural uses. It assures that, to the extent possible, federal programs are administered to be compatible with state, local units of government, and private programs and policies to protect farmland. Federal agencies are required to develop and review their policies and procedures to implement the FPPA every two years. The FPPA does not authorize the federal government to regulate the use of private or nonfederal land or, in any way, affect the property rights of owners.

For the purpose of FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance. Farmland subject to FPPA requirements does not have to be currently used for cropland. It can be forest land, pastureland, cropland, or other land, but not water or urban built-up land.

Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency.

State

California Department of Conservation, Division of Land Resource Protection – Farmland Mapping and Monitoring Program

The DOC applies the Natural Resources Conservation Service (NRCS) soil classifications to identify agricultural lands, and these agricultural designations are used in planning for the present and future of California's agricultural land resources. The DOC has a minimum mapping unit of 10 acres, with parcels that are smaller than 10 acres being absorbed into the surrounding classifications.

Farmland Mapping and Monitoring Program

The list below provides a comprehensive description of all the categories mapped by the DOC (DOC 2015). Collectively, lands classified as Prime Farmland, Farmland of Statewide Importance, and Unique Farmland are referred to as Farmland (DOC 2004).

- **Prime Farmland (P):** Irrigated land with the best combination of physical and chemical features able to sustain long term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been irrigated for production of irrigated crops at some time during the four years prior to the mapping date.
- **Farmland of Statewide Importance (S):** Irrigated land similar to Prime Farmland that has a good combination of physical and chemical characteristics for the production of agricultural crops. This land has minor shortcomings, such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been irrigated for production of irrigated crops at some time during the four years prior to the mapping date.
- **Unique Farmland (U):** Lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the four years prior to the mapping date.
- **Farmland of Local Importance (L):** Although counties may choose to define Farmland of Local Importance within their jurisdictions, the Board of Supervisors determined that there will be no Farmland of Local Importance for Kern County.
- **Confined Animal Agriculture (C):** Although counties typically include Confined Animal Agriculture in the Farmland of Local Importance category, Kern County defines Confined Animal Agriculture as a separate FMMP category.
- **Grazing Land (G):** Land on which the existing vegetation is suited to the grazing of livestock. This category is used only in California and was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities.
- **Urban and Built-up Land.** Land occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately six structures to a 10-acre parcel. This land is used for residential, industrial, commercial, institutional, public administrative purposes, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, water control structures, and other developed purposes.
- **Other Land.** Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry or aquaculture facilities; strip mines and borrow pits; and water bodies smaller than 40 acres. Vacant and non-agricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land.

California Land Conservation Act (Williamson Act)

The California Land Conservation Act of 1965, commonly referred to as the Williamson Act, is promulgated in California Government Code Section 51200-51297.4 and, therefore, is applicable only to specific land parcels within the state of California. The Williamson Act

enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or compatible uses in return for reduced property tax assessments. Private land within locally designated agricultural preserve areas is eligible for enrollment under Williamson Act contracts. The Williamson Act program is administered by the DOC, in conjunction with local governments, which administer the individual contract arrangements with landowners. The landowner commits the parcel to a 10-year period wherein no conversion out of agricultural use is permitted. Each year the contract automatically renews unless a notice of non-renewal or cancellation is filed. In return, the land is taxed at a rate based on the actual use of the land for agricultural purposes, as opposed to its unrestricted market value. An application for immediate cancellation can also be requested by the landowner, provided that the proposed immediate cancellation application is consistent with the cancellation criteria stated in the California Land Conservation Act and those adopted by the affected county or city. Non-renewal or immediate cancellation does not change the zoning of the property. Participation in the Williamson Act program is dependent on county adoption and implementation of the program and is voluntary for landowners.

The Williamson Act states that a board or council by resolution shall adopt rules governing the administration of agricultural preserves. The rules of each agricultural preserve specify the uses allowed. Generally, any commercial agricultural use will be permitted within any agricultural preserve. In addition, local governments may identify compatible uses permitted with a use permit (California Code 2014).

California Government Code Section 51238 states that boards of supervisors may impose conditions on lands or land uses to be placed within preserves to permit and encourage compatible uses in conformity with Section 51238.1. The Kern County Agricultural Preserve Standard Uniform Rules specify that oil and gas drilling and production in accordance with the provisions of Chapter 19.98 of the Ordinance Code of Kern County are compatible uses in agricultural preserves.

Further, California Government Code Section 51238.1 allows a board or council to allow as compatible any use that without conditions or mitigations would otherwise be considered incompatible. However, this may occur only if that use meets the following conditions:

- The use will not significantly compromise the long-term productive agricultural capability of the subject contracted parcel or parcels on other contracted lands in agricultural preserves.
- The use will not significantly displace or impair current or reasonably foreseeable agricultural operations on the subject contracted parcel or parcels or on other contracted lands in agricultural preserves. Uses that significantly displace agricultural operations on the subject contracted parcel or parcels may be deemed compatible if they relate directly to the production of commercial agricultural products on the subject contracted parcel or parcels or neighboring lands, including activities such as harvesting, processing, or shipping.
- The use will not result in the significant removal of adjacent contracted land from agricultural or open-space use.

A board or council may approve uses on nonprime land, which, because of offsite or onsite impacts, would not comply with the first two criteria, provided that the use is approved pursuant to a conditional use permit that sets forth findings required by California Government Code Section 51238.1(c).

Farmland Security Zone Act

The Farmland Security Zone Act is similar to the Williamson Act and was passed by the California State Legislature in 1999 to ensure that long-term farmland preservation is part of public policy. Farmland Security Zone Act contracts are sometimes referred to as "Super Williamson Act Contracts." Under the provisions of this act, a landowner already under a Williamson Act contract can apply for Farmland Security Zone status by entering into a contract with the County. Farmland Security Zone classification automatically renews each year for an additional 20 years. In return for a further 35% reduction in the taxable value of land and growing improvements (in addition to Williamson Act tax benefits), the owner of the property promises not to develop the property into nonagricultural uses.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element of the KCGP includes goals, policies, and implementation measures related to agricultural and forestry resources that apply to the Project, as described below.

The KCGP states that agriculture is vital to the future of Kern County and sets the goals of protecting important agricultural lands for future use and preventing the conversion of prime agricultural lands to other uses (e.g., industrial or residential uses). The KCGP includes three designations for agricultural land:

8.1, Intensive Agriculture (minimum parcel size: 20 acres, gross), land that is devoted to the production of irrigated crops or having the potential for such use.

8.2, Resource Reserve (minimum parcel size: 80 acres, gross), areas with mixed natural resource characteristics, including rangeland.

8.3, Extensive Agriculture (minimum parcel size: 20 acres, gross, except lands subject to a Williamson Act contract/Farmland Security Zone contract, in which case the minimum parcel size shall be 80 acres, gross), devoted to uses involving large amounts of land with relatively low value-per-acre yields, such as livestock grazing, dryland farming, and woodland uses.

Petroleum exploration and extraction are allowable uses in all three agricultural designations.

The policies and implementation measures in the KCGP for Agriculture and Forest Resources applicable to the proposed Project are outlined below. The KCGP contains additional policies, goals, and implementation measures that are more general in nature and not specific to development such as the Project. Therefore, these measures are not listed below, but, as stated in Chapter 2, Introduction, all policies, goals, and implementation measures in the KCGP are incorporated by reference.

Chapter 1. Land Use, Conservation, and Open Space Element

1.4. Public Facilities and Services

Goals

Goal 5. Ensure that adequate supplies of quality (appropriate for intended use) water are available to residential, industrial, and agricultural users within Kern County.

1.9. Resource

Goals

Goal 1. To contain new development within an area large enough to meet generous projections of foreseeable need, but in locations which will not impair the economic strength derived from the petroleum, agriculture, rangeland, or mineral resources, or diminish the other amenities which exist in the County.

Goal 2. Protect areas of important mineral, petroleum, and agricultural resource potential for future use.

Goal 5. Conserve prime agriculture lands from premature conversion.

Policies

Policy 1. Appropriate resource uses of all types will be encouraged as desirable and consistent interim uses in undeveloped portions of the County regardless of General Plan designation.

Policy 2. In areas with a resource designation on the General Plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of the particular resource will be considered to be consistent with the General Plan.

Policy 5. Areas of low intensity agriculture use (Map Code 8.2 (Resource Reserve), Map Code 8.3 (Extensive Agriculture), and Map Code 8.5 (Resource Management)) should be of an economically viable size in order to participate in the state Williamson Act Program/Farmland Security Zone Contract.

Policy 7. Areas designated for agricultural use, which include Class I and II and other enhanced agricultural soils with surface delivery water systems, should be protected from incompatible residential, commercial, and industrial subdivision and development activities.

Policy 11. Minimize the alteration of natural drainage areas. Require development plans to include necessary mitigation to stabilize runoff and silt deposition through utilization of grading and flood protection ordinances.

Policy 12. Areas identified by the Natural Resource Conservation Service (formerly Soil Conservation Service) as having high range-site value should be conserved for Extensive Agriculture uses or as Resource Reserve, if located within a County water district.

Policy 15. Agriculture and other resource uses will be considered a consistent use in areas designated for Mineral and Petroleum Resource uses on the General Plan.

Policy 21. The County shall encourage qualifying agricultural lands to participate in the Williamson Act program or Farmland Security Zone program.

Implementation Measures

Implementation Measure B. Areas designated as Resource Reserve (Map Code 8.2), Extensive Agriculture (Map Code 8.3), Resource Management (Map Code 8.5) that are under Williamson Act Contracts or Farmland Security Zone Contracts will have a minimum parcel size of 80 acres until such time as a contract is expired or is cancelled, at which time the minimum parcel size will become 20 acres.

Implementation Measure C. The County Planning Department will seek review and comment from the County Engineering, Surveying, and Permit Services Department on the implementation of the National Pollution Discharge Elimination System for all discretionary projects.

Implementation Measure F. Prime agricultural lands, according to the Kern County Interim-Important Farmland map produced by the Department of Conservation, which have Class I or II soils and a surface delivery water system shall be conserved through the use of agricultural zoning with minimum parcel size provisions.

Implementation Measure G. Property placed under the Williamson Act/Farmland Security Zone Contract must be in a Resource designation.

Implementation Measure K. Protect oilfields and mineral extraction areas through the use of appropriate implementing Zone Districts: A (Exclusive Agriculture), DI (Drilling Island), NR (Natural Resource), or PE (Petroleum Extraction).

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands

within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to agricultural and forestry resources.

Chapter V. Conservation Element

C. Soils and Agriculture

Goals

Goal 1. Provide for the planned management, conservation, and wise utilization of agricultural land in the Planning Area.

Goal 2. Promote soil conservation and minimize development of prime agricultural land as defined by the following criteria:

- Capability Class I and/or II irrigated soils.
- 80-100 Storie Index rating.
- Gross crop return of $200 or more per acre per year.
- Annual carrying capacity of 1 animal unit per acre per year.

Goal 3. Establish urban development patterns and practices that promote soil conservation and that protect areas of agricultural production of food and fiber crops, and nursery products.

Policies

Policy 1. Determine the extent and location of all prime agricultural land within the study area (I-1).

Policy 2. Review projects that propose subdividing or urbanizing prime agricultural land to ascertain how continued commercial agricultural production in the Project vicinity will be affected (I-2).

Policy 4. Monitor the amount of prime agricultural land taken out of production for urban uses or added within the plan area (I-3).

Policy 7. Land use patterns, grading, and landscaping practices shall be designed to prevent soil erosion while retaining natural watercourses when possible (I-4).

Policy 12. Prohibit premature removal of ground cover in advance of development and require measures to prevent soil erosion during and immediately after construction (I-4).

Implementation Measures

Implementation Measure 2. Evaluate discretionary projects for their impact on agricultural resources.

Implementation Measure 3. Document urban expansion and changes in the amount of agricultural land for purposes of determining cumulative impacts to prime agricultural land.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County Zoning Ordinance

The Kern County Zoning Ordinance designates two agricultural zones:

(A) Exclusive Agriculture: the purpose is to designate areas suitable for agricultural uses and to prevent the encroachment of incompatible uses onto agricultural lands and the premature conversion of such lands to nonagricultural uses. Uses in the A District are primarily limited to agricultural uses and other activities compatible with agricultural uses.

(A-1) Limited Agriculture District: the purpose is to designate areas suitable for a combination of estate-type residential development, agricultural uses, and other compatible uses.

Chapters 19.12 and 19.14 currently include as permitted uses in the A and A-1 zones:

- Cogeneration facility or steam generators, primarily intended for steam production, used for production of oil and gas, excluding coal fired.
- Oil or gas exploration and production pursuant to Chapter 19.98 of this title, including the temporary installation of commercial coaches as accessory to this activity, not to exceed a two- (2-) year period.
- Nonhazardous oil production and/or oily waste disposal facility.
- Nonhazardous oilfield waste treatment or recycling.
- Coal-fired cogeneration facility or steam generators, primarily intended for production of oil or gas (with a conditional use permit).

Williamson Act Standard Uniform Rules

Kern County has adopted a set of Agricultural Preserve Standard Uniform Rules that identify land uses that are considered compatible uses within agricultural preserves established under the Williamson Act. These rules are designed to restrict the uses of land enrolled in a Williamson Act contract to agriculture or other compatible uses. The Agricultural Preserve Standard Uniform Rules identify five classes of agricultural uses such as crop cultivation, grazing

operations, commercial wind farms, livestock breeding, dairies, and uses that are incidental to agricultural uses allowed within the Agricultural Preserves. The rules also include 19 classes of compatible uses that include, but are not limited to, oil and gas drilling and production in accordance with Chapter 19.98 of the Ordinance Code of Kern County, as well as the erection of gas, electric, communications, water, and other similar public utilities.

4.2.4 Impacts and Mitigation Measures

Methodology

The evaluation of possible impacts to agricultural resources included the review of the Kern County General Land Use Plan and zoning information, the MBGP, and the most current DOC, Division of Land Resource Protection, Important Farmland data, and Kern County's Williamson Act data. Agricultural land conversion associated with oil and gas exploration and production operational activities related to the Project were predicted based on the anticipated land disturbance associated with anticipated oil and gas development described in Appendix F, and compared to the significance thresholds. The methodology used to evaluate potential agricultural conversion is described in detail in Appendix H.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;
- Conflict with existing zoning for agricultural use or a Williamson Act Contract;
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined in Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g));
- Result in the loss of forest land or conversion of forest land to non-forest use;
- Involve other changes in the existing environment which, because of their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use; or
- Result in the cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for any parcel of 100 or more acres (Section 15206(b)(3) Public Resources Code).

Project Impacts

Direct impacts on agricultural and forestry resources are the immediate effects of a project. These impacts would include: conversion of agricultural or timberland to non-agricultural or timber use; interference with agricultural or timber operations; and disturbance or damage to crops or timber trees from dust, or accidental releases of hazardous materials. Indirect impacts are caused by or would result from a project, but occur later in time or farther in distance than direct impacts. These impacts might include effects from erosion or sedimentation onto agricultural land. Other indirect effects which would impact agriculture along with other uses and resources, such as introduction of invasive exotic species, or increased competition for water resources, are addressed in the chapters on these topics.

Impact 4.2-1: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to Non-Agricultural Use

Oil and gas exploration and production activities that would be authorized through implementation of the proposed Project could result in land disturbance throughout the Project Area, as described in Chapter 3, Project Description. As shown in Table 4.2-7, approximately 364,724 acres of the Core Areas are located within mapped FMMP lands, as shown for each Subarea. The majority of these Core Area FMMP lands are located within Tier 2 (93%) (Appendix H).

Table 4.2-7: Acreages of FMMP Agricultural Land in Core Areas and Tiers

Core Area or Tier	Western Subarea	Central Subarea	Eastern Subarea	Core Area Total
FMMP Lands in Core Areas				
Core Areas	125,204	143,821	95,698	364,724
Non-Core Areas	152,959	287,423	75,229	515,611
Total FMMP land	278,163	431,244	170,927	880,335
FMMP Lands in Tiers				
Tier 1	0	0	0	0
Tier 2	276,758	394,373	157,842	336,235
Tiers 3-5[1]	N/A	N/A	N/A	N/A

Source: see Appendix H
Note:
[1] FMMP designated lands were mapped, in limited instances, on lands within Tiers 3, 4 and 5. However, these designations occurred on lands that did not contain agricultural uses, nor did these designations occur on lands with an agricultural zone classification. Therefore, these are not considered further in this analysis.

Assessment of potential impacts to agricultural and forestry resources focused on proposed exploration and production activities within areas identified as Tier 2 within the Project Area and land use disturbance associated with those activities.

To estimate potential land use disturbance associated with the proposed oil and gas exploration and production activities, "land use disturbance factors" were developed for each new oil and gas production well (see Appendix F). The disturbance factors included disturbance associated with all oil and gas facilities as identified in Chapter 3, Project Description, including, but not limited to, well pads, access roads, transmission lines, collection and distribution pipelines, drilling and operational sumps, storage tanks, administrative buildings, steam generators, etc.

The estimated annual land disturbance associated with future oil and gas exploration and production activities within the Project Area is presented in Table 4.2-8. To provide a conservative analysis, it is assumed that all land disturbed by oil and gas activities within Tier 2 areas would be Farmlands, although, in fact, not all land within Tier 2 is in that category. Therefore, the proposed Project could result in the conversion of 298 acres of Farmlands annually, with 148 acres of conversion occurring in the Western Subarea, 60 acres occurring in the Central Subarea, and 90 acres in the Eastern Subarea.

Table 4.2-8: Annual Projected Agricultural Conversion

Subarea	Disturbance Factor (acres)	Anticipated New Producing Wells in Tier 2	Disturbance (acres)
Western	2.0	74	148
Central	3.0	20	60
Eastern	1.20	75	90
TOTAL		**169**	**298**

Source: see Appendix H
Note: New Producing Well = Oil and Gas, Dry Gas, Dry Hole and Liquid Petroleum Wells, as explained further in Chapter 3, Project Description.

These estimated Tier 2 Farmland disturbance areas from the Project would impact approximately 0.04% of the 828,973 acres of FMMP lands in Tier 2 annually (Table 4.2-9).

Table 4.2-9: Acreages of FMMP Agricultural Land in Tier 2

FMMP Mapping Category	Western Subarea	Central Subarea	Eastern Subarea	Tier 2 Total
Prime Farmland	187,440	252,890	100,116	540,446
Farmland of Statewide Importance	55,147	112,894	35,550	203,591
Unique Farmland	34,170	28,589	22,176	84,935
TOTAL	**276,758**	**394,373**	**157,842**	**828,973**

Source: see Appendix H
Note: Acres may not total exactly, due to rounding

Given the estimated acreage of agricultural land converted annually (Table 4.2-8), the projected amount of FMMP farmland that could be converted between the years 2015 and 2040 in Tier 2 is a total of 7,450 acres (Table 4.2-10). Using this conservative approach, it is estimated that 0.9% of FMMP farmlands in Tier 2 would be impacted by the Project from 2015 to 2040.

Table 4.2-10: Maximum Conversion of FMMP Farmland in Tier 2 (2015 to 2040)

FMMP Mapping Category	Western Subarea	Central Subarea	Eastern Subarea	Project Area Total
Prime Farmland	2,514	978	1,430	4,922
Farmland of Statewide Importance	744	429	507	1,680
Unique Farmland	442	93	313	848
TOTAL	**3,700**	**1,500**	**2,250**	**7,450**

Source: see Appendix H

The acreage of actively farmed land changes from year to year, and it is not possible to accurately project 25 years into the future. For this analysis, the acreage of land that has been farmed for at least five of the past ten years (2005-2014) was determined. This provided a basis for estimating the percentage of converted Important Farmland that would require mitigation over the 25-year period.

If the rate of active farming (farmed for five of the last 10 years) on Prime Farmland, Farmland of Statewide Importance, and Unique Farmland were to continue at its current rates, then in 25 years, the conversion of actively-farmed FMMP farmland would be approximately 3,386 acres in the Western Subarea (91.5%), 1,389 acres in the Central Subarea (92.6%), and 2,092 acres in the Eastern Subarea (93.0%) (Appendix H, Table 13).

A review of crop data over the past ten years suggests that there is a high degree of annual variability among crop types grown from one year to the next. For the purposes of this impact analysis, the percent of generalized crop types (Table 4.2-3) was used to estimate impacts of oil and gas development on different crop types into the future. There would be a loss of different generalized crop types proportional to the overall acreage loss. Projected from the current conditions, within 25 years, approximately 52% of converted farmland would be orchards and vineyards, 38% would be row crops, less than 1% would be pasture or sod, and the remainder would be uncultivated.

The worst-case projection of 7,450 acres between 2015 and 2040 represents less than 1% of the total acreage of Farmland (828,973 acres) in Tier 2 (Table 4.2-9). Nonetheless, based on the importance of agricultural lands in Kern County and the San Joaquin Valley, this impact is considered significant.

Mitigation Measures

MM 4.2-1 For future oil and gas exploration and extraction activities that are: 1) on land designated Prime, Farmland of Statewide Importance or Unique Farmland; and 2) that have been actively farmed 5 years or more out of the last 10 years, agricultural land mitigation is required at a ratio of 1:1. The 1:1 ratio is applied to actual ground disturbance area for oil and gas activities (inclusive of temporary construction and permanent operational impact areas), but excludes non-farmed existing areas such as roads, and tank and maintenance areas, and lands for which agricultural mitigation has previously been provided at a 1:1 ratio. Prior to ground disturbing activity, the Applicant shall submit to the County written evidence of completion of one or more of the following measures to achieve this 1:1 mitigation ratio:

a. Funding and/or purchasing agricultural conservation easements or similar instrument acceptable to the County (to be managed and maintained by an appropriate entity).

b. Purchasing of credits for conservation of agricultural lands from an established agricultural farmland mitigation bank or an equivalent agricultural farmland preservation program managed by the County.

c. Restoring agricultural lands to productive use through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment.

d. Participating in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation than the measures listed above.

Mitigation lands shall meet the definition of Prime Farmland, Farmland of Statewide Importance, and/or Unique Farmland, and be of similar or higher agricultural quality as the lands, as established by the California Department of Conservation. Completion of the selected measure or, with the Kern County Planning and Community Development Director's approval, a combination of measures, are to occur on qualifying land in Kern County. If qualifying lands cannot be found in Kern County, upon written application to the County, the mitigation lands may be located within the San Joaquin Valley (San Joaquin, Stanislaus, Merced, Fresno, Madera, Kings, Tulare, or Kern County) or outside the San Joaquin Valley with written evidence that the same or equivalent crops can be produced on the mitigation land.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.2-2: Conflict with Existing Zoning for Agricultural Use or a Williamson Act Contract

Chapters 19.12 and 19.14 of the Kern County Zoning Ordinance currently include as permitted uses in the A and A-1 zones: steam generators, primarily intended for steam production, used for production of oil and gas; oil or gas exploration and production pursuant to Chapter 19.98; nonhazardous oil production and/or oily waste disposal facility; nonhazardous oilfield waste treatment or recycling; and coal-fired cogeneration facilities or steam generators, primarily intended for production of oil or gas (with a conditional use permit)

Under the proposed Zoning Ordinance Amendment, every oil and gas development in Tiers 2 and 3 would undergo an oil and gas conformity review process. The process would begin with the Applicant submitting an Oil and Gas Conformity Review application, a site plan, and evidence of notification of the surface owner (if different from the mineral owner). The Kern County Planning and Community Development Department would conduct a review of the submitted application. When the application is complete, the County would transmit a copy of the Kern County Oil and Gas Conformity Review issuance to California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR), the mineral owner (if different from the operator), and the surface owner. Upon receipt of the Kern County Oil and Gas Conformity Review issuance, and any other necessary state or federal permits, the Applicant would be able to begin construction. During the construction and operations of the oil and gas activity, the Applicant would be responsible for complying with the issued Oil and Gas Conformity Review and site plan, and all applicable development standards as outlined in Chapter 19.98 of the Kern County Zoning Ordinance.

The Kern County Agricultural Preserve Standard Uniform Rules identify uses allowed within the Agricultural Preserves that have been established under the Williamson Act. The rules include 19 classes of compatible uses that include, but are not limited to oil and gas drilling and production activities, in accordance with Chapter 19.98.

Therefore, there would be no conflict with existing zoning for agricultural use or a Williamson Act Contract from implementation of the proposed Project, and the Project would not cause any significant impact with respect to Williamson Act contracts.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Impact 4.2-3: Conflict with Existing Zoning For, or Cause Rezoning of, Forest Land or Timberland

Future oil and gas exploration and production activities that would be authorized under the Project would not conflict with existing zoning for, or cause rezoning of forest land or timberland because there are not forest or timberlands in the Project Area. No impact is identified for this issue.

Mitigation Measures

No mitigation measures are required.

Level of Significance

The Project would result in no impacts to zoning for forest land or timberland.

Impact 4.2-4: Result in the Loss of Forest Land or Conversion of Forest Land to Non-Forest Use

Future oil and gas exploration and production activities authorized under the proposed Project would not result in the loss of forest land or conversion of forest land to non-forest use because there is no forest land or timberland in the Project Area. No impact is identified for this issue.

Mitigation Measures

No mitigation measures are required.

Level of Significance

The Project would result in no impacts to forest land or the conversion of forest land to non-forest use.

Impact 4.2-5: Involve Other Changes in the Existing Environment which, Because of Their Location or Nature, Could Result in Conversion of Farmland to Non-Agricultural Use or Conversion of Forest Land to Non-forest Use

Future oil and gas exploration and production activities that would be authorized under the proposed Project would involve drilling of approximately 2,700 new oil or gas wells, annually, and also other ancillary facilities, including pipelines, electrical distribution lines, temporary pits, percolation ponds, sumps, and central processing facilities.

Although Kern County Zoning considers oil and gas and agriculture as compatible land uses, certain agricultural practices and portions of the oil and gas production cycle, if conducted in close proximity, would not be compatible and would have direct impacts. Fragmentation of farmland into smaller field sizes could make it difficult for farmers to operate certain types of equipment that are necessary to their planting, production, and harvest operations, or to viably produce certain types of crops. Oil and gas development within agricultural lands could also

disrupt irrigation or field drainage systems (see Figure 4.2-3). Truck traffic could generate dust which could harm the photosynthetic processes of plants and potentially cause localized damage to fruit, vegetables, and greens. Row crops could most readily be adjusted to farm plot size and configuration, but removal of orchard trees or supported vines that take years to reach productive maturity may not be as adaptable to changes and, therefore, this impact is considered significant.

Clearing and grading involved with construction of access roads and well pad construction would disturb the agricultural soil and potentially mix topsoil and subsoil, and create dust. Use of heavy equipment, including trucks, and tanks used during oil and gas production activities would result in soil compaction beneath roads leading to well pad areas.

Temporary pits and sumps that collect non-hazardous drilling fluids, wellbore cuttings, drilling wastes, crude oil, or produced water, may increase the risk of exposure of agricultural soils to potentially hazardous chemicals and materials. Drilling pits and sumps are subject to requirements to prevent potential impacts to groundwater, under the State Water Resources Control Board's (SWRCB's) Statewide General Order (No. 2003-0003-DWQ) for low-threat discharges to land or Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board (CVRWQCB). In most cases, drilling sumps are not permitted on agricultural lands and a closed-loop system is used instead. Produced water impoundments are also regulated by the state and generally will not be permitted on agricultural lands. Produced water that contains concentrations of constituents that exceed water quality objectives must be constructed in locations where site characteristics and containment structures isolate wastes from waters of the state (see Section 4.9, Hydrology and Water Quality, for further details). Nevertheless, there could be a potential for spills during the process of removing operations fluids from sumps and, therefore, significant impacts.

Indirect impacts of oil and gas activities on adjacent FMMP land could include dust from truck traffic, soil erosion from graded areas and sedimentation onto agricultural land, and accidental releases of hazardous materials.

Mitigation Measures

MM 4.2-2 To protect crops and structures adjacent to oil and gas activities on active agricultural lands, each Applicant/operator shall comply with the following mitigation measures set forth in other chapters of this Environmental Impact Report:

a. Surface water runoff and drainage on the well pads shall be mitigated as described in mitigation measures for Hydrology and Water Quality.

b. A Spill Prevention Countermeasure and Contingency Plan or Division of Oil Gas and Geothermal Resources Assembly Bill 1960 spill plan, as applicable, shall be prepared for the site and oil and chemical spills treated in accordance with the Division of Oil Gas and Geothermal Resources Senate Bill 4

Regulations for the site to protect adjacent farmland, as described in Mitigation Measure for Hazards.

c. Speed limits for oil and gas trucks shall be posted on unpaved roads to reduce dust generation; in the absence of signage, speed limits shall be limited to 25 miles per hour (or an alternate, more stringent dust suppression standard as adopted by the San Joaquin Valley Air Pollution Control District), and Applicants shall attest that employees have been trained in the appropriate speed limits.

d. Unpaved roads shall be watered or otherwise treated for dust suppression and control as described in Mitigation Measure for Air Quality.

e. Vehicle tracking control shall be installed where unpaved roads intersect with paved roads, to prevent tracking of mud, dust, and weed seeds off site. This shall consist of a 50-foot length of a 3 inch-thick layer of gravel one inch or larger in diameter (or an alternate, more stringent dust suppression technique as approved by the San Joaquin Valley Air Pollution Control District).

f. Stormwater control shall be required at construction sites during well drilling, reworking, and/or decommissioning as described in mitigation measures for Hydrology.

g. Hazardous materials shall be stored within secondary containment as described in mitigation measures for Hazards.

h. Overhead electrical or communication lines shall be shown on the Site Plan, and shall be aligned to the greatest extent feasible with existing access roads and the minimum distance between the access road and the well installation or other oil and gas facility, parallel to tree or row crops, described further in mitigation measures for Public Utilities. If the use of existing roads is not feasible, lines shall be routed to minimize surface disturbance and minimize the impacts to surface activity

i. Underground pipelines serving the Project shall be shown on the Site Plan with locations marked and recorded with USAA, and periodically inspected and maintained as described in mitigation measures for Hazards.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.2-6: Result in the Cancellation of an Open Space Contract Made Pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for Any Parcel of 100 or More Acres

Approximately 997,916 acres of the Project Area are currently subject to the Williamson Act, and 138,277 acres are contracted under the Farmland Security Act. Approximately 3,500 of the

over 9,000 contracts are for parcels 100 acres or more in size. Kern County has determined that oil and gas activities are a compatible use with Williamson Act contracted lands and lands contracted under the Farmland Security Act. For this reason, cancellation of Williamson Act or Farmland Security Zone Contracts would not be anticipated as the result of oil and gas activities authorized under the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance and there would be no impact.

Mitigation Measures

No mitigation measures are required.

Level of Significance

No impacts relating to cancellation of a Williamson Act or Farmland Security Zone contract would occur.

4.2.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to agricultural and forest resources encompasses the whole of Kern County. As agricultural land statistics and characteristics are typically collected at the County level, cumulative impacts to agricultural and forest land should be evaluated within the context of Kern County.

Impacts that were evaluated to have no impact are not discussed in the cumulative analysis.

Impact 4.2-7: Cumulative Impacts to Agricultural or Forest Resources

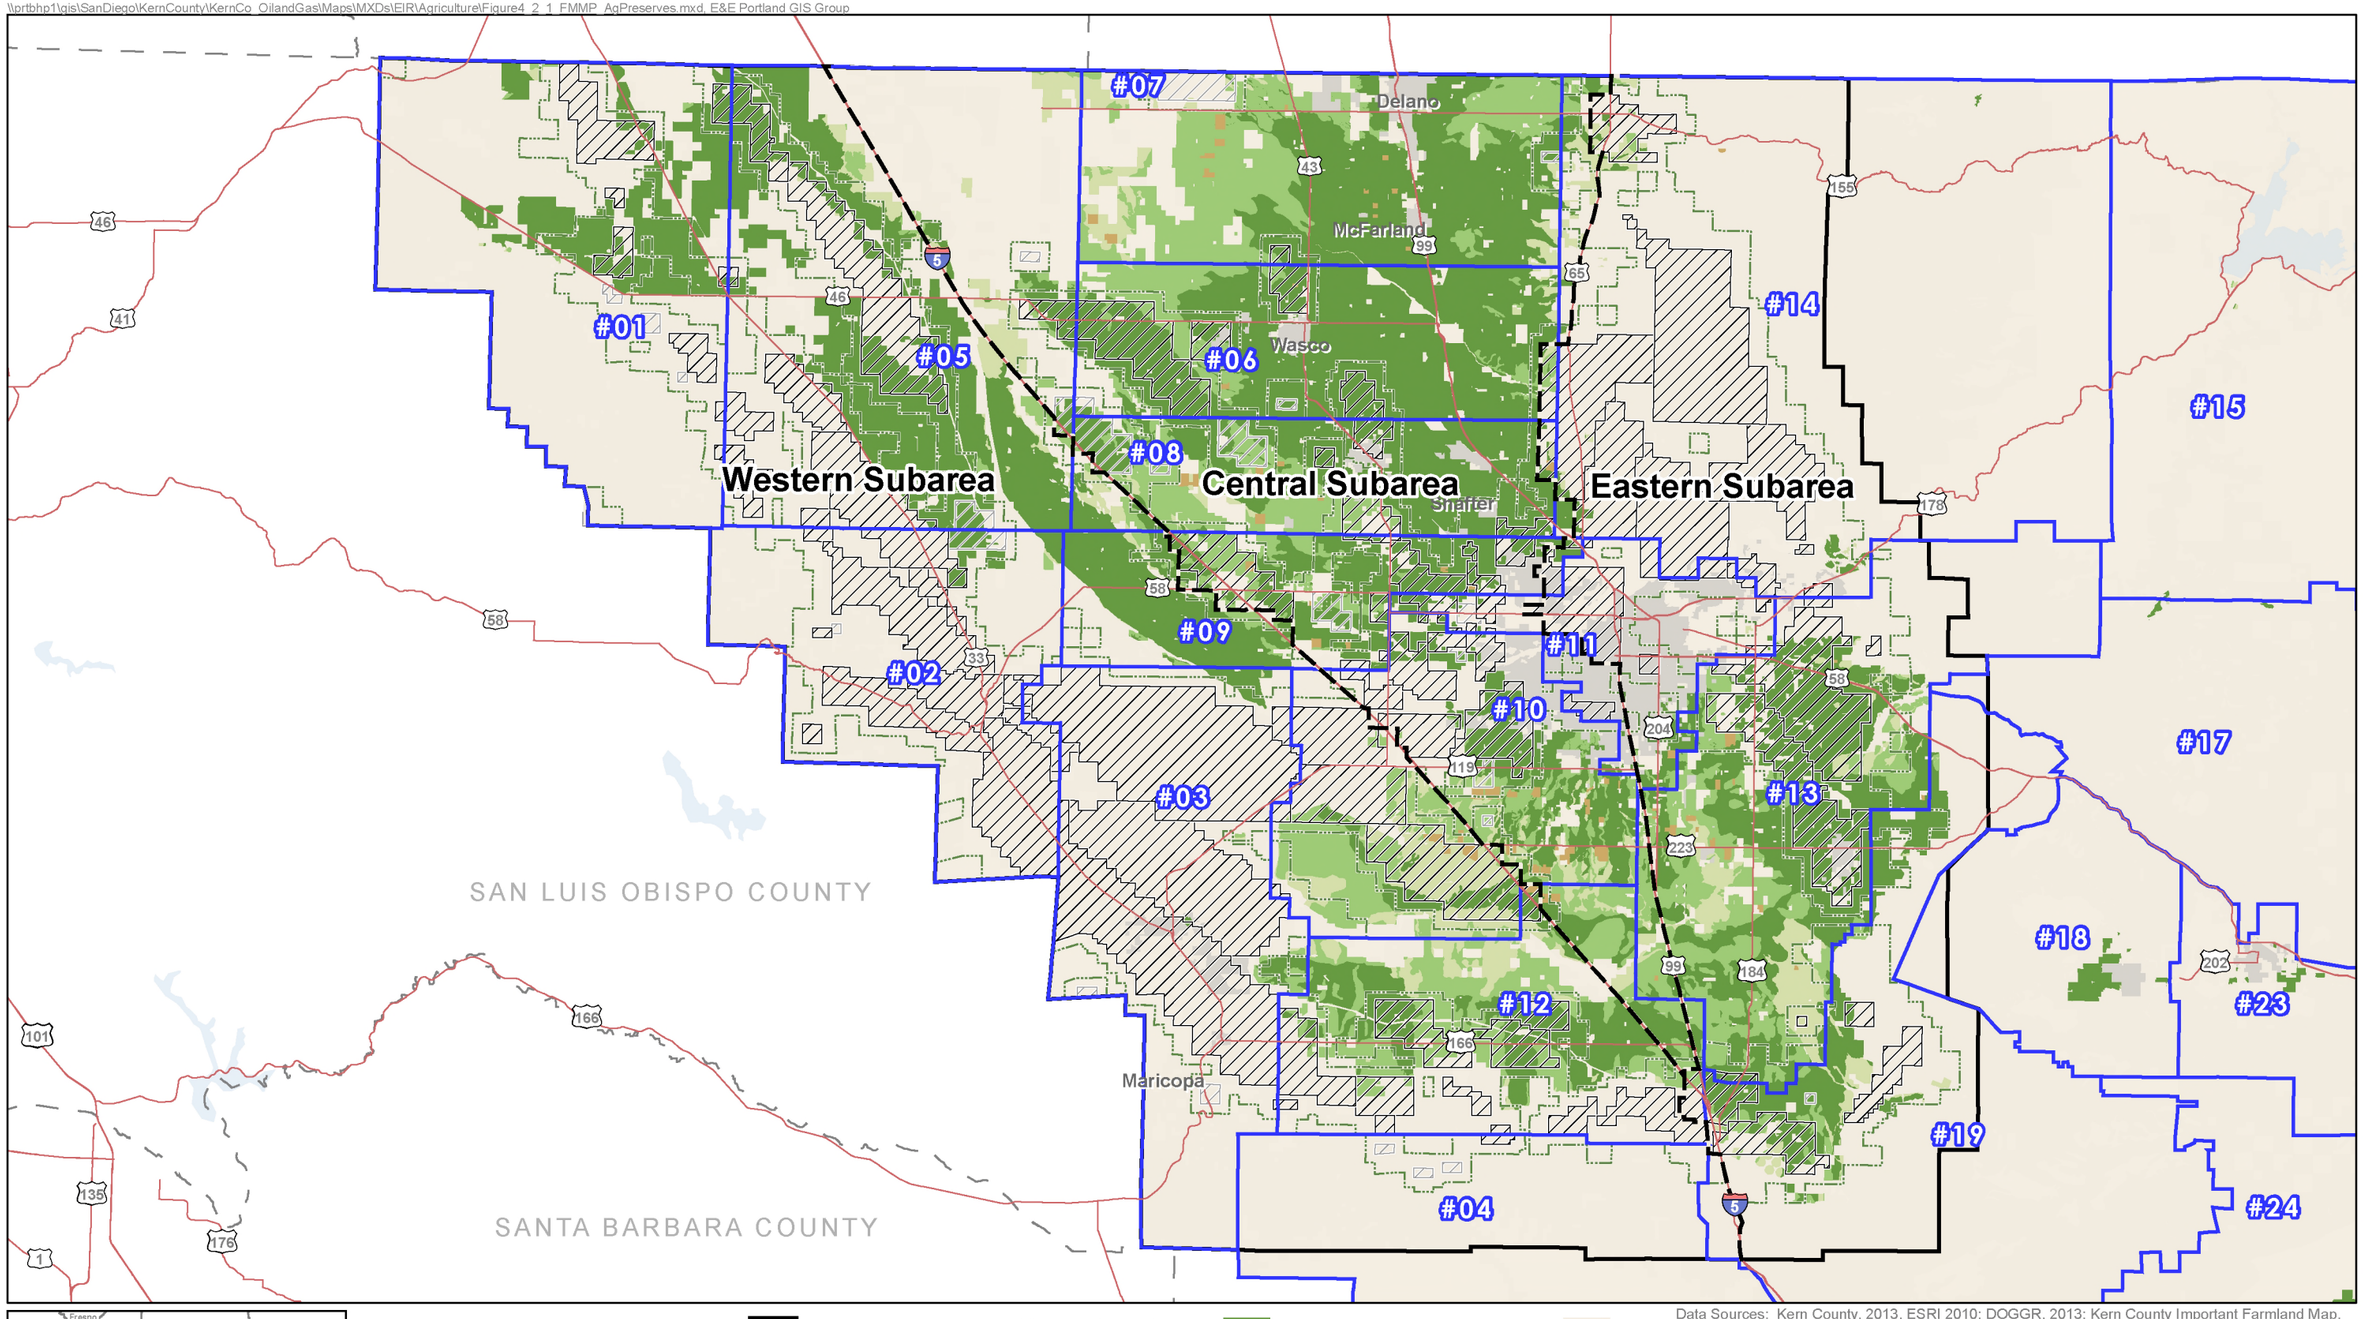
The plans evaluated in this cumulative analysis are described in Section 3.8, Cumulative Projects. Implementation of these plans and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions within which each related project is located.

With respect to agricultural farmland conversion, from 1998 to 2013, in Kern County, the average annual agricultural lands conversion rate has been 1,085 acres.

Under the worst-case scenario, 298 acres of Prime Farmland, Farmland of Statewide Importance, or Unique Farmland could be converted annually from the implementation of the proposed Project. This 298 acres of converted Farmland would combine with other losses throughout the County to result in a significant cumulative impact on agriculture.

Population growth is expected to continue in the County, and conversion of agricultural land to non-agricultural use can also be expected to occur from the need for additional residential development and infrastructure to accommodate the growth in the County.

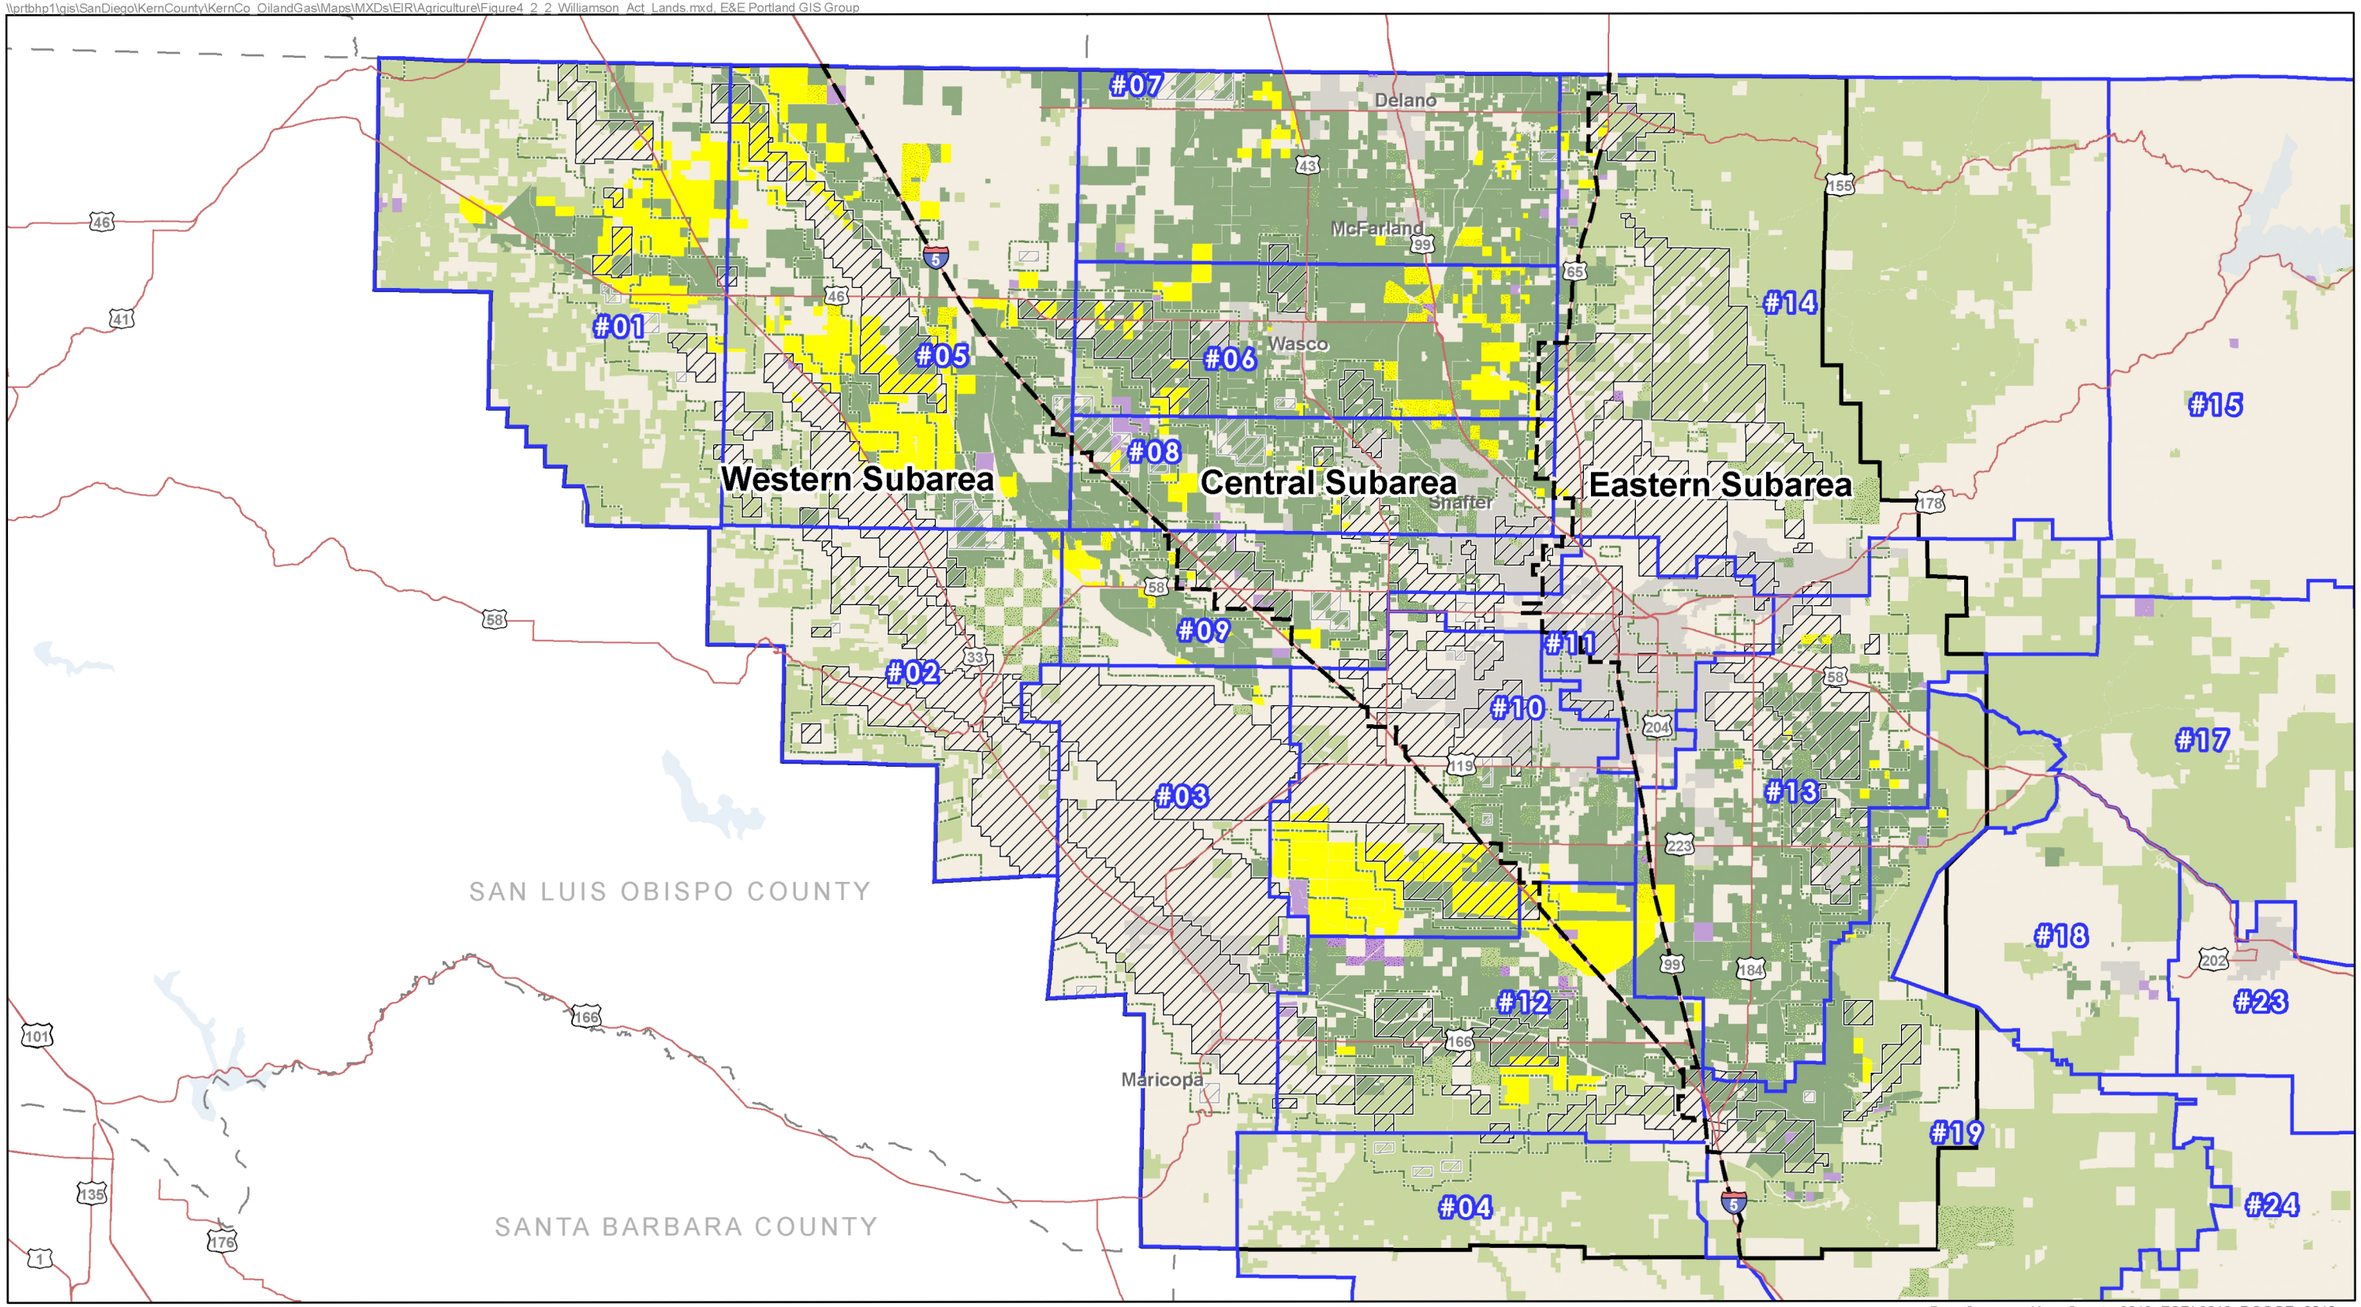
The 2014 Kern COG Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) forecasts the addition of 577,100 people and the conversion of 24 square miles, less than 2% of Farmland and 1/10th the conversion compared to the previous 22 years (Kern COG 2014). Implementation of the Kern COG RTP/SCS would result in a reduction in the rate of Farmland conversion due to policies to concentrate new development in existing urban areas and potential impacts would be mitigated. Nonetheless, due to the importance of the region's agricultural resources, the impacts related to the Project's incremental contribution to the cumulative farmland conversion would be considered cumulatively considerable.



Because there are other factors, such as commodity pricing in the global market and water pricing and availability, that influence the feasibility of ongoing agricultural operations in Kern County, there may be a cumulative significant loss in agricultural resources in Kern County for reasons that are outside the jurisdiction and control of the County. The Kern County General Plan also forecast a net loss of 80,854 acres of Prime and Important Farmland and 55,000 acres of grazing lands in Kern County based on land use conversions consistent on existing land use plans, which would further reduce Kern County's agricultural lands.

Mitigation Measures

Implement MM 4.2-1 and MM 4.2-2, as described above.



Level of Significance After Mitigation

Project impacts would be significant and unavoidable.

Section 4.3

Air Quality

Section 4.3

Air Quality

4.3.1 Introduction

This section of the Environmental Impact Report (EIR) describes the affected environment and regulatory setting for air quality. It also describes air quality impacts that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related chapters of the Kern County Zoning Ordinance (Project), and mitigation measures that would reduce these impacts.

Potential impacts on the environment and human health due to emissions affecting air quality during implementation of the Project are discussed using applicable thresholds where indicated. Mitigation measures that would reduce impacts, where applicable, are also discussed.

4.3.2 Environmental Setting

The Project Area encompasses 3,700 square miles and generally includes most of the San Joaquin Valley (SJV) Floor or western portion of Kern County. The SJV Floor is within the southern end of the San Joaquin Valley Air Basin (SJVAB), which is made up of all or portions of eight counties in California's Central Valley. These counties include Fresno, Kings, Madera, Merced, San Joaquin, Stanislaus, and Tulare counties, as well as the SJV portion of Kern County. The western portion of Kern County, where the Project is located is regulated by the San Joaquin Air Pollution Control District (SJVAPCD).

Air pollution in the SJVAB can be attributed to both human-related (anthropogenic) and natural (non-anthropogenic) activities that produce emissions. Air pollution from significant anthropogenic activities in the SJVAB includes a variety of industrial-based sources as well as on- and off-road mobile sources. Activities that tend to increase mobile activity include increases in population, increases in traffic (including automobiles, trucks, aircraft, and rail), urban sprawl (which increases commuter driving distances), and general local land management practices as they pertain to modes of commuter transportation (SJVAPCD 2015a). Air pollution is also transported into the SJVAB from a variety of sources, including northern California and Asia (Faloona et al. 2015).

Meteorological Conditions

The SJVAB is the southern half of California's Central Valley and is 250 miles long and bordered by mountains on three sides. The SJV is bordered by the Sierra Nevada Mountains in the east (8,000 to 14,491 feet in elevation), the Coast Ranges in the west (averaging 3,000 feet in elevation), and the Tehachapi mountains in the south (6,000 to 7,981 feet in elevation). There is a slight downward elevation gradient from Bakersfield in the southeast end (elevation 408 feet) to sea level at the northwest end where the valley opens to the San Francisco Bay at the Carquinez

Straits. At its northern end is the Sacramento Valley, which comprises the northern half of California's Central Valley. The bowl shaped topography inhibits movement of pollutants out of the valley.

The overall climate in the SJVAB is warm and semi-arid. The San Joaquin Valley is in a Mediterranean Climate Zone. Mediterranean Climate Zones occur on the west coast of continents at 30 to 40 degrees latitude and are influenced by a subtropical high-pressure area most of the year. Mediterranean climates are characterized by sparse rainfall, which occurs mainly in the winter. There is only one wet season during the year and 90% of the precipitation falls during October through April. Snow in the valley is infrequent and thunderstorms seldom occur. Summers are hot and dry. Summertime maximum temperatures often exceed 100°F in the valley.

The subtropical high-pressure area is strongest during spring, summer, and fall and produces subsiding air, which can result in temperature inversions in the valley. Air temperature in the lowest layer of the atmosphere typically decreases with altitude. A reversal of this atmospheric state, where the air temperature increases with height, is termed an inversion. The height of the base of the inversion is known as the "mixing height." This is the level to which pollutants can mix vertically. Mixing of air is minimized above the inversion base. The inversion base represents an abrupt density change where little air movement occurs. A temperature inversion can act like a lid, inhibiting vertical mixing of the air mass near the land surface, resulting in trapping of air pollutants below the inversion. Most of the surrounding mountains are above the normal height of summer inversions (1,500 to 3,000 feet). Concentration levels of air pollutants are directly related to inversion layers due to the limitation of vertical mixing. Inversion layers enhance the formation of ozone and limit dispersion of directly emitted pollutants like particulate matter and carbon monoxide (SJVAPCD 2015).

Winter-time high pressure events can often last many weeks with surface temperature often lowering into the 30°F range. During these events, fog can be present and inversions are extremely strong. These winter-time inversions can inhibit vertical mixing of pollutants to a few hundred feet (SJVAPCD 2015a)

The transport and dispersion of air pollutants in ambient air are influenced by many complex factors. The primary factors are wind, topological boundaries, and atmospheric stability. During the summer, wind speed and direction data indicate that summer wind usually originates at the north end of SJV and flows in a south-southeasterly direction through the valley and the Tehachapi pass, into the Mojave Desert. During the winter months, the SJV experiences light, variable winds, less than 10 miles per hour (mph).

Topography

Air pollution is directly related to a region's topographic features. The SJVAB is approximately 250 miles long, an average of 35 miles wide, and is the second largest air basin in the state. The SJVAB is defined by the Sierra Nevada mountains in the east (8,000 to 14,000 feet in elevation), the Coast Ranges in the west (averaging 3,000 feet in elevation), and the Tehachapi Mountains in the south (6,000 to 8,000 feet in elevation). The valley is basically flat with a slight downward

gradient to the northwest, and opens to the sea at the Carquinez Straits where the San Joaquin-Sacramento Delta empties into San Francisco Bay.

Wind Patterns

The SJVAB's topography has a dominating effect on wind patterns. Winds tend to blow somewhat parallel to the valley and mountain range orientation. In spring and early summer, thermal low-pressure systems develop over the interior basins east of the Sierra Nevada mountain range, and the Pacific High (high pressure system that develops over the central Pacific Ocean near the Hawaiian Islands) moves northward. These developments and the topography produce the high incidence of relatively strong northwesterly winds in the spring and early summer (SJVAPCD 2013a).

Wind speed and direction data indicate that during the summer, winds usually originate at the north end of the SJVAB and flow in a south-southeasterly direction through the Tehachapi Pass into the Southeast Desert Air Basin. Wind speed and direction data indicate that during the winter, winds occasionally originate from the south end of the SJVAB and flow in a north-northwesterly direction. Also, during winter, the SJVAB experiences light, variable winds, typically less than 10 mph. Low wind speeds, combined with low inversion layers in the winter, create a climate conducive to high carbon monoxide (CO) and inhalable particulates concentrations (SJVAPCD 2013a).

For the southernmost portion of the SJVAB, steady winds are typical in the mountainous area that characterizes this portion, and quickly disperse air pollutants.

Temperature

The vertical rise and mixing of air pollutants is limited by the presence of persistent temperature inversions. Inversions may be either ground level or elevated. Ground-level inversions occur frequently during early fall and winter (i.e., October through January). High concentrations of primary pollutants, which are those emitted directly into the atmosphere (e.g., CO), may be found at these times. Elevated inversions act as a lid over the basin and limit vertical mixing, resulting in severe air stagnation. Elevated inversions contribute to the occurrence of high levels of ozone during the summer months.

In winter, storm systems moving in from the Pacific Ocean bring a maritime influence to the SJV. The Sierra Nevada mountain range prevents the cold, continental air masses from influencing the valley. Temperatures below freezing are unusual. In the southern portion of the SJVAB, average high temperatures in the winter are in the 60s, but highs in the 30s and 40s can occur with persistent fog and low cloudiness. In summer, high temperatures often exceed 100 degrees, with averages in the mid/high 90s in the southern SJVAB. Summer low temperatures average in the mid-50s in the southern basin (Western Regional Climate Center 2014).

Precipitation

Precipitation in the SJVAB is strongly influenced by the position of the semi-permanent subtropical high-pressure area located off the Pacific Coast (the Pacific High). In the winter, this high-pressure system moves southward, allowing Pacific storms to move through the SJVAB. The majority of the precipitation in the valley is winter rain produced by these storms. Snowstorms, hailstorms, and ice storms occur infrequently in the valley, and severe occurrences are very rare.

Precipitation on the SJVAB floor and in the Sierra Nevada decreases from north to south. This decrease is primarily because the Pacific storm track often passes through the northern part of the state while the southern part of the state remains protected by the Pacific High. For example, the northern portion of the SJVAB (Manteca and Stockton areas) receives approximately 20 inches of rain per year; the central portion of the basin (Fresno area) receives approximately 10 inches of rain per year; and the southern portion of the basin (Bakersfield area) receives less than 6 inches of rain per year. The Tejon Pass area receives about 12 inches of rain per year (SJVAPCD 2013a).

Existing Air Quality

The United States Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) have established health-based ambient air quality standards for several different pollutants. The EPA sets National Ambient Air Quality Standards (NAAQS) for the following seven pollutants for ozone (O_3), CO, nitrogen dioxide (NO_2), respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), sulfur dioxide (SO_2) and lead (Pb). These seven pollutants are commonly referred to as "criteria pollutants." Primary standards provide public health protection, including protecting the health of "sensitive" populations, such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

In addition, CARB has established California Ambient Air Quality Standards (CAAQS) standards for these pollutants, as well as for sulfate (SO_4), visibility reducing particles, hydrogen sulfide (H_2S), and vinyl chloride. California standards are generally stricter than national standards. The National Ambient Air Quality Standards and the CAAQS are shown in Table 4.3-1.

Table 4.3-1: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[2, 5]	National Standards[1, 5]	
			Primary[3]	Secondary[4]
Ozone (O_3)	1-Hour	0.09 ppm (180 µg/m^3)	---[6]	---
	8-Hour	0.070 ppm (137 µg/m^3)	0.075 ppm (147 µg/m^3)	Same as Primary Standard
Carbon monoxide (CO)	1-Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	---
	8-Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	---

Table 4.3-1: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[2, 5]	National Standards[1, 5]	
			Primary[3]	Secondary[4]
Nitrogen dioxide (NO_2)	1-Hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	---
	Annual Mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as Primary Standard
Sulfur dioxide (SO_2)[7]	1-Hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)	---
	3-Hour	---	---	0.5 ppm (1,300 µg/m^3)
	24-Hour	0.04 ppm (105 µg/m^3)	---	---
Respirable Particulate Matter (PM_{10})[8]	24-Hour	50 µg/m^3	150 µg/m^3	Same as Primary Standard
	Annual Mean	20 µg/m^3	---	---
Fine Particulate Matter ($PM_{2.5}$)[8]	24-Hour	---	35 µg/m^3	Same as Primary Standard
	Annual Mean	12 µg/m^3	12.0 µg/m^3	15 µg/m^3
Lead (Pb)	30-day Average	1.5 µg/m^3		
	Rolling 3-month Average		0.15 µg/m^3	Same as Primary Standard
Hydrogen sulfide (H_2S)	1-Hour	0.03 ppm (42 µg/m^3)	No Federal Standards	
Sulfates (SO_4)	24-Hour	25 µg/m^3		
Visibility reducing particles	8-Hour	See Note 9		
Vinyl chloride[10]	24-Hour	0.01 ppm (26 µg/m^3)		

Sources: EPA 2014a; California Environmental Protection Agency Air Resources Board 2014.
Key:
ppb = parts per billion
ppm = parts per million
µg/m^3 = micrograms per cubic meter
mg/m^3 = milligrams per cubic meter
Notes:
[1] NAAQS (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth-highest 8-hour concentration in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is not to be exceeded more than once per year on average over 3 years. The 24-hour standard is attained when the 3-year average of the weighted annual mean at each monitor within an area does not exceed 150 µg/m^3. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, do not exceed 35 µg/m^3. The annual standard is attained when the 3-year average of the weighted annual mean at single or multiple community-oriented monitors does not exceed 12 µg/m^3.
[2] CAAQS for ozone, CO (except 8-hour Lake Tahoe), SO_2 (1- and 24-hour), NO_2, PM_{10} and visibility reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded.
[3] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

Table 4.3-1: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[2, 5]	National Standards[1, 5]	
			Primary[3]	Secondary[4]

[4] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse impacts of a pollutant.
[5] Concentration expressed first in units in which it was promulgated. Parts per million in this table refers to ppm by volume or micromoles of pollutant per mole of gas.
[6] The federal 1-hour ozone standard was revoked for most areas of the United States, including all of California on June 15, 2005.
[7] Final rule signed June 2, 2010. The 1971 annual and 24-hour SO_2 standards were revoked in that same rulemaking.
[8] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12 µg/m^3. Existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^{3}also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
[9] In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.
[10] The California Air Resources Board has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health impacts determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Table 4.3-2 summarizes the federal and state attainment status for the SJVAB, as of 2014, based on the NAAQS and CAAQS, respectively.

Table 4.3-2: Attainment Status for the San Joaquin Valley APCD

Pollutant	Designation/Classification	
	Federal	State
Ozone	Nonattainment/Extreme[(1),(2)]	Nonattainment/Severe
PM_{10}	Attainment[(3)]	Nonattainment
$PM_{2.5}$	Nonattainment[(4)]	Nonattainment
Carbon monoxide (CO)	Unclassifiable/Attainment	Attainment/Unclassified
Nitrogen dioxide (NO_2)	Unclassifiable/Attainment	Attainment
Sulfur dioxide (SO_2)	Attainment/Unclassified	Attainment
Lead (Pb)	Unclassifiable/Attainment	Attainment
Hydrogen sulfide (H_2S)	No Federal Standard	Unclassified
Sulfates (SO_4)	No Federal Standard	Attainment
Visibility reducing particulate	No Federal Standard	Unclassified
Vinyl chloride	No Federal Standard	Attainment

Source: SJVAPCD 2015b
Notes:
[1] Even though the EPA, revoked the federal 1-hour ozone standard, including associated designations and classifications in 2005, EPA had previously classified the SJVAB as extreme nonattainment for this standard. EPA approved the 2004 Extreme Ozone Attainment Demonstration Plan on March 8, 2010. Many applicable requirements for extreme 1-hour ozone nonattainment areas continue to apply to the SJVAB.
[2] Though the San Joaquin Valley was initially classified as serious nonattainment for the 1997 8-hour ozone standard, EPA approved reclassification to extreme nonattainment in the Federal Register on May 5, 2010.

Table 4.3-2: Attainment Status for the San Joaquin Valley APCD

Pollutant	Designation/Classification	
	Federal	State

[3] On September 25, 2008, EPA redesignated the San Joaquin Valley to attainment for the PM_{10} standard and approved the PM_{10} Maintenance Plan.
[4] The San Joaquin Valley is designated nonattainment for the 1997 $PM_{2.5}$ standard. EPA designated the San Joaquin Valley as nonattainment for the 2006 PM2.5 standard on November 13, 2009.

On May 2014, the SJVAPCD formally requested that the EPA determine that the San Joaquin Valley has attained the federal 1-hour ozone standard based on the fact that the San Joaquin Valley has been meeting the 1-hour ozone standard based on the "expected exceedance days" test over the 2011-2013 three-year period air monitoring data.

Since 1992, the SJVAPCD air quality management strategies have focused on the 1-hour ozone standard, trying to achieve the emissions reductions needed to demonstrate attainment by developing and implementing attainment plans, adopting over 500 stringent rules, and supplementing its regulatory programs with a voluntary incentive program.

Ambient Air Quality

The SJVAPCD, CARB, National Park Service, and Santa Rosa Rancheria in Lemoore operate an extensive network of air monitoring stations in the San Joaquin Valley. The monitoring station network provides air quality monitoring data, including real-time meteorological data and ambient pollutant levels, as well as historical data. The network in the SJVAB consists of 36 monitoring stations, nine of which are located in western Kern County within the Project Area (SJVAPCD 2014). Table 4.3-3 presents the measured ambient pollutant concentrations and the exceedances of state and federal standards that have occurred at the above-mentioned monitoring stations from 2010 through 2012, the most recent years for which data are available.

Criteria Air Pollutants and Health Effects

The following is a general description of the criteria air pollutants that are hazardous to human health and are regulated by federal and state ambient air quality standards or criteria for outdoor concentrations.

Ozone (O_3)

In the presence of ultraviolet radiation, nitrogen oxides (NO_X) and volatile organic compounds (VOCs)/reactive organic gases (ROG) go through a number of complex chemical reactions to form ozone. Ozone was monitored at the Mojave, Lancaster, and Victorville monitoring stations for the years 2009 to 2011. Table 4.3-3 also includes the maximum hourly concentration and the number of days above the federal and State standards. As shown in Table 4.3-3, ozone continues to be above the State 1-hour and both the federal and State 8-hour ozone standards in many places in Kern County. The SJVAPCD attainment status for ozone is currently severe nonattainment for State 1-hour ozone; nonattainment/extreme for the federal 8-hour ozone; and, nonattainment for State 8-hour ozone.

While ozone in the upper atmosphere protects the earth from harmful ultraviolet radiation, high concentrations of ground-level ozone can adversely affect the human respiratory system. Many respiratory ailments, as well as cardiovascular disease, are aggravated by exposure to high ozone levels. ozone also damages natural ecosystems, such as forests and foothill communities; agricultural crops; and some man-made materials, such as rubber, paint, and plastic. High levels of ozone may negatively affect immune systems, making people more susceptible to respiratory illnesses, including bronchitis and pneumonia. ozone also accelerates aging and exacerbates pre-existing asthma and bronchitis and, in cases with high concentrations, can lead to the development of asthma in active children. Active people, both children and adults, appear to be more at risk from ozone exposure than those with a low level of activity. Additionally, the elderly and those with respiratory disease are also considered sensitive populations for ozone.

People who work or play outdoors are at a greater risk for harmful health effects from ozone. Children and adolescents are also at greater risk because they are more likely than adults to spend time engaged in vigorous activities. Research indicates that children under 12 years of age spend nearly twice as much time outdoors daily than adults. Teenagers spend at least twice as much time as adults in active sports and outdoor activities. Also, children inhale more air per pound of body weight than adults, and they breathe more rapidly than adults. Children are less likely than adults to notice their own symptoms and avoid harmful exposures.

Ozone is an oxidant that is comparable to household bleach, which can kill living cells (such as germs or human skin cells) upon contact. Ozone can damage the respiratory tract, causing inflammation and irritation, and it can induce symptoms such as coughing, chest tightness, shortness of breath, and worsening of asthmatic symptoms. Ozone in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. Exposure to levels of ozone above the current ambient air quality standard can lead to lung inflammation and

lung tissue damage and a reduction in the amount of air inhaled into the lungs. Recent evidence has, for the first time, linked the onset of asthma to exposure to elevated ozone levels in exercising children. Elevated ozone concentrations also reduce crop and timber yields, damage native plants, and damage materials such as rubber, paints, fabric, and plastics (American Lung Association 2015).

Carbon Monoxide (CO)

CO is a colorless, odorless gas produced by incomplete combustion of carbon-containing fuels (e.g., gasoline, diesel fuel, and biomass). CO is primarily a byproduct of motor vehicle exhaust, which contributes more than two-thirds of all CO emissions nationwide. In cities, automobile exhaust can cause as much as 95% of all CO emissions. These emissions can result in high concentrations of CO, particularly in local areas with heavy traffic congestion. Other sources of CO emissions include industrial processes and fuel combustion in sources such as boilers and incinerators. Despite an overall downward trend in concentrations and emissions of CO, some metropolitan areas still experience high levels of CO.

CO is essentially inert to plants and materials but can have significant effects on human health. CO enters the bloodstream and binds more readily to hemoglobin than oxygen, reducing the oxygen-carrying capacity of blood, thus reducing oxygen delivery to organs and tissues. The health threat from CO is most serious for those who suffer from cardiovascular disease. Healthy individuals are also affected, but only at higher levels of exposure. CO in the bloodstream reduces the blood's capacity for carrying oxygen to the heart, brain, and other parts of the body. Exposure to CO can cause chest pain in heart patients, headaches, and reduced mental alertness. At high concentrations, CO can cause heart difficulties in people with chronic diseases, and can impair mental abilities. Exposure to elevated CO levels is associated with visual impairment, reduced work capacity, reduced manual dexterity, poor learning ability, difficulty performing complex tasks, and in prolonged, enclosed exposure, death.

The adverse health effects associated with exposure to ambient and indoor concentrations of CO are related to concentration of carboxyhemoglobin (COHb) in the blood. Health effects observed may include early onset of cardiovascular disease, behavioral impairment, decreased exercise performance of young healthy men, reduced birth weight, Sudden Infant Death Syndrome, and increased daily mortality rate. Most of the studies evaluating adverse health effects of CO on the central nervous system examine high-level poisoning. Such poisoning results in symptoms ranging from common flu and cold symptoms (shortness of breath on mild exertion, mild headaches, and nausea) to unconsciousness and death. It has been reported that there is an association between daily death rate and exposure to ambient CO in Los Angeles County, where it is postulated that a concentration of 20.2 parts per million (ppm) (the highest daily concentration recorded during a 4-year period) contributed to 11 out of 159 deaths. Additional studies conducted in Los Angeles and in Sao Paulo, Brazil, also suggest a relationship between daily death rates and CO concentrations.

Table 4.3-3 summarizes the CO data collected for 2010 the Bakersfield-Golden State Highway monitoring station. The SJVAPCD attainment status for CO is unclassified/attainment for federal standards and unclassified for State standards

Nitrogen Dioxide (NO_2) and Oxides of Nitrogen (NO_x)

NO_2 is a reddish brown, highly reactive gas that is formed in the ambient air through the oxidation of nitric oxide. NO_X, the generic term for a group of highly reactive gases that contain nitrogen and oxygen in varying amounts, plays a major role in the formation of ozone, particulate matter (PM), and acid rain. NO_X emissions result from high-temperature combustion processes such as vehicle exhaust emissions and power plants. Home heaters and gas stoves can also produce substantial amounts of NO_2 in indoor settings. The majority of the NO_X emitted from combustion sources is in the form of nitrogen oxide (NO), while the balance is mainly NO_2. NO is oxidized by ozone in the atmosphere to NO_2 but some level of photochemical activity is needed for this conversion.

NO_X reacts with other pollutants to form, ground-level ozone, nitrate particles, acid aerosols, as well as NO_2, which cause respiratory problems. NO_X and the pollutants formed from NO_X can be transported over long distances, following the patterns of prevailing winds. Therefore controlling NO_X is often most effective if done from a regional perspective, rather than focusing on the nearest sources.

Current scientific evidence links short-term NO_2 exposures, ranging from 30 minutes to 24 hours, with adverse respiratory effects including airway inflammation in healthy people and increased respiratory symptoms in people with asthma. Also, studies show a connection between breathing elevated short-term NO_2 concentrations, and increased visits to emergency departments and hospital admissions for respiratory issues, especially asthma (EPA 2014b). Nitrogen oxides are ozone precursors that combine with ROGs to form ozone. See the "Ozone (O_3)" section above for a discussion of the health effects of ozone.

Direct inhalation of NO_X can also cause a wide range of health effects. NO_X can irritate the lungs, cause lung damage, and lower resistance to respiratory infections such as influenza. Short-term exposures (e.g., less than 3 hours) to low levels of NO_2 (a subset of NO_X) may lead to changes in airway responsiveness and lung function in individuals with preexisting respiratory illnesses. These exposures may also increase respiratory illnesses in children. Long-term exposures to NO_2 may lead to increased susceptibility to respiratory infection and may cause irreversible alterations in lung structure. Other health effects associated with NO_X are an increase in the incidence of chronic bronchitis and lung irritation. Chronic exposure to NO_2 may lead to eye and mucus membrane aggravation, along with pulmonary dysfunction. NO_X can cause fading of textile dyes and additives, deterioration of cotton and nylon, and corrosion of metals due to production of particulate nitrates. Airborne NO_X can also impair visibility. NO_X is a major component of acid deposition in California. NO_X may affect both terrestrial and aquatic ecosystems. NO_X in the air is a potentially significant contributor to a number of environmental effects such as acid rain and eutrophication in coastal waters. Eutrophication occurs when a body of water suffers an increase in nutrients that reduce the amount of oxygen in the water, producing an environment that is destructive to fish and other animal life.

NO_2 is toxic to various animals as well as to humans. Its toxicity relates to its ability to combine with water to form nitric acid in the eye, lung, mucus membranes, and skin. Studies of the health impacts

of NO_2 include experimental studies on animals, controlled laboratory studies on humans, and observational studies. In animals, long-term exposure to NO_2 increases susceptibility to respiratory infections, lowering their resistance to diseases such as pneumonia and influenza. Laboratory studies show susceptible humans, such as asthmatics, exposed to high concentrations of NO_2 can suffer lung irritation and, potentially, lung damage. Epidemiological studies have also shown associations between NO_2 concentrations and daily mortality from respiratory and cardiovascular causes, and with hospital admissions for respiratory conditions.

Nitrogen oxides contribute to a wide range of environmental effects directly and when combined with other precursors in acid rain and ozone. Increased nitrogen inputs to terrestrial and wetland systems can lead to changes in plant species composition and diversity. Similarly, direct nitrogen inputs to aquatic ecosystems, such as those found in estuarine and coastal waters, can lead to eutrophication (a condition that promotes excessive algae growth, which can lead to a severe depletion of dissolved oxygen and increased levels of toxins harmful to aquatic life). Nitrogen, alone or in acid rain, also can acidify soils and surface waters. Acidification of soils causes the loss of essential plant nutrients and increased levels of soluble aluminum that are toxic to plants. Acidification of surface waters creates conditions of low pH and levels of aluminum that are toxic to fish and other aquatic organisms. Nitrogen oxides also contribute to visibility impairment.

Table 4.3-3 summarizes NO_X data collected from the Arvin-Bear Mountain Boulevard, Bakersfield 5558 California Avenue, Bakersfield Golden State Highway, Bakersfield Municipal Airport, Edison and Shafter Walker Street monitoring stations between 2010 and 2012. As indicated in the table, there have been no exceedances of the State standards and no data are available to determine exceedances under federal standards. The SJVAPCD attainment status for NO_2 is attainment/unclassified for federal and attainment for State standards.

Particulate Matter (PM_{10} and $PM_{2.5}$)

PM pollution consists of very small aerosol and solid particles suspended in the air. PM is a mixture of materials that can include acids (such as nitrates and sulfates), organic chemicals, smoke, soot, dust, salt, acids, metals, and allergens (such as fragments of pollen or mold spores). PM also forms when gases emitted from motor vehicles and industrial sources undergo chemical reactions in the atmosphere. The EPA currently regulates two types of PM emissions: PM_{10} and $PM_{2.5}$. PM_{10} refers to particles less than or equal to 10 microns in diameter and $PM_{2.5}$ refers to particles less than or equal to 2.5 microns in diameter.

Respirable Particulate Matter (PM_{10})

PM_{10} can be emitted directly or it can be formed many miles downwind from emission sources when various precursor pollutants interact in the atmosphere. Gaseous emissions of pollutants like NO_X, sulfur oxides (SO_X), VOC, and ammonia, given the right meteorological conditions, can form PM in the form of nitrates (NO_3), SO_4, and organic particles. These pollutants are known as secondary particulates, because they are not directly emitted, but are formed through complex chemical reactions in the atmosphere.

Table 4.3-3 summarizes the ambient PM_{10} data collected from the Bakersfield 5558 California Avenue, Bakersfield Golden State Highway, Mojave 923 Poole Street, Oildale 3311 Manor Street, Canebrake, and Ridgecrest monitoring stations near the Project site and includes the maximum 24-hour and annual arithmetic average concentrations and the number of days above the federal and State standards. The SJVAPCD attainment status for the federal PM_{10} standards is attainment and the State PM_{10} standard is nonattainment/severe.

Fine Particulate Matter ($PM_{2.5}$)

Table 4.3-3 summarizes the ambient fine PM data collected for the years 2010 to 2012 from the Arvin Bear Mountain Boulevard, Arvin Di Giorgio, Bakersfield 5558 California Avenue, Bakersfield 410 E. Planz Road, Mojave 923 Poole Street, Ridgecrest, and Lebec-Beartrap Road monitoring stations located near the Project site. The SJVAPCD is in nonattainment for the federal and State $PM_{2.5}$ standards.

The size of particles is directly linked to their potential for causing health problems. PM_{10} pose the greatest problems because they can get deep into lungs and the bloodstream. Being even smaller, $PM_{2.5}$ will travel further into the lungs. Exposure to such particles can affect both lungs and heart. Numerous scientific studies have linked particle pollution exposure to a variety of problems, including (EPA 2014c):

- Premature death in people with heart or lung disease;
- Nonfatal heart attacks;
- Irregular heartbeat;
- Aggravated asthma;
- Decreased lung function; and
- Increased respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing.

Sulfur Dioxide (SO_2)

SO_2 is typically emitted as a result of the combustion of a fuel containing sulfur. SO_2 is a colorless, irritating gas with a "rotten egg" smell formed primarily by the combustion of sulfur-containing fossil fuels. Fuels, such as natural gas, contain very little sulfur and consequently have very low SO_2 emissions when combusted. By contrast, fuels high in sulfur content, such as coal or heavy fuel oils, can emit very large amounts of SO_2 when combusted. Sources of SO_2 emissions come from every economic sector and include a wide variety of fuels, and other gases, liquids, and solids.

Current scientific evidence links short-term exposures to SO_2, ranging from 5 minutes to 24 hours, with an array of adverse respiratory effects including bronchoconstriction and increased asthma symptoms. These effects are particularly important for asthmatics at elevated ventilation rates (e.g., while exercising or playing; EPA 2015a). SO_X can also react with other compounds in the

atmosphere to form small particles. These particles penetrate deeply into sensitive parts of the lungs and can cause or worsen respiratory disease, such as emphysema and bronchitis, and can aggravate existing heart disease, leading to increased hospital admissions and premature death. High concentrations of SO_2 can result in temporary breathing impairment for asthmatic children and adults who are active outdoors. Short-term exposures of asthmatic individuals to elevated SO_2 levels during moderate activity may result in breathing difficulties that can be accompanied by symptoms such as wheezing, chest tightness, or shortness of breath. Other effects that have been associated with longer-term exposures to high concentrations of SO_2, in conjunction with high levels of PM, include aggravation of existing cardiovascular disease, respiratory illness, and alterations in the lungs' defenses. SO_2 also is a major precursor to $PM_{2.5}$, which is a significant health concern, and is a primary contributor to poor visibility. (See also health effects under "Particulate Matter (PM_{10} and $PM_{2.5}$)," above.)

Exposure to high concentrations of SO_2 for short periods of time can constrict the bronchi and increase mucous flow, making breathing difficult. Additional health effects of SO_2 are listed below.

- SO_2 can immediately irritate the lung and throat at concentrations greater than 6 ppm in many people.
- SO_2 can impair the respiratory system's defenses against foreign particles and bacteria, when exposed to concentrations less than 6 ppm for longer time periods.
- SO_2 can enhance the harmful effects of ozone. (Combinations of the two gases at concentrations occasionally found in the ambient air appear to increase airway resistance to breathing.)
- SO_2 tends to have more toxic effects when acidic pollutants, liquid or solid aerosols, and particulates are also present. (In the 1950s and 1960s, thousands of excess deaths occurred in areas where SO_2 concentrations exceeded 1 ppm for a few days and other pollutants were also high.) Effects are more pronounced among mouth breathers, e.g., people who are exercising or who have head colds. These effects are listed below.
  - SO_2 concentrations can result in health problems, such as episodes of bronchitis requiring hospitalization associated with lower-level acid concentrations.
  - SO_2 concentrations have been linked to self-reported respiratory conditions, such as chronic cough and difficult breathing, associated with acid aerosol concentrations. (Asthmatic individuals are especially susceptible to these effects. The elderly and those with chronic respiratory conditions may also be affected at lower concentrations than the general population.)
  - Increased respiratory tract infections have been associated with longer-term, lower-level exposures to SO_2 and acid aerosols.
  - SO_2 concentrations are also known to result in subjective symptoms, such as headaches and nausea, in the absence of pathological abnormalities, due to long-term exposure.

- SO_2 easily injures many plant species and varieties, both native and cultivated. Some of the most sensitive plants include various commercially valuable pines, legumes, red and black oaks, white ash, alfalfa and blackberry. The effects include:
  - Visible injury to the most sensitive plants at exposures as low as 0.12 ppm for 8 hours;
  - Visible injury to many other plant types of intermediate sensitivity at exposures of 0.30 ppm for 8 hours; and
- Positive benefits from low levels, in a very few species growing on sulfur deficient soils.
- Increases in SO_2 concentrations accelerate the corrosion of metals, probably through the formation of acids. (SO_2 is a major precursor to acidic deposition.) SO_2 may also damage stone and masonry, paint, various fibers, paper, leather, and electrical components.
- Increased SO_2 also contributes to impaired visibility. Particulate sulfate, much of which is derived from SO_2 emissions, is a major component of the complex total suspended particulate mixture.

As shown in Table 4.3-2, the SJVAPCD is designated attainment or unclassified for all SO_2 State and federal ambient air quality standards, respectively. Due to the restrictions for the use of high sulfur fuels, reduction in gasoline and diesel sulfur contents and reduction in SO_2 emissions from other industrial sources, such as refineries, SO_2 pollution is no longer a major air quality concern in most of California, including the Project site.

Lead (Pb)

Lead in the atmosphere occurs as PM. Main sources of lead emissions include leaded gasoline, battery manufacture, paint, ink, ceramics, ammunition, and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. After the phase-out of leaded gasoline between 1978 and 1987, secondary lead smelters, battery recycling, and manufacturing facilities became lead emission sources of greater concern. Current federal standards for lead have no attainment designation, but areas lacking an attainment designation are treated as being in attainment of the standard. The SJVAPCD is designated as attainment for State standards and lead is no longer monitored in the ambient air of the SJVAPCD.

Exposure to lead occurs mainly through inhalation of air and ingestion of lead in food, water, soil, or dust. It accumulates in the blood, bones, and soft tissues and can adversely affect the kidneys, liver, nervous system, and other organs. Excessive exposure to lead may cause neurological impairments such as seizures, mental retardation, and behavioral disorders. Even at low doses, lead exposure is associated with damage to the nervous systems of fetuses and young children, resulting in learning deficits, and lowered IQ. Recent studies also show that lead may be a factor in high blood pressure and subsequent heart disease. Lead can also be deposited on the leaves of plants, presenting a hazard to grazing animals and humans through ingestion.

Reactive Organic Gases and Volatile Organic Compounds

Hydrocarbons are organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases, including ROGs and VOCs. ROGs are a set of organic gases based on State rules and regulations. VOCs are similar to ROGs in that they include all organic gases except those exempted by federal law. The list of compounds excluded from the definition of VOC is provided by the SJVAPCD in SJVAPCD Rule 1020, Section 3.53. VOCs are emitted from incomplete combustion of hydrocarbons or other carbon-based fuels. Combustion engine exhaust, oil refineries, and oil-fueled power plants are the primary sources of hydrocarbons. Another source of hydrocarbons is evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

The primary health effects of hydrocarbons result from the formation of ozone and its related health effects (see ozone health effects discussion above). High levels of hydrocarbons in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. There are no separate federal or CAAQS for VOC. Carcinogenic forms of VOC are considered toxic air contaminants (TACs). An example is benzene, which is a carcinogen. The health effects of individual carcinogenic VOCs are described below under the heading "Toxic Air Contaminants."

Sulfates (SO_4^{2-})

Sulfates (SO_4^{2-}) are particulate products of combustion of sulfur-containing fossil fuels. When SO or SO_2 are exposed to oxygen they precipitate out into sulfates (SO_3 or SO_4). Sulfates are the fully oxidized ionic form of sulfur. Sulfates occur in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (that is, gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to SO_2 during the combustion process and is subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place relatively rapidly and completely in urban areas of California due to regional meteorological features.

CARB's sulfates standard is designed to prevent aggravation of respiratory symptoms. Effects of sulfate exposure at levels above the standard include a decrease in ventilatory function, aggravation of asthmatic symptoms, and an increased risk of cardiopulmonary disease. Sulfates are particularly effective in degrading visibility, and, because they are usually acidic, can harm ecosystems and damage materials and property.

Hydrogen Sulfide (H_2S)

Hydrogen sulfide (H_2S) is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation. In Kern County, H_2S is associated with geothermal activity, oil and gas production, refining, sewage treatment plants, and confined animal feeding operations.

Exposure to low concentrations of H_2S may irritate the eyes, nose, and throat. It may also cause difficulty in breathing for some asthmatics. Exposure to higher concentrations (above 100 ppm) of

H_2S can cause olfactory fatigue, respiratory paralysis, and death. Brief exposures to high concentrations of H_2S, greater than 500 ppm, can cause a loss of consciousness. In most cases, the person appears to regain consciousness without any other effects. However, in many individuals, there may be permanent or long-term effects such as headaches, poor attention span, poor memory, and poor motor function. No health effects have been found in humans exposed to typical environmental concentrations of H_2S, 0.00011 to 0.00033 ppm. Deaths due to inhaling large amounts of H_2S have been reported in a variety of different work settings, including sewers, animal processing plants, waste dumps, sludge plants, oil and gas well drilling sites, and tanks and cesspools. Current federal standards for H_2S have no attainment designation and the SJVAPCD is designated as unclassified for State standards.

Visibility Reducing Particulates

Visibility reducing particles are a mixture of suspended PM consisting of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt.

This standard is a measure of visibility. The CARB does not yet have a measurement method that is accurate or precise enough to designate areas in the state as being in attainment or nonattainment. Thus, the entire state is unclassified.

Vinyl Chloride

Vinyl chloride monomer is a sweet smelling, colorless gas at ambient temperature. Landfills, publicly owned treatment works, and polyvinyl chloride (PVC) production are the major identified sources of vinyl chloride emissions in California. PVC can be fabricated into several products, such as pipes, pipefittings, and plastics. In humans, epidemiological studies of occupationally exposed workers have linked vinyl chloride exposure to development of liver angiosarcoma, which is a rare cancer, and have suggested a relationship between exposure and cancers of the lung and brain. There are currently no adopted ambient air standards for vinyl chloride.

Acute exposure of humans to high levels of vinyl chloride via inhalation has resulted in effects on the central nervous system, such as dizziness, drowsiness, headaches, and giddiness.

Vinyl chloride is reported to be slightly irritating to the eyes and respiratory tract in humans. Acute exposure to extremely high levels of vinyl chloride has caused loss of consciousness, irritation to the lungs and kidneys, and inhibition of blood clotting in humans and cardiac arrhythmias in animals.

Tests involving acute exposure of mice to vinyl chloride have shown a high acute toxicity from inhalation exposure to the substance. Long-term exposure to vinyl chloride concentrations has been linked with chronic health effects:

- Liver damage may result in humans from chronic exposure to vinyl chloride, through both inhalation and oral exposure.

- A small percentage of individuals occupationally exposed to high levels of vinyl chloride in air have developed a set of symptoms termed "vinyl chloride disease," which is characterized by Raynaud's phenomenon (fingers blanch and numbness and discomfort are experienced upon exposure to the cold), changes in the bones at the end of the fingers, joint and muscle pain, and scleroderma-like skin changes (thickening of the skin, decreased elasticity, and slight edema).
- Central nervous system effects (including dizziness, drowsiness, fatigue, headache, visual and/or hearing disturbances, memory loss, and sleep disturbances) as well as peripheral nervous system symptoms (peripheral neuropathy, tingling, numbness, weakness, and pain in fingers) have also been reported in workers exposed to vinyl chloride.

Several reproductive/developmental health effects from vinyl chloride exposure have been identified:

- Several case reports suggest that male sexual performance may be affected by vinyl chloride. However, these studies are limited by lack of quantitative exposure information and possible co-occurring exposure to other chemicals.
- Several epidemiological studies have reported an association between vinyl chloride exposure in pregnant women and an increased incidence of birth defects, while other studies have not reported similar findings.
- Epidemiological studies have suggested an association between men occupationally exposed to vinyl chloride and miscarriages in their wives' pregnancies, although other studies have not supported these findings.

Long-term exposure to vinyl chloride has also been identified as a cancer risk:

- Inhaled vinyl chloride has been shown to increase the risk of a rare form of liver cancer (angiosarcoma of the liver) in humans.
- Animal studies have shown that vinyl chloride, via inhalation, increases the incidence of angiosarcoma of the liver and cancer of the liver.

Toxic Air Contaminants (TACs)

Hazardous air pollutants (HAPs) is a term used by the federal Clean Air Act (CAA) that includes a variety of pollutants generated or emitted by industrial production activities. Called TACs under California law (see Health and Safety Code §§ 39650 et seq.), 10 pollutants have been identified through ambient air quality data as posing the most substantial health risk in California. Direct exposure to all of these pollutants has been shown to cause cancer, birth defects, damage to brain and nervous system and respiratory disorders. CARB provides emission inventories for TACs for only the larger air basins in the state.

Emissions from the top 10 TACs in the SJVAB are presented in the following table. Similar to the criteria pollutants, TACs are emitted from stationary sources, area-wide sources, mobile sources, and natural sources.

Table 4.3-4: 2009 TAC Emissions in San Joaquin Valley Air Basin (tons per year)

Toxic Air Contaminant	Fresno	Kern (SJV)	Kings	Madera	Merced	San Joaquin	Stanislaus	Tulare	Total SJVAB
Acetaldehyde	320	360	136	82	143	258	155	148	1,603
Benzene	288	645	71	77	91	227	137	144	1,680
1,3-Butadiene	113	58	36	31	24	52	42	158	515
Carbon Tetrachloride	<0.01	<0.01	0	0	0	0	0	0	0.01
Hexavalent Chromium	0.04	0.03	<0.01	<0.01	<0.01	0.03	<0.01	<0.01	0.12
para-Dichlorobenzene	37	30	6	6	10	28	21	17	156
Formaldehyde	688	1,301	365	196	302	565	334	315	4,065
Methylene Chloride	126	65	14	15	26	74	58	43	423
Perchloroethylene	170	96	22	25	36	117	89	62	617
Diesel particulate matter	1,159	1,640	319	273	658	993	531	500	6,073

Source: CARB 2009

The primary sources of benzene in the state include mobile sources (87%) and stationary sources (12%). Forty-six percent of hexavalent chromium emissions are from stationary sources such as electrical generation, aircraft and parts manufacturing, and fabricated metal produce manufacturing. The majority of 1,3-butadiene emissions are generated from incomplete combustion of gasoline and diesel fuels. Fifty-three percent of 1,3-butadiene emissions are from mobile sources and 21% are from area sources such as agricultural waste burning and open burning. Emissions of carbon tetrachloride are all produced by stationary sources such as chemical and allied produce manufacturers and petroleum refineries. Most of the emissions of para-dichlorobenzene are from consumer products such as non-aerosol insect repellents and solid/gel air fresheners. Eighty-two percent of formaldehyde emissions in California are from mobile sources, while 48% of methylene chloride emissions are from paint removers/strippers, automotive brake cleaners, and other consumer products. Perchloroethylene is produced primarily from stationary sources such as dry cleaning plants and manufacture of aircraft parts and fabricated metal parts. Emissions of DPM are from mobile sources (98%) and stationary sources (1%). Para-dichlorobenzene and perchloroethylene are not relevant to oil and gas operations or energy generation in Kern County, since- as described above- both substances are commonly used in other industries; therefore, they are not discussed further in this section.

TACs do not have ambient air quality standards. Since no safe levels of TACs can be determined, there are no air quality standards for TACs. Instead, TAC impacts are evaluated by calculating the health risks associated with a given exposure. The requirements of the Air Toxic "Hot Spots" Information and Assessment Act apply to facilities that use, produce, or emit toxic chemicals. Facilities that are subject to the toxic emission inventory requirements of the Act must prepare and submit toxic emission inventory plans and reports, and periodically update those reports. Of the Kern County portion of the SJVAB, no facility in SJVAPCD has reported cancer risk exceeding 10 in 1 million or a hazard index over 1.0, and, therefore, are not considered significant by the standards of the Hot Spots program in the SJVAPCD.

Health Effects and Risks of Toxic Air Contaminants

Acetaldehyde

Acetaldehyde is classified as a federal hazardous air pollutant and as a California TAC. Acetaldehyde is both directly emitted into the atmosphere and formed in the atmosphere from photochemical oxidation. Sources include combustion processes such as exhaust from mobile sources and fuel combustion from stationary internal combustion engines, boilers, and process heaters. In California, photochemical oxidation is the largest source of acetaldehyde concentrations in the ambient air. According to CARB 2009, approximately 85% of the emissions of acetaldehyde in the SJVAB are from mobile sources — primarily diesel-fueled. Area-wide sources, such as residential wood combustion, account for approximately 10%. However in general, acetaldehyde concentrations are higher indoors than outdoors, due in part to the abundance of combustion sources, such as cigarettes, fireplaces, and woodstoves.

The primary acute effect of inhalation exposure to acetaldehyde is irritation of the eyes, skin, and respiratory tract in humans. At higher exposure levels, erythema, coughing, pulmonary edema, and necrosis may also occur. Acute inhalation of acetaldehyde resulted in a depressed respiratory rate and elevated blood pressure in experimental animals. Tests involving acute exposure of rats, rabbits, and hamsters have demonstrated acetaldehyde to have low acute toxicity from inhalation and moderate acute toxicity from oral or dermal exposure.

Benzene

Benzene is highly carcinogenic and occurs throughout California. Benzene also has non-cancer–related health effects. The primary sources of benzene emissions in the SJVAB are mobile sources (approximately 67%) and stationary sources (approximately 32%). The mobile source emissions are primarily gasoline-fueled.

Brief inhalation exposure to high concentrations can cause central nervous system depression. Acute effects include central nervous system symptoms of nausea, tremors, drowsiness, dizziness, headache, intoxication, and unconsciousness. Neurological symptoms of inhalation exposure to benzene include drowsiness, dizziness, headaches, and unconsciousness in humans. Ingestion of large amounts of benzene may result in vomiting, dizziness, and convulsions in humans. Exposure to

benzene in liquid and vapor form may irritate the skin, eyes, and upper respiratory tract in humans. Redness and blisters may result from dermal exposure to benzene.

Chronic inhalation of certain levels of benzene causes blood disorders in humans; specifically, benzene affects bone marrow (the tissues that produce blood cells). Aplastic anemia, excessive bleeding, and damage to the immune system (by changes in blood levels of antibodies and loss of white blood cells) may develop. Increased incidence of leukemia (cancer of the tissues that form white blood cells) has been observed in humans who have been occupationally exposed to benzene.

1,3-Butadiene (vinyl ethylene)

1,3-butadiene has been identified as a carcinogen in California. The majority of 1,3-butadiene emissions come from incomplete combustion of petroleum-based fuels. Mobile sources account for 48% of total SJVAB emissions. Area sources, such as agricultural waste burning, open burning associated with forest management, and woodstoves and fireplaces, contribute to approximately 27%. Since the majority of 1,3-butadiene emissions are from incomplete combustion of gasoline and diesel fuels, CARB's 1990 adopted low emission vehicle/Clean Fuels regulations and the 1996 Phase II reformulated gasoline regulations are expected to continue to reduce 1,3-butadiene emissions from cars and light-duty trucks as the fleet turns over and new low-emission vehicles are introduced into the fleet.

At very high levels, butadiene vapors cause neurological effects, such as blurred vision, fatigue, headache, and vertigo. Dermal exposure of humans to 1,3-butadiene causes a sensation of cold, followed by a burning sensation, which may lead to frostbite.

One epidemiological study reported that chronic (long-term) exposure to 1,3-butadiene by inhalation resulted in an increase in cardiovascular diseases, such as rheumatic and arteriosclerotic heart diseases, while other human studies have reported effects on the blood. A large epidemiological study of synthetic rubber industry workers demonstrated a consistent association between 1,3-butadiene exposure and occurrence of leukemia. Several epidemiological studies of workers in styrene-butadiene rubber factories have shown an increased incidence of respiratory, bladder, stomach, and lymphato-hematopoietic cancers. However, these studies are not sufficient to determine a causal association between 1,3-butadiene exposure and cancer, due to possible exposure to other chemicals and other confounding factors.

