Typically, a prehistoric archaeological site in California is recommended eligible for listing in the CRHR based on its potential to yield information important in prehistory or history (Criterion 4). Important information includes chronological markers, such as projectile point styles or obsidian artifacts that can be subjected to dating methods, or undisturbed deposits that retain their stratigraphic integrity. Sites such as these have the ability to address research questions.

California Historical Landmarks

California Historical Landmarks (CHLs) are buildings, structures, sites, or places that have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value and that have been determined to have statewide historical significance by meeting at least one of the criteria listed below. The resource also must be approved for designation by the County Board of Supervisors (or the city or town council in whose jurisdiction it is located), be recommended by the State Historical Resources Commission, and be officially designated by the Director of California State Parks. The specific standards now

in use were first applied in the designation of CHL #770. CHLs #770 and above are automatically listed in the CRHR.

To be eligible for designation as a landmark, a resource must meet at least one of the following criteria:

- It is the first, last, only, or most significant of its type in the state or within a large geographic region (e.g., Northern, Central, or Southern California);
- It is associated with an individual or group having a profound influence on the history of California; or
- It is a prototype of, or an outstanding example of, a period, style, architectural movement or construction, or is one of the more notable works or the best surviving work in a region of a pioneer architect, designer, or master builder.

California Points of Historical Interest

California points of historical interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. Points of historical interest designated after December 1997 and recommended by the State Historical Resources Commission are also listed in the CRHR. No historic resource may be designated as both a landmark and a point. If a point is later granted status as a landmark, the point designation will be retired. In practice, the point designation program is most often used in localities that do not have a locally enacted cultural heritage or preservation ordinance.

To be eligible for designation as a point of historical interest, a resource must meet at least one of the following criteria:

- It is the first, last, only, or most significant of its type within the local geographic region (city or county);
- It is associated with an individual or group having a profound influence on the history of the local area; or
- It is a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or is one of the more notable works or the best surviving work in the local region of a pioneer architect, designer, or master builder.

Native American Heritage Commission

Section 5097.91 of the California Public Resources Code (PRC) established the Native American Heritage Commission (NAHC), whose duties include the inventory of places of religious or social significance to Native Americans and the identification of known graves and cemeteries of Native Americans on private lands. Section 5097.98 of the PRC specifies a protocol to be followed when the NAHC receives notification of a discovery of Native American human remains from a county coroner.

California Public Records Act

Sections 6254(r) and 6254.10 of the California Public Records Act were enacted to protect archaeological sites from unauthorized excavation, looting, or vandalism. Section 6254(r) explicitly authorizes public agencies to withhold information from the public relating to "Native American graves, cemeteries, and sacred places maintained by the Native American Heritage Commission." Section 6254.10 specifically exempts from disclosure requests for "records that relate to archaeological site information and reports maintained by, or in the possession of, the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the NAHC, another state agency, or a local agency, including the records that the agency obtains through a consultation process between a Native American tribe and a state or local agency."

Health and Safety Code, Sections 7050 and 7052

Health and Safety Code Section 7050.5 declares that, in the event of the discovery of human remains outside of a dedicated cemetery, all ground disturbance must cease and the County Coroner must be notified. Section 7052 establishes a felony penalty for mutilating, disinterring, or otherwise disturbing human remains, except by relatives.

California Penal Code, Section 622.5

California Penal Code Section 622.5 provides for misdemeanor penalties for injuring or destroying objects of historic or archaeological interest located on public or private lands, but specifically excludes the landowner.

Public Resources Code, Section 5097.5

PRC Section 5097.5 defines as a misdemeanor the unauthorized disturbance or removal of archaeological, historic, or paleontological resources located on public lands.

Senate Bill 18

Senate Bill (SB) 18, which went into effect on January 1, 2005, requires local governments (city and county) to consult with Native American tribes before making certain planning decisions and to provide notice to tribes at certain key points in the planning process. The intent is to "provide California Native American tribes and opportunity to participate in local land use decisions at an early planning stage, for the purpose of protecting or mitigating impacts to, cultural places" (Governor's Office of Planning and Research 2005).

The purpose of involving tribes at these early planning stages is to allow consideration of cultural places in the context of broad local land use policy, before individual site-specific, project-level, land use designations are made by a local government. The consultation requirements of SB 18 apply to General Plan or Specific Plan processes proposed on or after March 1, 2005.