Carbon Tetrachloride (tetrachloromethane)

Carbon tetrachloride is a central nervous system depressant, which the EPA has classified as a Group B2, a probable human carcinogen. The primary sources of carbon tetrachloride in California include chemical and allied product manufacturers and petroleum refineries. Unlike many of the other TACs, carbon tetrachloride is emitted primarily by sources other than motor vehicles, and there are virtually no emissions within the SJVAB or California.

Acute inhalation and oral exposures to high levels of carbon tetrachloride have been observed primarily to damage the liver (swollen, tender liver, changes in enzyme levels, and jaundice) and

kidneys (nephritis, nephrosis, proteinurea) of humans. Depression of the central nervous system has also been reported. Symptoms of acute exposure in humans include headache, weakness, lethargy, nausea, and vomiting. Delayed pulmonary edema (fluid in lungs) has been observed in humans who have been exposed to high levels of carbon tetrachloride by inhalation and ingestion, but this is believed to be due to injury to the kidney rather than direct action of carbon tetrachloride on the lung. Chronic inhalation or oral exposure to carbon tetrachloride produces liver and kidney damage in humans and animals.

Chromium, Hexavalent

Hexavalent chromium emissions come mainly from electric generation, aircraft and parts manufacturing, and fabricated metal produce manufacturing. In California, hexavalent chromium has been identified as a carcinogen. Epidemiological evidence suggests that exposure to inhaled hexavalent chromium may result in lung cancer.

The respiratory tract is the major target organ for chromium (VI) following inhalation exposure in humans. Other effects noted from acute inhalation exposure to very high concentrations of chromium (VI) include gastrointestinal and neurological effects, while dermal exposure causes skin burns in humans. Chronic inhalation exposure to chromium (VI) in humans results in effects on the respiratory tract, with perforations and ulcerations of the septum, bronchitis, decreased pulmonary function, pneumonia, asthma, and nasal itching and soreness reported. Chronic human exposure to high levels of chromium (VI) by inhalation or oral exposure may produce effects on the liver, kidney, gastrointestinal and immune systems, and possibly the blood.

para-Dichlorobenzene

In California, para-dichlorobenzene has been identified as a carcinogen. In addition to the carcinogenic impact, long-term inhalation exposure may affect the liver, skin, and central nervous system in humans. Para-dichlorobenzene is a chlorinated aromatic hydrocarbon (NPIC 2010). It was first registered for use in the United States in 1942, and it is sometimes called 1,4-dichlorobenzene. It is a fumigant insecticide and repellent. Para-dichlorobenzene turns directly from a solid into a gas, a process called sublimation.

The primary sources of para-dichlorobenzene include consumer products such as non-aerosol insect repellents and solid/gel air fresheners. These sources contribute to 97% of SJVAB para-dichlorobenzene emissions.

People who have been exposed to para-dichlorobenzene have experienced nausea, vomiting, dizziness, fatigue, and headaches. Para-dichlorobenzene vapor can also irritate the eyes and nasal passages. It may also cause kidney and liver damage in pets.

Formaldehyde

Formaldehyde is both directly emitted into the atmosphere and formed in the atmosphere as a result of photochemical oxidation. Photochemical oxidation is the largest source of formaldehyde

concentrations in California ambient air. Directly emitted formaldehyde is a product of incomplete combustion. One of the primary sources of formaldehyde is vehicular exhaust. In fact approximately 76% of the formaldehyde emissions in the SJVAB are from mobile sources, of which the source is predominantly diesel-fueled. Formaldehyde is also used in resins, fumigants, and soil disinfectants, and it can be found in many consumer products as an antimicrobial agent.

The major toxic effects caused by acute formaldehyde exposure via inhalation are eye, nose, and throat irritation and effects on the nasal cavity. Other effects seen from exposure to high levels of formaldehyde in humans are coughing, wheezing, chest pains, and bronchitis. Chronic exposure to formaldehyde by inhalation in humans has been associated with respiratory symptoms and irritation of the eye, nose, and throat. Animal studies have reported effects on the nasal respiratory epithelium and lesions in the respiratory system from chronic inhalation exposure to formaldehyde.

Occupational studies have noted statistically significant associations between exposure to formaldehyde and increased incidence of lung and nasopharyngeal cancer. This evidence is considered to be "limited," rather than "sufficient," due to possible exposure to other agents that may have contributed to the excess cancers. EPA considers formaldehyde to be a probable human carcinogen and has ranked it in the EPA's Group B1. In California, formaldehyde has been identified as a carcinogen.

Methylene Chloride (Dichloromethane)

In California, methylene chloride has been identified as a carcinogen. In addition, chronic exposure can lead to bone marrow, hepatic, and renal toxicity. Methylene chloride is used as a solvent, a blowing and cleaning agent in the manufacture of polyurethane foam and plastic fabrication, and as a solvent in paint stripping operations. Approximately 80% of the SJVAB emissions of methylene chloride are from paint removers/strippers, automotive brake cleaners, and other consumer products. The statewide trend for methylene chloride shows that by comparing the statewide average methylene chloride concentration for 1990-1992 to that for 2005-2007 the result is a 77% decrease in both concentration and health risk.

Case studies of methylene chloride poisoning during paint stripping operations have demonstrated that inhalation exposure to extremely high levels of methylene chloride can be fatal to humans. Acute inhalation exposure to high levels of methylene chloride in humans has affected the central nervous system including decreased visual, auditory, and psychomotor functions, but these effects are reversible once exposure ceases. Methylene chloride also irritates the nose and throat at high concentrations. The major effects from chronic inhalation exposure to methylene chloride in humans are effects on the central nervous system, such as headaches, dizziness, nausea, and memory loss. In addition, chronic exposure can lead to bone marrow, hepatic, and renal toxicity. EPA considers methylene chloride to be a probable human carcinogen and has ranked it in EPA's Group B2. The State of California considers methylene chloride to be a carcinogen.

Perchloroethylene (tetrachloroethylene)

In California, perchloroethylene (PERC) has been identified as a carcinogen. PERC vapors are irritating to the eyes and respiratory tract. Following chronic exposure, workers have shown signs of liver toxicity as well as kidney dysfunction and neurological disorders.

PERC is used as a solvent, primarily in dry cleaning operations. PERC is also used in degreasing operations, paints and coatings, adhesives, aerosols, specialty chemical production, printing inks, silicones, rug shampoos, and laboratory solvents. In the SJVAB, approximately 65% of the emissions of perchloroethylene are from such stationary sources as dry cleaning plants and manufacturers of aircraft parts and fabricated metal parts. Areawide sources contribute approximately 35%. In comparing the statewide perchloroethylene concentration for 1990-1992 to that for 2005-2007 the result is an 84% decrease in both concentration and health risk.

Breathing PERC for short periods of time can adversely affect the human nervous system. Effects range from dizziness, fatigue, headaches, and sweating to incoordination and unconsciousness. Contact with PERC liquid or vapor irritates the skin, eyes, nose, and throat. These effects are not likely to occur at levels of PERC that are normally found in the environment (EPA 1994).

Breathing PERC over longer periods of time can cause liver and kidney damage in humans. Workers exposed repeatedly to large amounts of PERC in air can also experience memory loss and confusion. Laboratory studies show that PERC causes kidney and liver damage and cancer in animals exposed repeatedly by inhalation and by mouth. Repeat exposure to large amounts of PERC in air may likewise cause cancer in humans.

Diesel Particulate Matter

Diesel exhaust and many individual substances contained in it (including arsenic, benzene, formaldehyde, and nickel) have the potential to contribute to mutations in cells that can lead to cancer. More than 40 diesel exhaust components are listed by the State and federal government as TACs or hazardous air pollutants, respectively. In California, particulate emissions from diesel-fueled engines has been identified as a carcinogen (17 California Code of Regulations (CCR) § 93000). Most researchers believe that diesel exhaust particles contribute the majority of the risk because the particles in the exhaust carry many harmful organics and metals.

Diesel particulate matter (DPM) is emitted from both mobile and stationary sources. In the SJVAB, on-road diesel-fueled vehicles contribute approximately 61% of the total, with an additional 38% attributed to other diesel-fueled mobile sources such as construction and agricultural equipment.

Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by the California Office of Environmental Health Hazard Assessment (OEHHA). CARB estimates that about 70% of the cancer risk that the average Californian faces from breathing TACs stems from diesel exhaust particles.

In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely than workers who were not exposed to diesel emissions to develop lung cancer. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Using information from OEHHA's assessment, CARB estimates that diesel-particle levels measured in California's air in 2000 could cause 540 "excess" cancers (beyond what would occur if there were no diesel particles in the air) in a population of 1 million people over a 70-year lifetime (OEHHA 2002).

Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health, have calculated similar cancer risks from diesel exhaust as those calculated by OEHHA and CARB.

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Diesel engines are a major source of fine-particle pollution. The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution.

Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among people suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can reduce lung function in children. In California, diesel exhaust particles have been identified as carcinogens.

Polycyclic Aromatic Hydrocarbons (PAHs)

The term polycyclic aromatic hydrocarbons (PAHs) refers to a group of several hundred chemically related, environmentally persistent organic compounds of various structures and varied toxicity. Most of them are formed by a process of thermal decomposition (pyrolysis) and subsequent recombination (pyrosynthesis) of organic molecules. PAHs enter the environment through various routes and are usually found as a mixture containing two or more of these compounds, e.g., soot. They have been shown to cause carcinogenic and mutagenic effects and are potent immunosuppressants. Effects have been documented on immune system development. They are by-products of natural gas combustion.

Valley Fever

Valley Fever or coccidioidomycosis is one of the most studied and oldest known fungal infections. Coccidioidomycosis was first discovered in the early 1890s in Domingo Ezcurra, an Argentinean

soldier, and in 1900 was established as a fungal disease. After an outbreak in the 1930s in the San Joaquin Valley of California, this disease was given its nickname "San Joaquin Valley Fever," often shortened further to "Valley Fever" (Los Angeles County Department of Health Services, Public Health 2004).

Valley Fever is primarily a disease of the lungs caused by inhalation of spores of the *Coccidioides immitis* fungus. The *Coccidioides* fungus resides in the soil in southwestern United States, northern Mexico, and parts of Central and South America. When weather and moisture conditions are favorable, the fungus "blooms" and forms many tiny spores that lie dormant in the soil. The spores are found in the top few inches of soil, become airborne when the soil is disturbed by wind, vehicles, excavation, or other ground-moving activities, and are subsequently inhaled into the lungs. After the fungal spores have settled in the lungs, they change into a multicellular structure called a spherule. Fungal growth in the lungs occurs as the spherule grows and bursts, releasing endospores, which then develop into more spherules.

Infection occurs when the spores of the fungus become airborne and are inhaled. The fungal spores become airborne when contaminated soil is disturbed by human activities, such as construction and agricultural activities, and natural phenomenon, such as wind storms, dust storms, and earthquakes.

Valley Fever symptoms generally occur within two to three weeks of exposure. Approximately 60% of Valley Fever cases are mild and display flu-like symptoms or no symptoms at all. The remainder developed flu-like symptoms (fatigue, cough, chest pain, fever, rash, headache, and joint aches) that can last for a month and tiredness that can sometimes last for longer than a few weeks. In some cases, painful red bumps may develop. A small percentage of infected persons (<1%) can develop disseminated disease that spreads outside the lungs to the brain, bone, and skin. Without proper treatment, Valley Fever can lead to severe pneumonia, meningitis, and even death. Symptoms may appear between one to four weeks after exposure.

One important fact to mention is that these symptoms are not unique to Valley Fever and may be caused by other illnesses as well. Identifying and confirming this disease requires specific laboratory tests such as: (1) microscopic identification of the fungal spherules in the infected tissue, sputum, or body fluid sample; (2) growing a culture of *Coccidioides immitis* from a tissue specimen, sputum, or body fluid; (3) detection of antibodies (serological tests specifically for Valley Fever) against the fungus in blood serum or other body fluids; and (4) administering the Valley Fever skin test (called coccidioidin or spherulin), which indicates prior exposure to the fungus

Valley Fever is not contagious and therefore cannot be passed from person to person. Most of those who are infected will recover without treatment within six months and will have a life-long immunity to the fungal spores. In severe cases, such as patients with rapid and extensive primary illness, those who are at risk for dissemination of disease, and those who have disseminated disease, antifungal drug therapy is used. Only 1% to 2% of those exposed who seek medical attention will develop a disease that disseminates (spreads) to other parts of the body other than the lungs. Table 4.3-5 presents the various infection classifications and normal diagnostic spread as noted in recent research.

Table 4.3-5: Range of Valley Fever Cases

Infection Classification	Percent of Total Diagnosed Cases
Asymptomatic infections	60
Infections that resolve spontaneously (with lifelong immunity)	35
Chronic disease or disease disseminated throughout the body	Up to 5
Meningeal infection (affecting brain and/or spinal cord and requiring lifetime treatment)	0.15–0.75

Source: Hector 2005.

Factors that affect the susceptibility to coccidioidal dissemination are race, sex, pregnancy, age, and immunosuppression. According to data gathered by the Kern County Health Department, Hispanic/Latino-Americans are 3.4 times more likely than whites to develop coccidioidal dissemination, African-Americans are 13.7 times more likely, and Filipinos are 175.5 times more likely. Regarding the number of deaths attributed to the disease, compared to whites, the number of Hispanic/Latino is five times greater; African Americans, 23.3 times greater; and Filipinos, 191.4 times greater. In addition, residents new to the San Joaquin Valley are at a higher risk of infection due primarily to low immunity to this particular fungus (see also KCPHS 2014).

Asbestos

Asbestos is the name given to a number of naturally occurring fibrous silicate minerals that have been mined for their useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The three most common types of asbestos are chrysotile, amosite, and crocidolite. Ultramafic, serpentinized rock is closely associated with asbestos and is chemically composed of the following list of minerals:

- Antigorite; $(Mg, Fe)_3Si_2O_5(OH)_4$;
- Clinochrysotile; $Mg_3Si_2O_5(OH)_4$;
- Lizardite; $Mg_3Si_2O_5(OH)_4$;
- Orthrochrysotile; $Mg_3Si_2O_5(OH)_4$; and
- Parachrsotile; $(Mg, Fe)_3Si_2O_5(OH)_4$.

These minerals have essentially the same chemistry but different structures. Chysotile minerals are more likely to form serpentinite asbestos; however, serpentinite is uncommon to sedimentary soil found in the proposed Project Area.

Asbestos can adversely affect humans only in its fibrous form, and these fibers must be broken and dispersed into the air and then inhaled. During geological processes (e.g., fault movement), the asbestos mineral can be crushed, causing it to become airborne. It also enters the air or water from the breakdown of natural deposits. Constant exposure to asbestos at high levels on a regular basis

may cause cancer in humans. The two most common forms of cancer are lung cancer and mesothelioma, a rare cancer of the lining that covers the lungs and stomach.

Chrysotile, also known as white asbestos, is the most common type of asbestos found in buildings. Chrysotile makes up approximately 90% to 95% of all asbestos contained in buildings in the United States. Project construction sometimes requires the demolition of existing buildings where construction occurs. Buildings often include materials containing asbestos. Most demolitions and many renovations are subject to an asbestos inspection prior to start of activity. The demolition, renovation, or removal of asbestos-containing building materials is subject to the limitations of the National Emissions Standards for Hazardous Air Pollutants (NESHAP) regulations as listed in the Code of Federal Regulations requiring notification, inspection, and compliance with local air district regulations. The SJVAPCD requires compliance with NESHAP and has adopted Rule 4002.

In addition, asbestos is also found in a natural state. Exposure and disturbance of rock and soil that naturally contains asbestos can result in the release of fibers to the air and consequent exposure to the public. Asbestos most commonly occurs in ultramafic rock that has undergone partial or complete alteration to serpentine rock (serpentinite) and often contains chrysotile asbestos. In addition, another form of asbestos, tremolite, can be found associated with ultramafic rock, particularly near faults. Sources of asbestos emissions include unpaved roads or driveways surfaced with ultramafic rock, construction activities in ultramafic rock deposits, or rock quarrying activities where ultramafic rock is present.

To address some of the health concerns associated with exposure to asbestos from these activities, CARB has adopted two Airborne Toxic Control Measures (ATCMs). CARB has an ATCM for construction, grading, quarrying, and surface mining operations requiring the implementation of mitigation measures to minimize emissions of asbestos-laden dust. This ATCM applies to road construction and maintenance, construction and grading operations, and quarries and surface mines when the activity occurs in an area where naturally occurring asbestos (NOA) is likely to be found. Areas are subject to the regulation if they are identified on maps published by the California Department of Conservation as ultramafic rock units or if the Air Pollution Control Officer (APCO) or owner/operator has knowledge of the presence of ultramafic rock, serpentine, or NOA on the site. The ATCM also applies if ultramafic rock, serpentine, or asbestos is discovered during any operation or activity.

In addition, CARB has an ATCM for surfacing applications. This ATCM applies to any person who produces, sells, supplies, offers for sale or supply, uses, applies, or transports any: (1) aggregate material extracted from property where any portion of the property is located in a geographic ultramafic rock unit; or (2) aggregate material extracted from property that is not located in a geographic ultramafic rock unit, if:

- The material has been evaluated at the request of the APCO and determined to be ultramafic rock or serpentine.

- Material tested at the request of the APCO is determined to have an asbestos content of 0.25% or greater or is determined by the owner/operator of a facility to be ultramafic rock or serpentine.

- The material has an asbestos content of 0.25% or greater.

The ATCM prohibits a person from using, applying, selling, supplying, or offering for sale or supply any restricted material for surfacing unless it has been tested and determined to have an asbestos content that is less than 0.25%.

Carbon Dioxide

Carbon dioxide, along with several other compounds, is considered a greenhouse gas (GHG) that is contributing to climate change. Discussion of carbon dioxide and other greenhouse gases is included in Section 4.7, Greenhouse Gas Emissions and Global Climate Change.

Sensitive and Worker Receptors

Some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved. Land uses that can be considered sensitive receptors include residential communities, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Sensitive individuals with compromised immune systems, such as children and the elderly, may be exposed to emissions from the construction and operation of the Project. Worker receptors refer to employees and locations where people work. Impacts on sensitive receptors are of particular concern, because they are the people most vulnerable to the effects of air pollution.

Odorous Compounds

Odor refers to the perception or sensation experienced when one or more volatilized chemical compounds come in contact with receptors on the olfactory nerves. Odorant refers to any volatile chemical in the air that is part of the perception of odor by a human. The difference in sensory and physical responses experienced by individuals is responsible for the significant variability in the individual sensitivity to the quality and intensity of an odorant.

Several compounds associated with the oil and gas industry can produce odors that can be determined to be nuisances. Sulfur compounds, found in oil and gas, have very low odor threshold levels. For instance, H_2S can be detected by humans at concentrations from 0.5 parts per billion (ppb) (detected by 2% of the population), to 40 ppb, qualified as annoying by 50% of the population. These levels are significantly lower than concentrations that could affect human health (2 ppm [2,000 ppb] can cause headaches and increased airway resistance in asthmatics; inhalation of more than 600 ppm can be instantly lethal and inhalation of over 100 ppm can be lethal if exposed to for more than 60 minutes [ERPG-3]).

Many volatile compounds found in oil and gas (ethane and longer chain hydrocarbons) typically have petroleum or gasoline odor with various odor thresholds.

Natural gas contains mostly methane (which is odorless), thus it has to be odorized as dictated by law, before being placed into a distribution pipeline. The various odorizing compounds that are used for odorization (e.g. methyl mercaptan or ethyl mercaptan), contain sulfur compounds having a very low odor threshold and can produce odors if released into the atmosphere.

Because of the location of most oil and gas production activities in rural areas, odors may accumulate with agricultural odorous compounds, which are typically produced by insecticides, chemical fertilizers, and compost, particularly manure. A large number of odorous compounds are released from agricultural and dairy activities, including notably ammonia (NH_3) and H_2S.

Baseline Emissions Inventory

Criteria Air Pollutants

Table 4.3-6 summarizes the CARB inventories for criteria air pollutant emissions from anthropogenic (i.e., not natural) sources in California, the San Joaquin Valley and Kern County for 2012, defined by the applicant as baseline year for the Project air quality impact analysis.

Table 4.3-6: Criteria Air Pollutant Emissions Inventory – Year 2012

4.3.3 Regulatory Setting

Air quality in the Project Area is addressed through the efforts of various federal, state, regional, and local government agencies. The agencies primarily responsible for improving the air quality within the County include the EPA, CARB, SJVAPCD, and the Kern Council of Governments (COG). These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies primarily responsible for improving the air quality within Kern County are discussed below, along with their individual responsibilities.

Federal

The principal air quality regulatory mechanism on the federal level is the CAA as amended in 1990 and in particular, the NAAQS established by the EPA pursuant to the CAA. These standards identify levels of air quality for "criteria" pollutants that are considered the maximum levels of ambient (background) air considered safe, with an adequate margin of safety, to protect the public health and welfare. The criteria pollutants include ozone, CO, NO_2, PM_{10}, $PM_{2.5}$, SO_2, which is a form of SO_X, and Pb. The EPA also has regulatory and enforcement jurisdiction over emission sources beyond state waters (outer continental shelf), and those that are under the exclusive authority of the federal government, such as aircraft, locomotives, and interstate trucking. The EPA's primary role at the State level is to oversee the State air quality programs. The EPA sets federal vehicle and stationary source emission standards and oversees approval of all State Implementation Plans (SIP), as well as providing research and guidance in air pollution programs. The SIP is a state-level document that identifies all air pollution control programs within California that are designed to help the State meet the NAAQS.

Attainment defines the status of a given airshed with regard to NAAQS requirements. Airsheds not meeting these standards are classified as "nonattainment."

Title V and Extreme Designation

Title V of the federal CAA, as amended in 1990, creates an operating permits program for facilities classified as major emission sources. Major emission sources are those that emit pollutants above the major source threshold applicable to the location of the emission source. In general, major source thresholds are 100 tons per year for any criteria pollutant. However, this will vary depending upon the attainment status of the source's location. In an ozone extreme nonattainment area, such as the

Project Area, sources that emit more than 10 tons per year of NO_X and ROG are classified as major sources for Title V permitting. This results in more businesses having to comply with Title V permitting requirements under the Extreme nonattainment designation.

Title V does not impose any new air pollution standards, require installation of any new controls on the affected facilities, or require reductions in emissions. Title V enhances public and EPA participation in the permitting process and requires additional record keeping and reporting by businesses, which results in significant administrative requirements.

EPA Emission Standards

The EPA establishes and maintains emission standards of performance of new stationary sources under CAA Section 111(b), as the New Source Performance Standards (NSPS; 40 CFR 60). Categories of existing stationary sources can also be retroactively controlled under CAA Section 111(d).

Categories of sources that cause HAP emissions are controlled through separate standards under CAA Section 112: National Emission Standards for Hazardous Air Pollutants (NESHAP). These standards are specifically designed to reduce the potency, persistence, or potential bioaccumulation of toxic air pollutants. The emission standards for HAPs under CAA Section 112 prevent adverse health risks and carcinogenic effects from targeted types of facilities.

New Source Performance Standards (NSPS) for the Oil and Gas Sector

The following Subparts of NSPS (40 CFR 60) are applicable to the Project:

- **NSPS Subpart OOOO:** Crude Oil and Natural Gas Production, Transmission, and Distribution, including the Oil and Natural Gas Sector for Fractured Wells (drilled after August 23, 2011). This Rule requires control of VOC and SO_2 from each natural gas well completion to implement measures such as reduced emission completions (RECs), or the use of completion combustion devices to control flowback emissions (Section 60.5375). Companies must provide notifications of natural gas well completions. Because NSPS Subpart OOOO addressed natural gas well completions, EPA is also researching techniques available to reduce emissions from oil well completions.
- **NSPS Subpart KKK:** Equipment Leaks of VOC from Onshore Natural Gas Processing Plants.
- **NSPS Subpart LLL:** SO_2 Emissions from Onshore Natural Gas Processing.
- **NSPS Subpart III:** Stationary Compression Ignition.
- **NSPS Subpart JJJ:** Spark Ignition Internal Combustion Engines.
- **NSPS Subpart KKKK:** Stationary Combustion Turbines.

National Emission Standards for Hazardous Air Pollutants (NESHAPs)

The following Subparts of NESHAP (40 CFR 61 and 63) are applicable to the Project:

- **NESHAP Subpart V (40 CFR 61):** Equipment Leaks and Fugitive Emissions.
- **NESHAP Subpart H (40 CFR 63):** Hazardous Organic Pollutant Equipment Leaks.
- **NESHAP Subpart HH (40 CFR 63):** Oil and Gas Natural Production.
- **NESHAP Subpart HHH (40 CFR 63):** Natural Gas Transmission and Storage.
- **NESHAP Subpart YYYY (40 CFR 63):** Stationary Combustion Turbines.
- **NESHAP Subpart ZZZZ (40 CFR 63):** Reciprocating Internal Combustion Engines.

EPA Natural Gas STAR Program

This voluntary program encourages oil and natural gas companies to adopt cost-effective technologies and practices to improve operational efficiency and prevent emissions from methane. The Natural Gas STAR program defines protocols for methane control at natural gas production facilities, resulting in concomitant reductions of other organic compounds (EPA 2015a).

As of January 14, 2015, EPA announced an additional strategy for a series of steps it plans to take to address methane and smog-forming VOC emissions from the oil and gas industry (EPA 2015b). The steps include building on commonsense standards for VOC emissions to help avoid anticipated increase in methane emissions from new sources; reducing additional pollution in areas with ozone problems by issuing Control Techniques Guidelines that provide an analysis of the available, cost-effective technologies for controlling VOC emissions from covered oil and gas sources; and providing additional support for industry actions to reduce methane emissions including several voluntary efforts to address these sources that already are underway, including EPA's plans to expand the successful Natural Gas STAR Program by launching a new partnership in collaboration with key stakeholders later in 2015.

State

California Air Resources Board

The CARB, a department of the California Environmental Protection Agency, oversees air quality planning and control throughout California by administering the SIP. Its primary responsibility lies in ensuring implementation of the 1989 California Clean Air Act (CCAA), responding to the federal CAA requirements and regulating emissions from motor vehicles sold in California. It also sets fuel specifications to further reduce vehicular emissions.

The CCAA establishes a legal mandate to achieve many of the CAAQS by the earliest practical date. These standards apply to the same criteria pollutants as the federal CAA, and also include sulfate, visibility reducing particulates, H2S and vinyl chloride. They are also more stringent than the federal standards.

The CARB is also responsible for regulations pertaining to TACs. The "Tanner Act," enacted in 1983, directed CARB to identify toxic air contaminants and to adopt ATCMs to "reduce, avoid, or eliminate the emissions of a toxic air contaminant." To date, CARB has formally identified 21 TACs and has adopted 26 ATCMs (see CARB 2015). The Air Toxics "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588; Health & Safety Code §§ 44300 et seq.) was enacted in 1987 as a means to establish a formal air toxics emission inventory risk quantification program. AB 2588, as amended, establishes a process that requires stationary sources to report the type and quantities of certain substances their facilities routinely release into their air basin. Each air pollution control district ranks the data into high, intermediate, and low priority categories. When considering the ranking, the potency, toxicity, quantity, volume and proximity of the facility to receptors are given consideration by an air district. AB 2588 was amended in 1992 by Senate Bill (SB) 1731, and further modified by AB 564 in 1996. The goal of the Air Toxics "Hot Spots" Act, as amended, is to collect emission data indicative of routine predictable releases of toxic substances to the air, to identify facilities having localized impacts, to evaluate health risks from exposure to the emissions, to notify nearby residents of significant risks, and, reduce risk below the determined level of significance (CARB 2014a).

The CARB also has on-road and off-road engine emission reduction programs that indirectly affect the Project's emissions through the phasing in of cleaner on-road and off-road equipment engines. Additionally, the CARB has a Portable Equipment Registration Program (PERP) that allows owners or operators of portable engines and associated equipment to register their units under a statewide portable program to operate their equipment, which must meet specified program emission requirements, throughout California without having to obtain individual permits from local air districts.

The State has also enacted an ATCM for the reduction of DPM and criteria pollutant emissions from in-use off-road diesel-fueled vehicles (CCR Title 13, Article 4.8, Chapter 9, Section 2449). This regulation provides target emission rates for PM and NOx emissions from owners of fleets of diesel-fueled off-road vehicles and applies to equipment fleets of three specific sizes and the target emission rates are reduced over time (CARB 2007).

Regulation of Air Pollution Transport between Air Basins

The CCAA directs CARB to assess the contribution of ozone and ozone precursors in upwind basins or regions to ozone concentrations that violate the state ozone standard in downwind basins or regions. The movement of ozone and ozone precursors between basins or regions is referred to as "transport." In addition, the CCAA directs CARB to establish mitigation requirements for upwind districts commensurate with their contributions to the air quality problems in downwind basins or regions.

Over the last decade, CARB has published several transport reports that include technical assessments of transport relationships between air basins and regions in California. Along with these technical assessments, the reports have included mitigation requirements to ensure that upwind areas do their part to limit the effects of transport on their downwind neighbors. CARB originally

established mitigation requirements in 1990, which are contained in Title 17, CCR, Sections 70600 and 70601. These regulations were amended in 1993 and more recently in 2003. The most recent amendments added two new requirements for upwind districts. These amendments require upwind districts to: (1) consult with their downwind neighbors and adopt "all feasible measures" for ozone precursors; and (2) amend their "no net increase" thresholds for permitting so that they are equivalent to those of their downwind neighbors. The amendments clarify that upwind districts are required to comply with the mitigation requirements, even if they attain the state ozone standard in their own district, unless the mitigation measures are not needed in the downwind district.

According to SVVAPCD, air pollution transported from the San Francisco Bay and Sacramento areas account for approximately 27% of the total emissions in the northern portion of the SJVAPCD (San Joaquin, Stanislaus, and Merced counties). In the Central region (Fresno, Madera and Kings counties), the percentage drops to 11%, and in the south valley (the Valley portion of Kern and Tulare counties), transported air pollution accounts for only 7% of the total problem.

The Mojave Desert Air Basin (MDAB) includes the desert portions of Los Angeles, Kern, San Bernardino, and Riverside counties. Most of this area is commonly referred to as the "high desert," because elevations range from approximately 2,000 to 5,000 feet above sea level. The MDAB is characterized by extreme temperature fluctuations, strong seasonal winds, and clear skies. While the Project limits do not extend into the Kern County portion of the MDAB, studies in the Southern San Joaquin Valley, South Coast Air Basin, and other airsheds have included intensive ozone and meteorological measurements, tracer studies, and development of transport models (CARB 2009a). The issue of ozone transport in the Kern County area has been studied for over 30 years (WZI 1994). A recent study recognized the significant ozone transport from the San Joaquin Valley into the Mojave Desert area through the Tehachapi Pass (Sonoma Technology 2006).

The topography and climate of southern California combine to make the South Coast Air Basin an area with a high potential for air pollution, which constrains efforts to achieve clean air. During the summer months, a warm air mass frequently descends over the cool, moist marine layer produced by the interaction between the ocean's surface and the lowest layer of the atmosphere. The warm upper layer forms a cap over the cool marine layer and inhibits the pollutants in the marine layer from dispersing upward. In addition, light winds during the summer further limit ventilation. Furthermore, sunlight triggers the photochemical reactions which produce ozone, and this region experiences more days of sunlight than many other major urban areas in the nation (South Coast Air Quality Management District 2006). Transboundary ozone transport form Asia and its impact on air quality in the SJVAB is being further studied and increases in ozone levels due to transport have been confirmed (SJVAPCD 2013c).

Local

San Joaquin Valley Air Pollution Control District

State law assigns much of the authority to regulate stationary, indirect, and area sources to local air pollution control and air quality management districts. The SJVAPCD has primary responsibility for

regulating stationary sources of air pollution situated within its jurisdictional boundaries. To this end, the SJVAPCD implements air quality programs required by State and federal mandates, enforces rules and regulations based on air pollution laws, and educates businesses and residents about their role in protecting air quality. The SJVAPCD is responsible for regulating stationary, indirect, and area sources of air pollution in the SJVAB. The eight counties that comprise the SJVAPCD are divided into three regions: the Northern Region (Merced, San Joaquin, and Stanislaus counties), the Central Region (Madera, Fresno, and Kings counties), and the Southern Region (Tulare County and San Joaquin Valley portion of Kern County).

The San Joaquin Valley (or portions thereof) is designated as nonattainment with respect to federal air quality standards for ozone and $PM_{2.5}$. It also has a maintenance plan for PM_{10} in the Valley and for CO for the urbanized/metropolitan areas of Kern, Fresno, Stanislaus, and San Joaquin counties.

The SJVAPCD is responsible for managing and permitting existing, new, and modified sources of air emissions within its boundaries and also established the following rules and regulations to ensure compliance with local, State, and federal air quality regulations:

Rules and Regulations

The following SJVAPCD Rules and Regulations apply to the oil and gas production industry and its ancillary facilities.

Regulation I (General Provisions)

Regulation I (General Provisions) is a series of rules that establish the basic framework for interacting with the SJVAPCD including enforcement procedures, inspections, and source sampling requirements, and regulatory accountability.

Regulation II (Permits)

Rule 2010 (Permits Required) requires any person constructing, altering, replacing, or operating any source operation which emits, may emit, or may reduce emissions to obtain an Authority to Construct or a Permit to Operate.

Rule 2092 (Standards for Permits to Operate) defines the conditions which must be met in order for an APCO to issue a Permit to Operate.

Rule 2201 (New and Modified Stationary Source Review Rule) provides for the review of new and modified Stationary Sources of air pollution and to provide mechanisms including emission offsets by which Authorities to Construct such sources may be granted, without interfering with the attainment or maintenance of Ambient Air Quality Standards; and ensure that no net increase in emissions above specified thresholds from new and modified Stationary Sources of all nonattainment pollutants and their precursors occur.

Rule 2250 (Permit-Exempt Equipment Registration) is essentially an SJVAPCD rule designed to provide the SJVAPCD with oversight of equipment that would otherwise not require an air permit.

According to the SJVAPCD's Permit-Exempt Equipment Registration – Frequently Asked Questions document, "PEER is necessary to enforce the requirements of certain District prohibitory rules in which the emissions equipment is exempt from permitting requirements" (SJVAPCD 2008). Section 4.5 of Rule 2250 states that the District shall issue the Permit-Exempt Equipment Registration (PEER) within 90 days of receipt of a completed application. Section 4.7 - 4.8 specify that a PEER unit is neither transferable between locations or owners without an application for transfer. See Rule 3155 for information on fees relating to PEER units. Additionally, Rules 4702, 4307, and 4622 define different types of PEER units.

Rule 2280 (Portable Equipment Registration) provides the administrative requirements for permitting portable emissions units for operation in participating districts throughout the state of California, starting in Section 4.0 - 4.13. To register portable equipment, an application must be submitted to the district in which operation will first occur. The Applicant shall provide the administering district with all necessary emissions and engineering data in order to demonstrate compliance with Section 5 of this rule. Section 4.4 states that prior to issuing a permit for portable registration, the SJVAPCD will conduct an onsite inspection of the unit. There are several notification and reporting rules associated with portable equipment. Namely, Section 6.1 states that if a portable emissions unit remains at a location for more than 24 hours, the SJVAPCD must be notified within two calendar days, and Section 6.2 states that within 30 days after the end of every calendar quarter, the SJVAPCD must be provided with the level of activity (hours of operation) for the previous quarter, unless the equipment is a rental. Finally, Section 8.0 provides emissions limitation and minimum distance requirements of 1,000 feet from kindergarden-12th grade schools.

Rule 2410 (Prevention of Signification Deterioration) - Rule 2410 is triggered when obtaining construction permits for a new major stationary source and/or major modification to existing major stationary sources located in areas classified as "in attainment" or in areas that are unclassifiable for any criteria pollutant. The most important of the "Requirements" in Section 4.0 is that of 4.1 requiring that a PSD permit be obtained prior to beginning any construction of a new major stationary source or a major modification to an existing major stationary source. Lastly, the SJVAPCD must follow the public notice requirements of Rule 2201 prior to issuing a federal PSD permit.

Rule 2520 (Federally Mandated Operating Permits) applies to major sources of criteria pollutants and/or toxics, stationary sources with the potential to emit 100 tons per year or more of any air contaminant, sources required by Title V to obtain acid rain permits, sources required by the PSD program to have a preconstruction review, solid waste incinerators subject to Sections 111 or 129 of the CAA and any source in a source category designated by the EPA.

Rule 2540 (Acid Rain Program) incorporates the Acid Rain Standards from Part 72, Title 40 CFR and is applicable to all stationary sources subject to Part 72, Title 40, CFR.

Rule 2550 (Federally Mandated Preconstruction Review for Major Sources of Air Toxics) applies to applications to construct or reconstruct a major air toxics source with Authority to Construct issued on or after June 28, 1998. Section 5.0 requires the application of toxic best

available control technology (TBACT) to new major air toxic sources and sources with the potential to emit in excess of a major air toxic source threshold. Section 6.1 requires an application for authority to construct for major air toxic sources subject to the requirements of SJVAPCD Rule 2201.

Regulation III (Fees)

Regulation III sets the fees associated with owning and operating facilities, activities, and equipment that have the potential to emit air pollutants in the San Joaquin Valley.

Regulation IV (Prohibitions)

Rule 4001 (New Source Performance Standards) applies to all new sources of air pollution and modifications of existing sources of air pollution within the source categories for which EPA has adopted standards. Section 4.0, Requirements, lists all of the provisions of 40 CFR Part 60 that are incorporated into the New Source Performance Standard.

Rule 4002 (National Emission Standards for Hazardous Air Pollutants). In the event that any portion of an existing building will be renovated, partially demolished or removed, the Project will be subject to SJVAPCD Rule 4002. Prior to any demolition activity, an asbestos survey of existing structures on the Project site may be required to identify the presence of any asbestos-containing building material (ACBM). Any identified ACBM having the potential for disturbance must be removed by a certified asbestos contractor in accordance with California Occupational Safety and Health Administration (Cal/OSHA) requirements.

Rule 4101 (Visible Emissions) prohibits the emission of visible air contaminants into the atmosphere and applies to any source operation with the potential to emit air contaminants. Section 4.0 - 4.12 list the following exemptions: fires set by a permitted public officer (such as those for the instruction of fighting fire), orchard or citrus grove heater which produces less than one gram per minute unconsumed solid carbonaceous matter, hazard reduction burning, aircraft distribution of agricultural aids over lands devoted to agriculture, open outdoor fires used for cooking and/or recreation, emissions from equipment used for the instruction/certification of individuals in visible emissions, wet plumes where the presence of uncombined water is the only reason for the failure of an emission to meet rule limitations, emissions from maritime vessels using steam boilers during emergency boiler shutdowns for safety reasons, the use of an obscurant for the purpose of training military personnel and the testing of military equipment by the U.S. Department of Defense, and emissions specifically exempt from Regulation VIII. Section 5.0 - 5.2 requires that there be no discharge from a single source of emission for a period or periods aggregating more than 3 minutes in any one hour which is as dark or darker than a designated Ringelmann No. 1 rating by the U.S. Bureau of Mines, or of opacity that can obscure an observers view equal to or greater than the Ringelmann No. 1 rating.

Rule 4102 (Nuisance) applies to any source operation that emits or may emit air contaminants or other materials. In the event that the Project or construction of the Project creates a public nuisance, it could be in violation and be subject to SJVAPCD enforcement action.

Rule 4201 (Particulate Matter Concentration) sets a standard maximum of 0.1 grain per cubic foot of gas at dry standard conditions for PM emissions. This rule applies to any source operation that emits dust, fumes, or total suspended PM.

Rule 4202 (Particulate Matter – Emission Rate) establishes allowable emissions rates for PM. This rule requires any source operation that may emit particulate matter emissions to meet the standards set forth in the table "Allowable Emission Rate Base on Process Weight Rate."

Rule 4301 (Fuel Burning Equipment) was created to limit the emission of air contaminants from fuel burning equipment. This rule applies to any fuel burning equipment except air pollution control equipment which is exempted in Section 4.0 of this rule. This rule requires in Section 5.0 that combustion contaminants discharged into the atmosphere do not exceed 0.1 grain per cubic foot of gas calculated to 12% CO_2 at dry standard conditions. The rule also requires the building, installation and expansion of non-mobile fuel burning equipment not to exceed 200 pounds/hour of sulfur compounds, 140 pounds/hour of N_2O, or 10 pounds/hour of combustion contaminants as defined in rule 1020 (definitions) and derived from the fuel. Finally, Section 6.0 specifies the test methods that can be used to determine compliance.

Rule 4304 (Equipment Tuning Procedures for Boilers, Steam Generators, and Process Heaters) applies to any boiler, steam generator, or process heater that requires tuning pursuant to SJVAPCD regulations or permit conditions. Attachments to this rule detail tuning requirements for different types of boilers, steam generators, and process heaters: Mechanical Draft (4304-A) and Natural and Induced Draft (4304-B).

Rule 4305 (Boilers, Steam Generators, and Process Heaters – Phase 2) limits the emissions of NO_x and CO emissions from boilers, steam generators, and process heaters. This rule applies to any gaseous fuel or liquid fuel fired boiler, steam generator, or process heater with a heat input rating greater than 5 Million Metric British Thermal Units per hour (MMBtu/hr). Exemptions to the rule are solid fuel fired units, dryers, kilns and smelters, unfired or fired waste recovery boilers that are used to recover or augment heat from the exhaust of combustion turbines or internal combustion engines, and exemptions from the requirements when using fuel other than Public Utilities Commission quality natural gas during curtailments and for units that operate exclusively from November to February for less than 500 hours total. Amongst the requirements in Sections 5.0, the most commonly referenced is the NO_x emission limits table in Section 5.1.1, setting the following limitations: For all units, except box or cabin type units and vertical cylindrical process heaters operated on gaseous fuel 30 ppmv or 0.036 lb/MMBtu or operated on liquid fuel 40 parts per million volume (ppmv) or 0.052 lb/MMBtu. For box or cabin type units, and vertical cylindrical process heaters operated on gaseous fuel, 147 ppmv or 0.18 lb/MMBtu or operated on liquid fuel, 155 ppmv or 0.2 lb/MMBtu. Units operated on a combination of gaseous and liquid fuel shall use a heat input weighted average of the previous limits. Additionally, all units subject to this rule shall not exceed 400 ppmv of CO emissions.

Rule 4306 (Boilers, Steam Generators, and Process Heaters – Phase 3) limits emissions of NO_X and CO from boilers, steam generators, and process heaters and "build on" the rules set forth in Rule

4305. As with Rule 4305, this rule applies to any gaseous fuel or liquid fired boiler, steam generator, or process heater with a total rated heat input greater than 5 MMBtu. Section 5.0 sets forth extensive NO_X and CO limits, in addition to monitoring provisions in Section 5.4 – 5.4.5. Additionally, there are compliance testing guidelines in Section 6, most often requiring a source test to demonstrate compliance annually.

Rule 4307 (Boilers, Steam Generators, and Process Heaters 2.0 MMBtu/hr to 5.0 MMBtu/hr) limits the emissions of NO_X, CO, SO_2, and PM_{10} from gaseous or liquid fuel fired boilers, steam generators or process heaters with a total rated heat input of 2.0 MMBtu /hr up to and including 5.0 MMBtu/hr. NO_X and CO limits are set forth in Section 5.0 - 5.6.5 in which details on PM_{10} control requirements, start up and shut down requirements, monitoring provisions and more are provided.

Rule 4308 (Boilers, Steam Generators, and Process Heaters 0.075 MMBtu/hr to less than 2.0 MMBtu/hr) limits NO_X and CO from boilers, steam generators, process heaters and water heaters with heat inputs greater than or equal to 0.075 MMBtu/hr to less than 2.0 MMBtu/hr. Exemptions from this rule are units installed in manufactured homes, recreational vehicles, and hot water pressure washers. Tables 1 and 2 in Section 5.0 provide emissions limits while administrative requirements, such as source testing and certification for retrofits, are in Section 6.0.

Rule 4311 (Flares) limits VOC, NO_x and SO_x from the operation of flares. Exempted flares are those operated in municipal solid waste landfills subject to the requirements of Rule 4642, flares subject to the requirements of 40 CFR Subpart WWWW or Cc, and stationary sources with the potential to emit less than 10 tons per year of VOC and NO_x (record keeping requirements do apply for stationary sources however). Section 5.0 sets forth requirements such as automatic ignition systems and flow-sensing ignition systems in given circumstances, as well as provides emission standards for VOC and NO_x from ground level enclosed flares. Note that Section 5.9 specifically addresses petroleum refinery SO_2 performance targets requiring the minimization of SO_2 flare emissions to less than 1.50 tons per million barrels of crude processing capacity and on and after January 1, 2017, this limit drops to 0.50 tons per million barrels of crude processing capacity, calculated as an average over one calendar year. Administrative requirements in Section 6.0 primarily require compliance demonstration, flare reporting, annual monitoring, flare minimization plans for petroleum refinery flares with a capacity greater than or equal to 5.0 MMBtu/hr, vent gas composition monitoring, pilot purge gas monitoring, water seal monitoring, video monitoring and general monitoring.

Rule 4320 (Advanced Emission Reduction Options for Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr) limits NO_X, CO, SO_2 and PM_{10} emissions from boilers, steam generators, and process heaters with a total heat input greater than 5 MMBtu/hr. Section 4.0 provides several exemptions like solid fuel fired units, dryers and glass melting furnaces, kilns and smelters where the products of combustion come into direct contact with the material to be heated, and unfired or fired heat recovery boilers that are used to recover or augment heat from the exhaust of combustion turbines or internal combustion engines. The requirements in Section 5.0 detail compliance deadlines, emissions limits, annual fees, particulate matter requirements, startup and

shutdown requirements, monitoring provisions and compliance determination. Under Section 6.0 (Administrative Requirements) are details on compliance testing and emissions control plans (ECP).

Rule 4351 (Boilers, Steam Generators, and Process Heaters – Phase 1) limits NO_X emissions from boilers, steam generators, and process heaters to levels consistent with reasonably available control technology (RACT). This rule applies to a boiler, steam generator, or process heater with a rated heat input greater than 5 MMBtu/hr that is fired with gaseous and/or liquid fuels and is included in a major NO_X source. (Note: this rule does not apply to any unit located west of Interstate Highway 5 located in Fresno, Kern or Kings Counties.) Section 5.1 details NO_X emission limits for any unit with a heat input equal to or greater than 9 billion Btu per year, as well as NO_X compliance alternatives and compliance schedules.

Rule 4352 (Solid Fuel-Fired Boilers, Steam Generators, and Process Heaters) limits the emissions of NO_X and CO from any solid fuel fired boiler, steam generator and/or process heater. Section 4.0, exemptions, states that except for complying with record keeping requirements, this rule does not apply to any stationary source with a potential to emit less than 10 tons per year of NO_X or VOC. Emissions limits are provided in Table 1 of Section 5.0

Rule 4401 (Steam Enhanced Crude Oil Production Wells) limits VOC emissions from steam-enhanced crude oil production wells and applies to any steam-enhanced cruel oil production well and any associated VOC collection and control system. Section 4.0 lists seven exemptions given certain circumstances. Section 5.0, Requirements, lists well venting requirements, determination of compliance with the Leak Standards, operating, inspection and re-inspection and leak repair requirements. Additionally, the Administrative Requirements of Section 6.0 requires that all operators maintain records for five years with further detail on the record required. This section also required annual Compliance Source Testing, test methods, an inspection log, employee training, and operator management plan.

Rule 4402 (Crude Oil Production Sumps) limits VOC emissions from sumps and applies to all first, second, and third stage sumps at facilities producing, gathering, separating, processing, and/or storing crude oil in an oilfield. This rule prohibits first stage sumps as of January 1, 2013, and requires a flexible floating cover or rigid floating cover equipped with closure device between the sump wall and the cover edge for all second and third stage sumps. Section 6.0 also contains administrative requirements.

Rule 4404 (Heavy Oil Test Station – Kern County) limits VOC emissions from the operation of heavy oil test stations by imposing emissions control requirements.

Rule 4405 (Oxides of Nitrogen Emissions from Existing Steam Generators used in Thermally Enhanced Oil Recovery – Central and Western Kern County Fields) limits NO_X emissions from oil field steam generators by setting forth NO_X emissions limits and alternate emission limits in Section 4.0 and 5.0. This rule applies to existing steam generators used in thermally enhanced oil recovery in the Central and Western Kern County Fields.

Rule 4406 (Sulfur Compounds from Oilfield Steam Generators – Kern County) limits the emissions of sulfur from oilfield operations in Kern County but does not apply to cogeneration facilities. After July 1, 1984, emissions are limited to 0.11 pounds of sulfur per MMBtu of heat input. In addition to exempting cogeneration, this rule has a small producer exemption in Section 8.0.

Rule 4407 (In-Situ Combustion Well Vents) implements federally enforceable emission limits for in-situ combustion well vents and applies to crude oil production where production has been enhanced by in-situ combustion. The rule requires that no person operate an in-situ combustion well unless the vent is connected to an emissions control device which abates 85% by weight of entering VOC gases and vapor or fuel burning equipment or a smokeless flare. All components of a collection and control system shall be maintained in good repair and the total number of leaks in a collection and control system shall not exceed 2% of the components in that system.

Rule 4408 (Glycol Dehydration Systems) limits VOC emissions from any glycol dehydration system with a glycol dehydration vent that is subject to permitting requirements pursuant to Regulation II (Permits). The requirements of this rule do not apply if a glycol dehydration system is permitted to operate less than 200 hours per year, or is permitted to dehydrate less than 5 million standard cubic feet of gas per year. This rule requires controlling vents using a system that directs all vapors to a vapor recovery system, a fuel gas system or a sales gas system or a system in which VOC emissions are combusted by a flare, incinerator, reboiler, or thermal oxidizer or any other emissions control system that controls glycol dehydration emissions by at least 95%. There are several administrative requirements in Section 6.0 worth noting, loosely: glycol dehydration vent testing, vent emission testing, emission control system testing, and the utilization of the gas research institute's GLYCalc™ software.

Rule 4409 (Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities) limits VOC emissions from leaking components at light crude oil production facilities, natural gas production facilities, and natural gas processing facilities. This rule applies to components containing or contacting VOC streams at the above-mentioned facilities. Section 3.0 has a number of definitions, while Section 4.0 details exemptions. This rule provides operating requirements, details, SJVAPCD inspections, leak standards, repair periods, component control technology replacement/retrofit, and component identification requirements.

Rule 4601 (Architectural Coatings) limits VOCs from architectural coatings. This rule specifies architectural coatings storage, clean up and labeling requirements and is applicable to any person who supplies, sells, offers for sale, applies, or solicits the application of any architectural coating or who manufactures, blends or repackages any architectural coating for use within the SJVAPCD. Aerosol coating products, architectural coatings from outside of the SJVAPCD, and the majority of architectural coating containers with a volume of one liter or less are exempt. VOC contents, restrictions, directions for thinning, and a table of standards are all supplied in the Requirements Section 5.0.

Rule 4623 (Storage of Organic Liquids) limits VOC emissions from the storage of organic liquids. This rule applies to any tank with a capacity of 1,100 gallons or greater in which any organic liquid is placed, held, or stored. Table 1 provides General VOC Control System Requirements and Table 2 provides Small Producer VOC Control System Requirements for Crude Oil Storage Tanks. This rule provides specification for pressure-vacuum relief valves and external floating roof tanks in Section 5.2 - 5.3, as well as guidance for welded tanks with primary metallic-shoe type seals, tanks with primary resilient toroid seals and much more guidance based on seal type in the latter portion of Section 5.0. Additionally, Section 5.6 provides specification for vapor recovery systems and Section 5.7.5.4 provides tank degassing requirements. There are many administrative requirements ranging from inspections to gravity testing to record keeping in Section 6.0.

Rule 4624 (Transfer of Organic Liquid) limits VOC emissions from the transfer of organic liquids and applies to organic liquid transfer facilities as defined within the rule. This rule requires that VOC emissions from Class 1 organic liquid transfer facilities not exceed 0.08 pounds per 1,000 gallons of liquid transferred. Additionally, Class 2 organic liquid transfer facilities shall prevent the release to the atmosphere of at least 95% by weight of the VOC displaced during organic liquid transfers. Section 5.0 also sets forth delivery, transfer, construction and leak inspection requirements. Several record keeping requirements are detailed in Section 6.0 in addition to compliance testing.

Rule 4625 (Wastewater Separators) limits the emission of VOCs from wastewater separators, including air floatation units as defined in this rule, during the separation of crude oil and water after custody transfer by requiring vapor loss control devices, recordkeeping, inspection, and test methods.

Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving, and Maintenance Operations) limits VOC emissions by restricting the application and manufacturing of certain types of asphalt for paving and maintenance operations. This rule applies to the manufacture and use of cutback asphalt, slow cure asphalt and emulsified asphalt for paving and maintenance operations. Section 5.0 requires that a person shall not manufacture for sale nor use any of the following for penetrating prime coat, tack coat, dust palliative, or other paving and maintenance operations: rapid cure cutback asphalt, medium cure cutback asphalt, slow cure asphalt which contains more than 0.5% of organic compounds which evaporate at 500 degrees Fahrenheit or lower, or emulsified asphalt containing organic compounds in excess of 3% by volume which evaporate at 500 degrees Fahrenheit or lower.

Rule 4642 (Solid Waste Disposal Sites). The purpose of this rule is to reduce VOC emissions from any solid waste disposal site which has a gas collection system and/or control device in operation, or undergoing maintenance or repair. In addition to several exemptions, this rule provides regulatory guidance on gas collection systems at solid waste disposal sites, control devices, emission controls during excavation of solid waste and emission control during maintenance.

Rule 4651 (Soil Decontamination Operations) limits the emissions of VOCs from soil that has been contaminated with a VOC-containing liquid and applies to operations involving the excavation, transportation, handling, decontamination, and disposal of contaminated soil. Exempt from this rule is the excavation, handling, transportation, and decontamination of less than one cubic yard of

contaminated soil per occurrence, operations related to the accidental spillage of 5 gallons or less of VOC-containing liquid per occurrence, contaminated soil exposed for the sole purpose of sampling and soil contaminated solely by a known VOC-containing liquid or petroleum liquid that has an initial boiling point of 320 degrees Fahrenheit. Rule requirements in Section 5.0 span written notices, monitoring, handling, storage, transportation and decontamination.

Rule 4661 (Organic Solvents) limits the emission of VOCs from the use of organic solvents while specifying reduction, monitoring, reporting and disposal requirements. This rule applies to any source operation that uses organic solvents unless the source operation is exempted under Section 4.0.

Rule 4662 (Organic Solvent Degreasing Operations). The purpose of this rule is to limit VOCs and hazardous air pollutant emissions from organic solvent degreasing operations and to provide the administrative requirements for recording and measuring emissions. This rule applies to all organic solvent degreasing operations. Section 4.0 sets forth exemptions to the rule. Section 5.0 details the rule's requirements such as cold cleaner requirements, cold cleaner VOC emission control system requirements, general operating requirements for degreasers that are not cold cleaners, open-top vapor degreaser requirements, conveyorized degreasers that are not cold cleaner. Also important are the recordkeeping requirements of Section 6.1 such as waste disposal records and VOC emission control system records.

Rule 4663 (Organic Solvent Cleaning, Storage and Disposal) limits the emission of VOCs from organic solvent cleaning and from the storage and disposal of solvents and waste solvent materials. This rule is applicable to any organic solvent cleaning performed outside a degreaser during the production, repair, maintenance, or services of parts, products, tools, machinery, equipment, or in general work areas at stationary sources. This rule also applies to the storage and disposal of all solvents and waste solvent materials at stationary sources.

Rule 4701 (Internal Combustion Engines – Phase 1) limits the emission of NO_X, CO, and VOCs from internal combustion engines. The rule applies to any internal combustion engine rated greater than 50 brake horsepower (bhp) that requires a permit to operate except for those exempted in Section 4.0.

Rule 4702 (Internal Combustion Engines) limits the emissions of NO_X CO, VOC and SO_X from internal combustion engines. The rule applies to any internal combustion engine rate at 25 bhp or greater.

Rule 4703 (Stationary Gas Turbines) limits NO_X emissions from stationary gas turbine systems and applies to all stationary gas turbine systems, which are subject to district permitting requirements, and with ratings equal to or greater than 0.3 megawatt (MW) or a maximum heat input rating of more than 3,000,000 Btu per hour, except as provided in Section 4.0 of this rule.

Rule 4801 (Sulfur Compounds) limits the emissions of sulfur compounds. This rule applies to any discharge to the atmosphere of sulfur compounds, which exist as a liquid or a gas at standard

conditions. This rule has no exemptions, and requires that a person shall not discharge sulfur compounds in concentrations exceeding 0.2% by volume calculated as SO_2 on a dry basis averaged over 15 consecutive minutes. Additionally, EPA Method 8 and CARB method 1-100 must be used to determine such emissions.

Regulation V (Procedure Before the Hearing Board)

Regulation V (Procedure Before the Hearing Board) establishes the procedures in which a owner/operator can approach the Hearing Board in order to file petitions for variances from regulations.

Regulation VI (Air Pollution Emergency Contingency Plan)

Regulation VI (Air Pollution Emergency Contingency Plan) establishes a plan of action to be taken to prevent air pollutant concentration from reaching levels which could endanger the public health or to abate such concentrations should they occur.

Regulation VII (Toxic Air Pollutants)

Rule 7050 (Asbestos - Containing Material for Surfacing Applications). The purpose of this rule is to control airborne emissions of asbestos containing rock. Compliance schedule, recordkeeping, and test methods are specified. This rule incorporates provisions of the CCR Section 93106.

Regulation VIII (Fugitive PM_{10} Prohibitions)

Regulation VIII (Fugitive PM_{10} Prohibitions) is a series of rules to reduce ambient concentrations of fine particulate matter (PM_{10}) by requiring actions to prevent, reduce or mitigate anthropogenic fugitive dust emissions.

Rule 8021 (Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities) limits fugitive dust emissions from construction, demolition, excavation, extraction, and other earthmoving activities and applies to any construction, demolition, excavation, extraction, and other earthmoving activities, including, but not limited to, land clearing, grubbing, scraping, travel onsite, and travel on access roads to and from the site.

Rule 8031 (Bulk Materials) limits fugitive dust emissions from the outdoor handling, storage, and transport of bulk materials and applies to the outdoor handling, storage, and transport of any bulk material.

Rule 8041 (Carryout and Trackout) prevents or limits fugitive dust emissions from carryout and trackout and applies to all sites that are subject to any of the following rules where carryout or trackout has occurred or may occur on paved public roads or the paved shoulders of a paved public road.

Rule 8051 (Open Areas) limits fugitive dust emissions from open areas and applies to any open area having 0.5 acre or more within urban areas, or 3.0 acres or more within rural areas; and contains at least 1,000 square feet of disturbed surface area.

Rule 8061 (Paved and Unpaved Roads) limits fugitive dust emissions from paved and unpaved roads by implementing control measures and design criteria.

Rule 8071 (Unpaved Vehicle/Equipment Traffic Areas) limits fugitive dust emissions from unpaved vehicle and equipment traffic areas.

Regulation IX (Mobile and Indirect Sources)

Rule 9410 (Employer Based Trip Reduction) reduces vehicle miles traveled (VMT) from private vehicles used by employees to commute to and from their worksites to reduce emissions of NO_x, VOC and PM.

Rule 9510 (Indirect Source Review). Indirect sources are land uses that attract or generate motor vehicles trips. Indirect source emissions contain many pollutants, principally PM_{10}, ROG, and NO_x. The San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) first implemented this requirement in the adopted 2003 PM_{10} Plan to develop and implement an Indirect Source Rule (ISR) by July 2004, with implementation to begin in 2005. Senate Bill 709 (SB 709) (Florez 2003) as well required the SJVUAPCD to adopt by regulation a schedule of fees to be assessed on area-wide and indirect sources of emissions. After public hearings the Air District adopted Rule 9510 December 15, 2005, and it became effective in 2006.

The purpose of Rule 9510 is to reduce emissions of NO_x and PM_{10} from new development projects. The District determined that reducing one precursor NO_x, would reduce the cumulative impact on ozone form new development to less than significant levels. Sufficient ROG was obtained from other control measures to enable the District to predict attainment without additional ROG controls. The rule applies to development projects that seek to gain a discretionary approval for projects that, upon full buildout, will include any one of the following: 50 residential units; 2,000 square feet of commercial space; 25,000 square feet of light industrial space; 20,000 square feet of medical or recreational space; 39,000 square feet of general office space; 100,000 square feet of heavy industrial space; 9,000 square feet of educational space; 10,000 square feet of government space; or 9,000 square feet of any land use not identified above. Several sources are exempt from the rule, including transportation projects, transit projects, reconstruction projects that result from a natural disaster, and development projects whose primary source of emissions are subject to district Rules 2201 and 2010, which address stationary sources. Any development project that has a mitigated baseline of less than 2 tons per year for each of NO_x and PM_{10} is exempted from the mitigation requirements of the rule as well as Oil and Gas activities. Developers are encouraged to reduce as much air pollution as possible through onsite mitigation, or incorporating air-friendly designs and practices into the Project. Some examples include; bike paths and sidewalks, traditional street design; medium- to high-density residential developments; locating near bus stops and bike paths; locating near different land use zones, such as commercial; and increasing energy efficiency. If these practices do not completely meet the required reductions then, under the rule, new development projects are required to mitigate the remainder of their emissions by contributing to a mitigation fund that would be used to pay for the most cost-effective projects to reduce emissions. Examples of such projects include retirement and crushing of gross polluting cars, replacement of older diesel engines,

and diesel-powered vehicles and programs that would encourage the replacement of gas-powered lawn mowers with electric lawn mowers.

The ISR requires developers to reduce 20% of construction-exhaust NO_x, 45% of construction-exhaust PM_{10}, 33% of operational NO_X over 10 years and 50% of operational PM_{10} over 10 years. The district estimates that the potential reductions from this program in 2010 at 11.5 tons per day, or 4,197.5 tons per year, of PM_{10} and 4.1 tons per day, or 1,496.5 tons per year, of NO_x.

Emission Reduction Agreements

The implementation, as mitigation, of a Development Mitigation Contract or Voluntary Emission Reduction Agreement (VERA) to reduce criteria pollutants of NO_X, ROGs, and PM_{10} net incremental emissions generated by a project has been incorporated into development projects in Kern County since 2008. They are not a "voluntary" agreement with the San Joaquin Valley Air Quality Control District but are mandated by enforceable mitigation measures and are therefore called Development Mitigation Contracts (DMC). The emission reductions required by a DMC are implemented within the SJVAB in quantities sufficient to fully mitigate the Project's air quality impacts such that development of the Project could be considered to result in no net increase in the designated criteria pollutant emissions over the criteria pollutant emissions that would otherwise exist without the development of the Project, all to be verified by the SJVAPCD. Thus, the DMC results in greater reductions than would otherwise occur under the District's ISR, since the ISR does not require ROG reductions and the ISR only requires a percentage of reductions rather than full reductions of NO_X and PM_{10} resulting from Project construction and operations. When adopting the ISR and the subsequent VERA/DMC programs, the District acknowledges that as ROG is a precursor to ozone, the reductions are not required in the ISR. In the VERA/DMC, the reductions are achieved by increasing the NOx and PM_{10} tonnage for project levels (SJVAPCD 2005b). As the actual amount of ROG reductions achieved from NO_x and PM_{10} reductions is not absolutely certain, Project emissions are still considered significant and unavoidable; however all feasible and reasonable mitigation has been required to reduce criteria pollutants as close to "no net increase" as scientifically possible. This approach has been found legally sufficient by court rulings in the following cases; California Building Industry Assn. v. San Joaquin Valley APCD, Fresno County Case No. 06 CECG 02100 DS13. National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District; Federal District Court, Eastern District of California, Case No. 1:07-CV-00820-LJO-DLB; and Center for Biological Diversity et al v Kern County, Fifth Appellate District, Case No. F061908.

Local Control Measures

The SJVAPCD requires all local governments within its eight-county jurisdiction to adopt resolutions as part of the Ozone Attainment Demonstration Plan (OADP) that must be approved by EPA. The resolutions describe the reasonably available control measures that each jurisdiction will implement to reduce ozone-causing emissions into the air from transportation sources. Local jurisdictions are also required to adopt best available control technology measures to reduce particle emissions as part of the PM_{10} Area Attainment Demonstration Plan. This process is coordinated and assisted by regional transportation planning agencies, such as the Kern COG.

The Kern County Board of Supervisors adopted a resolution on March 12, 2002, that committed the County to implementing several measures to reduce ozone-causing emissions. Among the measures are cost incentives for road contractors to minimize land closures, transit-oriented land use planning, and measures to encourage County employees and other motorists to restrict driving on days with high ozone levels as well as continuing efforts to convert County vehicles to low-emission compressed natural gas and gasoline/electric hybrid engines. Many of these measures have been incorporated as general plan policies.

The Kern County Board of Supervisors adopted a resolution on January 7, 2003, that committed the committed the County to implementing several measures aimed at reducing PM_{10} emissions from County roadways. Among the measures are plans to determine the feasibility of paving the County's unpaved roads, which are lightly traveled; paving the shoulders of the most heavily traveled paved County roads as funding allows; and purchasing two PM_{10}-compliant street sweepers as funding allows. The resolution also committed the County to imposing tougher rules for cancelling road improvements on large rural parcels; requiring public and private access roads for new commercial and industrial development to be paved; evaluating the adverse air quality impacts of new development and, where appropriate, requiring mitigation measures; implementing policies that require developers to control and abate dust during grading and construction operations; and to receive a permit for expansion or a significantly altered use, requiring unpaved parking and storage areas of commercial and agricultural operations in County areas to be paved. These measures are being implemented through the Kern County Land Division Ordinance, Zoning Ordinance, and in the approved General Plan.

Air Quality Plans

The SJVAPCD has developed plans to attain State and federal standards for ozone and particulate matter. The District's air quality plans include emissions inventories to identify the sources and quantities of air pollutants, to evaluate how well different control methods have worked, and to demonstrate how air pollution will be reduced. The plans also use computer modeling to estimate future levels of pollution and make sure that the Valley will meet air quality goals. The SJVAPCD's attainment plans are subject to approval by the SJVAPCD's Governing Board. At the time of this writing, the following attainment plans were in effect.

The adopted plans include emissions inventories, projected changes in population, vehicles, fuels and equipment, and associated emissions. The plans then identify existing rules and additional proposed measures required to reduce emissions to the ambient air quality standards. These rules and proposed measures include requirements to obtain permits to construct and operate, and rules regulating the allowable emissions from various activities or classes of equipment.

One-Hour Ozone Plan

CARB submitted the 2004 Extreme Ozone Attainment Demonstration Plan to the EPA on November 15, 2004. The plan was amended by the District in 2008. Effective June 15, 2005, the EPA revoked the federal 1-hour ozone ambient air quality standard, finding that the 8-hour ozone standard was more health protective and adopted anti-backsliding provisions to preserve existing 1-hour ozone

control measure and emissions reductions obligations; this delayed EPA action on the District's 2004 Plan until 2010. The SJVAPCD implemented the 2004 plan's control measures and emissions reductions strategies, and the Valley must still attain the revoked standard before it can rescind the CAA Section 185 fees collected under Rule 3170.

In 2012, the EPA withdrew its 2010 approval of the SJVAPCD's 2004 Plan required submittal of a new plan for the revoked 1-hour standard that includes the following:

- A Rate of Progress (ROP) demonstration;
- Contingency measures for ROP and for attainment;
- An attainment demonstration;
- A demonstration for Reasonably Available Control Measures (RACM);
- A demonstration for clean fuels/clean technologies are in place for boilers; and
- A VMT offset demonstration;

The SJVAPCD's Governing Board adopted the 2013 Plan for the Revoked 1-Hour Ozone Standard in September 2013, thereby fulfilling air quality planning requirements under the federal CAA for the revoked 1-Hour ozone standard. The District Governing Board also requested EPA to set 2017 as the attainment date for the revoked 1-hour ozone NAAQS, adopted in 1979.

Eight-Hour Ozone Plan

The SJVAPCD's Governing Board adopted the 2007 Ozone Plan on April 30, 2007. This far-reaching plan, with innovative measures and a "dual path" strategy, assures expeditious attainment of the federal 8-hour ozone standard as set by the EPA in 1997. The plan projects that the Valley will achieve the 8-hour ozone standard for all areas of the SJVAB no later than 2023 and calls for a 75% reduction in ozone-forming NO_x emissions. Regulatory measures for mobile and stationary sources are projected to reduce NO_x emissions by 61% by 2023; incentives and the deployment of advanced technologies are project to reduce NO_x emissions 14% by 2023 (SJVAPCD 2007).

CARB approved the plan on June 14, 2007. The EPA approved the 2007 Ozone Plan effective April 30, 2012. It is expected that the plan addressing EPA's 2008 revised 8-hour ozone standard will be due to the EPA in 2015.

PM_{10} Maintenance Plan

Based on PM_{10} measurements from 2003-2006, the EPA found that the SJVAB has reached federal PM_{10} standards. On September 21, 2007, the SJVAPCD adopted the 2007 PM_{10} Maintenance Plan and Request for Redesignation. This plan demonstrates that the Valley will continue to meet the PM_{10} standard. The EPA approved the document and on September 25, 2008, the SJVAB was re-designated to attainment for PM_{10} NAAQS.

2008 $PM_{2.5}$ Plan

The Valley is designated nonattainment for federal $PM_{2.5}$ standards. The EPA set their first $PM_{2.5}$ standards in 1997, and they strengthened the 24-hour standard in 2006. Building upon the strategy used in the 2007 Ozone Plan, the SJVAPCD agreed to additional control measures to reduce directly produced $PM_{2.5}$. The SJVAPCD's Governing Board adopted the 2008 $PM_{2.5}$ Plan on April 30, 2008. The plan estimates that the SJVAB will reach the $PM_{2.5}$ standard by 2014. The CARB approved the Plan on May 22, 2008. The EPA approved most provisions of the 2008 $PM_{2.5}$ Plan effective January 9, 2012.

2012 $PM_{2.5}$ Plan

The SJVAPCD adopted the 2012 $PM_{2.5}$ Plan on December 20, 2012. The plan demonstrates that the SJVAB will achieved the 2006 24-hour $PM_{2.5}$ NAAQS of 35 $\mu g/m_3$ by 2019. The CARB approved the SJVAPCDs 2012 $PM_{2.5}$ Plan in January 2013.

Air Quality Conformity Determination for Transportation Plans and Programs

The CAA amendments of 1990 require a finding to be made stating that any project, program, or plan subject to approval by a metropolitan planning organization conforms to air plans for attainment of air quality standards. Kern COG is designated the Regional Transportation Planning Agency and Metropolitan Planning Organization for Kern County. In that capacity, Kern COG models air quality projections on population projections in conjunction with current general plan designations and estimated vehicle miles as well as the current Regional Transportation Plan (RTP) and the federal transportation plan for Kern County finalized in June 19, 2014. Kern County is contained within two air basins: SJVAB and the Mojave Desert Air Basin. Each air basin has its own plans and pollutant budgets. Kern COG makes conformity findings for each air basin (COG 2014a, 2014b). The Federal Transportation Improvement Program (FTIP) for the Kern County region is a six-year schedule of multimodal transportation improvements, and the RTP is a long-range, 26-year transportation plan and sustainability.

The Conformity Analysis for the 2015 FTIP and 2014 RTP was adopted by Kern COG June 19, 2014, and approved by the Federal Highway Administration and the Federal Transit Administration on December 15, 2014. The regional emissions analysis was conducted for the years 2014, 2017, 2018, 2020, 2023, 2025, 2032, 2035, and 2040 for each applicable pollutant. The conformity findings conclude that the FTIP and RTP result in emissions that are less than the emission budgets of baseline emissions or approved trading mechanisms for transportation conformity purposes for CO, VOC, NO_X, PM_{10} and $PM_{2.5}$ (COG 2014a).

Guide for Assessing and Mitigating Air Quality Impacts/Air Quality Thresholds of Significance

In August 1998, the SJVAPCD adopted its Guide for Assessing and Mitigating Air Quality Impacts (GAMAQI) to provide lead agencies, consultants, and project applicants with uniform procedures for addressing air quality in environmental documents. The District subsequently revised its GAMAQI

document in January 2002 (SJVAPCD 2002). In 2012, the SJVAPCD began the process to update its GAMAQI document. The update was intended to codify long-standing district practices, provide updated data, revise recommended significance thresholds, and provide additional technical guidance. The May 2012 Draft GAMAQI is more environmentally protective than the January 2002 GAMAQI. In March 2015, the SJVAPCD again updated the GAMAQI. This document utilizes the significance thresholds recommended in its most recently March 2015 Final GAMAQI (SJVAPCD 2015a).

In December 2006, the Kern County Planning and Community Development Department (KCPCDD) issued its own Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports (Kern County Air Quality Assessment Guidelines). The document provided specific guidance for County-prepared EIRs, including air quality issues to be considered, analytical approaches and resources, a significance threshold for PM_{10} (which was not reflected in the January 2002 GAMAQI, but is included in the March 2015 Final GAMAQI), and a cumulative impact analysis methodology (KCPCDD 2006). This analysis also utilizes the analytical approach and issues recommended in the KCPCDD's Guidelines.

Criteria Pollutant Emissions

Table 4.3-8 presents the SJVAPCD's criteria pollutant emissions significance thresholds for construction and Project operation, based on the District's Final March 2015 GAMAQI. As seen in Table 4.3-8, the SJVAPCD recommends that emissions from permitted sources and activities be evaluated separately from non-permitted sources and activities.

Table 4.3-8: Criteria Pollutant Emissions Significance Thresholds (tons per year, or tpy)

Pollutant/ Precursor	Construction Emissions	Operational Emissions	
		Permitted Sources and Activities	Non-Permitted Sources and Activities
ROG	10	10	10
NOx	10	10	10
PM_{10}	15	15	15
$PM_{2.5}$	15	15	15
CO	100	100	100
SO_X	27	27	27

Source: SJVAPCD 2015a, Section 8.3

As indicated in the 2015 GAMAQI, permitted sources and activities are subject to SJVAPCD Regulation II (Permits), notably Rule 2201 (New and Modified Stationary Source Review) and Rule 2301 (Emission Reduction Credit Banking). Rule 2201 requires that any emission increases from new permitted stationary sources are mitigated by emission offsets. In most cases, permitted

stationary source emissions, therefore, will be reduced or mitigated to below the SJVAPCD's recommended significance thresholds (SJVAPCD 2015a, Section 8.2.1.).

Criteria Pollutant Modeling

The SJVAPCD's 2015 GAMAQI states that a project should be considered to have a significant impact if its emissions would cause or contribute to a violation of any CAAQS or NAAQS (SJVAPCD 2015a, Section 8.4.). Accordingly, this analysis utilizes applicable CAAQS or NAAQS to establish thresholds of significance for pollutants subject to a standard for which the SJVAB is designated attainment or unclassified. For pollutants subject to a standard for which the SJVAB is designated non-attainment, this analysis utilizes the EPA's Significant Impact Levels, as shown in Table 4.3-9.

Table 4.3-9: Criteria Pollutant Ambient Concentration Significance Thresholds

Pollutant	Averaging Period	EPA Significant Impact Levels[a] ($\mu g/m^3$)	Applicable Ambient Air Quality Standards[b] ($\mu g/m^3$)	Significance Threshold ($\mu g/m^3$)
NO_2	1 hour	7.5	339 (California) 188.7 (Federal)	339 (California)[c] 188.7 (Federal)[c]
	Annual	1	57 (California) 100 (Federal)	57[c]
PM_{10}	24 hours	5	50 (California) 150 (Federal)	increase > 5[d]
	Annual	1	20 (California)	increase > 1[d]
$PM_{2.5}$	24 hours	1.2	35 (Federal)	increase > 1.2[d]
	Annual	0.3	12 (California, Federal)	increase > 0.3[d]
CO	1 hour	2,000	23,000 (California) 40,000 (Federal)	23,000[c]
	8 hours	500	10,000 (California, Federal)	10,000[c]
SO_2	1 hour	7.8	655 (California) 196 (Federal)	655 (California)[c] 196 (Federal)[c]
	3 hours	25	1,300 (Federal)	1,300[c]
	24 hours	5	105 (California)	105[c]

Notes:
a. Source: SJVAPCD 2013b
b. Source: Table 3-1; CARB 2013d.
c. Since the SJVAB is designated unclassifiable or attainment for California and federal NO_2, CO, and SO_2 standards, the significance thresholds are based on the most restrictive applicable ambient air quality standards. Because the federal one-hour NO_2 and SO_2 standards have different forms than California one-hour NO_2 and SO_2 standards, significance thresholds are based on both California and federal one-hour NO_2 and SO_2 ambient standards.
d. Since the SJVAB is designated nonattainment for California PM_{10} standards, and nonattainment for California and federal $PM_{2.5}$ standards, significance thresholds are based on EPA Significant Impact Levels.

Odors

The SJVAPCD recommends that lead agencies assess odor significance based on a review of District complaint records. For a project locating near an existing source of odors, the impact is potentially significant when the project site is at least as close as any other site that has already experienced significant odor problems related to the odor source. Significant odor problems are defined as:

- More than one confirmed complaint per year averaged over a three year period; or
- Three unconfirmed complaints per year averaged over a three-year period.

A complaint is deemed unconfirmed if the odor/air contaminant release could not be detected, or the source/facility cannot be determined.

The Kern County Air Quality Assessment Guidelines recommend dispersion modeling of maximum 24–hour average concentrations of odorous compounds at the Project boundary and within a 6 mile limit to determine ambient concentrations at nearby sensitive receptors (e.g., residences and schools), including approved, but not constructed sensitive receptors. Ambient concentrations at such receptors should be compared to odor thresholds and California Environmental Quality Act (CEQA) impact thresholds to determine potential odor impacts.

Air Toxic Program

In the context of toxic air contaminants, to meet the requirements of federal and State law, the SJVAPCD has created an Integrated Air Toxic Program. This program serves as a tool for implementation of the requirements outlined in Title III of the 1990 CAA Amendments and the TAC-related requirements of state law and District regulations. The goals of SJVAPCD risk management efforts are to: (1) minimize increases in toxic emissions associated with new and modified sources of air pollution; and (2) ensure that new and modified sources of air pollution do not pose unacceptable health risks at nearby residences and businesses.

In order to achieve these goals, the SJVAPCD reviews the risk associated with each permitting action where there is an increase in emissions of TACs. SJVAPCD staff, as part of the engineering evaluation for these projects, performs this risk management review. The risk management review is performed concurrently with other project review functions necessary to process permit applications with the SJVAPCD.

Under the Agency's risk management policy, TBACT must be applied to all units that, based on their potential emissions may pose greater than de minimis risks. Facilities that pose health risks above SJVAPCD action levels are required to submit plans to reduce their risk. Action levels for risk were established in the SJVAPCD's Board-Approved Health Risk Reduction Strategy. The action level for cancer risk was 10 cases per 1 million exposed persons, based on the maximum exposure beyond facility boundaries at a residence or business. Following recent changes to the state Health Risk Assessment Guidelines (discussed in Impact 4.3-4), the SJVAPCD changed its cancer risk action level to 20 per 1 million in a policy dated May 28, 2015 (APR-1906 "Framework for Performing Health Risk Assessments"). The action level for non-cancer risk is a hazard index of 1.0

at any point beyond the facility boundary where a person could reasonably experience exposure to such risk.

SJVAPCD Health-Risk Reduction Strategy (HRRS)

In 2010, the SJVAPCD Governing Board adopted the Risk-Based Strategy, which focuses on measures that address the pollutants for which the Valley is working toward attainment: ozone and fine-particulate matter. This strategy is also gaining widespread support by the EPA and the scientific community. In May 2013, the SJVAPCD renamed its Risk-Based Strategy as the Health-Risk Reduction Strategy (HRRS).

Driven by a rapidly expanding body of scientific research, there is now a growing recognition within the scientific community that from an exposure perspective, the NAAQS metrics for progress are a necessary but increasingly insufficient measure of total public health risk associated with air pollutants. In particular, control strategies for sources of $PM_{2.5}$ and ozone do not necessarily account for qualitative differences in the nature of their emissions. For $PM_{2.5}$, toxicity has been shown to vary depending on particle size, chemical species, and surface area. In the case of ozone, differences in the relative potency of ozone precursors, VOCs in particular, is not captured by a strict, mass-based approach to precursor controls. Thus, while the NAAQS and SIP process is motivated by public health, the process set forward under the CAA does not guarantee that the public health benefits of control strategies will be maximized.

The HRRS applies to regulatory, incentive, and outreach strategies and recognizes that risk to the public is not always proportional to the mass rate of emissions based on factors such as:

- Ultrafine particles versus coarse particles ;
- Toxicity/carcinogens ;
- Intake fraction/deposition fraction ;
- NO_x versus VOCs ;
- NO_x versus ammonia reductions; and
- Photochemical reactivity of VOCs.

The HRRS does not establish a new acceptable risk level, delay attainment of mass-based air quality standards, or ask for a change in the form of the mass-based air quality standards. Instead, it describes how to determine the potential risk to public health from a particular project.

SJVAPCD Policy APR 1905

In Policy APR 1905, the SJVAPCD establishes three (03) stages for Risk Evaluation for all projects resulting in increases in hourly, daily, or annual potential to emit hazardous air pollutants from new and modified sources, except projects specifically exempted in approved SJVAPCD permitting policies. The stages are the following:

A. Prioritization

Projects shall be prioritized using the California Air Pollution Control Officers Association (CAPCOA) Facility Prioritization Guidelines. A prioritization score is used for determining the applicability of TBACT to each new and modified emissions units and the need for a detailed health risk assessment.

B. Health Risk Assessment

Projects with cumulative increases in prioritization score of greater than one require a Health Risk Assessment using the OEHHA Guidelines.

C. Calculation of Increase in Permitted Emissions

Increase is determined as the difference between the baseline and proposed Potential to Emit for the pollutant. APR 1905 specifies that the SJVAPCD policy defining certain small increases of criteria pollutant emissions as zero does not apply to hazardous air pollutants.

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element, the Safety Element, and the Energy Element of the KCGP include goals, policies, and implementation measures related to air quality that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.10.2. Air Quality

Policies

Policy 19. In considering discretionary projects for which an Environmental Impact Report must be prepared pursuant to the California Environmental Quality Act, the appropriate decision making body, as part of its deliberations, will ensure that:

a) All feasible mitigation to reduce significant adverse air quality impacts have been adopted; and

b) The benefits of the proposed Project outweigh any unavoidable significant adverse effects on air quality found to exist after inclusion of all feasible mitigation. This finding shall be made in a statement of overriding considerations and shall be supported by factual evidence to the extent that such a statement is required pursuant to the CEQA.

Policy 20. The County shall include fugitive dust control measures as a requirement for discretionary projects and as required by the adopted rules and regulations of the San Joaquin Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District on ministerial permits.

Policy 21. The County shall support air districts' efforts to reduce PM_{10} and $PM_{2.5}$ emissions.

Policy 22. Kern County shall continue to work with the San Joaquin Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District toward air quality attainment with federal, State, and local standards.

Policy 23. The County shall continue to implement the local government control measures in coordination with the Kern Council of Governments and the San Joaquin Valley Unified Air Pollution Control District.

Implementation Measures

Implementation Measure F. All discretionary permits shall be referred to the appropriate air district for review and comment.

Implementation Measure G. Discretionary development projects involving the use of tractor trailer rigs shall incorporate diesel exhaust reduction strategies including, but not limited to:

- Minimizing idling time.
- Electrical overnight plug-ins.

Implementation Measure H. Discretionary projects may use one or more of the following to reduce air quality effects:

- Pave dirt roads within the development.
- Pave outside storage areas.
- Provide additional low Volatile Organic Compounds (VOC) producing trees on landscape plans.
- Use of alternative fuel fleet vehicles or hybrid vehicles.
- Use of emission control devices on diesel equipment.
- Develop residential neighborhoods without fireplaces or with the use of Environmental Protection Agency certified, low emission natural gas fireplaces.
- Provide bicycle lockers and shower facilities onsite.
- Increasing the amount of landscaping beyond what is required in the Zoning Ordinance (Chapter 19.86).
- The use and development of park and ride facilities in outlying areas.
- Other strategies that may be recommended by the local Air Pollution Control Districts.

Chapter 4. Safety Element

4.2. General Policies and Implementation Measure, which Apply to more than One Safety

Constraint

Policies

Policy 1. That the County's program of identification, mapping, and evaluating the geologic, fire, flood safety hazard areas, and significant concentrations of hydrogen sulfide in oilfield areas, presently under way by various County departments, be continued.

Chapter 5. Energy Element

5.3.1. Urban/Residential Development in Petroleum Resource Areas

Policies

Policy 8. Reduce the public's exposure to fires, explosions, blowouts, and other hazards associated with the accidental release of crude oil, natural gas, or hydrogen sulfide gas by ensuring that discretionary development projects have adequate separation from oil and natural gas production land uses.

5.3.6. Environmental Impacts of Petroleum Development

Policies

Policy 4. The County should encourage the use of clean-burning technologies in petroleum production.

Policy 5. The County should encourage air pollution control policies which apply the burden equally to local and upwind sources and to all classes of air polluters.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to air quality.

Chapter V. Conservation Element

B. Mineral Resources

Goals

Goal 4. Protect land, water, air quality and visual resources from environmental damage resulting from mineral and energy resource development.

Policies

Policy 15. Require petroleum production sites in urban areas which are subject to discretionary permits, to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways (I-4).

E. Air Quality

Goals

Goal 1. Promote air quality that is compatible with health, well-being, and enjoyment of life by controlling point sources and minimizing vehicular trips to reduce air pollutants.

Goal 2. Continue working toward attainment of Federal, State and Local standards as enforced by the San Joaquin Valley Unified Air Pollution Control District.

Goal 3. Reduce the amount of vehicular emissions in the Planning Area.

Policies

Policy 1. Comply with and promote San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) control measures regarding Reactive Organic Gases (ROG). Such measures are focused on: (a) steam driven well vents, (b) Pseudo-cyclic wells, (c) natural gas processing plant fugitives, (d) heavy oil test stations, (e) light oil production fugitives, (f) refinery pumps and compressors, and (g) vehicle inspection and maintenance (I-1).

Policy 2. Encourage land uses and land use practices which do not contribute significantly to air quality degradation (I-1).

Policy 3. Require dust abatement measures during significant grading and construction operations (I-1).

Policy 5. Consider the location of sensitive receptors such as schools, hospitals, and housing developments when locating industrial uses to minimize the impact of industrial sources of air pollution (I-1).

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

4.3.4 Impacts and Mitigation Measures

Methodology

This section discusses the methodologies used to conduct the evaluation of air quality impacts for the Project, including guidelines for preparing environmental documents under CEQA and technical methods employed in the evaluation. The air quality significance criteria were developed considering the CEQA significance criteria developed by the local air quality districts in the Project Area which is the SJVAPCD, approved CEQA air quality checklists, and considering other federal criteria.

The baseline for purposes of this analysis is considered to be the physical environmental conditions existing as of the beginning of environmental analysis (2012) according to KCPCDD, which have determined that the level of activity occurring during 2012 is representative of the Project's baseline conditions. The change in the environment caused by the Project results from oil and gas production and processing activities conducted between 2015 and 2035.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would have a significant air quality impact if it would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard as adopted in (c)i or (c)ii, or established by EPA or air district or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors). Specifically, implementation of the project would have a significant impact on air quality if it would exceed any of the following adopted thresholds:

Operational and Area/Construction Sources	Reactive organic gases (ROG)	10 tons per year
	Oxides of nitrogen (NO_x)	10 tons per year

	Particulate matter (PM_{10})	15 tons per year
Stationary Sources (as Determined by District Rules)	Severe nonattainment	25 tons per year
	Extreme nonattainment	10 tons per year

- Expose sensitive receptors to substantial pollutant concentrations; and
- Create objectionable odors affecting a substantial number of people.

Project Impacts

Impact 4.3-1: Conflict with or Obstruct Implementation of the Applicable Air Quality Plan

APCD and air quality management district (AQMD) have the primary responsibility for controlling emissions from sources other than locomotives, motor vehicles and other specified statewide sources (such as consumer products), which are the responsibility of CARB or the EPA. Air districts adopt and enforce rules and regulations to ensure that emissions comply with national, state, and local emission standards, and will not interfere with the attainment and maintenance of the state and federal ambient air quality standards. The Project is located within the administrative boundaries of the SJVAPCD, which has jurisdiction over air quality in the SJVAB.

Future oil and gas exploration and production activities that would be authorized under the Project would result in emissions from stationary sources such as boilers, cogeneration plants, process heaters, reciprocating internal combustion engines, steam generators, production tanks, thermally enhanced oil recovery wells, and volatile organic compounds destruction devices (VOCDD) (flares), and non-permitted sources (small equipment, well-related maintenance and treating operations, routine business travels). Air pollutants would also be emitted during Project construction (off-road construction equipment, on-road vehicles, fugitive particulate matter from material movement, asphalt paving, and use of architectural coatings).

Consistency with Applicable Air Quality Plans

The SJVAPCD has developed plans to attain state and federal standards for ozone and PM. The District's air quality plans include emissions inventories to identify the sources and quantities of air pollutant emissions, evaluate how well different control methods have worked, and demonstrate how air pollution will be reduced. The plans also use computer modeling to estimate future levels of pollution to ensure that the Valley will meet air quality goals. As of March 2015, the following attainment/maintenance plans are in effect, as detailed in Section 4.3.3, Regulatory Setting, above.

One-Hour Ozone Plan

CARB submitted the SJVAPCD's 2004 Extreme Ozone Attainment Demonstration Plan to the EPA on November 15, 2004. The plan was amended by the District in 2008. Effective June 15, 2005 the EPA revoked the federal 1-hour ozone ambient air quality standard, finding that the 8-hour ozone standard was more health protective. Under federal anti-backsliding provisions, the District has

continued to implement the 2004 plan's control measures and emissions reductions strategies. The District developed a new plan for EPA's revoked 1-hour ozone standard, which was adopted by the District's Governing Board on September 19, 2013.

Eight-Hour Ozone Plan

The SJVAPCD adopted the 2007 Ozone Plan on April 30, 2007. This far-reaching plan, with innovative measures and a "dual path" strategy, assures expeditious attainment of the federal 8-hour ozone standard established by the EPA in 1997. The plan projects that the Valley will achieve the 8-hour ozone standard for all areas of the SJVAB no later than 2023. The CARB approved the plan on June 14, 2007. EPA approved the 2007 Ozone Plan effective April 30, 2012. It is expected that the plan addressing the more stringent 8-hour ozone standard enacted by EPA in 2008 will be due to EPA in 2015.

PM_{10} Maintenance Plan

Based on PM_{10} measurements from 2003-2006, the EPA found that the SJVAB has achieved the federal PM_{10} NAAQS. On September 21, 2007, the District's Governing Board adopted the 2007 PM_{10} Maintenance Plan and Request for Redesignation. This plan demonstrates that the Valley will continue to meet the PM_{10} standard. The EPA approved the document and effective December 12, 2008, the SJVAB was redesignated to attainment for the PM_{10} NAAQS.

2008 PM2.5 Plan

The Valley is designated nonattainment for federal $PM_{2.5}$ standards. The EPA established its first $PM_{2.5}$ standards in 1997. The EPA strengthened the 24-hour standard in 2006 and the annual standard in 2013. Building upon the strategy used in the 2007 Ozone Plan, the District agreed to additional control measures to reduce directly produced $PM_{2.5}$. The District's Governing Board adopted the 2008 $PM_{2.5}$ Plan on April 30, 2008. The plan demonstrates that the SJVAB will achieve the 1997 annual $PM_{2.5}$ NAAQS of 15 $\mu g/m^3$ by 2014. The CARB approved the Plan on May 22, 2008. The EPA approved most provisions of the 2008 $PM_{2.5}$ Plan effective January 9, 2012.

2012 $PM_{2.5}$ Plan

The SJVAPCD adopted the 2012 $PM_{2.5}$ Plan on December 20, 2012. The plan demonstrates that the SJVAB will achieve the 2006 24-hour $PM_{2.5}$ NAAQS of 35 $\mu g/m^3$ by 2019. The CARB approved the Plan on January 24, 2013. The SJVAPCD will need to revise its $PM_{2.5}$ strategy in the future to address attainment of the 2013 annual standard.

These plans include emissions inventories, projected changes in population, vehicles, fuels and equipment, and the consequent changes in the associated emission levels. The plans then identify existing rules and additional proposed measures required to reduce emissions and ensure compliance with the ambient air quality standards. These rules and proposed measures include requirements to obtain permits to construct and operate, and rules regulating the allowable emissions from various activities or classes of equipment.

Consistency with SJVAPCD Applicable Permits Required

SJVAPCD Rule 2010 (Permits Required) requires that an Authority to Construct permit and a Permit to Operate be obtained prior to constructing, altering, replacing, or operating any device that emits or may emit air contaminants. Since the Project would require construction of various stationary source devices in Kern County, Authority to Construct permits and Permits to Operate would be required.

SJVAPCD Rule 2410 (Prevention of Significant Deterioration) requires that pre-construction permits be obtained for new major stationary sources and major modifications to existing major stationary sources in areas classified as attainment or unclassifiable for any criteria pollutant. A stationary source or a modification is considered major if the net emissions increase equals or exceeds 40 tons per year VOC, 40 tons per year NO_X, 15 tons per year PM_{10}, 10 tons per year $PM_{2.5}$, 100 tons per year CO, or 40 tons per year SO_2. Stationary source emissions increases associated with the Project may exceed these thresholds, depending on the type of facility and new equipment to be built. Therefore, a PSD pre-construction permit may be required for the new oil and gas facilities of the Project.

Consistency with SJVAPCD Applicable Rules

Oil and gas activities that would be authorized under this Project would result in emissions from stationary sources (boilers, cogeneration plants, process heaters, reciprocating internal combustion engines, steam generators, production tanks, thermally enhanced oil recovery wells, and VOCDD (flares), storage tanks, loading and unloading racks, and fugitive emissions), and non-permitted sources (trucks, automobile work trips, and onsite vehicles). Air pollutants would be emitted during construction activities (off-road construction equipment, on-road vehicles, fugitive particulate matter from material movement) and operational activities (employee and contractor commute and the transport of material, onsite travel to conduct day-to-day field operations, vehicle trips to perform maintenance). Following is a list of the SJVAPCD rules that could potentially apply to construction and operation activities that would be authorized under this Project.

Future oil and gas exploration and production activities that would be authorized under this Project would be required to comply with the relevant provisions of the following rules:

- Rule 2010 (Permits Required)
- Rule 2020 (Exemptions)
- Rule 2070 (Standards for Granting Applications)
- Rule 2201 (New and Modified New Source Review)
- Rule 2250 (Permit-Exempt Equipment Registration)
- Rule 2280 (Portable Equipment Registration)
- Rule 2410 (Prevention of Signification Deterioration)
- Rule 2520 (Federally Mandated Operating Permits)

- Rule 2540 (Acid Rain Program)
- Rule 2550 (Federally Mandated Preconstruction Review for Major Sources of Air Toxics)
- Rule 3135 (Dust Control Plan Fee)
- Rule 4001 (New Source Performance Standards)
- Rule 4002 (National Emission Standards for Hazardous Air Pollutants)
- Rule 4101 (Visible Emissions)
- Rule 4102 (Nuisance)
- Rule 4201 (Particulate Matter Concentration)
- Rule 4202 (Particulate Matter Emission Rate)
- Rule 4301 (Fuel Burning Equipment)
- Rule 4304 (Equipment Tuning Procedures for Boilers, Steam Generators, and Process Heaters)
- Rule 4305 (Boilers, Steam Generators and Process Heaters, Phase 2)
- Rule 4306 (Boilers, Steam Generators and Process Heaters, Phase 3)
- Rule 4307 (Boilers, Steam Generators, and Process Heaters 2.0 MMBtu/hr to 5.0 MMBtu/hr)
- Rule 4308 (Boilers, Steam Generators, and Process Heaters 0.075 MMBtu/hr to less than 2.0 MMBtu/hr)
- Rule 4311 (Flares)
- Rule 4320 (Advanced Emission Reduction Options for Boilers, Steam Generators, and Process
- Heaters Greater than 5.0 MMBtu/hr)
- Rule 4351 (Boilers, Steam Generators and Process Heaters, Phase 1)
- Rule 4352 (Solid Fuel Fired Boilers, Steam Generators, and Process Heaters)
- Rule 4401 (Steam Enhanced Crude Oil Production Wells)
- Rule 4402 (Crude Oil Production Sumps)
- Rule 4404 (Heavy Oil Test Station – Kern County)
- Rule 4405 (Oxides of Nitrogen Emissions from Existing Steam Generators used in Thermally Enhanced Oil Recovery – Central and Western Kern County Fields)
- Rule 4406 (Sulfur Compounds from Oil-Field Steam Generators – Kern County)
- Rule 4407 (In-Situ Combustion Well Vents)
- Rule 4408 (Glycol Dehydration Systems)

- Rule 4409 (Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities)
- Rule 4455 (Components at Petroleum Refineries, Gas Liquids Processing Facilities and Chemical Plants)
- Rule 4601 (Architectural Coatings)
- Rule 4612 (Motor Vehicle and Mobile Equipment Coating Operations)
- Rule 4621 (Gasoline Transfer into Stationary Storage Containers, Delivery Vessels, and Bulk Plants)
- Rule 4623 (Storage of Organic Liquids)
- Rule 4624 (Transfer of Organic Liquid)
- Rule 4625 (Wastewater Separators)
- Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations)
- Rule 4642 (Solid Waste Disposal Sites)
- Rule 4651 (Soil Decontamination Operations)
- Rule 4661 (Organic Solvents)
- Rule 4662 (Organic Solvent Degreasing Operations)
- Rule 4663 (Organic Solvent Cleaning, Storage and Disposal)
- Rule 4701 (Internal Combustion Engines – Phase 1)
- Rule 4702 (Internal Combustion Engines)
- Rule 4703 (Stationary Gas Turbines)
- Rule 7050 (Asbestos - Containing Material for Surfacing Applications).
- Rule 4801 (Sulfur Compounds)
- Rule 8011 (General Requirements)
- Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities)
- Rule 8031 (Bulk Materials)
- Rule 8041 (Carryout and Trackout)
- Rule 8051 (Open Areas)
- Rule 8061 (Paved and Unpaved Roads)
- Rule 8071 (Unpaved Vehicle/Equipment Traffic Areas)

- Rule 9510 (Indirect Source Review)

Consistency with Applicable Indirect Source Review

On December 15, 2005, the SJVAPCD Governing Board adopted Rule 9510 (Indirect Source Review, or ISR). The District's ISR rule is intended to reduce NO_x and PM_{10} emissions from new development projects. Rule 9510 requires developers of specified development projects to submit applications and reduce emissions through onsite mitigation, offsite SJVAPCD-administered projects, or a combination of the two.

Rule 9510 exempts development projects for facilities with primary functions that are subject to District Rule 2201 (New and Modified Stationary Source Review Rule) or 2010 (Permits Required). The list of specific projects exempted under Rule 9510 includes "Gas Processing and Production" (Section 4.4.3.9). The oil and gas activities authorized under this Project involve construction of gas wells and gas processing facilities, and would be subject to Rules 2010 and 2201. Therefore, the Project is exempt from Rule 9510 under Section 4.4.3, more specifically under Section 4.4.3.9 (SJVAPCD 2005a).

Permitted Source Emissions

Emission increases associated with activities under the Project's permitted sources would come from boilers, cogeneration plants, process heaters, reciprocating internal combustion engines, steam generators, production tanks, thermally enhanced oil recovery wells, and VOCDD (flares). These sources would be subject to SJVAPCD prohibitory rules, notably Rule 4455 (Components at Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants) and Rule 4623 (Storage of Organic Liquids). Emissions from new permitted sources would also be required to be mitigated by emission offsets under Rule 2201 (New and Modified Stationary Source Review). Therefore, permitted source emissions would be consistent with the SJVAPCD's adopted regulatory program to attain state and federal ozone and particulate matter standards.

Non-Permitted Source/Activity Emissions

Non-permitted sources and activities would be subject to the following federal and state regulatory programs, which are incorporated within the attainment plans for state and federal ozone and particulate matter standards:

Heavy-duty engine and on-road vehicle standards enacted by CARB and the EPA (California standards codified at 13 CCR Section 1956.8).

Light and medium on-road vehicle standards enacted by CARB (starting at 13 CCR Section 1900).

Non-permitted source/activity emissions were calculated using CARB's EMFAC2011 (January 2013) emissions model, which reflects adopted California on-road vehicle emission standards, and CARB'S OFFROAD2011 model to generate fleet average emission factors for off-road mobile sources and portable equipment operated within the SJVAB. Fugitive dust emissions were calculated using predictive emission factors recommended by the EPA in AP42, Fifth Edition. Therefore, non-

permitted source/activities would be consistent with adopted regulatory programs incorporated within the SJVAPCD's ozone and particulate matter attainment plans.

Consistency with Kern County General Plan

Future oil and gas exploration and production activities that would be authorized under the Project would be required to comply with the policies and measures of the KCGP as discussed in greater detail in Section 4.10, Land Use and Planning.

Consistency with the Metropolitan Bakersfield General Plan

Future oil and gas exploration and production activities that would be authorized under the Project would have to comply with the Metropolitan Bakersfield General Plan policies which are applicable to County land, as discussed in greater detail in Section 4.10, Land Use and Planning.

Oil and gas activities that would be authorized under the Project could conflict with or obstruct implementation of the applicable air quality plan or potentially be inconsistent with the General Plan measures and therefore could be significant.

Mitigation Measures

MM 4.3-1 Consistent with the requirements of the San Joaquin Valley Air Pollution Control District Regulation II-Permits, the Applicant shall obtain an Authority to Construct permit and a Permit to Operate for any facility or equipment requiring a permit from the San Joaquin Valley Air Pollution Control District, such as stationary sources required to obtain permits pursuant to District Rule 2010. All emissions increases from permitted equipment shall comply with District Rule 2201.

MM 4.3-2 The Applicant shall develop and implement a Fugitive Dust Control Plan in compliance with San Joaquin Valley Air Pollution Control District fugitive dust suppression regulations to further reduce emissions, during construction, of particulate matter that is 10 microns or less and 2.5 microns or less in diameter. The Fugitive Dust Control Plan shall include:

a. Name(s), address(es), and phone number(s) of person(s) responsible for the preparation, submission, and implementation of the plan.

b. Description and location of operation(s).

c. Listing of all fugitive dust emissions sources included in the operation.

d. The following dust control measures shall be implemented:

    1. All onsite unpaved roads shall be effectively stabilized using water or chemical soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board approved soil stabilizers, and that shall not increase any other environmental impacts including loss of vegetation.

2. All material excavated or graded will be sufficiently watered to prevent excessive dust. Watering will occur as needed with complete coverage of disturbed areas. The excavated soil piles will be watered as needed to limit dust emissions to less than 20% opacity or covered with temporary coverings.
3. Construction activities that occur on unpaved surfaces will be discontinued during windy conditions when winds exceed 25 miles per hour and those activities cause visible dust plumes. Construction activities may continue if dust suppression measures are used to minimize visible dust plumes.
4. Track-out debris onto public paved roads shall not extend 50 feet or more from an active operation and track-out shall be removed or isolated such as behind a locked gate at the conclusion of each workday.
5. All hauling materials should be moist while being loaded into dump trucks.
6. All haul trucks hauling soil, sand, and other loose materials on public roads shall be covered (e.g., with tarps or other enclosures that would reduce fugitive dust emissions).
7. Soil loads should be kept below 6 inches or the freeboard of the truck.
8. Drop heights should be minimized when loaders dump soil into trucks.
9. Gate seals should be tight on dump trucks.
10. Traffic speeds on unpaved roads shall be limited to 25 miles per hour.
11. All grading activities shall be suspended when visible dust emissions exceed 20%.
12. Other fugitive dust control measures as necessary to comply with San Joaquin Valley Air Pollution Control District Rules and Regulations.
13. Disturbed areas should be minimized.
14. Disturbed areas should be re-vegetated as soon as possible after disturbance if area is no longer needed for oil and gas activities.

MM 4.3-3 All off-road construction diesel engines not registered under California Air Resources Board's Statewide Portable Equipment Registration Program, which have a rating of 50 horsepower or more, shall meet, at a minimum, the Tier 3 California Emission Standards for Off-road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, section 2423(b)(1) unless that such engine is not available for a particular item of equipment. In the event a Tier 3 engine is not available for any off-road engine larger than 100 horsepower, that engine shall be equipped with retrofit controls that would provide nitrogen oxides and particulate matter emissions that are equivalent to Tier 3 engine.

a. All equipment shall be turned off when not in use. Engine idling of all equipment shall be limited to five minutes, except under exemptions specified in California Code of Regulations Title 13 Section 2449(d)(2)(A).

b. All equipment engines shall be maintained in good operating condition and in proper tune per manufacturers' specifications.

MM 4.3-4 To further reduce emissions of oxides of nitrogen from on-road heavy-duty diesel haul vehicles:

a. 2007 engines or pre-2007 engines shall comply with California Air Resources Board retrofit requirements set forth in California Code of Regulations Title 13 Section 2025.

b. All on-road construction vehicles, except those meeting the 2007/California Air Resources Board-certified Level 3 diesel emissions controls, shall meet all applicable California on-road emission standards and shall be licensed in the State of California. This does not apply to worker personal vehicles.

c. All on-road construction vehicles shall be properly tuned and maintained in accordance with the manufacturers' specifications.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation

Impact 4.3-2: Violate Any Air Quality Standard as Adopted in (c)i or (c)ii, or Established by EPA or Air District or Contribute Substantially to an Existing or Projected Air Quality Violation

As stated above, the SJVAPCD's 2015 GAMAQI states that a project should be considered to have a significant impact if its emissions would cause or contribute to a violation of any California or NAAQS (SJVAPCD 2015a, Section 8.4.) In order to evaluate whether the oil and gas activities that would be authorized under the Project would result in a violation of an air quality standard, the Kern County CEQA checklist uses SJVUAPCD thresholds of:

Operational and Area/Construction Sources	Reactive organic gases (ROG)	10 tons per year
	Oxides of nitrogen (NO_x)	10 tons per year
	Particulate matter (PM_{10})	15 tons per year
Stationary Sources (as Determined by District Rules)	Severe nonattainment	25 tons per year
	Extreme nonattainment	10 tons per year

If the levels of ROG, NO_x or PM_{10} are exceeded, then Project generated emissions would be considered to have a considerable net increase. However, since the San Joaquin Valley is in

nonattainment also for $PM_{2.5}$ and ozone, then levels of CO and $PM_{2.5}$ will be evaluated against the San Joaquin Valley Criteria Pollutant thresholds listed in Table 4.3-10.

Table 4.3-10: SJVAPCD Criteria Pollutant Emissions Significance Thresholds (tons per year, or tpy)

Pollutant/ Precursor	Construction Emissions	Operational Emissions	
		Permitted Sources and Activities	Non-Permitted Sources and Activities
ROG	10	10	10
NOx	10	10	10
PM_{10}	15	15	15
$PM_{2.5}$	15	15	15
CO	100	100	100
SO_X	27	27	27

Source: SJVAPCD 2015b, Section 8.3

The thresholds of significance for ROG, NO_x and PM_{10} presented in the table are equivalent to the Kern County CEQA Implementation Document and Kern County Environmental Checklist standards listed above; the table provides also standards for criteria pollutants such as $PM_{2.5}$, CO, and SO_x, which were not listed among the Kern County CEQA Implementation Document and Kern County Environmental Checklist standards. Therefore, emissions generated by the project were evaluated against the SJVAPCD Air Quality Thresholds of Significance for Criteria Pollutants. For this analysis, if these thresholds are exceeded then the Project would be considered to have significant impacts.

Source data and emissions associated with the Project were determined based on the Air Quality Technical Report prepared by Vector Environmental, Inc. (Vector; Vector 2015a). Air quality impacts associated with the Project are separated by construction and operational emissions. The emissions tables derived from the data provided by Vector are presented in Appendix I.

The air analysis conducted by Vector to support this evaluation uses a baseline level of 43,028 wells that were operating in 2012 and an assumed number of 82,136 wells operating in 2035. The assumed number of new wells constructed spans from 3,966 in 2015 to 4,083 in 2035. The number of wells projected to be built every year exceeds the number of wells that are projected to be authorized under this Project and therefore these estimates are considered conservative. Kern County does not anticipate authorizing more than 3,647 new well permits in a single year. Therefore, the final total emissions from the Project will be calculated by scaling down the emissions calculated using the assumed number of new wells to the emissions corresponding to the authorized number of new wells per year, that is 3,647 wells each year (Table 4.3-32D).

Construction Emissions

To estimate emissions associated with construction activities associated with the proposed Project, each activity was estimated separately for:

- Construction of new facilities for crude oil and natural gas production and processing, such as crude oil dehydration facilities and new steam generator plants;
- Construction of permit exempt equipment and small production settings; and
- Construction activity related to wells.

The following table provides the data sources and assumptions used to estimated construction emissions. A list of equipment used during construction is presented as Appendix K.

Table 4.3-11: Data Sources and Assumptions for the Construction Air Impact Analysis

Activity	Data Source/Assumption
Construction of Permitted Equipment (New Facilities)	
Baseline	The number of emission units constructed during the baseline year (2012) was determined from the number of SJVAPCD Authority to Construct (ATC) permits for new equipment converted to equipment Permits to Operate (PTO).
Future activities	In order to determine the number of new units expected to be required for the 2035 Project build-out, the change in needed capacity was determined by assuming that the capacity will grow at the same rate as the number of active wells. Project equipment needed for 2035 was forecast using the difference between the number of active wells in 2012 and the number of active wells forecast for 2035. The number of additional units for each equipment category was determined by dividing the change in capacity by the average capacity of the equipment.
Emission Factors	Emission factors for on-road mobile sources were derived using EMFAC2011. The model was used to generate Kern County fleet average emission factors by vehicle weight class and year. Emission factors for off-road mobile sources and portable equipment were derived using OFFROAD2011. The model was used to generate fleet average emission factors for the off-road mobile source and portable equipment fleet located in the San Joaquin Valley. Factors were generated by equipment type, horsepower category and fuel type for 2012 and annually for the period 2015 through 2035.
Required Equipment and Timing	For oilfield facilities, the time required to complete construction usually depends on the number of new emission units to be installed and the size of the emission units. When detailed construction information was lacking, the type of equipment to be built and the Project acreage was used to generate lists of equipment and activities likely required for the construction Project.
Vehicle Trips	Using the available data, the number of vehicle trips required for the construction of a given type of facility (emission unit) were determined for each source category (i.e., tanks, boilers, engines).
Average Trip Length	The offsite travel distance per vehicle trip was calculated as the average travel distance to the oil and gas planning zone (Subarea). The onsite travel distance per vehicle trip was calculated as the average onsite distance between facilities.

Table 4.3-11: Data Sources and Assumptions for the Construction Air Impact Analysis

Activity	Data Source/Assumption
Fugitive Dust	Fugitive dust emissions were calculated using EPA predictive emission factor equations (EPA AP42, Chapter-13).
Construction Related to Wells	
Baseline	The number of wells constructed, reworked, and abandoned in the baseline year 2012 were determined from preliminary well counts provided by the DOGGR Distict-4 Office. The number of wells that underwent hydraulic stimulation during 2012 was determined from records obtained from "Frac-Focus."
New Well Activities	The information used for evaluating well construction activities was obtained from detailed records compiled during the construction of ten new oil and gas production wells in 2010 and 2011. Detailed activity lists of the onroad mobile sources, offroad mobile sources, and portable equipment used for each construction phase were maintained. The data were compiled during the construction of wells having an average depth of about 10,000 feet. Consequently, to use data for evaluating activities which depend on well depth (such as drilling) the data was adjusted to enable its use for evaluating activities required for construction of wells having other depths.
Onroad and Offroad Sources	The list of the onroad mobile sources, offroad mobile sources, and portable equipment used for each construction phase was obtained from the records compiled during the construction of 10 new oil and gas production wells, having an average depth of about 10,000 feet, in 2010 and 2011. Onroad activities for construction include worker commute and delivery of equipment and materials. Offroad activities for construction include site preparation, pre-drilling survey, drilling, completion, stimulation, installation of flow lines, installation of pumping unit, installation of electrical systems, well rework, and well abandonment.
Well Stimulation	Hydraulic stimulation information was derived from data obtained from the DOGGR, EPA publications, and fundamental engineering principles. Four categories of well depths were evaluated, namely 5,000, 10,000, 15,000, and 20,000 feet and greater. Each well was evaluated according to its depth. The activity predicted for hydraulic stimulation includes the vehicles and equipment required. The number of vehicles primarily depends upon the surface injection pressure, mass of proppant and injection volumes. The equipment likely to be used for the stimulation job was determined based on the wells that underwent hydraulic stimulation during the baseline year. Each well completed in future years was assumed to undergo initial hydraulic stimulation. Emissions from stimulation jobs conducted during rework should be added to the emissions predicted for rework. Emissions were calculated using the OFFROAD2011 fleet average emission factors.
Decommissioning Emissions	Well abandonment involves plugging by placing cement in the well-bore or casing at certain specified intervals. The capacity of a rig used for plugging and abandonment was assumed to be comparable to those used for drilling and completions. Since historic information on the equipment used for well abandonment was not available, the vehicle and equipment list used for routine well maintenance was used for calculating emissions from well abandonment. Emissions were calculated using the OFFROAD2011 fleet average emission factors.

Table 4.3-11: Data Sources and Assumptions for the Construction Air Impact Analysis

Activity	Data Source/Assumption
Engines	The horsepower required for both the hoist system and the mud circulation system depends on the depth of the rig. For the activities of well drilling, well completions, and well rework, the number and average horsepower rating of the engines used by the rig hoist and mud circulation systems were estimated from the data reported by the drilling industry for the 2012 U.S. fleet. Engine type and horsepower for well abandonment was determined from information provided by a manufacturer of these types of rigs and provide of well pulling services ("Stewart and Stevens").
Ancillary Equipment	Ancillary equipment may include diesel engines to power the mud filtration system, small generator sets to power utility systems and other miscellaneous equipment, and offroad mobile sources such as cranes for setting up the rig structure and mast. The list of ancillary equipment included in the drilling operation was obtained from the construction records of 10 wells in 2010 and 2011.
Duration	The number of days required to complete drilling, completion, rework, and abandonments depends on the well depth, and was estimated by interpolating data reported in DOGGR well records. Durations of other tasks required for completing a specific phase of a construction activity were obtained from the records of the construction of 10 wells in 2010 and 2011.

Construction of New Facilities

As the number of active wells increases over time more substantial construction activities, such as those required for building new emission units, may be required. New facilities that could be constructed under this Project include crude oil and natural gas production and processing plants, such as crude oil dehydration facilities and new steam generator plants. Equipment that was assumed would be built included boilers, process heaters, internal combustion engines, steam generators, production tanks, and flaring facilities.

The number of emission units constructed during the baseline year (2012) was determined from the number of SJVAPCD Authority to Construct (ATC) permits for new equipment converted to Permits to Operate (PTO) during the year. Facility construction activity occurring during 2012 was determined from a list of equipment provided by the SJVAPCD. The equipment is listed below in Table-4.3-11a.

Table-4.3-11a: Baseline Equipment Constructed in Kern County During 2012

Permitted Equipment	Total Acreage		Capacity		Count
			Rating	Units	
Boilers	<0.01	(0.01)	10	MMBtu/Hr	0.1
Cogeneration	0.20	(0.50)	33	MW	0.4
Process Heaters	<0.01	(0.01)	8	MMBtu/Hr	0.4
IC Engines	0.02	(0.01)	671	BHP*Hr	1.5
Steam Generators	0.27	(0.08)	65	MMBtu/Hr	2.4
Tanks Settings	0.15	(0.04)	3,400	BBL Capacity	3.7
TEOR Systems	0.25	(0.50)	74	System	0.5
VOCDD (Flare)	0.05	(0.01)	346	MMBtu/Hr	0.5

Notes:
Acreage numbers in parenthesis are estimates of the footprint (acres) per emission unit.
Estimates include the area required for access of equipment.

In order to determine the number of new units expected to be required for the 2035 Project build-out, the change in needed capacity was determined by assuming that capacity will grow at the same rate as the number of active wells. The number of new emission units required to provide additional processing capacity for the change in the number of active wells from 2012 to 2035 was calculated for each source category (tanks, boilers, engines, etc.) as follows. First, the total processing capacity of the equipment included in each source category was determined from the 2012 annual emission inventory for Title V oil and gas production sources which was obtained from the SJVAPCD. The Title V operators account for approximately 90% of the active crude oil wells in Kern County. To account for smaller non-Title V producers, the capacity was increased by 10%.

The increased processing capacity required for Project build out was then determined by prorating the baseline processing capacity using the ratio of the change in active well counts between 2012 and 2035. The average capacity of the baseline equipment included in each source category was then determined. Finally, the number of new emission units within a given source category required for Project build out was determined by dividing the change in processing capacity (2012 to 2035) for each source category by the average capacity of the baseline equipment.

The results of the forecasts for new emissions units are summarized below in Table-4.3-11b.

Table-4.3-11b: Forecast of Additional Equipment Needed for 2035 Project Build-Out

Permitted Equipment	Kern County Baseline		Required Acreage for New Systems	Count			
	Total Capacity	Units		Kern County	Western Subarea	Central Subarea	Eastern Subarea
Boilers	122.22	MMBtu/Hr	0.05	6	3	0	3
Cogeneration	2,046.12	MW	21.95	54	20	0	34
Process Heaters	667.24	MMBtu/Hr	0.24	43	25	17	1
IC Engines	239,045.18	BHP*Hr	1.17	102	84	0	18
Steam Generators	38,120.94	MMBtu/Hr	30.07	262	173	0	89
Production Tanks	2,993,043.30	BBL Capacity	23.21	405	170	27	208
TEOR Systems	30,495.30	System	0.28	78	20	0	58
VOCDD (Flare)	45,555.21	MMBtu/Hr	1,63	40	15	12	13

Equipment assumed to be used during construction of new facilities includes graders, tractors/loaders/backhoes, concrete/industrial saws, rubber-tired bulldozers, cranes, forklifts, cement and mortar mixers, pavers, rollers, and air compressors. Emissions estimate were calculated based on the usage hours, horse powers and load factors of the above equipment required to perform site preparation, grading, building construction, paving, and architectural coating.

Emissions from vehicle trips for construction activity were calculated by determining the number of vehicle trips required for construction of each source category (i.e., tanks, boilers, engines, etc.) as determined by the tasks to be completed for installation of new emissions units and the time to complete those tasks, as described above. The average travel distance to each Subarea was used to estimate the offsite travel distance per vehicle trip. The average onsite distance between facilities was used to calculate onsite travel distance per vehicle trip. The trip distances per Subarea are listed in Table 4.3-11c.

Table-4.3-11c: Trip Distances for Assessing Onroad Vehicle Miles Traveled for Construction

Activity	Western Subarea	Central Subarea	Eastern Subarea
Offsite Travel[1]	42.74	20.11	13.87
Onsite Travel[2]	0.21	1.15	0.40

Note:
1. Average distance from the intersection of Coffee Road and Rosedale Highway to the wells contained with the planning zone
2. The average distance is estimated by dividing the total onsite distance required to travel to the equipment (permit-units) locations divided by the total number of permit units. Travel on unpaved roads accounts for 90% of the total onsite travel.

The analysis of emissions generated in the construction of new facilities takes into account baseline and future activities. Onroad and offroad emission factors associated with construction were estimated using two models: EMFAC2011 for onroad emission factors and OFFROAD 2011 for offroad emission factors. Total emissions were calculated using the CalEEMod model.

Total emissions resulting from the construction of new facility equipment during a Project year (i.e., any year between 2015 and 2035), and the construction of facilities over the Project period (2015 - 2035) are summarized below in Tables 4.3-12 and 4.3-13. These tables show the type of equipment that would be built, the annual average number of new equipment that would be built, the total (onroad, offroad, and all portable equipment) emissions generated by the construction of the equipment, and the SJVAPCD construction emissions thresholds.

Table 4.3-12: Kern County Facility Construction Emissions during a Single Year (Tons/Year)

Equipment to be Built	Average Number of Equipment to be Built Annually	ROG	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$

VOCDD (Flare)	19	38	300	179	0	22	20
TOTAL		**940**	**7,818**	**4,662**	**6**	**572**	**509**
SJVAPCD Construction Emissions Threshold		10	10	100	27	15	15

Table 4.3-13: Total Kern County Facility Construction Emissions over the Project Period (2015 – 2035) (Tons/Year)

Equipment to be Built	Number of Equipment to be Built	ROG	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Boiler	72	116.9	1,103.7	649.0	0.9	79.0	71.5
Process Heater	273	527.9	4,227.4	2,513.0	3.5	307.9	275.0
Internal Combustion Engine (RICE)	1,145	1,894.9	17,727.2	10,512.5	14.6	1,286.6	1,152.3
Steam Generators	3,261	5,867.1	50,525.3	30,257.5	42.1	3,718.9	3,294.8

Table 4.3-13: Total Kern County Facility Construction Emissions over the Project Period (2015 – 2035) (Tons/Year)

Equipment to be Built	Number of Equipment to be Built	ROG	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Production Tanks	5,442	10,538.8	84,287.0	50,210.8	69.6	6,153.2	5,484.5
VOCDD (Flare)	407	788.5	6,304.5	3,763.3	5.2	461.7	410.6
	TOTAL	**19,734.1**	**164,175.2**	**97,905.9**	**136.0**	**12,007.3**	**10,688.8**

Total Project emission resulting from the construction of new facilities on an annual basis would exceed the SJVAPCD Criteria Pollutant Emissions Significance Thresholds except SO_2. However, constructing of new facilities would be subjected to the District's air permitting process (Rule 2201), which would ensure that all emissions would have to be fully offset. Therefore, there would be no net increase in these emissions.

Construction of Permit Exempt Equipment and Small Production Settings

Permit-exempt equipment and small production settings consist mainly of pressure vessels and piping components, and typically occupy less than ½ acre. Future production activities would entail the construction of these types of small production settings. The new equipment would have a small footprint and would require simple construction activity. Small production settings would be constructed on an as-needed basis over time and would be distributed throughout the oilfield. No information is available on the number and location of permit-exempt equipment and small production settings that would be constructed or installed during the Project years 2015 – 2035. Due lack of data and because missions from construction of permit exempt equipment and small production settings are known to be small in quantity, they were assumed to be equivalent to be 5% of the construction emissions for permitted equipment.

Total estimated emissions resulting from the construction of new Permit Exempt Equipment and Small Production Settings during a Project year (i.e., any year between 2015 and 2035) are summarized below in Table 4.3-14.

Table 4.3-14: Total Estimated Emissions from Construction of Permit Exempt Equipment and Small Production Settings

	Emissions (Tons/Year)					
	ROG	**NO_x**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
TOTAL	**47**	**391**	**233**	**0.32**	**29**	**25**
SJVAPCD Construction Emissions Threshold	10	10	100	27	15	15

This emissions listed in table indicate that the emissions of all criteria pollutants except SO_2 associated with construction activities related to Permit Exempt Equipment and Small Production Settings would exceed the SJVAPCD Construction Emissions Threshold. These types of construction activities do not require air permits and therefore these emissions would not be offset.

Construction Related to Wells

The construction activities related to wells include well drilling, rework of wells, well stimulation and well abandonment. The emissions of criteria pollutants associated with each of these activities are presented in the Tables 4.3-15 through 4.3-18 below. As discussed above, the air analysis used the baseline level of wells that were operating in 2012 and an assumed number of wells of 82,136 operating in in 2035. The number of new wells projected to be built in 2035 (4,083) exceeds the number of wells that are projected to be authorized under this Project and therefore these estimates are considered conservative. This EIR will not authorize Kern County permitting any more than 3,647 new well permits in a single year. The total emissions will be adjusted (Table 4.3-32D) to account for the smaller number of wells authorized, compared to the number of wells used in the calculations.

The well count numbers for drilling, rework, well stimulation, and well abandonment for the baseline year 2012 were determined using preliminary information obtained from the California Division of Oil, Gas and Geothermal Resources (DOGGR) District-4 Field Office. The petroleum industry provided projected well counts during the Project period 2015 through 2035.

SJVAPCD Construction Emissions Threshold		10	10	100	27	15	15

The above tables indicate that the emissions associated with well construction activities would exceed SJVAPCD Construction Emissions Threshold. Since the San Joaquin Valley Project region is nonattainment for PM_{10}, $PM_{2.5}$, and ozone, well construction related criteria pollutant emissions would result in considerable net increase of the criteria pollutants NO_X, VOC, CO, PM_{10} and $PM_{2.5}$ and would be significant impact. Well construction activities do not require air permits and therefore these emissions would not be offset.

Summary of Construction Emissions

In summary, emissions from the new facility and well construction at a Project level would result in emissions levels that would exceed SJVAPCD Construction Emissions Threshold. Only the new facility construction emissions would be required to be off-set because it would be a condition of the SJVAPCD air permit. Although offset all permitted construction emissions that are above baseline would be offset, other equipment and activities are exempt. In addition, well construction emissions have no offset requirements. Since these emissions exceed the SJVAPCD Construction Emissions Threshold and would not be offset, they would result in a cumulatively considerable net increase of criteria pollutants for which the Project region is nonattainment and therefore the construction impacts would be significant.

Operational Emissions

Operational emissions sources include emissions from oil and gas production facilities which are stationary permitted sources, emissions from permit-exempt sources, such as small pumps and generators, and emissions from mobile sources, such as vehicles. The analysis that follows is consistent with the recommendations of the SJVAPCD's March 2015 Guidance for Assessing and Mitigating Air Quality Impacts that operational criteria pollutant emissions associated with

permitted sources and activities be evaluated separately from non-permitted sources and activities (SJVAPCD 2015a, Section 8.3.3).

Permitted Stationary Equipment

Oil and gas activities that would be authorized under the Project would result in the operations of several types of stationary permitted emission sources, such as boilers, cogeneration plants, process heaters, reciprocating internal combustion engines, steam generators, production tanks, thermally enhanced oil recovery wells, and VOCDD (flares). The SJVAPCD air permit program requires the application of District Rule 2201 (New Source Review) which mandates that new permitted stationary equipment include BACT and that all criteria pollutant emissions be offset to below thresholds of significance established by the District. BACT represents the most stringent control technique or limitation that has been achieved in current technology for the same class of source. In addition, more effective control technique must be used where possible. Emissions offsets may be provided by emissions reductions, or may be obtained by purchasing emissions reduction credits from another party. Therefore, the net impact of offsetting is a reduction of emission at the regional scale.

For the evaluation of emissions that would be generated from this Project, emissions from permitted stationary equipment used for crude oil and natural gas production in Kern County were determined from the 2012 emission inventories obtained from the Air District for oil and gas production companies subject to Title V permit requirements (Table 4.3-20). The permitted emission sources evaluated in this analysis includes the following:

- Boiler;
- Process Heater;
- Internal Combustion Engine (RICE);
- Steam Generators;
- Production Tanks;
- Thermally Enhanced Oil Recovery Wells (TEOR Wells);
- VOCDD (Flare);
- Fugitive $PM_{10;}$ and
- Fugitive VOC.

Since the Title V oil and gas production sources account for approximately 90% of the active wells in the County and more than 95% of the total oil production in the County, it was assumed that they also account for 90% to 95% of the emissions from equipment used by the oil and gas sector. To account for the remaining emissions from small oil and gas operators, not subject to Title V permit requirements, emissions were increased by 10%.

Table 4.3-20: Estimated Change in Operational Emissions For Stationary Source Equipment

Change in Equip. Emissions	Change in Capacity	Capacity Units	Kern County Change in Emissions from Stationary Source Equipment					
			NO_x TPY	VOC TPY	CO TPY	SO_x TPY	PM_{10} TPY	$PM_{2.5}$ TPY

Total Emissions All O&G Sources (TPD)			3.87	5.33	5.94	0.64	1.85	1.85

Source: Vector 2015

The increase in capacity required for future production was assumed to be proportional to the increase in the number of active wells. The number of new emission units was estimated from the change in capacity and the average size of the emission unit.

Project emissions would exceed the SJVAPCD Operational Emissions and therefore would represent a potentially significant impact. The annual contribution of PM_{10} and $PM_{2.5}$ would be almost 30 times the threshold. The emissions of ozone precursors (NO_x, ROG, and CO) would exceed their respective thresholds: NO_X would be almost 50 times the threshold, VOC more than 170 times the threshold, and CO more than eight times the threshold. However, all emissions increases from permitted equipment plus the 10% allowance from non-permitted equipment would be required to be fully offset pursuant to District Rule 2201. Offsets for emissions of NO_X and VOC would be required at a ratio of 1 to 1.5. Other criteria pollutants are assumed to be offset at a ratio of 1 to 1. Therefore, there would be no net increase in these emissions.

Permit Exempt Equipment

District Rule 2020 exempts equipment or activities that emit less than 2.0 lb/day or 75 lb/year of each air contaminant, and for some special categories of equipment. Most crude oil and natural gas production wells emit less than 2.0 lb/day and as such are permit exempt pursuant to Rule 2020. However, at a Project level, the combined emissions from permit exempt equipment at wells could results in significant impacts because oil and gas wells operations generate fugitive VOC emissions from well head piping components and from downstream equipment, the latter being normally accounted for on District permits. Fugitive VOC emissions from wells are subject to leak detection and repair (LDAR) requirements pursuant to District Rule 4409 and Rule 4401.

Fugitive VOC emissions from the wells were estimated based on the total number of active and idle wells in Kern County (Table 4.3-21), and were determined using weight fraction of VOC for light oil and heavy oil obtained from the U.S. Department of Interior, Users Guide for 2014 Gulfwide Offshore Activities Data System (Bureau of Ocean Energy Management 2014), and EPA approved average leak rate equations for a 2,000 ppmv leak. The calculation procedures include the recommendations contained in District Policy APR2015. The uncontrolled and the controlled fugitive VOC emissions from the wells, on a County-wide basis are summarized below. The number of idle wells is the same for every Project year 2015 – 2035, and was calculated as the average of the number of idle wells reported to DOGGR from 1999 through 2014.

Table 4.3-21: Uncontrolled and Controlled Fugitive Volatile Organic Emissions

	Eastern	31,511	5,297	236
	Totals	70,037	11,773	2,946
SJVAPCD Threshold*				10

Note: *The SJVAPCD threshold is set for ROG. The Kern County CEQA Implementation Document (June 2004) states the equivalence of ROG and VOC

The VOC fugitive emissions from permit exempt equipment would exceed the SJVAPCD threshold for ROG of 10 tons per year. ROG, which is an ozone precursor, is a criteria pollutant for which the Project region is nonattainment. Therefore the VOC fugitive emissions would have a significant impact.

Mobile Sources

Mobile emissions sources include onroad sources of emission, such as gasoline fueled light duty autos and heavy-duty diesel trucks; offroad sources, such as trucks and tractors, and portable equipment, such as accumulators, generators, pumps, etc. Emissions are generated from three operational activities: routine business travel, routine well operations (and facility inspections), and routine well maintenance. Routine business travel includes employee and contractor commute and the transport of material needed for daily business; emissions are generated by onroad sources and fugitive dust. Routine well operations include onsite travel on paved and unpaved oilfield roads to conduct daily field operations; emissions are generated by onroad sources and fugitive dust. Routine well maintenance includes travel and use of equipment to conduct maintenance and treatment activities;

The analysis of emissions generated by mobile sources include emissions and fugitive dust generated by onroad sources during routine business travel and routine well operations; and by onroad, offroad and portable equipment sources during routine well maintenance. Emission factors for the onroad mobile sources were calculated using the EMFAC2011 model; emission factors for offroad sources and portable equipment were calculated using the OFFROAD2011 model. Final emissions were calculated combining the emission factors with activity data obtained from industry or from well records obtained from DOGGR. The assumptions and factors associated with each of these types of mobile sources are discussed in detail below.

Routine Business Travel

This activity includes employee and contractor commute and the transport of material needed for conducting day-to-day business. Gasoline fueled light duty autos (LDA) were assumed for daily commute and general business activities, and heavy-duty diesel trucks (T7-Single) were assumed for the transport of material and supplies. The number of vehicle trips per year depends on the number of petroleum industry employees and the average vehicle occupancy.

The number of people employed by the petroleum industry during the baseline year was obtained from the U.S. Bureau of Labor Statistics (BLS). The 2012 baseline employment was allocated to the individual planning zones based on the percentages of the active wells included in each Subarea during 2012. Employment in future Project years in was assumed proportional to the number of active wells.

SJVAPCD Rule 9410 (Ride Sharing) requires that companies with more than 100 employees reporting to the same location participate in a ride sharing program, and estimates the average vehicle occupancy expected to be achieved.

Emissions generated by routine business travel are estimated in Table 4.3-22. Truck trips required for the transportation of freight and miscellaneous supplies were calculated using "truck trip generation equations" derived from the report *Truck Trip Generation Study, City of Fontana, August 2003*. The vehicle miles traveled per trip was determined based on a weighted average travel distance to the wells in the Subareas. Fugitive dust emissions resulting from onroad travel were calculated using the EPA AP42 procedure.

Table 4.3-22: Estimated Annual Criteria Pollutant Emission Generated by Routine Business Travel (Tons per year)

Year	NO_X	ROG	CO	SO_X	PM_{10}	$PM_{2.5}$
2012	93.1	26.2	258.7	0.5	14.8	5.8
2035	28.5	11.1	121.3	0.8	21.2	7.2

Routine Well Operations

Emissions generated by routine well operations are estimated in Table 4.3-23. This activity includes onsite travel on paved and unpaved oilfield roads to conduct day-to-day field operations. Offsite travel on paved public roads to reach the oilfield destination is accounted for in "Routine Business Travel."

Oilfield production facilities and wells are routinely inspected to ensure proper operation. Light duty, gasoline fueled trucks are assumed to provide transportation for these types of operational activities. Chemical treatment of wells to prevent corrosion and scale formation may also be conducted using light duty gasoline fueled trucks as well as heavy duty diesel fueled trucks required for delivery of chemicals.

The number of annual trips for the day-to-day management of wells was calculated assuming that the wells are inspected on a weekly basis, and that an oilfield operator manages 200 wells with one trip.

Actively producing crude oil and natural gas wells are normally treated to prevent corrosion and scale formation. Treatment is usually handled by an oilfield service companies. Onsite travel for well treatment to prevent corrosion and scale formation depends on the type of treatment provided to the well. 180 well site visits per year for treatment were assumed for each well. The

trips to the well site are about evenly distributed between light duty truck trips and heavy duty trucks trips. Onsite vehicle miles traveled per trip was estimated for two cases: travel to permitted equipment; and travel to well site locations.

Emissions generated by activities related to inspection of facility equipment are estimated in Table 4.3-24. Facilities were assumed to be inspected every other workday. The number of facilities was increased by 10% to account for non-permitted sources. The average trip length for the inspection and operation of permitted equipment included within a Subarea was calculated based on the equipment locations within the Subarea. The average trip length for well surveillance and treating was determined from the average travel distance between the wells. Onsite travel was assumed to occur for 90% on unpaved oilfield roads.

Routine Well Maintenance (Pulling)

Emissions generated by routine well maintenance are estimated in Table 4.3-25. Well maintenance (or well workover or pulling) includes routine activities conducted on downhole equipment to maintain the well in proper operating conditions. It entails onroad and offroad mobile sources and portable equipment.

Well pulling counts were estimated to be equal to 50% of the total active oil and gas production wells, based on data provided by one operating company and discussions with other company representatives.

The number of vehicle trips depends on the number of days required for maintenance, which, in turn, depends on the well depth. The well depth and the number of days required to complete the activity is also needed to calculate the total number of operating hours and the emissions resulting from the use of offroad mobile sources and portable equipment required. The number of days required for conducting well maintenance was determined from data provided by one operating company. The equipment required for conducting well maintenance activities was obtained from one oilfield production company (Vector 2015).

Fugitive dust emissions from onsite travel were estimated assuming that 90% of the onsite travel occurred on unpaved oilfield roads.

Total Mobile Sources Emissions

The total emissions generated by mobile sources including routine business travel, well operations, facility inspection and well maintenance are calculated in Table 4.3-26.

SJVAPCD Operational Emissions Threshold (TPY)		10	10	100	27	15	15

The total annual emissions of all criteria pollutants from mobile sources associated with business travel, well operations, facility inspection, and well maintenance do not require air permits and, therefore, would not be offset. Table 4.3-26 indicates that in 2035 these emissions would exceed SJVAPCD Operational Emissions Thresholds with the exception of SO_X. Since the San Joaquin Valley Project region is in nonattainment for PM_{10}, $PM_{2.5}$, and ozone, criteria pollutant emissions from mobile sources operational activities emissions would result in considerable net increase of the criteria pollutants NO_X, VOC, CO, PM_{10} and $PM_{2.5}$ and would be a significant impact.

Summary of Operational Emissions

In summary, emissions from permitted stationary sources, permit-exempt equipment, and mobile sources at a Project level would result in emissions levels that would exceed SJVAPCD Operational Emissions Threshold. Only the permitted stationary sources would be required to be off-set because it is a condition of SJVAPCD air permit. Since the remaining emissions would exceed the SJVAPCD Construction Emissions Threshold and would not be offset, operational emission would result in considerable net increase of the criteria pollutants NO_X, VOC, CO, PM_{10} and $PM_{2.5}$ and would be significant impact.

Criteria Pollutant Modeling

Ambient air quality modeling results for NO_2, SO_2, and CO, PM_{10} and $PM_{2.5}$ is sometimes warranted for large stationary sources near potentially sensitive receptors. Since the Project consists of Zoning Code Amendments that will regulate a broad range of oil and gas activities located throughout the Project Area, and excludes the types of large stationary sources (e.g., new and expanded cogeneration plants) that could warrant ambient air quality modelling, this modelling was not required to evaluate the potential significance of Project-related air emissions. TAC modelling to assess health risks was completed as described below, and the toxicity of criteria pollutants more generally is discussed above.

Visibility

A visibility screening analysis for each Class I area located within 100 kilometers of the Project was not conducted as the Project is not expected to generate large individual plumes that may be visible at a distance.

Carbon Monoxide "Hot Spots"

The Kern County Air Quality Assessment Guidelines require preparation of a CO "Hot Spots" analysis for projects meeting the following criteria:

- The proposed Project impacts an intersection or roadway identified at Level of Service (LOS) E or worse;
- The proposed Project will add signalization and/or channelization to an intersection; and
- Sensitive receptors, such as residences, schools, hospitals, etc., are located in the vicinity of the impacted intersection or proposed signalization.

A CO "Hot Spots" analysis is not appropriate as the Project does not meet the above criteria.

In summary, emissions from construction and operational activities would violate applicable air quality standards at a Project level, specifically the SJVAPCD Construction and Operational Emissions Thresholds, respectively. Only certain permitted portions of these emissions would be required to be offset under SJVAPCD regulations. The non-permitted portion of the emissions is not required to be offset and is in exceedance of SJVAPCD regulations. Therefore, Project-related impacts to air quality would be significant before mitigation.

Total Project Emissions

Table 4.3-27 presents the annual total estimated emissions from both construction and operational activities (permitted, non-permitted, and permit exempt equipment) for the Project, including:

- Construction of permitted equipment;
- Operation of permitted equipment;
- Construction of permitted-exempt equipment and small production settings;
- Well abandonment;
- Drilling;
- Stimulation;
- Rework;
- Maintenance;
- Operation;
- Fugitive VOC from well heads;
- Routine business travel; and
- Facility inspection.

The annual emissions from operation of permitted equipment have been calculated by dividing the projected change in the permitted equipment emissions at Project build out in 2035 by the number of Project years from 2015 to 2035 (i.e., 21 years).

Table 4.3-27: Total Estimated Emissions from the Project in Tons per Year

Year	NO_X	ROG	CO	SO_2	PM_{10}	$PM_{2.5}$
2012	21,834	10,864	16,307	413	2,593	1,899

Table 4.3-28 presents the total estimated emissions from the Project from construction and operation, including equipment and mobile sources, and excluding the permitted emissions requiring offsets under District regulations. Tables 4.3-28 and 4.3-29 include emissions estimates from:

- Construction of permitted-exempt equipment and small production settings;
- Well abandonment;
- Drilling;
- Stimulation;
- Rework;
- Maintenance;
- Operation;
- Fugitive VOC from well heads;
- Routine business travel; and
- Facility inspection.

Table 4.3-28: Total Estimated Emissions from the Project Non-Permitted Equipment and Activities in Tons per Year

Year	NOx	ROG	CO	SO_2	PM_{10}	$PM_{2.5}$

2032	5,450	7,019	11,426	17	1,245	275
2033	5,494	7,054	11,515	17	1,264	278
2034	5,525	7,099	11,584	17	1,278	281
2035	5,561	7,142	11,662	17	1,296	283

Because the Baseline year of 2012 also included construction of 3,392 new wells and other construction and operational Project activity, Table 4.3-29 shows the incremental new emissions from the Project compared to the Baseline year 2012. Table 4.3-29 presents the total estimated incremental increase in emissions from the same Project non-permitted equipment and activities in tons per year as for Table 4.3-28 above.

For construction activities, all non-permitted emissions estimated for each Project year 2015 – 2035 are included in the table.

For operational activities, for each year only the non-permitted emission associated with activities started in 2015 have been included. In particular:

- The incremental emissions from the activities of routine business travels, routine well operations, and facility inspections have been calculated by determining for each year and for each activity the emissions per active well, and then multiplying the emissions per active well by the number of new active wells compared to the baseline active wells;
- The incremental emissions for fugitive VOC from well heads have been calculated by determining for each year the fugitive VOC per well (including active plus idle wells), and then multiplying the fugitive VOC per well by the new wells (active plus idle) compared to the baseline number of active plus idle wells; and
- The incremental emissions from routine well maintenance have been calculated by determining for each year the emissions per well undergoing maintenance, and then multiplying them by the incremental number of well undergoing maintenance compared to the baseline year.

Therefore, Table 4.3-29 presents the total non-permitted incremental emissions from the Project, excluding the non-permitted emissions from oil and gas production and processing activities initiated before the start of the Project in 2015.

Average Annual Incremental Emissions per Well		**1.68**	**0.73**	**2.38**	**0.003**	**0.19**	**0.07**

Table 4.3-31 presents the total estimated incremental increase in emissions from the Project non-permitted equipment and activities in tons per year, obtained by multiplying the emissions per well calculated in Table 4.3-30 by the maximum number of new wells that may be authorized, namely 3,647 new wells every year. The bottom line of the table shows the average annual incremental emissions of the Project, obtained by averaging the annual projected incremental emissions over the Project years 2015 – 2035.

Table 4.3-31: Total Estimated Incremental Emissions from the Project Non-Permitted Equipment and Activities per New Well in Tons per Year

Year	New authorized wells	NOx	ROG	CO	SO_2	PM_{10}	$PM_{2.5}$

	Average Project Annual Incremental Emissions	**6,124**	**2,666**	**8,692**	**13**	**684**	**254**

Construction and operations associated with the Project would occur concurrently and have to be considered in total. Total Project emissions continue to be a major emission source as identified in Table 4.3-28, as well as incremental increases in Project emissions as shown in Table 4.3-29. Because the Project's incremental emissions would exceed the SJVAPCD thresholds for all

criteria pollutants except SO_2 for which the Project region is nonattainment under an applicable federal or state ambient air quality standard, this impact is considered significant before mitigation.

The implementation, as mitigation, of a DMC or VERA to reduce criteria pollutants of NO_X, ROGs, and PM_{10} net incremental emissions generated by a project has been incorporated into development projects in Kern County since 2008. They are not a "voluntary" agreement with the SJVAQCD but are mandated by enforceable mitigation measures and are therefore called DMC. The emission reductions required by a DMC are implemented within the SJVAB in quantities sufficient to fully mitigate the Project's air quality impacts such that development of the Project could be considered to result in no net increase in the designated criteria pollutant emissions over the criteria pollutant emissions that would otherwise exist without the development of the Project, all to be verified by the SJVAPCD. Thus, the DMC results in greater reductions than would otherwise occur under the District's ISR, since the ISR does not require ROG reductions and the ISR only requires a percentage of reductions rather than full reductions of NO_X and PM_{10} resulting from Project construction and operations. When adopting the ISR and the subsequent VERA/DMC programs, the District acknowledges that as ROG is a precursor to ozone, the reductions are not required in the ISR. (Note: In the VERA/DMC, the reductions are achieved by increasing the NOx and PM_{10} tonnage for Project levels; see SJVAPCD 2005b; this and other key SJVAPCD documents are included as Appendix L of this EIR.) As the actual amount of ROG reductions achieved from NO_x and PM_{10} reductions is not absolutely certain, Project emissions are still considered significant and unavoidable; however all feasible and reasonable mitigation has been required to reduce criteria pollutants as close to "no net increase" as scientifically possible. This approach has been found legally sufficient by court rulings in the following cases; *California Building Industry Assn. v. San Joaquin Valley APCD*, Fresno County Case No. 06 CECG 02100 DS13; *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District*, Federal District Court, Eastern District of California, Case No. 1:07-CV-00820-LJO-DLB; and *Center for Biological Diversity et al. v. Kern County*, Fifth Appellate District, Case No. F061908.

The projects that have been required to implement DMCs are residential, commercial and industrial projects. Those projects have one developer and a finite construction to completion schedule. The oil and gas activities in the proposed Project will be implemented by hundreds of individual operators, and impacts will occur every year on a varying basis dependent on how many new wells and new activities occur. The number of new wells and activities covered by this EIR and the new Oil and Gas Conformity Review is a not to exceed of 3647 permits a year. To implement the required mitigation reductions, the mitigation will require an agreement between the Kern County Board of Supervisors and the SJVAPCD Board for an Oil and Gas Emission Reduction Agreement (OG-ERA) or, if that agreement is not completed, an ERA between individual well permittees and the Air District. The OG-ERA agreement will focus on the core requirement that the calculated emissions, that are not otherwise regulated and offset by District stationary source rules, from NO_x, ROG and PM_{10}, from Project construction and operations activities shall be mitigated to a level of no net increase. The mitigation will be

required, as discussed below, for new well permits under the Oil and Gas Conformity Review and Minor Activities Permit, when applicable.

The mandated emission reductions will be achieved by a menu of options that range from paying a calculated mitigation fee for use in doing emission reduction projects through a grant-type program, to applicant's changing equipment on existing operations or proposing projects for implementation instead of paying the fee. The first pathway, the mitigation fee, will involve paying a calculated mitigation fee to the County on each permit for implementation of the OG-ERA. The mitigation fee shall be placed in a fund, established by the Board of Supervisors, with an additional administrative fee collected for the SJVAPCD. Expenditure of the mitigation funds shall be for certified air quality reduction projects managed jointly by Kern County and the SJVAPCD. Final determination of air quality reductions achieved shall be under the determination of the SJVAPCD; however, selection of specific projects shall be determined by Kern County in consultation with District. Projects to off-set criteria pollutants under the OG-ERA would be given priority for Kern County valley locations and be implemented on a yearly basis. Multi-year phased projects could also be funded. The fee will be based and tiered to address different configurations of equipment that could be used, as well as other variables such as the depth of the well at standard depths of 3,000, 5,000, and 10,000 feet. An example of such changes to equipment could be adding diesel particle filters or upgrading to cleaner engines that are not currently required. Under a Small Producers Assistance Program being developed by the County for permit implementation, phased payment of the fee will also be offered.

Another mitigation menu option would be for an applicant, instead of paying the fee, to present, at the time of permit application, a proposed emission reduction project with supporting documentation that describes the proposed Project and emission reductions, including a description of the methodology and quantifications of emission reductions for NO_x, ROG and/or PM_{10}. The proposed emission reduction project package would be reviewed by the SJVAPCD for methodology and verification of the emission reduction tonnage requested, and reviewed by both Kern County and the SJVAPCD for the Project location and structure and timeline for implementation. The reductions will then be used as credits for compliance with the mitigation measure requirements. Examples of emission reduction projects that could be submitted by the applicant in lieu of mitigation fee payments include changes to Applicant-owned fleets and trucks, implementation of van pools or other trip reduction programs that can be quantified and enforced, and paving onsite private access roads.

As an agreement between the SJVAPCD and County, the requirements of the OG-ERA are limited to those impacts resulting from the Project that occur within the SJVAB. However, as areas of the Project are near the border of the SJVAB and the SCAB, some mobile source emissions associated with the Project could occur outside the SJVAB. Although the OG-ERA does not require full offsets of these out of basin emissions, projects under consideration for implementation would result in reductions of potential transport and cross-basin emissions. Other emissions reductions projects that are implemented pursuant to the OG-ERA may also result in additional emissions reductions within the SCAB.

The number of well permits issued annually will vary based on a variety of factors, and can range from 1,800 to 3,647. Air emissions modelling used in this EIR conservatively assumed a higher well count than 3,647 (with a maximum annual well count of 4,083), the Project Description includes a yearly total wells not to exceed 3,647. The estimated incremental emission is provided in Table 4.3-32, which shows the next 21 years of permitting and the emissions each year for an individual well. The emission totals include all Project-related construction and operational activities that are not subject to the District's stationary source permitting and emission offset rules, such as mobile sources like construction equipment, maintenance trucks, employee automobile trips, construction of access roads and well pads, drilling, accessory activities, well operation, and eventual abandonment. Emissions from idled wells are also included. The annual totals also include mandatory emission reductions from existing legal requirements, such as federal and state mandated changes for certain types of engines which will cause NO_x emissions to increase slightly while PM_{10} declines. These Project-related construction and operational emissions that are not required to be offset under District stationary source permitting rules are then averaged for all wells over a 20-year period to illustrate how the OG-ERA will generate totals.

Table 4.3-32: Total Estimated per Well Emissions for Preliminary Considerations in OG-ERA

Year	New Projected Wells	NO_x	ROG	PM_{10}	Per well Projected Emissions	Maximum Authorized Wells	Projected Emissions Scaled to 3,647 Wells
2015	3,966	2.9	0.5	0.19	3.59	3,647	3.30
2016	3,970	2.78	0.53	0.19	3.50	3,647	3.22
2017	3,976	2.68	0.56	0.19	3.43	3,647	3.15
2018	3,982	2.43	0.58	0.19	3.20	3,647	2.93
2019	3,988	2.21	0.6	0.18	2.99	3,647	2.73
2020	3,994	1.98	0.63	0.18	2.79	3,647	2.55
2021	4,000	1.9	0.66	0.18	2.74	3,647	2.50
2022	4,006	1.63	0.67	0.18	2.48	3,647	2.26
2023	4,012	1.56	0.7	0.18	2.44	3,647	2.22
2024	4,018	1.49	0.72	0.18	2.39	3,647	2.17
2025	4,024	1.45	0.74	0.18	2.37	3,647	2.15
2026	4,030	1.27	0.76	0.18	2.21	3,647	2.00
2027	4,036	1.24	0.78	0.18	2.20	3,647	1.99
2028	4,042	1.21	0.8	0.18	2.19	3,647	1.98
2029	4,048	1.19	0.82	0.18	2.19	3,647	1.97
2030	4,054	1.2	0.84	0.19	2.23	3,647	2.01
2031	4,060	1.21	0.86	0.19	2.26	3,647	2.03
2032	4,066	1.22	0.88	0.2	2.30	3,647	2.06
2033	4,071	1.23	0.89	0.2	2.32	3,647	2.08

Table 4.3-32: Total Estimated per Well Emissions for Preliminary Considerations in OG-ERA

Year	New Projected Wells	NO_x	ROG	PM_{10}	Per well Projected Emissions	Maximum Authorized Wells	Projected Emissions Scaled to 3,647 Wells
2034	4,077	1.23	0.91	0.21	2.35	3,647	2.10
2035	4,083	1.24	0.92	0.21	2.37	3,647	2.12

Based on current emissions estimates for the average emissions per new well over the next 21 years, the OG-ERA would include provisions to further reduce the proposed Project's emissions by an estimated average total ranging from 2.67 tons per year to less than 1.00 ton based on equipment configuration. Based on that estimated average, amount the OG-ERA will generate between 4,086 tons to 8,279 tons per year of combined ROG, NO_x, and PM_{10}.

The SJVAPCD 2014 Annual Report on the Indirect Source Review Program shows the cost currently as $6,974 per ton to implement projects. Based on this estimated cost, which will be adjusted for depth of well and equipment configuration, the mitigation fee will be range from $18,603 to $8,000, per well plus an administrative cost to the Air District to be determined which is up to 4%. The estimated amount generated every year for in mitigation fees to fund emission reduction projects ranges from $30 million to $14 million (based on an estimate of 1,800 permits year). The total fees collected by the OG-ERA over 21 years (again using the estimate of 1,800 permits per year) will range from $600 million to $280 million. Emission reductions funded by the OG-ERA mitigation fees will offset the impacts from the new oil and gas activities resulting in a "no net increase" to contributions of designated criteria air emissions in the entire air basin. While the size and scope of such projects has not been implemented in the SJVAPCD, projects have clearly been implemented in full compliance with the ISR, VERA, DMCs. CARB also has an existing program called the Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program) (CARB 2014, included as Appendix E of this EIR) which provides grant funding for cleaner than required engines and equipment. Eligible projects include cleaner on-road, off-road, marine, locomotive, law and garden, light duty passenger vehicles being scrapped and agricultural equipment. The Carl Moyer Program has quantified and validated that those reductions can be achieved. Based on these existing programs and the expansion of potential emission reduction projects based on the funding that would be available over a 21-year period, the following are examples of potential projects and costs that will achieve the required emission reductions:

Pave 500 miles of unpaved County-maintained roads in Kern County ($1 million a mile)	$310 million
Replace and upgrade vehicle fleets for County, cities, and other eligible entities	$50 million
Upgrade school buses for public, private, churches, charitable organizations, and other eligible entities	$150 million
Replace cars in disadvantaged communities	$120 million

Truck upgrades and replacement for eligible entities	$100 million
Fund new and upgraded transit programs	$120 million

While emission reduction projects will be prioritized in Kern County, future years will involve emission reduction projects in other counties in the SJVAB. While the reductions will offset NO_x and PM_{10} emissions to net zero, actual reduction of ROG remains not possible to certify as 100% reduced to zero. Therefore, this uncertainty and small unknown quantities remaining under CEQA make air quality impacts both project and cumulatively significant and unavoidable. However, all reasonable and feasible mitigation has been required and will reduce the air emissions as close to a "no net increase" from the current emissions over the next 21 years as is scientifically possible to quantify and confirm.

Mitigation Measures

Implement MM 4.3-1 through MM 4.3-4, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation

Impact 4.3-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations

Health Risk Assessment

The Health Risk Assessment (HRA) evaluated the potential cancer risk and acute and chronic non-cancer risk from toxic emissions associated with well construction, drilling, completion, and oil and gas processing equipment. The HRA was conducted by the County Application Technical Committee (CATC) (CATC 2015) and is provided in Appendix M of this EIR. A summary is provided below.

The HRA was performed following the OEHHA, Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2015). As recommended by the guidelines, the CARB Hotspots Analysis and Reporting Program, Version 2 (HARP2) (CARB, 2015) was used to perform a refined health risk assessment for potential future construction and operational emissions. HARP2 includes the following three modules: a dispersion model, an exposure/dose module, and a risk module. The dispersion model incorporates the EPA's AERMOD model and the risk model includes the latest changes made by the State of California to the Risk Assessment inputs.

In general, risk assessments involve four steps:

- Emissions Estimations;
- Exposure Assessments;
- Dose-response Assessments; and

- Potential Health Risk Quantification.

Emission Estimations

Emission estimates involve identifying and quantifying emissions of potential regulated toxic substances from each source. The OEHHA determines the relative toxicity of chemicals regulated by the State of California and determines whether or not they are carcinogenic or possibly associated with short-term or long-term non-cancer health impacts. Toxic emissions from each source were quantified.

According to the CAA, "hazardous air pollutants" include a variety of pollutants generated or emitted by industrial production activities. HAPs are also referred to as TACs under California law (pursuant to the Tanner Act of 1983, codified at Health and Safety Code Section 39650 et. seq.). The State of California determines the toxicity of each pollutant and assigns each a potency factor. Those factors are built into the HARP2 risk assessment model.

For purposes of this study, all $PM_{2.5}$ from diesel equipment associated with well drilling (including potential dust and mobile equipment) is assumed to be toxic diesel PM. California listed diesel exhaust or DPM as a TAC in 1998. The DPM toxicity number incorporates the cumulative health effects of all of the constituents of diesel exhaust into one risk number. DPM is the only TAC expected emitted from well construction and completion.

The risk from the oil processing equipment is due for approximately 94% to benzene, as well as formaldehyde and PAHs. All three are byproducts of natural gas combustion. Potential health effects from these compounds are summarized here.

Construction Emissions

For well construction, well drilling and well completion, seven phases of construction were considered. All $PM_{2.5}$ were considered to be toxic DPM. Emissions from the following seven construction phases were assumed to occur simultaneously, although these activities are unlikely to all occur concurrently:

- Land Preparation;
- Drilling Survey;
- Well Drilling;
- Well Completion;
- Well Flowline;
- Pump Unit; and
- Electrical.

Emissions from the drilling of well to depths of 2,000 feet, 5,000 feet, and 10,000 feet were evaluated as emissions sources. According to DOGGR, only 3% of the wells drilled in Kern

County in 2014 were at depths of 10,000 feet or greater. An initial year of 2015 was modeled and the final year of 2035 was modeled. For the 10,000-foot well, the year 2018 was also modeled.

Table 4.3-33: Estimated Emissions used in the HRA Analysis

Depth Feet	Year[1]	Total $PM_{2.5}$[2] pounds	Annual $PM_{2.5}$[3] pounds	Days[4]
10,000	2015	516.89	17.23	23
10,000	2018	444	14.8	23
10,000	2035	151.83	5.06	23
5,000	2015	171.18	5.71	8
5,000	2035	35.86	1.20	8
2,000	2015	97.12	3.24	4
2,000	2035	20.42	0.68	4

Notes:
[1] 2029-2035 emissions are the same.
[2] From Vector Environmental Spreadsheet titled "DRL_EMISSIONS.xlsx", worksheet "EMF".
[3] Total emissions divided by 30 years per OEHHA's HARP2 exposure duration requirements.
[4] From Vector Spreadsheet titled "DRL_EMISSIONS.xlsx", worksheet "MUD".

Operational Equipment Emissions

Emissions from operational activities were evaluated separately from construction activities. Two different scenarios were evaluated: oil processing and natural gas.

Emissions from the following operational equipment (as provided by Vector) were analyzed as the operational emissions in the oil processing scenario:

- Two – 1,000 barrel (bbl) aboveground tanks;
- One – 3,000 bbl aboveground tank;
- One 10 MMBtu/hour flare;
- Truck loading rack;
- Fugitive emissions from valves, flanges, and one underground sump; and
- Thermally enhanced oil recovery (TEOR) equipment.

Emissions from the following natural gas combustion equipment were analyzed in the natural gas scenario:

- One new 100 MMBtu/hour flare;
- One – 8 MMBtu/hour process heater;
- One – 10 MMBtu/hour boiler;

- One – 85 MMBtu/hour steam generator; and
- One – 33 MW cogeneration plant.

Potential toxic emissions from each of these devices are summarized in Appendix A of the HRA.

Exposure Assessment

- The exposure assessment was used to evaluate a receptors potential exposure to emissions through inhalation, ingestion, and dermal exposure. A receptor can be hypothetically exposed to a substance through several different pathways. Typically, the primary environmental exposure pathway in an HRA is direct inhalation of gaseous and particulate air pollutants. However, there is the potential for exposure via non-inhalation pathways due to the deposition of particulate pollutants (diesel particulate matter) in the environment.
- Air dispersion modeling was used to estimate ground-level concentrations. The concentrations are then multiplied by the worst-case potential emission rate for each substance to obtain the corresponding ground-level concentrations. A description of the models and the assumptions used are included in the HRA (Appendix M).
- Three different locations within Kern County were assessed in order to capture various terrains, wind speed, wind direction and other dispersion characteristics within Kern County:
  - Western Subarea – Midway Sunset Oilfield,
  - Central Subarea – No. Shafter Oilfield, and
  - Eastern Subarea – Kern River Oilfield.

Dose-Response

The dose-response assessment describes the quantitative relationship between a human's exposure to a substance (the dose) and the incidence or occurrence of an adverse health impact (the response). For carcinogens, OEHHA has developed cancer potency factors. A cancer potency factor represents the upper bound probability of developing cancer based on a continuous lifetime exposure. The cancer potency factor does not represent a threshold under which a person would not develop cancer, but instead is used to estimate the probability of developing cancer.

For non-carcinogenic chemicals, OEHHA has developed Recommended Exposure Limits (RELs) for acute and chronic impacts. RELs represent concentration thresholds at which no adverse noncancer health effects are anticipated. For chemicals that are not deemed by the State of California as possible carcinogens, but which may pose either short-term (acute) or other non-cancer long-term (chronic) health effects, a Hazard Index (HI) calculation of potential risk is also required by the air district and the State as part of an HRA.

Significance Thresholds

SJVAPCD publishes CEQA significance thresholds for potential health risk from proposed projects. Currently, risks from a project that are less than the following regulatory thresholds are considered not to be significant and are, therefore, acceptable:

- Cancer risk equal to or less than 10 in one million;
- Chronic hazard index equal to or less than 1; and
- Acute hazard index equal to or less than 1.

These metrics are generally applied to the maximally exposed individual (MEI). There are separate MEIs for residential exposure (i.e., residential areas) and for worker exposure (i.e., offsite work places).

As discussed above, the HRA was performed using the HARP2 model. The following table provides the estimated cancer risk from construction activities for the three well depths in each Subarea.

As shown, well construction activities in the Western and Central Subareas have the highest potential risk. Risks at locations between the construction activities and the distance indicated in the table would exceed the cancer risk threshold of 10 in on million for a 10,000 deep well, and a 5,000 feet wells in 2015.

Table 4.3-34: Potential Health Risk from Well Construction, Drilling, and Completion Emissions

Well Depth (feet)	Year	Maximum distance from well site and project boundary to 10 in one million calculated risk
Western Subarea		
10,000	2015	367 feet
10,000	2020	232 feet
10,000	2029	82 feet
50,00	2015	116 feet
5,000	2029	NA*
2,000	2015	NA
2,000	2029/2035	NA
Central Subarea		
10,000	2015	367 feet
10,000	2020	232 feet
10,000	2029	82 feet
5,000	2015	116 feet

Table 4.3-34: Potential Health Risk from Well Construction, Drilling, and Completion Emissions

Well Depth (feet)	Year	Maximum distance from well site and project boundary to 10 in one million calculated risk
5,000	2029	NA
2,000	2015	NA
2,000	2029/2035	NA
Eastern Subarea		
10,000	2015	296 feet
10,000	2019	183 feet
10,000	2029	NA
5,000	2015	NA
5,000	2029	NA
2,000	2015	NA
2,000	2029/2035	NA

Note:
* NA = no offsite risk greater than 10 in one million

Table 4.3-35a and 4.3-35b provide the estimated cancer risks that would be associated with operational activities in each Subarea from natural gas and oil processing equipment, respectively. Table 4.3-35b shows that the cumulative risk from oil processing equipment exceeds the threshold in each Subarea at the distances listed in the table, at distances to 478 to 701 feet from the operational activity, depending on the Subarea of Kern County.

Table 4.3-35a: Estimated Cancer Risks from Operational Emissions from Natural Gas Processing Equipment

Equipment	Risk greater than 10 in one million?
1,000 bhp natural gas ICE	No
100 MMBtu/hr flare	No
85 MMBtu/hour steam generator	No
8 mm Btu/hour boiler	No
33 MW cogen	No
TEOR Equipment	No

Table 4.3-35b: Estimated Cancer Risks from Operational Emissions from Oil Processing Equipment

	Cancer Risk Distance to 10 in one million		
Equipment	**Western Subarea**	**Central Subarea**	**Eastern Subarea**
Cumulative Risk Distances	701 feet	625 feet	478 feet

*Oil processing equipment includes: 1,000 bbl oil tank, 1,000 bbl oil tank, 3,000 bbl oil tank, truck loading rack, 30-foot by 30-foot underground sump, 10,000 Btu/hour flare, and Fugitive VOCs. Emissions for gas and oil processing equipment are assumed to be the same between 2015 and 2035. Emissions "credit" for potential future emission reductions was not assumed.

Table 4.3-36 provides the estimated potential acute non-cancer risk impacts that would be associated with the emissions generated by the activities of drilling, oil processing, and gas processing in each Subarea. Acute impact refers to the risk associated with short-term effects of exposure to toxic emissions. The estimated acute risks associated with drilling, oil processing, and gas processing are below the hazard index standard in each Subarea.

Table 4.3-36: Potential Acute Impacts

Equipment	Western Subarea Acute Risk	Central Subarea Acute Risk	Eastern Subarea Acute Risk	Hazard Index Standard	Significant Risk?
Drilling Emissions	0.0098	0.0098	0.0090	1.0	No
Oil Processing Emissions	0.43	0.41	0.40	1.0	No
Gas Processing Emissions	0.88	0.88	0.89	1.0	No

Table 4.3-37 provides the estimated potential chronic non-cancer risk that would be associated with the emissions generated by the activities of drilling, oil processing and gas processing in each Subarea. Chronic impact refers to the risk associated with long-term effects of exposure to toxic emissions. The estimated acute risks associated with drilling, oil processing, and gas processing do not exceed the HI standard in each Subarea.

Table 4.3-37: Potential Chronic (Non-Cancer Risk)

Equipment	Western Subarea Chronic Risk	Central Subarea Chronic Risk	Eastern Subarea Chronic Risk	Hazard Index Standard	Significant Risk?
Drilling Emissions	0.0009	0.0009	0.0008	1.0	No
Oil Processing Emissions	0.063	0.63	0.60	1.0	No
Gas Processing Emissions	0.034	0.034	0.030	1.0	No

Health Risk Assessment Results

The HRA shows that the potential cancer risk exceeds the current CEQA significance thresholds (as of May 2015), for drilling a 10,000-foot well in any Project year, and for drilling a 5,000-foot well in year 2015, and for operations of the oil processing equipment.

By 2018, due to emission reductions resulting from compliance deadlines occurring from CARB current diesel regulations, the risks associated with drilling a 5,000 foot (or less deep) well would not exceed the 10 in one million (10×10^{-6}) threshold. Therefore, the Project would exceed the current 10 in one million CEQA significance threshold for cancer risk if a 10,000-foot well is drilled, and if a 5,000-foot well is drilled for the years 2015 to 2017, assuming that the risk level in years 2016 and 2017 would be the same as in 2015.

The cancer risk from all oil processing equipment would exceed 10 in one million from the fenceline to 478 to 701 feet, depending on the Subarea. The oil processing equipment would require operating permits from the SJVAPCD (except possibly the loading rack for which there may be a Rule 2020 Exemption) and, as such, total risk from the facility would be modeled at that time. Emissions and risk from any future proposed facilities would be required to meet the Air District's risk threshold which is currently 10 in one million. Therefore, impacts would be significant.

Valley Fever

The *Coccidioides immitis* fungus spores found in soil, which are responsible for transmitting the Valley Fever, can disperse in the air when the soil is disturbed during construction activities, and then can be inhaled into the lungs. Onsite construction workers potentially could be exposed to Valley Fever from fugitive dust generated during construction of the proposed Project, notably during excavation, grading, and other earthmoving activities. Construction activities within the Project Area are subject to SJVAPCD Regulation VIII (Fugitive PM_{10} Prohibition). Regulation VIII is intended to reduce ambient concentrations of PM_{10} by requiring actions to prevent, reduce or mitigate anthropogenic fugitive dust emissions. By reducing fugitive dust emissions, Regulation VIII reduces potential exposure to Valley Fever. Since current long-term residents typically already have been exposed to and have developed immunity to Valley Fever, construction activities are not expected to add significantly to exposure of offsite residents to the fungus

Impacts are potentially significant because cancer risk levels exceed thresholds at locations where receptors are located closer than 200 meters from a well. In addition, the risks associated with exposure to Valley Fever are significant without mitigation.

Mitigation Measures

MM 4.3-5 The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines).

a. If there are no sensitive receptors within this potential impact area, then no construction mitigation measures shall be required.

b. If there are sensitive receptors within the potential impact area, then additional information must be provided showing the setback from the closest edge of the well pad to the property line of the nearest sensitive receptor. The minimum distances shall be as follows:

Well Depth (Feet)	Minimum Setback Distance from Well Site to Adjacent Property Line of an Existing Sensitive Receptor (Feet)
Western Subarea	
10,000	367
5,000	116
2,000	NA
Central Subarea	
10,000	367
5,000	116
2,000	NA
Eastern Subarea	
10,000	296
5,000	NA
2,000	NA

c. If the above setbacks cannot be met, the Applicant shall implement the following risk minimization measures, or other such measures that are demonstrated by the Applicant to achieve a level of risk less than the threshold risk level:

1. Placement of engines in the potential impact area away from the sensitive receptors.
2. Utilize directional drilling to locate rig away further from the sensitive receptor(s).
3. Use of late-model engines, low-emission diesel products, alternative cleaner fuels (e.g., natural gas or liquefied petroleum gas), engine retrofit technology, add-on devices such as diesel particulate filters or oxidation catalyst, and/or other options as such become available to reduce emissions from off-road and other equipment.
4. Utilize electricity line power if available.

5. Shutdown all equipment when not in use, and otherwise minimize engine idling by limiting idling to 15 minutes.
6. Use of automatic rigs.
7. Assist and pay to relocate residents to an area hotel during well construction, drilling, and completion activities.

MM 4.3-6 Applicants shall include in their Worker Environmental Awareness Program information on how to recognize the symptoms of Valley Fever and to promptly report suspected symptoms of work-related Valley Fever to a supervisor. Workers exposed to fugitive dust shall be provided with the option of using a filter fitted over their nose and mouth, secured by a strap, including training for appropriate mask practices as part of the Worker Environmental Awareness Training Program.

Level of Significance After Mitigation

Less than significant

Impact 4.3-4: Create Objectionable Odors Affecting a Substantial Number of People

The GAMAQI recommends an approach for evaluating Project-specific odor impacts based on SJVAPCD complaint records, and a screening level analysis. The Kern County Air Quality Assessment Guidelines recommend application of dispersion modeling. The approach we use in this document is to first assess the odor impacts using the screening level approach as recommended by the SJVAPCD, and applying the more refined analysis recommended in the Kern County Air Quality Assessment Guidelines if the screening level analysis indicate potential concern.

For existing odor sources, the SJVAPCD recommends that odor impacts be considered significant if the source has:

- More than one confirmed complaint per year averaged over a three-year period; or
- Three or more unconfirmed complaints per year averaged over a three-year period.

Because of the large number of variables involved in an odor assessment, the possible number of odor sources, and the subjective nature of the level of nuisance caused by odors, nuisance odors cannot be assessed quantitatively using formulas. Instead, qualitative methodologies are used to determine if potential odors would have a significant impact, taking into consideration Project design elements and proximity to offsite receptors that potentially would be exposed to objectionable odors.

In addition to the analysis of the complaints, the District has produced a list of common types of facilities, along with the distance from the source within which odors could possibly be significant. The list provides a qualitative assessment of a project's potential to adversely affect

offsite receptors. Table 4.3-38 below presents the list of common facilities and the minimum distance from the source below which the odor impacts may be significant. None of the facilities included in the Project are on this list, which is provided for informational purposes only.

Table 4.3-38: Screening Levels for Potential Odor Sources

Type of Facility	Distance
Waste Water Treatment Facility	2 Miles
Sanitary Landfill	1 Mile
Transfer Station	1 Mile
Composting Facility	1 Mile
Petroleum Refinery	2 Miles
Asphalt Batch Plant	1 Mile
Chemical Manufacturing	1 Mile
Fiberglass Manufacturing	1 Mile
Painting/Coating Operations	1 Mile
Food Processing Facility	1 Mile
Feed Lot/Dairy	1 Mile
Rendering Plant	1 Mile

Construction

During construction activities, odorous compounds may be present in the exhausts from on-road vehicles and off-road construction equipment. The operations of drilling, completing, and stimulation of wells may also result in the release of odorous compounds.

According to the SJVAPCD, there was only one unconfirmed odor complaint related to construction activities filed over three years. Since the District's threshold for unconfirmed complaints is three or more complaints per year averaged over three years (that is, nine unconfirmed complaints over three years), odor impacts from construction operations are not expected to be significant.

Operations – Permitted Equipment

The operation of permitted equipment used for crude oil and natural gas production and processing, subject to District Rule 4409 and Federal NSPS, which ensure stringent LDAR requirements. Tanks, loading racks and any other permitted equipment which may potentially release odorous compounds must be controlled by vapor recovery systems, with high VOC destruction efficiency (95% to 99%). The SJVAPCD complaint records for operation of permitted equipment are shown in Table 4.3-39 below:

Table 4.3-39: Unconfirmed and Confirmed Odor Complaints Filed for Operation of Permitted Equipment

Significance of Odor	Odor Complaints Over Three Years	
	Unconfirmed	Confirmed
Activity Complaints	Less than 3	Less than 2
District Odor Threshold	More than 9	More than 3
Contribution to Effect	No	No

Table 4.3-39 shows that less than three unconfirmed complaints and less than two confirmed complaints were filed over a three-year period. Both the number of unconfirmed and confirmed complaints do not exceed the thresholds of significance established by the odor complaints for a given petroleum production or gas processing facility. The above table thus indicates that in general operation of permitted equipment does not result in an appreciable amount of emissions of odorous compounds.

In addition to the complaints analysis, the odor assessment screening tool based on the list of facilities presented in Table 4.3-38 shows that oil and gas production and processing facilities are not included in the list of common facilities that are likely to have potentially significant odor emissions.

Operations – Non-Permitted Activities

Non-permitted activities with a potential to release odors consists mainly in on-road travel and well maintenance. During well maintenance, a fluid is normally introduced into the well bore, and the hydraulic pressure exerted by the fluid prevents gas from escaping into the atmosphere.

Diesel-fueled trucks traveling on local roadways would produce exhaust odors that could be considered offensive to some individuals. Although, in general, odors associated with diesel fumes are temporary and disperse rapidly with distance from the source, exposure of receptors to objectionable odor emissions from mobile-sources represent an unavoidable nuisance.

The SJVAPCD complaint record for non-permitted activities is shown in Table 4.3-40 below:

Table 4.3-40: Significance of Odor Effects from Operational Activities – Non-Permitted Equipment

Significance of Odor	Odor Complaints Over Three Years	
	Unconfirmed	Confirmed
Activity Complaints	1	0
District Odor Threshold	More than 9	More than 3
Contribution to Effect	No	No

Within the last three years, the SJVAPCD has received one unconfirmed odor complaint related to well maintenance activities, which is below the odor threshold.

Also, emissions from non-permitted activities are not included in the list of activities that are likely to result in a potentially significant effect for odor, as presented in Table 4.3-38 above.

The Project will continue to create odors, but based on past and projected future operations has not resulted in any significant adverse impacts to nearby sensitive receptors.

Mitigation Measures

MM 4.3-7 Applicant shall submit an Odor Complaint Management Plan to the County prior to receiving its first Site Plan conformity review approval. The Plan shall include a designated contact for odor complaints, creation of a log for odor complaints, and protocol for handling odor complaints. The Odor log and report files shall be available for public review upon request.

Level of Significance After Mitigation

Impacts would be significant and unavoidable.

4.3.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7, Cumulative Projects. Implementation of these plans and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions within with each related project is located. This includes the possibility of being required to undergo environmental review, in compliance with the requirements of CEQA and/or the National Environmental Policy Act (NEPA). Should potential impacts to air quality be identified, appropriate mitigation would be prescribed.

Impact 4.3-5: Results in a Cumulatively Considerable Net Increase of Any Criteria Pollutant for which the Project Region is Nonattainment Under an Applicable Federal or State Ambient Air Quality Standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)

The current nonattainment status of regional pollutants is determined by past development and present activities. The District's attainment plans are designed to ensure the future attainment of State and federal ambient air quality standards. Consequently, the District's application of thresholds of significance for emission of criteria pollutants determines whether a project's emissions would have a cumulatively considerable contribution of emissions a criteria pollutant

for which the District is non-attainment. If project emissions exceed the thresholds of significance for criteria pollutants the project would be expected to result in a considerable net increase of any criteria pollutant for which the District is in non-attainment under applicable federal or State ambient air quality standards. The San Joaquin Valley is in nonattainment for $PM_{2.5}$, PM_{10}, and ozone. Ozone is addressed by examining its precursors which are NO_X, VOC, and CO.

Per the SJVAPCD's March 2015 GAMAQI:

> "By its very nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development. Future attainment of State and Federal ambient air quality standards is a function of successful implementation of the District's attainment plans. Consequently, the District's application of thresholds of significance for criteria pollutants is relevant to the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality.
>
> A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program, including, but not limited to an air quality attainment or maintenance plan that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located [CCR §15064(h)(1)].
>
> Thus, if project specific emissions would be less than the thresholds of significance for criteria pollutants, as a general matter the project would not be expected to result in a cumulatively considerable net increase of any criteria pollutant for which the District is in non-attainment under applicable federal or State ambient air quality standards." (SJVAPCD 2015a, Section 7.14.)

The SJVAPCD March 2015 Draft GAMAQI also states,

> As discussed in Section 8.3.1 (Basis for Air Quality Thresholds of Significance), the District's thresholds of significance for criteria pollutants are based on District rule 2201 (New Source Review) offset requirements. Furthermore, New Source Review (NSR) is a major component of the District's attainment strategy. NSR provides mechanisms, including emission trade-offs, by which Authorities to Construct such sources may be granted, without interfering with the attainment or maintenance of Ambient Air Quality Standards. District implementation of NSR ensures that there is no net increase in emissions above specified thresholds from new and modified Stationary Sources for all nonattainment pollutants and their precursors. In fact, permitted emissions above offset thresholds equivalent to the District's thresholds of significance for criteria pollutants are mitigated to below the thresholds, and the District's attainment plans show that this level of

> emissions increase will not interfere with attainment or maintenance of ambient air quality standards.
>
> The District's attainment plans demonstrate that project-specific net emissions increase below New Source Review (NSR) offset requirements will not prevent the District from achieving attainment. Consequently, emission impacts from sources permitted consistent with NSR requirements are not individually significant and are not cumulatively significant. (SJVAPCD 2015a, Section 8.8.4.)

The Kern County Air Quality Assessment Guidelines further require the cumulative air quality impact assessment to include assessment of the following issues:

- Consistency with Existing Air Quality Plans. Discuss the Project in relation to Kern COG conformity and Traffic Analysis Zones. Quantify emissions from similar projects and evaluate consistency with the applicable attainment plan.
- Localized Impacts. Assess the cumulative emissions impact associated with the proposed Project, in conjunction with approved and proposed projects located within a 1- and 6-mile radius of the proposed Project.
- Air Basin Emissions Analysis. Compare emissions from the proposed Project to emissions within the SJVAB and the Kern County portion of the SJVAB.

Consistency with Existing Air Quality Plans.

The Kern COG 2014 RTP is a 26-year plan to set regional transportation goals, policies, and actions intended to guide development of the planned transportation systems in Kern County (2014a). The Kern COG is a federally designated Metropolitan Planning Organization (MPO) and a state designated Regional Transportation Planning Agency (RTPA).

The implementation of the RTP, in conjunction with the Project, was used to assess cumulative effects that could impact consistency with applicable attainment plans. The Program EIR for the RTP analyzed potential impacts of the multiple modes of transportation including:

- Transit/Rail/High Speed Rail;
- Operational Improvements – High-Occupancy Vehicle (HOV) Lanes/Ramp Metering;
- Pedestrian Complete Streets and Bicycle Improvements;
- Local Streets and Roads;
- Major Highway Improvements; and
- Freight Rail.

A complete list of these projects, the Constrained Program of Projects, is available in the RTP. The RTP's air quality modeling forecast showed that by 2040 the NO_X precursor component to $PM_{2.5}$ would increase unless actions were taken. As a result, the plan focused on new strategies

such as improving transit, bike, walk, and housing options to achieve and maintain the federal air quality standards and the new state climate change goals. Planned improvements in the RTP have undergone air quality conformity analyses to ensure that they would comply with state and federal air quality rules. As a result, it was determined that implementation of RTP would not delay attainment of federal air quality standards in the SIPs for air quality.

In contrast, the construction and operational activities of oil and gas activities that would be authorized under this Project would result in an increase of criteria pollutants (NO_x, VOC, CO, PM_{10} and $PM_{2.5}$) in excess of the recommended criteria pollutant significance threshold adopted by the SJVAPCD Board.

Both the RTP and the Project would be consistent the applicable air quality plans.

Localized Impacts

Efforts to reduce emissions in the Kern Region that have been conducted since the early 1990s at the national, state, regional, and local entities since the early 1990s are presented in Table 4.3-41. The agency involved are the EPA, U.S. Department of Energy, Federal Highways Administration, Federal Transit Administration, CARB, California Department of Transportation, California Energy Commission, SJVAPCD, Eastern Kern APCD, and Kern COG and its local member agencies.

Table 4.3-41: Programs Designed to Reduce Air Pollutant Emissions

Valley Clean Air Now (CAN)
Local	Bicycle/Pedestrian Projects and Programs GET Online Trip Planner Transit Marketing, Information, and Amenities New/Expanded/Increased Transit Services Road Paving & Street Sweeping

The construction and operational activities of oil and gas activities that would be authorized under this Project would result in a considerable net increase of the following criteria pollutants NO_x, VOC, CO, PM_{10} and $PM_{2.5}$, in excess of the recommended criteria pollutant significance threshold adopted by the SJVAPCD Board.

Emissions associated with the implementation of the Project would not be counterbalanced by the above efforts to reduce emissions undertaken at the State and local levels, as well as the air quality improvement goals stated in the 2014 RTP. Therefore, the contribution of Project-related impacts to air quality would be cumulatively considerable.

Air Basin Emissions Analysis

Operational emissions for the proposed Project were compared to emissions of the entire SJVAB and the Kern County portion of the SJVAB, to assess the Project's contribution to cumulative air quality impacts. The SJVAB and Kern County emissions analyses utilize data from the CARB's California Emissions Projection Analysis Model (CEPAM). CEPAM (CARB 2013c) reflects emission projections to the year 2035 by summary category based on a 2012 base year. Forecasts reflect both anticipated growth and controls, as updated by CARB. The emissions analysis is presented in Table 4.3-42.

Table 4.3-42: Comparison of 2035 Emission Projections – Proposed Project, Kern County, and San Joaquin Valley Air Basin

Emissions Source	Emissions (Tons/Year)				
	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Project Emissions					
Permitted operation	3,279.85	5,048.92	629.53	1,490.73	1,490.73
Permitted Construction	410.44	244.77	0.34	30.02	26.72
Non-permitted	5,169.75	11,428.56	16.89	1,267.14	257.93

Table 4.3-42: Comparison of 2035 Emission Projections – Proposed Project, Kern County, and San Joaquin Valley Air Basin

Emissions Source	Emissions (Tons/Year)				
	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Total Operational Project Emissions	8,860.04	16,722.25	646.76	2,787.89	1,775.38
Kern County and San Joaquin Valley Air Basin Emissions					
San Joaquin Valley Air Basin	60,151.27	389,879.13	5,382.66	114,641.39	38,758.26
Kern County Portion of SJVAB	12,671.34	42,887.14	668.32	14,641.98	4,389.49
Analytical Results					
Kern County Percent of SJVAB	21.07%	11.00%	12.42%	12.77%	11.33%
Proposed Project Percent of SJVAB	14.73%	4.29%	12.02%	2.43%	4.58%
Proposed Project Percent of Kern County Portion of SJVAB	69.92%	38.99%	96.77%	19.04%	40.45%

As can be seen in Table 4.3-42, emissions sources in Kern County contribute between 11% and 21% of criteria pollutant emissions in the SJVAB. The Project would contribute between two and 14% of these pollutants in the SJVAB or between 19% and 97% of Kern County's contribution. This analysis indicates that most SO_2 emissions in Kern County would originate from oil and gas activities and the majority of NO_X emissions. Therefore, the proposed Project would have a cumulatively considerable contribution of criteria pollutant (NO_X, PM_{10}, $PM_{2.5}$, CO and SO_2) emissions to the Kern County portion of the SJVAB.

Mitigation Measures

Implement MM 4.3-1 through MM 4.3-4, as described above.

MM 4.3-8 For Project facilities or equipment that are not required to offset emissions under a District rule as described in MM 4.3-1, and for Project vehicle and other mobile source emissions, the County will enter into emission reduction agreement with the San Joaquin Valley Air Pollution Control District, pursuant to which the Applicant shall pay fees to fully offset Project emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive reductions of particulate matter of 10 microns or less in diameter) (collectively, "designated criteria emissions") to avoid any net increase in these pollutants. The air quality mitigation fee shall be paid to the County as part of the Site Plan review and approval process, and shall be used to reduce designated criteria emissions to fully offset Project emissions that are not otherwise required to be fully offset by District permit rules and regulations.

As an alternative to paying the fee, an Applicant may reduce emissions for one or more designated criteria emissions through actual reductions in air emissions

from other Applicant sources, as submitted to the County and validated by the District. This Project offset requirement shall be enforced by the County and verified by San Joaquin Valley Air Pollution Control District. If a voluntary emission reduction agreement is not executed by the County and San Joaquin Valley Air Pollution Control District, then each Applicant must mitigate for the full amount of designated criteria pollutants as verified by the San Joaquin Valley Air Pollution Control District, with evidence of such District-verified offsets presented as part of the Site Plan Conformity Review application documentation.

Examples of feasible air emission reduction activities that may be funded by air quality fees paid by Applicant or proposed and implemented by the Applicant under the emission reduction agreement include, but are not limited to, the following:

a. Replacing or retrofitting diesel-powered stationary equipment such as motors on generators, pumps and wells with electric or other lower-emission engines that are not subject to Title V reductions.

b. Replacing or retrofitting diesel-powered school, transit, municipal and other community mobile sources such as buses, car fleets, and maintenance equipment, with electric or other lower-emission engines.

c. Reducing emissions from public infrastructure sources such as water and wastewater treatment and conveyance facilities, and reducing water-related emissions through water conservation and reclamation.

Funding lower-emission equipment and processes for local businesses, schools, non-profit and religious institutions, hospitals, city and county facilities.

Level of Significance After Mitigation

Impacts would be significant and unavoidable.

Feasible and Reasonable Mitigation Analysis

In August 2013, the Kern County Planning Department published a Notice of Preparation/Initial Study for this Draft EIR. Comments were received during the public scoping period that followed this announcement, including certain suggested mitigation for potential Project impacts.

Each of the suggested mitigation measures identified during the scoping period and in other sources that were known to the Kern County Planning Department were evaluated to determine if: (1) the suggestions were applicable to the Project; (2) the suggestions addressed at least one significant impact associated with the Project; (3) an equivalent or more effective mitigation measure was already identified in the Draft EIR; (4) the applicable impact would remain significant and unavoidable with the suggested mitigation; and (5) the suggested mitigation would be feasible as defined by CEQA.

Suggested mitigation measures were considered only for those areas in which Project impacts were determined to exceed applicable significance thresholds. If significance thresholds were not exceeded, suggested mitigation measures were not considered because the suggested measures would not address an impact as defined by CEQA. If significance thresholds were exceeded, suggested mitigation measures were considered and compared with the mitigation measures identified in the Draft EIR. If the Draft EIR did not contain equivalent or more effective mitigation, suggested mitigation measures were assessed to determine whether they would be feasible under CEQA. Infeasible measures were not included in the Draft EIR.

CEQA Section 15364 defines feasible to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors."

Suggested Mitigation Measure	**Result of Evaluation**
Require oil and gas projects to generate their own clean electricity during production using photovoltaic (PV) solar, direct line power, or both, to eliminate all needs for operational power diesel generator onsite.	Increasing use of renewable energy is considered in an Alternative to this EIR. While operational emissions during production activities are low on a per well basis, emissions of NO_x, ROGs and PM_{10} are required to be fully offset under the Air Quality Mitigation Measures. Producers can achieve this no net increase requirement by using solar PV or other available technologies, and thereby reduce what would be otherwise required as a fee under the OG-ERA to achieve no net increase in NO_x, ROG and PM_{10} emissions.
There should be a percent limit on the amount of time they can flare gas.	Flare emissions have been included in the calculation of Project air emissions, and the Air Quality Mitigation Measures require no net increase in NO_x, ROGs and PM_{10} emissions. Most flares are used for emergency management. Requiring a percent limit on the amount of time gas can be flared would impede the flare's emergency response capability.

Section 4.4

Biological Resources

Section 4.4

Biological Resources

4.4.1 Introduction

This section describes the affected environment and regulatory setting for biological resources, identifies and analyzes environmental impacts for the Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance (Project), and identifies measures to reduce or avoid significant impacts anticipated from Project construction and operation. In some cases, compliance with existing laws and regulations would reduce or avoid certain impacts that might otherwise occur with the implementation of the Project. Implementation of the Project would result in temporary disturbance and permanent impacts to biological resources. Impacts are measured by analyzing the potential disturbance acreage that could occur in the Project Area, broken out by subarea and tier as further described in this section. Species habitat modeling was completed to analyze potential impacts to certain species in the Project Area by the projected annual level of disturbance over 25 years.

The information and analysis that is presented in this section has been derived from published literature, federal and state databases, and site-specific investigations within the Project Area and adjacent locations. The sources of information used in this analysis are listed in the references section below.

Kern County will utilize the Data Basin website to display biological resource information along with other special data within the Project Area. The Data Basin website is a science-based mapping and analysis platform that supports learning, research, and sustainable environmental stewardship (www.databasin.org). Figures 4.4-A to 4.4-C characterize how the information is displayed on the website.

4.4.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley, bounded by Kings and Tulare Counties to the north; Santa Barbara and San Luis Obispo Counties to the west; the Tehachapi Mountains and the Sierra Nevadas to east; and the northern boundary of the Los Padres National Forest to the south.

The Project Area encompasses portions of the San Joaquin Valley Floor and portions of the adjoining foothills of Kern County. It is bordered by the Coast Range Mountains to the west, the Sierra Nevada to the east, and the Transverse Range to the south. The topography of the Project Area is mostly flat and almost all of the land occurs at elevations below 2,000 feet; a small portion in the southern Project Area extends above 2,000 feet into the Tehachapi Mountains.

Elevations within the Project Area range from a low of 206 feet above mean sea level (AMSL) 12 miles west of Delano, California (to the north), to a maximum elevation of 6,005 feet AMSL in the Transverse Range to the south. The Project Area is located within a semi-arid region, which relies on rainfall, groundwater, and several sources of indigenous and imported surface water such as the Kern River, the Friant-Kern Canal, and the California Aqueduct. Most rainfall occurs in the winter and spring, and averages 7 to 8 inches per year on the valley floor and 9 to 12 inches in bordering mountain ranges.

According to the U.S. Department of Agriculture (USDA) Soil Conservation Service, 415 specific soils types occur within the Project Area. Predominant major soil types found in the southern San Joaquin Valley consist of Copus-Lokern, Garces-Millox, Bakersfield-Oldriver, Guijarral-Cerini-Excelsior, Kimberlina-Granoso-Vineland, Premier-Wheelridge, and Calfax-Excelsior-Fages (USDA 2009).

Bakersfield is the largest metropolitan center in the Project Area, which also includes the communities of Taft, Delano, Shafter, Arvin, McFarland, Maricopa, and Wasco. Major and minor roadways bisect the County and serve as primary connectors for the movement of commerce and public travel through the region. Interstate 5 (I-5) is the most prominent roadway and runs north-south through the Project Area. The daily traffic load for I-5 through Kern County (County Line at Lebec to the Kings County line) is estimated to be 800,000 vehicles (AARoads 2012). Other significant north-south traffic occurs along California Highway 99 and Highway 33 (east and west of I-5, respectively). A number of smaller frequently travelled east-to-west routes serve the area and include State Route 58 between Atascadero and Barstow, and State Route 46 between Bakersfield and Paso Robles.

The Project Area occurs in the Tulare Lake hydrologic region with exception of a small area along its western perimeter that occurs in the Central Coast hydrologic region. Rivers within the Tulare Lake region include the Kings, Kaweah, Tule, and Kern Rivers with origins on the western slope of the Sierra Nevada, draining into the San Joaquin Valley Floor. This basin is now hydrologically closed, having no outlet to the Pacific Ocean. Portions of the Project Area are categorized by the Federal Emergency Management Agency as a 100-year flood zone. Project Area hydrology and flood issues are discussed in Section 4.9, Hydrology and Water Quality.

Subareas

To facilitate detailed analysis, the Project Area as defined in Chapter 3, Project Description, and shown in Figure 3-2 was divided into three subareas: the Western, Central, and Eastern. In general, the three subareas are divided along the major transportation corridors, including I-5 and State Route 99. Subarea boundaries were adjusted to account for locations where the oilfield administrative boundaries that have been identified by the California Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR) are located on both sides of a freeway or highway.

Land Use Tiers

Oil and gas production in Kern County varies in intensity, depending on historic uses, surrounding land uses and zoning designation, and quality of other potential land uses (e.g., agricultural land). As part of this project-level Environmental Impact Report [EIR] process, both Core and non-Core areas within the overall Project Area were further categorized based on existing and zoned land uses. The Project Area was divided into five Tier Areas (Figure 3-4), as described in Chapter 3, Project Description:

Tier 1

Tier 1 is defined as the area in which current oil and gas activity is the primary land use. The well and activity densities preclude almost all other uses. According to DOGGR well information, 87% of all active oil and gas wells within the Project Area in 2014 were located within Tier 1 Areas.

The Tier 1 Areas were developed through the use of a well location database and oilfield Administrative Boundary GIS shape files for District 4 obtained from DOGGR. Tier 1 areas generally include all quarter-quarter Sections (40 acres) that contained a minimum of four wells.

Tier 1 does not include sensitive land uses, such as schools, daycare centers, hospitals, cemeteries, etc. It should also be noted that the quarter-quarter Sections that contained Important Farmlands, as identified by the Department of Conservation's (DOC's) Farmland Mapping and Monitoring Program for Kern County, are included in Tier 2, rather than Tier 1, as described below.

Tier 2

Tier 2 includes all lands within the following agricultural Zone Districts that are not within Tier 1:

- All land that is zoned Exclusive Agriculture (A); and
- All land that is zoned Limited Agriculture (A-1).

Tier 2 also includes the following Important Farmlands identified by the DOC Farmland Mapping and Monitoring Program for Kern County 2012, which is the most recent available data:

- Prime Farmland;
- Farmland of Statewide Importance;
- Unique Farmland; and
- Confined Animal Agriculture.

Tier 3

Tier 3 is defined as Zone Districts where historic drilling activity has been or could have been approved as "Unrestricted" or "Ministerial" under the existing Zoning Ordinance, and those areas that are not categorized as Tiers 1 or 2. These Zone Districts include:

- Natural Resource (NR);
- Recreation Forestry (RF);
- Light Industrial (M-1);
- Medium Industrial (M-2);
- Heavy Industrial (M-3);
- Floodplain Primary (FPP);
- Drilling Island (DI); and
- Zone districts that have a Petroleum Extraction (PE) combining district.

Tier 4

Tier 4 consists of all Zone Districts where oil or gas exploration and production activities are currently or proposed to be allowed with a Conditional Use Permit (CUP). These Zone Districts include:

- Estate District (E);
- Low-density Residential (R-1);
- Medium-density Residential (R-2);
- High-density Residential (R-3);
- Commercial Office (CO);
- Neighborhood Commercial (C-1);
- General Commercial (C-2);
- Highway Commercial (CH);
- Platted Lands (PL); and
- Mobile Home Park (MP).

Authorized oil and gas activities in Tier 4 are subject to approval of a CUP in accordance with 19.104 of this Title. The Open Space (OS) zone district includes those areas where oil or gas exploration and production activities are prohibited, but ancillary facilities are an allowable use.

Tier 5

Tier 5 are areas including current and future Specific Plan boundaries either adopted with a Special Plan Zone District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities would be allowed with a CUP or as permitted by the regulations contained within the adopted Specific Plan(s) in Tier 5 areas.

Habitats and Vegetation

This section describes the natural vegetation community types, non-native vegetation coverage, and developed and agricultural land uses in the southern San Joaquin Valley. Land cover types that are natural communities are based on the List of California Terrestrial Natural Communities Recognized by the California Department of Fish and Wildlife Natural Diversity Database (CNDDB) and descriptions from Holland (1986). The primary sources for spatial mapping include the University of California Santa Barbara Biogeography Lab California Gap Analysis Project and the Classification and Assessment with Landsat of Visible Ecological Groupings (CALVEG) analysis and mapping system maintained by the U.S. Forest Service Region 5 Ecology Group for California and other Pacific states. The purpose of the CALVEG system is to classify California vegetation communities for use in statewide resource planning considerations. The CALVEG database currently maps 213 vegetation communities occurring in nine regions with enhanced image resolution. The descriptions of major resource areas are largely based on CALVEG data, and agricultural information was updated from 2014 aerial maps provided by Kern County Planning and Community Development Department (KCPCDD).

There are 28 types of vegetation cover occurring within the Project Area according to the US Forest Services' CALVEG breakdown (Figure 4.4-1).

Annual Grass is the most abundant cover type in the Eastern and Western Subareas, covering 736,282 acres of the total Project Area (Table 4.4-1).

Table 4.4-1: Vegetation Cover Types by Tier and Subarea

Natural habitats that historically occurred in the Project Area have been significantly modified by agricultural and urban development; mineral development; local, regional and state infrastructure improvements; and livestock grazing and other land uses, primarily during the twentieth century. By 1979, nearly all the valley floor and many of the flatter upland areas were urbanized or converted to cultivated agriculture, and less than 5% of the these areas remained uncultivated (United States Fish and Wildlife Service [USFWS] 1998). Historically, wetlands were extensive in the Buena Vista Lake watershed, which is located in the south-central Project Area, and surrounded the lake for many square miles. Corridors of wetland habitat were associated with the Kern River, Poso Creek, and several other north-flowing drainages from the Tehachapi Mountains. Slow-moving sloughs that occurred in the center of the valley supported freshwater, emergent wetlands. Almost all of the historical wetland habitats in the Project Area have been converted to agricultural uses or affected by subsequent land use changes, and primarily occur in

riparian areas associated with Kern River and Poso Creek or emergent wetlands supported by ponds and other artificial impoundments.