According to the Tribal Consultation Guidelines: Supplemental to General Plan Guidelines (2005), the following are the contract and notification responsibilities of local governments:

- Prior to the adoption or any amendment of a General Plan or Specific Plan, a local government must notify the appropriate tribes (on the contact list maintained by the NAHC) of the opportunity to conduct consultations for the purpose of preserving, or mitigating impacts to, cultural places located on land within the local government's jurisdiction that is affected by the proposed plan adoption or amendment. Tribes have 90 days from the date on which they receive notification to request consultation, unless a shorter timeframe has been agreed to by the tribe (Government Code Section 65352.3).

- Prior to the adoption or substantial amendment of a General Plan or Specific Plan, a local government must refer to the proposed action to those tribes that are on the NAHC contact list and have traditional lands located within the city or county's jurisdiction. The referral must allow a 45-day comment period (Government Code Section 65352). Notice must be sent regardless of whether prior consultation has taken place. Such notice does not initiate a new consultation process.

- Local governments must send a notice of a public hearing at least 20 days prior to the hearing to tribes who have filed a written request for such notice (Government Code Section 65092).

As this Project involves the amendment of a Zoning Ordinance, Kern County is required to conduct SB 18 consultations with the appropriate tribes.

Assembly Bill 52

On September 25, 2014, Governor Brown signed Assembly Bill (AB) 52, which amends CEQA (PRC Section 21000, et seq.) to include a new category of "tribal cultural resources." The law requires lead agencies to consider tribal cultural values in their environmental documents, in addition to the scientific and archaeological values that must be evaluated under preexisting provisions of CEQA, when determining impacts and mitigation. The requirements of AB 52 apply to a project for which a notice of preparation of an environmental impact report (EIR) or a notice of negative declaration or mitigated negative declaration was filed on or after July 1, 2015 (PRC Section 21084.3 (c)).

Paleontological Resources

Consideration of paleontological resources is required by CEQA (see CEQA Guidelines, Appendix G). Other state requirements for paleontological resource management are found in PRC Chapter 1.7, Section 5097.5, Archaeological, Paleontological, and Historical Sites. This statute specifies that state agencies may undertake surveys, excavations, or other operations as necessary on state lands to preserve or record paleontological resources.

No state or local agencies have specific jurisdiction over paleontological resources. No state or local agency requires a paleontological collecting permit to allow for the recovery of fossil remains discovered as a result of construction-related earth moving on state or private land in a project site.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element of the KCGP includes goals, policies, and implementation measures related to cultural resources that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.10.3. Archaeological, Paleontological, Cultural, and Historical Preservation

Policies

Policy 25. The County will promote the preservation of cultural and historic resources which provide ties with the past and constitute a heritage value to residents and visitors.

Implementation Measures

Implementation Measure K. Coordinate with the California State University, Bakersfield Archaeology Inventory Center.

Implementation Measure L. The County shall address archaeological and historical resources for discretionary projects in accordance with CEQA.

Implementation Measure M. In areas of known paleontological resources, the County should address the preservation of these resources where feasible.

Implementation Measure N. The County shall develop a list of Native American organizations and individuals who desire to be notified of proposed discretionary projects. This notification will be accomplished through the established procedures for discretionary projects and CEQA documents.

Implementation Measure O. On a project-specific basis, the County Planning Department shall evaluate the necessity for the involvement of a qualified Native American monitor for grading or other construction activities on discretionary projects that are subject to a CEQA document.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands

within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to cultural resources.

Chapter 2. Land Use Element

Policies

104. As part of the environmental review procedure, an evaluation of the significance of paleontological, archaeological, and historical resources and the impact of proposed development on those resources shall be conducted and appropriate mitigation and monitoring included for development projects.

105. Development on land containing known archaeological resources (i.e., high sensitivity areas) shall utilize methodology set forth, as described necessary by a qualified archaeologist, to locate proposed structures, paving, landscaping, and fill dirt in such a way as to preserve these resources undamaged for future generations when it is the recommendation of a qualified archaeologist that said resources be preserved in situ.

106. The preservation of significant historical resources shall be encouraged by developing and implementing incentives such as building and planning application permit fee waivers, Mills Act contracts, grants and loans, implementing the State Historic Building Code and other incentives as identified in the City's Historic Preservation Ordinance.