The modification of natural habitats within the Project Area and the southern San Joaquin Valley affected several plant and animal species in the region, many of which have subsequently been listed as threatened or endangered under state and federal law. In the late 1980s and early 1990s, local, state, and federal agencies and other regional stakeholders began to consider approaches for conserving certain species and their habitats in the valley floor region. In 1989, the USFWS, California Department of Fish and Wildlife (CDFW), U.S. Department of the Interior, Bureau of Land Management (BLM), California Energy Commission (CEC), DOGGR, and Kern County signed a memorandum of understanding in an effort to develop a Recovery Plan for Upland Species of the San Joaquin Valley (SJV Recovery Plan), a federal Habitat Conservation Plan (HCP), and to support related state species permitting for the Kern County portion of the valley floor up to 2,000 feet in elevation. As discussed below, several Valley Floor Habitat Conservation Plan (VFHCP) drafts have been considered, but not yet finalized or approved by the agencies.

In 1998, the USFWS published an ecosystem-oriented the SJV Recovery Plan for 34 special status species in the greater San Joaquin Valley, including the Project Area in Kern County. Federal recovery plans provide guidance for managing land and resources in a manner that fosters the recovery and continued survival of threatened, endangered and other covered species. The SJV Recovery Plan focuses on the conservation of certain "umbrella" species (i.e., a species whose presence can be considered to indicate habitat potential for other species, because the umbrella species has more sensitivities to environmental pressures (e.g., San Joaquin kit fox) and "keystone" species (i.e., a species whose influence on other species is disproportionately large relative to its population size (e.g., giant kangaroo rat and, to a lesser extent, the Fresno, short-nosed, and Tipton kangaroo rats) (scientific names for all organisms are provided in Tables 4.4-26 and 4.4-36). This is because conservation measures for umbrella and keystone species most broadly benefit other species in the region. In general, the SJV Recovery Plan seeks to protect land in large blocks to minimize edge effects, increase the likelihood that ecosystem functions will remain intact, and facilitate management. The SJV Recovery Plan further recommends that blocks of conservation lands should also be connected to allow for movement of organisms between blocks (USFWS 1998, 2010a).

The SJV Recovery Plan generally divides the southern San Joaquin Valley into three primary land cover types: agriculture, urban, and "natural" lands (USFWS 1998; Figure 4.4-2). The natural lands category encompasses locations where resource extraction activities occur, including extensive oil and gas production and exploration. Livestock grazing is also an important activity in the natural land areas. The distribution of agriculture, urban, and natural lands within the Project Area is shown on Figure 4.4-2.

Land Cover Types

Each Subarea (i.e., Western, Central, and Eastern; Figure 4.4-2), has varying percentages of the three land cover types (Table 4.4-2). About 1,146,410 acres of the Project Area are natural lands, which are located primarily in the Western Subarea and to lesser extent in the Eastern Subarea.

These lands also include oil and gas fields that account for almost all of the oil and gas production in the County. Agricultural lands account for 1,099,263 acres of the Project Area, and 83% of the Central Subarea. About 90,842 acres of the County consist of urban and developed lands, about half of which is located within the Eastern Subarea.

Table 4.4-2: Agriculture, Urban, and Natural Land Acreage within the Project Area and by Subarea

	Natural Lands	Agricultural Lands	Urban/ Developed	Totals

Source: FS 2014

Agricultural Lands

Agricultural land uses have reduced habitat values for most animal and plant species for over a century. Large mammals are known to use agriculture land as habitat connectivity corridors, including coyote (scientific names for all species are provided in Tables 4.4-26 and 4.4-36) and San Joaquin kit fox. Bird species, such as American kestrel and red-tailed hawk, hunt small mammals and insects of these areas. Irrigated pasture lands provide foraging habitat for raptors, such as Swainson's hawk and American kestrel. Crops provide cover and food for mammals, such as California ground squirrels, desert cottontail, and black-tailed jackrabbit. As discussed below, water conveyance facilities associated with agriculture in the Project Area also provide wildlife habitat. The state-owned California aqueduct and federal Friant-Kern canal rights-of-way (ROWs) contain undeveloped lands that provide habitat corridors for terrestrial wildlife.

Canals, ditches, and ponds convey and store agricultural water, control flooding, and support habitats throughout the Project Area. Agricultural tail ponds and ditches are present in all but the far eastern and western portions of the southern San Joaquin Valley. The ponds are predominantly excavated in upland areas and are used to store agricultural runoff or for irrigation.

These ponds are usually steep-sided (often earthen), and often have low oxygen levels and high levels of certain chemical constituents related to agricultural use, and can sometimes support vegetation, such as cattails, and certain birds and terrestrial animals, such as red-winged blackbirds, American bullfrogs, and California ground squirrels.

Urban and Developed Lands

Urban and developed land-cover types in the southern San Joaquin Valley include airports, landfills, highways, commercial and industrial areas, golf courses, residential, commercial, industrial, educational facilities, public facilities, natural resources, and mineral development activities. Bakersfield is Kern County's largest population center, and other urban development occurs in the Lost Hills, McKittrick, Taft, Maricopa, Delano, McFarland, Wasco, Shafter, Rosedale, Oildale, Lamont, and Arvin communities. Developed lands do not provide substantial wildlife habitat, but a few occurrences of protected or sensitive species, such as the San Joaquin kit fox, have been documented, primarily in unpaved and fallow parcels interspersed in developed areas (USFWS 1998; Bjurlin et al. 2005).

Natural Lands

Natural Lands. The predominant uses in the natural land portion of the Project Area include livestock grazing, an historical use for over a century, mineral extraction, and oil and gas production. The majority of Tier 1 oil and gas exploration and development areas are located in the natural lands portion of the Project Area. Grazing, an historical use for over a century, can maintain habitat values for some species, although certain species may be negatively affected by livestock impacts to drainages, ponds, and similar resources. The general extent and location of agricultural, developed, and natural lands are depicted on Figure 4.4-2.

Wildlife Refuges and Protected Habitat Areas

Several permanently preserved conservation lands are located within the Project Area. Some preserves were created under the terms of existing HCPs for oil and gas activities, and others are managed by federal, state, local, or private organizations. Preserved lands within the Project Area include the following:

- The Coles Levee Ecosystem Preserve HCP conserved 6,059 acres under an existing oil and gas HCP to the east of the Elk Hills Oil Field (EHOF) and south of the Kern Water Bank in the Western Subarea;

- The Kern Water Bank HCP, which will permanently preserve 10,349 acres for habitat purposes in the Central and Western Subareas;

- The Freeport-McMoRan Oil & Gas HCP conserved 1,519 acres under an oil and gas HCP in the Western Subarea;

- The EHOF conservation area, which consists of 8,028 gross acres and 7,878 net acres of undisturbed habitat, of which a minimum of 7,075 acres undisturbed acres must be preserved under a Section 7 permit and agreements with state and federal agencies in conjunction with the sale of former Naval Petroleum Reserve properties in the Western Subarea;

- The LINN Energy Enos conservation lands, 400 acres of conservation lands held in the Poso Creek oilfield within the Eastern Subarea;

- The LINN Energy Lokern-Buena Vista Valley conservation lands are 2,895 acres of conservation lands held in the Western Subarea;

- The Lokern-Buena Vista BLM Areas of Critical Environmental Concern located to the north of the Elk Hills and east of the Cymric-McKittrick oilfields in the Western Subarea;

- The Kern National Wildlife Refuge, 11,249 acres located 18 miles west of the city of Delano in the Central Subarea;

- The Hart Park Ecological Reserve, 500 acres managed by the CDFW in three separate parcels located north of Bakersfield in the Eastern Subarea;

- The Buttonwillow Ecological Reserve, 1,391 acres managed by CDFW northeast of Buttonwillow in the Central Subarea;

- The Lokern Ecological Reserve, 4,000 acres in the Semitropic Ridge area and the 295 acres Sand Ridge Wildflower preserve east of Bakersfield managed by the Center for Natural Land Management in the Central and Eastern Subareas;

- The Semitropic Ecological Reserve, 4,800 acres adjacent to 3,100 acres of land that is managed by the Center for Natural Lands Management and the Kern National Wildlife Refuge in the Central Subarea;

- The Tule Elk State Reserve, 987 acres adjacent to the Kern Water Bank and the EHOF managed by the California Department of Parks and Recreation in the Western Subarea (California Department of Parks and Recreation 2013);

- A portion of the 97,000 acre Windwolves (Wildlands Conservancy) Preserve located along the southwest border of the Project Area; and

- A portion of the conservation land subject to the Tejon Ranch Conservation and Land Use Agreement along the south-central and southeast borders of the Project Area.

Designated Critical Habitat

As identified in Table 4.4-3 and shown in Figure 4.4-3, critical habitat has been designated by the USFWS for the Buena Vista lake shrew (one location in the central Project Area just east of I-5),

the California condor (south and east of I-5 in the far southern Project Area and north of Bakersfield along the Eastern Subarea boundary), the California red-legged frog (in the far northwest corner of the western Project Area), and the California tiger salamander (northwest corner of the Western Subarea).

Table 4.4-3: USFWS Designated Critical Habitat in the Project Area (acres)

	Tier 1	Tier 2	Tier 3	Tier 4	Tier 5	State	Other Areas	Grand Total
Western Subarea								
California condor	-	4,232.52	95.01	76.77	0.49	-	278.97	4,683.76

TOTAL	**452.66**	**80,387.99**	**230.06**	**225.73**	**320.48**	**310.33**	**574.98**	**82,502.24**

Sensitive Natural Communities

Based on an analysis by the Conservation Biology Institute, CALVEG database, and reported occurrences (CDFW 2015a), 15 sensitive natural communities occur with the Project Area: Alkali Seep, Coastal and Valley Freshwater Marsh, Desert Scrub, Desert Wash, Great Valley Cottonwood Riparian Forest, Great Valley Mesquite Scrub, Mixed Chaparral, Montane Hardwood, Native Valley Foothill Riparian, Stabilized Interior Dunes, Valley Needlegrass Grassland, Valley Oak/Oak Woodland, Valley Sacaton Grassland, Valley Saltbush Scrub, and Valley Sink Scrub. In addition, the USFWS has identified a San Joaquin Valley Vernal Pool Region and the Carrizo Vernal Pool Region in the Vernal Pool Recovery Plan (USFWS 2004) that include lands that extend into the Project Area.

Sensitive natural communities are ranked according to their degree of imperilment (as measured by rarity, trends, and threats), which follows NatureServe's Heritage Methodology, in which all alliances are listed with a G (global) and S (state) rank. Sensitive natural communities consist of groups with a global and/or state ranking of 3 or higher:

- G1/S1 Critically Imperiled - Critically imperiled because of extreme rarity or because of some factor(s) making it especially vulnerable to extirpation or extinction. Typically 5 or fewer occurrences or less than 1,000 remaining individuals.

- G2/S2 Imperiled - Imperiled because of rarity or because of some factor(s) making it very vulnerable to extirpation or extinction. Typically 6 to 20 occurrences or between 1,000 and 3,000 remaining individuals.

- G3/S3 Vulnerable - Vulnerable either because rare and uncommon, or found only in a restricted range (even if abundant at some locations), or because of other factors making it vulnerable to extirpation or extinction. Typically 21 to 100 occurrences or between 3,000 and 10,000 remaining individuals.

A conservative approach was used to identify the location and acreages of each sensitive natural community in the Project Area. The approach used available data from the CNDDB, CALVEG, CDFW, and USFWS. Because each data source delineated the extent of each community differently, this caused some potential overlap of the sensitive natural communities. To address the habitat overlaps and the uncertainty of changing land use conditions, sensitive communities with multiple data sources have been assigned an aggregated total of acres to represent the total land area covered by the available data sources listed above to eliminate double counting where habitat overlaps. The locations of sensitive natural communities in the Project Area are shown in Figure 4.4-4. Sensitive Natural Communities are shown in greater detail in each Subarea in Figure 4.4-5 for the Western Subarea, Figure 4.4-6 for the Central Subarea, and Figure 4.4-7 for the Eastern Subarea. The Sensitive Natural Communities tables (Tables 4.4-4 through 4.4-18) provide the actual acreages and the aggregated acres.

The following sections summarize the status of sensitive natural communities in the Project Area.

Alkali Seep

Alkali Seep is represented by low-growing perennial herbs, usually forming relatively complete cover, growing throughout the year in areas with mild winters. This vegetation type is present in permanently moist or wet alkaline seeps, often associated with alkali meadows. It is dominated by alkali saltgrass, spiny naiad, boraxweed, pondweed, ribbon weed, ditch-grass, and horned pondweed (Holland 1986 code 45320). Alkali Seep occurs scattered throughout the desert regions of California (Holland 1986). Alkali Seep habitat may occur within the Project Area where natural seeps or springs persist. The extent of Alkali Seep habitat is not well quantified, but is generally sporadic and tends to occur in small patches. Less than 7 acres total have been identified in the CNDDB within the Project Area. Alkali Seep can be found in areas where perched water or a high water table exists (e.g., lowlands or former lakebeds, the base of alluvial fans and/or foothill drainages, or along seismic or geologic rifts). The only portion of the Project Area with Alkali Seep habitat is the Central Area, Tier 2, comprised of 69.40 acres (CDFW 2015a).

Coastal and Valley Freshwater Marsh

Coastal and Valley Freshwater Marsh is represented by perennial, emergent monocots from 12 to 15 feet tall, often forming completely closed canopies. This vegetation type is present on quiet sites permanently flooded by fresh water (rather than brackish, alkaline, or variable water) where

prolonged saturation permits accumulation of deep, peaty soils. It is dominated by cattails and Scirpus species (Holland 1986 code 52410). Coastal and Valley Freshwater Marsh occurs along the coast and in coastal valleys near river mouths and around the margins of lakes and springs. The most extensive presence is in the upper portion of the Sacramento-San Joaquin River Delta; however, it is common in the Sacramento and San Joaquin Valleys in river oxbows and other areas on the floodplain. Coastal and Valley Freshwater Marsh is also occasional along the Colorado River on the California-Arizona border (Holland 1986). Table 4.4-4 lists the Coastal and Valley Freshwater Marsh acreages within the Project Area.

Table 4.4-4: Acres of Coastal and Valley Freshwater Marsh Sensitive Natural Community by Tier and Project Subarea

TOTAL	**1,277.88**	**5,383.63**	**2,602.08**	**9,263.59**

Source: CBI 2015

Desert Scrub

Desert Scrub communities are typically characterized by open, scattered assemblages of broadleaved evergreen or deciduous microphyll shrubs rarely exceeding 10 feet in height. Canopy cover is generally less than 50%, often with bare ground between plants (CDFG 1988). Desert Scrub, the most widespread habitat in the California deserts, is generally found below 4,000 feet, but may occur 1,000 feet higher on south-facing slopes (CDFG 1988). Desert Scrub natural communities are found in California throughout the Mojave and Sonoran Deserts at suitable elevations. Creosotebush is often considered a dominant of Desert Scrub habitats but its dominance is usually due to its tall stature rather than density (CDFG 1988). Desert Scrub habitats generally have low species diversity (CDFG 1988); however, many plant species are found in the habitat. These species include catclaw acacia, desert agave, coastal bladderpod, white brittlebush, burrobush, white bursage, barrel and hedgehog cactus, branched pencil and teddybear cholla, Palmer's coldenia, Wiggins croton, desert globemallow, jojoba, littleleaf krameria, ocotillo, beavertail pricklypear, Douglas and rubber rabbitbrush, desert sand verbena, desert senna, squaw waterweed, Anderson's wolfberry, and Mojave yucca (CDFG 1988). Forbs and grasses may include triangle evening primrose, galleta, big galleta, galletagrass, and spanishneedles (CDFG 1988). Table 4.4-5 lists the acreages of Desert Scrub habitat within the Project Area.

Source: CBI 2015

Desert Wash

Desert Wash communities are characterized by the presence of arborescent, often spiny, shrubs generally associated with intermittent streams or drier bajadas. The height of wash vegetation usually is proportional to the size of the arroyo (CDFG 1988). Desert Wash habitats in the south exhibit a more diverse vertical structure than those in the north. The composition of desert wash plant assemblages depends on variables such as latitude, elevation, and precipitation. Generally, washes in the south are more diverse in plant species composition and vertical structure than washes to the north. Canopy species typically found in washes include blue paloverde, littleleaf paloverde, desert ironwood, smoketree, catclaw acacia, mesquite, screwbean mesquite, and tamarisk (CDFG 1988). Plants of the subcanopy include desert broom, crucillo, Anderson's wolfberry, arrowweed, and desert willow (CDFG 1988), as well as small individuals belonging to the dominant canopy species. Ground cover plants include white brittlebush, Opuntia, snakeweed, goldenbush, saltbush, bursage, and desert lavender (CDFG 1988), as well as a variety of forbs and grasses. Table 4.4-6 lists the acreages of Desert Wash habitat within the Project Area.

Table 4.4-6: Acres of Desert Wash Sensitive Natural Community by Tier and Project Subarea

Great Valley Cottonwood Riparian Forest

Great Valley Cottonwood Riparian Forest is represented by a dense, broad-leafed, winter-deciduous riparian forest dominated by Fremont cottonwood and black willow. The understory is dense, with abundant vegetative reproduction of canopy dominants. California wild grape is the most conspicuous liana. Scattered seedlings and saplings of shade-tolerant species such as California box elder or Oregon ash may be found, but frequent flooding prevents their reaching into the canopy. This vegetation type is present on fine-grained alluvial soils near perennial or nearly-perennial streams that provide subsurface irrigation even when the channel is dry. These sites are inundated yearly during spring, resulting in annual input of nutrients, soil, and new germination sites (Holland 1986 code 61410). Great Valley Cottonwood Riparian Forest historically occurs along the major low-gradient (depositional) streams throughout the Great Valley. The distribution of this vegetation type occurs in scattered, isolated remnants or young stands because of flood control, water diversion, agricultural development, and urban expansion (Holland 1986). Table 4.4-7 lists the acreages of Great Valley Cottonwood Riparian Forest habitat within the Project Area.

Table 4.4-7: Acres of Great Valley Cottonwood Riparian Forest Sensitive Natural Community by Tier and Project Subarea

Great Valley Mesquite Scrub

Great Valley Mesquite Scrub is represented by open woodlands or savannas dominated by honey mesquite and allscale. The understory is grassy in good rainfall years, though usually dominated by introduced annuals. Perennial cover is usually low, with honey mesquite densities as low as two to three plants per acre. This vegetation type is present on sandy loams of alluvial origin, often with wind-modified micro-topography and high water table (Holland 1986 code 63420). Great Valley Mesquite Scrub historically occurred in the southern San Joaquin Valley from Bakersfield to the Inner South Coast Range at Tupman and Buena Vista Lake. Table 4.4-8 lists the acreages of Great Valley Mesquite Scrub habitat within the Project Area.

Interior Dunes

Interior Dunes are represented by an open, primarily perennial, winter- and spring-growing herbaceous community with a scattering of low shrubs or coast live oak. Shrubs are typically less than waist-high and contribute less than 10% of cover. Dominant species may include California croton, California matchweed, telegraphweed, naked buckwheat, Contra Costa wallflower, and Antioch Dunes evening primrose (Holland 1986 code 23000). Interior Dunes are historically narrowly restricted to the mouth of the Sacramento-San Joaquin Delta, and have been reduced by agricultural development and sand quarrying (Holland 1986). Table 4.4-9 lists the acreages of Interior Dunes habitat within the Project Area.

Mixed Chaparral

Mixed Chaparral is a structurally homogeneous brushland type dominated by shrubs with thick, stiff, heavily cutinized evergreen leaves. Shrub height and crown cover vary considerably with precipitation regime, aspect, age since last burn, and soil type (CDFG 1988). At maturity,

cismontane Mixed Chaparral typically is a dense, nearly impenetrable thicket with greater than 80% absolute shrub cover. Considerable leaf litter and standing dead material may accumulate in stands that have not burned for several decades.

Mixed Chaparral is a floristically rich type that supports approximately 240 species of woody plants (CDFG 1988). Composition changes between northern and southern California and with precipitation regime, aspect, and soil type. Dominant species in cismontane Mixed Chaparral include scrub oak, chaparral oak, and several species of ceanothus and manzanita. Individual sites may support pure stands of these shrubs or diverse mixtures of several species. Commonly associated shrubs include chamise, birchleaf mountain mahogany, silk-tassel, toyon, yerba-santa, California buckeye, poison-oak, sumac, California buckthorn, hollyleaf cherry, Montana chaparral-pea, and California fremontia. Some of these species may be locally dominant. Shrubs such as Jepson, coyote, and dwarf ceanothus and serpentine manzanita are local serpentine endemics (CDFG 1988). Shrub live oak, desert ceanothus, and desert bitterbrush are examples of shrubs found in Mixed Chaparral only on transmontane slopes (CDFG 1988). Many species found in cismontane stands are also common on desert-facing slopes. Examples include bigberry manzanita, chamise, birchleaf mountain mahogany, California fremontia, and several species of ceanothus. Table 4.4-10 lists the acreages of Mixed Chaparral habitat within the Project Area.

Montane Hardwood-Conifer

Montane Hardwood-Conifer habitat includes both conifers and hardwoods (CDFG 1988), often as a closed forest. To be considered Montane Hardwood-Conifer, at least one-third of the trees must be conifer and at least one-third must be broad-leaved (CDFG 1988). The habitat often occurs in a mosaic-like pattern with small pure stands of conifers interspersed with small stands of broad-leaved trees (CDFG 1988). This diverse habitat consists of a broad spectrum of mixed, vigorously growing conifer and hardwood species. Typically, conifers to 200 feet in height form the upper canopy and broad-leaved trees 30 to 100 feet in height comprise the lower canopy (CDFG 1988). Most of the broad-leaved trees are sclerophyllous evergreen, but winter-deciduous species also occur (CDFG 1988). Relatively little understory occurs under the dense, bilayered canopy.

Common associates with the montane hardwood-conifer natural community are ponderosa pine, Douglas-fir, incense-cedar, California black oak, tan oak, Pacific madrone, Oregon white oak, and other localized species. Species composition varies substantially among different geographic areas. In the southern Sierra Nevada, common associates include California black oak, black cottonwood, canyon live oak, Jeffrey pine, Douglas-fir, ponderosa pine, sugar pine, incense-cedar, and localized areas of giant sequoia (CDFG 1988). In the central coast, common associates include coast live oak, big leaf maple, Pacific madrone, tanoak, canyon live oak, Coulter pine, coastal redwood and, to a lesser extent, California black oak and ponderosa pine. In the northern central coast, Douglas-fir is found; while in the southern areas, bigcone Douglas-fir occurs. In the Tehachapi, transverse and peninsular ranges of Southern California, common associates include canyon live oak, Pacific madrone, and coast live oak (CDFG 1988). Table 4.4-11 lists the acreages of Montane Hardwood habitat within the Project Area.

Native Valley Foothill Riparian

Native Valley Foothill Riparian communities are generally characterized with a canopy cover of 20 to 80% and an average canopy height of 98 feet in a mature riparian forest. Most trees are winter deciduous. There is a subcanopy tree layer and an understory shrub layer. Lianas frequently provide 30 to 50% of the ground cover and festoon trees to heights of 65 to 98 feet. Herbaceous vegetation constitutes about one percent of the cover, except in openings where tall forbs and shade-tolerant grasses occur (CDFG 1988). Generally, the understory is impenetrable and includes fallen limbs and other debris. Dominant species in the canopy layer are cottonwood, California sycamore and valley oak. Subcanopy trees are white alder, boxelder, and Oregon ash. Typical understory shrub layer plants include wild grape, wild rose, California blackberry, blue elderberry, poison oak, buttonbrush, and willows. The herbaceous layer consists of sedges, rushes, grasses, miner's lettuce, Douglas sagewort, poison-hemlock, and hoary nettle.

Valley-foothill riparian habitats are found in valleys bordered by sloping alluvial fans, slightly dissected terraces, lower foothills, and coastal plains. They are generally associated with low velocity flows, flood plains, and gentle topography. Valley-foothill riparian habitats occur in the

Central Valley and the lower foothills of the Cascade, Sierra Nevada and Coast Ranges. They are also found in lower slopes at the bases of the Peninsular and Transverse ranges. A few lower elevation locations are on the desert side of the southern California mountains. Table 4.4-12 lists the acreages of Native Valley Foothill Riparian habitat within the Project Area.

Valley Needlegrass Grassland

Valley Needlegrass Grassland is represented by mid-height (to 2 feet) grassland dominated by perennial bunchgrasses such as purple needlegrass. Native and introduced annuals occur among the perennials, often actually exceeding the bunchgrasses in cover. This vegetation type is present usually on fine-textured (often clay) soils, moist or even waterlogged during winter, but very dry in summer (Holland 1986 Code 42110). Valley Needlegrass Grassland was formerly extensive around the Sacramento, San Joaquin, and Salinas Valleys, as well as the Los Angeles Basin, but is now much reduced (Holland 1986). Reported occurrence data (CDFW 2014) includes 327 acres (<0.0001% of the Project Area) of Valley Needlegrass Grassland within the Project Area. Table 4.4-13 lists the acreages of Valley Needlegrass Grassland habitat within the Project Area.

Valley Oak Woodland

Valley Oak Woodland is characterized by valley, coast live, black, and blue, oaks; California sycamore; California coffeeberry; and other tree and shrub species. Several special-status species identified within the Project Area utilize Valley Oak Woodland habitats including slender salamanders, bats, and nesting raptors (Holland 1986 code 71130). The CNDDB (CDFW 2014) indicates that Valley Oak Woodland no longer exists within the Project Area. The CALVEG (2015) database, however, indicates that 5,354 acres (0.2% of the Project Area) occur in the Project Area. CALVEG results reflect a more detailed vegetation community analysis process, which identifies individual Valley oak trees and mixed or small monotypic stands of Valley Oak Woodland in isolated locations on privately held lands mainly in the southern foothill portions of the Project Area. Table 4.4-14 lists the acreages of Valley Oak Woodland habitat within the Project Area.

Valley Sacaton Grassland

Valley Sacaton Grassland is represented by up to 3-foot tall tussock-forming grassland dominated by alkali Sacaton. This vegetation type is present on fine-textured, poorly drained, usually alkaline soils. Most sites have seasonally high water tables or are overflowed during winter flooding (Holland 1986 Code: 42120). Valley Sacaton Grassland was formerly extensive in the Tulare Lake Basin and along the San Joaquin Valley north to Stanislaus and Contra Costa Counties, but has been much reduced (Holland 1986). Reported occurrence data (CDFW 2014) includes 327 acres (<0.0001% of the Project Area) of Valley Sacaton Scrub within the Project Area. Table 4.4-15 lists the acreages of Valley Sacaton Grassland habitat within the Project Area.

Valley Saltbush Scrub

Valley Saltbush Scrub is dominated by woody shrubs and may vary in density and composition based on soil, drainage, slope, elevation, etc. Valley Saltbush Scrub is represented by open, gray or blue-green chenopod scrubs (10 to 40% cover), usually over a low herbaceous annual understory. It is dominated by common saltbush, arrowscale saltbush, spiny saltbush, alkali heath, cheesebush, and Bakersfield cactus (Holland 1986 Code: 36220). This vegetation type is present typically on sandy to loamy soils without surface alkalinity; largely on rolling, dissected alluvial fans with low relief. Valley Saltbush Scrub is known to historically occur from the Southern and southwestern San Joaquin Valley and the Carrizo Plains of San Luis Obispo County. Reported occurrence data (CDFW 2014) includes 19,572 acres (0.008% of the Project Area) of Valley Saltbush Scrub within the Project Area. Table 4.4-16 lists the acreages of Valley Saltbush Scrub habitat within the Project Area.

Valley Sink Scrub

Valley Sink Scrub is lowland scrub habitat dominated by specialized, highly alkali-tolerant succulents with little or no associated understory vegetation (Holland 1986 Code: 36210). Other salt-tolerant plants such as saltgrass, Jared's peppergrass and a number of special-status plants may occur within these sink areas. Reported occurrence data (CDFW 2014) includes 20,652 acres (0.009% of the Project Area) of Valley Sink Scrub within the Project Area. Table 4.4-17 lists the acreages of Valley Sink Scrub habitat within the Project Area.

Vernal Pool Complex

The Vernal Pool Recovery Plan (USFWS 2004) identifies two vernal pool regions that extend into the Project Area: the San Joaquin Valley and Carrizo Vernal Pool Regions. The plan also identifies "Core Areas" for recovery planning. None of the Core Areas in the plan include Project Area lands. Vernal pools occurring with these regions are generally classified as Northern Claypan Vernal Pools or are assigned to an undefined category. Although records of Northern Claypan Vernal Pools are not present in the CNDDB, the Vernal Pool Recovery Plan and other sources indicate that Northern Claypan Vernal Pools could occur in the Project Area, primarily within agricultural lands, where cultivation generally reduces or eliminates vernal pool occurrences. Table 4.4-18 lists the acreages of Vernal Pool Complex habitat within the Project Area.

Wetlands and Waters

The acreage and length of perennial, seasonal, and ephemeral drainages; wetlands; artificial ponds; ditches and other conveyance facilities within the Project Area was estimated for each Subarea by using the National Hydrology Dataset (NHD) and the National Wetlands Inventory (NWI; Figure 4.4-8). The acreage of wetlands and similar water features, and the length of linear watercourses within each Subarea were estimated from the NHD and NWI data (Table 4.4-20). Figure 4.4-8 shows that largely ephemeral streams flow generally east in the Western Subarea and west in the Eastern Subarea to the valley floor. Flows from the southern mountains move north towards the valley. A small portion of the far Western Subarea drains to the Carrizo Valley to the east.

Lake	302.7	6,599.4	110.2	103.7	-	7,116.0
Other	134.8	2,208.8	17.4	22.5	0.9	2,384.5
Riverine	105.0	1,485.6	132.9	12.7	2.5	1,738.8

The acreage of wetland features in the NWI dataset is summarized from each Subarea in Table 4.4-20. This analysis is conservative in approach, because the NWI dataset includes artificial ponds and drains used for agricultural, oil and gas operations, mining, and other industrial activities in one or more category of wetlands.

The length of watercourses in the NHD is summarized for each Subarea in Table 4.4-21. This analysis is conservative because the NHD includes artificial ditches, channels, and other constructed linear facilities used in agricultural, oil and gas operations, mining and other industrial activities in one or more category of watercourse. The Central Subarea, for example, has been heavily altered for agriculture, but has over 3.4 million linear feet of canals and ditches compared with just 1.9 million linear feet of natural drainages (streams). Natural watercourses account for the preponderance of all linear water features in the Western and Eastern Subareas where agriculture, and related water conveyance facilities, account for a proportionately smaller share of the land uses.

Table 4.4-21: NHD Watercourses in Each Subarea (linear feet)

NHD Watercourse	Tier 1	Tier 2	Tier 3	Tier 4	Tier 5	Total

Many waters in the Project Area have been determined by federal agencies to be non-navigable and to not have a hydrological connection with federally jurisdictional navigable waters. Very few watercourses in the Project Area are navigable at any time, and surface waters in most Kern County valley floor locations do not flow to or connect with waters that eventually drain into the Sacramento Delta to the north. However, the extent to which wetlands and waters in the Project Area are subject to federal jurisdiction is subject to considerable uncertainty. The U.S. Environmental Protection Agency (EPA) has recently adopted new regulations for defining federally jurisdictional wetlands and waters; however, these regulations may be challenged or set aside by Congressional action (see Section 4.4.3, Regulatory Setting). The project evaluated in this EIR does not include, nor does this EIR provide California Environmental Quality Act (CEQA) coverage for, any dredge or fill activities in federally jurisdictional wetlands and waters.

Methods

Literature Review

For the purposes of this analysis, "'special-status species" are defined herein to include those plant and animal species listed as threatened or endangered by the state or federal resources agencies; those for which critical habitat has been designated or proposed; those listed as Species of Special Concern (SSC) or Fully Protected in California; and, because agencies often consider them in environmental review documents, those that appear on Non-Government Organization "watch lists." A list of species with potential to occur in the Project Area was compiled based on results of literature and database searches. In addition to other sources listed in the references section below, information was obtained from:

- CNDDB (CDFW 2014, 2015a);
- California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (CNPS 2014);
- SJV Recovery Plan (USFWS 1998);
- Vernal Pool Recovery Plan (USFWS 2004),
- The federal endangered and threatened species list (USFWS 2013a);
- VertNet© records (VertNet 2015);

- The Jepson Herbarium, University of California, Berkeley; and
- California Resources Corporation (formerly Occidental Petroleum of Elk Hills) survey data.

Special status species that could occur within the Project Area were identified and grouped into three categories.

Category 1 species include plants and animals that are known or likely to occur in the Project Area and for which one of four types of habitat suitability modeling data was available and used to quantify and analyze potential Project impacts by subarea and tier based on conservative assumptions regarding the level of future Project-related activities. The models and analytical approaches used to analyze Category 1 species are discussed in more detail below. Nine plant and 28 wildlife species are included in Category 1 and evaluated using modeling data (see Tables 4.4-26 and 4.4-36 and Impact 4.4-1).

Category 2 species include plants and animals that are known or likely to occur in the Project Area for which modeling data was not available to quantify and analyze potential Project impacts. Impacts to Category 2 species were evaluated by identifying the subareas and tiers where these species could occur and by considering the level of potential new disturbance in each location based on conservative assumptions regarding the level of future Project-related activities. A total of 31 plant and 19 wildlife Category 2 species are included in Category 2 (see Tables 4.4-26 and 4.4-36 and Impact 4.4-1).

Category 3 species were identified during the literature review or by local experts as potentially occurring in the vicinity of the Project Area, and for which suitable habitat is present. As discussed below (see Tables 4.4-26 and 4.4-36), Category 3 species may also be present in the Project Area. Category 3 plant and wildlife species were not further analyzed in the EIR because they lack official status as a State of California or a federally threatened or endangered species (e.g., a California Rare Plant Rank [CRPR] Rank 4 species). A total of 53 plants and 24 wildlife species were included in Category 3 and not further analyzed in this EIR (see Tables 4.4-26 and 4.4-36 and Impact 4.4-1).

Category 1 Species Analysis Approach

Potential impacts to all Category 1 species were evaluated by using habitat suitability models that were previously prepared for other HCPs, other permit purposes, or by the Project Applicant's biologists (Quad Knopf, Inc. [QK]) within the Project Area. All of the available models were reviewed by biologists retained by the County for the pruposes of preparing this EIR to determine if the model methodologies were appropriate for inclusion in the impact analysis. In certain cases, the County-retained biologists determined that model data did not provide useful information about the applicable species, and the models were not used in the analysis.

The 9 plant and 28 wildlife species models that were used in this EIR include three different modeling approaches using various environmental parameters to produce maps and acreage

estimates depicting habitat suitability for each species within the Project Area. Six plant and 25 wildlife models were obtained from information prepared by URS for drafts versions of the Lokern Habitat Conservation Plan (LHCP) proposed by the Chevron North America Exploration and Production Company, a division of Chevron U.S.A. Inc. (Chevron) (URS 2014). Three plant and two wildlife models were obtained from information prepared by ICF International, Inc. (ICF) for the revised Metropolitan Bakersfield Habitat Conservation Plan (MBHCP) (ICF 1994). One wildlife model (Tehachapi slender salamander) was obtained from information prepared by QK on behalf of the Project Applicant. Except for the QK model, the URS and ICF models generally include the Project Area below approximately 2,000 feet, which accounts for all existing Tier 1 locations and the vast majority of Project Area land in a DOGGR administrative oilfield boundary area. Habitat suitability modeling has been used to estimate potential species distribution and impacts in larger landscapes. The model results identify potentially suitable habitat for each modeled species and not actual species distribution in the Project Area. A summary level of discussion of the modeling methods utilized by URS, ICF and QK are provided below.

URS Modeling Analysis

The URS models use two analytical approches: (1) a statistical-based model(SBM) using the MaxEnt methodology (URS 2014), and (2) a habitat suitability-based approach.

The SBM or MaxEnt methodology is a statistically based model that predicts the areas of high or low suitability for a species in a given geographic area. MaxEnt models use the correlation between locations or occurrences where a species has been found and environmental parameters (such as soil, landform, and climate data) to produce an estimate of the species potential distribution. For each of the MaxEnt models used in this EIR, 75% of available occurrence data for a species were randomly selected to train and create the model. The remaining 25% were reserved during model creation for use in model verification, which tests the model's accuracy following training. Five replications of each model were run, and each replication used a different set of randomized training and verification points.

MaxEnt models produce a "grid" indicating the predicted suitability of habitat conditions for the modeled species. The size of the grid is dictated by the grid size of the model input parameters, which must all have the same grid size. The MaxEnt models used in this EIR have a grid size of 2,461 feet by 2,461 feet (750 meters by 750 meters), which is the maximum resolution of the climactic data used for model building. Statistical metrics were analyzed to determine whether each model has sufficient predictive power to be used in the analysis. A primary indicator of model fitness provided by the MaxEnt output is called the "Area Under the Curve" (AUC) metric. The AUC provides a measure of the model's predictive power versus randomly assigned suitability indices. The theoretical maximum of the AUC value approaches 1, while a value of 0.5 indicates the results are no better than random (no predictive power). AUC values above 0.7 are considered to have reasonable to good predictive power, and all of the SBM models used in this EIR were determined to meet or exceed the 0.7 AUC criterion.

Other models developed by URS used a habitat suitability model (HSM) approach for species that could not be modeled with a statistically-valid MaxEnt results. The URS HSM analysis identifies the types of habitats used by each species and estimates the suitability of those habitat types based on scientific literature, regulatory agency guidelines and habitat suitability on data obtained from the California Wildlife Habitat Relationships (CWHR) program (URS 2014). Using land use and vegetation community mapping, the HSM method identifies suitable habitat within the currently known range of a species and provides details on the type of habitat present (breeding vs. foraging) and the relative values of the habitat type (e.g., high, moderate, low, and not suitable). The HSM is a tool for assessing the suitability of habitat for a given species based on known affinities with vegetation communities, environmental parameters and expert opinions from literature sources. The HSM model results primarily identify portions of the Project Area that, under the model assumptions, could provide high, moderate, low or no habitat for foraging and/or breeding activity.

ICF Modeling Analysis

A habitat modeling analysis for some of the special-status species known to occur in the San Joaquin Valley portion of Kern County was conducted by ICF (1994) for the revised MBHCP. The ICF model output generally identifies higher-value habitat suitability for foraging, breeding, nesting habitat, or plant growth. The results were classified into primary and secondary habitat for each species. Model input parameters include landcover type, soil series data, elevation range, and species occurrence information from literature and the CNDDB. As discusssed below, the ICF model results generally identify habitats that are similar to the high quality URS model results and do not identify lower to moderate quality habitats in the Project Area. ICF models were used to analyze the least Bell's vireo, recurved larkspur, rose flowered larkspur.

QK Modeling Analysis

The QK model methodology was used for the Tehachapi slender salamander, adobe sunburst and San Joaquin pocket mouse. The QK model methodology was similar to the ICF model approach. Species habitat suitability was identified based on: (1) vegetation community affinities; (2) known range within the Project Area; (3) elevation range; and (4) soil type affinities. Data sources included the USDA's EVEG data fields, CWHR classifications for the Project Area, and other authoritative sources, including The Jepson Manual; CalFlora; data compiled by CDFW, and USFWS, and data in support of the Freeport McMoRan Oil & Gas (formerly Nuevo Energy Company/Torch Operting Company [Nuevo-Torch]) and the proposed California Resources Corporation (formerly Occidental Petroleum Corporation) Elk Hills HCP (EHHCP).

As discussed above, both the SBM and HSM URS models provided estimates of Project Area habitat suitability ranging from poor to ideal (SBM models) or low to high (HSM models). The URS model results were grouped into two categories: (1) "high" quality habitats and (2) "low to moderate" quality habitat. The ICF and QK models identified areas of habitat suitability that generally conform with the URS "high" quality habitat suitability category. As a result, the ICF and QK models do not generate estimates of "low to moderate" quality habitats in the Project Area. As discussed in the species descriptions below, the total acreage of the predicted "high"

quality or "low to moderate" habitat by tier and subarea for the URS SBM and URS HSM models, and the "high" quality habitat predicted by the ICF and QK models, are summarized for each species in a table and shown on a map of the Project Area by tier and subarea. The maps are included in Appendix N. Tables 4.4-22 through 4.4-25 identify the URS SBM, URS HSM, ICF, and QK habitat suitability prediction outputs, and the URS SBM and URS HSM outputs that were grouped into either the "high" quality or "low to moderate" quality habitat categories for analysis purposes.

Plant and Wildlife Species Summary

This section summaries the special-status plant and wildlife species that may potentially occur in the Project Area grouped by Category 1 (species analyzed using model data), Category 2 (species analyzed without model data), and Category 3 (species considered but not further analyzed because they either do not occur in the region or they are not considered to be a sensitive species within the Project Area). In addition, species considered on "watch lists" were included in Category 3 unless the review of their distribution and status indicated that the portion of the species' distribution within the Project Area warranted further consideration of Project impacts.

A total of 93 special-status plant species were identified in the literature search as potentially occurring within the Project Area (Table 4.4-26). Of these, 53 species were considered to be Category 3 species because they were absent from the Project Area or not considered to be a sensitive species within the Project Area. Forty species were included in Category 1 (9 species) and Category 2 (31 species), of which five are federally listed as threatened or endangered, and two are state-listed only (one threatened and one endangered). Thirty-two of the 40 plant species retained are ranked as CRPR Rank 1B or 2B species, and are not federally or state listed.

A total of 73 special-status wildlife species were identified during the initial species review for the Project Area (Table 4.4-36). Of these, 24 species were considered to be Category 3 species because they were absent from the Project Area, not considered to be a sensitive species within the Project Area, or on "watch lists" unless the review of their distribution and status indicated that the portion of the species' distribution within the Project Area warranted further consideration of Project impacts. Of the 49 species retained, 13 are federally listed and 12 are state-listed.

Special Status Plant Species

Special-status plant species are defined herein as those that are listed as threatened and/or endangered by the USFWS or CDFW; designated as SSC or locally significant by CDFW; fully protected under state law; or species that meet the definition of rare or endangered under CEQA Sections 15380(b) and (d). The status and known distributions of special-status plant species in the Project Area were evaluated based on a review of available literature, and from federal and state databases, including the CNDDB. Data collected from previous conservation-related studies

and projects within the Project Area were also reviewed. No critical habitat has been designated by the USFWS for any plant species in the Project Area. Data sources included:

- Plant species listed as threatened or endangered under the federal Endangered Species Act (ESA) (Wildlife, 50 CFR § 17.11 and Errata; Plants, 50 CFR §17.12 and Errata, 2002).
- Plant species that are candidates for listing under ESA (Wildlife and Plants, 50 CFR §17.3 Proposed and Final Rules, 1999).
- SJV Recovery Plan (USFWS 1998).
- Plant species listed as rare, threatened, or endangered under California Endangered Species Act (CESA) (Wildlife, CCR Title 14, Section 670.5, 1971 as amended; Plants, CCR Title 14, Section 670.2, 1978 as amended).
- CNPS's Inventory of Rare and Endangered Plants (CNPS 2014).
- CNDDB (CDFW 2014, 2015a).
- California Special Vascular Plants, Bryophytes, and Lichens List (CDFW 2015b).
- Kern County VFHCP (Garcia and Associates 2010).
- MBHCP and EIR (City of Bakersfield and County of Kern 1994).
- University of California, Berkeley, The Jepson Online Interchange California Floristics, online herbarium resource (University of California, Berkeley 2014).
- Draft Chevron LHCP.
- Draft California Resources Corporation EHHCP.
- Freeport McMoRan Oil & Gas HCP.
- A list of all Category 1, Category 2, and Category 3 plants considered in the analysis is provided in Table 4.4-26.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Category 1 Plant Species			
Bakersfield cactus *(Opuntia treleasei)*	E/E/1B	Chenopod scrub, cismontane woodlands, and valley and foothill grasslands at elevations between 350 and 4,800 feet (CNPS 2014).	Yes, in all Tiers and in all Subareas.
California jewelflower *(Caulanthus californicus)*	E/E/1B.1	Chenopod scrub, pinyon and juniper woodlands, and grasslands at elevations from 200 to 3,300 feet (CNPS 2014).	Yes, in Tiers 2 and 4 of all Subareas.
Heartscale *(Atriplex cordulata var. cordulata)*	-/-/1B.2	Chenopod scrub, meadows and seeps, and grasslands on sandy/saline or alkaline soils at elevations to 1,900 feet.	Yes, in all Tiers and in all Subareas.
Kern County larkspur (Rose-flowered larkspur) *(Delphinium purpusii)*	-/-/1B.3	Rocky and carbonate soils in chaparral, cismontane woodland, and pinyon and juniper woodlands. The species usually occurs at elevations from 950 to 4,500 feet and is only known from east of the San Joaquin Valley.	Yes, in Tiers 2 and 3 of the Eastern Subarea.
Kern mallow *(Eremalche kernensis)*	E/-/1B.1	Chenopod scrub and grasslands at elevations from 200 to 4,300 feet (CNPS 2014).	Yes, in Tiers 1, 2, and 3 in all Subareas.
Lost Hills crownscale *(Atriplex coronata S. Watson var. vallicola)*	-/-/1B.2	Chenopod scrub, grassland habitat, and vernal pool habitats at elevations from 150 to 2,500 feet.	Yes, in Tiers 1, 2 and 4 of the Western and Central Subareas.
Recurved larkspur *(Delphinium recurvatum)*	-/-/1B.2	Alkaline soils of chenopod scrub, cismontane woodlands, and grassland habitats at elevations to 2,600 feet. Fairly widespread throughout the San Joaquin Valley, Carrizo Plain, Mojave Desert, and Coast Ranges.	Yes, in Tiers 1, 2, and 4 in all Subareas.
San Joaquin adobe sunburst *(Pseudobahia peirsonii)*	T/E/1B.1	North- to northeast-facing small hills, or Mima mounds, associated with the upland portions of vernal pool habitats (USFWS 2004). All known wild occurrences are associated with Cibo clay, Porterville clay, Centerville clay, and Mt. Olive clay. Elevations ranging from 300 to 2,600 feet; all occurrences are from the Eastern Subarea and north and east of the Project Area.	Yes, in Tiers 2 of the Eastern Subarea.
San Joaquin woolly-threads *(Monolopia congdonii)*	E/-/1B.2	Chenopod scrub and valley and foothill grasslands at elevations from 150 to 2,700 feet (CNPS 2014).	Yes, in Tiers 1, 2 and 3 in all Subareas.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Category 2 Plant Species			
Alkali mariposa lily *(Calochortus striatus)*	-/-/1B.2	Chaparral, chenopod scrub, Mojave Desert scrub, and meadows and seeps in alkaline and mesic soils at elevations between 200 and 5,300 feet.	Yes, in Tier 2 of the Central and Western Subareas.
Bakersfield smallscale *(Atriplex tularensis)*	-/-/1A	Chenopod scrub habitats at elevations from 290 to 660 feet on alkaline soils and shores of dry lakes.	Yes, in Tiers 1, 2, 3, and 4 of all Subareas.
Calico monkeyflower *(Mimulus pictus)*	-/-/1B.2	Occurs in broad-leafed upland forests and cismontane woodlands at elevations from 1,400 to 4,100 feet in the western Sierra Nevada and Tehachapi Mountains.	Yes, in Tiers 2 and 4 of the Eastern Subarea.
California satintail *(Imperata brevifolia)*	-/-/2B.1	Mesic areas of chaparral, coastal scrub, Mojave Desert, meadow and seep, and riparian scrub habitats at elevations from 600 to 4,000 feet. Widespread but apparently uncommon with many herbarium specimens from historic collections with very little habitat information. Only one collection from Project Area; most likely to occur in riparian scrub.	Yes, in Tiers 1, 2, 3, and 4 of the Eastern Subarea.
California tortula moss (California screw-moss) *(Tortula californica)*	-/-/1B.2	Chenopod scrub and valley and foothill grassland habitats on dry, sandy soils at elevations from 30 to 4,800 feet. One record from the vicinity of Bakersfield and all others in southern California.	Yes, in Tier 3 of the Eastern Subarea.
Comanche Point layia *(Layia leucopappa)*	-/-/1B.1	Chenopod scrub and valley and foothill grassland habitats at elevations from 300 to 1,200 feet; in Project Area, known from southeastern San Joaquin Valley and Tehachapi Mountains.	Yes, in Tier 2 of the Western and Eastern Subareas.
Coulter's goldfields *(Lasthenia glabrata ssp. coulteri)*	-/-/1B.1	Marshes and swamps, playas, and vernal pools at elevations from 0 to 3,700 feet. In the Project Area, may occur throughout the San Joaquin Valley and lower elevations of the Sierra Nevada and Tehachapi Mountains.	Yes, in Tier 2 of the Western Subarea.
Deltoid bract saltbush (Subtle orache) *(Atriplex subtilis)*	-/-/1B.2	Grasslands, often in the vicinity of vernal pools at elevations from 130 to 330 feet in alkaline soils. In the Project Area, lower elevation San Joaquin Valley intact alkali sink areas.	Yes, in Tiers 1, 2, 3, and 4 of the Central and Western Subareas.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Diamond-petaled California poppy *(Eschscholzia rhombipetala)*	-/-/1B.1	Grassland habitats in alkaline and clay soils at elevations from 30 to 3,300 feet. Most of the populations reported have been on hillsides, but community associations varied widely among the sites. In the region of the Project Area, only known from the Temblor Range and to the west in San Luis Obispo County.	Yes, in Tiers 1, 2, and 4 of the Western Subarea.
Erect-stem saltbush (Earlimart orache) *(Atriplex cordulata var. erecticaulis)*	-/-/1B.2	Low-lying, sparsely-vegetated grasslands and on mounds between vernal pools on saline or alkaline soils at elevations from 130 to 350 feet. In the Project Area, only known from a few occurrences in the far northern, central San Joaquin Valley. All other known populations are to the north of the Project Area.	Yes, in Tier 2 of the Central Subarea.
Hall's tarplant *(Deinandra halliana)*	-/-/1B.1	Chenopod scrub, cismontane woodland, and grassland habitats at elevations from 850 to 3,150 feet.	Yes, in Tiers 1 and 2 of the Western Subarea.
Hispid bird's-beak *(Chloropyron molle ssp. hispidum)*	-/-/1B.1	Alkaline meadows and seeps, playas, and grassland habitats at elevations to 510 feet. Only known from a few populations in the southern portion of the Central Subarea and southeastern portion of the Eastern Subarea, the remainder of collections are from disjunct areas to the north of the Project Area.	Yes, in Tier 1 of the Central and Eastern Subarea.
Horn's milk-vetch *(Astragalus hornii var. hornii)*	-/-/1B.1	Meadows, seeps, and playas along lake margins on alkaline soils at elevations from 190 to 2,800 feet.	Yes, in Tier 2 of the Central Subarea.
Jared's pepper-grass *(Lepidium jaredii ssp. jaredii)*	-/-/1B.2	Valley and foothill grassland habitats at elevations from 1,000 to 3,300 feet. In the Project Area, only known from the far northwestern corner of the Western Subarea; also known from west of the Project Area.	Yes, in Tier 2 of the Western Subarea.
Kings gold *(Tropidocarpum californicum)*	-/-/1B.1	Known from a small number of populations in chenopod scrub at elevations of approximately 200 feet. Recently described with little known about ecological requirements.	Yes, in Tiers 1, 2, 3, and 4 of the Eastern and Western Subareas.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Lemmon's jewelflower *(Caulanthus lemmonii)*	-/-/1B.2	Pinyon and juniper woodlands and grassland habitats at elevations from 250 to 4,000 feet; only known from above the San Joaquin Valley floor in the Project Area and vicinity.	Yes, in Tier 2 of the Western Subarea.
Lesser saltscale *(Atriplex minuscula)*	-/-/1B.1	Chenopod scrub habitat, playas, and grasslands on alkaline, sandy soils, and often in association with slough systems and river floodplains. It is found only in microhabitats that are not inundated year-round. This species occurs at elevations to 650 feet.	Yes, in Tier 2 of the Central Subarea.
Mason's neststraw *(Stylocline masonii)*	-/-/1B.1	Chenopod scrub and pinyon and juniper woodlands in sandy soils at elevations from 300 to 4,000 feet. Although very few populations known from Project Area, species is known from a wide variety of habitat types in the region.	Yes, in Tiers 2 and 4 of the Western and Eastern Subareas
Munz's tidy-tips *(Layia munzii)*	-/-/1B.2	Chenopod scrub and valley and foothill grassland habitats at elevations from 150 to 2,100 feet in alkaline clay.	Yes, in Tier 2 of the Western and Central Subareas.
Oil neststraw *(Stylocline citroleum)*	-/-/1B.1	Chenopod scrub, coastal scrub, and valley and foothill grassland habitats with clay or sandy soils. It is known to grow on land that has been developed for oil production (USFWS 1998). The oil nestraw is located at elevations from 190 to 1,000 feet.	Yes, in Tiers 1 and 2 of the Western Subarea.
Pale-yellow layia *(Layia heterotricha)*	-/-/1B.1	Cismontane woodlands, pinion and juniper woodlands, and valley and foothill grasslands on alkaline soils or clay. It grows at elevations from 850 to 5,000 feet.	Yes, in Tier 2 of the Western and Eastern Subareas.
Piute Mountains navarretia *(Navarretia setiloba)*	-/-/1B.1	Cismontane woodland, pinyon-juniper woodland, and valley and foothill grasslands in clay or gravelly loam soils between 800 and 7,000 feet in elevation (CNPS 2014).	Yes, in Tier 2 of the Eastern and Western Subareas.
Round-leaved filaree *(California macrophylla)*	-/-/1B.1	Cismontane woodland and grassland habitats in open areas at elevations to 4,000 feet in clay soils. Widespread through many habitat types in California; known from the middle elevations within the Project Area.	Yes, in Tier 2 of the Eastern and Western Subareas.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Shevock's golden aster *(Heterotheca shevockii)*	-/-/1B.3	Chaparral and cismontane woodlands in crevices and shallow sand at elevations from 750 to 3,000 feet. Only known from the vicinity of the Kern River and surrounding drainages east of Bakersfield.	Yes, in Tiers 1, 2, 3, and 4 of the Eastern Subarea.
Showy golden madia *(Madia radiata)*	-/-/1B.1	Cismontane woodlands and valley and foothill grasslands at elevations to 4,000 feet; known from the far northwestern portion of the Western Subarea; all other populations are west and north of Kern County.	Yes, in Tier 2 of the Western Subarea.
Slough thistle *(Cirsium crassicaule)*	-/-/1B.1	Chenopod scrub, in marshes and swamps, and riparian scrub at elevations to 350 feet in the San Joaquin Valley floor.	Yes, in Tier 1 and 2 of the Central and Western Subareas.
Spiny-sepaled button-celery *(Eryngium spinosepalum)*	-/-/1B.2	Valley and foothill grasslands within vernal pools and depressions at elevations from 260 to 900 feet. Known occurrences in the Project Area are in the north and northeastern portions of the Eastern Subarea, with one historic location from the northern Central Subarea.	Yes, in Tier 2 of the Eastern Subarea.
Striped adobe-lily *(Fritillaria striata)*	-/T/1B.1	This species occurs at elevations from 440 to 3,750 feet in cismontane woodlands and grassland habitats, and appears to be restricted to some of the heavy clay (adobe) soils that are found along the eastern side of the San Joaquin Valley and lower foothills.	Yes, in Tier 2 of the Eastern Subarea.
Tejon poppy *(Eschscholzia lemmonii ssp. kernensis)*	-/-/1B.1	Chenopod scrub and grassland habitats on adobe clay soils between 528 and 2,000 feet in elevation (University of California, Berkeley 2013).	Yes, in Tiers 1 and 2 of the Western and Eastern Subareas.
Temblor buckwheat *(Eriogonum temblorense)*	-/-/1B.2	Valley and foothill grasslands at elevations from 950 to 3,300 feet on clay or sandstone. Only known from far western portion of Western Subarea in Temblor Range.	Yes, in Tier 1 of the Western Subarea.
Vasek's clarkia *(Clarkia tembloriensis ssp. Calientensis)*	-/-/1B.1	This species occurs in grassland habitat at elevations from 850 to 1,700 feet. Known from only three occurrences along Caliente Creek in the eastern portion of the East subarea.	Yes, in Tier 2 of the Eastern Subarea.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Category 3 Plant Species			
Adobe navarretia *(Navarretia nigelliformis ssp. nigelliformis)*	-/-/4.2	Vernal pools, clay depressions, and sometimes serpentine soil in valley and vernally mesic foothill grasslands. This species is limited to clay and adobe soils that occur between 300 and 3,300 feet in elevation within the Project Area.	Very low potential to occur in Project Area.
Adobe yampah *(Perideridia pringlei)*	-/-/4.3	Chaparral, cismontane woodland, coastal scrub, and pinyon and juniper woodland habitats on grassy slopes and serpentine outcrops at elevations from 950 to 5,900 feet.	Very low potential to occur in Project Area.
Brittlescale *(Atriplex depressa)*	-/-/1B.2	Chenopod scrub, meadows and seeps, playas, annual grasslands, and vernal pool habitats consisting of alkaline, clay soils at elevations from 3 to 1,050 feet.	Very unlikely to occur in Project Area.
California androsace *(Androsace elongata ssp. acuta)*	-/-/4.2	Dry grassy slopes between 500 to 4,000 feet in elevation (Baldwin et al. 2012).	Yes, there is a low potential for this species to occur in the Project Area. Fairly common outside of the Project Area.
Chaparral ragwort *(Senecio aphanactis)*	-/-/2B.2	Chaparral, cismontane woodland, and coastal scrub habitats on alkaline soils at elevations of 49 to 2,625 feet.	Not expected
Cottony buckwheat *(Eriogonum gossypinum)*	-/-/4.2	Chenopod scrub and grassland habitats at elevations from 300 to 1,640 feet (CNPS 2014).	Yes, in Tiers 1 and 2 of the Western and Eastern Subareas.
Crownscale *(Atriplex coronata var. coronata)*	-/-/4.2	Chenopod scrub, grassland habitat, and vernal pool habitats at elevations from 150 to 2,500 feet.	Yes, in Tiers 1 and 2 of the Western and Central Subareas.
Cuyama gilia *(Gilia latiflora ssp. cuyamensis)*	-/-/4.3	Pinyon and juniper woodland habitats on sandy flats and lower river valleys at elevations from 1,950 to 6,600 feet (CNPS 2014; Baldwin et al. 2012).	Much more common outside of Project Area; very low potential for occurrence in an area of impact
Delicate bluecup *(Githopsis tenella)*	-/-/1B.3	Chaparral and cismontane woodland in mesic sandy loam soils at elevations from 3,600 to 6,300 feet.	Not expected

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Douglas' fiddleneck *(Amsinckia douglasiana)*	-/-/4.2	Cismontane woodland and grassland habitats at elevations from 30 to 5,150 feet.	Relatively common outside of Project Area.
Ferris' goldfields *(Lasthenia ferrisiae)*	-/-/4.2	Occurs in vernal pool habitats on alkaline or clay soil at elevations from 30 to 2,100 feet.	Yes, in Tier 4 of the Western Subarea.
Forked fiddleneck *(Amsinckia furcata)*	-/-/4.2	Cismontane woodland and valley and foothill grassland habitats at elevations from 150 to 3,300 feet.	Relatively common outside of Project Area; very low potential for occurrence in an area of impact.
Gairdner's yampah *(Perideridia gairdneri ssp. gairdneri)*	-/-/4.2	Vernal pool habitats at elevations from to 2,000 feet.	Not expected
Golden goodmania *(Goodmania luteola)*	-/-/4.2	Mojavean desert scrub, meadows and seeps, playas, and valley and foothill grassland communities on alkaline or clay soils at elevations from to 7,250 feet.	Relatively common
Golden violet (*Viola purpurea* ssp. *aurea)*	-/-/2B.2	Sandy soils in Great Basin scrub and pinyon and juniper woodland communities at elevations from 3,280 to 8,200 feet.	Not expected
Greenhorn fritillary *(Fritillaria brandegeei)*	-/-/1B.3	Lower montane coniferous forest in granitic sandy loam soils at elevations from 4,642 to 6,890 feet.	Not expected
Grey-leaved violet *(Viola pinetorum var. grisea)*	-/-/1B.3	Meadows and seeps, subalpine coniferous forests, and upper montane coniferous forests at elevations from 4,900 to 11,200 feet.	Not expected
Hoover's Woollystar (Hoover's Eriastrum)*(Eriastrum hooveri)*	DL/-/4.2	Hoover's eriastrum occurs in chenopod scrub, pinyon and juniper woodlands, and grassland habitats at elevations from 160 to 3,000 feet on both north- and south-facing slopes and on ridge tops.	Yes, in Tiers 1, 2, 3 and 4 of all subareas.
Indian Valley spineflower *(Aristocapsa insignis)*	-/-/1B.2	Cismontane woodland in sandy soils at elevations from 984 to 1,968 feet.	Not expected
Keck's checkerbloom *(Sidalcea keckii)*	E/-/1B.1	Cismontane woodland and grassland habitats and is found in serpentine and clay substrates at elevations between 245 and 2,130 feet.	Not expected

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Kern Canyon clarkia *(Clarkia xantiana* ssp. *parviflora)*	-/-/4.2	Dry slopes in the Kern River drainage within the southern Sierra Nevada between 2,950 and 4,950 feet in elevation.	Not expected
La Panza mariposa lily *(Calochortus simulans)*	-/-/1B.3	Sandy granitic, and sometimes serpentinite, soils in chaparral, cismontane woodland, lower montane coniferous forest, and valley and foothill grasslands. It usually occurs at elevations from 1,200 to 3,600 feet (CNPS 2014).	Not expected
Large-flowered nemacladus *(Nemacladus secundiflorus var. secundiflorus)*	-/-/4.3	Chaparral and annual grassland in open dry gravelly areas at elevations from 650 to 6,550 feet.	Not expected
Madera leptosiphon *(Leptosiphon serrulatus)*	-/-/1B.2	Chaparral, cismontane woodlands, and lower montane coniferous forests at elevations from 900 to 4,300 feet.	Not expected, very small amount of potential habitat.
Marsh claytonia *(Claytonia palustris)*	-/-/4.3	Meadows and seeps, marshes and swamps, upper montane coniferous forest along springs and stream banks at elevations from 3,280 to 8,200 feet.	Not expected
Mexican mosquito fern *(Azolla microphylla)*	-/-/4.2	Occurs in pools and slow water areas in marshes and swamps at elevations to 4,400 feet.	More common outside of Project Area; perennially wet portions of Kern River provide the only likely habitat.
Mojave Indian paintbrush *(Castilleja plagiotoma)*	-/-/4.3	Great Basin scrub, Joshua tree woodland, lower montane coniferous forest, and pinyon and juniper woodlands at elevations between 950 and 8,200 feet.	Relatively common outside of Project Area, low numbers in the Project Area.
Mt. Pinos larkspur *(Delphinium parryi* ssp. *purpureum)*	-/-/4.3	Dry chaparral, Mojavean desert scrub, and pinion and juniper woodlands at elevations from 1,800 to 7,000 feet.	Not expected, more common outside of Project Area.
Mt. Pinos onion *(Allium howellii* var. *clokeyi)*	-/-/1B.3	Open slopes in sagebrush scrub at elevations from 4,200 to 6,100 feet (University of California, Berkeley 2013).	Yes, in Tier 2 of the Western and Eastern Subareas.
Munz's iris *(Iris munzii)*	-/-/1B.3	Cismontane woodland at elevations from 1,000 to 2,650 feet.	Not expected
New York Mountains cryptantha *(Cryptantha tumulosa)*	-/-/4.3	Mojavean desert scrub and pinyon and juniper woodlands on gravelly, clay, granitic, or carbonate soils at elevations from 3,000 to 7,000 feet.	Not expected

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Nine Mile Canyon phacelia (*Phacelia novenmillensis*)	-/-/1B.2	Dry disturbed banks, granitic or metamorphic soils of upper slopes on east-facing canyons at elevations from 5,100 to 7,000 feet.	Not expected
Onyx Peak bedstraw (*Galium angustifolium* ssp. *onycense*)	-/-/1B.3	Cismontane woodland and pinyon and juniper woodlands in rocky soils at elevations from 2,800 to 7,600 feet.	Yes, in Tier 2 of the Western Subarea.
Oval-leaved snapdragon *(Antirrhinum ovatum)*	-/-/4.2	Heavy adobe clay soils (e.g., clay or gypsum) and often in alkaline soils, on gentle open slopes at elevations from 650 to 3,300 feet.	Yes, in Tier 2 of the Western Subarea.
Paniculate tarplant *(Deinandra paniculata)*	-/-/4.2	Coastal scrub, grasslands, and vernal pool habitats in mesic and sometimes sandy substrates at elevations from 80 to 3,100 feet.	Not expected
Panoche pepper-grass *(Lepidium jaredii ssp. album)*	-/-/1B.2	Valley and foothill grassland habitats, along washes and alluvial fans, at elevations from 600 to 900 feet.	Not expected
Potbellied spineflower *(Chorizanthe ventricosa)*	-/-/4.3	Cismontane woodland and annual grassland on serpentine outcrops at elevations from 200 to 4,100 feet.	Not expected
Salinas milk-vetch *(Astragalus macrodon)*	-/-/4.3	Chaparral, cismontane woodland, and grassland habitats on sandstone, shale or serpentine alluvium at elevations from 800 to 3,200 feet.	Yes, in Tier 2 of the Western Subarea.
San Jacinto Valley crownscale *(Atriplex coronata var. notatior)*	E/-/1B.1	Playas, annual grassland, and vernal pools on alkaline soils at elevations from 400 to 1,700 feet.	Not expected
San Joaquin bluecurls *(Trichostema ovatum)*	-/-/4.2	Chenopod scrub and valley and foothill grasslands at elevations from 200 to 1,100 feet.	Yes, in Tier 2 and 3 of the Central and Eastern Subareas.
Short-bracted bird's-beak *(Cordylanthus rigidus ssp. brevibracteatus)*	-/-/4.3	Chaparral, lower montane coniferous forest, pinyon and juniper woodlands, and upper montane coniferous forests in open and granitic areas. The short-bracted bird's-beak is known to occur at elevations from 2,000 to 8,500 feet.	Not expected
Sierra Canyon gooseberry (Aromatic canyon gooseberry) *(Ribes menziesii var. ixoderme)*	-/-/1B.2	Chaparral, Cismontane woodlands at elevations from 2,000 to 3,800 feet.	Not expected

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
Sierra Nevada monkeyflower *(Erythranthe sierrae)*	-/-/4.2	Dry meadows and seeps and in vernally wet depressions, swales, and streambanks in openings of cismontane woodlands and lower montane coniferous forests at elevations from 600 to 7,500 feet (CNPS 2014).	Not expected
Silky lupine *(Lupinus elatus)*	-/-/4.3	Dry areas of lower montane coniferous forests and upper montane coniferous forests at elevations from 4,900 to 9,850 feet.	Relatively common
Slender clarkia (*Clarkia exilis*)	-/-/4.3	Cismontane woodlands and grows at elevations from 390 to 3,300 feet.	Yes, in Tier 2 of the Eastern Subarea.
Small flowered morning glory *(Convolvulus simulans)*	-/-/4.2	Chaparral, coastal scrub, and grassland habitats at elevations from 100 to 2,300 feet.	Yes, in Tier 2 of the Eastern Subarea.
Stinkbells *(Fritillaria agrestis)*	-/-/4.2	Chaparral, cismontane woodland, pinyon juniper and grassland habitats sometimes in serpentine soils at elevations from 300 to 5,100 feet.	Relatively common, minor occurrence
Streambank spring beauty *(Claytonia parviflora ssp. grandiflora)*	-/-/4.2	Pine/blue oak woodlands in the Sierra Nevada Foothills at elevations from 800 to 4,000 feet (CNPS 2014). It is typically found in uplands and valleys with gentle to steep slopes where soils tend to be shallow, infertile, and moderately to excessively-drained with extensive rock fragments that may cover the ground surface.	Not expected
Sylvan microseris *(Microseris sylvatica)*	-/-/4.2	Chaparral, cismontane woodland, pinyon and juniper woodlands, and grassland habitats.	Yes, in Tier 2 of the Eastern Subarea.
Tehachapi buckwheat *(Eriogonum callistum)*	-/-/1B.1	Chaparral habitats on rocky and limestone areas at elevations from 4,600 to 4,900 feet (CNPS 2014).	Not expected
Tehachapi monardella *(Monardella linoides ssp. oblonga)*	-/-/1B.3	Upper and lower montane coniferous forest, and pinyon and juniper woodlands at elevations from 2,900 to 8,200 feet.	Not expected
Tracy's eriastrum *(Eriastrum tracyi)*	-/CR/3.2	This species occurs in chaparral and cismontane woodland habitats. It usually occurs at elevations from 1,000 to 5,500 feet (CNPS 2014).	Yes, in Tier 2 of the Western Subarea.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area

Species	Status (Fed/State/CNPS)	Habitat	Potential to Occur in Project Area
White pygmy-poppy *(Canbya candida)*	-/-/4.2	Joshua tree woodland, Mojavean desert scrub, and pinyon and juniper woodland habitats. The species usually occurs at elevations from 1,900 to 4,800 feet (CNPS 2014).	Not expected

Status abbreviations:
Federal and State Listing Code
E = Federal or State-listed Endangered
T = Federal or State-listed Threatened
DL = Delisted

California Rare Plant Ranks (formerly known as CNPS Lists)
1A: Plants Presumed Extirpated in California and Either Rare or Extinct Elsewhere
1B: Plants Rare, Threatened, or Endangered in California and Elsewhere
2A: Plants Presumed Extirpated in California, But Common Elsewhere
2B: Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere
3: Plants About Which More Information is Needed - A Review List
4: Plants of Limited Distribution - A Watch List
Threat Ranks
0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

Additional information is provided for all Category 1 and Category 2 plants below. The Category 1 plant modeled suitable habitat maps are provided in Appendix N.

Category 1 Plant Species

Bakersfield Cactus (*Opuntia basilaris* var. *treleasei*)

The Bakersfield cactus is federally and state endangered and has a CRPR of 1B.1 (CNPS 2014). It is included in the SJV Recovery Plan (USFWS 1998) and in the MBHCP (ICF 1994). This species occurs in chenopod scrub, cismontane woodlands, and valley and foothill grasslands at elevations between 350 and 4,800 feet (CNPS 2014). The Bakersfield cactus is a perennial stem succulent with showy magenta flowers. It blooms between April to May (CNPS 2014).

The Bakersfield cactus is endemic to the southeastern San Joaquin Valley, and historically ranged from immediately north of Bakersfield to Wheeler Ridge. One-third of Bakersfield cactus locations have been eliminated, largely due to its habitat being converted to agricultural and urban uses (USFWS 1998). Remaining Bakersfield cactus populations are fragmented and generally occur on small parcels. There is an ongoing effort to increase the number of Bakersfield cactus populations by relocating plants from existing populations into areas where the species had been previously extirpated.

Habitat modeling data were available for this species and the URS SBM model produced results that have good predictive power. The primary environmental factors for this species' habitat included winter mean temperature (most important), followed by ruggedness, summer mean temperature, soil type, and aspect (northing).

Areas characterized as having the potential to provide habitat for the Bakersfield cactus are shown by the URS SBM model to occur in the West and Eastern Subareas. The western extent of the species' range, however, extends only as far as the extreme southeastern corner of the Western Subarea (CNPS 2014). The habitat that is identified north of Maricopa Flat is outside of the range of this species, and should be discounted. Table 4.4-27 summarizes the modeled Bakersfield Cactus habitat, both high and low to moderate quality acreage, by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-1 in Appendix N.

Table 4.4-27: Modeled Bakersfield Cactus High Quality and Poor to Moderate Quality Habitat, Acres by Tier and Subarea

California Jewel Flower (*Caulanthus californicus*)

The California jewelflower has a CRPR of 1B.1 (CNPS 2014). It is included in the SJV Recovery Plan (USFWS 1998). It is an annual herb that can grow from 4 inches to more than 20 inches tall, with erect or spreading branched stems. The rounded or oval, toothed leaves are up to 4 inches long and clasp the stem, mainly around its lower portion. The inflorescence produces several

rounded flowers, often only along one side of the stem. Each flower has pouched sepals that are dark purple when new and turn light green to white as the flower opens. The frilly petals inside are nearly white with purple veining. This species occurs in chenopod scrub, pinyon and juniper woodlands, and grasslands at elevations from 200 to 3,300 feet (CNPS 2014). This species primarily grows in subalkaline and sandy loam soils on 0% to 25% slopes. At most, California jewelflower sites are dense in herbaceous cover. Native plant species such as annual fescue, clovers, red maids, and goldfields comprise a high proportion of the vegetation. This species is also associated with the burrow systems of giant kangaroo rats, specifically on the Carrizo Plain (USFWS 1998). This species blooms from February to May (CNPS 2014).

The historical range of the California jewelflower is based on specimens collected between 1880 and 1973. Nearly half of the collection sites were on the San Joaquin Valley floor in Fresno, Kern, and Tulare Counties. Several other collections came from the Carrizo Plain in San Luis Obispo County and the Cuyama Valley in Santa Barbara and Ventura Counties. Three collections occurred in the Sierra Nevada foothills at the eastern margin of the San Joaquin Valley in Kern County. The remainder of the collections occurred in the foothills west of the San Joaquin Valley in Fresno, Kern, and Kings Counties (USFWS 1998). As of 1986, all natural occurrences of the California jewelflower on the San Joaquin and Cuyama Valley floors had been extirpated. There are multiple presumed extant occurrences in Kern, Santa Barbara, San Luis Obispo, Fresno, and Kings Counties (USFWS 2013b). Two populations were introduced in the Los Padres National Forest in 1995. Although these records still appear in the CNDDB, both populations have failed and are no longer extant (USFWS 2013b).

The URS SBM model for this species produced results that have good predictive power. The primary environmental factors affecting the habitat suitability for this species included soil type (most important) followed by aspect (northing), elevation, ruggedness, and summer high temperature. As shown on Figure 4.4-2 in Appendix N, habitat values for the species generally range from poor to low throughout the Project Area, with relatively minor variability among each subarea.

The results of the analysis predict highly restricted areas of moderate to ideal habitat quality. The largest of these areas, and the only area to contain ideal and high quality habitat, occurs in the far eastern portion of the Eastern Subarea to the north of Highway 178 in the foothills of the Greenhorn Mountains. Table 4.4-28 summarizes modeled California jewelflower high quality and poor to moderate quality habitat acreage by tier and subarea.

Heartscale (Atriplex cordulata var. cordulata)

The heartscale has a CRPR of 1B.2 (CNPS 2014). The heartscale is an annual herb with an erect stem between 4 and 59 inches tall. It has oval scaly-gray heart-shaped basal leaves that are no longer than 0.6 inch. This plant has male and female inflorescences, which are small hard clusters of flowers. The reddish brown seeds are about 0.1 inch wide. This species occurs in chenopod scrub, meadows and seeps, and grasslands on sandy/saline or alkaline soils at elevations to 1,900 feet. It blooms from April to October (CNPS 2014).

This species is endemic to the southern Sacramento Valley and San Joaquin Valley. The Kern County VFHCP recognized populations of the heartscale in the vicinity of Allensworth Ecological Reserve, Semitropic-Kern National Wildlife Refuge, Lokern Ecological Reserve, west of the Buena Vista Lake bed, and in areas from Maricopa to Taft (Garcia and Associates 2010).

The URS SBM model for this species produced results that have good predictive power. Environmental characteristics that were strongly correlated with this species included soil type (most important), followed by elevation, summer high temperature, precipitation of wettest month, and precipitation of driest month. The results of the analysis predict that the majority of the Project Area consists of low quality habitat for the heartscale. A small area of moderate to ideal quality habitat is predicted within the Western Subarea of the Project Area between Elk Hills, Buena Vista Valley, and the Buena Vista Lake Bed. Areas of high to moderate quality habitat are predicted within the Western Subarea near the southern tip of the Temblor Mountain Range and north of Elk Hills. Areas of high to moderate quality habitat are also predicted within the Central Subarea east of I-5. No high quality habitat is predicted to occur within the Eastern Subarea. Table 4.4-29 summarizes modeled heartscale high quality and poor to moderate quality

habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-3 in Appendix N.

Kern County Larkspur (Rose-Flowered Larkspur) (*Delphinium purpusii*)

The Kern County larkspur has a CRPR of 1B.3 (CNPS 2014). The rose- flowered larkspur is a perennial herb that is an endemic to California. Its flower is generally pink to a deep rose-pink and its height ranges from 10 inches to 50 inches (University of California, Berkeley 2013). Its blooming period is from April to May (CNPS 2014). This species occurs on rocky and carbonate soils in chaparral, cismontane woodland, and pinyon and juniper woodlands. The species usually occurs at elevations from 950 to 4,500 feet (CNPS 2014). The threats to this species are unknown (CNPS 2014).

The Kern County larkspur is known to occur in Kern and Tulare Counties (CNPS 2014). This species ranges from the foothills east of the City of Bakersfield to north throughout the foothills and mid-elevations of the Sierra Nevada (CNPS 2014). The northernmost population of the rose-flowered larkspur is located east of the City of Exeter in Tulare County (CNPS 2014).

The ICF model was used to analyze this species. The results of the analyses predict that the majority of the Project Area lacks high quality predicted habitat. Areas containing suitable habitat

are predicted to occur within the foothills of the San Emigdio Mountains located in the southern part of the Western Subarea and within the foothills of the Greenhorn Mountains located in the Eastern Subarea. As explained in Table 4.4-25, the ICF model does not provide acreage estimates for low to moderate quality habitat. Table 4.4-30 provides modeled Kern County larkspur high quality modeled habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-4 in Appendix N.

Table 4.4-30: Modeled Kern County Larkspur High Quality Habitat, Acres by Tier and Subarea

Kern Mallow (Eremalche kernensis (Eremalche parryi ssp. Kernensis))

The Kern mallow is listed as federally endangered and has a CRPR of 1B.1 (CNPS 2014). This species is included in the SJV Recovery Plan (USFWS 1998). This taxon has undergone several changes in taxonomic identification and nomenclature. Based on the most recent 5-year status review, the USFWS has retained the name *Eremalche kernensis*, unless further biosystematics investigation shows otherwise (USFWS 2013c). Confusion regarding the identification and the taxonomic status of *E. kernensis* has centered on flower color, gender, and range (USFWS 1998). While the use of *E. parryi* ssp. *kernensis* has gained acceptance (University of California, Berkeley 2013), the USFWS suggests that further investigation into the classification is necessary. A combination of gender, flower color, and other floral characteristics are now considered diagnostic for identification of *Eremalche kernensis* (USFWS 2013c).

The Kern mallow is an herbaceous annual plant that can have a single stem or multiple stems. Stem lengths at flowering may range from less than 1 inch to nearly 20 inches. Its central stem is erect and its lateral stem(s) trail along the ground. Its flowers have five petals, and its wheel-shaped fruits are divided into single-seeded segments. The Kern mallow occurs in chenopod scrub and grasslands at elevations from 200 to 4,300 feet (CNPS 2014). It grows on dry open sandy to clay soils, eroded hillsides and alkali flats (CNPS 2014; Baldwin et al. 2012). Associated herbs include red brome, red-stemmed filaree, woolly goldfields, and white Sierran layia. The Kern mallow usually grows in areas where shrub cover is less than 25% and herbaceous cover is variable (USFWS 1998). The blooming period of this species is from March to May (CNPS 2014).

The SJV Recovery Plan initially recognized populations of pink-flowered plants thought to be Kern mallow in Buena Vista Valley, Elk Hills, Lost Hills, McKittrick Hills, Stockdale, the Temblor Range (all in Kern County), Corcoran (Kings County), Cuyama Valley (Santa Barbara County), and Pixley (Tulare County). However, Andreasen, Cypher, and Baldwin (2002) found that many previous records of the Kern mallow in the San Joaquin Valley were likely misidentified and were actually white mallow (*Eremalche exilis*), which is morphologically similar to, and more common than, Kern mallow (USFWS 2013c). As such, the known range of Kern mallow was previously reduced to a narrow band along Lokern Road in western Kern County (USFWS 1998).

URS SBM data was available for this species and had good predictive power. Table 4.4-31 summarizes modeled Kern mallow high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-5 in Appendix N.

Lost Hills Crownscale (Atriplex coronata S. Watson var. vallicola)

The Lost Hills crownscale has a CRPR of 1B.2 (CNPS 2014). The Lost Hills crownscale is an annual herb with short stems that has few branches and alternate, egg-shaped leaves with entire margins. Its individual flowers are inconspicuous because they are tiny and have no petals. Male and female flowers are mixed in small clusters on the upper leaf axils. The fruiting bracts are

broadly triangular, irregularly toothed, and may or may not have tubercles (warty projections). Each pair of bracts encloses a flattened, dark brown seed. The Lost Hills crownscale occurs in chenopod scrub, grassland habitat, and vernal pool habitats at elevations from 150 to 2,500 feet. The Lost Hills crownscale typically grows in the dried beds of alkaline pools within scrub or annual grassland communities, but one population in southern Kern County occurs on exposed slopes rich in gypsum. The associated species most frequently reported with the Lost Hills crownscale are spiny saltbush, common saltbush, seepweed, red brome, and annual fescue (USFWS 1998). This species blooms from April to August.

The Lost Hills crownscale is historically known to occur in Kern, Fresno, Kings, Tulare, Merced, and San Luis Obispo Counties. Two relatively large occurrence regions remain today. One region overlaps the Kern-Kings County boundary near the community of Lost Hills; and the second region occurs on the Carrizo Plain in San Luis Obispo County. Much smaller populations are known from the Kerman Ecological Reserve in Fresno County, near Lokern-McKittrick in Kern County, and southwestern Merced County. Extant Valley floor populations range in elevation from 160 to 300 feet, but populations on the Carrizo Plain and south of McKittrick range in elevation from 1,300 to 2,000 feet (USFWS 1998). Much of the Valley floor habitat, including that containing historical occurrences, has been destroyed by agricultural development.

There are multiple occurrences of Lost Hills crownscale located within the Project Area. Fifteen occurrences have been documented since 1990, and 56 occurrences were documented prior to 1990 or were from an unknown year (CDFW 2014; University of California, Berkeley 2013). These occurrences are located within the Central and Western Subareas. The most recent records of the Lost Hills crownscale within the Central Subarea are located in proximity to the Kern National Wildlife Refuge. The most recent records within the Western Subarea are located near the foothills of Temblor Range and Elk Hills and just west of the California Aqueduct. The records in the northern part of the Project Area are from the Lost Hills and Kern Wildlife Refuge Area.

URS SBM modeling data was available for this species. The results of the analysis predict that the majority of the eastern and southern side of the San Joaquin Valley consists of poor quality habitat.

The SBM model for this species produced results that have good predictive power. The primary environmental factors related to habitat for this species included soil type (most important), followed by aspect (easting), winter low temperature, precipitation of wettest month, and summer high temperature. Table 4.4-32 summarizes modeled Lost Hills crownscale high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-6 in Appendix N.

Recurved Larkspur (Delphinium recurvatum)

The recurved larkspur has a CRPR of 1B.2 (CNPS 2014). The recurved larkspur is a perennial herb up to about 19 inches tall. It has deeply lobed leaves, many of which are basal. The leaves located further up the dark purple stem are much smaller. Its flowers are generally blue, with its sepals and lower petals darker than its upper petals. Its sepals are usually curved back, the trait which gives the plant its name. This species occurs in chenopod, cismontane woodlands, and grassland habitats at elevations to 2,600 feet. The blooming period of this species is from March to June (CNPS 2014). The recurved larkspur is endemic to California and is historically known to occur in California's Great Valley, ranging from Butte County to Kern County. Most of the known occurrences of this species are in Kern, Tulare, and San Luis Obispo Counties.

ICF modeling data was available for this species. The results of the analysis predict that the highest concentration of habitat for the recurved larkspur occurs within the Western Subarea of the Project, in Sunflower Valley, from Antelope Valley south to Elk Hills, in Buena Vista Valley, and north of the Buena Vista Lake Bed. A few areas of predicted habitat are also scattered throughout the Central Subarea along I-5, and near Highway 46 in the north. There is also predicted habitat in the Eastern Subarea located mostly along the southern end of the Greenhorn Mountains. The ICF model does not provide acreage estimates for low to moderate

quality habitat. Table 4.4-33 summarizes modeled recurved larkspur high quality modeled habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-7 in Appendix N.

Table 4.4-33: Modeled Recurved Larkspur High Quality Habitat, Acres by Tier and Subarea

San Joaquin adobe sunburst (*Pseudobahia peirsonii*)

The San Joaquin adobe sunburst is listed as federally threatened and state endangered, and has a CRPR of 1B.1 (CNPS 2014). It is included in the Draft Recovery Plan for Southern Sierra Foothills Plants. This species is an annual herb growing 7.8 to 27.5 inches tall. It has a thin coating of woolly hairs. Its leaves are up to 2.3 inches long, and are generally divided into a few leaflets which are subdivided into lobed segments. Its inflorescence is a solitary flower head lined with about eight phyllaries that are fused at the base, making the involucre a rounded cup with pointed lobes. There are about eight golden ray florets. At the center of the head are yellow disc florets. This species occurs in cismontane woodlands and grasslands at elevations from 450 to 2,600 feet (CNPS 2014). Associated grasses and forbs include non-native species such as wild oats, foxtail chess, soft brome, foxtail barley, and red-stemmed filaree, and such native species as fiddleneck and blow-wives. The optimum habitat for the San Joaquin adobe sunburst consist of the north- to northeast-facing small hills, or Mima mounds, associated with the upland portions of vernal pool habitats (USFWS 2007a). All known wild occurrences are associated with Cibo clay, Porterville clay, Centerville clay, and Mt. Olive clay. The blooming period of this species is from March to April (CNPS 2014).

The historical distribution of the San Joaquin adobe sunburst is not known because when the species was first described in 1949, extensive areas of habitat for this species in the lower San Joaquin Valley were already being converted to agriculture (USFWS 2007a). Currently, three major population concentrations of the San Joaquin adobe sunburst now include areas east of Fresno in Fresno County, west of Lake Success in Tulare County, and northeast of Bakersfield in Kern County (USFWS 2007a).

QK modeling data was available for this species. Results of the analysis predict that habitat for the San Joaquin adobe sunburst occurs within the Eastern Subarea in the Tehachapi Mountains

and Greenhorn Mountains and northeast of Bakersfield. The QK model does not provide low to moderate quality habitat acreage estimates. Table 4.4-34 summarizes modeled San Joaquin adobe sunburst high quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-8 in Appendix N.

San Joaquin Woolly-Threads (*Monolopia congdonii*)

The San Joaquin woolly-threads is federally endangered and has a CRPR of 1B.2 (CNPS 2014). It is included in the SJV Recovery Plan (USFWS 1998). The San Joaquin woolly-threads stands about 3 inches high and has long, trailing stems that are covered with hairs (USFWS 1998). This species occurs in chenopod scrub and valley and foothill grasslands at elevations from 150 to 2,700 feet (CNPS 2014). The blooming period of this species is from February to May (CNPS 2014).

According to the SJV Recovery Plan, the historical range of the San Joaquin woolly-threads included Fresno, Kings, Kern, San Benito, San Luis Obispo, and Santa Barbara Counties (USFWS 1998). There are extant or presumed extant occurrences located within Kern County near Lost Hills and in the Bakersfield vicinity (USFWS 2010a). The largest metapopulation of this species is currently located within the Project Area in the Carrizo Plain Natural Area (USFWS 1998).

URS SBM modeling data was available for this species and produced results that have good predictive power. The primary environmental factors related to habitat for San Joaquin woolly-threads included soil type (most important), followed by summer high temperature, winter low temperature, mean diurnal temperature range, and elevation. Table 4.4-35 summarizes modeled San Joaquin woolly-threads high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-9 in Appendix N.

Category 2 Plant Species

Alkali Mariposa Lily (*Calochortus striatus*)

The alkali Mariposa lily has a CRPR of 1B.2 (CNPS 2014). It is a perennial bulbiferous herb with an erect stem 0.4 to 2.0 inches tall. Its flowers have three rounded petals which may be slightly toothed. Each petal is 0.8 to 1.2 inches long and varies from light to very dark pink or purplish with darker pink or purple veining or mottling. The cup of the flower is somewhat hairy with anthers bright to dull pink; its pollen is pink. Each flower has pointed sepals around its base. The alkali mariposa lily occurs in chaparral, chenopod scrub, Mojave Desert scrub, and meadows and seeps in alkaline and mesic soils at elevations between 200 and 5,300 feet. It blooms between April and June (CNPS 2014). In California, it occurs in the Sierra Nevada foothills and western Mojave Desert, including Kern, Inyo, Tulare, Los Angeles, and San Bernardino Counties (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Bakersfield Smallscale *(Atriplex tularensis)*

The Bakersfield smallscale is listed as a state endangered species and has a CRPR of 1A (CNPS 2014). This species is included in the SJV Recovery Plan (USFWS 1998). The Bakersfield smallscale is an annual herb, reddish-green or grayish in color, growing up to 31 inches tall. The leaves are up to 1.2 inches long and oval to lance-shaped. Leaves and stem branches are white, scaly, and tough. Both male and female flowers are small, in hard clusters, and occur in leaf axils throughout the plant. The fruits are enclosed in diamond-shaped bracts that are smooth on the surface but toothed on the margin. The Bakersfield smallscale occurs in chenopod scrub habitats at elevations from 290 to 660 feet on alkaline soils and shores of dry lakes (CNPS 2014; Baldwin et al. 2012). The Bakersfield smallscale is typically associated with species such as alkali heath, glasswort, scratchgrass, and saltgrass (USFWS 1998). The blooming period of this species is from June to October (CNPS 2014). Historically, the Bakersfield smallscale was restricted to a small area of south-central Kern County between Greenfield and Mettler with collection localities near Greenfield, Adobe Station, Adobe Road, and Highway 223 (USFWS 1998). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Calico Monkeyflower *(Mimulus pictus)*

The calico monkeyflower has a CRPR of 1B.2 (CNPS 2014). The calico monkeyflower is an annual herb that is a native endemic to California. Its flowers are generally white to red, or maroon to purple (University of California, Berkeley 2013). The calico monkeyflower can grow to about 15 inches tall. This species occurs in broad-leafed upland forests and cismontane woodlands at elevations from 1,400 to 4,100 feet (CNPS 2014). This species is usually found in grantic and disturbed areas and often in bare, sunny or shrubby areas. It blooms from March to May (CNPS 2014). The primary threat to the calico monkeyflower is grazing (CNPS 2014). It historically occurred in the southern Sierra Nevada foothills and the Tehachapi Mountains. This species is known to occur in Kern and Tulare Counties. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

California satintail (*Imperata brevifolia*)

The California satintail has a CRPR of 2B.1 (CNPS 2014). It is a perennial grass that grows from a hard rhizome to nearly 5 feet tall. The flat leaves are up to 20 inches long and 0.6 inches wide. The inflorescence is a narrow, cylindrical white plume between 4 and 12 inches in length. It is compacted with silky white hairs and dotted with dark speckles, which are orange-brown anthers and purplish-brown stigmas of the spikelets. The California satintail occurs in chaparral, coastal scrub, Mojave Desert, meadow and seep, and riparian scrub habitats at elevations from 600 to 4,000 feet. The blooming period of this species is September to May (CNPS 2014). The California satintail historically ranged from California to Baja California, Arizona, Nevada, Utah New Mexico, and Texas. In California, it is known to occur in the San Joaquin Valley, south Coast Range, San Gabriel Mountains, San Bernardino Mountains, and the Mojave Desert (Baldwin et al. 2012). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

California Tortula Moss (California Screw-Moss) (*Tortula californica*)

The California tortula moss has a CRPR of 1B.2 (CNPS 2014), and is considered a sensitive species by the BLM. This species occurs in chenopod scrub and valley and foothill grassland habitats on dry, sandy soils at elevations from 30 to 4,800 feet. The California tortula moss is a small non-vascular, herbaceous plant. It forms cushions on dry, bare soils and rocks. The leaves of this species are generally broad with a narrow base and green in color. The sporophyte is usually reddish to brown in coloring. Blooming occurs seasonally after heavy rains. The California tortula moss is endemic to California and historically occurred in Kern, Los Angeles, Monterey, Modoc, Riverside, Santa Barbara, and Ventura Counties. There are no known threats listed for this species (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Comanche Point Layia (*Layia leucopappa*)

The Comanche Point layia has a CRPR of 1B.1 (CNPS 2014) and is included in the SJV Recovery Plan (USFWS 1998). This species is an annual and can grow 3 to 24 inches tall (University of California, Berkeley 2013). This species is glandular and not strongly scented. Its stem is straw-colored, and its leaves are oblanceolate and lobed. Its flowers are white and range between 0.3 and 0.6 inches in length (University of California, Berkeley 2013). The Comanche Point layia occurs in chenopod scrub and valley and foothill grassland habitats at elevations from 300 to 1,200 feet. It blooms between March and April (CNPS 2014). The Comanche Point layia is threatened by agriculture, urban development, and grazing (USFWS 1998).

Historically, this species occurred in three general areas of the extreme southern San Joaquin Valley and the adjacent hills to the east, including the Comanche and Tejon Hills, the area between Edison and Bena, and the valley floor near the southern end of Kern Lake (USFWS 1998). The current distribution of the Comanche Point layia remains in the Comanche and Tejon Hills, but it has not been observed in the Edison-Bena area or on the valley floor since 1935 (CDFW 2014). The population of the Comanche Point layia on the Valley floor has likely been eliminated by agricultural development, and its overall population is declining. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Coulter's Goldfields (*Lasthenia glabrata* ssp. *coulteri*)

The Coulter's goldfields has a CRPR of 1B.1 (CNPS 2014). This is an annual herb that grows to less than 2 feet tall. Its leaves are linear, smooth edged, without hairs, and can be 1.5 to 6 inches long. Its inflorescences are heads with many disk flowers, and 7 to 15 orange-yellow ray flowers; the heads contain 10 to 14 fused bracts (phyllaries) without hairs (University of California, Berkeley 2013). The fruit is an oblong to oblanceolate, gray and smooth achene, which is less than 0.3 inches long with wart-like hairs (University of California, Berkeley 2013). It occurs in marshes and swamps, playas, and vernal pools at elevations to 3,700 feet. The blooming period of this species is February to June (CNPS 2014). The Coulter's goldfields historically occurred in California in the Tehachapi Mountains, outer south Coast Range, south coast, the north Channel Islands (Santa Rosa Island), Peninsular Ranges, and the western Mojave Desert (Baldwin et al. 2012). As

discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Deltoid Bract Saltbush (Subtle Orache) (*Atriplex subtilis*)

The subtle orache has a CRPR of 1B.2 (CNPS 2014). This species is an annual herb with upright stems which are often reddish-purple. The subtle orache has leaves that are only 0.08 to 0.16 inches long. It primarily has opposite leaves and branches. Its inconspicuous male and female flowers are hidden in the leaf axils. It occurs in grassland habitat, often in the vicinity of vernal pools at elevations from 130 to 330 feet. The blooming period of this species is from June to October (CNPS 2014). The subtle orache is endemic to California and is historically known to occur in the San Joaquin and Sacramento Valleys, including in Butte, Merced, Madera, Stanislaus, Kings, Fresno, Tulare, and Kern Counties (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Diamond-Petaled California Poppy (*Eschscholzia rhombipetala*)

The diamond-petaled California poppy has a CRPR of 1B.1 (CNPS 2014) and is included in the SJV Recovery Plan (USFWS 1998). The diamond-petaled California poppy, in comparison to Lemon's poppy and Tejon poppy, may have erect or nodding buds. Its flowers are small and yellow, and the bases of its leaves are fleshy (Hoover 1970; Clark 1993). The fruits of diamond-petaled California poppy are conspicuous because they are 1.5 to 3 inches long, which may nearly equal the height of the plants (Hoover 1970). The Diamond-petaled California poppy is distinguished from other poppy species that occur in the same general area, by leaf position and seed characteristics (Clark 1993). This species occurs in grassland habitats in alkaline and clay soils at elevations from 30 to 3,300 feet. Most of the populations reported have been on hillsides, but community associations varied widely among the sites. This species blooms from March to April (CNPS 2014).

The diamond-petaled California poppy was known historically from seven sites in the inner Coastal Ranges, including Corral Hollow in Alameda County, Antelope Valley near the town of Sites in Colusa County, Antioch and the hills south of Byron in Contra Costa County, La Panza and Yeguas Creek in San Luis Obispo County, and Del Puerto Canyon in Stanislaus County (USFWS 1998). Hoover (1970) mentioned that the species occurred in San Joaquin County, but no specimens remain to document this report.

Currently, at least two extant populations of the diamond-petaled California poppy are known. The first was discovered in 1992 on a privately owned portion of the northern Carrizo Plain in San Luis Obispo County, and the second was discovered in 1997 on Lawrence Livermore National Laboratory property in Alameda County. The latter is believed to be the occurrence reported historically as Corral Hollow. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Erect-Stem Saltbush (Earlimart Orache) (*Atriplex cordulata* var. *erecticaulis*)

The Earlimart orache has a CRPR of 1B.2 (CNPS 2014). The Earlimart orache is an annual plant, similar in appearance to the heartscale. However, the Earlimart orache is more widely branching and differs in several details of its reproductive structures. This species grows in low-lying, sparsely-vegetated grasslands and on mounds between vernal pools on saline or alkaline soils at elevations from 130 to 350 feet (CNPS 2014). The blooming period of this species is from August to November (CNPS 2014). The Earlimart orache is endemic to California and is known to historically occur within the San Joaquin Valley in Tulare, Kern, and Kings Counties in uncultivated areas (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Hall's tarplant (*Deinandra halliana*)

The Hall's tarplant has a CRPR of 1B.1 (CNPS 2014). The Hall's tarplant is an annual herb with a hollow stem that ranges in height from 0.5 to 4.0 feet in height. The leaf edges are entire or serrate with glabrous faces. The flowers are deep yellow in coloration. This species occurs in chenopod scrub, cismontane woodland, and grassland habitats at elevations from 850 to 3,150 feet. The blooming period of the Hall's tarplant is April to May (CNPS 2014). This species is historically known to occur in the San Joaquin Valley and inner south Coastal Range including Fresno, Monterey, San Benito, and San Luis Obispo Counties. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Hispid Bird's-Beak (*Chloropyron molle* ssp. *hispidum*)

The hispid bird's-beak has a CRPR of 1B.1 (CNPS 2014). The hispid bird's-beak is an annual hemiparasitic herb with stems branching near its base. The species is grayish or purplish green and coated in long, sometimes bristly and glandular, whitish hairs. Its woolly inflorescence is a spike of club-shaped white flowers enclosed in densely hairy sepals. It occurs in alkaline meadows and seeps, playas, and grassland habitats at elevations to 510 feet. The blooming period of this species is from June to September (CNPS 2014). The hispid bird's-beak is endemic to California and historically known to occur in the Sacramento and San Joaquin Valleys (Baldwin et al. 2012); however, it has been extirpated from much of the lower San Joaquin Valley (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Horn's Milk-Vetch (*Astragalus hornii* var. *hornii*)

The Horn's milk-vetch has a CRPR of 1B.1 (CNPS 2014). It is an annual herb with widely branched stems between 11 and 47 inches tall. Its leaves are 0.5 to 5.1 inches long, and are often reflexed. Its flower petals are white to pale lilac, ovate with spreading hairs. The Horn's milk-vetch occurs in meadows, seeps, and playas along lake margins on alkaline soils at elevations from 190 to 2,800 feet. The blooming period of this species is May to October (CNPS 2014). The Horn's milk-vetch historically occurred in west-central Nevada and in California in the south San Joaquin Valley, South Coast, western Traverse Ranges, and along the west edge of the Mojave

Desert (Baldwin et al. 2012). It is known from Kern, Inyo, San Bernardino, and Tulare Counties (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Jared's Pepper-Grass (*Lepidium jaredii* ssp. *jaredii*)

The Jared's pepper-grass has a CRPR of 1B.2 (CNPS 2014) and is included in the SJV Recovery Plan (USFWS 1998). The Jared's pepper-grass is an annual plant that ranges between 4 and 28 inches tall and has branched stems. Its leaves are narrow and sometimes serrated. Tiny white flowers are located on the top of each branch. This species occurs in valley and foothill grassland habitats at elevations from 1,000 to 3,300 feet. Its blooming period is from March to May.

The Jared's pepper-grass historically ranged from Kern to San Luis Obispo Counties. Occurrences are known from near Soda Lake on the Carrizo Plain in San Luis Obispo County and from near Devil's Den in Kern County (USFWS 1998). The Jared's pepper-grass is threatened by solar energy development and possibly by grazing and trampling (CNPS 2014; USFWS 1998). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Kings Gold (Tropidocarpum californicum)

The Kings gold has a CRPR of 1B.1 (CNPS 2014). It occurs in chenopod scrub at elevations to 250 feet and blooms during March. The Kings gold is a perennial herb that is native to California. Its stems are prostrate to erect and its flowers are oblong, with spoon-shaped petals. The flowers are yellow in color with an occasional purple tint (University of California, Berkeley 2013).

The Kings gold is historically known to occur in the San Joaquin Valley in Kings and northern Kern Counties (CNPS 2014). The historical range of this species overlaps the northern boundary of the Project Area. The current distribution of the Kings gold is limited to two populations in Kern County within the I-5 corridor to the north and south of Kern National Wildlife Refuge (CNPS 2014). The primary threat to this species is development (CNPS 2014). The population of the Kings gold on the Valley floor has likely been eliminated by agricultural developments and its overall population is declining (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Lemmon's Jewelflower (*Caulanthus lemmonii*)

The Lemmon's jewelflower has a CRPR of 1B.2 (CNPS 2014). It is an annual herb with a glabrous stem that is 8 to 32 inches long. The plant has an erect stem and is oblanceolate, with coarsely dentate leaves. Its flower petals are white with dark purple veins. The Lemmon's jewelflower occurs in pinyon and juniper woodlands and grassland habitats at elevations from 250 to 4,000 feet. The blooming period of this species is from March to May (CNPS 2014). The Lemmon's jewelflower is endemic to California and historically occurs in the southwestern part of the San Joaquin Valley; southeast of San Francisco Bay Area; east of Outer South Coastal Ranges; and within South Coastal Ranges including Alameda, Merced, Monterey, Santa Barbara,

San Benito, San Joaquin, Stanislaus, Ventura, Fresno, Kings, and Kern Counties (Baldwin et al. 2012). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Lesser Saltscale (*Atriplex minuscula*)

The lesser saltscale has a CRPR of 1B.1 (CNPS 2014) and is included in the SJV Recovery Plan (USFWS 1998). It is an annual herb with many upright, reddish stems and spreading, brittle branches. Its leaves are egg-shaped, white and scaly below, and green above with smooth margins. Its typical leaf arrangement is opposite on the upper branches and alternate on the lower branches. Both flower genders occur in the leaf axils with the male flowers on the upper part of the stem and female flowers near the base of the stem. This species occurs in chenopod scrub habitat, playas, and grasslands on alkaline, sandy soils, and often in association with slough systems and river floodplains. It is found only in microhabitats that are not inundated year-round. This species occurs at elevations from 50 to 650 feet. The lesser saltscale grows with other halophytes (plants which grow in salty or alkaline soils), including alkali sacaton, brittlescale, heartscale, and seepweed (USFWS 1998). The blooming period of the lesser saltscale is from May to October (CNPS 2014).

The lesser saltscale was historically collected only at Goshen (Tulare County) and El Nido (Merced County); however, it is unknown if the species remains extant at these locations. Recently, the lesser saltscale was discovered at five new localities in the San Joaquin and Sacramento Valleys. The southernmost occurrence was from Kern County, near the intersection of I-5 and State Highway 58, and the northernmost occurrence was from the Gray Lodge Wildlife Area in Butte County. The remaining reports were from the Kerman Ecological Reserve in Fresno County, San Luis Island in Merced County, and along the Fresno River in Madera County. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Mason's Neststraw (*Stylocline masonii*)

The Mason's neststraw has a CRPR of 1B.1 (CNPS 2014) and is classified by the BLM as a sensitive species. This species is endemic to California, and occurs in chenopod scrub and pinyon and juniper woodlands at elevations from 300 to 4,000 feet. The Mason's neststraw is often located on sandy soil, and it blooms between March and May. This species is an annual herb that grows at ground-level and reaches about 4 inches tall. It has small white flowers, small leaves that are radial along the stem, and a narrow stem that is covered with small, white hairs. Due to its small size and nondescript flower size and color, this species is inconspicuous. It only flowers during wet years, for only two to four weeks at a time. This can make it difficult to detect and identify. The Mason's neststraw is threatened by development and habitat disturbance (CNPS 2014).

The Mason's neststraw is historically known to occur in scattered locations between Kern, Monterey, San Luis Obispo, and Los Angeles Counties (CNPS 2014). Historical occurrences of the Mason's neststraw are known from the Project Area (CNPS 2014). Some occurrences were

recorded in 1989 along Rosedale Highway, but the exact locations of these occurrences are unknown (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Munz's Tidy-Tips (*Layia munzii*)

The Munz's tidy-tips has a CRPR of 1B.2 (CNPS 2014), is classified by the BLM as a sensitive species, and is included in the SJV Recovery Plan (USFWS 1998). The Munz's tidy-tips occur in chenopod scrub and valley and foothill grassland habitats at elevations from 150 to 2,100 feet. The Munz's tidy-tips typically grows on alkaline clay soils, and its blooming period is from March to April. The Munz's tidy-tips has a stem that can either trail or grow upright with very thin leaves (USFWS 1998). Its flowers are yellow with white tips.

Historically, the Munz's tidy-tips were widespread in the western San Joaquin Valley and inner Coastal Ranges south of Fresno. Currently, the Munz's tidy-tips remains on the Carrizo Plain, ranging from the area southeast of Soda Lake to California Valley in San Luis Obispo County (CSUS 2006). This species has also been observed in Kern County in the vicinity of Lost Hills, Comanche Point, and the Kern Lake Bed during the late 1980s (CDFW 2014). The Munz's tidy-tips is potentially threatened by agricultural conversion, commercial development, and cattle grazing, but no detrimental effects have been observed to date (USFWS 1998). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Oil Neststraw (Stylocline citroleum)

The oil neststraw has a CRPR of 1B.1 (CNPS 2014) and is included in the SJV Recovery Plan (USFWS 1998). This species is an annual herb that grows at ground level and reaches only about 5 inches tall. It has round flower heads with many florets, and a narrow stem that is covered with woolly hairs. Due to its small size, its nondescript color, and its tendency to grow close to the ground, this species is inconspicuous and difficult to detect and identify. In fact, the oil neststraw is most effectively identified using a microscope. This species is endemic to California and occurs in chenopod scrub, coastal scrub, and valley and foothill grassland habitats with clay or sandy soils. It is known to grow on land that has been developed for oil production (USFWS 1998). The oil neststraw is located at elevations from 190 to 1,000 feet, and its blooming period is from March to April.

The oil neststraw range encompasses portions of Kern County and coastal San Diego County (USFWS 1998). Multiple populations of the oil neststraw were known historically from Kern County in the vicinities of Bakersfield, McKittrick, and Taft, and in San Diego County (USFWS 1998). The oil neststraw is currently known to occur in Elk Hills and the nearby Coles Levee Ecosystem Preserve in western Kern County (USFWS 1998). The oil neststraw is potentially threatened by energy development and urbanization (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Pale-Yellow Layia (*Layia heterotricha*)

The pale-yellow layia has a CRPR of 1B.1 (CNPS 2014) and is considered a sensitive species by the BLM and the United States Forest Service (USFS). This species stands 9 inches tall and has pale yellow to white flowers. It occurs in cismontane woodlands, pinion and juniper woodlands, and valley and foothill grasslands on alkaline soils or clay. It grows at elevations from 850 to 5,000 feet and blooms from March to June (CNPS 2014).

The pale-yellow layia historically occurred in the San Joaquin Valley, southern Sierra Nevada foothills, Tehachapi Mountains, Inner and Outer South Coastal Ranges, and Western Transverse Range (Baldwin et al. 2012). This species is threatened by agricultural conversion, construction, grazing, non-native plants, and vehicles (CNPS 2014). Other potential threats include road maintenance and wind energy development (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Piute Mountains Navarretia (*Navarretia setiloba*)

The Piute Mountains navarretia has a CRPR of 1B.1 (CNPS 2014). This species is an annual plant that is generally prickly. Its stem is usually erect and glaborous and hairy. The plant is usually from 4 to 8 inches tall. Its leaves are placed alternately and are simple with linear lobes. Its flowers are purple to light pink. The Piute Mountains navarretia occurs in cismontane woodland, pinyon-juniper woodland, and valley and foothill grasslands in clay or gravelly loam soils between 800 and 7,000 feet in elevation (CNPS 2014). The blooming period of this species is from April to July (CNPS 2014).

The Piute Mountains navarretia historically occurred in Los Angeles, Kern, and Tulare Counties (CNPS 2014). It is believed that the populations of Piute Mountains navarretia on the Valley floor have mostly been extirpated by conversion of habitat to agriculture. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Round-Leaved Filaree (*California macrophylla*)

The round-leaved filaree has a CRPR of 1B.1 (CNPS 2014). The round- leaved filaree is an annual herb with a stem that is less than 2 inches tall, forming a patch of slightly lobed, somewhat kidney-shaped to rounded leaves on long slender petioles. Its inflorescence is an umbel of white flowers with petals around 0.4 inches long. Its petals are often tinted pinkish or purple. Its fruit has a fuzzy base and a long narrow style which may reach 2 inches long. This species occurs in cismontane woodland and grassland habitats in open areas at elevations from 30 to 4,000 feet. The blooming period of this species is from March to May (CNPS 2014).

Historically, the round-leaved filaree ranged from southern Oregon through California into northern Mexico (QK 2014). In California, it is known from scattered occurrences in the Great Valley, southern North Coast Ranges, San Francisco Bay Area, South Coast Ranges, Channel Islands, Transverse Ranges, and Peninsular Ranges (Baldwin et al. 2012). As discussed in Impact

4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Shevock's Golden Aster (*Heterotheca shevockii*)

The Shevock's golden-aster has a CRPR of 1B.1 (CNPS 2014). It is a perennial herb that grows 11 to 51 inches tall, and often has many erect stems. Its stems are hairy to bristly. Its lance-shaped leaves are up to 2.5 inches long and 0.6 inch wide. Its inflorescence contains 3 to 70 flower heads borne on hairy glandular peduncles. Each head contains up to 18 yellow ray florets, each up to 0.4 inch long, and many disc florets at its center. Shevock's golden-aster occurs in chaparral and cismontane woodlands in crevices and shallow sand at elevations from 750 to 3,000 feet. The blooming period of this species is from August to November (CNPS 2014). The Shevock's golden aster is endemic to California and is known only from Kern County. Historical occurrences were recorded in the lower Kern River Canyon within the Greenhorn Mountains. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Showy Golden Madia (*Madia radiata*)

The showy golden madia has a CRPR of 1B.1 (CNPS 2014), and is considered by the BLM to be a sensitive species. The showy golden madia is an annual herb with a yellow stem that ranges between 4 and 36 inches tall. Its inflorescence has radiant flowers that are golden yellow. This species occurs in cismontane woodlands and valley and foothill grasslands at elevations from 80 to 4,000 feet. It blooms from March through May. The showy golden madia is threatened by grazing and non-native plants (CNPS 2014).

The showy golden madia historically ranged from the western San Joaquin Valley to the eastern San Francisco Bay Area and Inner South Coastal Ranges (Baldwin et al. 2012). Populations likely still exist in Fresno, Kern, San Benito, Santa Clara, San Luis Obispo, and Stanislaus Counties (CNPS 2014). The showy golden madia is likely extirpated from Contra Costa, Kings, Monterey, Santa Barbara, and San Joaquin Counties (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Slough Thistle (Cirsium crassicaule)

The slough thistle has a CRPR of 1B.1 (CNPS 2014). It is an annual or perennial herb known to reach 10 feet tall. Its thick stem is hollow and may be nearly 4 inches wide at the base. It is coated in hairs and cobwebby fibers. The woolly spiny leaves are deeply cut into many lobes. The lobes are often lined with teeth. The longest leaves near the base of the plant may be up to 27 inches long. Its inflorescence is a cluster of several flower heads, each up to 1.2 inches long. Its head is lined with spiny phyllaries and filled with pale pink or occasionally white flowers. The slough thistle occurs in chenopod scrub, in marshes and swamps, and riparian scrub at elevations from 10 to 350 feet. The blooming period of this species is from May to August (CNPS 2014). This species is endemic to California and is historically known to occur in the San Joaquin Valley in Kings, San Joaquin, and Kern Counties (CNPS 2014). As discussed in Impact

4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Spiny-Sepaled Button-Celery (*Eryngium spinosepalum*)

The spiny-sepaled button-celery has a CRPR of 1B.2 (CNPS 2014). The blooming period of this species is from April to May (CNPS 2014). The spiny-sepaled button-celery occurs in valley and foothill grasslands within vernal pools and depressions at elevations from 260 to 900 feet (CNPS 2014). This species grows to 30 inches tall and its leaves are lance-shaped with sharp edges. The spiny-sepaled button-celery has a distinctive inflorescence due to its array of spherical flower heads that are edged with points and bracts. The heads bloom in white petals.

Historically, the spiny-sepaled button-celery is known to occur in the San Joaquin Valley and southern Sierra Nevada foothills (CNPS 2014). The range of this species includes Contra Costa, Fresno, Kern, Madera, Merced, San Luis Obispo, Stanislaus, Tulare, and Tuolumne Counties. The range of the spiny-sepaled button-celery within Kern County is mostly restricted to the northern half of the Project Area northeast of Bakersfield and at the northern tip of the Carrizo Plain (CNPS 2014). This species is threatened by development, grazing, road maintenance, hydrological alterations, and agriculture (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Striped Adobe-Lily (*Fritillaria striata*)

The striped adobe-lily is listed as state threatened and has a CRPR of 1B.1 (CNPS 2014). The striped adobe-lily is included in the *Draft Recovery Plan for Southern Sierra Foothills Plants*. This plant is 10 to 16 inches tall and has pairs of long oval-shaped leaves about 2.3 to 2.7 inches long. Its nodding flower is a bell-shaped, fragrant bloom with six light pink petals each striped with darker pink. The tips roll back. In the darker center of the flower is greenish-yellow nectar surrounded by yellow anthers. This species occurs at elevations from 440 to 3,750 feet in cismontane woodlands and grassland habitats (CNPS 2014), and appears to be restricted to some of the heavy clay (adobe) soils that are found along the eastern side of the San Joaquin Valley and in some of the foothills. The blooming period of this species is from February to April (CNPS 2014) and flowering is positively correlated with elevation, exposure, and soil moisture levels.

The common species found associated with striped adobe-lily include the wild oat, purple brodiaea, fiddleneck, and blow wives. In those grassland sites where the habitat quality has been substantially degraded, the species is often associated with "weedy" non-natives such as groundsel, filaree, and chickweed. In the higher elevation occurrences in the foothills, the species is associated with widely scattered blue oak trees. Common herbaceous associates in this setting include the popcorn flower, soap plant, lomatium, and red brome.

Historically, the striped adobe-lily was known from several locations in the San Joaquin Valley in Kern and Tulare Counties. Most of these historical valley populations have been extirpated by

urbanization and agricultural development. Twelve extant populations were described in the Striped Adobe Lily Species Management Plan. The Draft Kern County VFHCP recognized three extant populations of the striped adobe-lily, including one in Tulare County and two in Kern County (Garcia and Associates 2010). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Tejon Poppy (Eschscholzia lemmonii ssp. kernensis)

The Tejon poppy has a CRPR of 1B.1 (CNPS 2014). Conservation guidelines are described for this species in the SJV Recovery Plan (USFWS 1998). The Tejon poppy reaches a maximum height of 12 inches. Its deeply-divided leaves are mostly clustered at the base of the plant. Each flowering stem is taller than its leaves and bears a single erect, hairless bud that develops into a showy, orange flower. The Tejon poppy lacks a rim-like appendage below the flower, unlike other poppies. The fruit is elongated and contains many tiny, rough seeds. It occurs on chenopod scrub and grassland habitats on adobe clay soils between 800 and 2,000 feet in elevation (CNPS 2015). Details of the life history are not known, but Tejon poppy populations are conspicuous only in years of above-average precipitation. The blooming period of the Tejon poppy is from March to May (CNPS 2014). Association of the Tejon poppy with Kern brodiaea, sunset lupine, and Comanche Point layia is known from occurrences near Comanche Point.

The Tejon poppy distribution is restricted to Kern County. Based on literature reports and collections, this species occurred historically in six areas in the low hills that surround the southern tip of the San Joaquin Valley. In Tejon Hills, it occurred between Chanac and Tejon Canyons. Other historical locations are located near Dry Bog Knoll in Adobe Canyon, mesas east of Bakersfield, Comanche Point, Elk Hills, Pleito Hills, and Maricopa (USFWS 1998). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Temblor Buckwheat (Eriogonum temblorense)

The Temblor buckwheat has a CRPR of 1B.2 (CNPS 2014), is included in the SJV Recovery Plan (USFWS 1998), and is considered by the BLM to be a sensitive species. This species occurs in valley and foothill grasslands at elevations from 950 to 3,300 feet, and blooms from April to September. The Temblor buckwheat ranges in height from 4 to 30 inches. Its leaves are located at the base of the plant and are covered with hairs. White flowers are located within a cup-like structure that emerges from the tips of the branches. The threats to this species have not been evaluated at the historical locations, and are unknown. It is anticipated that this species might be potentially threatened by energy development (CNPS 2014) and cattle trampling (USFWS 1998).

The historical distribution of the Temblor buckwheat is based on multiple collections, which are restricted to eight areas of the inner Coast Ranges, including Chico Martinez Canyon and the Shale Hills in Kern County; Indian Valley, Parkfield Grade, and Stone Canyon in Monterey County; and Polonio Pass, Cottonwood Pass, and the Shandon area in San Luis Obispo County. The historical occurrences have not been revisited in recent years, but are believed to be extant.

Another center of occurrence was discovered on the Elkhorn Plain in 1995 (USFWS 1998). The historical database shows multiple historical occurrences of the Temblor buckwheat from Chico Martinez Canyon and Shale Hills, which are located within the Project Area (CNPS 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Vasek's Clarkia (Clarkia tembloriensis ssp. Calientensis)

The Vasek's clarkia has a CRPR of 1B.1 (CNPS 2014), is considered sensitive by the BLM, and is included in the SJV Recovery Plan (USFWS 1998). The Vasek's clarkia can grow up to 30 inches tall and has alternate, grayish-green, lance-shaped leaves. Its flowers have four lavender-pink petals with narrow bases and diamond-shaped tips. This species occurs in grassland habitat at elevations from 850 to 1,700 feet. The blooming period of this species is in April (CNPS 2014).

The Vasek's clarkia is endemic to the Caliente Hills of Kern County, which are southeast of Bakersfield. Its known historical distribution is limited to the type locality where this species was first collected in 1967. This species has not been observed at this location since 1982, despite repeated searches. Two other occurrences were, however, discovered in 1982 to the west of the type locality (USFWS 1998). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Special Status Wildlife

Special-status wildlife species are defined herein as those that are listed as threatened and/or endangered by the USFWS or CDFW; designated as SSC or locally significant by CDFW; fully protected under state law; or species that meet the definition of rare or endangered under CEQA Sections 15380(b) and (d). Special status is also extended to birds protected under the Migratory Bird Treaty Act (MBTA). The status and known distributions of special-status wildlife species in the Project Area were evaluated based on a review of available literature, and from federal and state databases, including the CNDDB.

Data collected from previous conservation-related studies and projects within the Project Area were also reviewed. Data sources included:

- Wildlife species listed as threatened or endangered under ESA (Wildlife, 50 CFR § 17.11 and Errata; Plants, 50 CFR §17.12 and Errata, 2002).
- Wildlife species that are candidates for listing under ESA (Wildlife and Plants, 50 CFR §17.3 Proposed and Final Rules, 1999).
- SJV Recovery Plan (USFWS 1998).
- Wildlife species listed as rare, threatened, or endangered under CESA (Wildlife, CCR Title 14, Section 670.5, 1971 as amended; Plants, CCR Title 14, Section 670.2, 1978 as amended).

- CNDDB (CDFW 2014, 2015a).
- California Special Animals (CDFW 2015b).
- Kern County VFHCP (Garcia and Associates 2010).
- MBHCP and EIR (City of Bakersfield and County of Kern 1994).
- Draft Chevron LHCP.
- Draft California Resources Corporation EHHCP.
- Freeport McMoRan Oil & Gas HCP.

A list of all Category 1, Category 2 and Category 3 wildlife considered in the analysis is provided in Table 4.4-36.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Category 1 Wildlife Species			
Amphibians			
Tehachapi slender salamander *(Batrachoseps stebbinsi)*	-/T	This species inhabits north-facing, moist canyons and ravines in oak and mixed woodlands in arid to semi-arid locations (California Herps 2014). It is found under rocks, logs, bark, and other debris in moist areas, especially in areas with a lot of leaf-litter, often near talus slopes at elevations from 2,000 to 4,600 feet.	Yes, in Tier 1 of the Eastern Subarea.
Western spadefoot *(Spea hammondii)*	-/CSC	Occupies various habitats, including grassland, chaparral and oak-pine woodlands. Requires vernal pools for breeding and egg-laying. Occurs throughout the greater San Joaquin Valley, including associated foothills (California Herps 2014).	Yes, in Tier 2 of all subareas.
Reptiles			
Blunt-nosed leopard lizard *(Gambelia sila)*	E/E, SFP	Sparsely vegetated, arid habitats of saltbush scrub, alkali sinks, non-native grasslands, Ephedra scrub, and washes ranging in elevations from 90 to 2,600 feet.	Yes, in Tiers 1, 2, 3, and 4 of all subareas.
Coast horned lizard *(Phrynosoma coronatum)*	-/CSC	Occurs in relatively open areas of coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland, and pine forest habitat on sandy soil, often in association with harvester ants.	Yes, in portions of Tiers 1, 2, 3, and 4 of all subareas.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
San Joaquin coachwhip *(Masticophis flagellum ruddocki)*	-/CSC	Open, dry, treeless areas, including grasslands and saltbush scrub habitat to 3,000 feet in elevation (Jennings and Hayes 1994). This species takes refuge in rodent burrows, under shaded vegetation, and under surface objects such as woody debris, rocks, and boards.	Yes, in Tiers 1, 2, and 4 of the Western and Central Subareas.
Silvery legless lizard *(Anniella pulchra pulchra)*	-/CSC	Burrows in sandy or loose loamy soil and leaf litter of high moisture content under sparse vegetation, particularly in coastal dune and oak woodland habitats.	Yes, in Tiers, 2 and 3 of all subareas.
Western pond turtle *(Actinemys marmorata)*	-/CSC	Inhabits vegetated ponds, lakes, and watercourses including rivers, streams, creeks, and canals with basking substrates such as logs, rocks, and exposed banks.	Yes, in Tiers 1, 2, and 3 of all subareas.
Birds			
Burrowing owl *(Athene cunicularia)*	-/CSC	Resident throughout southern California. Occurs in open grassland, desert, and scrubland habitats with widely spaced vegetation. Dependent upon burrowing mammals, especially California ground squirrel, for nesting. Forages on insects and small reptiles or mammals. Permanent resident in southern California.	Yes, in Tiers 1, 2, 3, 4, and 5 of all subareas.
Golden eagle (*Aquila chrysaetos*)	-/WL, CFP	Resident throughout southern California. Forages in open terrain in deserts, mountains, foothill slopes, and valleys throughout southern California. Nests on cliffs or large trees, and also on artificial structures or rarely, the ground.	Yes, in Tiers 1, 2, and 3 of the Western Subarea.
Grasshopper sparrow *(Ammodramus savannarum)*	-/CSC	The species occurs in dense grasslands on rolling hills, lowland plains, valleys, and on hillsides on lower mountain slopes. It favors native grasslands mixed with forbs and scattered shrubs and is loosely colonial while nesting (CDFW 2014).	Yes, in all Tiers in the Western and Eastern Subareas.
Least Bell's vireo *(Vireo bellii pusillus)*	E/E	Requires a dense shrub layer 1.5 to 9 feet aboveground in riparian willow scrub habitat, but will use non-riparian habitat as well. Largely absent above 1,640 feet in elevation. Nests occur primarily in willow. Much of historically suitable habitat within the Project Area has been degraded and only known from one location at Windwolves Preserve in the far southern portion of the Western Subarea.	Yes, within Tiers 1 and 2 of the Western and Eastern Subareas.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Le Conte's thrasher *(Toxostoma lecontei)*	-/CSC	This species is generally found in open desert scrub, alkali desert scrub, and desert succulent scrub. Nesting habitat mainly consists of taller, bushier shrubs. The Le Conte's thrasher is most commonly associated with sandy and alkaline soils (USWFS 1998). Found to 3,800 feet in elevation.	Yes, in Tiers 1, 2, and 4 of all subareas.
Lesser sandhill crane *(Grus canadensis canadensis)*	-/CSC	This species winters near annual and perennial grassland habitats, croplands, and open emergent wetlands in the San Joaquin and Imperial Valleys, and up to Sacramento Valley. Foraging habitat for the lesser sandhill crane consists of shortgrass plains, grain fields, and open wetlands (Grinnell and Miller 1944). It most commonly uses moist sites; however, dry plains farther from water are also utilized.	Yes, in Tiers 1, 2, 3, and 4 of the Western and Central Subareas.
Mountain plover *(Charadrius montanus)*	C/CSC	This species inhabits open, arid, sparsely vegetated shortgrass plains and fields, plowed fields, rolling hills, and deserts. This species prefers non-sandy soils with at least 30% bare ground, and favors prairie dog towns, areas heavily grazed by domestic livestock, bare ground areas near artificial watering structures, and recently fallowed or tilled crop fields. Blue grama (*Bouteloua gracilis*) and buffalograss (*Buchloe dactyloides*) communities can provide habitat for this species (Knopf and Rupert 1995).	Yes, in Tiers 1 and 2 of the Western and Central Subareas.
Northern harrier *(Circus cyaneus)*	-/CSC	Ground nester in variety of habitats, including wet meadows, lightly grazed pastures, old fields, freshwater and brackish marshes, dry upland prairies, mesic grasslands, drained marshlands, croplands, and riparian woodland.	Yes, in Tiers 1 and 2 of the Western Subarea.
Swainson's hawk *(Buteo swainsoni)*	-/T	Breeds throughout California in mixed agricultural or savannah landscapes with fields and scattered trees. Vagrant in coastal southern California. Occurs in Los Angeles County mountains.	Yes, in Tiers 1 and 2 of the Western and Central Subareas.
Tricolored blackbird *(Agelaius tricolor)*	-/E	Breeds and forages in fresh-water marshes of cattails, tule and sedges; and willows and blackberries. In southern California, occurs from Santa Barbara to San Diego Counties.	Yes, the Tiers 1, 2, and 3 of all subareas.
Yellow-headed blackbird *(Xanthocephalus xanthocephalus)*	-/CSC	The species is found in freshwater marshes during the summer amongst cattails, tule, and bulrush. During migration and over the winter months, it is found in open, cultivated lands, in cropfields, and in pastures (Dotzour 2002).	Yes, in Tiers 2 of the Western and Eastern Subarea.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Mammals			
American badger *(Taxidea taxus)*	-/CSC	This species occurs primarily in large grass and sagebrush meadows and valleys with friable soil; however, badgers are also found in forest glades and meadows, marshes, brushy areas, hot deserts, and mountain meadows. In California, the American badger occurs from high alpine meadows to sea level (or below in Death Valley).	Yes, in Tiers 1, 2, and 4 of all subareas.
Buena Vista Lake shrew *(Sorex ornatus relictus)*	E/-	This species inhabits riparian and wetland vegetation communities with an abundance of leaf litter and dense herbaceous cover (Williams and Harpster 2001).	Yes, in Tiers 1, 2, and 4 of the Western and Central Subareas.
Giant kangaroo rat *(Dipodomys ingens)*	E/E	This species inhabits grasslands and shrub communities on a variety of soil types and on slopes up to about 22% and 2,900 feet above sea level (USFWS 1998).	Yes, in all Tiers of all Subareas.
San Joaquin antelope squirrel *(Ammospermophilus nelsoni)*	-/T	This species inhabits relatively arid annual grassland and shrubland communities. The San Joaquin antelope squirrel is restricted to desert and shrubland habitats.	Yes, in Tiers 1, 2, 3, and 4 of all subareas.
San Joaquin kit fox *(Vulpes macrotis mutica)*	E/T	The San Joaquin kit fox occupies a variety of habitats, including grasslands, scrublands, oak woodlands, alkali sink scrubland, vernal pool areas, and alkali meadow communities as well as extensively modified habitats, such as oilfields and wind turbine facilities (USFWS 1998). They are present, but generally less abundant, in other highly modified landscapes, such as agricultural row crops, irrigated pastures, orchards, vineyards, and grazed annual grasslands.	Yes, in Tiers 1, 2, 3, 4 and 5 of all subareas.
San Joaquin pocket mouse *(Perognathus inornatus)*	-/CSC	The species' habitat is generally characterized as open and sandy areas with grasses and forbs. This species can usually be found between 1,000 to 2,000 feet elevation. Likely to be present in many habitat types found within the Project Area.	Yes, in Tiers 1, 2, 3, and 4 of all subareas.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Short-nosed kangaroo rat *(Dipodomys nitratoides brevinasus)*	-/CSC	This species inhabits arid grasslands and shrublands with low, gently-sloping hills and friable soils, particularly those along the western half of the Central Valley ranging from Merced County south to the foothills of the Tehachapi Mountains. They are known to inhabit alkaline soils around Soda Lake on the Carrizo Plain; however, they are also known to occur on less saline soils elsewhere. They are generally found on lighter, powdery soils near sandy bottoms and banks of arroyos and other sandy areas (USFWS 1998).	Yes, in Tier 1, 2, 3, and 4 of all subareas.
Tipton kangaroo rat *(Dipodomys nitratoides nitratoides)*	E/E	This species inhabits arid-land communities occupying the valley floor of the Tulare Basin in level or nearly level terrain. It occupies alluvial fan and floodplain soils ranging from fine sands to clay-sized particles. Generally, woody shrubs of one or more species are sparsely scattered over occupied terrain with scant-to-moderate ground cover of grasses and forbs.	Yes, in Tiers 1, 2, 3, and 4 of all subareas.
Tulare grasshopper mouse *(Onychomys torridus tularensis)*	BLMS -/CSC	This species is known to occur within arid shrubland and grassland habitats including blue oak woodlands, alkali sink and mesquite vegetation (USFWS 1998).	Yes, in Tiers 1, 2, and 4 of the Western and Eastern Subareas.
Western mastiff bat (Greater western mastiff bat) *(Eumops perotis californicus)*	-/CSC	Range extends from California to west Texas and into Mexico, occupying a wide range of habitat from desert scrub to mixed montane forest. Roosting occurs on cliffs with crevices or exfoliating rock slabs.	Yes, in Tiers 1 and 2 of the Western Subarea.
Category 2 Wildlife Species			
Invertebrates			
Kern primrose sphinx moth *(Euproserpinus euterpe)*	T/-	This species is associated with sandy washes consisting of coarse to fine textured, decomposed granite soil, and dominant vegetation that includes red-stemmed stork's beak (*Erodium cicutarium*), baby blue-eyes (*Nemophila menziesii*), rabbit brush (*Chyysothamnus nausseosus*), gold fields (*Lasthenia chrysostoma*), and brome grass (*Bromus arenarius*).	Yes, within Tiers 1, 2, 3, and 4 of the Western Subarea.
Longhorn fairy shrimp *(Branchinecta longiantenna)*	E/-	The species typically occurs in large, turbid pools and can occur in vernal pools of different landforms, geologic formations, and soil types. Known from the Western Subarea within the Carrizo Vernal Pool Regions.	Yes, in Tiers 1, 2, 3, and 4 of the Central and Western Subareas

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Vernal pool fairy shrimp *(Branchinecta lynchi)*	T/-	Vernal pools with clear to tea-colored water, typically in grass or mud-bottomed swales in unplowed grasslands (Eriksen and Belk 1999), but has been found to occur in pools ranging from small, clear, sandstone rock pools to large, turbid, alkaline, grassland valley floor pools.	Yes, in Tier 2 of the Central and Eastern Subareas.
Fishes			
Kern brook lamprey *(Entosphenus hubbsi)*	-/CSC	The Kern brook lamprey tends to occupy slow backwaters of foothill streams and is commonly associated with sand, gravel, and rubble substrates.	Yes, within waterbodies in Tiers 1 and 2 of the Eastern Subarea.
Amphibians			
California red-legged frog *(Rana draytonii)*	T/-	The species occurs in quiet pools of streams, marshes, and sometimes ponds. It is found mainly near ponds in humid forests, woodlands, grasslands, coastal scrub, and streamsides with plant cover and most often occurs in lowlands or foothills and in woods adjacent to streams. Breeding habitat consists of permanent or ephemeral water sources such as lakes, ponds, reservoirs, slow streams, marshes, bogs, and swamps. This species is usually found at elevations to 5,000 feet.	Yes, within Tier 2 of the Western Subarea.
California tiger salamander *(Ambystoma californiense)*	E/T	The USFWS has identified critical habitat for the California tiger salamander in the northwest corner of the Project Area within the Temblor Range. Grasslands and low foothill regions where lowland aquatic sites are available for breeding. This species also requires nearby upland terrestrial habitat for aestivation that contains small mammal burrows (particularly California ground squirrel burrows) or crevices that provide refugia. The California tiger salamander occurs at elevations to 3,200 feet (Jennings and Hayes 1994).	Yes, within Tier 2 of the Western Subarea.
Kern Canyon slender salamander *(Batrachoseps simatus)*	-/T	The species occurs only in the lower Kern River Canyon in chaparral, cismontane woodland, riparian scrub, and riparian woodland communities. It prefers north facing slopes and is found under vegetative liter such as downed pine, oak, and chaparral scrub logs as well as under rocks (California Herps 2014). The species' elevation ranges from 1,400 feet up to 4,000 feet at Erskine Creek.	Yes, within Tiers 2 and 3 of the Eastern Subarea.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Yellow-blotched salamander (*Ensatina eschscholtzii croceator)*	-/CSC	This species is found in evergreen and deciduous forests, under rocks, logs, and other surface debris, especially bark that has peeled off and fallen beside decaying logs.	Yes, in Tier 2 of the Eastern Subarea.
Reptiles			
Bakersfield legless lizard *(Annielle grinnelli)*	-/-	Burrows in sandy or loose loamy soil and leaf litter of high moisture content under sparse vegetation, particularly in coastal dune and oak woodland habitats.	Yes, in Tiers 1, 2, 3, and 4 of all Subareas.
Temblor legless lizard *(Anniella alexanderae)*	-/-	Burrows in sandy or loose loamy soil and leaf litter of high moisture content under sparse vegetation, particularly in coastal dune and oak woodland habitats.	Yes, in Tiers 1, 2, 3, and 4 of all Subareas.
Birds			
Bald eagle *(Haliaeetus leucocephalus)*	D/E, SFP	During winter, may forage in non-urbanized portions of Project component areas. This species is occasionally present as a local winter migrant at a few localities in Kern County. It most frequently uses perches that are open and easily approached, such as large, stoutly limbed trees, snags, or broken-topped trees.	Yes, in Tiers 1 and 2 of the Eastern Subarea.
California condor *(Gymnogyps californianus)*	E/E, SFP	Roosts on large trees, snags, or isolated rock outcrops or cliffs. Nests where there is minimal disturbance, typically cliffs or shallow caves with no nesting material. Requires vast remote areas for foraging, including grasslands and oak savannas. Feeds on carrion of large mammals. Condors may fly 150 miles a day in search of food.	Yes, in Tiers 1 and 2 of the Eastern and Western Subareas.
Fulvous whistling-duck (*Dendrocygna bicolor)*	-/CSC	It inhabits and nests in marshlands, wet meadows, rice fields, flooded agricultural areas, and lagoons. This species prefers to nest in dense wetlands, shallow lacustrine and quiet riverine waters.	Yes, within Tier 2 of the Central and Western Subareas.
Loggerhead shrike *(Lanius ludovicianus)*	-/CSC	Relatively common in suitable habitat within the Project Area. Suitable habitat for nesting and foraging present throughout Project component areas. Nests in dense shrubs. Hunts in grassland, scrubland, or open woodland, preferring open areas bordered by trees and brush.	Yes, in Tiers 1, 2, and 4 of the Western and Eastern Subareas.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Long-eared owl *(Asio otus)*	-/CSC	This species inhabits conifer, oak, riparian, pinyon-juniper, and desert woodlands that are either open or are adjacent to grasslands, meadows, or shrublands from sea level up to 6,550 feet in elevation. Nesting and roosting habitat require dense wooded areas with openings for hunting, windrows, caves and/or cracks in rock canyons.	Yes, in Tier 1 of the Eastern Subarea.
Short-eared owl *(Asio flammeus)*	-/CSC	In the Project Area, this species is likely to winter in marsh and seep, meadow and seep, valley and foothill grassland, and wetland habitats. May also forage in irrigated alfalfa fields. It requires tall grasses for daytime seclusion.	Yes, in all Tiers of the Central and Western Subareas
Western snowy plover *(Charadrius alexandrinus nivosus)*	T/-	In the Project Area, this ground nesting bird may inhabit barren to sparsely vegetated sand beaches, levees and flats at salt-evaporation ponds, river bars, along alkaline or saline lakes, reservoirs, and ponds.	Yes, in Tier 2 of the Central and Western Subareas.
White-tailed kite *(Elanus leucurus)*	-/SFP	Occurs in grasslands, savannah, oak woodlands, and mixed agricultural areas. Nesting typically near water in large trees. Permanent resident in southern California.	Yes, in Tiers 1, 2, 3, and 4 of all subareas.
Mammals			
Pallid bat *(Antrozous pallidus)*	-/CSC	Inhabits a variety of habitats. Associated with oak woodlands. Roosting occurs singly or in groups in a wide range of crevice types.	Yes, in Tiers 1, 2, 3, and 4 of the Western Subarea and in Tiers 2, 3, and 4 of the Eastern Subarea.
Ringtail *(Bassariscus astutus)*	-/CSC, CFP	The ringtail prefers to live in rocky habitats associated with water. These areas can include riparian canyons, caves, and mine shafts.	Yes, in Tiers 1, 2, 3, and 4 of the Western and Eastern Subareas.
Townsend's big-eared bat *(Corynorhinus townsendii)*	-/C	Townsend's big-eared bats occur in a variety of habitats throughout California, but they are most commonly associated with desert scrub, mixed conifer forest, and pinon-juniper or pine forest habitat.	Yes, in Tiers 1, 2, 3, and 4 of all subareas.
Category 3 Wildlife Species			
Invertebrates			
Conservancy fairy shrimp *(Branchinecta conservatio)*	E/-	The species typically occurs in large, highly turbid pools, and it can occur in vernal pools of different landforms, geologic formations, and soil types.	Not expected

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Hopping's blister beetle *(Lytta hoppingi)*	-/-	There is no published information on habitat or floral visitation records for Hopping's blister beetle.	Not expected
Kern shoulderband *(Helminthoglypta callistoderma)*	-/-	There is no published information on habitat or floral visitation records for Kern shoulderband.	Not expected
Moestan blister beetle *(Lytta moesta)*	-/-	There is no published information on habitat or floral visitation records for this species.	Yes, in Tier 2 of the Western and Eastern Subareas.
Morrison's blister beetle *(Lytta morrisoni)*	-/-	There is no published information on habitat for this species available.	Not expected
San Emigdio blue butterfly *(Plebulina emigdionis)*	-/-	The San Emigdio butterfly occupies desert canyons and is found along riverbeds.	Yes, in Tier 1 of the Western Subarea.
Valley elderberry longhorn beetle *(Desmocerus californicus dimorphus)*	T/-	Riparian habitat only in the vicinity of their host plant, the elderberry.	Not expected
Zavortink's protodufourea bee *(Protodufourea zavortinki)*	-/-	There is no information on species habitat preferences published.	Yes, in Tier 4 of the Western Subarea.
Fishes			
Delta smelt *(Hypomesus transpacificus)*	T/T	The delta smelt moves into tidal freshwater habitats to spawn from late winter to spring. Most of the spawning of this species occurs in Suisun Marsh and the Napa River.	Not expected
Amphibians			
Foothill yellow-legged frog *(Rana boylii)*	-/SSC	This species prefers partly-shaded shallow streams with a rocky substrate in a variety of habitats such as chaparral, cismontane woodland, coastal scrub, Klamath/North coast flowing waters, lower montane coniferous forests, meadow and seep, riparian forest, riparian woodland, and Sacramento and San Joaquin flowing waters (CDFW 2014).	Not expected

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Northern leopard frog *(Lithobates pipiens)*	-/SSC	This species requires a mosaic of habitats to meet the requirements of all of its life stages. It breeds in a variety of aquatic habitats that includes slow-moving or still water along streams and rivers, wetlands, permanent or temporary pools, beaver ponds, and human-constructed habitats such as earthen stock tanks and borrow pits.	Not expected
Reptiles			
Giant garter snake *(Thamnophis gigas)*	FT/CT	This species is found in marshes, sloughs, drainage canals, and irrigation ditches, especially around rice fields, and occasionally in slow-moving creeks from sea level to 400 feet. It prefers locations with vegetation close to the water for basking (California Herps 2014).	Not expected
San Bernardino ringneck snake *(Diadophis punctatus modestus)*	-/-	The San Bernardino ringneck snake is found primarily in canyons and foothills, and sometimes in sand dunes. They are secretive, and often take refuge under rocks, dead leaves, and downed woody debris.	Yes, in Tiers 1 and 2 of the Eastern Subarea.
Birds			
Black-crowned night heron *(Nycticorax nycticorax)*	-/-	The black-crowned night-heron is a fairly common, yearlong resident in lowlands and foothills throughout most of California. Feeds along the margins of lacustrine, large riverine, and fresh and saline emergent habitats and, rarely, on kelp beds in marine subtidal habitats. Nests and roosts in dense-foliaged trees and dense emergent wetlands.	Yes, in Tier 2 of the Western Subarea.
California horned lark *(Eremophila alpestris actia)*	-/WL	It is found in open areas dominated by sparse low herbaceous vegetation or widely scattered low shrubs. California horned larks nest in on the ground often next to grass tufts, clods of earth, or manure (NatureServe Explorer 2015).	Yes, in Tiers 1 and 2 in all subareas.
Great egret *(Ardea alba)*	-/-	Requires groves of trees suitable for nesting and roosting, relatively isolated from human activities, near aquatic foraging areas. Feeds in shallow water and along shores of estuaries, lakes, ditches, and slow-moving streams, in salt ponds and mudflats, and in irrigated croplands and pastures.	Yes, in Tier 2 of the Western and Eastern Subareas.
Merlin *(Falco columbarius)*	-/WL	Inhabits coastlines, open grasslands, savannahs, woodlands, lakes, wetlands, edges, and land in early successional stages. It ranges from annual grasslands to ponderosa pine and montane hardwood-conifer habitats (Zeiner et al. 1988-1990).	Yes, in Tier 2 and 4 of the Western and Eastern Subareas.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Prairie falcon *(Falco mexicanus)*	-/WL	Prairie falcons inhabit grasslands, shrub-steppe, deserts, and other open areas of the west up to about 10,000 feet elevation, but they also reside in cultivated fields, lakeshores, and desert scrub during the winter (Cornell 2015a). In the Sierra Nevada, prairie falcons range above timberline in late summer, but at lower elevations during the winter, such as in the San Joaquin Valley. During the breeding season, prairie falcons are commonly found in the foothills and mountains which provide cliffs and escarpments suitable for nest sites. The prairie falcon generally nests on cliffs and prefers cliffs with sheltered ledges, loose debris, or gravel that overlook treeless country for hunting. The species also nests on power pole structures. In the San Joaquin Valley, most prairie falcon nests have northern exposures; no south-facing ledges have been documented.	Yes, in all Tiers and in all Subareas.
Snowy egret *(Egretta thula)*	-/-	During the breeding season, snowy egrets feed in estuaries, saltmarshes, tidal channels, shallow bays, and mangroves. They winter in mangroves, saltwater lagoons, freshwater swamps, grassy ponds, and temporary pools, and forage on beaches, shallow reefs, and wet fields.	Yes, in Tier 2 of the Western and Eastern Subareas.
Southwestern willow flycatcher *(Empidonax traillii extimus)*	E/E	Nests in riparian vegetation, willows, and coast live oak. Feeds on insects.	Yes, in Tier 2 of the Western Subarea.
Western yellow-billed cuckoo *(Coccyzus americanus occidentalis)*	C/E	Inhabits large tracts of riparian woodland with unbroken canopy and dense understory. Nests in trees typically with vertical branching.	Not expected
White-faced ibis (*Plegadis chihi*)	-/WL	This species inhabits fresh and saltwater marshes containing many rushes and sedges which are used to nest on, obtaining nesting materials, and for finding food. It is also found around ponds, rivers and in flooded pastures and agricultural fields. White-faced ibis occurs from near sea level to 14,100 feet elevation. (Gumbleton 2007)	Yes, in Tier 2 of the Western Subarea.

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area

Species	Status (Fed/State)	Habitat	Potential to Occur in Project Area
Mammals			
Dulzura pocket mouse *(Chaetodipus californicus femoralis)*	-/CSC	This species can occur in a wide variety of habitats, including montane hardwood, valley foothill hardwood-conifer forest, valley foothill hardwood, annual grassland, sagebrush, chamise-redshank and montane chaparral, and coastal scrub (Erickson and Patten 1999). This species is mostly abundant from areas where grassland and chaparral co-occur.	Not expected
Hoary bat *(Lasiurus cinereus)*	-/-	May be found at any location in California, although distribution is patchy in southeastern deserts. Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Generally roosts in dense foliage of medium to large trees. (Anderson 2002)	Yes, in Tier 2 of the Western and Eastern Subareas.

Additional information is provided for all Category 1 and Category 2 wildlife species below. The Category 1 wildlife species modeled suitable habitat maps are provided in Appendix N.

Category 1 Wildlife Species

Tehachapi Slender Salamander *(Batrachoseps stebbinsi)*

The Tehachapi slender salamander is a state threatened species. The Tehachapi slender salamander is red to brown in coloration with light beige, tan, or black patches and blotches along its back (California Herps 2014). This species is described in the Tehachapi Uplands Multiple Species Habitat Conservation Plan (TUMSHCP). The Tehachapi slender salamander is has been found in habitat in a few isolated localities in the Piute and Tehachapi Mountains of Kern County, and possibly in Los Angeles County. This species inhabits north-facing, moist canyons and ravines, in oak and mixed woodlands in arid to semi-arid locations (California Herps 2014). It is found under rocks, logs, bark, and other debris in moist areas, especially in areas with a lot of leaf-litter, often near talus slopes at elevations from 2,000 to 4,600 feet.

The Tehachapi slender salamander is found only in Kern County. It is known from scattered populations in the Caliente Creek drainage at the juncture of the Sierra Nevada and the Tehachapi Mountains, and in isolated canyons on the northern slopes of the Tehachapi Mountains from Tejon Canyon to Fort Tejon (California Herps 2014). One specimen was collected in 1957 near Tehachapi Pass, but none have been found in that area since then (California Herps 2014). Additionally, the historical database shows one occurrence recorded in 1979 near Elderberry Springs at Tejon Ranch (CDFW 2014).

Modeled suitable habitat data for this species was prepared by QK. The QK model does not provide acreage estimates for low to moderate quality habitat. Table 4.4-37 summarizes modeled Tehachapi slender salamander high quality modeled habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-10 in Appendix N.

Western Spadefoot *(Spea hammondii)*

The western spadefoot is a California SSC. The western spadefoot inhabits sandy or gravelly soils within alluvial fans, alkali flats, grasslands, sandy washes, river floodplains, coastal sage scrub, woodlands, foothills, and mountains. This species will generally occur in grasslands; however, populations can persist for a few years in orchard or vineyard habitats. It requires water for breeding, which occurs during periods of rainfall between October and May. The primary threats to the western spadefoot are land conversion, which eliminates rain pools, as well as predation of larvae by introduced predators such as bullfrogs and mosquito fish. Adult western spadefoots usually feed on insects, worms, and other invertebrates. Tadpoles will consume planktonic organisms and algae, but will be mostly carnivorous. Additionally, loss of individuals and burrows during ground disturbance associated with construction activities and vehicle movement as well as introduction of pollutants to aquatic zones may negatively impact this species. This species generally occurs from sea level to 4,500 feet.

In California, the western spadefoot ranges throughout the Central Valley, and throughout the Coastal Ranges and the coastal lowlands from San Francisco Bay southward to Mexico (Jennings and Hayes 1994). The western spadefoot has been extirpated throughout most of the lowlands of

southern California (USFWS 1998) and from many historical locations within the Central Valley (Jennings and Hayes 1994). Since 1996, 44 new occurrences were reported from the San Joaquin Valley and seven from within the Project Area (CDFW 2014).

URS SBM modeling data was available for this species and produced results that have good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), followed by annual precipitation, mean diurnal temperature range, elevation, and winter low temperature. Table 4.4-38 summarizes modeled Western spadefoot high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-11 in Appendix N.

Blunt-Nosed Leopard Lizard *(Gambelia sila)*

The blunt-nosed leopard lizard is listed as a federal and state endangered species, and is a state fully protected species. It is included in the SJV Recovery Plan (USFWS 1998). This species is characterized by a short blunt snout. It is grayish yellow above with dark spots arranged in rows, and has distinct pale cross-bands along on its body. It has a distinct head and is relatively large in comparison to other lizard species in its range. Young individuals and breeding females develop reddish-orange spots on their bodies that aid in identification of the species. Breeding males generally have a broader head and display a pink to salmon color on their throat and chest and sometimes over their entire body (USFWS 1998). Blunt-nosed leopard lizards are

typically associated with sparsely vegetated, arid habitats of saltbush scrub, alkali sinks, non-native grasslands, *Ephedra* scrub, and washes ranging in elevations from 90 to 2,600 feet.

The current distribution of the blunt-nosed leopard lizard is restricted to scattered sites in the southern San Joaquin Valley, Carrizo Plain, Elkhorn Plain, and southeastern Cuyama Valley, roughly corresponding to the western half of Kern County, the eastern boundary of San Luis Obispo and Kings Counties, the western boundary of Fresno County, and extreme southwestern Tulare County. This species persists in only 15% of its original range (Germano and Williams 1992). These lizards are now rare and localized within habitats throughout their current range.

URS SBM modeling data was used to analyze this species and had good predictive power. The primary environmental factors affecting habitat for this species included winter low temperature (most important), followed by soil type, ruggedness, annual precipitation, and slope. Table 4.4-39 summarizes modeled blunt nosed leopard lizard high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-12 in Appendix N.

Coast Horned Lizard (*Phrynosoma coronatum*)

The coast horned lizard (Blainville's horned lizard or California horned lizard) is a California SSC. It is described as a flat-bodied lizard with a wide oval- shaped body, scattered enlarged pointed scales on the upper body and tail, and a large crown of horns or spines on the head. The two center horns are the longest, and each side of the body has two rows of pointed fringe scales (USFWS 1998). Each side of the throat has two to three rows of enlarged pointed scales as well (USFWS 1998). The coast horned lizard can be reddish, brown, yellow, or gray with dark blotches on the back and large dark spots on the sides of the neck. The belly is cream, beige, or yellow, usually with dark spots, and the belly scales are smooth. This species typically inhabits grasslands, woodlands, forests, washes and low vegetation areas with loose sandy soil from sea level to 8,000 feet.

The coast horned lizard is found primarily in coastal areas of the southwestern coast of the United States and the Baja Peninsula of northwestern Mexico. The species was historically found from the Shasta Reservoir and San Francisco Bay, the Transverse Ranges of Kern and Santa Barbara Counties, south along the coast and inland valleys to the tip of the Baja Peninsula, Mexico.

URS SBM modeling data was available for this species and had good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), followed by water availability, ruggedness, precipitation of wettest month, and slope. Table 4.4-40 summarizes modeled Coast horned lizard high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-13 in Appendix N.

San Joaquin Coachwhip (Masticophis flagellum ruddocki)

The San Joaquin whipsnake is a California SSC. This species is around 43 inches in length, is slender in girth, and has a large head in comparison to the size of its body. The San Joaquin whipsnake occurs in open, dry, treeless areas, including grasslands and saltbush scrub habitat between 60 and 3,000 feet in elevation (Jennings and Hayes 1994). This species takes refuge in rodent burrows, under shaded vegetation, and under surface objects such as woody debris, rocks, and boards.

The San Joaquin whipsnake historically ranged from Arbuckle in the Sacramento Valley in Colusa County southward to the Grapevine in Kern County and westward into the inner South Coastal Ranges. Currently, the population is declining throughout its range (USFWS 1994). The primary threats to the species are land use changes and urban development resulting in the loss of food sources and the mammal burrows used for refuge. Individuals may also be impacted or lost as a result of ground disturbing activities related to other human development projects. Based on the habitat requirements of the San Joaquin whipsnake, the land use conversion practices associated with oil and gas production will likely result in conditions that are incompatible with this species (Jennings and Hayes 1994).

URS SBM modeling data was available for this species and had good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), followed by ruggedness, precipitation of wettest month, aspect (easting), and elevation. Table 4.4-41 summarizes modeled San Joaquin Coachwhip high quality and poor to moderate quality habitat acreage by tier and subarea. Modeling results showed the Western Subarea has the highest acreages of poor to moderate quality habitat in all Tiers. Poor to moderate habitat for the Central Subarea only occurs in Tier 2. The Eastern Subarea has poor to moderate quality habitat in all Tiers. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-14 in Appendix N.

Silvery Legless Lizard (*Anniella pulchra pulchra*)

In September 2013, the *Anniella* species was split into five species based on the four newly described lineages, identifying four new species and giving a new common name to the species now known as *Anniella pulchra* (California Herps 2014). The silvery legless lizard is a California SSC and the statuses of the four newly described species have not yet been determined. Two of the newly described species, the Temblor legless lizard and the Bakersfield legless lizard, are known to have a range within the Project and are described below. Because little is still known about these new species, they are considered as special-status here due to the status of silvery legless lizard as a California SSC. It is further assumed that, based on Papenfuss and Parham (2013), all legless lizards expected to occur within the Project Area would be one of the three described here. However, given the extremely limited distribution information available for the two newly described species, all three species are discussed together. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

The silvery legless lizard can be mistaken for a snake because of its elongated body and complete lack of limbs. However, silvery legless lizards lack external ear openings and have unreduced eyes with moveable lids (QK 2014). The species' snout to vent length is 3.5 to 6.7 inches and their total length is around 7.9 inches. The silvery legless lizards are typically found in moist warm loose soil with plant cover in sparsely vegetated areas of beach dunes,

chaparral, pine-oak woodlands, desert scrub, sandy washes, and stream terraces with sycamores, cottonwoods, or oaks where leaf litter accumulates. Individuals may also be found under surface objects such as rocks, boards, driftwood, and logs.

Historically, the silvery legless lizards ranged from the southern edge of the San Joaquin River in northern Contra Costa County south to northwestern Baja California Del Norte. This species occurs in scattered locations in the San Joaquin Valley and along the southern Sierra Nevada Mountains including the Tehachapi Mountains, the edge of the deserts in Walker Pass, Morongo Valley, Whitewater, and the east slope of the Peninsular Ranges. It also occurs in the western Mojave Desert near Lancaster in the Antelope Valley.

URS SBM modeling data was available for the silvery legless lizard, had good predictive power, and included all three species of legless lizard. The primary environmental factors affecting habitat for this species included soil type (most important), followed by precipitation of driest month, precipitation of wettest month, water availability, and slope. Table 4.4-42 summarizes modeled silvery legless lizard high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-15 in Appendix N.

Western Pond Turtle (*Actinemys marmorata*)

The Western pond turtle is a California SSC, and is under review by the USFWS for protection under the ESA. Adult western pond turtles measure about 7 inches in length and weigh around 2 pounds. This species has a dark brown to black carapace, and a black and yellow plastron. The species inhabits vegetated ponds, lakes, and watercourses including rivers, streams, creeks, and canals with basking substrates such as logs, rocks, and exposed banks.

The Western pond turtle is historically found from British Columbia to northern Baja California. The turtle's known range is now considerably decreased. The northwestern subspecies ranges from southern British Columbia south to central California, while the southwestern subspecies tends to be more coastal, and ranges northward from northern Mexico to the San Francisco Peninsula. The two subspecies intergraded in the Central Valley, from north of Sacramento to Kern County. Threats to the species include agriculture and grazing, predation, loss of habitat, disease and collection. Individuals may also be impacted or lost as a result of ground disturbing activities, which can destroy nests, and water diversion projects.

URS SBM modeling data as available for this species and had good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), followed by water availability, summer mean temperature, ruggedness, and aspect (northing). Table 4.4-43 summarizes modeled Western Pond turtle high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-16 in Appendix N.

Burrowing Owl (Athene cunicularia)

The burrowing owl (western burrowing owl) is a California SSC and is protected by the MBTA. The burrowing owl's body is generally brown with speckles of white. The owl's breast is a lighter color brown while its face is encircled in white, with tinges of sandy brown feathers. Its wings are about the same size as its body; its legs are featherless, and it has round yellow eyes. The burrowing owl occupies grasslands, deserts, sagebrush scrub, agricultural areas (including pastures and untilled margins of cropland), earthen levees and berms, coastal uplands, and urban vacant lots; as well as the margins of airports, golf courses, and roads. It selects sites that support short vegetation, even bare soil, presumably because this landscape increases visibility. This species is opportunistic and known to utilize abandoned or unused pipes. The burrowing owl nests and roosts in abandoned burrows dug by small mammals such as ground squirrels, but will sometimes occupy abandoned badger, tortoise, or kit fox dens.

The range of the burrowing owl in California extends through the lowlands south and west from north central California to Mexico, with small, scattered populations occurring in the Great Basin and the desert regions of the state. Burrowing owls are absent from the coast north of Sonoma County and from high mountain areas such as the Sierra Nevada and the ranges extending east from Santa Barbara to San Bernardino. Burrowing owl populations have been greatly reduced or extirpated from many areas. They have also apparently disappeared from the Coachella Valley. The remaining major population densities of the burrowing owls in California are in the Central and Imperial Valleys.

The burrowing owl is a Category 1 wildlife species. URS SBM modeling data was used to analyze this species and had good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), elevation, maximum temperature of the warmest month, mean diurnal temperature range, and aspect (easting). Table 4.4-44 summarizes modeled burrowing owl high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-17 in Appendix N.

Golden Eagle (*Aquila chrysaetos*)

The golden eagle is listed as a state fully protected species and is protected by the Bald and Golden Eagle Protection Act, the MBTA, and the Lacey Act. The golden eagle is brown in color and about 35 inches in height with a wingspan of around 6 feet. It ranges from elevations between sea level and 11,500 feet, and occurs primarily in rolling foothills, mountain areas, sage-juniper flats, and deserts (Grinnell and Miller 1944). The golden eagle needs open terrain for hunting, and soars between 100 and 300 feet above the ground in search of prey. Rugged, open habitats with canyons and escarpments are used most frequently for nesting. It maintains alternative nest sites, and also reuses old nests. Its nests are large platforms, often 10 feet wide and 3 feet high, that are composed of sticks, twigs, and greenery. The golden eagle breeds from late January through August, with breeding peaking in March through July.

The golden eagle is a common permanent resident and migrant throughout California. The majority of the Project Area is classified as winter range for the golden eagle, but natural lands that are located at the eastern, western, and southern boundaries are classified as yearlong range and may be used for nesting (Zeiner et al. 1988-1990). The primary threats to the golden eagle includes loss of foraging areas, loss of nesting habitat, pesticide poisoning, lead poisoning, and collision with man-made structures such as wind turbines.

URS SBM modeling data was available for this species and indicates that low quality nesting habitat occurs within the portions of the Project Area located below 2,000 feet. Only a very

restricted portion of the southern Eastern Subarea adjacent to the Tejon Hills contains potential nesting habitat. Golden eagles prefer cliffs for building their nests, but will use large trees on occasion. The lack of cliffs throughout the Valley greatly reduces the likelihood of the golden eagle nesting within the Project Area. Given its mostly flat landscape, the Project Area provides foraging habitat for this species. The golden eagle may actively hunt during the winter months within the Project Area, but because it is an aerial hunter this species would likely spend most of its time in flight.

The URS SBM model for golden eagle had strong predictive power and the primary environmental conditions for determining nesting habitat suitability were primarily soil type, followed by precipitation of driest month, ruggedness, water availability, and summer high temperature. Table 4.4-45 summarizes modeled golden eagle high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-18 in Appendix N.

Grasshopper Sparrow (*Ammodramus savannarum*)

The grasshopper sparrow is a California SSC and is protected under the MBTA. It is a medium-sized sparrow with brown-grey streaked upperparts and buff to white under parts. This species has pinkish feet and legs and a grey cone shaped beak. It has a clutch of three to six eggs that are laid on or near the ground. The species occurs in dense grasslands on rolling hills, lowland plains,

valleys, and on hillsides on lower mountain slopes. It favors native grasslands mixed with forbs and scattered shrubs and is loosely colonial while nesting (CDFW 2014).

Agriculture and urbanization have greatly reduced the number of the grasshopper sparrows in the Central Valley, but research indicates it still breeds locally, primarily at the edges and in low foothills, but also very sparingly on the Valley floor (Shuford and Gardali 2008). The grasshopper sparrow occurs in California primarily as a summer resident form March to September; the breeding season extends from mid-March to August (Shuford and Gardali 2008). It winters along the southern half of the United States and Mexico. There are no occurrences of the grasshopper sparrow documented within the Project Area (CDFW 2014; VertNet 2015).

URS HSM habitat modeling data was available for this species. Table 4.4-46 summarizes modeled grasshopper sparrow high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-19 in Appendix N.

Least Bell's Vireo (*Vireo bellii pusillus*)

The least Bell's vireo is a federally listed endangered species. Potential threats to the least Bell's vireo include agricultural conversion, urbanization, and exotic plant invasion, as well as, energy development, grazing, mining, and vehicles (USFWS 2006). Oil and gas extraction and conveyance continue to threaten least Bell's vireo. Impacts of oil and gas development on the

least Bell's vireo include the loss of habitat, reduction in habitat quality, destruction of individuals or populations, and habitat fragmentation.

ICF model habitat suitability results were used to analyze this species. The results indicate that the species has a higher potential to occur in the Eastern Subarea. The ICF model for the species does not include estimates of poor to moderate habitat. Table 4.4-47 summarizes the modeled least Bell's vireo high quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-20 in Appendix N.

Le Conte's Thrasher (*Toxostoma lecontei*)

The Le Conte's thrasher is listed as a state SSC and is protected by the MBTA. It is a medium sized song bird with a long, nearly black 4.7-inch long tail. This species has a distinctly de-curved 1-inch long black bill. The Le Conte's thrasher has a plain grayish or sandy colored body without wing bars or spots. The eye is dark and lacks a distinct stripe above the eye. The dark tail contrasts sharply with the much paler body. This species is generally found in open desert scrub, alkali desert scrub, and desert succulent scrub. Nesting habitat mainly consists of taller, bushier shrubs. The Le Conte's thrasher is most commonly associated with sandy and alkaline soils (USWFS 1998). Most Le Conte's thrashers are found between average mean sea level and 3,800 feet in elevation.

The Le Conte's thrasher historically occurs in two separate geographic areas including the Colorado and Mojave deserts down into Baja California and the southern San Joaquin Valley. The current distribution of the Le Conte's thrasher in the San Joaquin Valley is likely determined by the presence, structure, and vigor of saltbush, the size of habitat fragments, and the proximity to other saltbush areas (USFWS 1998). The current population of the Le Conte's thrasher in the San Joaquin Valley appears to be isolated geographically from other populations, residing only in the southern San Joaquin Valley and adjacent Cuyama Valley and Carrizo Plain (USFWS 1998). There are five known populations and one potentially extant population in Kern County, including the McKittrick-Maricopa Area, Lost Hills, Kettleman Hills, Carrizo and Elkhorn Plains, Cuyama Valley, and the Panoche Mountains (USWFS 1998).

Le Conte's thrasher is a Category 1 wildlife species. URS SBM habitat modeling data was available for this species and produced results that have very good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), aspect (easting), ruggedness, precipitation of driest month, and precipitation of wettest month. Table 4.4-48 summarizes modeled Le Conte's thrasher high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-21 in Appendix N.

Lesser Sandhill Crane (Grus canadensis Canadensis)

The lesser sandhill crane is listed as a California SSC and is protected under the MBTA. It is a large tall bird with a long neck, long legs, and broad wings. The lesser sandhill crane is grey in coloration and often has a rusty wash on the upper parts. This species winters near annual and perennial grassland habitats, croplands, and open emergent wetlands in the San Joaquin and Imperial Valleys, and up to the Sacramento Valley. Foraging habitat for the lesser sandhill crane consists of shortgrass plains, grain fields, and open wetlands (Grinnell and Miller 1944). It most commonly uses moist sites; however, dry plains farther from water are also utilized. This species feeds on grasses, forbs, roots, seeds, grains, insects, mice, small birds, snakes, frogs, and crayfish.

The sandhill crane is the most abundant of all cranes. They are distributed throughout North America, extending into Cuba and northeaster Siberia (Johnsgard 1983). The three migratory subspecies are distributed across a broad breeding range in the northern United States and Canada and into eastern Siberia (Johnsgard 1983). The wintering grounds are located in the southern United States and northern Mexico. There are no documented occurrences of lesser sandhill crane recorded within the Project Area (CDFW 2014; VertNet 2015).

URS HSM habitat modeling data was available for this species. The results indicate that suitable habitat does not occur in the Eastern Subarea. Table 4.4-49 summarizes modeled lesser sandhill crane high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-22 in Appendix N.

Mountain Plover (Charadrius montanus)

The mountain plover is a California SSC and is protected by the MBTA. This fairly large upland shorebird is 8 to 9.5 inches tall, has light brown on its back, a sandy-buff breast, pale legs, a black bill and stripe that extends to the eye, a light wing stripe, and a dark tail band. Its distinctive markings during breeding season consist of a dark crown, white forehead and line over the eye, and a paler chest. It loses facial markings in the fall and has a golden brown coloring on the upper chest. This species displays "falling leaf" and "butterfly" aerial displays

that it performs during the breeding season, as well as distraction displays, and bows and calls (Knopf and Rupert 1995).

This species inhabits open, arid, sparsely vegetated shortgrass plains and fields, plowed fields, rolling hills, and deserts. This species prefers non-sandy soils with at least 30% bare ground, and favors prairie dog towns, areas heavily grazed by domestic livestock, bare ground areas near artificial watering structures, and recently fallowed or tilled crop fields. Blue grama (*Bouteloua gracilis*) and buffalograss (*Buchloe dactyloides*) communities can provide habitat for this species (Knopf and Rupert 1995). The diet of the mountain plover consists primarily of grasshoppers and crickets, beetles, ants, flies, and other insects and invertebrates. The mountain plover does not breed in California, but 70% of the total population winters in the state (QK 2014). The major wintering areas in California are in the Sacramento, San Joaquin, and Imperial Valleys with smaller numbers wintering in western Mojave Desert (Antelope Valley and Harper Lake); San Jacinto, Santa Maria, and Salinas Valleys; the Carrizo Plain; Seal Beach; Tijuana River Valley; and the Lower Colorado River Valley. In the Sacramento and San Joaquin Valleys, valley sink scrub and non-native grasslands, as well as agricultural lands, are used for overwintering. Although this species is widely distributed throughout its range, it is considered rare or uncommon even in high quality habitat.

URS SBM habitat modeling data are available for this species and has good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), followed by ruggedness, winter low temperature, aspect (northing), and summer mean temperature. Table 4.4-50 summarizes modeled mountain plover high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-23 in Appendix N.

Northern Harrier (*Circus cyaneus*)

The northern harrier is a California SSC and is protected by the MBTA. It is a slender, medium-sized raptor with long, fairly broad wings and a long, rounded tail. It has a flat, owl-like face and a small, sharply hooked bill. Harriers often fly with their wings held in a dihedral, or V-shape above the horizontal. There is a visible white rump patch that is obvious in flight. Males are gray above and whitish below with black wingtips, a dark trailing edge to the wing, and a black-banded tail. Females and young are brown, with black bands on the tail. Adult females have whitish undersides with brown streaks, whereas the young are buffy in color with less streaking. This species occurs in a variety of habitats throughout California and forages in open wetlands, wet pastures, fallow fields, dry uplands, prairies, agricultural lands, and desert shrub-steppe utilizing open uplands including agricultural lands adjacent to foraging habitat for nesting.

The northern harrier historically ranges in North America from northern Alaska and Canada south to mid- and lower latitudes of the United States and northern Baja California (Shuford and Gardali 2008). In California, the current range of the northern harrier includes coastal areas, the Central Valley, northeastern California, and the Sierra Nevada region up to 3,600 feet.

URS SBM habitat modeling data was available for this species and has good predictive power. The top environmental conditions for determining nesting habitat suitability were soil type, followed by water availability, ruggedness, slope, and aspect (easting). Table 4.4-51 summarizes modeled Northern harrier high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-24 in Appendix N.

Swainson's Hawk (*Buteo swainsoni*)

The Swainson's hawk is listed as a state threatened species and is protected by the MBTA. The habitat of the Swainson's hawk consists of open and semi-open country including deserts, grasslands, and prairies, in both its breeding and wintering ranges. It favors wild prairie, hayfields, and pastures over wheat fields and alfalfa fields. The Swainson's hawk breeds in stands with few trees that are located in juniper-sage flats, riparian areas, and oak savannahs in the Central Valley (QK 2014). It nests on a platform of sticks, bark, and fresh leaves in trees, bushes, or utility poles from 4 to 100 feet above the ground. Breeding occurs between late March and late August, with peak activity occurring during late May through July. The Swainson's hawk is mostly white underneath with a dark red bib along its chin and upper chest. The throat and face both have a white patch, and the tips of the feathers are distinctly tipped with black. Swainson's hawks forage in grasslands, grain and alfalfa fields, and livestock pastures. They eat mice, gophers, ground squirrels, rabbits, large arthropods, amphibians, reptiles, and birds (QK 2014; Dunkle 1977). They typically soar in search of prey, but may also walk on the ground to catch prey, or catch insects and bats in flight. Competitors for food include the northern harrier, red-tailed hawk, white-tailed kite, burrowing owl, and golden eagle (QK 2014).

The Swainson's hawk is a common breeding residents and migrants in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen County, and Mojave Desert. Migrating individuals move south through the southern and central interior of California in September and October, and move north during March through May (Grinnell and Miller 1944). Some individuals migrate as far south as South America, passing in large flocks over Central America (QK 2014). The

current summer distribution of the Swainson's hawk in California is mainly confined to the Sacramento Valley, the northern half of the San Joaquin Valley and Northeastern Plateau of Lassen and Modoc Counties.

URS SBM habitat modeling data are available for this species and has strong predictive power. The primary environmental conditions for determining nesting habitat suitability were primarily elevation, followed by water availability, soil type, annual precipitation, and winter low temperature. The results indicate that high quality suitable habitat does not occur within the portions of the Project Area below about 2,000 feet included in the URS analysis. Table 4.4-52 summarizes modeled Swainson's hawk high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-25 in Appendix N.

Tricolored Blackbird (*Agelaius tricolor*)

The tricolored blackbird is listed as a California endangered species and is protected under the MBTA. It is identifiable from other red-winged blackbirds by its red shoulder patch with a bright white bar. Tricolored blackbirds inhabit emergent vegetation associated with wetlands and marshlands. This species will also use habitats such as seasonal ponds and pools, flood-irrigated agricultural lands (rice and hay fields), pastures and holding ponds associated with dairies and

feedlots, and scrub and saltbush habitat for foraging. With the decline of wetland habitat, multi-year drought, and agriculture development and practices incompatible with species' survival, the tricolored blackbird population has drastically declined (Shuford and Gardali 2008).

The tricolored blackbird's known historical breeding range in California includes the Sacramento and San Joaquin Valleys, the foothills of the Sierra Nevada south to Kern County, the coastal slope from Sonoma County south to the Mexican border, and sporadically on the Modoc Plateau (Grinnell and Miller 1944).

URS SBM habitat modeling data was available for this species. This species may likely coexist fairly well with oil and gas production. The tricolored blackbird relies heavily on wetland habitats, which should be mostly avoided by activities associated with oil and gas production. Table 4.4-53 summarizes modeled tricolored blackbird high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-26 in Appendix N.

Yellow-Headed Blackbird(Xanthocephalus xanthocephalus)

The yellow-headed blackbird is listed as a state watch-listed species and is protected by the MBTA. The yellow-headed blackbird is a medium size bird with a pointed bill. The adult male is mainly black with a yellow head and breast; they sometimes have a white wing patch which is only visible during flight. The adult female is mainly brown with a dull yellow throat and breast. The species is found in freshwater marshes during the summer amongst cattails, tule, and bulrush. During migration and over the winter months, it is found in open, cultivated lands, in cropfields, and in pastures (Dotzour 2002).

The breeding range of the yellow-headed blackbird stretches through the western and central United States, and the most easterly point of its distribution is the Great Lakes in Canada. During winter, this species is found in the southern United States in Arizona, New Mexico, and Texas, as well as in Mexico (USFWS 1998). In California, the yellow-headed blackbird breeds east of the Cascade Range and the Sierra Nevada's in the Imperial and Colorado River Valleys, in the Central Valley, and at selected locations in the Coast Ranges west of the Central Valley (Zeiner, et al. eds. 1988-1990).

URS HSM habitat modeling data was available for this species. The results of the analysis predict high quality breeding and foraging habitat to mostly occur within the northwest corner of the Central Subarea. Moderate foraging habitat is shown within the cultivated fields and pastures throughout all three subareas. There is low foraging habitat predicted to occur within the Temblor Range within the Western Subarea and within much of the Eastern Subarea. Breeding habitat for this species is characterized by areas with deep water and dense vegetation, such as occur in freshwater emergent wetland. Foraging habitat is characterized by fields and agricultural areas such as freshwater emergent wetland, cropland, and irrigated row and crop fields. Table 4.4-54 summarizes modeled yellow blackbird high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-27 in Appendix N.

American Badger (*Taxidea taxus*)

The American badger is a California SSC. It has long brown or black fur with white stripes on its cheeks; one of the stripes extends from the nose to the back of the head. The American badger has a flat body with short legs, a triangular face, and a long pointed nose. America badgers utilize dens and burrows for sleeping, hunting, storing food, and breeding. Their diet consists primarily of small mammals like ground squirrels, rats, gophers, and mice. This species occurs primarily in large grass and sagebrush meadows and valleys with friable soil; however, badgers are also found in forest glades and meadows, marshes, brushy areas, hot deserts, and mountain meadows. In California, the American badger occurs from high alpine meadows to sea level (or below in Death Valley). Habitat loss, vehicular accidents, farming operations, and indiscriminate shootings are the most common threats to this species.

The range of the American badger includes areas from the west coast of the United States to Texas, Oklahoma, Missouri, Illinois, Ohio, Michigan, and Indiana (CDFG 1986). According to the Kern County VFHCP, the American badger was historically quite widespread in the San Joaquin Valley, but the conversion of natural lands to other uses has reduced the distribution of this species substantially (Garcia and Associates 2010). Current data indicate that the American badger is still distributed throughout its range; however, the sightings are not evenly distributed. The greatest number of American badger sightings occurs in the northeastern region of the state along the south coastal area, and a moderate number occur in the southeastern desert areas, on the east side of the southern Sierra Nevada Mountains, and in the southernmost portion of the San Joaquin Valley.

URS HSM habitat modeling data was available for this species. The results of the analysis predict that breeding habitat is patchily distributed within and generally absent from the San Joaquin Valley floor. There is high quality breeding and foraging habitat predicted within all three subareas. The Eastern Subarea has the greatest concentration of higher quality habitat, which is generally predicted to occur in the north along the Greenhorn Mountains. Extensive habitat is

also predicted to occur within the Western Subarea near the Temblor Range and San Emigdio Mountains. Breeding and foraging habitat for this species are both characterized by grassy herbaceous vegetation with soils suitable for digging, such as annual grassland and perennial grassland. Alkali desert scrub provides moderate suitable breeding and foraging habitat (URS 2014). Table 4.4-55 summarizes the modeled American badger habitat high and poor to moderate quality acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-28 in Appendix N.

Buena Vista Lake Shrew (*Sorex ornatus relictus*)

The Buena Vista Lake shrew is listed as a federally endangered species. Conservation guidelines are described in the SJV Recovery Plan (USFWS 1998). It is a very small mammal with beadlike eyes and a long pointed nose. This species primarily feeds on invertebrates, particularly insects. This species is found in habitat containing riparian and wetland vegetation communities with an abundance of leaf litter and dense herbaceous cover (Williams and Harpster 2001).

Historically, the Buena Vista Lake shrew inhabited the interconnected network of tule marshes and other permanent and seasonal lakes, wetlands, and sloughs around the historical Tulare, Kern, and Buena Vista Lakes, and presumably throughout the Tulare Basin (Williams and Harpster 2001). Recent surveys for the shrew were conducted at 21 sites, and the shrew was found to be present on eight of them including Goose Lake, Atwell Island, Main Drain Canal,

Chica & Sons Twin Farms South Field Ranch, Lemoore Wetlands Preserve, Coles Levee Ecosystem Preserve, the Kern fan water recharge area, Kern National Wildlife Refuge, and the Kern Lake Preserve (USFWS 2011a).

URS HSM habitat modeling data was available for this species. The extent of the range of this species is generally not well known, but is presumed to be very limited. Modeling analysis results predict an extremely limited extent of breeding, foraging, and primary habitat, but this may be largely due to the lack of data on the species' occurrence records. Habitat is predicted to occur around the Kern National Wildlife Refuge and in very small fragments around the Kern Lake Preserve, Goose Lake Basin, and Tulare Lake Basin. There are fragmented patches of moderate quality breeding and foraging habitats predicted along the western edge of the Central Subarea and eastern edge of the Western Subarea.

Breeding and foraging habitat for this species are both characterized by dense, moist vegetation cover including ground litter and other detritus, and the presence of wetlands, such as occur in valley foothill riparian and freshwater emergent wetland. Alkali desert scrub within close proximity of permanent water provides moderately suitable breeding and foraging habitat (URS 2014). Table 4.4-56 summarizes modeled Buena Vista Lake shrew high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-29 in Appendix N.

Giant Kangaroo Rat (*Dipodomys ingens*)

The giant kangaroo rat is listed as a federal and state endangered species. Conservation guidelines are described in the SJV Recovery Plan (USFWS 1998). The giant kangaroo rat is one of the largest of kangaroo rat species. The giant kangaroo rat is buffy tan in coloration and is distinguished from other coexisting kangaroo rats by size and having five toes on the hind limbs (Best 1993). The giant kangaroo rat is an endemic species in the San Joaquin Valley and adjacent areas. This species inhabits grasslands and shrub communities on a variety of soil types and on slopes up to about 22% and 2,900 feet above sea level (USFWS 1998).

Historically, the giant kangaroo rat was found from the base of the Tehachapi Mountains in the south to 10 miles south of Los Banos, Merced County in the north, the Carrizo Plain and San Juan Creek watershed west of the Temblor Range to the west, and the floor of the San Joaquin Valley to the east. Currently, the distribution of the giant kangaroo rat is fragmented into six major geographic units. These include: (1) the Panoche Region in western Fresno and Eastern San Benito Counties; (2) Kettleman Hills in Kings County; (3) San Juan Creek Valley in San Luis Obispo County; (4) western Kern County near Lokern, Elk Hills, and other uplands around McKittrick, Taft, and Maricopa; (5) Carrizo Plain Natural Area in eastern San Luis Obispo County; and (6) Cuyama Valley in Santa Barbara and San Luis Obispo Counties (USFWS 1998).

URS SBM habitat modeling data was used to analyze this species and have strong predictive power. The primary environmental conditions for determining habitat suitability were primarily the minimum temperature of the coldest month and maximum temperature of warmest month, followed by slope, elevation, and soil type. Table 4.4-57 summarizes modeled giant kangaroo rat high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-30 in Appendix N.

San Joaquin Antelope Squirrel (*Ammospermophilus nelsoni*)

The San Joaquin antelope squirrel is listed as a state threatened species. It is included in the SJV Recovery Plan (USFWS 1998). The San Joaquin antelope squirrel is of a typical ground squirrel shape with small round ears and a streamlined body and short legs. This species inhabits relatively arid annual grassland and shrubland communities. The San Joaquin antelope squirrel is restricted to desert and shrubland habitats. Habitat of the San Joaquin antelope squirrel consists of grasslands with moderate shrub cover, which includes such species as salt bush, ephedra, bladder pod, goldenbush, snakeweed, and others. The squirrels live in small underground familial colonies in sandy, easily excavated soils in grasslands.

Historically, this species inhabited the western and southern portions of the Tulare Basin, San Joaquin Valley, and the contiguous areas to the west in the upper Cuyama Valley and the Carrizo and Elkhorn Plains. More specifically, they were distributed on the floor of the San Joaquin Valley in Kern County and along the eastern edge of the valley north near Tipton, Tulare County (USFWS 1998). The only remaining substantial populations remaining are located near the Lokern and Elk Hills in western Kern County, and the Carrizo and Elkhorn Plains in eastern San Luis Obispo County (USFWS 1998). This species is sometimes observed co-occurring with populations of the giant kangaroo rat.

URS SBM habitat modeling data was used to analyze the San Joaquin antelope squirrel. The species is relatively compatible with oil and gas production activities as long as some measure of vegetation cover and vegetation community connectivity is preserved (30% vegetation within a given area). Existing land use conditions may have altered the habitat to a point where it is no longer compatible with species occurrence.

The URS SBM model has strong predictive power and the primary environmental conditions for determining habitat suitability were primarily soil type and the minimum temperature of the coldest month, followed by ruggedness of terrain, precipitation of driest month, and habitat slope aspect (easting). Table 4.4-58 summarizes modeled San Joaquin antelope squirrel high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-31 in Appendix N.

San Joaquin Kit Fox (*Vulpes macrotis mutica*)

The San Joaquin kit fox is listed as a federally endangered and state threatened species. Conservation guidelines are described in the SJV Recovery Plan (USFWS 1998). The San Joaquin kit fox is a small fox with a bushy black-tipped tail. The body is usually a buffy-tan and individuals have long slender legs, and narrow noses. The San Joaquin kit fox occupies a variety of habitats, including grasslands, scrublands, oak woodlands, alkali sink scrubland, vernal pool areas, and alkali meadow communities, as well as extensively modified habitats, such as oilfields and wind turbine facilities (USFWS 1998). They are present, but generally less abundant, in other highly modified landscapes, such as agricultural row crops, irrigated pastures, orchards, vineyards, and grazed annual grasslands.

The San Joaquin kit fox currently only inhabits the San Joaquin Valley and surrounding foothills of the Coast Range, Sierra Nevada and Tehachapi Mountains, and on the Carrizo and Elkhorn Plains. Much of the historical natural vegetative communities within the range of the San Joaquin kit fox have been eliminated and are now represented only by small, isolated and degraded remnants. Accordingly, the San Joaquin kit fox occurs throughout Kern, Tulare, Kings, Fresno, Madera, San Benito, Merced, Stanislaus, San Joaquin, Alameda, and Contra Costa Counties. Three core populations of the San Joaquin kit fox have been identified at the Carrizo Plain Natural Area in San Luis Obispo County, natural lands of western Kern County, and the

Ciervo-Panoche Natural Area of western Fresno and eastern San Benito Counties (USFWS 1998).

URS SBM habitat modeling data was used to analyze this species. The results indicate that the entire valley floor in the Western Subarea between the California Aqueduct and the foothills of the Coast Range is predicted to be habitat for the San Joaquin kit fox. Very little of the Project Area is predicted to be of low quality habitat; the exception being a good majority of the southern portion of the Eastern Subarea from just south of Highway 58 and south along the eastern edge of the Valley to Tejon Ranch in the south. The vast majority of high quality habitat for the San Joaquin kit fox is predicted to occur in the Western Subarea with smaller and more fragmented occurrences in the Central and Eastern Subareas. A narrow belt of predicted low quality habitat extends from the Eastern Subarea west to the California Aqueduct just south of Highway 119.

As discussed above, the SJV Recovery Plan identifies the kit fox as the "umbrella" species for recovery planning because the species occupies habitats used by most of the other species in the plan. The range of the San Joaquin kit fox extends throughout all portions of the Project Area.

The USFWS 5-year review for the species concluded that continued oil and gas activity in western Kern County posed a potential risk to the species, including human disturbance, loss of habitat and den sites, entombment, entrapment in sumps or oil spills, and exposure to contaminants. San Joaquin kit fox appear to tolerate human activities, have frequently been observed around oil and gas facilities and are known to use manmade structures (pipe, culverts, and foundations) as dens, although with some mortality (EPA 2008). The USFWS concluded that these results could show that lower density oilfield development may have minimal effects on kit fox dynamics. The USFWS also indicated that since the most robust kit fox populations currently occur in the oil-producing regions of the San Joaquin Valley, the species persists well with low-density oil development. Moderate to high-density oilfields could, however, contribute to a decrease in carrying capacity for kit fox through habitat loss and changes in remaining habitat characteristics over time (USFWS 2010b).

The URS SBM model for this species has good predictive power and the primary environmental factors affecting habitat for this species included soil type (most important) followed by ruggedness, elevation, minimum temperature of coldest month, and annual precipitation. The results are conservative because the model does not take into account current land use or development. Areas where irrigated agriculture, urban development, and high-density oil and gas development has occurred would be considered unsuitable for this species. Much of the Project Area has been converted to irrigated agriculture or urban areas. In some locations, the San Joaquin kit fox has adapted to urban environments, such as urban Bakersfield, and this species may also be able to maintain populations in agricultural areas, provided there are suitable areas for denning and foraging. Land use conversion to urban or agriculture does not necessarily exclude this species. Table 4.4-59 summarizes modeled San Joaquin kit fox high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-32 in Appendix N.

San Joaquin pocket mouse (*Perognathus inornatus*)

The San Joaquin pocket mouse is a California SSC. This species is small in size and buffy-tan in coloration with a lighter colored belly. The San Joaquin pocket mouse primarily feeds on seeds, but also eats green vegetation and insects. This species inhabits arid annual grasslands, savannas, washes, and desert shrub associations with sand or finely textured soils throughout the San Joaquin Valley. Its habitat is generally characterized as open and sandy areas with grasses and forbs. This species can usually be found between 1,000 to 2,000 feet elevation. The primary threats and reasons for decline of this species have been identified as agricultural and urban development. Additionally, ground disturbing activities associated with construction may result in the loss of habitat, individuals, and burrows.

QK habitat modeling data was used to analyze this this species. High quality habitat is predicted throughout the Project Area, specifically habitat within the Eastern and Western Subareas in the Greenhorn Mountains, Tejon Hills, Temblor Range, and San Emigdio Mountains. There are a few habitat areas predicted that occur within the Central Subarea located northeast of the junction at I-5 and Highway 46. The QK data does not include poor to moderate quality habitat acreage estimates. Table 4.4-60 summarizes the higher quality modeled habitat for the San Joaquin

pocket mouse. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-33 in Appendix N.

Table 4.4-60: San Joaquin Pocket Mouse Acres of High Quality Habitat

Short-Nosed Kangaroo Rat (Dipodomys nitratoides brevinasus)

The short-nosed kangaroo rat is listed as a California SSC. Conservation guidelines are described in the SJV Recovery Plan (USFWS 1998). The short-nosed kangaroo rat is one of three species of San Joaquin kangaroo rat. The appearance of the short-nosed kangaroo rat is very similar to the Tipton kangaroo rat and the Fresno kangaroo rat. This species inhabits arid grasslands and shrublands with low, gently-sloping hills and friable soils, particularly those along the western half of the Central Valley ranging from Merced County south to the foothills of the Tehachapi Mountains. They are known to inhabit alkaline soils around Soda Lake on the Carrizo Plain; however, they are also known to occur on less saline soils elsewhere. They are generally found on lighter, powdery soils near sandy bottoms and banks of arroyos and other sandy areas (USFWS 1998).

The current distribution of the short-nosed kangaroo rat is relatively unknown. Some trapping surveys have shown small fragmented populations that still exist in the Coalinga area; Fresno County; a few scattered locations in Kettlemen and Lost Hills; Kings and Kern Counties; the Lokern, Elk Hills, San Emigdio, and Wheeler Ridge regions of western Kern County; the Carrizo Plain Natural Area; and the Caliente Mountains at the edge of the Cuyama Valley (USFWS 1998). There has not been a comprehensive study to identify the historical distribution of this species, and threats have been difficult to identify. It is thought that the species has declined due to agricultural development and has possibly been affected by rodenticides to control ground squirrel populations (USFWS 1998). The short-nosed kangaroo rat is separated from the distribution of the Tipton kangaroo rat by the California Aqueduct. The Tipton kangaroo rat occurs to the east of the aqueduct, and the short-nosed kangaroo rat occurs to the west.

URS SBM Habitat modeling data was available for this species and has strong predictive power. The environmental conditions for determining habitat suitability were primarily soil type, annual precipitation, and terrain ruggedness, followed by habitat slope aspect (easting), and

precipitation of wettest month. Table 4.4-61 summarizes modeled short-nosed kangaroo rat high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-34 in Appendix N.

Tipton Kangaroo Rat (Dipodomys nitratoides nitratoides)

The Tipton kangaroo rat is listed as a federally and state endangered species. Conservation guidelines are described in the SJV Recovery Plan (USFWS 1998). The Tipton kangaroo rat is one of three subspecies of the San Joaquin kangaroo rat. The Tipton kangaroo rat is slightly larger than the Fresno kangaroo rat, and is smaller than the short-nosed kangaroo rat. This species inhabits arid-land communities occupying the valley floor of the Tulare Basin in level or nearly level terrain. The Tipton kangaroo rat occupies alluvial fan and floodplain soils ranging from fine sands to clay-sized particles. Generally, woody shrubs species density are sparsely scattered over occupied terrain with scant-to-moderate ground cover of grasses and forbs. The Tipton kangaroo rat is typically associated with spinescale saltbush, allscale saltbush, leafcover saltweed, quailbush, iodine bush, alkali goldenbush, mesquite, and seepweed (USFWS 1998).

The historical geographic range of the Tipton kangaroo rat was over 1.7 million acres of arid-land communities occupying the valley floor of the Tulare Basin. Currently, the Tipton kangaroo rat inhabits small, scattered, isolated fragments of remnant habitat. In the southern San

Joaquin Valley, this includes the Kern and Pixley National Wildlife Refuges, and other scattered areas within Kern, Tulare, and Kings Counties (USFWS 2010c).

URS SBM habitat modeling data was used to analyze this species and have strong predictive power. The environmental conditions for determining habitat suitability were primarily precipitation of the wettest month, followed by soil type and annual precipitation. Table 4.4-62 summarizes modeled Tipton kangaroo rat high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-35 in Appendix N.

Tulare Grasshopper Mouse (Onychomys torridus tularensis)

The Tulare grasshopper mouse is a California SSC. Conservation guidelines are described in the SJV Recovery Plan (USFWS 1998). The Tulare grasshopper mouse has a stout body with a club-like tail. Individuals are bicolored with the head and upperbody pale brown to pink and the underbody is white. The tail is usually bicolored with a white tip. The Tulare grasshopper mouse is primarily carnivorous with a diet consisting of small mammals and insects. This species is known to occur within arid shrubland and grassland habitats including blue oak woodlands, alkali sink and mesquite vegetation (USFWS 1998). The Tulare grasshopper mouse is known to occur

in the blue oak woodlands at elevations up to 1,500 feet (USFWS 1998). The primary threats to the species include habitat loss, fragmentation, degradation, and the direct and indirect poisoning by insecticides. Additionally, ground disturbing activities associated with construction may result in the loss of habitat, individuals, and burrows.

Historically, the Tulare grasshopper mouse ranged from western Merced and eastern San Benito Counties east to Madera County and south to the Tehachapi Mountains. Currently, this species is known to occur along the western margin of the Tulare Basin, including western Kern County; Carrizo Plain Natural Area; along the Cuyama Valley side of the Caliente Mountains, San Luis Obispo County; and the Ciervo-Panoche Region, in Fresno and San Benito Counties (USFWS 1998). The Tulare grasshopper mouse is found on the valley floor, ranging from western margins of Merced County south to the Tehachapi Mountains (USFWS 1998).

URS SBM habitat modeling data was available for this species and has good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), minimum temperature for the coldest month, landscape ruggedness, annual precipitation, and aspect (northing). Table 4.4-63 summarizes modeled Tulare grasshopper mouse high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-36 in Appendix N.

Western Mastiff Bat (Greater Western Mastiff Bat) *(Eumops perotis californicus)*

The western mastiff bat is a California SSC. It is one of four molossid species that occurs in California. The western mastiff bat is distinguishable from other species of bats based on its size. It is the largest of bat species that occurs in California. The western mastiff bat is colonial; however, the colony sizes are generally fairly small. This species' diet consists primarily of moths. This species utilizes a wide variety of habitats for foraging and roosting including chaparral, coastal and desert scrub, open areas such as washes and agricultural lands, coniferous and deciduous forests and woodlands where roosting crevices in vertical rocky canyons and cliff-faces, trees, and man-made structures are present. The western mastiff bat can occur in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, annual and perennial grasslands, palm oases, chaparral, desert scrub, and urban areas.

In California, the Western mastiff bat is known to occur in southeastern San Joaquin Valley, Coastal Ranges from Monterey County southward through southern California, and from the coast eastward to the Colorado Desert. It is known that significant populations of this species occur in many of the Sierra Nevada river drainages, particularly in the central and southern Sierra, i.e., the Stanislaus, Tuolumne, Merced, San Joaquin, Kaweah, Tule, and Kern Rivers. Recent surveys have documented roosts up to 4,600 feet and have documented foraging animals up to greater than 8,900 feet.

URS SBM habitat modeling data was available for this species and has good predictive power. The primary environmental factors affecting habitat for this species included soil type (most important), water availability, elevation, aspect (northing), and aspect (easting). Table 4.4-64 provides modeled western mastiff bat high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-37 in Appendix N.

Category 2 Wildlife Species

Kern Primrose Sphinx Moth *(Euproserpinus euterpe)*

The Kern primrose sphinx moth is a federally threatened species. Conservation guidelines are depicted in the Kern Primrose Sphinx Moth Recovery Plan (USFWS 1984). It is a small day-flying moth which lays 0.04-inch light green eggs on various plants in the vicinity of the evening primrose host plants (*Camissonia contorta epilobiodes* or *Camissonia campestris*), which are essential to the survival of the Kern primrose sphinx moth. Larvae emerge from the eggs about a week after oviposition and begin to feed on the flowers and young leaves of the evening primrose. Larvae hatching from eggs laid on other plants are able to wander significant distances to find the host plant. This species is associated with sandy washes consisting of coarse- to fine-textured, decomposed granite soil, and dominant vegetation that includes red-stemmed stork's beak, baby blue-eyes, rabbit brush, gold fields, and brome grass. The adult's flight season occurs from mid-January to the first week of April, with a peak period in mid-February through mid-March, but the timing may vary according to the climatic conditions in the region.

The Kern primrose sphinx moth has a very restricted distribution and is currently known to occur at a privately owned ranch in the northwest portion of the Walker Basin in Kern County (USFWS 2007b). Additionally, six new populations were discovered for the first time at the Carrizo Plain in San Luis Obispo County and five new populations in the Cuyama Valley near New Cuyama and Ventucopa (USFWS 2007b). In addition to known occupied sites, habitat for the Kern primrose sphinx moth occurs on private, unprotected property at several locations in the northwestern section of the Walker Basin. About 75 miles west of the Walker Basin, there is a fairly large number of alluvial fans supporting Mojave sun cup located throughout the Carrizo Plain and the immediate surrounding areas. These areas were determined to be habitat for the Kern primrose sphinx moth (USFWS 2007b). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Longhorn Fairy Shrimp (Branchinecta longiantenna)

The longhorn fairy shrimp is listed as a federally endangered species. It is included in the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (USFWS 2005). It is entirely dependent upon inundated wetlands, such as vernal pools, that form in the cool, wet months of the year. This species occurs in grasslands and clear-water pools, typically in sandstone depressions (Eriksen and Belk 1999). The longhorn fairy shrimp has been found in the same general areas as the conservancy fairy shrimp, vernal pool fairy shrimp, California fairy shrimp, and western spadefoot toad tadpoles at multiple locations (USFWS 2005).

The longhorn fairy shrimp is known to occur in four widely separated populations including the Carrizo Plain near Soda Lake along the border of San Luis Obispo and Kern Counties, in San Luis National Wildlife Refuge in Merced County, in Vasco Caves Preserve in Contra Costa County, and in Brushy Peak Preserve in Alameda County. This species is believed to occur in Kern County (USFWS 2007c). All four known populations are comprised of multiple pools. Additionally, a single specimen of longhorn fairy shrimp was located in a roadside ditch adjacent to Miller Road, 2 miles north of Los Banos in Merced County (USFWS 2007c). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Vernal Pool Fairy Shrimp *(Branchinecta lynchi)*

The vernal pool fairy shrimp is listed as a federally threatened species. It is included in the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (USFWS 2005). It is entirely dependent upon inundated wetlands, such as vernal pools, that form in the cool, wet months of the year. The vernal pool fairy shrimp inhabits vernal pools with clear to tea-colored water, typically in grass or mud-bottomed swales in unplowed grasslands (Eriksen and Belk 1999), but has been found to occur in pools ranging from small, clear, sandstone rock pools to large, turbid, alkaline, grassland valley floor pools.

The vernal pool fairy shrimp is currently found in 28 counties across the Central Valley and Coast Ranges of California, and in Jackson County of southern Oregon. It is distributed more widely than most other fairy shrimp species included in the recovery plan, but it is generally uncommon throughout its range, and it is rarely abundant where it does occur (USFWS 2005). The current distribution of the vernal pool fairy shrimp in the Central Valley and within the Project Area may be similar to its historical distribution in extent, but remaining populations and vernal pool habitat are now considerably more fragmented and isolated than in pre-agricultural times (USFWS 2005). This species occupies a variety of vernal pool habitats and occurs in 11 of the 17 vernal pool regions identified in California (USFWS 2005).