107. The preservation of significant historical resources shall be promoted and other public agencies or private organizations shall be encouraged to assist in the purchase and/or relocation of sites, buildings, and structures deemed to be of historical significance.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

4.5.4 Impacts and Mitigation Measures

Methodology for Cultural Resources (Archaeology and Historical Architecture)

The cultural resources analysis for the ~2.4 million-acre Project Area was prepared using three kinds of data and analyses: (1) a review and data tabulation of recent large-area surveys; (2) a synthesis of existing degrees of ground surface disturbance; and (3) the development of a GIS predictive model of prehistoric/Native American site distribution and archaeological sensitivity.

According to Whitley et al. (2014), reliable, systematically recorded site locational data within the Study Area is primarily limited to large-area surveys conducted for federal projects since 2010, when the Bureau of Land Management (BLM) standardized the recording requirements for historical oilfield sites on federal lands and mineral estates, and large-area surveys on privately-owned fee lands for other kinds of land development. In order to develop a reliable and accurate synthesis of extant prehistoric and historical sites within the Project Area, the results of 25 large-area surveys conducted since 2010 were reviewed and tabulated. These surveys ranged from 160 to over 19,000 acres in size, and total over 65,000 intensively surveyed acres, or almost 3% of the Project Area. Although about two-thirds of the total acreage is within existing oilfields; the remainder falls outside of delineated oilfields, including over 15,000 acres that were surveyed and unrelated to oil industry projects (Whitley et al. 2014).

Existing Cultural Resources

Records Search

Based on Whitley et al. (2014), the 25 studies documented 1,250 archaeological sites: 151 prehistoric (12% of the total); 1,087 historical (87%); and 12 (1%) multi-component sites (i.e., sites that have both prehistoric and historical components).

Oil Well Density and Existing Ground Surface Disturbance

In order to evaluate both the degree of previous oil and gas development within the Project Area, and how much of the ground surface has been disturbed by that use-history, a well density map was developed by Whitley et al. (2014) (see Appendix O, Figures 8, 9, and 10). This was produced using oil well locations provided by the California Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR) (Department of Conservation 2013) Based on their records, there are a total of 136,149 existing or abandoned oil wells within the Project Area.

Whitley et al. (2014) conducted the analysis determining well density and degree of disturbance for the Eastern Subarea, Central Subarea, and Western Subarea (Appendix O). The oil well density analysis has the following implications:

- There is a small but significant portion (2.6%) of the Project Area with nearly 100% ground disturbance and, thus, very little chance for preserved prehistoric archaeological sites;
- A slightly higher proportion (3.5%) has been very heavily disturbed, including about 1% with 75% disturbance, which likewise has a low probability for preserved prehistoric sites;
- The large majority of prehistoric sites are preserved in sections with less than 50 existing oil wells;
- Because oil well density is partly a function of historical development, the heavily disturbed areas have the highest probability for historical oil industry sites; and
- Concomitantly, these same areas are, due to the history of development, the least likely to contain intact historical sites.

Potential for Unknown Buried Cultural Resources

According to Whitley et al. 2014, two primary factors affect archaeological site preservation and, thus, potential project impacts to cultural resources. The first factor is the original presence or absence of sites in the Project Area. The GIS predictive model of site locations provides a section by section measure of site sensitivity for the Project Area, ranging from high to low. The second factor is whether these sites are still preserved or instead have been destroyed due to natural forces or previous development. An oil well density map was generated to gauge the ranges of previous ground surface disturbance in each section. Though oil and gas development is far from the only activity that can adversely impact site preservation, this is the only type of potential effect that could be easily quantified for the 2.4 million acres of the Project Area (Whitley et al. 2014).

Archaeological site sensitivity and estimated range of ground surface disturbance were cross-tabulated to provide a measure of the likelihood of site preservation within any given section. No, minimal, moderate, and high likelihood categories were defined. A total of 100 sections (~3%) have no likelihood, 1,154 (31%) have minimal likelihood, 182 (~4%) have moderate likelihood, and 2,258 (~61%) have high likelihood of preserved prehistoric sites (Whitley et al. 2014).