The greatest number of known occurrences of the vernal pool fairy shrimp occur in the Southeastern Sacramento Vernal Pool Region, and in the San Joaquin Valley Vernal Pool Region, part of which occurs in the Central Subarea of the Project Area. The vernal pool fairy shrimp is found at the Grasslands Ecological Area in Merced County, at the Pixley National Wildlife Refuge in Tulare County, and at isolated locations in Kings and Stanislaus Counties. The vernal

pool fairy shrimp has been found at Camp Roberts and in the vicinity of Soda Lake on the Carrizo Plain in San Luis Obispo County (USFWS 2005) and in the Carrizo Vernal Pool Region in Kern County. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Kern Brook Lamprey (*Entosphenus hubbsi*)

The Kern brook lamprey is a California SSC and is endemic to California. It is characterized by having an oral disc narrower than its head, and its body coloration consists of gray to brown above, and black specks on the dorsal and caudal fins (Froese and Pauly 2015). The average adult length is 4.5 inches. It is believed that Kern brook lamprey is thinly distributed with isolated subpopulations throughout the San Joaquin Valley watershed, at elevations between 100 to 1,075 feet. The Kern brook lamprey tends to occupy slow backwaters of foothill streams and is commonly associated with sand, gravel, and rubble substrates.

Historical collections of the Kern brook lamprey are known only from the Friant-Kern Canal in Merced County and the Merced River (Froese and Pauly 2015). Recent studies documented seven Kern brook lampreys in Kings River, below the North Fork New River, near Trimmer California (Klamath-Siskiyou Wildlands Center et al. 2003).

Historical database shows only one occurrence of this species located within the Project Area, at the Friant-Kern Canal, east of Delano, which was collected in 1972 (CDFW 2014). The Kern brook lamprey is threatened by habitat loss, degradation, and fragmentation as a result of watershed projects and alterations including damming, channelization, and flow modifications, which ultimately restrict or prohibit phases of the reproductive cycle and/or isolate populations thereby limiting distribution and re-colonization of habitat. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

California Red-Legged Frog *(Rana draytonii)*

The California red-legged frog is federally threatened and a state SSC. It is a medium-sized frog, 1.75 to 5.25 inches long from snout to vent. It has long legs with dark banding and webbing on the hind feet. Its skin is smooth and reddish-brown or brown, grey, or olive in color with small black flecks and spots on the back and sides (California Herps 2014). The California red-legged frog occupies quiet pools of streams, marshes, and sometimes ponds. It is found mainly near ponds in humid forests, woodlands, grasslands, coastal scrub, and streamsides with plant cover and most often occurs in lowlands or foothills and in woods adjacent to streams. Breeding habitat consists of permanent or ephemeral water sources such as lakes, ponds, reservoirs, slow streams, marshes, bogs, and swamps. This species is usually found at elevations from 0 to 5,000 feet.

The California red-legged frog is endemic to California and northern Baja California. Historically, the California red-legged frog was found along the coast and Coast Ranges from Mendocino County in northern California south to northern Baja California. It was found inland east through the northern Sacramento Valley into the foothills of the Sierra Nevada Mountains,

south to Tulare and possibly Kern Counties. It is believed that this species did occur in the Central Valley due to annual floods. The USFWS has designated critical habitat for this species within the northwest area of Kern County. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

California Tiger Salamander *(Ambystoma californiense)*

The California tiger salamander is a federal and state threatened species and a state SSC. The California tiger salamander has a small rounded head with a blunt snout. The body's coloration is black with large yellow spots or bars, often along the middle of the back. This species is most commonly found in annual grassland habitat, but can occur in the grassy understory of valley foothill hardwood habitats, and uncommonly along stream courses in valley foothill riparian habitats. This nocturnal, fossorial species breeds in natural ephemeral pools, or ponds, that mimic it. California tiger salamanders require ponds or pools that remain inundated for 10 weeks or more. This species is restricted to grasslands and low foothill regions where lowland aquatic sites are available for breeding. This species also requires nearby upland terrestrial habitat for aestivation that contains small mammal burrows (particularly California ground squirrel burrows) or crevices that provide refugia. The California tiger salamander occurs at elevations from 0 to 3,200 feet (Jennings and Hayes 1994).

This species occurs from areas near Petaluma, Sonoma County, east through the Central Valley to Yolo and Sacramento, south to Tulare County, and from the vicinity of San Francisco Bay south to Santa Barbara County. The USFWS has identified critical habitat for the California tiger salamander in the northwest corner of the Project Area within the Temblor Range. No other habitat for this species is predicted to occur within the rest of the Project Area. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Kern Canyon Slender Salamander *(Batrachoseps simatus)*

The Kern Canyon slender salamander is listed as a California threatened species, and considered by the USFWS to be a sensitive species. The Kern Canyon slender salamander is relatively large and robust in comparison to other slender salamanders and has a dark grey to green to brown coloring with light flecks (California Herps 2014). The species occurs only in the lower Kern River Canyon in chaparral, cismontane woodland, riparian scrub, and riparian woodland communities. It prefers north facing slopes and is found under vegetative liter such as downed pine, oak, and chaparral scrub logs as well as under rocks (California Herps 2014). The species' elevation ranges from 1,400 feet up to 4,000 feet at Erskine Creek.

This species is known from a number of locations in the lower Kern River Canyon. This species has been documented to occur in the lower Kern River Canyon from Stork Creek to Erskine Creek (California Herps 2014). These creeks are not located within the Project Area and are not anticipated to be impacted as a result of the Project. The species occurs in isolated colonies. It is probable that this species can occur in many densely wooded canyons in the lower Kern River

Canyon. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Yellow-Blotched Salamander (Ensatina eschscholtzii croceator)

The yellow-blotched salamander is a California SSC. This species is described in the TUMSHCP (Dudek 2013). This species has a dark brown to black colored body marked with large yellow or cream-colored blotches, with yellow to orange on the base of the limbs. This species is found in evergreen and deciduous forests, under rocks, logs, and other surface debris, especially bark that has peeled off and fallen beside decaying logs. The yellow-blotched salamander favors north-facing areas, especially near creeks or streams (California Herps 2014). *Ensatina eschoscholzii* is typically treated as a "ring" species consisting of seven subspecies one of which is *croceator* (Moritz et al. 1992). The yellow-blotched salamander is threatened by loss of habitat and degradation. This species is endemic to California and occurs in the lower Kern River Canyon, the Piute Mountains, Breckenridge Mountain, the Tehachapi Mountains, on Mt. Pinos, near Fort Tejon, and near Frazier-Alamo Mountain (California Herps 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Bakersfield Legless Lizard *(Annielle grinnelli)*

The Bakersfield legless lizard is differentiated from all other species of *Anniella* in having a higher vertebral count. The Bakersfield legless lizard is restricted to the southern San Joaquin Valley and the east side of the Carrizo Plain, and within the city limits of Bakersfield. During the last 10 years, two of the three known Bakersfield populations were destroyed by housing developments. A protected population is located at the Sand Ridge Preserve. Individuals from the Carrizo Plain are similar in coloration and mitochondrial sequences to the San Joaquin Valley samples, but have a different nuclear genotype (Papenfuss and Parham 2013). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Temblor Legless Lizard (*Anniella alexanderae*)

Temblor legless lizard is differentiated from all other species of *Anniella* in having a light grey ventral coloring that is continuous from the lower jaw to the end of the tail. The Temblor legless lizard is known from two sites separated by continuous habitat west of Highway 33. The known sites are in areas of sandy soil at the southeast base of the Temblor Range between McKittrick and Taft on the west side of the southern San Joaquin Valley in Kern County, California. All specimens have been found between Highway 33 and the Temblor Range (Papenfuss and Parham 2013). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Bald Eagle (Haliaeetus leucocephalus)

The bald eagle is listed as a state endangered and state fully protected species, and is protected by the MBTA. Though this species was once federally endangered, it was delisted in 2007. The

population of bald eagles has been documented to be stable to increasing (USFWS 2006). The bald eagle is still protected under the Bald and Golden Eagle Protection Act as well as the Lacey Act. Adult bald eagles are typically brown in the body and have a white head and tail. Body length ranges from 28 to 50 inches and a typical wingspan ranges from 6 to 8 feet. The bald eagle is usually found within one mile of large bodies of water. It hunts from perches or soaring flight, but will also wade into shallow water to pursue fish. In flooded fields, it will occasionally prey upon displaced voles, or other small mammals. Groups may feed gregariously, especially on spawning fish. The bald eagle also scavenges for dead fish, water birds, and mammals. It most frequently uses perches that are open and easily approached, such as large, stoutly limbed trees, snags, or broken-topped trees (Zeiner et al. 1988-1990). It is more common at lower elevations, and is not found in the high Sierra Nevada.

Breeding habitat in California for the bald eagle is generally limited to Butte, Lake, Lassen, Modoc, Plumas, Shasta, Siskiyou, and Trinity Counties. About half of the wintering population is in the Klamath Basin. This species is fairly common as a local winter migrant at a few inland waters in southern California including Kern and San Bernardino Counties (Zeiner et al. 1988-1990). No breeding pairs have been recorded within Kern County, and the Project Area is likely only used by winter residents and migrants. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

California Condor (Gymnogyps californianus)

The condor was listed under the ESA in March 11, 1967 (32 FR 4001). Critical habitat for the California condor was designated September 24, 1976 (41 FR 41914–41916). The vast majority of condor critical habitat is located in higher elevation areas of the Tehachapis, Coastal Range, and Sierra mountain ranges. Condor critical habitat has been designated within the southern portion or immediately adjacent to the Project Area. The condor critical habitat designation, however, predated current regulatory criteria for designating critical habitat, most notably regulations requiring that critical habitat designations be made based on the "primary constituent elements" that are essential for the conservation of the listed species. Instead, the condor critical habitat designation was based on limited occurrence information and township blocks, which resulted in condor critical habitat maps that extend onto the valley floor below the 2,000-foot elevation, particularly in the vicinity of I-5.

The biology and lifecycle of the California condor at the time of the federal listing and designation of critical habitat reflected information largely derived from a period of severe stress for the species. In 1982, the condor population had declined to the point that the USFWS elected to capture and remove all existing condors from the wild for captive breeding in at the Los Angeles Zoo and San Diego Wild Animal Park. Condors were reintroduced into the wild in 1992, and have required constant monitoring to avoid mortality due to lead poisoning ingested from remnants of shot in discarded animal remains. In response, California enacted the Ridley-Tree Condor Conservation Act, which banned the use of lead ammunition within the state range of the California condor effective July 1, 2008. By 2002, a number of condors had been fitted with GPS transmitters that allowed for regular monitoring of condor locations and activities, such as

perching, flying or roosting, and the southern California condor population was 113 birds in 2011.

In 2013, the USFWS approved the TUMSHCP for 141,886 acres of Tejon Ranch, including lands that extend along the northern face of the Tehachapi Mountains to a minimum elevation of 2,000 feet above the valley floor. The 2,000 foot elevation level is also the maximum height used in the draft VFHCP due to the differences in habitat and species occurrence at that elevation threshold. During the preparation of the TUMSHCP, the USFWS conducted extensive analyses of condor occurrence generated by GPS data from released and wild condors over the period of 2002 to 2011. As shown in Figure 4.4-9, condor movement patterns tend to be highly influenced by food availability and nesting/roosting sites. The preponderance of all data points were in the Hopper Mountain and Bitter Creek National Wildlife Refuges and where historical and current nesting and roosting sites (Hopper National Wildlife Refuge) and supplemental feeding stations are located to trap condor for health checkups and transmitter updates. High numbers of location point were also recorded in the Wind Wolves Preserve where supplemental feeding sites have been occasionally established and where Tule elk populations occur, and in the higher elevations of Tejon Ranch primarily associated with foraging and occasional overnight roosting related to hunting and grazing activities on the ranch.

The USFWS data analysis demonstrates that condors are, in almost all cases, topographically constrained to upland areas at the periphery of the Project Area where topography sustains thermal weather patterns for flight. As shown in Figure 4.4-9, for example, there are almost no recorded condor aerial or ground occurrences over the entire decade of 2002 to 2011 in the northern half of the critical habitat area east of I-5 that extends to lower elevations and the valley floor. The overwhelming majority of all aerial or ground occurrences are also limited to locations above 2,000 feet, as indicated by the spatial data mapped along the northern border of the TUMSHCP (which traverses the 2,000-foot elevation level) in Figure 4.4-9. More generally, the data shows that condors do not use, or even fly over, nearly all of the Project Area in the valley floor up to 2,000 feet AMSL.

Generally, California condors use topography and associated thermal weather patterns for flight. This is best illustrated by observations indicating that almost all flights by California condors, whether covering long distances or not, followed routes over the foothills and mountains bordering the southern San Joaquin Valley, but did not pass directly over the flat, highly agricultural floor of the valley. Thus, the usual route for a bird starting from the coastal mountains of Santa Barbara County on its way to foraging grounds in Tulare County was to cross northern Ventura County, pass through the Tehachapi Mountains in southern Kern County (in the vicinity of Tejon Ranch), then turn north to fly closely by Breckenridge Mountain, and enter Tulare County somewhere between the Greenhorn Mountains and Blue Mountain. (USFWS 2013d)

The best available scientific information for the condor demonstrates that Project Area locations above 2,000 feet are significantly more subject to use by the condor for foraging activities. There is no condor nesting or breeding activity anywhere in the Project Area, including locations above 2,000 feet. The current and foreseeable future population of condors do not appear to be limited

by losses of foraging or breeding habitat related to development, including oil and gas activities (USFWS 2013).

When condors are recovered, continued population growth may at some point become limited by available forage, though no definitive scientific analysis of the carrying capacity of condor foraging habitat has been conducted. However, as noted above, nothing in the historical record indicates that condors currently lack adequate food or foraging opportunities. While agricultural conversion to more intensive uses and the corresponding increased human activity has caused speculation about the lack of adequate forage, no impact on the current population has been identified. Further, the availability of appropriate habitat could be restricted by limitations in connectivity of suitable areas for California condor foraging, nesting, and roosting. Once again, no such limitations have been noted aside from natural landscape features, and condors have been observed utilizing areas with roads, housing, gas and oilfields, and similar human features. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Fulvous Whistling-Duck (*Dendrocygna bicolor)*

The fulvous whistling-duck is a California SSC and an MBTA protected species. The fulvous whistling-duck is a medium-sized duck with a long neck and long legs. The head, neck, chest, and belly are cinnamon colored. It inhabits and nests in marshlands, wet meadows, rice fields, flooded agricultural areas, and lagoons. This species prefers to nest in dense wetlands, shallow lacustrine and quiet riverine waters. This species can sometimes feed in wet croplands and pastures, if available. The fulvous whistling-duck migrates out of California. The breeding population generally leaves from September to February, and migrates to its wintering grounds in Mexico. This species is threatened by nest predators, which include skunks, raccoons, opossums, and dogs. Other threats include pesticide poisoning and hunting.

There are populations of the fulvous whistling-duck found in Africa, Madagascar, India, Burma, Hawaii, the Caribbean, and throughout tropical America. In California, the fulvous whistling-duck is known to nest irregularly in the Imperial Valley and is uncommon to fairly common (some years only) in the San Joaquin Valley from April to November (Zeiner et al. 1988-1990). The breeding season extends from late April through early August. The winter status of the fulvous whistling-duck is poorly known historically. The establishment of irrigation for agricultural fields in the Los Banos area and the San Joaquin Valley created more habitat than was previously available. The Los Banos area was identified as the "chief breeding ground" and became one of the only locations in California where the species was considered common (Grinnell and Miller 1944). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Loggerhead Shrike (*Lanius ludovicianus*)

The loggerhead shrike is a California SSC and is protected by the MBTA. This species is identifiable based on its gray back, white belly, black coloration on the wings, and a black mask around the eyes. The loggerhead shrike has raptor-like habits and has been observed skewering

their kills on thorns, barbed wire, or by wedging their prey into a tight space. This species inhabits shrubland, open woodlands, grasslands, and other open habitats that provide woody or thorny shrubs and branches. Loggerhead shrikes primarily feed on large insects, but may also eat small birds, mammals, amphibians, reptiles, fish, carrion, and various other invertebrates.

Historically, this species was widespread throughout most of California with the exception of the northwest most corner of the state. The northern portion of the San Joaquin Valley is no longer considered to be a part of their present range. In California, the loggerhead shrike is known to breed in the Central Valley, Coastal Ranges, and the southeastern deserts (Zeiner et al. 1988-1990). The wintering range of this species includes the San Joaquin Valley, the south-central and south coasts, and the southeastern deserts (Sauer et al. 1996). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Long-Eared Owl *(Asio otus)*

The long-eared owl is listed as a California SSC and is protected under the MBTA. It is a medium-sized, brownish gray owl with pale patches on the face that give the appearance of white eyebrows, and a white patch below the bill. This species inhabits conifer, oak, riparian, pinyon-juniper, and desert woodlands that are either open or are adjacent to grasslands, meadows, or shrublands from sea level up to 6,550 feet in elevation. Nesting and roosting habitat require dense wooded areas with openings for hunting, windrows, caves and/or cracks in rock canyons.

The breeding range of the long-eared owl is spread throughout California except for the entire floor of the Central Valley and the southern coastal areas. There are, however, limited records suggesting that this owl is a very scarce and irregular breeder in the Central Valley with only a few observations from Yolo, Fresno, and Kern Counties. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Short-Eared Owl (*Asio flammeus*)

The short-eared owl is listed as a California SSC and is protected under the MBTA. It is a medium-sized owl with dark brown mottled upperparts and light buff colored underparts with dark streaks. The head is round and the facial disk is outlined in white with black around the eyes. It has yellow eyes and a black bill. This species occurs in Great Basin grassland, marsh and seep, meadow and seep, valley and foothill grassland, and wetland habitats. It is found in both fresh and saltwater marshes, lowland meadows, and irrigated alfalfa fields. It requires tall grasses for nesting and daytime seclusion. The short-eared owl builds its nest on the ground and produces a clutch of three to 11 eggs.

The breeding range of this species is from the coastal areas in Del Norte and Humboldt Counties, the San Francisco Bay Delta, northeastern Modoc Plateau, the east side of the Sierras from Lake Tahoe south to Inyo County, and the San Joaquin Valley (Zeiner et al. 1988-1990). The short-eared owl generally arrives in California in September or October and leaves in April (Zeiner et

al. 1988-1990). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Western Snowy Plover (Charadrius alexandrinus nivosus)

The Western snowy plover is listed as a federally threatened species, State SSC, and is protected by the MBTA. Conservation guidelines are depicted in the *Recovery Plan for the Pacific Coast Population of the Western Snowy Plover* (USFWS 2007d). The Western snowy plover is a small shorebird just over 6 inches in length and weighs 1.2 to 2 ounces. Overall, it has lateral patches of white on the hind neck and breast and dark lateral breast patches, a forehead bar, and eye patches. They have pale gray-brown upperparts, and the bill and legs are blackish (Cornell 2015b). Their diet comprises terrestrial freshwater brackish and marine invertebrates. Rove beetles, long-legged flies and shore flies are the most common invertebrates consumed by this species (Cornell 2015b). This ground nesting bird inhabits barren to sparsely vegetated sand beaches, dry salt flats in lagoons, dredge spoils deposited on beach or dune habitat, levees and flats at salt-evaporation ponds, river bars, along alkaline or saline lakes, reservoirs, and ponds.

The Western snowy plover declined 20% in its breeding population during surveys between the late 1970s and late 1980s (Cornell 2015b). The coastal breeding range of this species runs down the Pacific Coast, up the Gulf of California, down the west coast of Mexico, and along the shores of the Gulf Coast. California inland breeding areas occur at the Salton Sea, Mono Lake, and at isolated sites on the shores of alkali lakes in northeastern California, in the Central Valley, and southeastern deserts (Zeiner et al. 1988-1990). This inland range borders Nevada and extends up to southern Oregon. The species also breeds in northern Utah, Wyoming, Colorado, and Montana and along the southern corner of New Mexico, across northern Texas, and extending up to Kansas Cornell 2015b). It is known to occur from sea level within its coastal range and up to 10,000 feet in elevation when breeding inland. When the birds are inland, some regularly winter at agricultural wastewater ponds in the San Joaquin Valley, California. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

White-Tailed Kite (*Elanus leucurus*)

The white-tailed kite is listed as a state fully protected species and is protected by the MBTA. The white-tailed kite is found primarily in open grasslands, agricultural areas, wide river valleys, open oak savannas, and desert grasslands, and prefers low to middle elevation habitats (Zeiner et al. 1988-1990). It is a smaller, gull-like bird of prey with mostly white to grey coloring and black shoulders and has a distinctive black band near the tip of the tale. Adults have red eyes and have been known to dangle their feet during flight. It is 15 inches long, and has a wing span of about 38 inches. The nests of this species are usually located in solitary trees, or on the edge of forest stands. Nesting occurs between February through August, and peaks in March through May (Zeiner et al. 1988-1990).

The white-tailed kite ranges throughout the United States and into South America. Currently, the white-tailed kite is found in virtually all lowlands of California west of the Sierra Nevada Mountains and the southeast deserts. It is common in the Central Valley and along the entire California coast (Zeiner et al. 1988-1990). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Pallid Bat (Antrozous pallidus)

The pallid bat is a California SSC. The pallid bat is a large light-colored bat with a forearm length of 1.7 to 2.3 inches, with long prominent ears, a blunt snout, and pinkish-brown or gray wing, and tail membranes. Glands located near the scroll-shaped nostrils secrete a distinct skunk-like scent. Pallid bats can be distinguished from other long eared bats by their lighter fur, longer forearm, and lack of lappets (fleshy flaps) that protect them from the base of the ears or large rhinal lumps. The pallid bat inhabits rocky arid deserts and canyon-lands, shrub-steppe grasslands, karst formations up to 6,000 feet in elevation and higher elevation coniferous forests up to 7,000 feet. It is most abundant in xeric ecosystems, including the Great Basin, Mojave, and Sonoran Deserts. Day and night roosts include crevices in rocky outcrops and cliffs, caves, mines, trees, and various human structures such as bridges, barns, porches, bat boxes, and human-occupied as well as vacant buildings.

The pallid bat is distributed from southern British Columbia and Montana to central Mexico, and east to Texas, Oklahoma, and Kansas. An isolated population also occurs on Cuba (WBWG 2005). This species is common in low elevations throughout California except for the high Sierra Nevadas from Shasta to Kern Counties and the northwestern corner of the state from Del Norte and western Siskiyou County to northern Mendocino County (Zeiner et al. 1988-1990). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Ringtail (Bassariscus astutus)

The Ringtail is listed as a California SSC and is designated as fully protected by the CDFW. This species is nocturnal and primarily carnivorous. They eat mainly rodents and rabbits, but their diet also includes substantial amounts of birds and eggs, reptiles, invertebrates, fruits, nuts, and some carrion. They forage primarily on the ground, among rocks and in trees usually near water (Harris and Chester 1997). The ringtail likes to use hollow trees, logs, snags, cavities in talus and other rocky areas, and other recesses for cover. Ringtails could potentially occur in riparian habitats, and in brush stands of most forest and shrub habitats, associated with rocky areas no farther than 0.6 mile from permanent water.

The species is widely distributed in Mexico and across southern North America. In the United States it ranges from southern Oregon and California through the southwestern states to Texas (Harris and Chester 1997). In California, the ringtail is a widely distributed, common to uncommon permanent resident. It occurs in various riparian habitats, in brush stands of most forest and shrub habitats, and at low to middle elevations (Zeiner et al. 1988-1990). The species is usually distributed from sea level to 4,600 feet; however, the species is not known to occur in the

lower elevations of the San Joaquin Valley. Limited riparian habitat exists along the Kern River, and a sighting was confirmed in the riverine area of Bakersfield near Mohawk Street in 2012 (SJVC 2012). Apart from the Kern River riparian areas, ringtail suitable habitat is limited to upper elevations in the eastern and western portions of Kern County, except for the higher elevation locations to the south. There are no documented occurrences within the CNDDB (CDFW 2014). As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

Townsend's Big-Eared Bat (*Corynorhinus townsendii*)

The Townsend's big-eared bat is a candidate for listing in the state of California. The species is found throughout California in all alpine and subalpine habitats, and may be found during any season. This species of bat is medium-sized with very long ears. Their fur is pale gray or brown above and buff colored on the underside. This bat's ears are immense, reaching a length of 38 millimeters. When the ears are laid back they extend to the middle of its body. The face is marked by two large glandular lumps on either side of its nose.

Townsend's bid-eared bats are insectivorous. They tend to emerge late in the day to feed (Gruver and Keinath 2006). Townsend's big eared bats feed on small moths, beetles, or flies and either capture these insects from leaves or catch them directly in the air (Kunz and Martin 1982). Suitable foraging habitat for Townsend's big-eared bats will likely be a heterogeneous mosaic of forested and edge habitats, including riparian zones, which are also used for commuting and drinking (Fellers and Pierson 2002). Areas with substantial beaver activity enhance the quality of foraging habitat by increasing ecosystem productivity (Gruver and Keinath 2006), providing gaps in the forest canopy; providing small, quiet ponds for drinking; and causing an increase in insect activity. In California, both males and females foraged along the edges of riparian vegetation dominated by Douglas-fir, California bay, and willow species, but they also avoided open grasslands both when traveling and foraging (Fellers and Pierson 2002).

These animals are sensitive to light and movement so if they are disturbed during the day, they awake and their ears begin to move as they try to identify the intruder. If the disturbance occurs for more than a few seconds, the entire group will relocate (Gruver and Keinath 2006). Generally, Townsend's big-eared bats are found in the dry uplands throughout the West, but they also occur in mesic coniferous and deciduous forest habitats along the Pacific Coast (Kunz and Martin 1982). Townsend's big-eared bat is unequivocally associated with areas containing caves and cave-analogs for roosting habitat. Beyond the constraint for cavernous roosts, habitat associations become less well defined.

The Townsend's big-eared bat requires spacious cavern-like structures for roosting during all stages of its life cycle. Typically, they use caves and mines, but the species has been noted roosting in large hollows of redwood trees (Fellers and Pierson 2002), in attics and abandoned buildings (Fellers and Pierson 2002), and under bridges (Fellers and Pierson 2002). In coastal California, five of six known maternity colonies were in old buildings; the sixth was in a cave-like feature of a bridge (Fellers and Pierson 2002). During hibernation, these bats commonly change position within a hibernaculum or move to a nearby roost, presumably to find

temperatures that are more suitable. Roost movement in the summer likely occurs for the same reason.

As a group, bats are vulnerable to extirpation or extinction because of their unique life histories, notably their low annual fecundity. Townsend's big-eared bat may be even more susceptible because of its wing morphology, restrictive roosting requirements, sensitivity to disturbance at roost sites, and the ongoing elimination of roosting habitat. This species has declined due to direct killing by people and because of abandonment of roosts caused by disturbance due to explorers and vandals. Townsend's big-eared bats are notoriously sensitive to disturbance at roost sites (Kunz and Martin 1982). Disturbance of roost sites and elimination of roosting habitat through closure of abandoned mines poses a serious threat to the Townsend's big-eared bat in the West. Pesticides and other environmental toxins also affect these bats in two ways: through bioaccumulation and through reduction in prey abundance. As discussed in Impact 4.4-1, potential impacts were evaluated based on the potential occurrence of the species in each Project Area tier and subarea.

High Elevation Project Locations

As described above, a portion of the Project area extends to areas above 2,000 feet AMSL. The southern border of the Project Area, and potentially a few location points along the eastern border, include lands that are above 2,000 feet AMSL in elevation. Almost all of the Project Area and existing oil and gas fields are situated on the San Joaquin Valley floor or lower uplands that are below 2,000 AMSL. The vegetation and species occurrences in Project Area locations above and below 2,000 feet are significantly different. The southern border of the Project Area includes portions of Tejon Ranch east of I-5, and the Wind Wolves Preserve, privately managed conservation lands west of the interstate. The extreme southwest portion of the Project Area is adjacent to the federal Bittercreek National Wildlife Preserve.

In 2013, the USFWS approved the TUMSHCP for 141,886 acres of Tejon Ranch, including lands that extend along the northern face of the Tehachapi Mountains to a minimum elevation of 2,000 feet above the valley floor. As shown in Figure 4.4-10, the 2,000-foot elevation level marks a generally sharp transition from the agricultural lands, grasslands, and shrub habitats that are characteristic of almost all of the Project Area, to a savanna and woodland landscape.

As documented in the TUMSHCP and the NEPA review prepared for the HCP, several species occur with much greater frequency, and use locations above 2,000 feet more extensively for foraging, breeding, roosting or other life-cycle functions, than at lower elevations. As shown in Table 4.4-65, several of the state or federally protected species covered by the TUMSHCP occur to a much greater extent or only in locations above 2,000 feet than in the rest of the HCP area. Golden eagles breed at higher locations, for example, but not at lower elevations or on the valley floor. Habitat for the least bell's vireo, Tehachapi slender salamander, and striped adobe lily is almost exclusively confined to higher elevations. As discussed above, the California condor occurs almost exclusively in higher elevations in the mountains surrounding the Project Area to the south and east.

Table 4.4-65: Relative Occurrence of Certain Listed Species in Locations Above and Below 2,000 feet In the Tehachapi Uplands Multiple Species Habitat Conservation Plan Area

Species	Status	Habitat Function	Probability of Occurrence Compared with Project Area Below 2,000 feet
California condor	FE/SE/FP	Primary foraging, roosting	Much Higher
Golden eagle	SSC/FP	Foraging/ breeding	Much Higher
Least Bell's vireo	FE/SE	Breeding/foraging	Much Higher
Ringtail	FP	Suitable habitat	Higher
Striped adobe lily	ST	Suitable habitat	Much Higher
Tehachapi slender salamander	ST	Suitable habitat	Much Higher

Source: USFWS 2012
Notes:
Federal Status: FE=Listed as Endangered; FT=Listed as Threatened; FC=Federal Candidate
State Status: ST= State Listed as Threatened; SSC= Species of Special Concern; FP=State Fully Protected

Conversely, most of the species addressed in the federal SJV Recovery Plan (USFWS 1998), including the San Joaquin kit fox, the giant kangaroo rat, the Tipton kangaroo rat and the blunt-nosed leopard lizard, typically do not occur, or occur so infrequently in locations above 2,000 feet, that they were not analyzed by the USFWS in the TUMSHCP EIS or included as covered species in the HCP.

Connectivity and Migration Corridors

Habitat connectivity and wildlife movement corridors that facilitate connectivity are important for biodiversity conservation (Mackey, Watson, and Worboys 2010), maintaining gene flow (Beier and Noss 1998), maintaining ecological processes (Bennett 2003), and reducing species extinction risk (Crooks et al. 2011). Connectivity between blocks of habitat is maintained through a network of corridors defined by plants and wildlife use for movement events on varying scales (e.g., daily foraging, seasonal migration, or dispersal). Wildlife movement corridors and linkage functions include: (1) travel routes for wide-ranging animals, allowing animals to either migrate or come into contact with mates; (2) routes for the propagation of plant species; (3) spatial arrangement for genetic exchange between individuals; (4) areas where populations can move in response to environmental change or natural disasters; and (5) routes by which re-colonization can occur where populations have been locally extirpated (Beier and Loe 1992).

Wildlife connectivity and linkages in the Project Area were discussed and identified in the 1998 SJV Recovery Plan targeting upland species of the San Joaquin Valley. For the San Joaquin kit fox, identification of linkages between core and satellite populations in the greater San Joaquin Valley was further refined in the 2010 5-year review of the kit fox (USFWS 2010b) by evaluating modeling information designed to optimize reserve design for that species. As shown in Figure

4.4-11, the linkages were intended to connect core and satellite kit fox habitat. With San Joaquin kit fox as an umbrella species in the SJV Recovery Plan, the intent was that this reserve design combined with linkage features would benefit other target upland species that co-occur with the kit fox. The proposed linkages in the Project Area are located within two primary areas: (1) within the lower elevation natural lands bordering San Joaquin Valley and (2) along remnant riparian corridors across the middle of the Project Area. The proposed linkages in the natural lands bordering the Project Area are in the northern and southern Eastern Subarea and the southern and northwestern portions of the Western Subarea. Proposed linkages also pass from the Western Subarea to the Eastern Subarea along the Kern River corridor and from the Kern National Wildlife Refuge/Semitropic Ridge vicinity through the Central Subarea to the Eastern Subarea along Poso Creek.

In a separate effort in 2001, a statewide conference was held that considered habitat connectivity and wildlife movement patterns throughout California. Project Area movement corridors identified from the conference are referred to as "potential corridors" in the following analysis (Penrod, Hunter, and Merrifield 2001).

More recently, the California Essential Habitat Connectivity Project (CEHP) (Spencer et al. 2010) used statewide wildlife information from CDFW to identify natural habitat blocks that support native biodiversity (i.e., Natural Landscape Blocks) and to delineate large areas that are considered essential for ecological connectivity between these blocks (i.e., Essential Connectivity Areas). The essential connectivity areas identified in the CEHP for the Project Area are somewhat different, but generally overlap with USFWS San Joaquin kit fox Core, Satellite, and Linkage areas (USFWS 2010b) with the following differences to note:

- Some of the Essential Connectivity Areas identified in the CEHP are also considered Core and Satellite Areas for San Joaquin kit fox in the SJV Recovery Plan;
- Essential Connectivity Areas address habitat connectivity in general on a landscape scale rather than by species;
- The SJV Recovery Plan (USFWS 1998) and the USFWS 5-Year Species Review (USFWS 2010b) include kit fox Core Areas (Carrizo and Western Kern) connecting to linkage lands along the southwestern boundary of the Project Area (Western Subarea). This connection is not shown on the CEHP map between Natural Landscape Blocks and Essential Connectivity Areas.
- In the northwestern portion of the Project Area (Western Subarea), there is less overlap between CEHP Natural Landscape Blocks and Essential Connectivity Areas than the area shown as SJV Recovery Plan linkage lands (which connect Carrizo and Western Kern Core Areas to satellite populations in western Kings County and the Lost Hills area).
- The CEHP shows a potential corridor in the Central Subarea paralleling and to the east of I-5 that was not identified in the earlier USFWS design.

Figure 4.4-11 shows the locations of potential corridors, natural habitat blocks, and essential connectivity areas that have been identified within the Project Area (Chevron 2014).

As shown in Figure 4.4-11, Potential Corridors in the Project subareas are influenced by the location of existing foothill habitats and watercourses. In the Western Subarea, a Potential Corridor is identified that extends through grasslands and grazing lands along the base of the Temblor range to the north. A relatively short Potential Corridor extends through the Western and Central Subareas, between Lost Hills and the Kern National Wildlife Refuge. In the Central Subarea, an Essential Connectivity Area would link the KWB and Lokern Natural Area habitat with the Kern National Wildlife Refuge to the north. An essential connectivity area has also been identified that would connect the Kern National Wildlife Refuge and preserves located in adjacent counties to the north. A potential corridor also has been identified at the northern border of the eastern Project Area in grasslands and rangelands along the Sierra Nevada foothills that would pass through Natural Landscape Blocks and an Essential Connectivity Area.

Two Potential Corridors extend through the Eastern and Central Subareas in a generally east-west direction along the Kern River and Poso Creek. These corridors correspond with the areas where linkages should be promoted, as identified in the SJV Recovery Plan (USFWS 1998).

The Potential Corridors, Essential Connectivity Areas, and Natural Landscape Blocks identified in previous plans within the Project Area have been modified or otherwise affected by existing land uses, including agriculture, urban development, and oil and gas activities. A significant amount of the Essential Connectivity Areas in the Western Subarea include currently operating oil and gas fields, portions of which have been subject to relatively dense levels of development. The Lost Hills – Semitropic Ridge Potential Corridor is impeded by gaps in natural land due to existing agriculture lands and urban development and by existing features that serve as barriers to plant and wildlife movement, including I-5, the Kern River Flood Canal, and the California Aqueduct.

The Carrizo Plain-Western San Joaquin Valley Potential Corridor is affected by existing roads and highways that are the primary barriers to movement, and a choke-point exists at Pleasant Valley in western Fresno County.

The Kern Refuge-Semitropic Ridge Potential Corridor spans 30 miles between the former Buena Vista Lake and the Semitropic Ridge Ecological Reserve. As shown in Figure 4.4-11, the Buttonwillow Ecological Reserve, Kern Water Bank Authority conservation lands, and the Coles Levee Ecological Reserve are included in this Potential Corridor. The most significant barriers to plant and wildlife movement in this Potential Corridor are gaps in natural lands as a result of agricultural development and roads.

There is little remaining natural land connectivity in the central portion of the Project Area, including most of the Central Subarea, and the valley floor portions of the Eastern and Western Subareas where agriculture and urban development are the predominant land uses. Much of the contiguous natural land that occurs on the valley floor extends along riparian corridors. At the southeastern and southwestern borders of the Project Area, an essential connectivity area has been

identified that extends between the foothills of the Temblor Range to the west and the Sierra Nevada Mountains to the east (Spencer et al. 2010). Roads and highways are the primary barriers to movement, along with steep and hilly terrain for the valley floor species that prefer areas of low relief. The San Joaquin kit fox does not generally occur in steep terrain. Studies have found that they are either absent from or less abundant in terrain that exceeds 5% slope (USFWS 2010b).

The Kern River potential corridor runs east-west through an impacted riparian corridor for approximately 30 miles. The riparian habitat within this corridor is considered a remnant of the historic conditions due to water table drawdown and low annual flows in the Kern River. Plant and wildlife movement of certain species in this potential corridor may be impeded by the urban development in the Bakersfield area that affects immediately adjacent land uses and activities within the river bed and bank. The most significant barriers to plant and wildlife movement in this potential corridor are gaps in riparian habitat for riparian-dependent species, density of vegetation for species adapted to more open habitats, and water impoundments, which potentially restrict the movement of terrestrial species across areas that recently have had only intermittent water flow.

The Poso Creek potential corridor primarily runs east-west, and follows remnants of the Poso Creek riparian corridor for approximately 35 miles. The most significant barrier to plant and wildlife movement in this potential corridor is gaps in natural habitat as a result of narrow width from channelization and encroaching agricultural development.

The Highway 43/Garces Highway Potential Corridor includes a series of natural lands that surround State Highway 43 that link the Kern National Wildlife Refuge in the south with relatively undisturbed tracts of land further north. The most significant barriers to plant and wildlife movement in this potential corridor are gaps in natural lands as a result of agricultural development.

In the Eastern Subarea, essential connectivity areas have been identified along the Sierra Nevada foothills extending south to the Tehachapi Mountains. The Southeastern Foothills potential extends for 60 miles between the Tehachapi Range to the south, and the foothills of the Sierra Nevada mountains to the northern Project Area boundary. The most significant barriers to plant and wildlife movement in this potential corridor are roads and urban development.

The 5-year review of the San Joaquin kit fox listing found that the most robust kit fox populations occur in the portions of the Project Area that are most heavily used for oil and production. The USFWS concluded that that kit fox, the SJV Recovery Plan umbrella species, can persist well with low density oil development, but that oil and gas development may have cumulative and long-term effects on kit fox populations that are not fully known (USFWS 2010b). In many cases, the patchiness of oil and gas development maintains habitat between areas of high, low and medium density activity. This development pattern would likely impede wildlife movement to a lesser extent than agriculture or urban development that tends to fully convert habitat within large, contiguous areas for wide ranging species (Fiehler and Cypher 2011). The SJV Recovery Plan indicates that oil and gas production may provide greater opportunities for potential

connectivity and conservation than agricultural land uses (USFWS 1998). More recent studies also suggest that elements of the wildlife community remain relatively intact up to 70% disturbance in oilfield development, with some special-status species persisting provided that at least 30% of the natural landscape is left intact (Fiehler and Cypher 2011).

4.4.3 Regulatory Setting

Federal, state, regional, and local biological resource policies and regulations applicable to the proposed Project are identified below.

Federal

Federal Endangered Species Act of 1973 (16 U.S.C. 1531 through 1543)

The ESA (16 U.S. Code [U.S.C.] 1531 et seq.) was enacted to provide a means by which endangered and threatened species and the ecosystems on which they depend may be conserved. The ESA and the implementing regulations (50 CFR 17.1 et seq.) include provisions for the protection and management of federally listed threatened or endangered plants and animals and their critical habitats. Generally, the USFWS regulates upland and freshwater species, and the National Marine Fisheries Service (NMFS) oversees provisions for protection of anadromous, marine, and estuarine species. Section 4 of the ESA requires the USFWS and/or NMFS to make determinations on whether any species should be listed as an endangered or threatened species and to designate critical habitat for endangered and threatened species (16 U.S.C. 1533). Critical habitat is defined in the ESA as an area occupied by a listed species with physical or geographical/biological features essential to the species conservation or locations not currently occupied by listed species which are essential to the species conservation. 50 CFR 424.02 Section 9 of the ESA (16 U.S.C. 1538, 50 CFR 17.21402 et seq.) prohibits the unauthorized take of any species that is listed as threatened or endangered under the ESA. Take that is incidental to and not the purpose of the carrying out of otherwise lawful activities may be permitted under Section 7 and Section 10 of the ESA.

Section 7 of the ESA requires federal agencies to consult with the USFWS and/or NMFS and obtain a biological opinion prior to carrying out any federal program or agency action that may adversely affect threatened or endangered species. The ESA Section 7 consultation process and biological opinion includes an evaluation of whether a federal project, including issuance of an incidental take permit (ITP) under ESA Section 10, is likely to jeopardize the continued existence and recovery of any endangered or threatened species or result in the destruction or adverse modification of critical habitat designated for the species. If a proposed federal action would result in take of a listed animal species or adverse modification of designated critical habitat, ESA Section 7 requires the USFWS to provide an incidental take statement that includes reasonable and prudent measures and terms and conditions implementing those measures, to minimize the effects of such take. Compliance by the federal agency and any applicant with the incidental take statement exempts potential take or adverse critical habitat modification resulting from the proposed action from the prohibitions in Section 9 of the ESA.

Section 10 of the ESA provides mechanisms for authorizing otherwise prohibited take through the ITP process for a proposed action that does not involve a discretionary approval by a federal agency. Under Section 10(a) of the ESA, an ITP can be obtained provided the permit applicant submits to the USFWS a conservation plan (often termed an HCP, or a multiple species habitat conservation plan [MSHCP] when addressing more than one species) that satisfies Section 10(a)(2)(A) of the ESA, and provided the USFWS determines that the habitat conservation plan meets the issuance criteria of Section 10(a)(2)(B) of the ESA. Section 10(a)(2)(B) of the ESA requires the following criteria be met before the USFWS may issue an ITP: (1) The taking will be incidental; (2) The applicant will, to the maximum extent practicable, minimize and mitigate the impacts of such taking; (3) The applicant will ensure that adequate funding for the habitat conservation plan and procedures to deal with unforeseen circumstances will be provided; (4) The taking will not appreciably reduce the likelihood of survival and recovery of the species in the wild; and (5) The applicant will ensure that other measures that the USFWS may require as being necessary or appropriate will be provided.

The USFWS is required to annually identify species that are candidates for federal ESA listing, including species that USFWS records indicate are subject to sufficient biological vulnerability and threats to support a proposal for listing but for which a proposal has not been published due to other listing priorities. The list of candidate species is intended to: (1) notify the public that species face survival threats; (2) provide advance knowledge of potential listings for consideration by environmental planners and developers; (3) provide information that may stimulate and guide conservation efforts; (4) request additional input regarding candidate species; and (5) request information for setting listing priorities (Federal Register 79, No. 234 at 72451, December 5, 2014). The USFWS and other federal agencies, including the BLM, may also informally identify sensitive species or species of concern. These species are not subject to ESA or other federal statutory protection, but are considered by the USFWS and other agencies when evaluating the effects of a potential action or development resource management plans, including recovery plans under the ESA.

Migratory Bird Treaty Act (16 U.S.C. 703 through 712)

The MBTA (16 U.S.C. 703–712) includes provisions for the protection of migratory birds and prohibits the non-permitted take of most migratory birds. Take under the MBTA is defined as to "pursue, hunt, take, capture, kill, attempt to take, capture, or kill, possess, offer for sale, sell, offer to barter, barter, offer to purchase, purchase, deliver for shipment, ship export, import, cause to be shipped, exported, or imported, deliver for transportation, transport or cause to be transported, carry or cause to be carried, or receive for shipment, transportation, carriage, or export, any part, nest, or egg of any such bird, or any product, whether or not manufactured" (16 U.S.C. 703(a)). Apart from certain limited exceptions, the USFWS has not implemented an incidental take permit program for the MBTA.

Bald and Golden Eagle Protection Act (16 U.S.C. 668, enacted by 54 Stat. 250)

The Bald and Golden Eagle Protection Act (BGEPA) of 1940 prohibits any form of possession or take of bald eagles and golden eagles, including actions to "pursue, shoot, shoot at, poison,

wound, kill, capture, trap, collect, molest or disturb" an eagle (16 U.S.C. 668c). To disturb a bald and golden eagle means "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available: (1) injury to an eagle; (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior; or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior'' (72 FR 31132; 50 CFR 22.3). A 1962 amendment created a specific exemption for possession of an eagle or eagle parts (e.g., feathers) for religious purposes of Indian tribes.

On November 10, 2009, USFWS implemented new rules (74 Federal Register 175) that finalized permit regulations to authorize the limited take of these species associated with certain otherwise lawful activities, including take in the form of disturbance or actual physical take of eagles (50 CFR 22.26), and a the removal of eagle nests (50 CFR 22.27). The regulations establish a hierarchy of take permits that could be issued for specific categories of activity to ensure that the total amount of authorized incidental take does not adversely affect the eagle populations in the western and eastern United States. The USFWS has indicated that, other than permits for religious and ceremonial activities, BGEPA take permits will generally not be available except for certain "programmatic" activities that may disturb or otherwise take eagles on an ongoing operational basis. To date, programmatic BGEPA permit guidance has been developed by the USFWS for wind and other renewable energy projects, including the development of Avian Protection Plans Eagle Conservation Plans (ECP). Programmatic permits are not currently available for residential projects, and a very limited number of programmatic permits for renewable energy development have been issued by the USFWS.

Clean Water Act (33 U.S.C. §1251 et seq.)

The federal Clean Water Act (CWA) was enacted to protect the nation's waters. Section 404 of the CWA authorizes the Secretary of the Army, acting through the U.S. Army Corps of Engineers (USACE), to issue permits regulating the discharge of dredged or fill materials into "navigable waters at specified disposal sites." Waters of the United States (WOUS) are defined in CFR, Title 33, Section 328.3, subdivision (a) to include navigable waters, perennial and intermittent streams, lakes, rivers, and ponds, as well as wetlands, marshes, and wet meadows. The CWA extends additional protection to certain sensitive aquatic habitats, including wetlands. Authorization to discharge dredge or fill materials into sensitive aquatic habitats requires that an applicant demonstrate the proposed activity represents the least environmentally damaging practicable alternative for the project. A proposed discharge into federally regulated wetlands must also not result in a net loss of wetland functions or values (Compensatory Mitigation for Losses of Aquatic Resources, 73 Federal Register [FR] 19594 [April 10, 2008]; Executive Order 11990 [1977]) All authorizations to discharge dredge or fill materials into WOUS must demonstrate that the proposed projects have been designed to avoid, minimize and mitigate for all unavoidable effects on water of the United States.

The location and extent of WOUS are formally identified by the USACE through a jurisdictional delineation process applying technical criteria described in various guidance documents issued by the USACE, including the 1987 Corps of Engineers Wetlands Delineation Manual

(Environmental Laboratory 1987), the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2) (USACE 2008), A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States (USACE 2008), and in USACE Regulatory Guidance Letter No. 05-05 (USACE 2005).

Although there are some streams in the Project Area that are navigable by small boats (e.g., kayaks and rafts) for limited periods of time, all have "ephemeral" or "intermittent" flows and most are never navigable. Most of these streams do not discharge into a navigable water when they do flow for limited periods of time and terminate at various valley floor locations. The USACE has issued jurisdictional determinations (JDs) for several waters and wetlands in the Project Area, and in certain instances has concluded that the applicable resources were not federally jurisdictional. A JD is generally valid for a period of five years.

The section 404 permit program also applies to the dredge and fill of federal wetlands. Physically, a federal wetland must meet three specified criteria: (i) less permeable soils more likely to cause rainwater and other surface water flows to pond; (ii) seasonal ponding during specified types of rain events; and (iii) the presence of plants that are consistent with seasonally ponding. The extent to which a wetland area that meets the applicable criteria is federally jurisdictional, however, is subject to considerable legal uncertainty. In 2001, the United States Supreme Court issued a split decision concerning the jurisdictional status of a wetland that was not hydrologically connected to a federal surface water, occurred entirely within a single state, and was not used in interstate commerce. In Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers, 531 U.S. 159 (2001) (SWANCC), Justice Kennedy, in his own concurrence in the opinion, articulated a "nexus" test of jurisdictionality: if a wetland has a physical "nexus" to a jurisdictional water, then it is federally jurisdictional. Wetlands that lack a physical nexus with a federally jurisdictional water are not subject to federal jurisdiction.

The USACE and EPA issued a joint guidance interpreting SWANCC, which set forth a detailed procedure by which both agencies would consider whether a particular wetland was federally jurisdictional (USACE 2007).

In March 2014, the USACE and EPA issued a proposed rule that would modify the current regulatory definition of WOUS for CWA and other federal jurisdictional purposes. As proposed, the new rule generally was considered to expand federal wetland and waters jurisdiction relative to the SWANCC Guidance (EPA 2014). In January 2015, a scientific advisory panel for EPA issued a report that developed an even broader basis for determining nexus and connectivity (EPA 2015). For example, the EPA report found that geographically isolated wetlands completely surrounded by uplands—waters that would normally be considered nonjurisdictional under the SWANCC Guidance—may still have hydrologic (i.e., subsurface or flood period flows), chemical, and biological (i.e., animal or insect movement) connections to downstream waters.

On May 27, 2015, the USACE and EPA issued a final WOUS rule. The final rule establishes categories of waters that are (1) jurisdictional by rule, (2) jurisdictional if meeting the regulation's "significant nexus" standard, as determined on a case-by-case basis, and (3) excluded from the definition of WOUS that are jurisdictional by rule include traditional navigable waters, interstate

waters, territorial seas, impoundments of jurisdictional waters, tributaries that flow directly or indirectly to traditional navigable waters and have certain physical indicators, and waters that are adjacent to these categories, including wetlands, ponds, lakes, oxbows, impoundments and similar waters. Waters may meet the significant nexus test on a case-by-case basis if they are found to contribute significantly to the chemical, physical, or biological integrity of the nearest downstream traditional navigable water, interstate water or territorial seas, based on an evaluation of specified aquatic functions. Waters excluded from the definition of WOUS include waste treatment systems, prior converted cropland, certain ditches that have limited flow and are not within or do not relocate jurisdictional tributaries or do not flow directly or indirectly into traditional navigable waters, interstate waters or the territorial seas, and artificially irrigated and other features created on dry land.

Although the WOUS rule has been finalized, the potential extent of water and wetland connectivity sufficient to support federal jurisdiction remain uncertain. The new rule has not yet been applied by the agencies or interpreted by the courts in a manner that allows for consistent application by the USACE when performing jurisdictional delineations. In addition, the U.S. House of Representative passed a bill which would require the USACE and EPA to withdraw the WOUS rule and develop a new rule. Several public and private stakeholders have also threatened to sue the EPA and the outcome of any such litigation, if pursued, would add additional uncertainty regarding the definition of wetlands and waters subject to CWA Section 404 jurisdiction.

State

California Endangered Species Act (California State Fish and Game Code §2050 et seq.)

The CESA (California Fish and Game Code [CFGC], 2050 et seq.) is intended to conserve, protect, restore, and enhance any state-protected endangered or threatened species and its habitat and is implemented by the CDFW. CESA prohibits the unauthorized take of species listed as threatened or endangered under the act. Take under state law is defined as actions to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" a state-listed species (CFGC Section 86). The CFGC authorizes the take of endangered, threatened, or candidate species through an incidental take permit that may be issued by the CDFW under Section 2081. Alternatively, an incidental take of CESA-listed species may be authorized under Section 2080.1, which allows the CDFW to find that an incidental take permit issued under the federal ESA is consistent with CEQA state take permit requirements.

CDFW also maintains lists of SSC. An SSC designation is administrative in nature and does not create a formal legal status. CDFW has indicated that SSC designations are intended to: (1) focus attention on at-risk animals identified by state, local, and federal entities; land managers; planners; consulting biologists; and others; (2) stimulate species research; and (3) stimulate conservation measures that would avoid a CESA listing.

California State Fish and Game Code §1600-1616

Sections 1600 to 1616 of the CFGC states that it is unlawful to "substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake" without first notifying CDFW of that activity. If CDFW determines and informs the project proponent that the activity will not substantially adversely affect any existing fish or wildlife resources, the activity may be undertaken without further permitting. If CDFW determines that the proposed activity may substantially and adversely affect an existing fish or wildlife resource, a Lake or Streambed Alteration Agreement must be completed and approved by the CDFW, including reasonable measures necessary to protect the affected resources may be required prior to initiating the proposed activity (CFGC 1602).

State Waters (Water Code Section 13000 et seq.)

The Porter-Cologne Water Quality Control Act (Porter-Cologne) provides the State and Regional Boards with the authority to regulate discharges of waste to wetlands or other waters of the state. Section 13050(e) of the Water Code defines waters of the state to mean "any surface water or groundwater, including saline waters, within the boundaries of the state." Discharges of waste have been construed to include fill, any material resulting from human activity, or any other discharge that may directly or indirectly impact waters of the state. All WOUS in California are also waters of the state. Non-federal waters, including wetlands or waters that the USACE has delineated as isolated from federally regulated rivers or streams, are regulated by the State and Regional Boards under Porter-Cologne. State jurisdiction over waters of the state is broader in scope than federal jurisdiction of WOUS in California.

In general, the Porter Cologne Act requires that all parties proposing a discharge that could affect waters of the state file a report of waste discharge with the applicable regional board. The regional board may either issue waste discharge requirements (WDRs), including conditions and measures to protect waters of the state in a public hearing, or may waive the issuance of WDRs with or without additional discharge conditions. As discussed above, Section 4012 of the federal CWA requires state agencies certification that a proposed permit for the fill of a WOUS complies with state water quality objectives. In some instances, the state definition of a water may be larger in size and/or broader in scope than the definition used for federal CWA delineation purposes. Most regional boards utilize the 401 certification process to determine whether additional WDRs may be required for impacts to waters of the state that are not addressed by a proposed federal fill permit. Discharges to waters of the state that are not federally regulated require compliance with the Porter-Cologne discharge notice and WDR issuance process. Many regional boards have adopted criteria for the issuance of WDRs that are similar to federal CWA Section 404 permit requirements, including the need to demonstrate a project has been designed to avoid, minimize, and mitigate for unavoidable effects to waters of the state and would not result in a net loss of wetlands.

The State Board is considering the adoption of a Wetland and Riparian Area Protection Policy in three phases (State Board Resolution No. 2008-0026) in three phases. Phase 1, the "Wetland Area Protection and Dredge and Fill Permitting Policy," is currently under review by the Board and

includes a proposed wetland definition, delineation methods, an assessment framework for collecting and reporting aquatic resource information, and requirements applicable to discharges of dredged or fill material. A draft policy, draft regulation text, and CEQA analysis of the Phase 1 proposal remain pending (Cal/EPA 2015).

California State Fish and Game Code §§ 3503, 3503.5 and 3513 (Raptors and Migratory Birds)

Several provisions of the CFGC protect avian species, nests, and eggs. Section 3503 provides that it is unlawful "to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto." Section 3503.5 extends these statutory protections more specifically to raptors and birds of prey (Falconiformes or Strigiformes). The CDFW has not implemented incidental take permit programs for Sections 3503 or 3503.5. Section 3513 makes it unlawful to "possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act." As discussed above, apart from certain limited exceptions, the USFWS has not implemented an incidental take program for the MBTA.

Sections 3511, 4700, 5050, and 5515 of the CFGC prohibit the take or possession of certain birds, mammals, fish, and reptiles. These species are commonly referred to as "fully protected" under state law and state agencies are prohibited from permitting actions that would result in the incidental take of these species except under the auspices of an approved Natural Community Conservation Plan.

California Native Plant Protection Act of 1977; California Fish and Game Code §1900 et seq.

The Native Plant Protection Act of 1977 (CFGC 1900 et seq.) authorizes CDFW to designate rare and endangered native plants and provides specific protection measures for state listed species.

CEQA Guidelines Section 15380

CEQA Guidelines Section 15380(b) provides that species not listed on the federal or state list of protected species may be considered rare or endangered if the species can be shown to be "endangered" or "rare" within the meaning of the statute. To be "endangered" means that the species survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors. A species is "rare" when either: (1) although not presently threatened with extinction, the species exists in such small numbers throughout all or a significant portion of its range that it may become endangered if the environment worsens or (2) the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and not be considered "threatened" within the meaning of the ESA.

California Oak Protection Act §21083.4

Public Resources Code (PRC) § 21083.4 establishes state conservation standards for oak woodlands and requires the adoption of an oak woodland management plan, in any county where oak woodlands occur. Oak woodlands are defined as areas having a 10% or greater canopy cover of Quercus species with individual trees having a diameter at breast height (DBH) of 5 inches or more. PRC § 21083.4 also sets statewide minimum mitigation standards for significant impacts to oak woodland under CEQA. Kern County has not adopted a management plan for oak woodlands

Wildlife Protection and Oil Sump Regulations (Publication No. PRC01)

DOGGR has adopted regulations that protect wildlife from potential oil sump impacts related to petroleum and gas activities in California (PRC §§ 3780 through 3785). The regulations define an oil sump as "any open depression or basin in the ground, whether manmade or natural, which contains oil or a combination of oil and water" (PRC Section 3780). The regulations include the following requirements to protect wildlife:

Section 3780. As used in this chapter, an "oil sump" is any open depression or basin in the ground, whether manmade or natural, which contains oil or a combination of oil and water.

Section 3781. The Legislature hereby finds and declares that it is essential in order to protect the wildlife resources of California that all hazardous exposed oil sumps in this state be either screened or eliminated.

Section 3782. The Supervisor shall promulgate rules and regulations for the adequate screening of oil sumps to protect wildlife and shall order the closure of any oil and gas production operation maintaining an exposed or inadequately screened oil sump in violation of such rules and regulations.

Section 3783. Whenever the Supervisor receives notification from the Department of Fish and Game pursuant to subdivision (a) of Section 1016 of the Fish and Game Code that an oil sump is hazardous to wildlife, he shall forthwith given written notice of such hazardous condition to the owner, lessee, operator, or person responsible for the existence of the condition and set forth the hazardous conditions as specified by the Department of Fish and Game. The owner, lessee, operator, or person responsible shall, within 30 days from the date of such notification, or such longer period as may be mutually agreed upon by the Supervisor, the Department of Fish and Game, and the owner, lessee, operator, or person responsible, clean up or abate the condition to the satisfaction of the Supervisor and the Department of Fish and Game. If the owner, lessee, operator, or person responsible does not clean up or abate the condition to the satisfaction of the Supervisor and the Department of Fish and Game within the required period of time, the Supervisor shall forthwith order the closure of the oil and gas production operation maintaining the oil sump.

Section 3784. Whenever the Supervisor receives notification from the Department of Fish and Game pursuant to subdivision (b) of Section 1016 of the Fish and Game Code that an oil sump constitutes an immediate and grave danger to wildlife, he shall forthwith give written notice of

such immediately dangerous condition to the owner, lessee, operator, or person responsible for the existence of the condition and set forth the immediately dangerous condition as specified by the Department of Fish and Game. The owner, lessee, operator, or person responsible shall, within 10 days from the date of such notification, or such longer period as may be mutually agreed upon pursuant to Section 3784.5 by the Supervisor, the Department of Fish and Game, and the owner, lessee, operator, or person responsible, clean up or abate the condition to the satisfaction of the Supervisor and the Department of Fish and Game. If the owner, lessee, operator, or person responsible does not clean up or abate the condition to the satisfaction of the Supervisor and the Department of Fish and Game within the required period of time, the Supervisor shall forthwith order the closure of the oil and gas production operation maintaining the oil sump.

Section 3784.5. Extension of the 10-day period in Section 3784 may be granted only in cases where the Supervisor and the Department of Fish and Game have determined that screening or elimination of the oil sump cannot be reasonably accomplished within 10 days.

Section 3785. The Supervisor and the Department of Fish and Game shall develop a joint program to coordinate their respective responsibilities under this chapter and Section 1016 of the Fish and Game Code to protect the wildlife resources of the state from the hazards of exposed oil sumps.

Natural Community Planning Act (Fish and Game Code 2800 et seq.)

In 1991 California enacted the Natural Community Conservation Planning Act (CFGC Section 2800 et seq.) to authorize the creation and implementation of natural community conservation plans (NCCPs) to conserve natural communities at the ecosystem level while accommodating compatible land use. The act was revised in 2003 and has been subsequently amended. An MCPC is intended to function much like a federal HCP and provide for the long-term conservation of wildlife and plant communities in regional locations in manner that also allows for economic development and growth. Section 2805(e) allows the incidental take of fully protected species that are covered under an approved MCPC.

Regional and Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element, the Noise Element, and the Energy Element of the KCGP include goals, policies, and implementation measures related to biological resources that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.3. Physical and Environmental Constraints

Policies

Policy 9. Construction of structures that impede water flow in a primary floodplain will be discouraged.

Policy 11. Protect and maintain watershed integrity within Kern County.

Implementation Measures

Implementation Measure I. Designated flood channels and water courses, such as creeks, gullies, and riverbeds, will be preserved as resource management areas or in the case of urban areas, as linear parks whenever practical.

1.9. Resource

Policies

Policy 11. Minimize the alteration of natural drainage areas. Require development plans to include necessary mitigation to stabilize runoff and silt deposition through utilization of grading and flood protection ordinances.

Policy 20. Areas along rivers and streams will be conserved where feasible to enhance drainage, flood control, recreational, and other beneficial uses while acknowledging existing land use patterns.

1.10. General Provisions

1.10.5. Threatened and Endangered Species

Policies

Policy 27. Threatened or endangered plant and wildlife species should be protected in accordance with State and federal laws.

Policy 28. County should work closely with State and federal agencies to assure that discretionary projects avoid or minimize impacts to fish, wildlife, and botanical resources.

Policy 29. The County will seek cooperative efforts with local, State, and federal agencies to protect listed threatened and endangered plant and wildlife species through the use of conservation plans and other methods promoting management and conservation of habitat lands.

Policy 31. Under the provisions of the California Environmental Quality Act (CEQA), the County, as lead agency, will solicit comments from the California Department of Fish and Game

and the USFWS when an environmental document (Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report) is prepared.

Policy 32. Riparian areas will be managed in accordance with United States Army Corps of Engineers, and the California Department of Fish and Game rules and regulations to enhance the drainage, flood control, biological, recreational, and other beneficial uses while acknowledging existing land use patterns.

Implementation Measures

Implementation Measure Q. Discretionary projects shall consider effects to biological resources as required by the California Environmental Quality Act.

Implementation Measure R. Consult and consider the comments from responsible and trustee wildlife agencies when reviewing a discretionary project subject to the California Environmental Quality Act.

Implementation Measure S. Pursue the development and implementation of conservation programs with State and federal wildlife agencies for property owners desiring streamlined endangered species mitigation programs.

1.10.6. Surface Water and Groundwater

Policies

Policy 44. Discretionary projects shall analyze watershed impacts and mitigate for construction-related and urban pollutants, as well as alterations of flow patterns and introduction of impervious surfaces as required by the California Environmental Quality Act (CEQA), to prevent the degradation of the watershed to the extent practical.

1.10.7. Light and Glare

Policies

Policy 47. Ensure that light and glare from discretionary new development projects are minimized in rural as well as urban areas

Policy 48. Encourage the use of low-glare lighting to minimize nighttime glare effects on neighboring properties.

Implementation Measures

Implementation Measure AA. The County shall utilize CEQA Guidelines and the provisions of the Zoning Ordinance to minimize the impacts of light and glare on adjacent properties and in rural undeveloped areas.

1.10.10. Oak Tree Conservation

Policies

Policy 65. Oak woodlands and large oak trees shall be protected where possible and incorporated into project developments.

Policy 66. Promote the conservation of oak tree woodlands for their environmental value and scenic beauty.

Implementation Measures

Implementation Measure KK. The following applies to discretionary development projects (General Plan Amendment, zone change, conditional use permit, tract maps, parcel maps, precise development plan) that contains oak woodlands, which are defined as development parcels having canopy cover by oak trees of at least ten percent (10%), as determined from base line aerial photography or by site survey performed by a licensed or certified arborist or botanist. If this study is used in an Environmental Impact Report, then a Registered Professional Forester (RPF) shall perform the necessary analysis.

a. Development parcels containing oak woodlands are subject to a minimum canopy coverage retention standard of thirty percent (30%). The consultant shall include recommendations regarding thinning and diseased tree removal in conjunction with the discretionary project.

b. Use of aerial photography and a dot grid system shall be considered adequate in determining the required canopy coverage standard.

c. Adjustments below thirty percent (30%) minimum canopy standard may be made based on a report to assess the management of oak woodlands.

d. Discretionary development, within areas designated as meeting the minimum canopy standard, shall avoid the area beneath and within the trees unaltered dripline unless approved by a licensed or certified arborist or botanist.

Implementation Measure LL. The following applies to development of parcels having oak tree canopy cover of less than ten percent (10%), but containing individual oak trees equal to or greater than a 12-inch diameter trunk at 4.5 feet breast height.

a. Such trees shall be identified on plot plans.

b. Discretionary development shall avoid the area beneath and within the trees unaltered drip line unless approved by a licensed or certified arborist or botanist.

c. Specified tree removal related to the discretionary action may be granted by the decision making body upon showing that a hardship exists based on substantial evidence in the record.

Chapter 3. Noise Element

3.2. Noise Sensitive Areas

Policies

Policy 3. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise.

Policy 4. Utilize good land use planning principles to reduce conflicts related to noise emissions.

Chapter 5. Energy Element

5.3. Petroleum Resources and Development

5.3.6. Environmental Impacts of Petroleum Development

Policies

Policy 6. The County should work closely with State and federal agencies to avoid or minimize direct impacts to threatened and endangered species.

Implementation Measures

Implementation Measure B. The County will continue to participate in programs, such as the proposed Kern County Valley Floor Habitat Conservation Plan program, which are intended to mitigate impacts of development on threatened or endangered species, including seeking State and federal funding for endangered species protection programs.

Implementation Measure D. Energy resource industries should participate in the Kern County Valley Floor Habitat Conservation Plan to mitigate impacts to threatened and endangered species.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to biological resources.

Chapter V. Conservation Element

A. Biological Resources

Goals

Goal 1. Conserve and enhance Bakersfield's biological resources in a manner which facilitates orderly development and reflects the sensitivities and constraints of these resources.

Goal 2. To conserve and enhance habitat areas for designated "sensitive" animal and plant species.

Policies

Policy 1. Direct development away from "sensitive biological resource" areas, unless effective mitigation measures can be implemented (1·1, f-3, 1-4).

Policy 2. Preserve areas of riparian vegetation and wildlife habitat within floodways along rivers and streams, in accordance with the Kern River Plan Element and channel maintenance programs designed to maintain flood flow discharge capacity (1-4).

Policy 3. Discourage, where appropriate, the use of off-road vehicles to protect designated sensitive biological and natural resources (l-2).

Policy 4. Determine the feasibility of enhancing sensitive biological habitat and establishing additional wildlife habitat in the Project Boundary with State and/or Federal assistance (1-3).

Policy 5. Determine the locations and extent of suitable habitat areas required for the effective conservation management of designated "sensitive" plant and animal species (1-3).

Implementation Measures

Implementation Measure 1. When considering discretionary development proposals, consult available biological resource data covering the area. Determine the potential impacts and necessary mitigation measures for identified biological resources, as requiring in the California Environmental Quality Act. Regularly consult with responsible resource agencies.

Implementation Measure 3. Preserve habitat and avoid "take" of protected species as required in the Metropolitan Bakersfield Habitat Conservation Plan.

Chapter VI. Open Space Element

Goals

Goal 3. Locate and site development to minimize the disruption of open space areas.

Policies

Policy 1. Promote the establishment, maintenance and protection of the planning area's open space resources, including the following:

a) Conservation of natural resources (refer to Chapter II-Land Use, Chapter V-Conservation, and Chapter XII Kern River Plan Element).

- Kern River corridor
- Management of hillsides

Policy 5. Development location and siting should be sensitive to its relationship to the Kern River (I-3).

Policy 9. Encourage depleted resource extraction sites to be restored as alternative open space or developed with uses compatible with those adjacent (I-5).

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern River Plan Element

The Kern River Plan Element governs land use within the Kern River Planning Area. The Element was prepared as a joint effort by the City of Bakersfield and Kern County. The following Kern River Plan Element policies are applicable to the proposed Project with respect to biological resources for all unincorporated county lands within the Kern River Planning Area:

Chapter III. Issues, Goals, and Basic Plan Policies

3.2. Open Space Versus Development

Policy 11. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, areas designated as A.4 (Mineral and Petroleum) and electrical power lines to oil wells, water wells, and water control devises in areas designated as 8.5 (Resource Management) unless otherwise required by law, and at River crossings, or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

3.3. Riparian Vegetation and Wildlife Habitat

Policies

Policy 2. All development proposals shall be evaluated by a competent biologist to identify any significant biological areas necessary for protection. Cost incurred under this procedure shall be borne by the applicant.

Policy 3. Native vegetation shall be protected by minimizing the introduction of dominant nonnative plant species. All development proposals, except intensive agriculture, shall include a landscape plan to identify vegetation to be used on the site and the method of long-term maintenance of landscaped areas. The submitted landscape plan shall be used to verify the acceptability of vegetation for use along the River. Those plants not found acceptable shall not be used.

Policy 4. Existing significant plant specimens and stands of riparian vegetation shall be protected to the greatest extent feasible where channel maintenance is not affected.

Policy 5. Riparian vegetation and wildlife habitat shall be protected within the area of primary floodway to the degree that the floodway will not be obstructed or propagate debris.

Policy 6. The placement of structures and other related accessory uses shall respect wildlife corridors and shall not obstruct nor hinder the movement or migration of wildlife.

3.4. Floodplain Management

Policies

Policy 9. Oil and mineral exploration and production shall be allowed within the secondary floodway, provided that adverse effects on riparian vegetation and wildlife habitat are minimized. Appurtenant facilities, such as tank farms and steam generators, shall be located outside any floodway; except that they may be allowed within the 8.4/2.5 (Mineral and Petroleum/Secondary Floodway) upon showing by the operator that no other location is reasonably available for then, the proposed location and extent of construction is necessary for the operation of wells in the immediate vicinity, and the intent of this plan for the secondary floodway is followed.

3.6. Mineral and Petroleum

Goals

Goal. To provide for the continued production of petroleum resources and to ensure that future exploration activities can take place, while ensuring that other open space values in the River area are reasonably protected. Utilize sand and gravel resources of the River in such a way as to ensure that floodway, groundwater recharge, and wildlife habitat values are protected.

Policies

Policy 1. Sand and gravel removal shall be done in such a manner as not to degrade, or otherwise adversely affect, the natural and scenic qualities of the Kern River, riparian vegetation, or wildlife habitat except as is necessary or appropriate to maintain the required channel capacity for flood control in the primary floodway.

Policy 3. Petroleum extraction zone overlays and drilling island delineation shall be established in areas designated for resource uses for the purpose of protecting natural vegetation and wildlife. Brush clearing, moving of vegetation, and similar activities shall be permitted only to the extent required for those activities and a reclamation plan prepared.

Policy 4. Noise abatement measures shall be required of all resource management activities which would adversely affect adjacent land uses or wildlife habitat.

Chapter IV. Map Provisions and Policies

The intent of this plan with regard to the Primary and Secondary Floodways of the Kern River is that:

- No development or physical improvements for uses in the Primary Floodway which would restrict flows, interfere with groundwater recharge or increase the rise in water surface during high flows of the Kern River, or displace the primary floodway will be permitted.

- Limited development, with an emphasis on preserving open space within the area of the Secondary Floodway, with recognition of the potential flood hazard that exists therein, may be permitted.

4.8. Industrial

Policies

Policy 6. Industrial areas adjacent to the Kern River primary or secondary floodway should be buffered by landscaping or vegetation to provide the least possible conflict with open space values of the River.

Chapter V. Implementation Policies

B. Open Space and Development

Implementation Policies

Implementation Policy 2. Any new non-open space development, including projects by public agencies, shall not occur without prior City or County approval of a "Development Plan." The "Development Plan" shall be reviewed for completeness and consistency with the following guidelines:

a. Elevation drawings of all proposed structures and signs.

b. Landscaping plan which provides for screening of obnoxious uses and respects existing views of the Kern River channel.

c. Grading and revegetation plan.

d. Plot plan or recent aerial photograph depicting existing uses and natural vegetation cover.

e. A biota survey and analysis of effects which development would impose on any significant identified biota.

f. A certified delineation of the primary and secondary floodways, if applicable to the site, depicting both predevelopment conditions and future development conditions.

g. Other standard zoning and subdivision ordinance requirements in force at the time of application.

Implementation Policy 7. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, 8.4 areas (Mineral and Petroleum), and at River crossings or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

C. Riparian Vegetation

Implementation Policies

Implementation Policy 1. The City and County shall develop a master list of plant species for criteria to approve "Development Plans." This list shall be considered for incorporation into this plan by General Plan Amendment. Revegetation or landscaping with native or compatible shrubs and trees shall be required as part of all public and private projects. Areas of unique habitat value, such as the Mesquite-Saltbush Association in the vicinity of Enos lane, shall be preserved in accordance with the City's approved plan for use of the 2,800-acre recharge area and River channel maintenance.

Implementation Policy 2. Prior to any development within the Kern River Plan boundaries, including residential, commercial, industrial, recreational, water recharge, channel improvement, and resource recovery projects, a landscaping plan shall be submitted to the respective City or County Planning Department for review and approval.

Implementation Policy 3. For all new development in residentially, commercially, and industrially zoned properties within the plan boundaries, the River setback area shall be either landscaped or revegetated. Except as might be required by the City or County Fire Department, no clearing of shrubs or tree cutting will be allowed unless otherwise provided for by this plan.

F. Mineral and Petroleum Extraction

Implementation Policies

Implementation Policy 1. The City and County shall revise, within two years from adoption of this plan, mineral and petroleum extraction regulations and provisions of their respective floodplain zoning ordinances consistent with all plan policies and incorporate the following features:

b. Restrictions on the removal of riparian vegetation.

Kern County Zoning Ordinance (Title 19 of the Ordinance Code of Kern County)

Chapter 19.98 Oil and Gas Production

The purpose of this chapter is to promote the economic recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety by establishing reasonable limitations, safeguards, and controls on exploration, drilling, and production of hydrocarbon resources. The procedures and standards contained in this chapter shall apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County.

Section 19.98.050(I): Whenever oil or gas is produced into and shipped from tanks located on the premises, such tanks, whenever located within five hundred (500) feet of any dwelling or commercial building, shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping or shall be fenced in such a manner as to, insofar as practicable, screen such tanks from public view. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

Section 19.98.050(K): Pumping wells shall be operated by electric motors or muffled internal combustion engines.

Section 19.98.050(L): The height of all pumping units shall not exceed thirty-five (35) feet and shall be painted and kept in neat condition.

Section 19.98.050(N): After production begins and a pump is installed on the wellhead, a fence at least six (6) feet in height shall be installed around the pump site or drilling island for public safety. This fence shall be constructed of chain link with wood or metal slats or other screening fence as may be approved by the Planning Director. This fencing and screening requirement shall apply only to those pump sites located within five hundred (500) feet of any dwelling. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

Section 19.98.050(O): All required federal, State, and County rules and regulations shall be complied with at all times.

Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area

Oil and gas exploration and production activities could take place in areas within the boundaries of an approved HCP and/or Natural Community Conservation Plan (NCCP). As discussed in the regulatory setting below, HCPs are approved by the USFWS in conjunction with providing incidental take permit coverage for listed species and to also foster the conservation of other covered species. NCCPs are approved by the CDFW and are intended to function in a manner similar to the federal a HCP for state listed and other covered species. The CDFW may also issue incidental take permits for state covered species that are based on and coordinated with an approved federal HCP under section 2081(b) of the CESA. HCPs and NCCPs typically have permits terms ranging from 30 to 50 years.

The following sections summarize proposed and approved and HCPs for oil and gas activity, including oil and gas exploration, other HCPs within the Project Area, and approved regional plans or permits that address conservation and incidental take for oil and gas activities within the Project Area. The locations of HCPs and NCCPs within the Project Area are shown in figure 4.4-12

Draft Valley Floor HCP

The VFHCP encompasses 3,110 square miles and generally includes most of the San Joaquin Valley Floor portion of Kern County up to an elevation of 2,000 feet. The 2,000-foot elevation line was selected as the elevation limit for the VFHCP because (1) this border would, based on the professional judgment of resource agency personnel (including USFWS, CDFG, and BLM) encompass most locations in the Kern County valley floor likely to be subject to potential take of threatened and endangered species during the 30-year term of the proposed program; and (2) the 2,000-foot level approximates the elevation at which the species compositions of valley floor flora and fauna transition to foothill species. The HCP is intended to provide federal and state protected species incidental take authorization for covered activities throughout the valley floor area over a 30-year period.

The VFHCP planning process was initiated in 1989 by an interagency Memorandum of Understanding (MOU) among the USFWS, CDFW, BLM, CEC, DOGGR, and Kern County. The goals of the MOU include the development of (1) an HCP for the San Joaquin Valley Floor portion of Kern County; (2) a cooperative program among local, state, and federal agencies with endangered species permit authority in the valley floor portion of Kern County; and (3) a program to assure long-term species conservation and the continued economic growth of Kern County.

Some portions of the Kern County Valley Floor area are not covered by the VFHCP Program Area, including the Coles Levee Ecosystem Preserve that is part of the former Arco Western Energy (now Aera Energy) oil and gas HCP, the Freeport-McMoRan Oil & Gas (formerly Nuevo-Torch) HCP, and the CRC (formerly Occidental) Elk Hills and BLM-managed lands that were previously part of the Naval Petroleum Reserves. Other individual HCPs, including the Kern County Waste Management Department HCP, and the Kern Water Bank HCP, are also not

covered by the VFHCP. The MBHCP area footprint would be included in the VFHCP only for: (1) oil and gas production activities; (2) activities of water districts; and (3) activities which are not covered by the current MBHCP.

Tables 4.4-66 and 4.4-67 summarize the 14 plant and 11 animal species that would be covered by the VFHCP.

As shown in Figure 4.4-13, the VFHCP has attempted to develop a conservation program that characterizes covered lands and proposed compensatory mitigation within the Kern County valley floor area based on presumed habitat values. The proposed classifications include: (1) Red Zones (which contain the highest valued conservation habitat); (2) Green Zones (which contain habitat areas of moderate conservation value); and (3) White Zones (which have limited conservation value, primarily due to existing intensive land uses). Various overlays, including oil and gas zones, have also been proposed in the draft versions of the VFHCP.

The VFHCP habitat zone approach has been referenced in several proposed conservation planning and state and federal incidental take permit applications. The VFHCP has not yet been approved by the CDFW, USFWS, Kern County, or other applicable local, state, and federal agencies.

Chevron North American Exploration and Production Lokern Habitat Conservation Plan (LHCP)

Chevron has prepared an HCP and applied to the USFWS and CDFW for state and/or federally protected species incidental take authorization under Section 10(a)(1)(B) of the federal ESA and

Section 2081(b) of the CFGC of the CESA over a 50-year permit term. The species that would be covered by the permits are listed in Table 4.4-68.

As shown in Figure 4.4-14, the LHCP would include certain preserves (Chevron Lokern Lands), land adjacent to and within the Chevron Lokern Lands (Lokern Contiguous Area) and four existing fields in which Chevron currently conducts oil and gas operations, the Lost Hills, Cymric-McKittrick, Midway-Sunset and the Kern River oil fields.

The Chevron Lokern Lands consist of 13,333 acres, including 13,090 acres of currently undisturbed, high quality habitat, located north of the existing Elk Hills oil field and east of the existing Cymric-McKittrick oil fields and would be used primarily for conservation purposes. Chevron proposes to limit development in the Chevron Lokern Lands to 10% of the existing undisturbed habitat, or 1,309 acres. In addition, no more than 25% of any single section (or proportionately less if Chevron owns only part of a section) would be subject to impacts in the Chevron Lokern Lands. As a result, 11,781 of the Chevron Lokern Lands would be reserved for conservation and mitigation purposes, including mitigation for Chevron oil and gas activities within the Chevron Lokern Lands, the Lokern Contiguous Area, and the four oil fields covered by the HCP as a part of its permit area.

The Lokern Contiguous Area includes a checkerboard pattern of 14,522 acres adjacent to, within and extending to the northeast of Chevron Lokern Lands that are not under Chevron's control. The HCP would allow for Chevron to impact up to 150 acres of the Lokern Contiguous Area to support conservation and management activities on Chevron's Lokern Lands and in other preserve areas, and to connect oil and gas infrastructure necessary to service Chevron activities covered by the HCP.

The four existing oil fields in which Chevron operates and that would be covered by the HCP include the 59,118 acre Lost Hills oil field in the northern portion of the western project Subarea, the 34,918 acre Cymric-McKittrick and the 88,214 acre Midway-Sunset oil fields extending along the western border of the western project Subarea, and the 22,363 acre Kern River Field in the eastern project Subarea. The four oil fields include a total of 204,613 acres.

The Chevron Lokern Lands, Lokern Contiguous Area, and the four oilfields included in the HCP total 232,473 acres. The HCP would cover Chevron's construction, operation and closure of up to 12,000 new wells and 10,000 abandoned wells over the 50-year permit term.

The HCP would allow Chevron to generate conservation credits by using conversation easements to permanently preserve and providing funding for the management of Chevron Lokern Lands over the permit term. Chevron would permanently protect 1,500 acres of the Chevron Lokern Lands at the time that the HCP becomes effective. The credits created by preservation within the Chevron Lokern Lands would be used to mitigate for covered activity impacts in Chevron Lokern Lands, Lokern Contiguous Area, and the four oil fields included in the HCP. Chevron also proposes to allow for the use of conservation credits by Chevron or by sale to third parties to mitigate for impacts within an 2,261,715 acre (3,534 square mile) credit area that includes the San Joaquin Valley floor up to 2,000-foot elevation within Kern County. The state and federal incidental take permits that would be issued to Chevron by the USFWS and CDFW would not provide coverage for third party or Chevron activities outside of the Chevron Lokern Lands, Lokern Contiguous Area, and the four oil fields included in the HCP, and the use of credits generated by preservation within the Chevron Lokern Lands would be subject to separate approval/permitting processes as necessary.

The activities for which take coverage would be provided under the proposed HCP and state 2081(a) permits include existing and potential future oil and gas drilling and operational activities

described in Chapter 3, Project Description (Section 3.5, Potential Future Oil and Gas Development Scenario) together with the mitigation measures identified in Section 4.4.4, Impacts and Mitigation Measures. Habitat management and site restoration, reclamation and re-vegetation described in the Best Management Practices or required by mitigation measures may include, among other activities, scientific research to facilitate implementation of mitigation measures (to avoid and minimize take) and for monitoring; and continuation of livestock grazing on areas historically grazed or additional areas for management of non-native vegetation. There also may be incidental site visits for educational purposes, including school tours, VIP tours, regulatory agency tours, and other tours benefiting the public, with controlled ingress and egress on existing roads and supervision by Chevron.

The project EIR for the LHCP includes and analyzes impacts related to all proposed LHCP covered activities except activities, such as the use of conservation credits in other counties, that would occur outside of the Project Area.

California Resources Corporation Elk Hills Habitat Conservation Plan (EHHCP)

Background

The federal government established the EHOF in 1912 for national defense purposes as part of the Naval Petroleum Reserves (NPR). The EHOF was designated as NPR-1 and was largely maintained in reserve shut-in status until 1976. As a result of oil shortages in the early 1970's, Congress passed the Naval Petroleum Reserves Production Act in 1976, directing the Department of Energy (USDOE) to operate the EHOF at the "maximum efficient rate." EHOF oil and gas production activities consistent with the Naval Petroleum Reserves Production Act commenced at that time and continued until 1998. In the National Defense Authorization Act for Fiscal Year 1996, Congress directed the USDOE to sell the federal government's interests in NPR-1. The sale of the government's interests in EHOF was successfully concluded in 1998 and the EHOF was operated by Occidental of Elk Hills, Incorporated, until another corporation was spun off and created in 2014. This entity is known as California Resources Corporation - Elk Hills (CRC).

CRC proposes to continue its oil and gas operations in and near the EHOF, and to modify those operations by extending the anticipated duration of oil and gas operations, increasing the impacted acreage, and modifying certain other facilities and activities. CRC's continued and modified operations require additional take authorization under Section 2081 of CESA. The proposed incidental take permit (ITP) sought by the applicant under CESA Section 2081(b) would supersede an existing CESA Memorandum of Understanding (MOU) that was issued to the purchaser of the EHOF.

Requested ITP

CRC is applying for an ITP from CDFW, pursuant to Section 2081(b) of the Fish and CFGC. The Section 2081 application, which includes an associated HCP that supports the proposed conservation and management program for the proposed EHOF, was deemed complete by CDFW on March 3, 2014. The area covered by the proposed EHOF ITP encompasses the EHOF which is approximately 47,884 acres; facility rights-of-way (ROWs) located outside of the EHOF (refer to

Figures 4.4-16 and 4.4-17); and any Conservation Lands located within a Target Acquisition Area inside the 2-mile buffer and within a second Target Acquisition Area located outside the 2-mile buffer as identified on Figure 4.4-18 that are dedicated pursuant to the proposed EHOF and managed for the mitigation of impacts (the EHOF ITP Covered Lands). The proposed EHOF ITP Covered Lands includes projected oil and gas operations for 50 years; accordingly the requested ITP would have a term of 50 years and would authorize incidental take of certain State listed species (See Table 4.4-69) during the course of otherwise lawful activities described further below.

Table 4.4-69: Draft Elk Hills Habitat Conservation Plan Covered Species

Proposed Covered Activities

The proposed EHOF ITP would cover all existing and proposed facilities and activities within the EHOF ITP Covered Lands for a period of 50 years related to the continued exploration, development, production, recovery and processing of oil and gas reserves; on-site and off-site (to the extent that a ROW located within the EHOF extends off the EHOF into the 2-mile buffer) operation and maintenance of associated facilities, implementation of the conservation program described herein, and other miscellaneous proposed activities and uses described below.

Within the EHOF itself, the activities for which take coverage would be provided under the proposed ITP include existing and potential future oil and gas drilling and operational activities described in Chapter 3, Project Description (Section 3.5, Potential Future Oil and Gas Development Scenario) together with the mitigation measures identified in Section 4.4.4, Impacts and Mitigation Measures. Habitat management and site restoration, reclamation and re-vegetation described in the Best Management Practices or required by mitigation measures may include, among other

activities, scientific research to facilitate implementation of mitigation measures (to avoid and minimize take) and for monitoring; and continuation of livestock grazing on areas historically grazed or additional areas for management of non-native vegetation. There also may be incidental site visits for educational purposes, including regulatory agency tours, school tours, VIP tours, and other tours benefiting the public, with controlled ingress and egress on existing roads and supervision by CRC.

Implementation of a Conservation Program, including all activities associated with the implementation of the proposed ITP, will be included in a Management Plan for CDFW approval. The Management Plan would be property specific and any necessary activities would be developed and implemented based on existing conditions of each specific area. Such Management Plans are standard requirements of ITPs and must be developed and approved as part of the ITP conditions within a specified time period following issuance of an ITP. The purpose of the Management Plan is to ensure the Conservations Lands are managed, monitored and maintained in perpetuity. The Management Plan is also intended to assist in minimizing and fully mitigating the impacts of the authorized take. The Management Plan is a binding and enforceable instrument, implemented by the CDFW. The CDFW's approval of a Management Plan relies on meeting the fully mitigated standard. A Land Manager will be selected to manage and monitor the Conservation Lands in perpetuity to preserve its habitat and conservation values in accordance with the Conservation Easement and the Management Plan. The Land Manager will be responsible for providing annual reports to the CDFW that will include but not be limited to a discussion of the management tasks and monitoring activities that occurred during the specific monitoring year and the funds expended to cover those activities. The Management Plan will also document the status of the Covered Species and other species of concern and describe the status of the Conservation Lands. Components of this Management Plan would include, but not be limited to all activities associated with the implementation of the proposed ITP, including take avoidance and minimization activities (including salvage of Covered Species within Covered Lands), establishment and management of preserved habitat areas (including an endowment fund to cover short and long term management costs, fencing to prevent trespass, signage and trash removal), vegetation manipulation and enhancement (for example, ground disturbance, grazing, mowing or burning), monitoring (such as spotlighting surveys, walking transects, scent stations, small mammal trapping), maintenance of Conservation Lands infrastructure such as fences, gates, signs and access roads, habitat restoration, related vehicular access, and all activities associated with adaptive management and responses to changed or unforeseen circumstances.

Monitoring shall also be conducted to assess condition of fences, gates, and signage and to identify sources of illegal trash disposal. Fencing, gates, and signage will be repaired or replaced as necessary throughout the year. Trash will be collected and removed as identified to prevent attractive nuisances.

Revegetation opportunities for future habitat reclamation exist in areas on the EHOF where land has been disturbed as a result of prior construction and development, travel, or any other action which caused plant cover destruction and the disturbed area is no longer required to support ongoing operations. Inactive well pads and tank setting locations, ROWs, and dirt roads can all

offer opportunities for habitat reclamation. Many studies have been conducted in the area and it has been found that natural revegetation or reclamation with subsequent monitoring is the best way to restore smaller disturbed areas to their natural state. When comparing natural revegetation with other habitat reclamation projects the results are almost identical on a statistical recovery of vascular plant cover (EG&G Energy Measurements Inc. 1995; D. C. Anderson and B. L. Cypher, 1995, unpublished data).

The habitat reclamation program at the EHOF on smaller sites (less than three acres), therefore, consists of site cleanup, slope re-contouring and ripping of compacted sites/heavily disturbed sites followed by replacement of any salvaged topsoil and seed bank, scarifying the area to create seed traps and microhabitat, along with soil stabilization and erosion control measures. Smaller areas can be naturally reclaimed from windblown seed and infill from surrounding natural habitat and/or with the seed bank from re-spreading stockpiled topsoil. When larger (greater than three acres) areas of disturbances are to be reclaimed, enhanced reclamation measures such as artificial seeding is recommended as the size is too large to ensure that windblown seed sources and infill would be adequate to ensure reclamation success. With the use of monitoring practices, natural habitat reclamation or revegetation in disturbed areas has shown successful results to restore land to its natural state.

Dirt roads no longer needed to support ongoing operations can offer excellent opportunities for habitat reclamation. Road use can be limited with the use of locked gates and exclusion fencing. Where appropriate, travel on roads no longer needed is prevented with the use of earthen berms or barriers to prevent access. Signage can also be used to identify closed roads/reclaimed areas. Road reclamation can include ripping to reduce compaction and provide seed traps and microhabitats so as to help facilitate natural habitat reclamation.

Within the 2-mile buffer and the Two Target Acquisition Areas, Covered Activities would not include the full range of oil and gas-related facilities and activities described in Chapter 3, Project Description (Section 3.5, Potential Future Oil and Gas Development Scenario). Rather, in these areas, Covered Activities would consist of the following:

1. Operations and Maintenance of Facilities Associated with Existing Facility (ROWs). These activities include the operation, maintenance, repair, construction, reconstruction, replacement, and abandonment of transmission lines and pipelines located within the 2-mile buffer. This includes the maintenance of various powerlines or hydrostatic testing and cleaning of pipelines.

2. Limited Construction of Linear Facilities. From time to time, additional pipelines and transmission lines may have to be constructed within the 2-mile buffer in order to maintain EHOF operations and accommodate product sales, processing and distribution demands. The covered linear projects would be located within an area limited to a width of 200 feet of the centerline (total width of 400 feet) of existing ROWs. Each individual linear project would be limited to no more than a construction ROW width of 100-feet and length of 1-mile on a not to exceed basis per section (approximately 12-acres of disturbance per section). Note that if new disturbance occurs during this activity, it would be included in

the proposed Project's 4,000 acres of net permanent disturbance and 3,000 acres of temporary disturbance;

3. This also includes the installation, operation and maintenance of limited new facility ROWs within the 2-mile buffer located outside 200 feet of the centerline of existing ROWs. Any new authorized activity would be limited to no more than 12 sections with a maximum allowable disturbance (temporary and/or permanent) of 12 acres per section for a total cumulative disturbance amount of 144 acres. Lands acquired for this purpose would be subject to specific performance criteria as discussed. Note that any disturbance occurring from this activity would be included in the proposed Project's 4,000 acres of net permanent disturbance and 3,000 acres of total temporary disturbance;

4. Limited Construction of Linear Facilities within Conservation Lands Located within the 2-Mile Buffer. Authorized activities within Conservation Lands located within the 2-mile buffer include the construction of linear facilities (e.g., pipelines and transmission lines) not to exceed 12 acres per section. Note that if new disturbance occurs during this activity, it would be included in the proposed Project's 4,000 acres of net permanent disturbance and 3,000 acres of total temporary disturbance;

5. Implementation of Conservation Program Activities. Implementation of the Management Plan described above. Management of the Initial Conservation Lands and any potential conservation lands includes, but is not limited to, a) annual monitoring of Covered Species, b) annual reporting of findings to agencies, and c) habitat enhancements to increase sustainability of Covered Species. Habitat enhancements will likely include: 1) appropriate fencing to prohibit trespassing, 2) trash removal and signage, 3) improve vegetation appropriate for Covered Species (for example, enhance saltbush, improve grasslands through limited grazing, etc.), 4) limit road use and implement the reclamation of roads no longer needed for operations, and 5) reseeding areas with shrubs.

6. Geophysical Surveys to determine the extent of potential natural gas and oil reserves present within the EHOF formations (not within the 2-mile buffer), and whether such resources warrant development of additional production. Note that geophysical surveys will be restricted to the vibroseis method (not the shothole method) within any Conservation Lands.

7. Emergency Response and Environmental Remediation of spills including all activities necessary to protect public health, safety, the environment or property during an emergency, including responses to and remediation of spills or releases of petroleum, produced water, or hazardous substances; and actions required in response to Acts of God such as flood, fire or seismic activity.

8. Actions Required in Response to Acts of God such as Flood, Fire or Seismic Activity Natural disasters such as fires, floods, or earthquakes can create extremely dangerous conditions that require resources and actions from agency emergency response personnel to protect public health, safety and the environment. Responses to such acts would be

managed and directed by agency emergency responders and EHOF internal emergency response resources would be available in a support role to the agencies if assistance is required. The range of possible response actions to specific events is quite broad.

9. Regulatory Agency Requirements including all activities required by federal, state, regional and local regulatory agencies. In general these requirements include but are not limited to those required by the Department of Transportation and DOGGR for pipeline inspections and maintenance.

Except as described above in items 1-8, any disturbance of Covered Lands outside of the EHOF and within the 2-mile buffer and the Two Target Acquisition Areas would not be a Covered Activity. As a result, if CRC elects in the future to pursue any such disturbance, it would be required at that time to obtain all applicable regulatory approvals, including separate incidental take authorization.

In regards to FESA, CRC has also prepared an HCP in connection with a future proposed additional federal take authorization under Section 10 of FESA. There is no impending expiration date in the take authorization approved by the Service under FESA, or any other federal approval. Therefore, a future separate EIS will be prepared to comply with NEPA (42 [U.S.C.] 4321; 40 CFR 1500.1) with the Service as lead agency when it begins its evaluation for issuance of the federal ITP under Section 10 of the FESA, whenever such additional approval is deemed necessary.

Freeport-McMoRan Oil & Gas HCP

The Freeport-McMoRan Oil & Gas (formerly Nuevo-Torch then Plains Exploration and Production Company) HCP was adopted in 1999 and addresses ongoing oilfield exploration and production activities on oilfield properties located in western Kern County. The HCP encompasses 21,900 acres, including an initial 839.9 acres of conservation area lands in the Lokern area that will be set aside incrementally to compensate for habitat disturbances from oilfield activities. The federal incidental take statement authorized up to 1,700 acres of incidental take on the plan area lands. When Plains Exploration and Production Company acquired the properties from Nuevo-Torch in 2005, an additional 4,905 acres of land and were added to the HCP (an additional 414 acres of conservation area lands). In 2009, 300 acres of the incidental take acreage and 15 acres of the conservation land acreage were transferred to CRC (formerly Occidental) of Elk Hills, Inc., and Freeport-McMoRan (then Plains Exploration and Production Company) retained 1,400 acres of take acreage. Freeport-McMoRan has added an additional 146 acres of conservation area lands to the HCP through acquisitions throughout the years. Covered species include the recurved Larkspur (*Delphinium recurvatum*), California horned lizard (*Phrynosoma coronatum frontale*), San Joaquin pocket mouse (*Perognathus inornatus*), Tulare grasshopper mouse (*Onychomys torridus tularensis*), western burrowing owl (*Athene cunicularia hypugea*), mountain plover (*Charadrius montanus*), Nelson's antelope ground squirrel (*Ammospermophilus nelsoni*), San Joaquin LeConte's thrasher (*Toxostoma lecontei macmillanorum*), San Joaquin whipsnake (*Masticophis flagellum ruddocki*), Hoover's woolly-star (*Eriastrum hooveri*), Bakersfield cactus (*Opuntia treleasei*), California condor (*Gymnogyps*

californianus), San Joaquin kit fox (*Vulpes macrotis mutica*), California jewelflower (*Caulanthus californicus*), giant kangaroo rat (*Dipodomys ingens*) Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), blunt-nosed leopard lizard (*Gambelia silus*), Kern mallow (*Eremalche kernensis*), and San Joaquin woolly-threads (*Monolopia (=Lembertia) congdonii*).

CRC (formerly Occidental of Elk Hills, Inc.) Non-Unit HCP

The CRC Non-Unit HCP is a conservation plan that covers 7,050 acres (Live Oak Associates 2013). The HCP was originally prepared for Nuevo-Torch in February 1999. Incidental take authorization and responsibilities under the HCP were transferred to Plains Exploration and Production Company (PXP) on May 9, 2005. PXP subsequently transferred 300 acres of authorized incidental take and 15 acres of conservation lands to CRC on August 3, 2009. PXP retained take authorization and responsibilities on the remaining 1,400 acres of the original 1,700 acres authorized for incidental take, and these interests were subsequently conveyed to Freeport-McMoRan. In December 2009 USFWS approved the inclusion of 3,504 acres of new properties located in the vicinity of McKittrick Valley and the EHOF into the CRC Non-Unit HCP; 1,134 acres of the 3,504 acres were designated for use as mitigation land. No increase in the initially authorized 1,700 acres of take was included in the 2009 approval.

Aera Coles Levee Ecosystem Preserve HCP (previously Arco Western Energy HCP)

The Aera Coles Levee HCP was approved in 1996 and covers 120,320 acres (188 sections) of land used for oil and gas exploration and production and a 6,059 acre preserve area. The HCP covers the San Joaquin kit fox (*Vulpes macrotis mutica*), giant kangaroo rat (*Dipodomys ingens*), Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), blunt-nosed leopard lizard (*Gambelia silus*), Kern Mallow (*Eremalche kernensis*), short-nosed kangaroo rat (*Dipodomys nitratoides brevinasus*), recurved Larkspur (*Delphinium recurvatum*), western burrowing owl (*Athene cunicularia hypugea*), Nelson's antelope ground squirrel (*Ammospermophilus nelsoni*), slough thistle (*Cirsium crassicaule*), San Joaquin LeConte's thrasher (*Toxostoma lecontei macmillanorum*), southwestern pond turtle (*Actinemys marmorata pallida*), and Hoover's woolly-star (*Eriastrum hooveri*). The Coles Levee Ecosystem Preserve encompasses the last 2 miles of riparian habitat along the Kern River before it enters the Buena Vista Lake or reaches the California Aqueduct.

The Coles Levee Ecosystem Preserve is a land bank of compensation credits which have been pre-approved by the federal and state resource agencies for many of the listed species in the southern San Joaquin Valley. These credits are used by Aera for oil exploration and production projects, and may also be used by third parties that have acquired credits for projects which impact habitat and listed species. Aera has indicated that it intends to pursue updated versions of the federal and state (CESA Section 2081) incidental take authorizations while adding additional mitigation acreage to the preserve boundary.

Chevron Pipeline HCP

The Chevron Pipeline HCP includes 25.5 acres located in Western Subarea and covers the San Joaquin kit fox (*Vulpes macrotis mutica*), California jewelflower (*Caulanthus californicus*), giant kangaroo rat (*Dipodomys ingens*), blunt-nosed leopard lizard (*Gambelia silus*), Kern mallow (*Eremalche kernensis*), San Joaquin woolly-threads (*Monolopia lembertia congdonii*), green fiddleneck (*Amsinckia vernicosa*), heartscale (*Atriplex cordulata*), short-nosed kangaroo rat (*Dipodomys nitratoides brevinasus*), San Joaquin pocket mouse (*Perognathus inornatus*), Tulare grasshopper (*Onychomys torridus tularensis*) western burrowing owl (*Athene cunicularia hypugea*), Nelson's antelope ground squirrel (*Ammospermophilus nelsoni*), San Joaquin LeConte's thrasher (*Toxostoma lecontei macmillanorum*), San Joaquin Whipsnake (*Masticophis flagellum ruddocki*), and Hoover's woolly-star (*Eriastrum hooveri*).

California Aqueduct - San Joaquin Field Division HCP

The proposed California Aqueduct San Joaquin Field Division HCP would cover 11,816 acres adjacent to 121 miles of the California Aqueduct from Kettleman City to the Edmonston Pumping Plant at the base of the Tehachapi Mountains. The HCP also includes four pumping plants, two Operations and Maintenance Centers, and the initial 14.8 miles of the Coastal Branch Phase 1, a smaller canal that branches off from the California Aqueduct. The California Aqueduct San Joaquin Field Division HCP would allow for routine and non-routine maintenance activities, minor new construction, and emergency procedures for these facilities.

Kern County Waste Facilities HCP

The Kern County Waste Management Department (KCWMD) is responsible for the construction and management of 14 sanitary solid waste facilities (landfills) in Kern County, including seven closed or inactive sites where transfer stations may be operated. The Kern County Waste Facilities HCP covering these locations was adopted in 1997 and is in the process of being amended to cover expansion at the remaining active landfills and the closure of historic burn dumps. Covered species include the San Joaquin kit fox (*Vulpes macrotis mutica*), Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), giant kangaroo rat (*Dipodomys ingens*), blunt-nosed leopard lizard (*Gambelia silus*), desert tortoise (*Gopherus agassizii*), the Hoover's eriastrum (*Eriastrum hooverii*), and the San Joaquin antelope squirrel (*Ammospermophilus nelsoni*) if listed during the 50-year term of the permit. In October 2005, the USFWS published a Notice of Intent to prepare an EIS for an amendment of the take statement and the Kern County Waste Facilities HCP.

Kern Water Bank HCP/Natural Community Conservation Plan

The Kern Water Bank HCP/Natural Community Conservation Plan (HCP/NCCP) is managed by the Kern Water Bank Authority and covers 19,900 acres. The plan was approved in 1997 and covers water conservation by developing water recharge and recovery facilities, the conservation and restoration of upland, intermittent wetland/rangeland, and other sensitive habitat, and the San Joaquin kit fox (*Vulpes macrotis mutica*), Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), giant kangaroo rat (*Dipodomys ingens*), San Joaquin antelope squirrel

(*Ammospermophilus nelsoni*), and Bakersfield cactus (*Opuntia basilaris var*). The plan also includes a conservation bank that allows for conservation credit sales to third parties under certain conditions and subject to USFWS and CDFW approval. In 1997, 5,592 acres of the plan area were permanently preserved in the HCP area, and 3,267 acres were included in the conservation bank.

Pacific Gas and Electric (PG&E) San Joaquin Valley Operations and Maintenance Program HCP

The PG&E San Joaquin Valley region HCP was approved in early 2008 and covers routine operations and maintenance and minor new construction activities related to PG&E's electrical system in the San Joaquin Valley for 30 years. The HCP covers 23 wildlife and 42 plant species, including the San Joaquin kit fox, California red-Legged frog, vernal pool fairy shrimp, and Western burrowing owl. PG&E facilities that are covered by the HCP occur throughout the Project Area, generally within existing ROWs owned by the company.

Tehachapi Uplands Multiple Species HCP (TUMSHCP)

The TUMSHCP was approved in 2013 and includes 141,886 acres within Tejon Ranch and 25 species, including the California condor (Dudek 2013). The HCP term is 50 years. As discussed in the upland elevation section, the northern boundary of the TUMSHCP is largely defined by the 2,000-foot elevation level above the valley floor. Portions of the Project Area extend above 2,000 feet and include lands that are covered by the HCP. As discussed in greater detail in Section 4.4.4, Impacts and Mitigation Measures, pre-construction surveys and avoidance mandates for project activity above 2,000 feet have been modified to address the different species of concern at higher elevations. (USFWS 2012)

Metropolitan Bakersfield HCP

Implemented in 1994, the MBHCP (City of Bakersfield and County of Kern 1994) covers both federally and state-listed species in the 408-square-mile Metropolitan Bakersfield area, which includes both City land and unincorporated County land. The goal of the MBHCP is to allow urban development consistent with the Metropolitan Bakersfield 2010 General Plan and offset habitat loss by acquiring, preserving, and enhancing habitat for sensitive species. Oil drilling activities are not covered under the MBHCP. The federal Section 10(a) permit and state 2081 permit allow take outside of the primary floodplain of the Kern River and the KWBHCP area. Both permits were issued for a concurrent period of up to twenty years or until urban development permits are issued for 15,200 acres of natural lands or 43,000 acres of open lands. The Metropolitan Bakersfield HCP is a joint program of the City of Bakersfield and Kern County (Chapter 17.62 of the Kern County Ordinances) to assist urban development applicants in complying with federal- and state-endangered species regulations (City of Bakersfield and County of Kern 1994). The program uses mitigation fees paid by applicants for grading or building permits to fund the purchase and maintenance of habitat land to compensate for the impact of urban development on endangered species habitat. The County and City have updated the HCP to support the extension of the plan or a new set of take permits. A new Incidental Take

Permit was issued by CDFW and signed by the County and City on September 21, 2014 to authorize the take of species outlined in the permit as allowed in CFGC Section 2081, subdivisions (b) and (c) (See Cal. Code Regs., title 14, § 783.4). The ITP expires on September 1, 2019.

Recovery Plans

Section 4 of the federal ESA requires, subject to certain exceptions, that the USFWS develop recovery plans for listed species. A recovery plan is not regulatory action, and is intended to provide guidance for managing land and resources in a manner that fosters the recovery and continued survival of threatened and endangered species. The following sections discuss recovery plans that have been developed by the USFWS for the Project Area and adjacent lands.

Recovery Plan for Upland Species of the San Joaquin Valley, California (USFWS 1998)

In 1998, the USFWS published an ecosystem-oriented recovery plan for 11 threatened and endangered species (one, Hoover's woolley star, since delisted) and 23 other native plants and animals in the San Joaquin Valley, including the California jewelflower, palmate-bracted bird's-beak, Kern mallow, San Joaquin woolly-threads, Bakersfield cactus, Hoover's woolly-star, giant kangaroo rat, Fresno kangaroo rat, Tipton kangaroo rat, blunt-nosed leopard lizard, San Joaquin kit fox, lesser saltscale, Bakersfield smallscale, Lost Hills saltbush, Vaseks clarkia, Temblor buckwheat, Tejon poppy, diamond-petaled California poppy, Comanche Point lavia, Munz's tidy-tips, jared's peppergrass, Merced monardella, Merced phacelia, oil neststraw, San Joaquin dune beetle, Dovens dune weevil, San Joaquin antelope squirrel, short-nosed kangaroo rat, riparian woodrat, Tulare grasshopper mouse, Buena Vista Lake shrew, riparian brush rabbit, and San Joaquin Le Conte's thrasher.

The SJV Recovery Plan recommends the protection of land in large blocks to minimize edge effects, increase the likelihood that ecosystem functions will remain intact, and facilitate management. The plan also seeks to connect blocks of conservation lands to allow for movement of species between blocks. The plan focuses on the conservation of the San Joaquin kit fox because this species occurs in nearly all the natural communities used by plan plants and animals. As a result, kit fox conservation provides an "umbrella of protection" for these species, and the kit fox is treated as the plan "umbrella" species. The recovery plan also focuses on the giant kangaroo rat and, to a lesser extent, the Fresno, short-nosed, and Tipton kangaroo rats as "keystone" species because they provide important or essential components of the biological niche of other covered species.

The 1998 plan identified four locations as the highest priority for large block land conservation in Kern County: (1) Elk Hills and Buena Vista Valley; (2) the Kern Fan Element; (3) Western Kern County (including the Lokern area); and (4) the Pixley National Wildlife Refuge/Allensworth Natural Area along the Kings County border. Two other areas including land in Kern County were identified as lower priority locations: (1) the Kern National Wildlife Refuge Semitropic

Ridge Natural Area; and (2) the Bitter Creek National Wildlife Refuge. Fifteen smaller areas were identified as potential specialty reserves in the County.

Recovery Plan for Vernal Pool Ecosystems of California/Southern Oregon

The Vernal Pool Recovery Plan (USFWS 2004) seeks to protect known and potential habitat for vernal pools and associated sensitive species. The plan recommends the preparation and adoption of an HCP in areas potentially containing the listed species. As discussed in the Sensitive Natural Communities Section of the plan, certain locations in the Eastern Subarea and in the northern portions of the Central and Western Subareas in recovery plan "regions" are included. No species recovery plan "Core Areas" are located in the Project Area.

California Condor Recovery Plan

The California Condor Recovery Plan was developed in 1984 and last revised in April 1996 (USFWS 1996). The plan calls for a multi-pronged recovery strategy for the California condor, including (1) increasing reproduction in captivity to provide condors for release, (2) the release of condors to the wild, (3) minimizing condor mortality factors in wild populations, (4) maintaining habitat for condor recovery, and (5) implementing condor information and education programs. The primary objective of the recovery plan is the down-list of the condor to threatened status; with the minimum criterion for achieving this objective being the maintenance of at least two non-captive populations and one captive population. As discussed previously in the California Condor section of the Category 2 Special Status Wildlife Section the USFWS conducted a 5-year listing review for the species in 2013. The review concluded that condor recovery is unlikely to be constrained by a lack of foraging habitat throughout its current and potential future range and as the wild population increases in size. Condor occurrence is overwhelmingly limited to upland locations outside of the Project Area.

Pacific Bald Eagle Recovery Plan

The United States published five bald eagle recovery plans for various regions of the United States. The Pacific Bald Eagle (*Haliaeetus leucocephalus*) Recovery Plan (USFWS 1986) covers the western states including California. The primary objectives of The Pacific Bald Eagle Recovery Plan are to provide secure habitat for bald eagles in the Pacific recovery area and to increase the bald eagle population size to a level that warrants delisting of the species. Subsequent to the publication of the plan, the bald eagle was delisted under the ESA, but remains protected under the federal Bald and Golden Eagle Protection Act. Bald eagles may traverse the Project Area during seasonal migration, but the Project Area contains no breeding habitat, and potential areas of more intensive use are limited to perennial waterbodies in higher elevations outside of the Project Area.

4.4.4 Impacts and Mitigation Measures

Methodology

The following section describes potential impacts related to biological resources that could occur as a result of the Project, and proposed mitigation measures.

The CEQA Guidelines define *direct impacts* as those impacts that result from a project and occur at the same time and place. *Indirect impacts* are caused by a project, but can occur later in time or farther removed in distance while still reasonably foreseeable and related to the project. The potential impacts discussed in this analysis are those most likely to be associated with construction and operation of the Project. Construction impacts would include both direct and indirect impacts to biological resources. While direct impacts associated with construction of the Project are expected to occur only through the duration of construction activities, indirect construction impacts, such as the spread of non-native and invasive weeds, could potentially remain an ongoing source of disturbance. Operational impacts would also include both direct and indirect impacts to biological resources. Ongoing operations and maintenance impacts would occur during routine inspection and maintenance of the Project facilities and would include such activities as routine inspections and emergency repairs. Operational impacts would remain an ongoing source of disturbance for many plants and wildlife species that occur within the facility perimeter and in adjacent habitat.

Project impacts are considered permanent if they would involve the conversion of land to a new use, such as with the construction of new roads, well pad foundations, or operation and maintenance (O&M) facilities. Temporary project impacts are those effects that do not result in the permanent land use conversion. Temporary effects to vegetation communities or other ground disturbance activities restricted solely to the construction phase, such as grading roads and clearing vegetation within staging areas, are considered temporary, provided that native vegetation is not replaced with infrastructure or the area is not maintained free of vegetation, and that restoration is completed.

Construction and operation of the Project could impact plants and wildlife in a variety of ways. Construction activities could result in both direct and indirect impacts to species. Direct impacts as a result of construction activities associated with the installation of well pads and associated facilities would include temporary disturbance and/or loss of native vegetation communities utilized as habitat for both common and special-status wildlife and plants. Other impacts could include fugitive dust, lighting that may alter species behavior, and increased noise levels due to heavy equipment operations during construction. Increased interaction with humans, loss of burrows and dens during well pad preparation, trenching activities associated with flow/pipelines and steam lines, or entrapment during other activities associated with construction may cause increased harassment, injury and/or mortality of a species.

Direct impacts as a result of construction activities associated with the project could include:

- The permanent removal and/or temporary disturbance of native vegetation communities utilized as habitat for both common and special-status wildlife and plants, fugitive dust, and increased noise levels due to heavy equipment operations occurring in these areas.

- Excessive dust from construction activities can decrease the vigor and productivity of vegetation communities through effects on light penetration, photosynthesis, respiration, transpiration, increased penetration of phytotoxic gaseous pollutants, and increased incidence of pests and diseases.

- Noise and vibration associated with project activities may affect behavior of wildlife in several ways. Excessive noise may affect species behavior by causing nest or burrow abandonment and interfering or altering normal behaviors.

- Lighting may also affect behavioral activities, physiology, population ecology, and ecosystems of both diurnal and nocturnal wildlife.

- Increased human activity in the Project Area could affect essential behavioral activities and physiology of wildlife. Increased human activity could alter species behavior causing them to abandon nests or den sites. Abandonment (even temporary) of active nests or dens increases the risk to eggs, nestlings, fledglings, and other dependent young. Flushing animals from nests, dens, and other refuges also increases their risk of injury or mortality from collisions with construction equipment and other vehicles, as well as predation.

- An increase in nonnative and invasive species could potentially increase and remain an ongoing source of disturbance. Impacts could include the loss of habitat due to the establishment of nonnative and invasive weeds.

- An increase in mortality, injury, or displacement of special-status plants or wildlife, loss or degradation of native habitat, or interference with wildlife movement or migration may also occur.

Indirect impacts to habitat could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, and the establishment of nonnative and invasive weeds. Operational impacts include disturbance due to increased human presence, risk of injury or mortality from maintenance vehicles on access roads, and further opportunities for the introduction and spread of nonnative and invasive weeds. More specifically, indirect impacts as a result of construction activities associated with the project could include:

- The removal of vegetation can result in indirect effects to biological resources from the permanent loss of habitat. Loss or degradation of habitat including damage to shrubs and plants could alter access to a variety of essential resources, including shade and food sources.

- Indirect impacts to habitat could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, and the establishment of nonnative and invasive weeds.

- Indirect effects caused by disturbance-type impacts, such as construction activity near an active nest or primary foraging area, also have the potential to impact raptor species.

- Indirect impacts attributed to the colonization of nonnative weeds could include a gradual decrease in natural biodiversity as nonnative weed infestations may extirpate native plant populations.

Operational impacts could also include mortality, injury, or displacement of special-status plants or wildlife; loss or degradation of native habitat; interference with wildlife movement or migration; disturbance to plants, animals and habitat from noise, light, or dust; and disturbance due to increased human presence; risk of injury or mortality from maintenance vehicles on access roads; and further opportunities for the introduction and spread of nonnative and invasive weeds.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations or by the CDFW or USFWS;

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS;

- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance;

- Conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state HCP.

Project Impacts

Impact 4.4-1: Have a Substantial Adverse Effect, either Directly or through Habitat Modifications, on any Species Identified as a Candidate, Sensitive, or Special Status Species in Local or Regional Plans, Policies, or Regulations or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service

Methodology

As shown in Table 4.4-70 below, 90.1% (2,430) of the annual number of future production wells subject to the proposed Zoning Ordinance amendment review process (2,697) would be located in Tier 1 areas, 6.3% (169) would be in Tier 2, and 2.6% (71) would be located in Tier 3. About 64% (1,730) of the new wells would also be located in the Western Subarea, 5% (131) in the Central Subarea, and 31% (836) in the Eastern Subarea. Accordingly, the majority of new wells, approximately 95%, would be located in the Eastern and Western Subareas, which include the Project Area locations that have been subject to oil and gas exploration and production activities for several decades.

Table 4.4-70: Number of New Producing Wells per Year by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total
Tier 1	1,630	100	700	2,430
Tier 2	74	20	75	169
Tier 3	15	6	50	71
Tier 4	10	5	10	25
Tier 5	1	-	1	2
TOTAL	**1,730**	**131**	**836**	**2,697**

Table 4.4-71 summarizes the potential disturbance acreage that could occur in each subarea and tier assuming that all future oil and gas exploration and production subject to the proposed Zoning Ordinance amendment review process occurs in land that is not undergoing active disturbance, either from existing oil and gas activity, urban development, or agriculture.

Potential acreage impacts are estimated for each subarea based on the average historical disturbance per production well for all oil and gas exploration and production related activities, including well pads and staging areas, roads, utilities, pipelines, tanks, and other facilities and related infrastructure. Project Area special status plants and wildlife could be adversely affected by construction and operational activities that occur as a result of the Project. These activities include road, utility line, well and oil, and gas-related facility grading; staging; vehicular movement; construction; and oil and gas facility O&M, as more fully described in Chapter 3, Project Description. New land disturbance in locations occupied by special status plants and

wildlife could result in both direct and indirect impacts to such species. New land disturbance outside of actively disturbed areas could reduce the amount of available habitat for one or more special status species within the Project Area. Oil and gas activities could also indirectly affect special status plants and wildlife by generating dust, emissions, noise, light, and unintentional spills or discharges; introducing invasive species; or increasing the risk of unauthorized vehicular use or other human activity that disturb occupied or suitable species status species habitats.

The projected new land disturbance acreage in Table 4.4-71 is based on estimates of actual disturbance for any operations, including accidental spills or vehicular intrusion, observed in the 10 largest oilfields in each subarea. Impacts related to dust, emissions, light, noise and accidental spills and hazards are discussed in Sections 4.1, Aesthetic and Visual Resources; 4.3, Air Quality; and 4.8, Hazards and Hazardous Materials/Public Health Risks of this DEIR.

Table 4.4-71: Assumed New Disturbance Acres per Year by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total
Tier 1	3,260	300	840	4,400
Tier 2	148	60	90	298
Tier 3	30	18	60	108
Tier 4	20	15	12	47
Tier 5	2	-	1	3
TOTAL	**3,460**	**393**	**1,003**	**4,856**

Table 4.4-71 shows that 91% of the assumed new disturbance, or 4,400 of 4,856 acres per year, will occur in existing Tier 1 locations. Within each subarea, the majority of assumed new disturbance would occur in Tier 1 locations including 94% of all new disturbances in the Western Subarea (3,260 of 3,460 acres), 76% in the Central Subarea (300 of 393 acres), and 84% in the Eastern Subarea (840 of 1,003 acres). Assumed new disturbance within Tier 2 locations would account for 6.1% of total potential disturbance in the Project Area (298 of 4,856 acres), including 4% of all new disturbances in the Western Subarea (148 of 3,460 acres), 15% in the Central Subarea (60 of 393 acres), and 9% in the Eastern Subarea (90 of 1,003 acres). Given existing conditions, it is likely that anticipated new disturbance in the Central Subarea would occur on intensively farmed lands; however, for the purposes of impact assessment, it has been assumed that new disturbance would occur in land that is not undergoing active disturbance, as described above. About 71% of all future disturbances would occur in the Western Subarea (3,460 of 4,856 acres) compared with 21% in the Eastern Subarea (1,003 of 4,856 acres) and 8% in the Central Subarea (393 of 4,856 acres).

The potential annual disturbance levels projected in Table 4.4-71 are conservatively high because they have been rounded up and increased from the calculated levels of disturbance observed historically in each subarea. At least some future oil and gas exploration and production activities in the Project Area are likely to utilize existing actively disturbed areas, such as existing well pads, access roads, or existing facilities, such as pipelines and tanks, urban development and

intensively farmed areas to a greater extent than assumed in the analysis. As part of the site plan review process under the Zoning Ordinance Amendment, each Applicant would be required to submit a site plan to the County that identifies the existing areas of ongoing active disturbance and areas of new land disturbance that would result from proposed Project activities. As discussed below, the County would require mandatory minimum mitigation for any new land disturbance associated with oil and gas activities in the Project Area. The actual acreage of land subject to mandatory mitigation requirements would be verified in a completion report to be filed with the County. The primary objective of this new mandatory mitigation requirement is to encourage the avoidance and preservation of land that is not actively disturbed throughout the Project Area.

Potential impacts to special status wildlife and plants were analyzed by using: (1) statistical and habitat suitability models for 28 wildlife and 9 plant species, and (2) an assessment of the occurrence potential of 19 special status wildlife and 31 plant species by tier and subarea for which sufficient modeling data is not available.

A. Modeled Species Analysis Approach

Modeled data was obtained from URS (SBM and HSM models), ICF, and QK, and are described in more detail in Section 4.4.2, Environmental Setting. As discussed above, modeled habitat data and maps (see Appendix N) were used to analyze potential Project impacts for all Category 1 species, including nine plant and 28 wildlife species. The model results were used to generate the estimated suitable habitat acreage grouped by "high" or "poor to moderate" categories for the URS SBM and HSM models, "high" quality habitat for the ICF and QK models by tier and subarea for all modeled species, and to the extent that such information was produced in model outputs for the applicable species. Tables 4.4-26 to 4.4-64 summarize the model outputs that were grouped into each category. As discussed in Section 4.4.2, Environmental Setting, the identification of modeled high quality habitat and, where available, modeled poor to moderate quality habitat provides a conservative analysis of potential species occurrence within the Project Area because they generally do not account for existing land uses, such as agriculture, higher intensity oil and gas operations, or urban development that preclude or significantly reduce use by many of the more sensitive special-status species. The model results are used to provide a reasonable analysis of the potential Project Area impacts to habitat for the various species based on the conservative annual disturbance factors summarized in Table 4.4-71. By analyzing habitat impacts to each Category 1 species, impacts can be quantified without knowing the actual occurrence of a species at a particular place. The advantage of this analysis method is that given the fluctuations in species occupation levels, the importance of habitat to a species is based on relative quality instead of occupation levels that tend to change over time.

The group of modeled species includes the "umbrella" San Joaquin kit fox and "keystone" species (i.e., the giant, short-nosed, and Tipton kangaroo rats) identified by the USFWS in the SJV Recovery Plan for the Project Area. Both high quality and poor to moderate quality habitat model results are available for each of these species. The SJV Recovery Plan utilizes a "community-level strategy" to define conservation goals for the Project Area (as well as other parts of the San Joaquin Valley that are not in the Project Area) that places greater emphasis on

San Joaquin kit fox conservation and keystone species ecosystem dynamics. According to the SJV Recovery Plan, San Joaquin kit fox conservation provides an "umbrella of protection" for many other species that require less habitat, because the kit fox occurs in nearly all the natural communities used by other SJV Recovery Plan species. The giant, short-nosed, and Tipton kangaroo rats create burrows and provide refuges and living places for many small animals, including the blunt-nosed leopard lizard and San Joaquin antelope squirrel. Soils over and near keystone species burrows are also favored microhabitats for the California jewel flower and San Joaquin woolly-threads (USFWS 1998). As a result, the modeling data and impact analysis for the San Joaquin kit fox and giant, short-nosed, and Tipton kangaroo rats also provide a general means for assessing potential impacts to other SJV Recovery Plan and special status species in the Project Area.

Potential impacts to modeled special status species were characterized in terms of annual impacts to all identified habitat categories for each species analyzed within the Project Area. As noted above, this approach is conservative because it includes urbanized, agricultural, or high-density oil and gas production areas where predicted habitat values have been reduced or eliminated. Impacts were further divided into tiers and subareas based on the projected new disturbance acreage that could occur in each of these geographic locations (see Table 4.4-71). The level of impacts was calculated as the product of (1) the ratio of modeled high quality or, when available, poor to moderate quality habitat acreage to total acreage in each tier and subarea, and (2) the annual new disturbance acreage projected in each tier and subarea. (Table 4.4-72).

The following tables provide a detailed summary of the impact methodology used for Category 1 species with reference to the San Joaquin kit fox. As discussed above, the URS SBM model results were used for this species, and the predicted habitat locations generated by the model were grouped into two "high" and "poor to moderate" categories. Tables 4.4-72 to 4.4-74 summarize the total high and poor to moderate quality habitat acreage from the URS SBM model for the San Joaquin kit fox by tier and subarea. These results are also presented in the discussion of the San Joaquin kit fox in Section 4.4.2, Environmental Setting. and mapped on Figure 4.4-32 in Appendix N.

Table 4.4-72: Modeled San Joaquin Kit Fox High Quality and Poor to Moderate Quality Habitat, Acres by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total
High Quality Modeled San Joaquin Kit Fox Habitat				
Tier 1	132,762	-	13,104	145,866
Tier 2	175,957	69,309	24,055	269,322
Tier 3	1,223	977	5,266	7,466
Tier 4	2,089	1,147	4,091	7,327
Tier 5	-	-	13	13
TOTAL	**312,032**	**71,434**	**46,529**	**429,994**

Table 4.4-72: Modeled San Joaquin Kit Fox High Quality and Poor to Moderate Quality Habitat, Acres by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total
Poor to Moderate Quality Modeled San Joaquin Kit Fox Habitat				
Tier 1	30,275	3,002	27,414	60,691
Tier 2	542,945	452,701	419,500	1,415,147
Tier 3	821	1,824	5,770	8,415
Tier 4	1,416	9,224	10,498	21,139
Tier 5	771	-	1,727	2,499
TOTAL	**576,229**	**466,752**	**464,911**	**1,507,891**

Source: Chevron 2014.

As discussed in Chapter 3, Project Description, there are approximately 2.051 million acres in the Project Area. Table 4.4-73 summarizes the Project Area acreage by tier and subarea.

Table 4.4-73: Project Area Acreage By Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total
Tier 1	163,227	3,002	40,518	206,747
Tier 2	800,442	523,071	467,789	1,791,303
Tier 3	2,043	2,801	11,359	16,203
Tier 4	5,423	10,413	18,614	34,450
Tier 5	772	-	1,740	2,512
TOTAL	**971,908**	**539,287**	**540,020**	**2,051,215**

Table 4.4-74 summarizes the percentage of the land in each tier and subarea that modeled as high quality and poor to moderate quality San Joaquin kit fox habitat, calculated by dividing the amount of high or poor to moderate San Joaquin kit fox habitat by the total Project Area acreage in each tier and subarea. About 81% of the Tier 1 land in the Western Subarea (132,762 acres of high quality habitat of a total of 163,227 acres), and 32% of the Tier 1 land in the Eastern Subarea (13,104 acres of high quality habitat of a total of 40,518 acres) consists of modeled high quality San Joaquin kit fox habitat. None of the Central Subarea contains modeled high quality San Joaquin kit fox, and all of the Central Subarea is modeled as poor to moderate quality habitat.

Table 4.4-74: High Quality and Poor to Moderate Quality Modeled San Joaquin Kit Fox Habitat, Percentage of Total Project Area Acreage by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea
High Quality Modeled San Joaquin Kit Fox Habitat			
Tier 1	81%	0%	32%
Tier 2	22%	13%	5%
Tier 3	60%	35%	46%
Tier 4	39%	11%	22%
Tier 5	-	-	1%
TOTAL	**32%**	**13%**	**9%**
Poor to Moderate Quality Modeled San Joaquin Kit Fox Habitat			
Tier 1	19%	100%	68%
Tier 2	68%	87%	90%
Tier 3	40%	65%	51%
Tier 4	26%	89%	56%
Tier 5	100%	NA	99%
TOTAL	**59%**	**87%**	**86%**

Note:
The percentage of total acreage (high and poor to moderate quality habitat) does not necessarily add to 100% of the Project Area acreage in each subarea tier because: (a) as discussed in Section 4.4.2, Environmental Setting, the models do not generally include Project Area locations above about 2,000 feet, and/or (b) the model outputs may include locations that have no habitat value and are not included in the high or poor to moderate quality habitat categories (URS SBM and HSM models) or high quality category (ICF and QK models).

Table 4.4-75 summarizes the annual impacts to San Joaquin kit fox high quality habitat that could occur from Project Activities based on the projections in Table 4.4-71 and conservatively assuming that no existing disturbed areas would be used for any future oil and gas activities. Under these assumptions, about 3,032 acres of modeled high-quality San Joaquin kit fox habitat could be impacted per year in the Project Area, including 2,923 acres in Tier 1 areas, and 2,710 acres in the Western Subarea.

Table 4.4-75: Modeled San Joaquin Kit Fox High Quality and Poor to Moderate Quality Habitat, Potential Annual Impacts of Total Acreage by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total (sum of individual subarea tier impacts)
High Quality Modeled San Joaquin Kit Fox Habitat				
Tier 1	2,652	-	272	2,923
Tier 2	33	8	5	45
Tier 3	18	6	28	52

Table 4.4-75: Modeled San Joaquin Kit Fox High Quality and Poor to Moderate Quality Habitat, Potential Annual Impacts of Total Acreage by Tier and Subarea

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total (sum of individual subarea tier impacts)

Tier 4	5	13	7	25
Tier 5	2	-	1	3
TOTAL (sum of individual subarea tier impacts)	**724**	**377**	**687**	**1,789**

Chevron 2014

This methodology was used to estimate potential impacts to modeled high quality habitat data for all modeled species, and potential impacts to poor to moderate quality habitat when available for certain species. All model outputs were reviewed to ensure that model results did not unintentionally include lands that are considered outside of a species' range by published sources, such as Jepson (2013), VertNet, etc. A more detailed description of the methodologies and definitions of high quality and poor to moderate quality habitat used in the analysis is provided in Section 4.4.2, Environmental Setting.

B. Non-Modeled Species Analysis Approach

Non-modeled species were analyzed on the basis of species-specific occurrence information, including unique habitat requirements for aquatic plants and wildlife, fairy shrimp, certain plants or riparian species, reported occurrence information in publicly available species databases, and the field experience and judgment of qualified biologists with significant knowledge of the Project Area that were retained by the lead agency. The analysis included a summary assessment of which each non-modeled species could occur in each subarea and tier, and identified key habitat requirements or constraints that could affect the spatial distribution and of special status species in the Project Area.

The non-modeled species analysis is conservative because occurrence was considered possible even if there were only limited historical observations or an extremely low likelihood of species activity throughout a tier/subarea. As discussed in Section 4.4.2, Environmental Setting, actual occupation of habitat during critical life stages by certain species is limited to specific habitats (e.g., the sphinx moth), isolated and relatively minute portions of the Project Area (e.g., the

Tehachapi slender salamander), or higher elevation areas (e.g., the California condor). To provide a conservative assessment, the summary assessment by tier and subarea identifies potential occurrence even when the probability of species activity in the vast majority of the tier or subarea may be negligible. The assessment results were further refined by considering habitat, behavioral, seasonal activity, elevation, or other factors that would substantially affect the magnitude and significance of potential impacts from oil and gas activities.

C. High Elevation Species

Except where specifically noted, the model results, and in certain cases the non-modeled tier and subarea assessments, do not include or fully distinguish between the lower valley floor and the small amount of land along the southern and eastern borders of the Project Area that is above 2,000 feet in elevation. As discussed in Section 4.4.2, Environmental Setting, and in the TUMSHCP approved by the USFWS in 2013 (USFWS 2013d), the suite of species occurring in and adjacent to the valley floor transitions from valley floor to foothill and montane habitat near the 2,000-foot elevation level near the boundaries of the Project Area, especially in the southern and eastern boundary areas. Certain special status species, including the California condor, golden eagle, and the Tehachapi slender salamander, occur almost exclusively within, or only engage in significant life cycle activities such as breeding or roosting in higher elevation habitats just within the border of or adjacent to the Project Area.

Potential Special Status Plant Impacts

Table 4.4-76 summarizes the potential impacts, in terms of acres per year, that could occur to modeled high quality special status plant species habitats, and the potential occurrence of non-modeled special status plants by subarea and tier. Modeling data was utilized to analyze impacts to modeled high quality habitat for five of the six state and/or federally listed threatened or endangered species that occur in the Project Area, including the San Joaquin adobe sunburst (federal threatened, state endangered), Kern mallow (federal endangered), Bakersfield cactus (federal and state endangered), San Joaquin woolly-threads (federal endangered), and the California jewel flower (federal and state endangered). Impacts to modeled poor to moderate quality habitat, as described in Section 4.4.2, Environmental Setting, under "Methods" and in accordance with the category groupings summarized in Tables 4.4-26 and 4.4-36, were also evaluated for these species except for the San Joaquin adobe sunburst. Modeled high quality habitat data was available for four other unlisted plant species that occur within the Project Area: the recurved larkspur, Lost Hills crownscale, heartscale, and Kern County larkspur (rose-flowered larkspur). The model also predicted some low to moderate quality habitat for the Lost Hills crownscale and heartscale. The occurrence potential by tier and subarea was evaluated as either yes or no for 31 non-listed plants species for which Project Area modeling data was not available. Occurrence potential was determined based on presence of potentially suitable habitat given habitat requirements of each of the non-modeled species. Habitat potential was determined based on occurrence data for each species, known habitat requirements compared to CALVEG mapping and Google Earth images (University of California, Berkeley 2013; CDFW 2015a; USFS 2014; Google Earth Pro 2015).

Status abbreviations:
Federal and State Listing Code
E = Federal or State-listed Endangered
T = Federal or State-listed Threatened
DL = Delisted
California Rare Plant Rank (formerly CNPS List)
1A: Plants Presumed Extirpated in California and Either Rare or Extinct Elsewhere
1B: Plants Rare, Threatened, or Endangered in California and Elsewhere
2A: Plants Presumed Extirpated in California, But Common Elsewhere
2B: Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere
3: Plants About Which More Information is Needed - A Review List
4: Plants of Limited Distribution - A Watch List
Threat Ranks
0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)
*NA in "Total" column identifies non-modeled species

Table 4.4-76 shows that, based on modeled high quality habitat for six of the nine modeled plants that have poor to moderate quality habitat data that are based on the projected future disturbance impacts as shown on Table 4.4-71. Impacts to high quality modeled habitat for the Bakersfield cactus and the San Joaquin adobe sunburst would largely occur in Tier 1 locations within the Eastern Subarea. Impacts to high quality modeled habitat for the Lost Hills crownscale, recurved larkspur, Kern mallow, and heartscale would occur predominantly (recurved larkspur) or largely (Lost Hills crownscale, Kern mallow, and heartscale) occur in the Western Subarea. High quality modeled habitat for the San Joaquin woolly-threads, California jewel flower, and Kern County larkspur would occur to a much more limited extent in specialized Project Area habitats (Figures 4.4-2, 4.4-9, and 4.4-9 in Appendix N). Potential impacts to San Joaquin woolly-threads high quality modeled habitat would be largely confined to Tier 1 areas and could occur in each subarea. Potential impacts to California jewel flower high quality modeled habitat would be almost exclusively limited to Tier 3 locations in the Eastern Subarea. Impacts to Kern County larkspur high quality modeled habitat would be largely confined to Tier 2 and Tier 3 areas in the Western and Eastern Subareas. In general, areas that are not modeled as high quality habitats are modeled as poor to moderate quality habitat for applicable special status plants. Consequently, potential impacts to low to moderate quality modeled habitat vary to a lesser extent than for modeled high quality habitat.

The amount of modeled high quality habitat that could be impacted also varies for each modeled plant species, including more than 600 acres per year for the San Joaquin adobe sunburst and recurved larkspur; from 200 to 300 acres per year for the Kern mallow, Lost Hills crownscale and heartscale; and 77 acres per year for the Bakersfield Cactus. Impacts to modeled high quality San Joaquin woolly-threads, California jewel flower, and Kern County larkspur habitat would range from about 3 to 18 acres per year (Table 4.4-76). Impacts to poor to moderate quality modeled habitat would range from 4,518 acres per year (Kern mallow) to 4,815 acres per year (California jewel flower). Table 4.4-77 analyzes the amount of total modeled high quality and poor to moderate quality habitat for each modeled special status plant in the Project Area that could be impacted by the projected annual level of disturbance summarized in Table 4.4-71 over 25 years.

Table 4.4-77: Project Area Impacts to Total Modeled High Quality and Low to Moderate Special Status Plant Habitat per Year and Over 25 years (percent)

	Annual Impact	25-Year Impact
High Quality Modeled Habitat		
Lost Hills Crownscale	1.36%	33.9%
Heartscale	0.82%	20.5%
San Joaquin Woolly-threads	0.59%	14.7%
Kern Mallow	0.49%	12.1%
Recurved Larkspur	0.46%	11.4%
California Jewel Flower	0.41%	10.2%
Bakersfield Cactus	0.30%	7.5%
San Joaquin Adobe Sunburst	0.29%	7.1%

Table 4.4-77: Project Area Impacts to Total Modeled High Quality and Low to Moderate Special Status Plant Habitat per Year and Over 25 years (percent)

	Annual Impact	25-Year Impact
Kern County larkspur (Rose-flowered larkspur)	0.04%	0.9%
Poor to Moderate Quality Modeled Habitat		
California Jewel Flower	0.25%	6.2%
San Joaquin Woolly-threads	0.25%	6.2%
Bakersfield Cactus	0.25%	6.2%
Kern Mallow	0.24%	6.0%
Heartscale	0.24%	6.0%
Lost Hills Crownscale	0.24%	5.9%

Table 4.4-77 indicates that if the maximum level of annual disturbance conservatively assumed in Table 4.4-71 occurred each year for 25 years, impacts in the Project Area could range from 0.9% (Kern County larkspur) to 33.9% (Lost Hills crownscale) of the total modeled high quality habitat. On an annual basis, potential impacts would range from 0.04% (Kern County larkspur) to 1.36% (Lost Hills crownscale) of the total Project Area modeled high quality habitat. Impacts to the Lost Hills crownscale, heartscale San Joaquin woolly-threads, Kern mallow, recurved larkspur, and California jewelflower could range from 0.41% to 1.36% per year, and 10.2% to 33.9% over 25 years, of total Project Area high quality modeled habitat. Impacts to poor to moderate quality modeled habitat would range from 0.24% to 0.24% per year and 5.9% to 6.2% over 25 years for each of the six modeled plants for which such data was available. These impacts would be significant without mitigation.

As shown in Table 4.4-78, potential impacts to non-modeled special status plants would vary primarily by subarea, and to a lesser extent by tier. None of the non-modeled special status plants except the mason's nestraw and oil nestraw are anticipated to occur in Tier 5. As discussed above, most of the potential future Project Area disturbance is projected to occur in Tier 1 (91%) and Tier 2 (6.1%). All of the non-modeled plants could occur in Tier 1 or Tier 2 areas except for the Erectstem saltbush, which is limited to Tiers 2 through 4 in the Central Subarea. As a result, all except one non-modeled special status plant could occur in the Project Area tiers that have the highest levels of projected future disturbance.

Potential impacts to non-modeled special status plants vary to greater extent by subarea. Table 4.4-78 groups each non-modeled species by subarea occurrence.

Table 4.4-78: Non-Modeled Plant Species Occurrence by Subarea

Table 4.4-78: Non-Modeled Plant Species Occurrence by Subarea

Slough thistle
Kings gold

Eight of the non-modeled plants occur in all three subareas: Bakersfield smallscale, Coulter's goldfield, Horn's milk vetch, Tejon poppy, Mason's neststraw, Munz's tidy tips, Oil neststraw, and Hispid bird's-beak. These species are the most widely distributed in the Project Area, and could also occur in both Tier 1 and Tier 2 locations where more than 97% of future disturbance is projected to occur. As a result, impacts to these species would be significant without mitigation.

Seven of the non-modeled plants occur only in the Eastern Subarea: Calico monkeyflower, California satintail, California tortula moss (California screw-moss), Comanche Point layia, Shevock's golden aster, Striped adobe-lily, and Vasek's clarkia. All of these species could also occur in Tiers 1 through 3 within the Eastern Subarea. As discussed above, about 21% (1,003 acres per year) of all Project Area future disturbance is projected to occur in the Eastern Subarea, of which 84% would occur in Tier 1, 9% in Tier 2, and 6% in Tier 3. As a result, the seven non-modeled plant species that occur only in the Eastern Subarea of the Project Area also could occur in Tiers 1 through 3 which account for 99% of the total projected future disturbance in the subarea. Impacts to these species would be significant without mitigation.

Six of the non-modeled plants occur only in the Western Subarea: Diamond-petaled California poppy, Hall's tarplant, Jared's pepper-grass, Lemmon's jewel flower, Showy golden madia, and Temblor buckwheat. All of these species could also occur in Tier 1 and Tier 2 within the Western Subarea. As discussed above, about 71% (3,460 acres per year) of all Project Area future disturbances is projected to occur in the Western Subarea, of which 94% would occur in Tier 1 and 4.5% would occur in Tier 2. As a result, the six non-modeled plant species that occur only in the Western Subarea also could occur in Tiers 1 through 2, which account for 98.5% of the total projected future disturbance in the subarea. Impacts to these species would be significant without mitigation.

One non-modeled plant, Erectstem saltbush, occurs only in the Central Subarea. This species is not expected to occur in Tier 1, but could occur in Tiers 2 through 4 of the Central Subarea. About 8% of total Project Area disturbance is projected to occur in the Central Subarea, and 24% of this potential activity (about 93 acres per year) would occur in Tiers 2 through 4. The species is associated with seasonal wetlands and washes located in the northern portion of the Central Subarea, some of which is protected in existing preserve lands. Although impacts to Erectstem saltbush would likely be lower than for other non-modeled plant species due to the limited locations in which the species occurs, potential impacts could still be significant without mitigation in the event future oil and gas activities occur in these areas.

One non-modeled plant, spiny-sepaled button-celery, occurs only in the Central and Eastern Subareas. This species could also occur within Tiers 1 through 4 of in the Central and Eastern Subareas. About 29% of total Project Area disturbance is projected to occur in the Central and

Eastern Subareas, and 99.9% of this potential activity (about 1,395 acres per year) would occur in Tiers 1 through 4. Potential impacts to the spiny-sepaled button-celery would be significant without mitigation because the species occurs in locations where almost all future oil and gas disturbance would be concentrated in the Central and Eastern Subareas.

Three non-modeled plants, Pale yellow layia, Piute Mountains navarretia, and Round-leaved filaree, only occur in hilly terrain within the Western and Eastern Subareas. These species could also occur within Tiers 1 through 4 of in the Western and Eastern Subareas. About 92% of total Project Area disturbance is projected to occur in the Western and Eastern Subareas, and 99.9% of this potential activity (about 4,460 acres per year) would occur in Tiers 1 through 4. Potential impacts to the Pale yellow layia, Piute Mountains navarretia, and Round-leaved filaree, would be significant without mitigation because these species occur in locations where almost all future Project Area oil and gas disturbance would be concentrated.

Five non-modeled plants, Alkali mariposa lily, Deltoid bract saltbush (*Subtle orache*), Lesser saltscale, Slough thistle, and Kings gold, only occur within the Western and Central subareas. These species could also occur within Tiers 1 through 4 of in the Western and Central Subareas. About 79% of total Project Area disturbance is projected to occur in the Western and Central Subareas, and 99.9% of this potential activity (about 3,851 acres per year) would occur in Tiers 1 through 4. Potential impacts to the Alkali mariposa lily, Deltoid bract saltbush, Lesser saltscale, Slough thistle, and Kings gold would be significant without mitigation because these five species occur in locations where almost all future oil and gas disturbance would be concentrated in the Western and Central Subareas.

Potential Special Status Wildlife Impacts

Table 4.4-79 summarizes the potential impacts, in terms of acres per year that could occur to modeled high quality special status wildlife habitats. Table 4.4-80 summarizes the potential impacts that occur to modeled poor to moderate quality habitat for all but three species, the Tehachapi slender salamander, San Joaquin pocket mouse, and least Bell's vireo, for which poor to moderate habitat modeling data was unavailable. Table 4.4-81 summarizes the potential occurrence of non-modeled special status wildlife by subarea and tier.

Modeling data was utilized to analyze impacts to most of the state and federally listed threatened or endangered species that occur in the Project Area and that could be significantly affected by future oil and gas activity, including the San Joaquin kit fox (federal endangered, state threatened), San Joaquin antelope squirrel (state threatened), giant kangaroo rat (federal and state endangered), Tipton kangaroo rat (federal and state endangered), Buena Vista Lake shrew (federal endangered), blunt-nosed leopard lizard (federal and state endangered, state fully protected); Tehachapi slender salamander (state threatened; high quality modeled habitat only), tricolored blackbird (state endangered), least Bell's vireo (federal and state endangered high quality modeled habitat only), golden eagle habitat (state fully protected; lower elevation areas only), and Swainson's hawk (state threatened).

Eleven listed species were analyzed using occurrence probability estimates by tier and subarea, including the ringtail (state fully protected), California red-legged frog (federal threatened), California tiger salamander (federal and state threatened), Kern Canyon slender salamander (state threatened), bald eagle (state fully protected), California condor (federal and state endangered, state fully protected), western snowy plover (federal threatened), white tailed kite (state fully protected), vernal pool fairy shrimp (federal threatened), longhorn fairy shrimp (federal endangered), and the Kern primrose sphinx moth (federal threatened).

Modeling data was also available for 17 other unlisted special status species that occur within the Project Area, including the western spadefoot, San Joaquin pocket mouse (high quality modeled habitat only), American badger, Tulare grasshopper mouse, short-nosed kangaroo rat, western mastiff bat, San Joaquin coachwhip, silvery legless lizard (including Bakersfield legless lizard and Temblor legless lizard), western pond turtle, coast horned lizard, burrowing owl, Le Conte's thrasher, grasshopper sparrow, lesser sandhill crane, northern harrier, yellow headed blackbird, and mountain plover.

The occurrence potential by Tier and Subarea was evaluated for eight non-listed special status species for which Project Area modeling data was not available. Occurrence potential was determined based on presence of potentially suitable habitat given habitat requirements of each of the non-modeled species. Habitat potential was determined based on occurrence data for each species, known habitat requirements compared to CALVEG mapping and Google Earth images (CNDDB 2015; VertNet 2015; CALVEG 2014; Google Earth Pro 2015).

Mammals

As shown in Tables 4.4-79 to 81, potential impacts to 13 special status mammals were evaluated, including 10 modeled and 3 non-modeled species. The modeled species include the San Joaquin kit fox, the "umbrella" species identified by the SJV Recovery Plan, and three "keystone species" in the SJV Recovery Plan, the giant, Tipton, and short-nosed kangaroo rats.

Table 4.4-79 shows that impacts to high quality modeled habitat for several mammals would either substantially (San Joaquin pocket mouse, San Joaquin kit fox, Tipton kangaroo rat) or largely (San Joaquin antelope squirrel, giant kangaroo rat, Tulare grasshopper mouse, short-nosed kangaroo rat) occur in Tier 1 locations and in the Western Subarea. Impacts to American badger high quality modeled habitat would also be concentrated in Tier 1 locations, but would occur in the Eastern Subarea to a greater extent than in the Western Subarea. Impacts to modeled high quality habitat for the western mastiff bat would be smaller in magnitude than for other mammals and largely confined to Western Subarea Tier 1 locations. Buena Vista shrew high quality habitat is relatively rare in the Project Area and generally associated with isolated existing or historical lakebed locations. About 1.2 acres of modeled Buena Vista shrew high quality habitat could be impacted each year, primarily in the Central Subarea. Impacts to modeled high quality mammal habitat would range from 3,000 to nearly 4,000 acres per year for the San Joaquin kit fox and pocket mouse, and from about 300 acres to over 1,700 acres per year for the San Joaquin antelope squirrel, American badger, giant kangaroo rat, Tulare grasshopper mouse, short-nosed kangaroo rat, and Tipton kangaroo rat.

Table 4.4-80 shows that, for most species, modeled poor to moderate quality habitat comprises the majority of the land in each tier and subarea. Consequently, impacts to modeled poor to moderate quality special status mammal habitats would generally occur to the greatest extent in the Western Subarea, to a lesser extent in the Eastern Subarea, and mainly in Tier 1 areas because the largest amount of future disturbance is projected to occur in these portions of the Project Area. Special status mammals with the greatest amount of poor to moderate quality modeled habitat, and the largest level of potential impacts to such habitat, include the western mastiff bat (foraging), Tipton kangaroo rat, short-nosed kangaroo rat, and Tulare grasshopper mouse. Table 4.4-80 also indicates that certain species with proportionately higher amounts of high quality habitat in the Project Area, including the American badger, San Joaquin antelope squirrel, and San Joaquin kit fox, would also be subject to potential impacts to poor to moderate quality habitat ranging from 1,787 acres (San Joaquin kit fox) to nearly 3,500 acres per year (American badger). Given the proximity of large amounts of high-quality habitat in the Project Area, it is more likely that impacts to occupied habitat could also occur to these species in areas of modeled poor to moderate quality habitat.

Table 4.4-82 analyzes the amount of total modeled high quality habitat for each modeled special status mammal, and low to moderate quality habitat for each species except the San Joaquin pocket mouse in the Project Area that could be impacted by the projected annual level of disturbance summarized in Table 4.4-72 over 25 years.

Table 4.4-82: Project Area Impacts to Total Modeled High Quality and Poor to Moderate Quality Special Status Mammal Habitat per Year and Over 25 Years (percent)

	Annual Impact	25-Year Impact
High Quality Modeled Habitat		
Giant Kangaroo Rat	1.11%	27.7%
San Joaquin Antelope Squirrel	1.03%	25.7%
Short-Nosed Kangaroo Rat	0.81%	20.3%
San Joaquin Kit Fox	0.71%	17.6%
Tulare Grasshopper Mouse	0.63%	15.9%
San Joaquin Pocket Mouse	0.43%	10.8%
American Badger	0.20%	5.0%
Tipton Kangaroo Rat	0.14%	3.5%
Western Mastiff Bat	0.13%	3.3%
Buena Vista Lake Shrew	0.02%	0.4%
Poor to Moderate Quality Modeled Habitat		
Tipton Kangaroo Rat	0.26%	6.6%
American Badger	0.25%	6.3%
Western Mastiff Bat	0.25%	6.3%
Short-Nosed Kangaroo Rat	0.23%	5.8%
Tulare Grasshopper Mouse	0.23%	5.8%
Giant Kangaroo Rat	0.21%	5.3%
San Joaquin Antelope Squirrel	0.17%	4.4%
Buena Vista Lake Shrew	0.16%	4.1%
San Joaquin Kit Fox	0.12%	3.0%

Table 4.4-82 indicates that, if the maximum level of annual disturbance conservatively assumed in Table 4.4-71 occurred each year for 25 years, impacts in the Project Area could range from 0.4% (Buena Vista shrew) to 27.7% (giant kangaroo rat) of the total modeled high quality habitat. On an annual basis, potential impacts would range from 0.02% (Buena Vista shrew) to 1.11% (giant kangaroo rat) of the total Project Area modeled high quality habitat. Impacts to the giant kangaroo rat, San Joaquin antelope squirrel, short-nosed kangaroo rat, San Joaquin kit fox, Tulare grasshopper mouse, and San Joaquin pocket mouse could range from 0.43% to 1.11% per year, and 10.8% to 27.7% over 25 years, of total Project Area high quality modeled habitat. Impacts to poor to moderate quality modeled habitat would range from 0.12% (San Joaquin kit fox) to 0.26% (Tipton Kangaroo rat) per year and 3% to 6.6% over 25 years. Impacts to the Buena Vista Lake shrew would affect less than 0.5% of total high quality modeled habitat and 4.1% of poor to moderate quality modeled habitat in the Project Area if the maximum level of potential impacts

occurred annually for 25 years. Potential impacts to special status mammals would be significant without mitigation.

The occurrence assessment for the pallid bat, ringtail, and Townsend's big-eared bat indicates that these species could occur in Tiers 1 through 4 in the Western and Eastern Subareas. About 92% of the total potential annual impacts in the Project Area (4,460 acres) would occur in these locations. The Townsend's big-eared bat could also occur in the Central Subarea. Potential impacts to these species could be significant without mitigation. The ringtail is a nocturnal species that requires access to perennial water sources and generally prefers areas with high vegetative cover. It is more likely to occur in higher elevations, or in deeper canyons with reliable water supplies, than in most of the lower elevation, drier, and sparsely-covered portions of the Project Area. Potential impacts to the ringtail would be unlikely to occur in most of the Project Area other than deeper canyons and in higher elevation locations with significant groundcover and access to perennial water sources.

Reptiles and Amphibians

As shown in Tables 4.4-79 to 4.4-81, potential impacts to 10 special status reptiles and amphibians were evaluated, including seven modeled and three non-modeled species. The modeled species include the blunt-nosed leopard lizard (BNLL), a state and federal endangered and state fully protected species, and the Tehachapi slender salamander, as state threatened species.

Table 4.4-79 shows that impacts to modeled high quality habitat for BNLL and the San Joaquin coachwhip would largely occur in Tier 1 locations and in the Western Subarea. Impacts to BNLL high quality modeled habitat would, using the conservative assumptions summarized in Table 4.4-72, be about 1,774 acres per year, and 1,269 acres per year for the San Joaquin coachwhip. Impacts to other modeled species' high quality habitat, including the silvery legless lizard, western pond turtle, coast horned lizard, Tehachapi slender salamander, and western spadefoot would range from 0.03 acres per year (western spadefoot) to 103 acres per year for the silvery legless lizard. Potential impacts to modeled high quality habitat for the Tehachapi slender salamander would be limited to the Eastern Subarea, and to the Western Subarea for the western spadefoot. Potential impacts to other modeled high quality habitat could occur in all three subareas (silvery legless lizard, western pond turtle) and the Western and Southern Subareas (coast horned lizard).

Table 4.4-80 indicates that modeled poor to moderate quality habitat comprises the majority of the land in each tier and subarea. Consequently, impacts to modeled poor to moderate quality reptile and amphibian habitats would generally occur to the greatest extent in the Western Subarea, to a lesser extent in the Eastern Subarea, and mainly in Tier 1 areas because the largest amount of future disturbance is projected to occur in these portions of the Project Area. Reptiles and amphibians with the greatest amount of poor to moderate quality modeled habitat, and the largest level of potential impacts to such habitat, include the western spadefoot, coast horned lizard, western pond turtle and silvery legless lizard. Two species, the BNLL and the coachwhip, have relatively high amounts of modeled high quality habitat in the Project Area. Impacts to

occupied habitat may also be more likely to occur to these species in areas of modeled poor to moderate quality habitat.

Table 4.4-83 analyzes the amount of total modeled high quality habitat for each modeled special status reptile and amphibian, and low to moderate quality habitat for each species except the Tehachapi slender salamander in the Project Area that could be impacted by the projected annual level of disturbance summarized in Table 4.4-72 over 25 years.

Table 4.4-83: Project Area Impacts to Total Modeled High Quality and Poor to Moderate Quality Special Status Reptile and Amphibian Habitat per Year and Over 25 Years (percent)

	Annual Impact	25-Year Impact
High Quality Modeled Habitat		
San Joaquin Coachwhip	0.89%	22.4%
Blunt Nosed Leopard Lizard	0.75%	18.7%
Western Pond Turtle	0.70%	17.6%
Silvery Legless Lizard	0.40%	9.9%
Coast Horned Lizard	0.03%	0.7%
Tehachapi Slender Salamander	0.02%	0.5%
Western Spadefoot	0.02%	0.5%
Poor to Moderate Quality Modeled Habitat		
Coast Horned Lizard	0.26%	6.5%
Western Spadefoot	0.25%	6.2%
Silvery Legless Lizard	0.25%	6.2%
Western Pond Turtle	0.25%	6.2%
San Joaquin Coachwhip	0.20%	4.9%
Blunt Nosed Leopard Lizard	0.18%	4.5%

Table 4.4-79 indicates that, if the maximum level of annual disturbance conservatively assumed in Table 4.4-72 occurred each year for 25 years, impacts in the Project Area could range from 0.5% (western spadefoot, Tehachapi slender salamander) to 22.4% (San Joaquin coachwhip) of the total modeled high quality habitat. On an annual basis, potential impacts would range from 0.02% (western spadefoot, Tehachapi slender salamander) to 0.89% (San Joaquin coachwhip) of the total Project Area modeled high quality habitat. Impacts to the BNLL, western pond turtle, coachwhip and silvery legless lizard could range from 0.40% to 0.89% per year, and 9.9% to 22.4% over 25 years, of total Project Area modeled high quality habitat. Potential annual and 25-year impacts to modeled high quality habitat for the coast horned lizard, Tehachapi slender salamander and western spadefoot would affect between 0.5% to 0.7% of total modeled high quality habitat in the Project Area if the maximum level of potential impacts occurred annually

for 25 years. As discussed below, mitigation measures that require the avoidance (unless fully permitted by state and federal resource agencies) impacts to riparian and aquatic habitats in addition to species-related mitigation measures would reduce the level of the potential impacts to the Tehachapi slender salamander, western spadefoot and western pond turtle by avoiding the primary habitats where these species occur. Impacts to modeled poor to moderate quality habitat would range from 0.18% (BNLL) to 0.26% (coast horned lizard) per year and 4.5% to 6.5% over 25 years. These impacts would be significant without mitigation.

The occurrence assessment for the California red-legged frog, California tiger salamander, Kern Canyon slender salamander, and Yellow-blotched salamander indicates that the project would be unlikely to significantly impact these species. None have a substantial likelihood of occurring in Tier 1 areas, where over 90% of future disturbance is projected to be concentrated. The potential occurrence of the California red-legged frog and California tiger salamander is generally limited to Tier 2 locations in the far northwest corner of the Project Area and where critical habitat has been designated for these species (see Figure 4.4-3). The Kern Canyon slender salamander is generally limited to the Tier 2 and Tier 3 areas in the vicinity of the Kern River canyon. The yellow blotched salamander generally occurs in Tier 2 and Tier 4 areas in the Eastern and Western Subareas. As discussed below, mitigation measures that require the avoidance (unless fully permitted by state and federal resource agencies) of impacts to riparian and aquatic habitats in addition to species-related mitigation measures would reduce the level of the potential impacts to the Kern Canyon slender salamander in aquatic habitats associated with the Kern River and aquatic habitats that also support the yellow blotched salamander in the Eastern and Western Tier 2 and Tier 4 locations. Potential impacts to could occur in occupied north-facing slope habitat outside of aquatic and riparian areas that these species may also occupy.

Birds

As shown in Tables 4.4-79 to 4.4-81, potential impacts to 20 special status birds were evaluated, including 11 modeled and 9 non-modeled species. The modeled species include the unlisted burrowing owl, the tricolored blackbird (state endangered), and the least bell's vireo (state and federal endangered). As discussed above, the modeling data is generally confined to Project Area locations below about 2000 feet in elevation. Models of high quality habitat for the golden eagle (state fully protected) and Swainson's hawk (state threatened) were also used to evaluate potential project impacts to these species in lower elevation locations.

Table 4.4-79 shows that impacts to modeled high quality habitat for the burrowing owl, grasshopper sparrow, lesser sandhill crane and tricolored blackbird would be largely concentrated in Tier 1 areas and in the Western Subarea. Almost all of the projected impacts to Le Conte's thrasher modeled high quality habitat would occur in Tier 1 of the Western Subarea. Burrowing owl and lesser sandhill crane modeled high quality habitat impacts could occur to lesser extent in the Central Subarea, and impacts could also occur to burrowing owl and grasshopper sparrow modeled high quality habitat in the Eastern Subarea. Potential impacts to modeled high quality habitat would primarily occur in Tiers 1-2 of the Eastern Subarea for the northern harrier and Tier 1 and Tier 3 of the subarea for the least bell's vireo. Impacts to mountain plover high quality modeled habitat would mainly occur in Tier 2 of the Central Subarea. Potential impacts to yellow

headed blackbird modeled high quality habitat would occur in each of the three subareas and mainly in Tiers 1-2.

The models do not identify high quality habitat for the golden eagle or the Swainson's hawk within the lower elevation portions of the Project Area. The TUMSHCP EIS and the Biological Opinion for the TUMSHCP issued by the USFWS in 2013 show that, in contrast with the lower elevation portions of the Project Area, locations above 2,000 feet are known to support active golden eagle territories, nests, and high quality breeding and foraging habitat. Based on data from Tejon Ranch surveys conducted for the TUMSHCP, the USFWS concluded that, due to abundant prey, breeding pairs of golden eagles in higher elevations along the southern border of the Project Area likely maintain smaller than average territories (i.e., about 5,000 to 8,000 acres), which could result in greater than typical species densities in these locations (USFWS 2013d). To provide a conservative assessment, this DEIR assumes that all Project Area land located above 2,000 feet in elevation is high quality golden eagle habitat, and that disturbance in these areas could result in significant impacts to the species without mitigation. The Swainson's hawk was not included in the TUMSHCP.

Table 4.4-79 shows that acreage impacts to modeled high quality habitat vary by species. Impacts to burrowing owl, Le Conte's thrasher, grasshopper sparrow and lesser sandhill crane modeled high quality habitat would, using the conservative assumptions summarized in Table 4.4-71, range from 128 acres per year (lesser sandhill crane) to 1,003 acres per year (burrowing owl). Potential impact to modeled high quality habitat for the tricolored blackbird, least Bell's vireo, northern harrier, mountain plover and yellow-headed blackbird would range from 2.42 acres per year (yellow headed blackbird) to 42 acres per year (tricolored blackbird).

Table 4.4-80 shows that, consistent with the results for most mammals, reptiles and amphibians, most of the Project Area is modeled as poor to moderate quality modeled avian habitat for many species. Impacts to poor to moderate habitat for these species, including the Swainson's hawk, golden eagle, mountain plover, northern harrier, tricolored blackbird and Le Conte's thrasher, would range from just under 4,000 acres (Le Conte's thrasher) to more than 4,800 acres (Swainson's hawk, golden eagle, mountain plover, northern harrier) and would occur in the Western Subarea, to a lesser extent in the Eastern Subarea, and mainly in Tier 1 areas because the largest amount of future disturbance is projected to occur in these portions of the Project Area. Birds that have large amounts of modeled poor to moderate quality habitat in addition to modeled high quality habitat in the Project Area include the Le Conte's thrasher, burrowing owl, grasshopper sparrow and yellow-headed blackbird. Impacts to occupied habitat may also be more likely to occur to these species in areas of modeled poor to moderate quality habitat.

Table 4.4-84 analyzes the amount of total modeled high quality habitat for each modeled special status bird, and modeled poor to moderate quality habitat for each species except the least Bells' vireo in the Project Area that could be impacted by the projected annual level of disturbance summarized in Table 4.4-72 over 25 years.

Table 4.4-84: Project Area Impacts to Total Modeled High Quality and Poor to Moderate Quality Special Bird Habitat per Year and Over 25 years (percent)

	Annual Impact	25-Year Impact
High Quality Modeled Habitat		
Le Conte's Thrasher	1.15%	28.8%
Burrowing Owl	0.45%	11.1%
Least Bell's vireo	0.26%	6.6%
Tricolored Blackbird	0.20%	5.1%
Grasshopper Sparrow	0.14%	3.4%
Lesser Sandhill Crane	0.05%	1.1%
Yellow Headed Blackbird	0.04%	0.9%
Northern Harrier	0.03%	0.9%
Mountain Plover	0.01%	0.3%
Golden Eagle (low elevations only)	NA	NA
Swainson's Hawk	NA (nesting)	NA (nesting)
Poor to Moderate Quality Modeled Habitat		
Grasshopper Sparrow	0.61%	15.2%
Mountain Plover	0.25%	6.3%
Northern Harrier	0.25%	6.3%
Tricolored Blackbird	0.25%	6.2%
Golden Eagle	0.25%	6.2%
Swainson's Hawk	0.25%	6.2%
Burrowing Owl	0.22%	5.6%
Le Conte's Thrasher	0.21%	5.3%
Yellow Blackbird	0.12%	2.9%
Lesser Sandhill Crane	0.02%	0.5%

Table 4.4-84 indicates that, if the maximum level of annual disturbance conservatively assumed in Table 4.4-71 occurred each year for 25 years, impacts in the Project Area could range from 0.3% (mountain plover) to 28.8% (Le Conte's thrasher) of total modeled high quality habitat. On an annual basis, potential impacts would range from 0.01% (mountain plover) to 1.15% (Le Conte's thrasher) of the total Project Area modeled high quality habitat. Impacts to the Le Conte's thrasher and burrowing owl could range from 1.15% to 0.45% per year, and 28.8% to 11.% over 25 years, of total Project Area high quality modeled habitat. Potential 25-year impacts to high quality modeled habitat for the least Bell's vireo, tricolored blackbird, and grasshopper sparrow could range from 3.4% to 6.6%. Potential 25-year impacts to high quality modeled habitat for the lesser sandhill crane, yellow headed blackbird, northern harrier and mountain plover could range between 0.3% to 1.1%. Impacts to poor to moderate quality modeled habitat

would range from 0.02% (lesser sandhill crane) to 0.61% (grasshopper sparrow) per year and 0.5% to 15.2% over 25 years. These impacts would be significant without mitigation.

The occurrence assessment for the Fulvous whistling-duck indicates that the species is only likely to occur in Tier 2 areas within the Western and Central Subareas. About 4% (208 acres per year) of total Project Area impacts would occur in these locations, and mitigation measures that require the avoidance (unless fully permitted by state and federal resource agencies) of impacts to riparian and aquatic habitats in addition to species-related mitigation measures would reduce potential impacts to an additional extent. Project activities are unlikely to significantly affect the Fulvous whistling-duck. The occurrence assessments for the loggerhead shrike, long-eared owl, short-eared owl, western snowy plover and white-tailed kite indicate that each these species can occur in the Western Subarea and at least one additional subarea (long-eared owl, short-eared owl, western snowy plover) or the other two subareas (loggerhead shrike, white-tailed kite). All of these species could also occur in Tiers 1-4. Projected project impacts would occur primarily in the Western Subarea and in Tiers 1-4. Potential impacts to the loggerhead shrike, long-eared owl, short-eared owl, western snowy plover and white-tailed kite could be significant without mitigation.

As discussed above, the occurrence assessments for non-modeled species are conservative and treat any historical evidence of occurrence as indicating the possibility of future occurrence in an applicable tier or subarea. Using this approach, the occurrence assessment indicates that the California condor could occur in Tiers 1-5 of the Western and Eastern Subareas based on historical records that in most instances predate the capture of the existing population in the 1970s and subsequent re-release. Condor activity for the current population is regularly monitored by the USFWS using transmitters that are positioned on individual birds. The data for periods since 2000 were recently compiled and analyzed by the USFWS in conjunction with the TUMSHCP and show that, in contrast with historical reports, condors currently do not utilize lower elevation portions of the Project Area, other than very rare occurrences at the base of the adjacent mountain ranges (Figure 4.4.-5). The TUMSHCP approved by the USFWS in 2013 found that condor movement is topographically constrained to upland areas that produce updrafts, and that although prehistoric condors possibly made use of San Joaquin Valley floor habitat, and that the contemporary condor population appears to largely avoid the Central Valley floor for foraging, probably due to the lack of thermal activity and food sources (USFWS 2013d). Consequently, condor occurrence in the lower elevation portions, particularly any significant distance from the surrounding mountains that generate updrafts used by the species for movement (see Figure 4.4-9) is highly unlikely. In contrast, condor use of Project Area and adjacent locations above 2000 feet, particularly along the southern and eastern boundaries, has been well documented to occur, and is likely to occur to greater extent over time as the population recovers in the wild. To provide a conservative assessment, this DEIR assumes that all Project Area land located above 2,000 feet in elevation is high quality condor, and that disturbance in these areas could result in significant impacts to the species without mitigation.

Similarly, the occurrence assessment for the bald eagle is conservatively based on species migration patterns, and the occasional observation of the species in the Tiers 1-5 and the three

subareas over time. Bald eagles generally migrate south through the Project Area to southern locations during the winter. High quality wintering locations are characterized by trees for roosting and perennial waterbodies with food sources, including fish. Very few locations, and virtually none within the lower elevations of the Project Area meet these criteria. The limited extent of high quality bad eagle habitat in the region is indicated by the TUMSHCP analysis of the species, in which the USFWS determined that the 141,886-acre Tejon Ranch contained only 518 acres of modeled foraging habitat and 1,438 acres of modeled winter roosting habitat, all located exclusively around Castaic Lake. Castaic Lake is outside of the Project Area to the south. The modeling indicated no other locations within the ranch representing bald eagle foraging or wintering habitat, although eagles may temporarily use portions of the site during migration. Bald eagles are also not known to breed within the lower or upper elevations of the Project Area, or in the uplands to the south (USFWS 2013d). The Project Area is primarily used by bald eagles for temporary migratory purposes and does not provide high quality breeding, wintering or foraging habitat for the species.

Aquatic Species and Insects

As shown in Table 4.4-81, occurrence assessments were used to analyze potential impacts to the Kern brook lamprey, vernal pool fairy shrimp, longhorn fairy shrimp and the Kern primrose sphinx moth. The Kern brook lamprey could occur in streams in the Eastern Subarea. The vernal pool fairy shrimp could occur in seasonally inundated areas in the Central and Eastern Subareas, and the longhorn fairy shrimp could occur in seasonally inundated areas in the Western and Central Subareas. All of these species occur in pooled areas that remain inundated for a sufficient time period and exhibit suitable pH and other characteristics that support their reproductive cycle. Project impacts to habitats that may contain these species would be significant. As discussed below, mitigation measures require the avoidance (unless fully permitted by state and federal resource agencies) impacts to riparian and aquatic habitats, and potential project impacts to these species in these habitat types would be reduced to less than significant levels. However, where vernal pool fairy shrimp and longhorn fairy shrimp occur outside of aquatic or riparian habitats, impacts could be significant.

The sphinx moth is known to presently occur in only three general locations, all of which are outside of the Project Area: the Walker Basin on the eastern side of the Sierra range, the Carrizo Plain to the west of the Project Area, and the Cuyama Valley to the west of the Carrizo Plains. In 2007, the USFWS conducted a 5-year review of the species and did not identify oil and gas activity as factor affecting species survival or recovery. The review also indicated that the species has a high probability of recovery because suitable habitat exists on public land in the Carrizo Plain and Cuyama Valley areas that may support the species and pupae can diapause for several years in response to adverse conditions. In addition, the review concluded that species recovery did not conflict with "economical and land development practices within the area of known Kern primrose sphinx moth distribution" (USFWS 2013). Oil field activities were well-established in 2007 along the Temblor Range to the east of the Carrizo Plain, the closest area of known species occupation. Project Area activities are not likely to impact the known locations of, or suitable habitat for the species in the Walker Basin, Carrizo Plain, or Cuyama Valley. It is possible that sandy washes with appropriate vegetation may exist within the Western Subarea that support the

moth. Given the limited distribution of the species, impacts in these locations would be significant without mitigation.

Based on the analysis described above, potential project impacts to special status plants and wildlife would be significant without mitigation.

Mitigation Measures

MM 4.4-1 With the exception of focused surveys that are seasonally restricted, special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities. The purpose of the pre-disturbance surveys is to confirm the presence or absence of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act, or designated as fully-protected in the California Fish and Game Code (collectively, "Protected Species"), and to confirm the presence or absence of any other species considered "sensitive" under California Environmental Quality Act ("Sensitive Species"), and to identify and implement feasible avoidance and minimization measures for such species. The surveys shall be conducted in accordance with all currently-applicable presence and absence survey and/or species protocols established by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife ("Species Protocols"). In the absence of any approved protocols, the survey shall extend for a minimum of 250 feet from all areas where any ground disturbance activities would occur, provided that permission to access has been obtained. As an alternative to individual pre-disturbance surveys for each application, and after consultation with and concurrence by the California Department of Fish and Wildlife and the United States Fish and Wildlife Service, multiple parcels or areas of oil and gas production lands (including lands which may have multiple surface or mineral ownership) may be consolidated for the purpose of more efficiently managing pre-disturbance surveys and determinations regarding the absence of protected species in areas of proposed new ground disturbance activities.

MM 4.4-2 No incidental take of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act , or designated as fully-protected in the California Fish and Game Code (Protected Species) may occur unless the incidental take is authorized by applicable state and federal wildlife agencies in the form of a permit or other written authorization, an approved state or federal conservation plan, or in accordance with an approved regional plan such as the Draft Valley Floor Habitat Conservation Plan and/or Natural Community Conservation Plan.

MM 4.4-3 Exclusion barriers or buffers may be used, where effective and feasible in the opinion of the qualified biologist, to avoid any unauthorized incidental take of

Protected Species, and to minimize any incidental take of Sensitive Species, by separating the planned disturbance area from any locations where pre-disturbance surveys or previously conducted focused surveys have detected the presence of Protected Species or Sensitive Species. All buffers must extend for a minimum of 50 feet from the nearest point of disturbance unless a smaller avoidance buffer has been established by either the United States Fish and Wildlife Service or the California Department of Fish and Wildlife as the minimum to avoid unauthorized take of protected species, and the barriers must prevent the potential migration of wildlife into the construction area and unlawful incidental take of any Protected Species during ground disturbance activities. The minimum buffer distance shall be increased if required to avoid unauthorized incidental take of any Protected Species as determined by a qualified biologist. Exclusion barriers, buffer distances, and other avoidance measures that may be implemented to avoid impacts to Protected Species or Sensitive Species must be consistent with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, and shall be implemented and overseen by the qualified biologist.

MM 4.4-4 Occupied burrowing owl burrows shall not be disturbed during the species nesting season (February 1 through August 31). The following distances shall be maintained between all disturbance areas and burrowing owl nesting sites (Table 4.4-85).

Table 4.4-85: Setback Distances for Burrowing Owl Nesting Sites by Level of Proposed Project Impacts

Location		
Nesting sites	Nesting sites	Nesting sites
Time of Year		
April 1–Aug 15	Aug 16–Oct 15	Oct 16–Mar 31
Project Impact Level		
Low		
656 feet (200 meters)	656 feet (200 meters)	164 feet (50 meters)
Medium		
1,640 feet (500 meters)	656 feet (200 meters)	328 feet (100 meters)
High		
1,640 feet (500 meters)	1,640 feet (500 meters)	1,640 feet (500 meters)

Burrowing owls present in proposed disturbance areas or within 500 feet or as specified under an approved Habitat Conservation Plan (as identified during pre-disturbance surveys) outside of the breeding season (between September 1 and January 31) may be moved away from the disturbance area using passive

relocation techniques approved by the California Department of Fish and Wildlife. Passive relocation techniques in the California Department of Fish and Wildlife Staff Report on Burrowing Owl Mitigation Guidelines (California Department of Fish and Game 2012) include installing one-way doors in burrow entrances for 48 hours, to ensure the owl(s) have left the burrow, daily monitoring during the passive relocation period, and collapsing existing burrows to prevent reoccupation. A minimum of one or more weeks will be required to relocate the owl(s) and allow for acclimatization to alternate off-site burrows. Prior to burrow exclusion or eviction, a burrowing owl management plan shall be prepared and approved by the California Department of Fish and Wildlife. Destruction of burrows shall occur only pursuant to a management plan for the species approved by the California Department of Fish and Wildlife; burrow excavation shall be conducted by hand whenever possible.

As an alternative to passive relocation, occupied burrows identified off-site within 500 feet of construction activities may be buffered with hay bales, fencing (e.g. sheltering in place), or as directed by the qualified biologist and the California Department of Fish and Wildlife, to avoid disturbance of burrows.

MM 4.4-5 The pre-disturbance surveys shall determine whether active bat maternity roosts are located in or within 250 feet of any disturbance area. All active bat maternity roosts shall be avoided during breeding periods, including postponing disturbance activities if required, and to the maximum extent feasible at other times. If an active bat maternity roost location cannot feasibly be avoided by disturbance, the United States Fish and Wildlife Service and California Department of Fish and Wildlife must be contacted to identify appropriate impact minimization measures prior to initiating any disturbance that would affect the roost.

MM 4.4-6 Any potential San Joaquin kit fox dens (as defined in United States Fish and Wildlife Service 2011) detected during pre-disturbance surveys shall be reevaluated for species activity no more than 14 days prior to the commencement of ground disturbance. Potential kit fox dens shall be marked and a 50-foot avoidance buffer shall be delineated using stakes and flagging or similar materials to prevent inadvertent damage to the potential den. If a potential den cannot feasibly be avoided, the den may be hand excavated in accordance with the United States Fish and Wildlife Service *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance* (United States Fish and Wildlife Service 2011). If species activity is detected, the location shall be identified as a "known" kit fox den in accordance with the U.S. Fish and Wildlife Service species guidelines (United States Fish and Wildlife Service 2011). A minimum 100-foot buffer from any disturbance area shall be maintained for known dens and a minimum 500-foot buffer from any disturbance area shall be maintained for natal dens. No excavation of a known or natal den shall occur without prior authorization from the United States

Fish and Wildlife Service and the California Department of Fish and Wildlife. For activities occurring on land covered under an approved Habitat Conservation Plan, the requirements set forth in those documents shall be implemented. Other standard measures to protect San Joaquin kit fox, including capping pipes, covering trenches, adding exit ramps to excavated areas, shall be implemented in accordance with MM 4.4-19.

MM 4.4-7 Occupied American badger dens detected during pre-disturbance surveys shall be flagged and ground-disturbing activities avoided within 50 feet of the den. Maternity dens shall be avoided and a minimum 200-foot buffer from disturbance shall be maintained during pup-rearing season (February 15 through July 1). Maternity dens must be avoided to the maximum extent feasible. If a maternity den cannot feasibly be avoided, the California Department of Fish and Wildlife must be contacted to identify appropriate impact minimization measures prior to initiating any disturbance that would affect the den, including potential passive relocation by excavation before or after the rearing season.

MM 4.4-8 Pre-disturbance surveys for all sites located above 2,000 feet in elevation, or within 200 feet down gradient from the 2,000-foot elevation contour line, shall specifically survey for any golden eagle nests located within 2 miles of the site. If golden eagle nests are detected by the surveys, the qualified biologist shall conduct a nest-specific viewshed analysis. No disturbance may occur within 0.25 mile, or within 0.5 mile of the viewshed of an active golden eagle nest. The United States Fish and Wildlife Service and California Department of Fish and Wildlife must be notified prior to the commencement of any disturbance activities within 1 mile of an active golden eagle nest to avoid golden eagle take.

MM 4.4-9 All sites located above 2,000 feet in elevation, or within 200 feet down gradient from the 2,000-foot elevation contour line, shall implement the following measures to avoid and minimize potential adverse impacts to the California condor:

a. The site shall, at all times, be maintained to avoid any trash, debris, food sources and microtrash, such as bottle caps, that could be ingested by or attract California condor. Trash shall be disposed in animal-proof containers as required in BIO 4.4-19.

b. The Worker Environmental Awareness Program described in BIO MM 4.4-18 shall include information about microtrash and potential effects to California condor, and shall prohibit the disposal of trash (and microtrash) on the site of oil and gas activities.

c. If a condor is observed in a proposed construction site, all disturbance activities must immediately cease within 500 feet of the condor until the animal has moved from the site. If condor occurrence persists, the United States Fish and Wildlife Service and the California Department of Fish and

Wildlife must be contacted to identify appropriate avoidance measures prior to initiating or resuming any disturbance activity.

d. All condor observations shall be reported within 24 hours to the United States Fish and Wildlife Service and the California Department of Fish and Wildlife.

e. All tanks, liquid storage facilities, and any open area containing water or other liquid materials, including drilling sumps, must be covered or otherwise shielded in a manner that prevents condor intrusion and potential entrapment.

f. No overhead transmission lines may be used at the site without the prior approval of the United States Fish and Wildlife Service and the California Department of Fish and Wildlife.

MM 4.4-10 Pre-disturbance surveys for active bird nests must be conducted no more than 10 days prior to the commencement of disturbance. Surveys shall follow United States Fish and Wildlife and California Department of Fish and Wildlife guidance and/or protocols, as applicable. If no active nests or nesting birds are identified, then Project construction activities may proceed and no further mitigation measures for nesting birds are required. If active nest(s) are identified, the active nest(s) should be continuously surveyed for the first 24 hours after detection, to establish a behavioral baseline prior to any construction-related activities. Once construction commences, all nests shall be continuously monitored to detect any behavioral changes as a result of the Project (i.e., nest avoidance or abandonment). If behavioral changes are observed, the work causing that change should cease and the California Department of Fish and Wildlife and the United States Fish and Wildlife should be consulted for additional avoidance and minimization measures. If continuous monitoring of identified nests by a qualified wildlife biologist is not feasible, a minimum no-disturbance buffer of 250 feet will be established around active nests and a 500-foot no-disturbance buffer around the nests of raptors until the breeding season has ended, or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival, and any adult birds are no longer occupying the nest. Variance from these no-disturbance buffers may be implemented a qualified biologist concludes that work within the buffer area would not cause nest avoidance or abandonment (e.g., when the disturbance area would be concealed from a nest site by topography). The California Department of Fish and Wildlife and the United States Fish and Wildlife must be notified in advance of implementing of a variance in the no-disturbance buffer.

MM 4.4-11 The following measures will be implemented to avoid take of blunt-nosed leopard lizard and to ensure protection of these animals during Project activities:

a. Project activities will avoid all potential burrows that may be occupied by blunt-nosed leopard lizards. Suitable burrows within and adjacent to potential habitat for the species should be avoided by a minimum distance of 50-feet in all areas where ground-disturbing Project activities will occur.

b. No more than one year prior to ground disturbing activities, focused surveys following current California Department of Fish and Wildlife and United States Fish and Wildlife protocols for detection of this species or other methods approved by both agencies shall be conducted in all potential blunt-nosed leopard lizard habitat within the work site and a 250-foot buffer area. If no individual blunt-nosed leopard lizards are observed during focused surveys, and surveys are current (e.g., completed in the same calendar year), then Project activities may proceed.

c. If blunt-nosed leopard lizards are detected during focused surveys, a blunt-nosed leopard lizard avoidance plan shall be prepared for the Project that will result in avoidance of incidental take of this species unless take is separately authorized under a Natural Communities Conservation Plan and appropriate federal authorization is obtained. At a minimum, the blunt-nosed leopard lizard avoidance plan shall contain the following elements:

    1. A Worker Environmental Awareness Program shall be implemented for all construction personnel before construction begins (see MM 4.4-18).

    2. During periods that are optimal for blunt-nosed leopard lizard activity (early spring through late fall), a qualified biologist will be present during all ground disturbing activities. The qualified biologist will check the Project site(s) and access route(s) daily during the blunt-nosed leopard lizard active season to determine presence or absence of lizards in or near the work areas. Monitoring by a qualified biologist is not required during periods of inactivity (the winter season).

    3. All open trenches or excavations shall be covered at the end of each workday or protected with the use of exclusion fencing to prevent wildlife entrapment. If an excavation is too large to cover, escape ramps shall be installed at an incline ratio of no greater than 2:1. All trenches and pipes shall be inspected for the presence of wildlife each day prior to the commencement of work. If blunt-nosed leopard lizards are observed at the work site during construction, construction shall cease within a 250-foot radius and the United States Fish and Wildlife Service and the California Department of Fish and Wildlife shall be consulted to determine what additional measures would be necessary to prevent take of this species.

    4. Offsite locations where blunt-nosed leopard lizards have been observed or are likely to occur shall be clearly marked to prevent workers from driving off the road and to prevent inadvertent destruction of burrows. Barriers, such as exclusionary fencing may be installed. All construction equipment

and construction personnel vehicles will be checked prior to moving to ensure no blunt-nosed leopard lizard are under equipment/vehicles.

5. A speed limit of 10 miles per hour shall be posted and observed within 0.25 miles of any reported blunt-nosed leopard lizard observation.

6. Construction activities shall avoid burrows that may be used by blunt-nosed leopard lizards. Any location of proposed construction activity with potential to collapse or block burrows (i.e., stockpile storage, parking areas, staging areas, trenches) will be identified prior to construction in the blunt-nosed leopard lizard avoidance plan and approved by the qualified biologist. The qualified biologist may allow certain activities in burrow areas if the combination of soil hardness and activity impact is not expected to collapse burrows and no blunt-nosed leopard lizards have been found during pre-Project surveys in the impact area.

7. All individual blunt-nosed leopard lizards observed above-ground will be avoided. Any individual blunt-nosed leopard lizard that may enter the Project site(s) would be allowed to leave unobstructed, and on its own accord. If a blunt-nosed leopard lizard is detected during biological monitoring or observed at any other point, the California Department of Fish and Wildlife and the United States Fish and Wildlife Service shall be notified to determine what additional measures would be necessary to prevent take of the species.

MM 4.4-12 The Applicant shall comply with the following:

a. Plant surveys for Protected Species and Sensitive Species must be completed by a qualified biologist during the appropriate blooming periods for species identification and detection. Plant surveys shall be conducted in accordance with all applicable protocols established by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife for particular plant species ("Plant Survey Protocol"), and shall extend 50 feet from areas where any new disturbance would occur unless a greater survey distance is specified in the Plant Survey Protocol. All detected plant populations of Protected Species and Sensitive Species shall be identified in the field during the surveys with temporary flags or other appropriate materials to avoid and minimize impacts to the plant populations from any disturbance activities.

b. No incidental take or relocation of any plant listed under the California Endangered Species Act may occur unless the incidental take is authorized by the California Department of Fish and Wildlife in a permit or other authorization, or in an approved Natural Communities Conservation Plan. If pre-construction surveys detect the presence of any California Endangered Species Act Plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established

by the California Department of Fish and Wildlife. Projects covered under incidental take authority shall conduct activities in accordance with the take authorization. The California Department of Fish and Wildlife may be contacted to determine the appropriate buffer required to prevent incidental take of a California Endangered Species Act Plant if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable California Endangered Species Act Plant buffers have been implemented prior to the commencement of any disturbance activity.

c. If any non-listed sensitive plant species are identified that may be impacted by new ground disturbing activities, populations must be avoided by a 50-foot buffer.

MM 4.4-13 No incidental take or relocation of any plant listed under the California Endangered Species Act may occur unless the incidental take is authorized by the California Department of Fish and Wildlife in a permit or other authorization, or in an approved Natural Communities Conservation Plan. If pre-construction surveys detect the presence of any California Endangered Species Act Plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the California Department of Fish and Wildlife, unless incidental take authority is obtained. Projects covered under incidental take authority shall minimize disturbance in accordance with the take authorization. The California Department of Fish and Wildlife shall be contacted to determine the appropriate buffer required to prevent incidental take of a California Endangered Species Act Plant if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable California Endangered Species Act Plant buffers have been implemented prior to the commencement of any disturbance activity. If any non-listed sensitive plant species are identified that may be impacted by new ground disturbing activities, populations must be avoided by a 50-foot buffer.

MM 4.4-14 A Worker Environmental Awareness Program shall be developed and implemented for all personnel that could access the site prior to commencing any disturbance activities. The program shall consist of an on-site or center presentation that will describe the locations and types of sensitive plant, wildlife, and sensitive natural communities (collectively, "Biological Resources") on and near the site, an overview of the laws and regulations governing the protection of Biological Resources, the reasons for protecting the Biological Resources, the specific protection and avoidance measures that are applicable to the site, and the identity of designated points of contact should questions or issues arise, including the qualified biologist. The program shall provide training to recognize, avoid and report to applicable qualified biologists any Biological Resources on the site.

a. The Worker Environmental Awareness Program shall emphasize the need to avoid contact with onsite wildlife, and avoid entry into areas where Biological Resources have been identified based on pre-disturbance field surveys and to implement the buffer avoidance or other protection measures established by the United States Fish and Wildlife Service shall be identified California Department of Fish and Wildlife or required by the Biological Resource mitigation measures. The training shall emphasize the importance of not feeding or domesticating wildlife and the need to avoid any trash, microtrash, or potential food disposal onsite except in animal-proof containers emptied daily to avoid attracting, or causing adverse impacts to special status wildlife.

b. All onsite personnel must sign a statement verifying that they have completed the Worker Environmental Awareness Program, and that they understand and agree to implement the biological requirements for the worksite. If signed employee statements are not available, documentation may be provided by Worker Environmental Awareness Program training records, which shall be kept by the Applicant for a minimum of 5 years. Each Applicant shall maintain a list of all persons who have completed the training program, and shall provide the list to the County or to state and federal wildlife agency representatives upon request.

MM 4.4-15 The following additional measures shall be implemented to avoid and minimize potential significant adverse impacts to Protected and Sensitive Species:

a. All vehicles shall observe a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved roads unless otherwise posted. Off-road traffic outside of designated access routes is prohibited. Speed limit signs shall be posted in visible locations at the point of site entry and at regular intervals on all unpaved access roads.

b. All disturbance activities, except emergency situations or drilling that may require continuous operations, shall only occur during daylight hours. Night time disturbance activity for drilling purposes shall use directed lighting, shielding methods, or reduced lumen intensity to avoid unnecessary visual disturbance to wildlife and to comply with applicable lighting mitigation measures.

c. All food-related trash items and all forms of microtrash, such as wrappers, cans, bottles, bottle tops, and food scraps shall be disposed of in closed, animal proof containers and removed daily from the site.

d. Excavations, spoils piles, access roadways, and parking and staging areas shall subject to dust control as set forth in the dust control mitigation measures.

e. The use of herbicides for vegetation control shall be restricted to those approved by the United States Fish and Wildlife Service and the California

Department of Fish and Wildlife. No rodenticides shall be used on any site unless approved by the United States Fish and Wildlife Service, and the California Department of Fish and Wildlife, and shall observe label and other restrictions mandated by the United States Environmental Protection Agency, California Department of Food and Agriculture, and state and federal laws and regulations. For split estates, no herbicides for vegetation control may occur in Tier 2 areas without surface owner approval.

f. No plants or wildlife shall be collected, taken, or removed from the site or any adjacent locations except as necessary for Project-related vegetation removal or wildlife relocation by a qualified biologist and subject to all applicable permits and authorizations.

g. All open trenches or excavations shall be covered at the end of each workday to prevent wildlife entrapment. If an excavation is too large to cover, escape ramps shall be installed at an incline ratio of no greater than 2:1 to. All trenches and pipes shall be inspected for the presence of wildlife each day prior to the commencement of work.

h. To enable San Joaquin kit foxes and other wildlife to pass through the Project site, any perimeter fencing shall include a 4- to 8-inch opening between the fence mesh and the ground or the fence shall be raised 4 inches above the ground except blunt-nosed leopard lizard exclusion fencing. The bottom of the fence fabric shall be knuckled (wrapped back to form a smooth edge) to protect wildlife.

i. All vertical tubes used in Project construction and chain link fencing poles, shall be temporarily or permanently capped to avoid the entrapment and death of special-status wildlife and birds.

j. All dead or injured special status wildlife shall be left in place and reported to the United States Fish and Wildlife Service and the California Department of Fish and Wildlife within 48 hours of discovery for rescue or salvage. Discovery of state or federal listed species that are injured or dead shall also be reported immediately via telephone and within 24 hours in writing, and with a copy to Kern County Planning and Community Development.

k. All drilling installations and operations will comply at all times with the applicable federal, State, county, and local law ordinances and regulations.

l. All activity shall use previously disturbed areas to the maximum extent feasible to minimize the amount of new disturbance.

m. Vehicle, equipment, and material storage must be limited to previously disturbed areas. No construction or operational materials may be placed or stored outside of the planned disturbance area or stockpiled for future disposal. All concrete and asphalt debris should be removed from the site for recycling or proper disposal.

n. No vehicles or construction equipment shall be parked within a wetland or waterbody/dry wash.

o. Tracked vehicles and other construction equipment must be washed or maintained to be weed-free prior to entering and working within areas of new disturbance.

p. All washing of trucks, paint, equipment, or similar activities should occur in areas where runoff is fully contained for collection and offsite disposal. Wash water may not be discharged from the site and shall be located at least 100 feet from any water body, or sensitive Biological Resources.

q. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from wetland boundaries or waterbody, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land.

r. All areas that must be avoided as result of the pre-disturbance surveys, and areas where new disturbance will occur, shall be clearly delineated by fencing or staking and flagging and/or rope or cord.

s. No firearms shall be allowed on any site.

t. No pets shall be allowed on any site.

u. No smoking may occur except in designated areas.

v. If ground disturbance is intended to be temporary, perform topsoil segregation during construction activities to preserve the seed bank for restoration efforts. Store the segregated topsoil separate from the subsoil and restore segregated topsoil to its original location.

MM 4.4-16 Ground disturbance shall be mitigated at a 1.0 to 1.0 ratio (one-acre of new disturbance shall require one-acre of mitigation) except in Tier 1 areas that contain existing disturbance of 70% or greater which shall be mitigated at a 1.0 to 0.5 ratio (one-acre of new disturbance shall require one-half acre of mitigation). This compensatory mitigation requirement does not apply to construction on ground for which compensatory mitigation has already been provided, or on ground that has been previously disturbed (e.g., cleared of vegetation for other oil and gas extraction uses, existing unpaved roads, and existing unvegetated well pads). Ground disturbance activities that are authorized by permits or other written authorizations approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife, which include avoidance and compensatory mitigation acreage requirements, may be used to satisfy this County compensatory mitigation ratio. Compensatory mitigation shall be required for the actual acreage of ground disturbance documented during the site plan review and completion process. New disturbance mitigation may be satisfied by one or a combination of the following measures:

a. The recordation of a conservation easement or similar permanent, long-term conservation management agreement in a form acceptable to the County for land within the Project Area on land that has mitigation value. The easement lands may be owned by an Applicant or a third party under contract with an Applicant. Larger land areas may be placed under a conservation easement or similar agreement, and an Applicant may "draw down" the conserved land as needed to satisfy the acreage mitigation requirements for multiple site plan review conformity permits or other authorizations from the County for oil and gas activities.

b. Acquisition of land preservation credits from a mitigation bank located within the Project Area which is owned by the County, on other lands approved by the County, or on lands approved for mitigation or conservation purposes by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife.

c. Removal of legacy oil and gas equipment, inclusive of compliance with applicable legal requirements (e.g., well plugging and abandonment requirements under state or federal regulations), restoration of the surface grade to be consistent with surrounding lands, complete a reseeding effort using native species, and notification of the site owner (if not the Applicant) of the completion of the removal and grading restoration work.

d. Enhancement or restoration of existing habitat on lands already subject to a conservation easement or similar agreement, or which become subject to a conservation easement or similar agreement subsequent to the certification of this Environmental Impact Report, provided that such activities are covered in a permit or authorization, conservation plan, Habitat Conservation Plan, or Natural Community Conservation Plan, approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife.

Payment of a biological resources mitigation fee for the acquisition and management of mitigation lands, legacy equipment removal, and/or land enhancement already subject to conservation easements or a similar agreements under the terms of any biological resource mitigation program that is adopted by Kern County and approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife. The County shall coordinate with the United States Fish and Wildlife Service or the California Department of Fish and Wildlife to identify priority conservation areas and potential conservation partners and funding sources to increase the efficiency and effectiveness of mitigation fee expenditures.

Level of Significance After Mitigation

Impacts would be less than significant.

Impact 4.4-2: Have a Substantial Adverse Effect on any Riparian Habitat or other Sensitive Natural Community Identified in Local or Regional Plans, Policies, Regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service

Potential impacts to sensitive natural communities in the Project Area were evaluated for each subarea and tier using the same methodology described for special status wildlife and plants in Threshold 4.4-1. The annual potential impacts to each community was estimated based on the acreage of each sensitive natural community and by assuming that the conservative annual disturbance projections in Table 4.4-71 would occur in each subarea and tier. The percentage of the total amount of each sensitive natural community in the Project Area that could be impacted each year, and over 25 years, was estimated from the results of the analysis. The location of sensitive natural communities in the Project Area is shown in Figure 4.4-4. As discussed in Section 4.4.2, Environmental Setting, the sensitive natural communities identified within the Project Area include wetlands, water and other riparian habitat that are subject to state or federal permit requirements prior to physical disturbance.

Tables 4.4-86 and 4.4-87 indicate that the largest extent of potential impacts could occur to the great valley mesquite scrub, desert scrub, desert wash, great valley cottonwood riparian forest, and native valley foothill riparian sensitive natural communities. The great valley mesquite scrub community is primarily located in Tier 1 of the Central Subarea, the location where most of the future impacts would occur in that location. Potential impacts to great valley mesquite scrub could be over 3% of the total acreage in the Project Area per year, and 83.5% of the total acreage in the Project Area over 25 years. The desert scrub community is primarily located in the Western Subarea and occurs in Tier 1 locations where most of the future Project Area disturbance is projected to occur. Potential impacts to desert scrub could be about 1.1% of the total acreage in the Project Area per year, and 28.6% of the total acreage in the Project Area over 25 years. The desert wash community primarily occurs in Tier 1 of the Western Subarea, and impacts to total acreage in the Project Area could be 0.84% per year and 21.03% over 25 years. The great valley cottonwood riparian forest community primarily occurs in the Eastern Subarea, including Tier 1 locations, and impacts to total acreage in the Project Area could be 0.31% per year and 7.9% over 25 years. Potential impacts to the native valley foothill riparian community would primarily occur in Tier 1 areas of the Eastern Subarea and, to a lesser extent, the Western Subarea. Potential impacts to the native valley foothill riparian community could be about 0.21% of the total acreage in the Project Area per year, and 5.2% of the total acreage in the Project Area over 25 years.