Potential Impact Analysis

According to Whitley et al. (2014), adverse impacts potentially occur to cultural resources for oil and gas projects involving: (1) geophysical surveys (vibroseis, shotholes); (2) construction, operation, and maintenance (construction/demolition of pads and infrastructure); (3) treatment, equipment and facilities (construction/demolition of facilities and equipment); (4) pipelines (construction/demolition); (5) storage facilities (construction/demolition); (6) spill prevention, response, and remediation (construction of containment structures, heavy equipment use); (7) septic tanks and leach fields (administrative facility building and personal housing); (8) access roads (construction/maintenance); (9) transmission lines (construction/maintenance); (10) fencing (construction/maintenance and off-road travel); (11) plugging, decommissioning, and

abandonment (demolition); and (12) cathodic protection abandonment (demolition). More specifically, where sites are present, adverse impacts may occur as a result of grading, filling, grubbing, vehicular off-road travel, and other activities that disturb the ground surface, including the demolition of existing structures, facilities, and equipment.

Based on the background research, tabulations, and GIS modeling presented above, the approximately 2.4 million-acre Project Area has an average overall archaeological density of one site per 53 acres. This results in a total estimate of approximately 45,000 cultural resources within this portion of Kern County. Prehistoric/Native American archaeological site density is estimated at one site per 463 acres, yielding an estimate of slightly more than 5,000 such sites within the Project Area. Historical (Euro-American) site density is one site per 60 acres, or about 40,000 of these sites total. Not all of these resources are significant or unique and, therefore, qualify as historical resources under CEQA or historical properties under Section 106 of the NHPA, and the distribution of intact/preserved cultural resources is not uniform across the 2.4 million acres (Whitley et al. 2014).

With respect to prehistoric/Native American sites, one hundred 640-acre sections (~3%) have no likelihood of containing resources, based on predictive modeling and previous oilfield development, 1,154 sections (~31%) have minimal likelihood, 182 sections (~4%) have moderate likelihood, and 2,258 sections (~61%) have a high likelihood. Regionally, 93% of the Eastern Subarea sections have high (86%) plus moderate (7%) site likelihoods. In the Central Subarea, 54% have high (53%) plus moderate (1%) likelihoods. For the Western Subarea, the figures are 66% total (62% high plus 4% moderate). Whether calculated across the 2.4 million acres or within each Subarea, the clear majority of the 640-acre sections have high to moderate likelihoods of containing prehistoric/Native American sites. These likelihoods are greatest on the eastern and western sides of the valley, where oilfield development is also most intensive (Whitley et al. 2014).

All prehistoric/Native American archaeological sites are recommended as CEQA Significant/Unique, because they have potential research value (Criterion D), and/or because they have high expressed heritage values to Native American tribes or individuals. Unmitigated impacts to these cultural resources would constitute significant adverse impacts related to the Project. While impacts to research values could be mitigated with data recovery (salvage excavations), such mitigation could conflict with the religious and heritage values maintained by Native Americans, potentially representing further adverse impacts to these values. Preservation of all prehistoric/Native American sites in place, which is the preferred CEQA mitigation measure for cultural resources, would eliminate all significant adverse impacts to prehistoric/Native American archaeological sites (Whitley et al. 2014).

Historical archaeological sites are eight-times more common within the Project Area, with approximately 40,000 such sites estimated to be present in the 2.4 million acres. The large majority of these are oil industry related and, for that fact, they concentrate in the areas of the most intensive historical oilfield development and, thus, previous disturbance. These are the Eastern Subarea, particularly its northern half in the Kern River area, and the Western Subarea, primarily in a band that extends roughly from the South Belridge to the Midway-Sunset oilfields.

The Central Subarea, in contrast, has had minimal historical oilfield development. Historical archaeological site density appears to be relatively low throughout this zone (Whitley et al. 2014).

According to Whitley et al. (2014), not all of the historical archaeological sites are significant/unique. As described above, oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters lack appreciable research value (CEQA significance Criterion D), do not have significant associative values (Criteria A and B), are not exemplary of craftsmanship or representative of distinctive types (Criterion C), typically lack integrity due to DOGGR-mandated oilfield clean-ups, and have no identifiable heritage value to county residents. Previous State Historic Preservation Office (SHPO) and BLM evaluations of the significance and NRHP eligibility of these types of sites have consistently found them to be Not Eligible or Significant, including at the landscape level. These site types constitute approximately 70-80% of the historical sites in the Project Area as a whole, and likely higher proportions within the Eastern and Western Subareas, specifically. Following PRC Section 21083.2, Whitley et al. (2014) recommends that oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters be categorically determined Not Significant/Unique. Project-related impacts to historical oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters will not constitute significant adverse impacts to historical resources (Whitley et al. 2014).