Table 4.4-86: Summary of Potential Impacts to Sensitive Natural Communities by Subarea and Tier (acres per year)

Sensitive Natural Community	Western Subarea	Central Subarea	Eastern Subarea	Tier 1	Tier 2	Tier 3	Tier 4	Tier 5	Total
Alkali Seep	-	0.008	-	-	0.008	-	-	-	0.008
Coastal and Valley Freshwater Marsh	0.456	1.030	3.685	3.369	1.299	0.320	0.180	0.002	5.169
Desert Scrub	1.258	-	0.000	1.250	0.009	-	-	-	1.258
Desert Wash	28.1	0.00034	2.060	29.56	0.384	0.221	0.001	-	30.17

Table 4.4-87: Potential Impacts to Sensitive Natural Communities by Subarea and Tier Percent Total in Project Area per Year and 25 Years

Sensitive Natural Community	Annual Impact	25-Year Impact
Great Valley Mesquite Scrub	3.34%	83.52%
Desert Scrub	1.14%	28.62%
Desert Wash	0.84%	21.03%
Great Valley Cottonwood Riparian Forest	0.31%	7.86%
Native Valley Foothill Riparian	0.21%	5.24%
Valley Saltbush Scrub	0.07%	1.71%
Mixed Chaparral	0.07%	1.67%
Coastal and Valley Freshwater Marsh	0.06%	1.40%
Vernal Pool	0.05%	1.22%
Stabilized Interior Dunes	0.02%	0.52%
Valley Oak Woodland	0.02%	0.49%
Valley Needlegrass Grassland	0.02%	0.48%
Montane Hardwood	0.02%	0.47%
Valley Sacaton Grassland	0.02%	0.46%
Valley Sink Scrub	0.01%	0.34%
Alkali Seep	0.01%	0.29%

Potential impacts to the valley saltbush scrub, mixed chaparral, coastal and valley freshwater marsh, vernal pool, stabilized interior dunes, valley oak woodland, valley needlegrass grassland, montane hardwood, valley sacaton grassland, valley sink scrub and alkali seep natural communities would range from 0.01% of the total acreage in the Project Area (valley sink scrub and alkali seep) to 0.7% (valley saltbush scrub and mixed chaparral) per year. Over 25 years, potential impacts to the total acreage of these communities in the Project Area could range from 0.29% (alkali seep) to 1.7% (valley saltbush scrub).

Impacts to sensitive natural communities and riparian habitats in the Project Area would be significant without mitigation.

Mitigation Measures

Implement MM 4.4-1 through 4.4.18, described above, and dust control, spill and hazardous material avoidance and containment, and surface and subsurface water quality and hydrology mitigation measures.

MM 4.4-17 Pre-disturbance surveys shall be conducted by a qualified biologist during the appropriate periods for detecting Sensitive Natural Communities that could occur within the Project Area. The surveys shall be completed consistent with applicable protocols approved by the United States Fish and Wildlife Service and/or the California Department of Fish and Game, including the Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (California Department of Fish and Wildlife 2009). The qualified person shall map and identify all sensitive natural communities, including riparian communities that occur in or within 100 feet of any new disturbance area. The site plan for the proposed activity shall identify waters, wetlands and other riparian habitats that occur in and within 100 feet of the disturbance area.

MM 4.4-18 No land disturbance activity in any Sensitive Natural Community that requires a state or federal permit, including state or federally regulated wetlands and waters, shall occur unless the activity is specifically authorized by the issuance of permits or approvals as required by state and federal law. This provision is not intended to restrict survey activities.

Level of Significance After Mitigation

Impacts would be less than significant.

Impact 4.4-3: Have a Substantial Adverse Effect on Federally Protected Wetlands as Defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through Direct Removal, Filling, Hydrological Interruption, or other Means

As discussed in Section 4.4.2, Environmental Setting, the occurrence of wetlands and waters within the Project Area was estimated by using spatial data from the NWI and the NHD. Tables 4.4-88 and 4.4-89 summarize the acreage of potentially jurisdictional wetlands and linear feet of waters in the Project Area estimated from the available databases.

Stream/River Intermittent	4,043,145	16,647,485	88,543	223,718	-	21,002,892
Stream/River Perennial	30,383	451,372	21,989	17,917	-	521,660

As described in Impact 4.4-2 above, federally jurisdictional wetlands, and other waters and riparian habitats that are subject to state or federal jurisdiction, are included in the analysis of the sensitive natural communities within the Project Area. Any oil and gas activity that could be authorized under this Project that occurred in wetlands or other water would have a significant impact.

Mitigation Measures

Implementation of the Biological Resources mitigation measures would ensure that oil and gas activities would not disturb state or federally regulated wetlands and waters unless the activity is specifically authorized by the issuance of permits or approvals as required by state and federal laws and that activities in the vicinity of wetlands and water bodies would not adversely disturb them. Other mitigation measures identified in this Environmental Impact Report would further reduce potential state or federally jurisdictional wetland and waters, including dust control, spill and hazardous material avoidance and containment, surface and subsurface water quality and hydrology, mitigation measures.

Level of Significance After Mitigation

Impacts would be less than significant.

Impact 4.4-4: Interfere Substantially with the Movement of any Native Resident or Migratory Fish or Wildlife Species or with Established Native Resident or Migratory Wildlife Corridors, or Impede the Use of Wildlife Nursery Sites

As discussed in Section 4.4.2, Environmental Setting, and shown in Figure 4.4-11, the generalized patterns of wildlife movement in and through the Project Area have been characterized in certain studies. The length and width of these corridors have not been precisely determined and most correspond with major geographic features that are likely to facilitate species movement, including the Kern River and Poso Creek channels, and along the base of the mountain ranges that border the Project Area to the east, south and west.

Oil and gas exploration and production activities are more porous and maintain wildlife movement to a greater extent than urban development, and, depending on species requirements, agricultural uses that modify surface vegetation, soils and irrigation. A recent study conducted in 2008-2010 for the BLM found that species assemblages in saltbush scrub habitat remain relatively intact in oilfield locations with up to 70% disturbance in Kern County (Fiehler, C.A. and B. Cypher, 2011). This result indicates that even moderately developed oilfields as documented in the 2011 survey would retain the capacity for wildlife movement. However, oilfield development with more than 70% disturbance could reduce species movement, and potential impacts to wildlife movement in higher density locations would be significantly impacted by project activities without mitigation.

Mitigation Measures

Implementation of the Biological Resources mitigation measures would reduce wildlife movement impacts. Other mitigation measures identified in this Environmental Impact Report to further reduce wildlife movement impacts, include dust control, nighttime lighting, noise controls, spill and hazardous material avoidance and containment,, and surface and subsurface water quality and hydrology (including but not limited to Kern River and Poso Creek channels), measures.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.4-5: Conflict with any Local Policies or Ordinances Protecting Biological Resources, such as a Tree Preservation Policy or Ordinance

The Kern County General Plan and other ordinances and the Metropolitan Bakersfield General Plan include policies that protect several biological resources as summarized in Section 4.4.3, Regulatory Setting, including special status species, sensitive natural communities, wetlands, waters and riparian habitats and the Kern River corridor. As discussed in Impacts 4.4-1 through 4.4-4, potential impacts to these resources would be mitigated to less than significant levels.

Kern County has adopted oak tree conservation policies and implementation measures in Section 1.10.10 of the Kern County General Plan Land Use, Open Space and Conservation Element.

These policies and measures generally require avoidance of oak tree impacts, and the implementation of other protection measures for sites that have more than 10% oak tree cover (oak woodlands) and sites that have less than 10% oak tree cover. Impacts to oak trees are not anticipated to occur from oil and gas exploration and development activity because oak trees can generally be avoided by modifying the disturbance envelope. As shown in Table 4.4-86, the valley oak woodland community occurs within the Project Area and could be subject to 3 acres of impacts per year, mainly in Tier 2 locations in the Eastern Subarea (about 2 acres per year) and the Western Subarea (about 1 acre per year).

Mitigation Measures

MM 4.4-19 In the event that new disturbance would occur at a site within an oak woodland area as defined in Section 1.10.10 of the Kern County General Plan Land Use, Open Space and Conservation Element (10% or greater oak tree cover), the Applicant shall comply with the minimum 30% canopy retention standard in Section 1.10.10 KK (a). Impacts to oak trees in other locations, and in locations that meet the criteria for an oak woodland area, shall be avoided to the maximum extent practicable, including modification of the disturbance area, if feasible, to avoid existing oak trees within a site.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.4-6: Conflict with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other Approved Local, Regional, or State Habitat Conservation Plan

As discussed in Section 4.4.3, Regulatory Setting, the following HCPs have been adopted within, include portions of or are located in areas adjacent to the Project Area:

- Freeport-McMoRan Oil & Gas HCP
- Aera Coles Levee HCP (previously Arco Western Energy) HCP
- Chevron Pipeline HCP
- California Aqueduct - San Joaquin Field Division HCP
- Kern County Waste Facilities HCP
- Pacific Gas and Electric (PG&E) San Joaquin Valley Operations and Maintenance Program HCP
- TUMSHCP
- Metropolitan Bakersfield HCP

- CRC Non-Unit HCP

Three HCPs have been proposed but have not yet been approved for the Project Area:

- VFHCP.
- Chevron North American Exploration and Production LHCP.
- California Resources Corporation EHHCP.

The proposed Zoning Ordinance amendment would not conflict with any adopted HCP in or adjacent to the Project Area.

The proposed Zoning Ordinance amendment would also be consistent with the proposed Chevron LHCP and California Resources Corporation EHHCP.

As discussed above in the Regulatory Setting, there are three approved Habitat Conservation Plans for oil and gas activities in the Project Area: the Freeport-McMoRan Oil & Gas HCP, the Aera Coles Levee (previously Arco Western Energy) HCP, and the Chevron Pipeline HCP.

The Project is consistent with these approved HCPs. The Project continues to authorize oil and gas activities, including oil and gas activities included as "Covered Activities" in these approved HCPs, but imposes a variety of new mitigation measures, administrative procedures, and substantive compliance standards on such oil and gas activities which are not in conflict with these approved HCPs. The approved HCPs do include some "Covered Activities" that are outside the scope of activities included in the Project (e.g., hazardous substance remediation activities), but the Project does not impose any requirements that are inconsistent with or would otherwise preclude ongoing implementation of Covered Activities in these approved HCPs.

The Project Area also includes five HCPs that do not cover oil and gas production activities: the California Aqueduct - San Joaquin Field Division HCP, the Kern County Waste Facilities HCP, the Pacific Gas and Electric Company San Joaquin Valley Operations and Maintenance Program HCP, the TUMSHCP, and the Metropolitan Bakersfield HCP. The original term of the Metropolitan Bakersfield HCP has expired, and a renewal process is underway. The Project is likewise not inconsistent with these five HCPs that do not include oil and gas production as "Covered Activities."

Three additional HCPs have been proposed that would cover oil and gas activities in the Project Area.

The VFHCP would cover activities from multiple sectors, including most of the oil and gas production activities included in the Project, within the Valley Floor portion of the Project Area. Kern County is the lead Applicant for the VFHCP. Kern County and other stakeholders are also considering the potential for completing a Natural Communities Conservation Plan (NCCP) under California law, alongside a federal HCP. There is no pending draft HCP or proposed NCCP, and thus consistency with these plans cannot be evaluated in detail at this time. It is

anticipated, however, that a VFHCP/NCCP would be consistent with, or impose more stringent requirements than, the mitigation measures, procedural and substantive requirements included in this Project and EIR.

The Chevron LHCP is a pending application for a federal HCP, and for a state incidental take permit to be issued by the California Department of Fish and Game under section 20081(b), for oil and gas activities in for Chevron production lands within the Project Area, including (1) the Lokern lands owned by Chevron in the Western Subarea, the Lokern "Contiguous Area" surrounding the Lokern lands which are designated to be used primarily for biological enhancement and conservation activities with only limited authorized oil and gas activities, and (3) the "Four Fields," consisting of oil and gas production properties in Kern County in which Chevron has or may in the future have an ownership or mineral lease interest (see Figure 4.4-14). Because the "Four Fields" category includes lands not currently owned or leased by Chevron, the HCP does not include a specified total acreage amount for the "Covered Lands" included in the HCP.

The framework for permitted activities ("Covered Activities") in the LHCP include six general categories: (1) oil and gas extraction and production, and related activities; (2) emergency response; (3) ongoing operations on existing developed oil and gas production lands; (4) recreation and education activities; (5) scientific research; and (6) avoidance, minimization, mitigation, monitoring, habitat management (including livestock grazing), and restoration activities.

The LHCP includes 16 "Covered Species" which are listed or may become listed under federal or state species protection laws during the term of the HCP. This Biological Resources section addresses all of these Covered Species.

The Project is consistent with the overall framework of the LHCP, and imposes new mitigation measures, as well as substantive and procedural requirements, on most oil and gas production Covered Activities, including those within and outside of the three categories of lands included in the LHCP. Specifically:

1. Construction, operation and maintenance of oil and gas production activities on all Covered Lands are all included in the Project, with the exception of the construction and operation of new or expanded cogeneration facilities, landfills, and transmission lines. Specifically, these Project activities include the construction, operation and maintenance of oil field equipment, regulatory compliance activities required by DOGGR, and other regulatory agency compliance activities.

2. Emergency response and environmental remediation of accidental spills and releases of hazardous substances or hazardous wastes are included in the Project, but the construction or operation of new remediation facilities (e.g., landfills, hazardous waste treatment and storage facilities) are not included);

3. Passive recreational or education activities remain an authorized use on Chevron Covered Lands under existing County zoning requirements, and are not being modified by the Zoning Ordinance Amendments. New commercial recreational activities, as well as educational facilities (e.g., K-12 schools), are not authorized under the Project.

4. Scientific research, such as exploratory testing, monitoring or measuring environmental conditions, and other scientific observation and measurement activities that are ancillary to oil and gas production activities, are included in the Project; passive scientific observation and measurement activities unrelated to oil and gas activities are an authorized use on Chevron Covered Lands under applicable County Zoning requirements and are not being changed by the Project;

5. Avoidance, minimization, mitigation, habitat management (including livestock grazing), restoration and monitoring activities. Avoidance, minimization, and passive monitoring activities (e.g., passive field observations, but not temporary trapping or relocation of any protected species) are not restricted by the County's Zoning Code and remain authorized activities under the Project. Livestock grazing is an authorized use in several Tiers by the County's Zoning Code, and is likewise remain authorized activities under the Project. The Zoning Code Amendments and the Mitigation Measures set forth in this EIR require implementation of specified mitigation measures and development standards which include avoidance, minimization and mitigation of impacts to Biological Resources, none of which would preclude implementation of the corresponding measures included in the draft LHCP and are accordingly not inconsistent with this HCP.

CEQA requires responsible agencies to use the EIR prepared by the lead agency for projects, or portions of projects, that are wholly or partially within the jurisdiction of a responsible agency. This EIR provides project-level coverage under CEQA for the specified Covered Activities described above in the LHCP. The Project imposes new mitigation requirements, as well as procedural and substantive compliance requirements, on oil and gas activities that can currently be done "by right;" however, these new regulatory requirements are consistent with, and would not impede or otherwise interfere with, the draft HCP or ITP. The United States Fish and Wildlife Service, as the lead federal agency for the HCP, and the California Department of Fish and Wildlife as a responsible permitting agency for the Section 2081 permit for the Covered Activities described in the HCP and ITP, retain the jurisdiction to approve or disapprove the pending application, and to impose conditions of approval and other compliance requirements that fall within their respective jurisdictions.

The California Resources Corporation Elk Hills HCP is a pending application for an HCP, and for a California incidental take permit (ITP) to be issued by the California Department of Fish and Game Code under section 21081(b), for oil production and conservation activities, on the 47,884-acre Elk Hills Oil Fields (see Figure 4.4-15). EHOF is located approximately 26 miles southwest of Bakersfield in the Western Subarea. The Covered Activities in the pending HCP and ITP application are organized within the following framework:

Continued exploration, development, production, recovery and processing of oil and gas reserves, including the permanent disturbance of up to 4,000 acres and the temporary disturbance of up to 3,000 acres of presently undisturbed land;

The operation, maintenance and repair of facilities associated with existing linear facilities (e.g., pipelines, waterlines, transmission and powerlines) and associated rights of way (ROWs) in the EHOF and a surrounding 2-mile "buffer" area;

The installation, operation and maintenance of limited new off-site facilities within the 2-mile buffer; and

Implementation of specified conservation program activities on designated Conservation Lands within the EHOF.

Within this overall framework, the draft HCP and ITP explains that covered activities include but are not limited to twelve categories of activities: (1) construction, operation and maintenance of production activities including well stimulation as defined by SB4; (2) surface excavations; (3) activities required by the California Division of Oil, Gas and Geothermal Resources (DOGGR); (4) construction and operation of related facilities; (5) installation, maintenance and repair of perimeter and interior fencing; (6) transmission lines; (7) emergency response and environmental remediation; (8) livestock grazing; (9) regulatory agency requirements; (10) recreational and education activities; and (11) scientific research; and (12) implementation of conservation program activities.

The draft HCP and ITP includes 15 Covered Species which are listed under federal or state species protection law, or have the potential to be listed during the expected term of the HCP and ITP. (EHOF HCP, Table 2.5-2) All of these Covered Species are addressed in the Biological Resources section of this EIR.

The Project is consistent with the overall framework of the EHOF HCP and ITP, and imposes new mitigation measures, as well as substantive and procedural requirements, on most oil and gas production Covered Activities, including those within and outside of EHOF. Specifically:

Construction, operation and maintenance of oil and gas production activities are all included in the Project, with the exception of the construction and operation of new or expanded cogeneration facilities, landfills, and transmission lines.

Surface excavations are all included in the Project, provided that such excavations are undertaken as part of or in furtherance of production activities or ancillary activities thereto as described in the Zoning Ordinance Amendments.

Activities required by DOGGR are all included in the Project;

- Construction and operation of what the HCP and ITP designates as "related facilities" are included in the Project as described in Category (1) above;

- Installation, maintenance and repair of perimeter and interior fencing are all included in the Project, provided that such fencing is undertaken as part of or in furtherance of production activities or ancillary activities thereto as described in the Zoning Ordinance Amendments;

- Maintenance and operation of transmission lines are included in the Project, but construction and operation of new transmission lines are excluded;

- Emergency response and environmental remediation of accidental spills and releases of hazardous substances or hazardous wastes are included in the Project, but the construction or operation of new remediation facilities (e.g., landfills, hazardous waste treatment and storage facilities) are not included);

- Livestock grazing remains an authorized use in the Zoning Ordinance Amendments for designated Tiers, including EHOF, under the Project;

- Regulatory agency compliance for oil and gas production activities in the Project is included, except for the construction of new landfills or hazardous waste treatment and disposal facilities (which may be required to fulfill remediation obligations) and biological restoration and enhancement activities that could result in any unpermitted take of a protected species or regulated water;

- Passive recreational or education activities remain an authorized use in EHOF under existing County zoning requirements, and are not being modified by the Zoning Ordinance Amendments. New commercial recreational activities, as well as educational facilities (e.g., K-12 schools), are not authorized under the Project.

- Scientific research, such as exploratory testing, monitoring or measuring environmental conditions, and other scientific observation and measurement activities that are ancillary to oil and gas production activities, are included in the Project; passive scientific observation and measurement activities unrelated to oil and gas activities are an authorized use in EHOF under applicable County Zoning requirements and are not being changed by the Project;

- Implementation of biological resource enhancement and other conservation program activities on designated areas of EHOF are not included in the Project, although implementation of these activities is not inconsistent with the Project.

CEQA requires responsible agencies to use the EIR prepared by the lead agency for projects, or portions of projects, that are wholly or partially within the jurisdiction of a responsible agency. This EIR provides project-level coverage under CEQA for the specified Covered Activities described above in the Elk Hills HCP. The Project imposes new mitigation requirements, as well as procedural and substantive compliance requirements, on oil and gas activities that can currently be done "by right;" however, these new regulatory requirements are consistent with, and would not impede or otherwise interfere with, the draft HCP or ITP. The United States Fish and

Wildlife Service, as the lead federal agency for the HCP, and the California Department of Fish and Wildlife as a responsible permitting agency for the Section 2081 permit for the Covered Activities described in the HCP and ITP, retain the jurisdiction to approve or disapprove the pending application, and to impose conditions of approval and other compliance requirements that fall within their respective jurisdictions.

Potential impacts related to conflicts with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan could be significant.

Mitigation Measures

MM 4.4-20 Applicants shall fund through the Site Conformity Review administrative fee, preparation by Kern County of, an annual report describing the Project's ground disturbance acreage, and the acreage of compensatory mitigation lands, in each sub-area.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.4.5 Cumulative Setting, Impacts, and Mitigation Measures

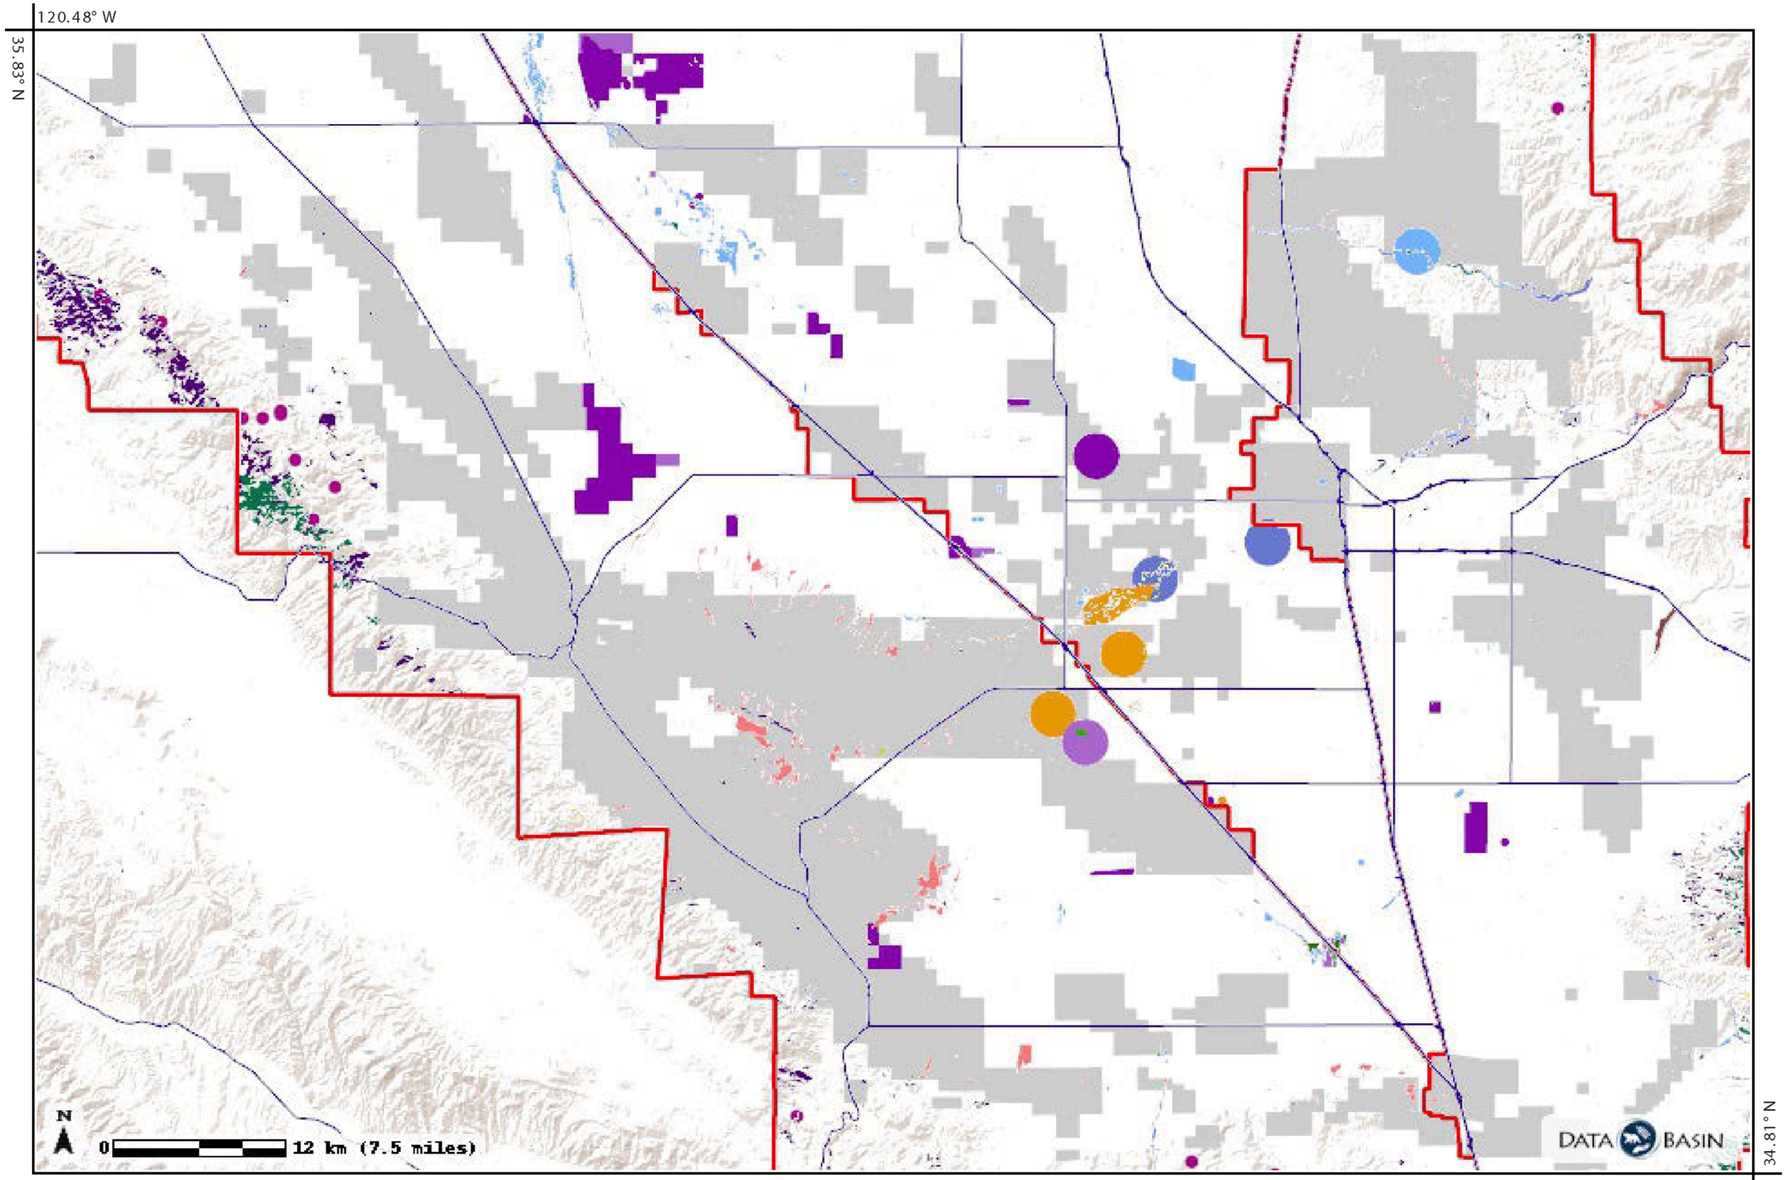
Impact 4.4-7: Cumulative Impacts to Biological Resources

The Project Area is interspersed with numerous incorporated cities and towns and federal and state owned lands. The cities of Arvin, Bakersfield, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi and Wasco account for about 141,149 acres within or adjacent to the Project Area. Federal land, including locations managed by the BLM and wildlife preserves, include about 117,186 within the Project Area. State-owned land, including wildlife and habitat preserves, account for about 25,548 within the Project Area.

Urbanized development areas are currently interspersed with less or undeveloped lands that are or may be planned for eventual urbanized development under adopted General Plans. Certain incorporated areas, such as the Kern River corridor through the City of Bakersfield, are subject to protection for regional habitat and wildlife conservation purposes.

State and federal lands within the Project Area include wildlife preserves, and other locations that are managed primarily to conserve biological resources. Certain state or federal lands, including BLM managed areas, are subject to commercial uses, including leases for oil and gas exploration and development. State and federal leased lands have biological resources that are similar in quality to the Tier 1 locations in the Project Area. Less developed Tier 1 areas typically have similar biological resource values as state and federal conservation lands.

Land uses along the periphery of the Project Area include federal forests, higher elevation ranching and rural homes, and privately-owned open space preserves such as the Wind Wolves Preserve located near the southwest border of the Project Area.



Future oil and gas exploration and production activities related to the proposed Zoning Ordinance amendment could contribute to a significant cumulative impact on Project Area biological resources because future use and development of federal, state and incorporated urban lands are not within the County's jurisdiction or control. Future land uses and development could affect biological resources in each of these jurisdictions and would be undertaken as independent actions with associated impacts, avoidance and minimization requirements, and mitigation, if required, under applicable federal, state, regional and local agency law.

Mitigation Measures

Implement MM 4.4-1 through MM 4.4-20, as described above.

Level of Significance After Mitigation

Impacts would remain significant and unavoidable with mitigation.

Section 4.5

Cultural and Paleontological Resources

Section 4.5

Cultural and Paleontological Resources

4.5.1 Introduction

This section provides contextual background information on historical resources in the Project Area, including the prehistoric, ethnographic, historical, and paleontological settings. This section also summarizes the results of previous cultural surveys of the Project site, analyzes the Proposed Project's potential impacts on cultural and paleontological resources, and identifies all feasible mitigation measures to address adverse impacts.

The historical resources information in this section is based on using three kinds of data and analyses: (1) a review and data tabulation of recent large-area surveys; (2) a synthesis of existing degrees of ground surface disturbance; and (3) the development of a geographic information system (GIS) predictive model of prehistoric/Native American site distribution and archaeological sensitivity. The paleontological resources information in this section is based on four sources of data and analyses: (1) an on-line search of institutional paleontological locality records; (2) the development of potential fossil yield classification (PFYC) rankings for Kern County geologic rock units; (3) a comprehensive review of published and unpublished paleontological literature for the Project Area; and (4) the compilation of available geologic mapping information to produce a GIS database including a geologic map and paleontological potential map.

The cultural evaluation was conducted in compliance with Section 5024.1 of the California Public Resource Code (PRC) to identify archaeological or historical resources in the Project Area. The cultural resources evaluation is presented as Appendix O of the EIR, and the paleontological resources evaluation is presented as Appendix P. Because of the confidential nature of the locations of cultural resources, such information has been removed from the report and is not included in the appendices.

For the purposes of the California Environmental Quality Act (CEQA), "historical resources" is a term of art with a defined statutory meaning (see PRC 21084.1 and CEQA Guidelines, Sections 15064.5(a) and 15064.5(b)). The term embraces any resource listed in, or determined to be eligible for listing in, the California Register of Historic Resources (CRHR). The CRHR includes resources listed in, or formally determined eligible for listing in, the National Register of Historic Places (NRHP), as well as some California State Landmarks and Points of Historical Interest.

4.5.2 Environmental Setting

This section discusses the existing conditions related to cultural resources, as described by Whitley et al. 2014, and paleontological resources in the Project Area.

Local and Regional Natural Setting

The Project Area lies within the unincorporated portions of the San Joaquin Valley and surrounding mountains, extending to about 2,000 feet in elevation. Much of the Project Area, especially the Central Subarea, is now a flat, open plain. This plain rises gradually from a minimum of roughly 200 feet above mean sea level near the center of the valley floor at the Kings and Tulare county lines, to almost 1,000 feet at the southernmost end of the valley near the Grapevine Canyon mouth. The valley floor is bordered to the south and southeast by the narrow foothills and steep slopes of the Tehachapi Mountains. The northeastern portion of the Eastern Subarea includes the broad, open and rolling foothills of the Greenhorn Mountains/Sierra Nevadas. The Western Subarea, in contrast, includes more internal topographic relief. From east to west in this Subarea, this includes the open valley floor, the low rolling and roughly north-south trending Lost, Antelope, Elk and Buena Vista hills, and the steep and heavily incised eastern flanks of the Temblor Range.

Although now open flats, historically, the southern San Joaquin Valley was a swampy, marsh zone consisting of a series of shallow lakes interconnected by sloughs and channels, primarily fed by streams originating in the mountains to the east. Kern River especially, and Poso Creek, were the two most important of these water sources. Other significant drainages included the Tehachapi/Caliente and Sycamore creeks on the east side, Tejon, Pastoria, Grapevine, and Pleito creeks to the south, and Buena Vista and Chico Martinez creeks to the west. Each of these were seasonal and/or at least historically drained into "sinks" in the valley bottom.

Kern Lake, near the boundary between the Eastern and Central Subareas, and Buena Vista Lake, in the Western Subarea, were jointly the southwestern terminus of the Kern River Delta. Goose Lake, near the northern Project Area boundary, and also in the Central Subarea, was a northern terminus of this same deltaic system of sloughs and swamps. Goose Lake was also fed by Poso Creek. Lakes, lakeshore environments, and swampy terrain then extended historically across the valley floor from the foothills of the Eastern Subarea to the series of low hills in the Western Subarea. One historical result was the concentration of human population along the eastern side of the valley, above the swamps and near the main fresh water source, the Kern River. Although reclamation of the valley bottom started in the late nineteenth century and is now virtually complete, San Joaquin Valley population distribution continues to be heavily oriented towards the east side of the valley. It is worth noting in contrast that, prehistorically, a significant concentration of Native American villages was located on the western edge of the lakes, especially Buena Vista Lake.

Vegetation on the valley floor is currently predominated by modern cultigens (row crops, vineyards and orchards) and other introduced species, such as Russian thistle (tumbleweed; *Salsola tragus*) and grasses, but also includes cheatgrass (*Bromus tectorum*) and doveweed (*Croton setiger*). Historically, however, this area was most likely covered by the Valley Grassland, Saltbush Scrub, and Riparian communities. Valley Grassland was dominated by perennial bunchgrasses, such as needle-grasses (*Stipa* spp.), triple-awned grasses (*Aristida* spp.), bluegrasses (*Poa* spp.), and rye grasses (*Elymus* spp.), as well as annual grasses, herbs, and geophytes. Saltbush Scrub includes indigenous saltbush (*Atriplex* spp.) and, occasional, other

species such as cheesebush (*Hymenoclea salsola*), bladderpod (*Isomeris arborea*), and vinegar weed (*Trichostema lanceolatum*). The marshy Riparian habitat included bulrushes or tules (*Scirpus lacustris*), rushes (*Juncus*), sedges (*Cyperus*), and cattails (*Typha*), with water-loving trees, such as willows (*Salix*), on higher ground. Riparian Woodlands likely bordered the larger streams. In addition to willows, this community included sycamore (*Platanus*), cottonwood (*Populus*), and box elder (*Acer negundo*).

The mountain foothills and slopes on the southeast and south sides of the Project Area include oak woodlands and riparian environments. Vegetation includes vinegar weed (*Trichostema lancedatim*), doveweed, fiddleneck (*Amsinckia* spp.), scrub and live oak (*Quercus* spp.), poison oak (*Toxicodendron diversilobum*), saltbush (*Atriplex* spp.), coyote brush/chaparral broom (*Baccharis pilularis*), gooseberry trees (*Ribes divericatum*), California buckeye trees (*Aesculus californica*), jimsonweed (*Datura wrightii*), Russian thistle, cheatgrass, and other annual grasses. The drier foothills to the northeast and the hills and flanks of the Temblor Range, on the west, were predominantly Saltbush Scrub habitat.

Ethnographic and Archaeological Context

Prehistoric Setting

The southern San Joaquin Valley region, remote from other portions of California, has received minimal archaeological attention compared to other areas of the state. This is due, in part, to the fact that the majority of California archaeological work has been concentrated in the Sacramento Delta, Santa Barbara Channel, and Mojave Desert areas. Although knowledge of the prehistory of the Project Area is limited in specific details, enough is known to conclude that the archaeological record is broadly similar to central and especially south-central California as a whole. Therefore, the general prehistory of the Project Area can be outlined as provided in the following sections (Whitley et al. 2014).

Early Holocene (12,000 to 7,000 B.P.)

Initial occupation of the region occurred at least as early as the Paleoindian Period, or prior to about 10,000 years before the present (B.P.). Evidence of this early use of the region has been revealed by the repeated discovery of characteristic fluted and stemmed projectile points found around the margins of Tulare and Buena Vista lakes, in the foothills of the Sierra, and in the Mojave. These finds suggest a terminal Pleistocene/early Holocene lakeshore adaptation similar to that found in other portions of the Far West at this same time, although little else is known about these earliest peoples. Importantly, many of the identified and characteristic projectile points have been discovered in lakeshore deposits, below the historic lake high-stands, reflecting the fact that this earliest period was a time of drought, with lake levels subsequently rising (Whitley et al. 2014).

Middle Holocene (7,000 to 4,000 B.P.)

Substantial evidence for human occupation of California first occurs during the middle Holocene, from roughly 7,500 to 4,000 B.P. This period is known as the Early Horizon, and is sometimes

alternatively referred to as the Early Millingstone along the Santa Barbara Channel. In the coastal area, population concentrated along the shore, with minimal visible use of inland areas. Adaptation appears to have emphasized hard seeds and nuts, with toolkits dominated by mullers and grindstones (manos and metates). Minimal evidence of Early Horizon occupation has been found in most inland portions of the state. In part, this is due to a severe cold and dry paleoclimatic period that occurred at this time. Evidence for an Early Horizon occupation of southern San Joaquin Valley is limited, and primarily consists of some early dates from the west side of Buena Vista Lake. While this indicates that the occupation of the west side of this lake, and thus portions of the Western Subarea, extends back for 7,000 or more years, it is clear overall that Early Horizon population density was low in interior south-central California, and probably throughout the Project Area. For example, very little evidence for Early Horizon sites has been found in the Tehachapi Mountains or Carrizo Plain to the west (Whitley et al. 2014).

Late Holocene I (4,000 to 2,000 B.P.)

Environmental conditions improved dramatically after about 4000 B.P., during the Middle Horizon (or Intermediate Period). This period is known climatically as the Holocene Maximum, and it was characterized by significantly warmer and wetter conditions than had been experienced previously (or than occur today). It was marked archaeologically by a large population increase and radiation into new environments along the south-central California coast, the southern Sierra Nevadas, and the Mojave Desert. In the Sacramento Delta region to the north, this same period of favorable environmental conditions was marked by the appearance of the Windmiller culture, which exhibited a high degree of ritual elaboration (especially in burial practices) and perhaps even a rudimentary mound-building tradition. Along with ritual elaboration, Middle Horizon times experienced increasing subsistence specialization, perhaps correlating with the appearance of the acorn-processing technology. Penutian-speaking peoples (including the Yokuts) are also posited to have entered the state, roughly at the beginning of this period and, perhaps, to have brought this technology with them. Likewise, the so-called "Shoshonean Wedge" in southern California, or the Takic-speaking groups that included the Gabrielino/Fernandeño, Tataviam, and Kitanemuk, appear to have moved into this region at about this time.

Test excavations have demonstrated a substantial Middle Horizon occupation in the Tehachapis; all habitation sites included at least some deposit from this period, and some of the villages were only inhabited at this time. A significant population increase is believed to have occurred in the Carrizo Plain, as well. The existing evidence, in fact, suggests that a similar pattern occurred in the inland Ventura County region, as well as possibly in the Antelope Valley and western Mojave Desert, the southern Sierra Nevadas, and the Coso Range region. A major expansion in settlement, the establishment of large site complexes, and an increase in the range of environments exploited appear to have occurred throughout this wide region roughly around 4,000 years ago. Although most efforts to explain this expansion have focused on very local circumstances and events, this was a major Southern California-wide occurrence (Whitley et al. 2014).

Late Holocene II, III (2,000 to 1,100 B.P.; 1,100 to 300 B.P.)

The beginning of the Late Horizon is set variously at 1500 and 800 B.P., although a consensus seems to be growing for the shorter chronology for this period. Regardless of the specific date, the appearance of the Late Horizon correlates with another series of periodic droughts at circa A.D. 800-1200, which decimated major portions of western North America. This is known, climatically, as the Medieval Climatic Anomaly, followed by the Little Ice Age, and this general period of climatic instability extended to about A.D. 1860. In much of inland south-central California, the Carrizo Plain, and the Mojave Desert, a large-scale abandonment of sites occurred approximately at the start of this period. For the ancestral Chumash, this appears to correlate with an increase in coastal populations, suggesting a shift from inland to seashore occupation rather than a drop in total numbers of people.

In contrast, along Buena Vista Lake, population appears to have been increasingly concentrated towards the later end of the Medieval Climatic Anomaly. Similarly, the Late Horizon environmental collapse did not result in wide-spread abandonment in the Tehachapi Mountains. This area is unusually well-watered and probably was not subjected to the same degree of desiccation as occurred elsewhere in interior south-central California. Some Middle Horizon villages were abandoned before the start of the Late Horizon, but those sites with Late Horizon occupation appear to have been more intensively occupied during the last 1,000 years, and no significant population change has yet been identified.

The Tehachapis and southern San Joaquin Valley then experienced intensification rather than the abandonment seen in surrounding areas during the last millennium. This most likely resulted from favorable (i.e., better watered) environments. Regardless of regional circumstance, the ethnographic Native American tribes and conditions are recognized as a direct outgrowth of the Late Horizon occupations of this portion of south-central California.

The identified prehistoric record in the Project Area has a series of implications for cultural resource management. The first is that a full range of site types are present. These include:

- Villages, primarily located on or near permanent water sources, occupied by large groups during the winter aggregation season;
- Seasonal camps, again typically located at water sources, occupied during other parts of the year tied to locally and seasonally available food sources;
- Special activity areas, especially plant processing locations containing bedrock mortars (BRMs), commonly (though not exclusively) near existing oak woodlands, and invariably at bedrock outcrops or exposed boulders;
- Stone quarries and tool workshops, occurring in two general contexts: (1) at or below naturally occurring chert exposures on the eastern front of the Temblor Range; and (2) at quartzite cobble exposures, often on hills or ridges;
- Ritual sites, most commonly pictographs (rock art) found at rockshelters or large exposed boulders, and cemeteries, both commonly associated with villages; and

- A variety of small lithic scatters (low-density surface scatters of stone tools).

The second implication for cultural resources management in the Project Area is that the locations of the water sources have sometimes changed over time so villages and camps are not exclusively associated with existing (or known historical) water sources. The sizes and locations of the Project Area's lakes, sloughs, and Kern River delta channels changed significantly during the last 12,000 years due to major paleoclimatic shifts. This altered the area's hydrology and, thus, prehistoric settlement patterns. The western shoreline of the Buena Vista Lake, the largest of the three lakes, was relatively stable, because it abutted the series of low hills in the Western Subarea. However, the northern, southern and eastern shorelines comprised the near-flat valley floor. Relatively minor fluctuations up or down in the lake level resulted in very significant changes in the areal expression of the lake on these three sides and, therefore, the locations of villages and camps. Although perhaps not as systematic, similar changes occurred with respect to stream channels and sloughs and potential site locations associated with them. This circumstance has implications for predicting site locations and archaeological sensitivity. Although discussed in more detail below, site sensitivity is hardest to predict in the open valley floor, especially in the Kern River delta area, near the northern, southern, and eastern shorelines of Buena Vista Lake, as well as around Kern Lake, due to fluctuating surface water levels (Whitley et al. 2014).

Ethnographic Setting

The Project Area was a contact point between three separate tribal groups immediately prior to the arrival of Euro-Americans in California: the southern Valley Yokuts, interior Chumash, and Kitanemuk- Haminat. These three groups were bordered at higher elevations by the Kawaiisu, in the Tehachapi area, and the Tubatulabal, in the Kern River Valley.

The San Joaquin Valley floor and, thus, the majority of the Project Area, was occupied by southern Valley Yokuts speakers, themselves divided into a series of autonomous "tribelets," the boundaries of which are not well defined. The Yauelmani Yokuts lived from the Kern River area, in modern Bakersfield, to the southeast corner of the valley, on the Tejon Ranch. The Hometwali were centered around Kern Lake, while the Tulamni occupied the west side of Buena Vista Lake and the foothills of the Temblors, at least to McKittrick. The Tuhohi resided from the Kern River delta north to the Goose Lake area and west to the sloughs near Buttonwillow. Yokuts villages apparently extended up to, but not into, the mouths of the canyons on the northern and western fronts of the Tehachapi Mountains, well into the foothills and lower elevations of the Sierra Nevadas on the east, and to the crest of the Temblor Range on the west. The Yokuts are Penutian speakers, and are linguistically related to northern occupants of the San Joaquin Valley.

The Kitanemuk occupied the south and central "heart" of the Tehachapi Mountains and the adjacent northwestern end of the Antelope Valley. These are speakers of the Serran branch of the Takic branch of the Uto-Aztecan language stock, and they are sometimes referred to as Haminat. They were closely related linguistically to other Serran Takic groups, such as the Serrano proper and Vanyume, who lived along the northern front of the Transverse Ranges. The Kitanemuk, however, probably did not extend any distance down onto the San Joaquin Valley floor, which was occupied by the Yokuts. The westernmost Kitanemuk occupation appears to have been at or

near Pastoria Creek, judging from known village locations, with most of their villages found farther east and south. Historic villages are known at the Pastoria, Tunis, El Paso, Tejon, and Chanac canyon mouths.

Chumash tribal territory is commonly viewed as focused on the Malibu to San Luis Obispo coast, but the interior Chumash extended to the edge of the southern San Joaquin Valley floor, from Grapevine Canyon westward. Chumash occupied four historic villages in canyon mouths on the Tejon and San Emidgio Ranches. The interior Chumash in this region most likely spoke Ventureño Chumash. The various Chumash languages are members of the Hokan linguistic stock, believed to be one of the oldest language families in the Americas.

Despite the apparent linguistic distinctions between these three groups, their lifeways were in many instances similar, reflecting widespread adaptive patterns in south-central California, as well as a deep and shared series of cultural traditions.

The Chumash, for example, followed a hunting-gathering-fishing subsistence pattern that incorporated a heavy reliance on maritime resources, including pelagic and littoral fish, and shellfish, at least for groups living along the coast. The sea resources that they exploited may have been a key factor in their evolutionary success; at the time of the arrival of the Spanish, the Chumash had reached levels of population density and complexities in social organization unequaled worldwide by other non-farming groups. These included permanent coastal villages along the Santa Barbara Channel area containing as many as 1,000 inhabitants, as well as a hierarchical sociopolitical organization consisting of at least two major chiefdoms. Further, based on recent reconstructions using mission registers, the Chumash appear to have had a matrilocal and, perhaps, matrilineal clan-based society.

The interior Chumash lacked direct access to the marine resources that contributed to such unusually high population densities along the Santa Barbara coastline. Adaptation to the environment was, therefore, more closely tied to terrestrial resources, especially the acorn-bearing oak, with cultural patterns, in general, very similar to surrounding interior groups, such as the Yokuts. Notably, however, the interior Chumash are particularly renowned for their rock paintings or pictographs, important concentrations of which are located on the San Emigdio Ranch and the Carrizo Plain.

Yokuts groups, in contrast, were organized in recognized and distinct tribelets (i.e., landowning groups linked by their shared territory and descent from a common ancestor). Depending upon tribelet location, subsistence emphasized the acorn-bearing oak, with the addition of a wide variety of other plants, fish, and game, or the bountiful lacustrine resources found around lakeshore environments.

Less ethnographic information exists on the Kitanemuk. Like many south-central California groups, however, the Kitanemuk were most likely divided into tribelets, with political organization and subsistence practices similar to their Yokuts neighbors. Following the acquisition of California by the United States, a Native American reserve was created on the Tejon Ranch in 1853 by Edward F. Beale. The so-called Sebastian Indian Reserve was created, in

part, because the influx of Euro-American settlers into the San Joaquin Valley had created unrest and resistance among tribal groups. The reserve was intended to be multi-tribal and was primarily occupied by Kitanemuk, Yokuts, and Chumash peoples, but also included members of other tribes such as the Tubatulabal, Kawaiisu, and (from the Los Angeles Basin) the Fernandeño. The reserve was disbanded and moved to Porterville following the Civil War, but a number of Native American families stayed on the Tejon Ranch, ultimately living exclusively in Tejon Canyon. Following the White Wolf Earthquake of 1952, most of the community moved to the Bakersfield area, but the last family continued to reside in Tejon Canyon until the mid-1960s. This multi-tribal community was the origin of the contemporary Tejon Indian Tribe, currently the only federally recognized tribe in Kern County (Whitley et al. 2014).

Historic Context

The historic account of early exploration and development within the Project Area, described below, is derived from the cultural resources survey report prepared by Whitley et al. 2014 in the Cultural Resources Technical Report for ASM Affiliates, Inc. (Appendix O).

Early Exploration and Development

Oil exploration, exploitation, and consumption are inextricably woven into the history of California and, in particular, Kern County. Spanish explorers visited the southern end of the San Joaquin Valley in 1772, but its lengthy distance from the missions and presidios along the Pacific Coast delayed permanent settlement for many years, including during the Mexican period of control over the Californian region. In the 1840s, Mexican rancho owners along the Pacific Coast allowed their cattle to wander and graze in the San Joaquin Valley. The Mexican government granted the first ranchos in the southern part of the San Joaquin Valley in the early 1840s, but these did not result in permanent settlement. It was not until the annexation of California in 1848 that the exploitation of the southern San Joaquin Valley occurred (Whitley et al. 2014).

Agriculture

The discovery of gold in northern California in 1848 resulted in a dramatic increase in population, consisting, in good part, of fortune seekers and gold miners who began to scour the rest of the state. In 1851, when gold was discovered in the Sierra Nevada Mountains in eastern Kern County, the population of the area grew rapidly. Some new immigrants began ranching in the San Joaquin Valley to supply the miners and mining towns. Ranchers grazed cattle and sheep, and farmers dry-farmed or used limited irrigation to grow grain crops, leading to the creation of small agricultural communities throughout the valley.

After the annexation, the southern San Joaquin Valley became significant as a center of food production for this new influx of people in California. The expansive unfenced and principally public foothill spaces were well-suited for grazing both sheep and cattle. As the Sierra Nevadas' gold rush presented extensive financial opportunities, and ranchers introduced new breeds of livestock, consisting of cattle, sheep, and pig.

Along with the dramatic increase of ranching in the southern San Joaquin Valley came the dramatic change in the landscape, as non-native grasses more beneficial for grazing and pasture replaced native flora. After the passing of the Arkansas Act in 1850, efforts were made to reclaim small tracts of land in order to create more usable spaces for ranching. Eventually, as farming supplanted ranching as a more profitable enterprise, large tracts of land began to be reclaimed for agricultural use, aided, in part, by the extension of the railroad in the 1870s.

Following the passage of statewide 'No-Fence' laws in 1874, ranching practices began to decline, while farming expanded in the San Joaquin Valley in both large land holdings and smaller, subdivided properties. As the farming population grew, so did the demand for irrigation. Settlers began reclamation of swampland in 1866 and built small dams across the Kern River to divert water into the fields. By 1880, 86 different groups were taking water from the Kern River. Ten years later, 15 major canals provided water to thousands of acres in Kern County.

During the period of reclaiming unproductive land in the southern San Joaquin Valley, grants were given to individuals who had both the resources and the finances to undertake the operation alone. One small agricultural settlement, founded by Colonel Thomas Baker in 1861 after procuring one such grant, took advantage of reclaimed swampland along the Kern River. This settlement became the City of Bakersfield in 1869, and quickly became the center of activity in the southern San Joaquin Valley and in the newly formed Kern County. Located on the main stage road through the San Joaquin Valley, the town became a primary market and transportation hub for stock and crops, as well as a popular stopping point for travelers on the Los Angeles and Stockton Road. The Southern Pacific Railroad reached the Bakersfield area in 1873, connecting it with important market towns elsewhere in the state and dramatically impacting both agriculture and oil production.

The San Joaquin Valley was dominated by agricultural pursuits until the oil boom of the early 1900s, which saw a shift in the region, as some reclaimed lands previously used for farming were leased to oil companies. The shift of the San Joaquin Valley towards oil production did not halt the continued growth of agriculture. The Great Depression of the 1930s brought with it the arrival of great number of migrants from the drought-affected Dust Bowl region looking for agricultural labor. These migrants established temporary camps in the valley, staying on long past the end of the drought and the Great Depression, and eventually settling in towns such as Bakersfield (Whitley et al. 2014).

Petroleum and Railway Development

While mining and agriculture led to the settlement of Kern County, the exploitation of the San Joaquin Valley's petroleum resources became the primary industry of the area in the late nineteenth and twentieth centuries. Historically, early European settlers noticed oil seeping from the ground and that Native Americans in the area used it to waterproof their tule balsas (reed boats). The new settlers used the petroleum as axle grease and lubrication for farm machinery. The use of petroleum did not begin in earnest until the Civil War, when the Union's supply of illuminating oil from Confederate sources was interrupted. Kerosene was used as a substitute, and

the Buena Vista Oil Refinery, the first in California, was established for this purpose in 1864, near McKittrick.

The beginning of oil industry development in the southern San Joaquin Valley began on the western side, with the first oil well drilled in 1877 and the first wooden oil derrick raised in 1887. By 1899, there were three oilfields established: (1) on the west side of the valley; (2) McKittrick and Midway-Sunset; and (3) with Kern River on the northeast of Bakersfield. The establishment of the western oilfields was greatly aided by the extension of the rail line to McKittrick in 1893. Thus, the expansion of the railways into the southern San Joaquin Valley was directly tied to, and symbiotic with, the drilling and production of the oil industry.

The McKittrick oilfield was originally established for the exploitation of asphaltum, and was subsequently the site of the first oil well and derrick. The area's rapid oil development was aided by the discovery of Klondike Oil Company's Shamrock Gusher in 1896, which produced, on average, 1,300 barrels per day. Thirty miles west of Bakersfield, the early development of the McKittrick oilfield was initially hindered by its remote location. Growth continued after the railway extension and, by 1914, McKittrick had 270 producing wells that were responsible for the production of 103,000 barrels of oil between 1903 and 1914. By 1943, McKittrick oilfield comprised 1,545 acres, with 250 producing wells and yielding 100 million barrels of oil.

Midway and Sunset oilfields were initially unconnected, separated by the Mount Diablo/San Bernardino baseline. With the first well drilled in the Sunset field in 1891, and systematic production beginning in 1894, the field became economically significant by 1900, when the 18 wells produced 12,500 barrels of oil. Within ten years, this increased to 9.2 million barrels, in large part due to the discovery and exploitation of the Lakeview Gusher in 1909, producing 7 million barrels in the subsequent year. After its development in 1900, Midway field entered heavy production and, by 1916, was producing 32 million barrels. Combined, the Midway and Sunset fields contained 1,710 producing wells. During the 1913-1916 period, the Midway and Sunset fields were responsible for roughly 50% of California's oil production.

The Kern River oilfield originally consisted of a hand-dug pit located 5 miles north of Bakersfield, near the Kern River, in 1899. As the first oilfield on the east side of San Joaquin Valley, its immediacy to Bakersfield and the main railway lines stimulated rapid development. By 1900, the field comprised 130 producing wells with a Southern Pacific railroad spur line. The field continued to thrive, producing 16 million barrels of oil in 1903. Boomtowns sprang up around the area, including Oildale, Oil Center, and Oil City. In turn, Bakersfield prospered from this proximity, eventually expanding to absorb these small boomtown communities. By 1914, the Kern River Oilfield covered 10 square miles with 1,675 wells producing 167 million barrels of oil.

The turn of the twentieth century brought with it the demand for crude oil, as it became the primary source of fuel for ships, railroad locomotives, automobiles, and farm machinery. In contrast to previous oil production procedures, which were primarily comprised of guesswork and hard labor, new efforts were made at standardization. Scientific methods were used to gauge

where to place oil derricks and pipelines, as well as new drilling techniques to minimize loss of oil.

In order to compensate for the growth of the oil industry, the southern San Joaquin Valley experienced a growth in small oil towns and settlements. Even with the advancement of railroads in the region, many of the most profitable oilfields were in remote locations, often requiring horse drawn carriages to haul barrels of oil to the railroads. These "lease towns," often no more than campsites, sprang up along the most commonly used routes, acting as housing for both laborers and their families. The larger oil companies formalized these sites, building bunk and boarding houses for their workers. The Sunset Railroad, jointly owned by the Southern Pacific and Santa Fe railroad companies, serviced the west side of the oilfields and was greatly responsible for the development of both the McKittrick and Midway-Sunset oilfields. The 1909 extension 7 miles beyond Maricopa, "Siding Two," was created to reach Midway-Sunset Field. The resulting settlement at this siding, originally called "Boost City," later "Moron," and finally "Taft," continues to be the largest community on the west side. Other such settlements have continued on today, originating in towns such as Fellows, Maricopa, McKittrick, and Oildale.

In 1903, the Standard Oil Company completed a 280-mile pipeline from the Kern River oilfield to its Point Richmond refineries on San Francisco Bay. The high viscosity of the oil from the Kern River oilfield required heating at pumping stations along the pipeline so that it flowed easily. Other pipelines connected the region's oilfields to nearby towns like Bakersfield or to railroad stations where it could be loaded into tank cars. In nearly all of the area's oilfields, producers were forced to develop new techniques to remove water or to prevent water from getting into their wells. Because of these advances, production in the Kern County oilfields rose steadily to meet the growing demand, and California became the nation's leading oil producing state in 1903. California produced over 24 million barrels that year, with approximately 70%coming from Kern County.

While the largest oil corporation, Standard Oil, was broken up by the U.S. Government in 1911, the vitality of the oil industry was safeguarded by the massive amounts of capital the monopolies had devoted to developing the industry, which experienced standardization in exploration and technology, and business conglomeration and organization. The industry became increasingly important economically due to the parallel development of the automobile and the growing need for gasoline. Though industrial standardization was slow, the history of oil drilling technology and production is particularly important for understanding the archaeology of the oilfields. The majority of the historical material culture in the oilfields comprises remnants of petroleum exploration, extraction, and movement. Despite the fact that industrial changes were far from uniform or synchronous (even within a single oilfield), the following summary is useful when looking at the oilfields material cultural record.

Initial drilling technology in the California fields involved the use of so-called cable (or percussion) rigs. These used wooden frame derricks to hoist the drill bit attached to a stem, and subsequently to insert or remove lengths of pipe down-hole. Once the well was drilled, a pump was erected within the derrick structure. Initially these were wooden "walking beam" pumps. Operating the derrick and the pump required an engine or motor of some kind, and a power

source. A variety of belts (subsequently chains) and pulley wheels (eventually gears) were also required, along with one or more (wooden) tanks.

Due to earthquake faulting, and the resulting small size of the subterranean petroleum pools, California oilfields developed more densely than oilfields in other parts of the world (where, a single well/pump may access a much larger underground reservoir). World War II disrupted the development of oilfield equipment and, following the war, internal combustion engines were used to run the drills and pumps.

Although the rotary drilling rig was introduced in 1908, cable rigs were initially still standard, especially in the California oilfields. Until the development of better rotary drill bits and circulating fluids, older technology was more efficient with difficult down-hole conditions. Initially, rotary rigs continued to be constructed with wooden derricks. Due to the variable down-hole conditions in the California fields, combination rigs, which allowed drillers to switch between cable-percussion and rotary bits and set-ups, were also employed.

Metal derricks, replacing the old wooden structures, were introduced locally in 1924 and allowed more flexibility to local field conditions. Although in theory metal derricks could be placed on the ground surface, most were built on concrete foundations with foundation bolts holding them in place. Derrick size (height and dimensions of base) was a function of well depth, and length of the necessary piping. In general terms, California oilfields required additional and heavier piping, resulting in larger derricks. However, no clear size distinction exists between derricks for cable versus rotary rigs, or wooden as opposed to metal construction.

Although earlier examples exist in other parts of the country, practical use of portable drilling rigs occurred in the region in 1940. This eliminated the need for a foundation, ultimately resulting in a pump jack resting on a small concrete foundation or pad.

The destabilization of the oil market during the period of the Great Depression was alleviated by the onset of World War II, which revived the industry and brought with it bigger, more global markets. The abandonment of Anti-Trust laws by the U.S. Government allowed oil production to increase 30% by the end of the war. With the number of vehicles in the United States doubling by 1950, the oil industry was permanently on the rise.

The 1960s began a new era of automation in the oil industry. Automated production machinery required minimal maintenance, and the well-developed regional infrastructure of the southern San Joaquin Valley allowed workers to live in more urban centers such as Bakersfield, eliminating the need for lease towns, which began to decline in population.

The practice of well stimulation by hydraulic fracturing began in the 1940s in California. However, hydraulic fracturing and other forms of well stimulation activity are brief and, once completed, do not result in the installation of surface equipment different from equipment used for wells that have not been stimulated. Therefore, well stimulation and other well stimulation treatment is not associated with historical resources impacts distinct from those of oilfields in general.

Based on the above discussion, and taking into account potential variation, the chronological trends in oilfield technology and their archaeological indicators are as follows:

- Most (but not all) wooden derricks lack concrete foundations and pre-date ca. 1924. The archaeological record at these locations typically includes a standing well-pipe, substantial quantities of wire-cut nails and (potentially) milled wood fragments, along with sumps.

- Most steel derrick remnants date between ca. 1924 and 1940. These typically include a standing well-pipe, four large concrete derrick foundations arrayed in a square or rectangle, and a series of additional concrete foundations for the pumpjack and motors, set-up in-line with the well-head. Because some set-ups of this type were enclosed in wooden sheds, milled wood fragments and wire-cut nails may also be present, along with sumps and other features.

- Potential cultural resources resulting from portable drilling rigs, post-dating about 1940, primarily consist of a standing well-pipe and flat concrete pad for the pumpjack with minimal other remains. In many cases, it may not be possible to determine whether resources of this type are 70, 50, or even 20 or 10 years old, based on the archaeological record.

- Boilers primarily will pre-date World War II. Because they were located a few hundred feet from the pumpjack, for safety purposes, they are expected to be encountered in isolation of other resources.

Table 4.5-1 lists the oilfields in the study area and their approximate creation dates. (Due to inconsistencies in the available records, certain dates represent the designation dates of oilfield rules and, thus, field delineations, whereas others are approximate initial exploration dates.) Based on oilfields in the Project Area and their approximate creation dates, ~20% of the oilfields date from 1925 or earlier (including 13% of the total that are over 100 years old), ~22% from 1926 – 1940, ~48% from 1941 to 1970, and ~9% after that date (Whitley et al. 2014).

The historical archaeological implications of the oilfield chronology are that:

- ~42% of the oilfields may have historical industrial remains.
- These are also fields with the longest history of use and, therefore, disturbance, resulting in the least likelihood that historical sites will maintain integrity.
- The remaining oilfields post-date 1940 and for that fact are less likely to include historical sites that meet the 50 years minimum age criterion for significance.

However, because the archaeological signature of post-war oil technology is very similar to that dating from the 1970s, it is often not possible to affirmatively establish, on the basis of the archaeological record alone, that mid-century oil industry remains meet the age criterion as

historical resources. The practical implication is that the large majority of potential identifiable oil industry historical sites will occur in the oilfields that pre-date World War II.

Paleontological Setting

The description of the paleontological setting is provided as described by Deméré and Donohue (2015) of the Department of PaleoServices, San Diego Natural History Museum, in the paleontological resources technical report for ASM Affiliates, Inc. (Appendix P). The Project Area has a geologic history that extends back in time almost 160 million years. This history is recorded in the thick sequence of sedimentary and igneous rock units that mostly underlie the floor of the San Joaquin Valley, but also are exposed in the upland areas that surround the valley to the east, south, and west. Geologic events documented in these strata include periods of marine inundation when the waters of the ancestral Pacific Ocean flooded the region and sediments accumulated on the ancient sea floor. These fine-grained marine strata would later become the source rocks of the future hydrocarbon riches of the valley. Additional geologic events documented in the deeply buried strata include periods of low sea level and the accumulation of sediments derived directly from surrounding uplands and deposited by regional rivers and alluvial fan systems. These coarser-grained deposits would later become the reservoir rocks that today serve as traps for migrating oil and gas resources. More recent geologic events document the final retreat of marine waters as the uplift of the Coast Ranges by regional tectonic processes (i.e., faulting and folding) and eventually created a permanent physical barrier between the valley and the Pacific Ocean (Deméré and Donohue 2015).

Another important aspect of the history of the region is the biological history of the organisms, including large-bodied and small-bodied vertebrates, invertebrates, and plants that lived and died in the ancient marine and non-marine environments, and whose remains and traces are preserved today as fossils in the sedimentary rocks of the Project Area. These fossils document not only the startling changes in the past biological diversity of the region, but also the complexity of the ecosystems supporting that diversity and the dramatic fluctuations in climate that continue to the present. The rock units preserving the majority of this geologic and paleontological history are sparingly exposed at the surface today, largely in the upland regions of the Western Subarea and Eastern Subarea. This patchwork of bedrock exposures is the result of a combination of plate tectonic forces expressed as regional uplift, folding and faulting and surficial forces expressed as weathering, erosion, and sedimentation. Although not all of the rock units exposed today in the

Project Area contain significant paleontological resources, a majority of these deposits do. Generally, no fossils are preserved in basement rocks nor in recent sediments less than 10,000 years old. Marine fossils known from the Project Area include a diverse and abundant array of marine animals and plants dating from 140 to 42.5 million years (Ma). Non-marine fossils represent diverse, although less numerous, assemblages dating from 68 Ma to 10,000 years B.P.

Basement Rocks

Basement rocks of late Paleozoic to Mesozoic age (~300 to 66 Ma) flank the Project Area to the south and east, and consist of intrusive igneous rocks (e.g., granite) and high-grade metamorphic rocks. The majority of the basement complex rocks are granitics from the intrusion of the Sierra Nevada Batholith in Mesozoic time (~167 to 67 Ma). Basement rocks are primarily located adjacent to the eastern uplands of the Eastern Subarea. They are also found within the San Emigdio and Tehachapi Mountains in the southern portion of the Project Area, in both the Western and Eastern Subareas (Deméré and Donohue 2015).

Franciscan Complex

The Franciscan Complex represents a suite of deepwater marine sedimentary and volcanic rocks of a subduction zone and associated accretionary wedge that formed adjacent to the North American Plate during Mesozoic time. The highly deformed mélange is believed to have been deposited in the late Jurassic to late Cretaceous (~160 to 68 Ma) within, and adjacent to, the subduction zone. As the oceanic tectonic plate descended into the mantle beneath the North American Plate, deep marine sedimentary rocks and volcanic rocks (basalt generated at a seafloor spreading location) were scraped off the descending plate and welded to the North American Plate. This accretionary process led to complex deformation including faulting, folding, and metamorphism. The Franciscan Complex is found in the Temblor Range at the northwest edges of the Project Area (Deméré and Donohue 2015).

Gravelly Flat Formation

The Gravelly Flat Formation is the lowermost (i.e., oldest) member of the Cretaceous, deep marine, sedimentary rocks known collectively as the Great Valley Sequence. The formation was deposited in a deep marine, forearc basin in late Jurassic to early Cretaceous time (~150 to 75 Ma). The type section consists of dark gray to olive brown shale, with interbeds of dark colored, brown-weathering, graywacke sandstones. Outcrops of the Gravelly Flat Formation are found in the Temblor Range within the northwestern most portion of the Project Area. Prominent exposures occur on either side of State Route 46, and a larger area of outcrop occurs just south of Bitterwater Creek (Deméré and Donohue 2015).

Hex Claystone

The Hex Claystone is a nearly homogenous, gray marine claystone of early Cretaceous age (~145 to ~100 Ma). It consists of gray bentonitic claystones with scattered fragments of oolitic limestone that transition westward into light blue tuffaceous shale with abundant gypsum veins. The Hex Claystone was likely injected as a plastic mass along fault planes between the Gravelly

Flat Formation and Panoche Formation, which is suggested by the strong plastic deformation of the formation and because it is bounded by faults. Because of the complex depositional history of the Hex Claystone its precise stratigraphic placement cannot be determined and the assigned early Cretaceous age is based on the presence of diagnostic fossils (e.g., cephalopods and foraminiferans). One minor outcrop of the Hex Claystone occurs within the northwestern most portion of the Project Area, east of the Devil's Den Field, and north of State Route 46 (Deméré and Donohue 2015).

Panoche Formation

The Panoche Formation is the uppermost (i.e., youngest) rock unit in the Cretaceous-age Great Valley Group exposed within the Project Area. The Panoche Formation was deposited in a submarine fan complex during late Cretaceous time (~75 to 68 Ma) and the deposits consist of "interbedded concretion-rich light-colored sandstone and dark-gray clay shale or claystone." The Panoche Formation is widely exposed within the Temblor Range in the Western Subarea. Prominent outcrops occur in the northwestern corner of the Project Area (east of the Devil's Den Field) and extend southward (Deméré and Donohue 2015).

Pattiway Formation

The Pattiway Formation is a marine sedimentary rock unit located in the Western Subarea. Paleomagnetic analyses indicate a middle Paleocene age (60.9 to 58.0 Ma). The Pattiway Formation ranges from olive gray to dark gray siltstone with interbeds of claystone and sandstone with localized concretions, to light olive gray fine- to medium-grained sandstones with some graded bedding. Conglomerate lenses also occur within the Pattiway Formation, suggesting it was deposited in a submarine fan complex. Conglomerates consist of yellow-gray to pale green-gray, lenticular, massive to thickly bedded, channelized sequences of pebble to boulder conglomerate. The Pattiway Formation is one of the only Paleocene-aged formations to crop out in the southwestern San Joaquin Valley. It is unconformably overlain by the Simmler Formation, and the base of the formation has not yet been exposed. The Pattiway Formation is located in a narrow, 3-mile-long outcrop belt in the southwesternmost corner of the Project Area, at the southern Project boundary (Deméré and Donohue 2015).

Lodo Formation

The Lodo Formation is a Paleocene- to Eocene-aged (~59 to 50 Ma), deepwater marine, sedimentary rock unit composed of soft gray claystone, mudstone, and shale. The Lodo Formation occurs as a narrow (about 0.25 mile thick), 9-mile-long band within the Temblor Range of the west-central portion of the Project Area, just north of State Route 58 (Carrisa Highway). This outcrop is the southernmost extent of the formation (Deméré and Donohue 2015).

Tejon Formation

The Tejon Formation is a middle-Eocene-aged (~49 to 39 Ma), marine, sedimentary rock unit deposited during a major marine transgressive–regressive cycle and has been subdivided into four members. These include, in ascending order: (1) the basal Uvas Conglomerate, a nearshore high

energy breccia, sandstone, and conglomerate transgressive facies; (2) the Liveoak Shale, an offshore sandstone and shale facies; (3) the Metralla Sandstone, a regressive shallow marine sandstone facies with interbedded conglomerate and shale; and (4) the Reed Canyon Siltstone, a shallow marine to brackish water sandy siltstone facies with lenses of coal and carbon debris. The Tejon Formation is the oldest Cenozoic sedimentary rock unit found along the southern margin of the San Joaquin Valley in the San Emigdio and western Tehachapi Mountains (Western and Eastern Subareas) (Deméré and Donohue 2015).

Avenal Sandstone

The Avenal Sandstone is a middle-Eocene-aged (~48 to 40 Ma), non-marine to shallow marine, sedimentary rock unit. Within the Project Area, the Avenal Sandstone occurs as two thin lenses in the Western Subarea. The southern lens is located adjacent to Media Agua Creek in the Temblor Range (west of the Carneros Creek Field), and is approximately 2 miles long, while the smaller northern lens is located at Point of Rocks, north of Antelope Valley (west of the Welcome Valley Field), and is approximately 0.5 mile long. Both lenses consist of fine-grained sandstones, suggesting upper sand flat and shoreface paleoenvironments (Deméré and Donohue 2015).

Kreyenhagen Shale

The Kreyenhagen Formation is a middle-Eocene-aged (~48 to 37 Ma), marine, sedimentary rock unit composed predominantly of shales, claystones, siltstones, and sandstones. In general, the Kreyenhagen Formation records a dramatic marine transgression of the Eocene San Joaquin Basin and represents a deepwater marine environment, although some parts of the formation represent submarine fan deposits. The Kreyenhagen Formation occurs within the northwestern portion of the Project Area, and crops out for approximately 30 miles within the Temblor Range. East of the Bacon Hills, exposures of the Kreyenhagen Formation are as much as 2.5 miles across (Deméré and Donohue 2015).

San Emigdio Formation

The San Emigdio Formation is an Eocene-aged to late Oligocene age (~48 to 24 Ma), shallow, marine rock unit that generally represents a transgressive-regressive marine sequence from deepwater marine to shallow water delta. The San Emigdio Formation consists of medium- to coarse-grained sandstone, bioturbated fine-grained sandstones, and nearshore marine sandstones. This formation is prominently exposed in the San Emigdio Mountains of the southern portion of the Western Subarea (Deméré and Donohue 2015).

Wagonwheel Formation

The Wagonwheel Formation is an upper Eocene-aged (~38 to 35 Ma), deepwater marine, sedimentary rock unit consisting of sandstones and clayey shales. The interpreted depositional environment of the Wagonwheel Formation is the interface between the continental shelf and continental slope; however, fossils also indicate a very rare cold seep environment. This formation has a very limited area of exposure in the Western Subarea, consisting of one small (2.5 miles in length) outcrop just west of Wagonwheel Mountain (Deméré and Donohue 2015).

Walker Formation

The Walker Formation is a non-marine sedimentary rock unit of late Eocene to earliest Miocene age (~38 to 23 Ma). The Walker Formation has two facies that have distinct stratigraphic horizons, lithologic characters, and depositional styles geographically separated by the Bakersfield Arch. The axis of the Bakersfield Arch underlies and roughly parallels the channel of the lower Kern River. North of the Kern River, deposits of the Walker Formation are late Eocene to Oligocene in age, and contain a sequence of volcanic lahar deposits. South of the Kern River, deposits of the Walker Formation are Oligocene to early Miocene in age, and are fluvial in origin. The geology is complex, but generally consists of claystones and sandstones with volcanic tuff layers. The Walker Formation has a limited area of outcrop in the Eastern Subarea and is confined to the east side foothill region between Poso Creek to the north and Caliente Canyon to the south (Deméré and Donohue 2015).

Bealville Fanglomerate

The Bealville Fanglomerate is a late Oligocene to early Miocene-aged (~35 to 18 Ma), terrestrial deposit consisting of light gray, poorly consolidated boulder debris flows, talus, and colluvium along Bealville Road, on the south side of Caliente Canyon, west of Caliente. There are a number of debris flow episodes recorded within the fanglomerate, while the remainder of the formation was likely deposited as part of a near-source alluvial fan. A single exposure of the Bealville Fanglomerate that is approximately 3 miles wide and 2.5 miles long is located in the Tehachapi Foothills, south of Caliente Creek, near Bena, California (Deméré and Donohue 2015).

Vedder Sand

The Vedder Sand is an Oligocene-aged (~34 to 24 Ma), marine, sedimentary rock unit that is primarily found in the subsurface, but has a limited area of outcrop north of Poso Creek. The formation consists of light gray, fine- to medium-grained, well-sorted sandstone, with locally well-cemented horizons. The Vedder Sand is present in several northeast trending outcrops to the north of Poso Creek, about 15 miles northeast of Bakersfield (Deméré and Donohue 2015).

Pleito Formation

The Pleito Formation is an Oligocene to early Miocene-aged (~34 to 22 Ma), marine, sedimentary rock unit and consists of basal white, tan, or yellowish-brown, massive to thickly bedded, medium- to coarse-grained sandstones with conglomerate horizons. These lower strata transition to gray, micaceous shales in the middle section, and are capped by massive yellow and gray medium- to coarse-grained sandstones at the top of the unit. The lower and upper sandstones of the Pleito Formation represent shallow marine depositional environments, while the middle shale was deposited in a deep marine environment, indicating fluctuations in sea level and/or tectonic events during the Oligocene. The Pleito Formation is prominently exposed in the San Emigdio Mountains of the southern portion of the Western Subarea (Deméré and Donohue 2015).

Simmler Formation

The Simmler Formation is an Oligocene to early Miocene-aged (~34 to 22 Ma), non-marine, sedimentary rock consisting of red and greenish-gray, well bedded sandstones, siltstones, and cobble conglomerate. A large, 3-mile-long by 2-mile-wide exposure of the Simmler Formation is found in the southwestern corner of the Project Area, just south of Bitter Creek and the San Andreas Fault Zone (Deméré and Donohue 2015).

Vaqueros Formation

The Vaqueros Formation is an Oligocene to early Miocene-aged (~34 to 22 Ma), marine, sedimentary rock unit that was first named for exposures of sandstones along Vaqueros Creek near King City. The Vaqueros Formation consists of grayish-yellow to yellowish-gray, fine- to medium-grained, regularly bedded sandstones, with intervals of pebble conglomerate. The Vaqueros Formation has a very limited area of outcrop in the Project Area, being confined to a single 0.5-mile-long exposure in the southwestern corner of the Western Subarea, adjacent to the San Andreas Fault Zone (Deméré and Donohue 2015).

Tecuya Formation

The Tecuya Formation is an Oligocene to middle Miocene-aged (~28 to 18 Ma), predominantly coarse-grained rock unit that was deposited in a large alluvial-fan to delta-fan system during a major marine regression. The formation consists of an upper and lower non-marine stratigraphic sequence, with a middle volcanic rock unit. In its easternmost areas of outcrop, the depositional environment of the Tecuya Formation is interpreted to have been a broad alluvial fan system with strata dominated by alternating debris-flow and braided-stream deposits. The base of the formation is a matrix- to clast-supported, pebble to boulder conglomerate unit with occasional horizons of coarse-grained sandstone and mudstone. The Tecuya Formation thins to the west, and clast size generally decreases in that direction, reflecting a general transition in depositional environments from an alluvial fan to a delta fan. The Tecuya Formation crops out within the southern portions of the Western and Eastern Subareas, on the north-facing flanks of the San Emigdio and Tehachapi Mountains (Deméré and Donohue 2015).

Temblor Formation

The Temblor Formation is an Oligocene to middle Miocene-aged (~28 to 18 Ma), predominantly marine, sedimentary rock unit. It is geologically complex along its nearly 100 miles of outcrop in the southern San Joaquin Valley, and consists of shallow marine, deep marine, and terrestrial deposits. Seven members have been formally recognized in the Temblor, and include, from oldest to youngest, the Cymric Shale, the Wygal Sandstone, the Santos Shale (lower and upper units), the Agua Sandstone, the Carneros Sandstone, the Media Shale, and the Buttonbed Sandstone. Generally, these members represent transitions between shales deposited in deeper, outer continental shelf conditions, and sandstones deposited in shallower, inner continental shelf conditions. The Temblor Formation has extensive surficial exposures in the Temblor Range and San Emigdio Mountains of the Western Subarea (Deméré and Donohue 2015).

Freeman Silt/Jewett Sand

The Jewett Sand and Freeman Silt are early Miocene-aged (~22 to 17 Ma), marine rock units that primarily occur in the subsurface. Surface exposures of these two formations are difficult to differentiate in outcrop because of their similar appearance; for this reason, they are often lumped together as a single rock unit designated as the Freeman Silt/Jewett Sand. The Jewett Sand in outcrop is generally very fine- to fine-grained, silty sandstone with reddish-brown concretions. In outcrop, the Freeman Silt is generally a light gray, sandy to clayey, micaceous siltstone. The Freeman Silt and Jewett Sand crop out in the Sierran foothills north of the Kern River, both north and south of Poso Creek, and about 15 miles northeast of Bakersfield (Deméré and Donohue 2015).

Olcese Sand

The Olcese Sand is an early Miocene-aged (~19 to 17 Ma), primarily marine rock unit that consists of a lower portion of very fine-grained, silty sandstone with interbedded sandy and clayey siltstone; a middle portion that is non-marine in origin and consists of bluish-gray, fine- to coarse-grained sandstone (often pumaceous and cross-bedded), with interbedded pebbly sandstones; and an upper portion that grades into siltstones of the overlying Round Mountain Silt and typically consists of light gray to tan, very fine- to fine-grained sandstone and sandy siltstone with interbeds of tuffaceous sandstones. The Olcese Sand was deposited during a series of marine transgressions and regressions. Marine strata in the lower part of the formation suggest a middle-shelf paleoenvironment, while marine strata in the upper part of the formation suggest depositional environments from shelf-edge to strandline. Non-marine strata in the middle part of the formation suggest deposition in braided stream and tidally dominated deltaic settings. The Olcese Sand crops out in the foothills of the western Sierras, northeast of Bakersfield, and to the south in the Tejon Hills (Deméré and Donohue 2015).

Bena Gravel

The Bena Gravel is a middle to late Miocene-aged (~18 to 11 Ma), coarse-grained, terrestrial to marine geologic deposit that occurs at three distinct locations within the Eastern Subarea. The type section of the Bena Gravel at Caliente Canyon east of Bakersfield exposes poorly bedded and poorly sorted medium- to very coarse-grained pebbly sandstone, and sandy pebble-cobble conglomerate that is mostly friable but clayey, and is light gray to grayish yellow in color. North of Kern River, the Bena Gravel includes a paralic facies that both underlies and overlies the fluvial facies and contains a fining upward sequence of sandstone, siltstone, and claystone that is interbedded with the typical conglomerates of the fluvial facies. In the Tejon Hills region, a fluvial facies of the Bena Gravel can be found (Deméré and Donohue 2015).

Caliente Formation

The Caliente Formation is a middle to late Miocene-aged (~17 to 5 Ma), non-marine, sedimentary rock unit with three members. The lower member consists of reddish brown to gray, massive to thickly bedded, coarse-grained sandstone and conglomerate deposited in a braided river system. The middle member consists of reddish brown thickly bedded sandstone and siltstone that grade

upward from medium- to coarse-grained sandstone to fine-grained sandstone and siltstone, representing fluvial deposits with an increasing lacustrine influence. Occasional channelized sandstone and gravel beds are found throughout this member. The upper member predominantly consists of pale brown to pink mudstone and claystone with a dark brown bentonite rich claystone bed, the Lockwood Clay. Two small, 0.5-mile-long and 0.25-mile-wide exposures of the Caliente Formation occur in the Western Subarea. The first is approximately 2.0 miles north of the southwestern most corner of the Project Area boundary, and the second is approximately 1.0 mile east of the southwestern most corner of the Project Area boundary (Deméré and Donohue 2015).

Round Mountain Silt

The Round Mountain Silt is a marine sedimentary rock unit of middle Miocene age (~16 to 13 Ma). The lower siltstone facies consists of light brown interbedded siltstone and sandy siltstone containing locally abundant micro- and macro-fossils indicative of inner to outer shelf water depths. This lower siltstone facies interfingers with strata of the underlying Olcese Sand. A middle diatomite facies consists of thick sequences of pure diatomite and diatomaceous shale with thin interbeds of siltstone and tuff. Microfossils (diatoms) from this facies are indicative of an open ocean paleoenvironment. The upper siltstone facies primarily consists of grayish tan, massive clayey and sandy siltstones, with local sequences of cross-bedded sandstones and pebble conglomerates. Taphonomic analysis suggests the world famous Sharktooth Hill bone bed (which occurs in the upper siltstone facies) formed over a period of ~700,000 years, between 16 and 15 Ma ago, coincident with a significant transgressive-regressive cycle. The Round Mountain Silt has a limited area of surface exposure in the Eastern Subarea that is confined to the foothills of the Sierras east of Bakersfield from Poso Creek in the north to Cottonwood Creek in the south (Deméré and Donohue 2015).

Monterey Formation

The Monterey Formation is a widespread and geologically complex marine sedimentary rock unit of middle to late Miocene age (~16 to 8 Ma). This rock unit is the major source rock for hydrocarbons throughout its area of occurrence. The Monterey Formation is characteristically known for its siliceous sediments, which range from soft diatomites to well cemented cherts and porcelanites. However, the formation also contains extensive sequences of phosphatic- and carbonate-rich strata that reflect the diversity of paleoenvironments in which the Monterey Formation was deposited. The Monterey Formation has extensive surficial exposures in the Temblor Range, and minor exposures in the San Emigdio Range of the Western Subarea (Deméré and Donohue 2015).

Santa Margarita Formation

The Santa Margarita Formation is a late Miocene-aged (~12 to 8 Ma), shallow marine to marginal marine, sedimentary rock unit. Typical exposures of the Santa Margarita Formation consist of white, generally poorly consolidated, massive to cross-bedded, coarse-grained sandstones that laterally grade into fine- to medium-grained sandstone or pebble conglomerate. The Santa Margarita Formation is exposed in the Temblor Range west of Fellows, where the northwest-

trending outcrops of this rock unit underlie the western portion of the Midway-Sunset Field (Demeré and Donohue 2015).

Chanac Formation

The Chanac Formation is a late Miocene-aged (~11 to 9 Ma), non-marine rock unit. Typical exposures consist of pale yellow brown sandy mudstones and brown clayey sandstones, with interbeds of light gray, friable, coarse-grained, pebbly sandstones containing deeply weathered plutonic clasts. These strata are generally referred to as fanglomerates and grade downward and laterally into finer-grained marine sedimentary rocks. The Chanac Formation is exposed in the western Sierra foothills, north of Kern River, and in the Tejon Hills near Arvin (Demeré and Donohue 2015).

Bitterwater Creek Shale

The Bitterwater Creek Shale is a late Miocene to possible early Pliocene-aged (~10 to 5 Ma) marine deposit. Typical exposures of the Bitterwater Creek Shale consist of pale brown, yellowish brown, pale olive green, or greenish gray, siliceous shales that are thinly bedded to indistinctly bedded. A pebble conglomerate facies with well-rounded granitic and sedimentary clasts, and occasional claystone and siltstone lenses, is also reported. The Bitterwater Creek Shale has been complexly folded, and its easily eroded nature makes outcrop study difficult. It is generally known that the onset of deposition occurred in the late Miocene, and potentially extended into the Pliocene. An 8-mile-long by 3-mile-wide exposure of the Bitterwater Creek Shale Formation is located along CA-33, southwest of Maricopa, California (Demeré and Donohue 2015).

Kern River Formation

The Kern River Formation is a late Miocene to early Pleistocene-aged (~8.5 to 2 Ma), non-marine, sedimentary rock unit located east of Bakersfield. The Kern River Formation was deposited as a broad, braided-stream, alluvial fan complex draining the western Sierra Nevada. The formation typically consists of light yellow to light brown, poorly sorted, angular to subrounded, massive to crudely bedded, sandstones and conglomerates with occasional interbedded horizons of green to brown siltstone and mudstone that likely represent small ephemeral lakes or ponds. Ash horizons are also present at several intervals within the formation. Conglomerates are most abundant in the easternmost exposures, and the formation becomes finer grained to the west, giving way to medium- to coarse-grained sandstones. The Kern River Formation is an important reservoir of hydrocarbons migrating from underlying, oil-bearing Monterey Formation rocks. The Kern River Formation has a crescent-shaped region of outcrop in the Eastern Subarea that is largely confined to the area north of the Kern River. The outcrop belt is widest between Poso Creek and Rag Gulch, northeast of Bakersfield (Demeré and Donohue 2015).

Unnamed Miocene Marine Deposits

Two prominent exposures of Miocene-aged marine sediments that are yet to be formally named or described are found within the Eastern Subarea. In the first region, the Tejon Hills, the unnamed sediments are present in two exposures north of the Comanche Point Field. Marine sandstones and siltstones whose age and composition have been debated in the literature have been informally referred to as the "Reserve" Sandstone and Edison Silts and represent a shallow marine phase (Deméré and Donohue 2015).

In the second region, approximately 20 miles northeast of Bakersfield, the sediments occur as an approximately 7.5-mile-long and up to 3.0-mile-wide exposure directly east of the Mount Poso Field. A minor, 0.3-mile-long surficial exposure of the unnamed sediments extends west into the Mount Poso. These sediments were mapped as a lower Miocene marine sandstone that is equivalent in age to the lower portion of the Olcese Sand, and to the undivided Freeman Silt/Jewett Sand. The sandstone ranges from massive to thin-bedded, friable, very fine-grained, and commonly bioturbated (Deméré and Donohue 2015).

Etchegoin Formation

The Etchegoin Formation is a Pliocene-aged (~5.4 to 4 Ma), shallow marine to estuarine rock unit. In general, the Etchegoin Formation consists of thick sequences of pale yellow to pale brown, massive to cross-bedded, sandy siltstones and fine-to coarse-grained sandstones. These are interbedded with blue, cross-bedded, coarse-grained sandstones to pebble conglomerates. A lacustrine facies is also known from the uppermost part of the formation, in its northern area of outcrop. The blue, pebble, cross-bedded sandstones represent a marine dominated delta complex, while the finer-grained pale yellow and brown sediments represent shallow marine and estuarine facies. A lower member dominated by siltstones with interbedded sandstones and conglomerates and an upper member dominated by sandstones are recognized. The Etchegoin Formation occurs as several minor outcrops within the Western Subarea of the Project Area (Deméré and Donohue 2015).

Quatal Formation

The Quatal Formation is a Pliocene-aged (~5 to 2.5 Ma), non-marine, sedimentary rock unit generally composed of a lower unit of red, brown, or gray thinly bedded claystones and siltstones with gypsum, and an upper unit of white, light brown, or orange clayey, gypsiferous sandstones with pebbles. A prominent gypsum bed is present at the base of the formation, and was deposited in a lacustrine setting, along with the overlying claystones. The pebbly sandstones were likely deposited in a fluvial system. A thin, about 500-foot-wide, approximately 2.0-mile-long exposure of the Quatal Formation occurs in the southwesternmost corner of the Project Area, bordering the Project boundary (Deméré and Donohue 2015).

Unnamed Pliocene Deposits

Exposures of Pliocene-aged (~5 to 2.5 Ma), terrestrial to brackish-water sediments, which are yet to be formally named or described, are known from the southern portion of the San Joaquin

Valley. These "terrestrial and marine sediments" have been divided into informal subunits, including a basal terrestrial claystone unit, a brackish water marine claystone unit, a brackish water marine sandstone unit, and an upper terrestrial sandstone unit. Both claystone units consist of greenish gray clay with minor interbeds of sandstone and pebbles, and the sandstones consist of gray sands with interbeds of claystone and pebble conglomerates. The unnamed Pliocene sediments are exposed along Wheeler Ridge in the southern portion of the Western Subarea, directly west of the Interstate 55/State Route 99 interchange (Deméré and Donohue 2015).

Paso Robles Formation

The Paso Robles Formation is a Pliocene- to late Pleistocene-aged (~5 to 0.1 Ma) fluvial deposit composed of unconsolidated sandstones and siltstones with occasional gravels, clays, and limestone deposits. The majority of the formation was deposited in fluvial environments with sediments derived from the adjacent Temblor Range, but marine facies are known from its westernmost exposures, outside of the Project Area, near Atascadero, California. The Paso Robles Formation is found within the Temblor Range, along the westernmost boundary of the Project Area, spanning from just south of CA-46 in the northwest to CA-166 in the southwest. The formation has been complexly folded and faulted due to movement along the San Andreas Fault Zone and uplift of the Temblor Range (Deméré and Donohue 2015).

San Joaquin Formation

The San Joaquin Formation is a Pliocene to Pleistocene-aged (~4.0 to 2.2 Ma), shallow marine, estuarine, and lacustrine sedimentary rock unit. Sediments generally consist of thick sequences of massive silty claystones, siltstones, and fine-grained sandstones that are interbedded with blue, cross-bedded, pebbly coarse-grained sandstones to pebble conglomerates. Lacustrine deposits are represented by thick sequences of silty claystones and siltstones, while estuarine and marine deposits are represented by siltstones and sandstones. The blue cross-bedded sandstones represent a marine-dominated delta complex. The San Joaquin Formation is generally subdivided into an upper member and a lower member, both of which are found within the Project Area. The variety of different sediment types found in the San Joaquin Formation document a series of advances and retreats of sea level during the late Pliocene and the eventual permanent withdrawal of marine waters from the San Joaquin Basin in the early Pleistocene. The San Joaquin Formation occurs as one relatively small (about 3 miles long by 0.75 mile wide) exposure within the Western Subarea, between State Route 33 and Interstate 5. This exposure is within the southernmost portion of the Kettleman Hills, on the west flank of South Dome (Deméré and Donohue 2015).

Morales Formation

The Pliocene to Pleistocene-aged (~4 to 0.1 Ma) Morales Formation consists of fluvial claystones, siltstones, sandstones, and conglomerates with occasional lacustrine horizons. The Morales Formation laterally grades into or interfingers with the Quatal Formation in the lower part where it is predominantly composed of claystones and siltstones. Two exposures of the Morales Formation occur within the Western Subarea. The first exposure is in the southwesternmost corner of the Project Area, bordering the Project boundary, and is

approximately 1.5 miles in length and up to 0.8 mile in width. The second exposure consists of two, approximately 1.75-mile-long linear outcrops in the Temblor Range, just south of State Route 58 (Carrisa Highway) (Deméré and Donohue 2015).

Tulare Formation

The Pleistocene-aged (2.5 to 0.6 Ma) Tulare Formation predominantly consists of poorly to moderately consolidated claystones, siltstones, sandstones, and conglomerates. Thick sequences of cross-bedded, pebbly sandstone are common, with horizons of conglomerate typically occurring in the upper part of the formation. Laterally extensive, finely bedded claystones and siltstones, and occasional freshwater limestones occur at irregular intervals throughout the formation and represent former lake beds. Ash deposits are found at several horizons within the Tulare Formation. In the subsurface, the Tulare Formation is proposed to be broadly correlative with the upper part of the Kern River Formation, which is its east-side equivalent in terms of depositional setting. Broadly speaking, strata of the Tulare Formation record the transition from the marine conditions that dominated the Miocene and Pliocene history of the San Joaquin Basin and the estuarine, lacustrine, fluvial, and alluvial fan conditions that characterized the Quaternary history of the basin. It is found on the western half of the Project Area (Deméré and Donohue 2015).

Quaternary Brea Deposits

Quaternary brea (asphalt seep, or "tar pit") deposits of late Pleistocene age (0.4 to 0.1 Ma) consist of oil-soaked unconsolidated sediments that formed when hydrocarbons percolated upwards to the surface along fractures, fault planes, or through permeable deposits. During upward migration and exposure at the surface, the lighter, volatile fraction of the petroleum evaporates, leaving behind viscous asphalt pools that can serve as "sticky animal traps," which entrain animals. Continuous episodes of entrapment can lead to high-density concentrations of well-preserved, asphalt-impregnated bones. Quaternary brea deposits occur within the Western Subarea and are located in the vicinity of McKittrick and Maricopa (Deméré and Donohue 2015).

Older Alluvial Deposits

The southern San Joaquin Basin has been accumulating sediments derived from uplift and erosion of the surrounding highlands since at least the early Pleistocene (~2.5 Ma), resulting in Quaternary older alluvial deposits several hundred feet thick covering the floor of much of the southern San Joaquin Valley. Older alluvial sediments are generally composed of reworked material from these surrounding highlands (e.g., Kern River Formation in the Eastern Subarea and Tulare Formation in the southwestern San Joaquin Valley). As sedimentation continued into the Holocene (10,000 years to present), the majority of these deposits were buried by deposits of Holocene younger alluvium. Surficial exposures of Quaternary older alluvial sediments generally occur as uplifted ridges (e.g., river terraces), and as large alluvial fan complexes flanking the surrounding uplands. Such older alluvial deposits can often be distinguished from younger alluvial deposits based on the greater number of erosional features (e.g., gullies and badland topography) in the former. Quaternary older alluvial sediments are found within all Subareas of the Project Area. These deposits most commonly flank the lower slopes of the surrounding

uplands, and occur as raised ridgelines in the center of the southern San Joaquin Valley (Demeré and Donohue 2015).

Holocene Deposits

Holocene-aged (10,000 years to present), alluvial, fluvial and lacustrine sediments make up the majority of the surficial sediments in western Kern County. For the purposes of this section, all Holocene alluvial sediments will be discussed together. Alluvial sediments are found across the floor of the San Joaquin Valley, and drainages and low-lying areas within the surrounding uplands. Sediments are primarily composed of unconsolidated or poorly consolidated clays, silts, sands, gravels, and cobbles that have been reworked from older formations and transported downstream. Much of the alluvial sediments are found in extensive, gravel and cobble rich alluvial fans that are actively building outwards from the base of the surrounding highlands. Other late Holocene depositional environments include rivers and streams, lakebeds, aeolian dunes, recent rock falls, and chemical weathering of granitic and metamorphic highlands. The estimated maximum thickness of Holocene alluvial sediments is 100 feet, but alluvial sediments can be found in veneers as thin as 1 foot. Alluvial sediments are found in all low-lying areas of the Project Area where they cover the majority of the valley floor, and can be found flanking the surrounding uplands as alluvial fan deposits or slope wash deposits. Holocene sediments are still being deposited within active river and stream drainages in the uplands and adjacent outwash plains (Demeré and Donohue 2015).

4.5.3 Regulatory Setting

Federal

Section 106 of the National Historic Preservation Act

Archaeological resources are protected through the National Historic Preservation Act (NHPA) of 1966, as amended (16 United States Code [U.S.C.] 470f), and its implementing regulation, Protection of Historic Properties (36 Code of Federal Regulations [CFR] Part 800), the Archaeological and Historic Preservation Act of 1974, and the Archaeological Resources Protection Act of 1979. Prior to implementing an "undertaking" (e.g., issuing a federal permit), Section 106 of the NHPA requires federal agencies to consider the effects of the undertaking on historic properties and to afford the Advisory Council on Historic Preservation and the State Historic Preservation Officer a reasonable opportunity to comment on any undertaking that would adversely affect properties eligible for listing in the NRHP. As indicated in Section 101(d)(6)(A) of the NHPA, properties of traditional religious and cultural importance to a tribe are eligible for inclusion in the NRHP. Under the NHPA, a resource is considered significant if it meets the NRHP listing criteria at 36 CFR 60.4.

National Register of Historic Places

The NRHP was established by the NHPA of 1966, as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation's historic

resources and to indicate what properties should be considered for protection from destruction or impairment" (36 CFR 60.2). The NRHP recognizes both historical-period and prehistoric archaeological properties that are significant at the national, state, and local levels. In the context of the Project, which does not involve any historical-period structures, the following NRHP criteria are given as the basis for evaluating archaeological resources.

To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must meet one or more of the following four established criteria (U.S. Department of Interior 1995):

- Are associated with events that have made a significant contribution to the broad patterns of our history;
- Are associated with the lives of persons significant in our past;
- Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- Have yielded, or may be likely to yield, information important in prehistory or history.

Unless the property possesses exceptional significance, it must be at least 50 years old to be eligible for NRHP listing (U.S. Department of the Interior 1995).

In addition to meeting the criteria of significance, a property must have integrity. Integrity is defined as "the ability of a property to convey its significance" (U.S. Department of the Interior 1995). The NRHP recognizes seven qualities that, in various combinations, define integrity. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association.

Paleontological Resources Preservation Act

This act aims to manage and protect paleontological resources on federal land, using scientific principles and expertise, and to develop plans for inventorying, monitoring, and deriving the scientific and educational use of such resources.

State

California Register of Historical Resources

Created in 1992 and implemented in 1998, the California Register of Historical Resources (CRHR) is "an authoritative guide in California to be used by state and local agencies, private

groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change." Certain properties, including those listed in or formally determined eligible for listing in the NRHP and California Historical Landmarks numbered 770 or higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historic resources surveys or designated by local landmarks programs, may be nominated for inclusion in the CRHR. A resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one of more of the following criteria, which are modeled on NRHP criteria:

- Criterion 1. It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- Criterion 2. It is associated with the lives of persons important in our past.
- Criterion 3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of an important creative individual, or possesses high artistic values.
- Criterion 4. It has yielded, or may be likely to yield, information important in history or prehistory.

Furthermore, under 14 California Code of Regulations (CCR) Section 4852(c), a cultural resource must retain integrity to be considered eligible for the CRHR. Specifically, it must retain sufficient character or appearance to be recognizable as a historical resource and convey reasons of significance. Integrity is evaluated with regard to retention of such factors as location, design, setting, materials, workmanship, feeling, and association. Cultural sites that have been affected by ground-disturbing activities, such as grazing and off-road vehicle use, often lack integrity because they have been directly damaged or removed from their original location, among other changes.