Camps, homesteads, ranch complexes, large refuse scatters, mines and other kinds of historical sites may, however, have research value (Criterion D), according to Whitley et al. (2014). Intact historical oilfield equipment, such as wooden walking beam pump-jacks, intact brick boilers, wooden oil derricks, and intact historical buildings, are rare and, therefore, may have educational or other values, outside of the CEQA criteria. Whitley et al. (2014) recommends that these site types be considered potentially CEQA Significant/Unique, with any potential adverse impacts mitigated through preservation in-place, removal and curation, or data recovery; specifically, salvage excavation for historical archaeological sites. Data recovery for historical structures and equipment shall follow the guidelines of the Secretary of the Interior's Standards for Architectural and Engineering Documentation, thereby contributing to the Historic American Buildings Survey (HABS) and/or Historic American Engineering Record (HAER) (Whitley et al. 2014).

Methodology for Paleontology

Previously discovered paleontological resources in the vicinity of the Project Area were assessed through literature searches and, where available, online searches of institutional records for museums with significant paleontological collections obtained from Kern County. This included the San Diego Natural History Museum, the Natural History Museum of Los Angeles County, and the University of California Museum of Paleontology (Demeré and Donohue 2015).

A search of existing paleontological and geological literature was conducted to provide a context for discussing the paleontological resources of the Project Area, and for locating existing paleontological collection localities not documented within museum databases. Sources consulted include published articles in peer-reviewed scientific journals and books, fieldtrip guidebooks, published professional conference abstracts, preliminary studies issued as government open-file

reports, and geological data summarized on published geologic maps. All data sources are listed in Appendix P.

These data were then used to assign PFYC values to formations for evaluation purposes. Adverse impacts may occur as a result of grading, other earth disturbance, grubbing, vehicular off-road travel, and other activities that disturb the ground-surface or subsurface, including the demolition of existing structures, facilities and equipment.

Existing Paleontological Resources

There are no fossils preserved in basement rocks. Holocene-aged alluvial sediments do not contain significant fossil resources due to their young age, however, these sediments are archaeologically important for answering questions concerning climatic and environmental changes. Fossils known from the other 39 rock units and their potential to produce fossils are discussed below, which are ranked using the PFYC system. This system was developed by the Forest Service and BLM and ranks rock units based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts. The recognized classes include:

- Class 1 or very low, used for rocks with little to no potential to yield fossils;
- Class 2 or low, used for rocks with some potential to yield fossils;
- Class 3 is divided into 3a, used for rock units know to produce fossils in limited portions of the sediment, and 3b, used for rocks that have not produced fossils in the past but may in the future;
- Class 4 or high, used for rocks known to produce many fossils; and
- Class 5 or very high, used for rocks that produce abundant fossils in predictable locations.

Basement Complex

Igneous and metamorphic basement rocks have no potential for fossil resources. These rocks are assigned a very low PFYC Class 1 (Deméré and Donohue 2015).

Franciscan Complex

Deposits of the Franciscan Complex rarely preserve macrofossils; however, none are known within the Project Area. Elsewhere in California, rare occurrences of invertebrates, dolphin-like marine reptiles called ichthyosaurs, and a long-necked marine reptiles called a plesiosaur have been reported. The Franciscan Complex is assigned a low PFYC Class 2, based on the well-cemented nature of most surface exposures of this rock unit (Deméré and Donohue 2015).

Gravelly Flat Formation

Fossils of Mesozoic clams are known from this formation. The Gravelly Flat Formation is assigned a moderate PFYC Class 3a, based on the presence of sparse but significant invertebrate fossils (Deméré and Donohue 2015).

Hex Claystone

Fossils of cephalopods called belemnites and clams are known from this formation. The Hex Claystone is assigned a moderate PFYC Class 3a (Deméré and Donohue 2015).

Panoche Formation

The Panoche Formation has produced remains of numerous types of marine invertebrates including mollusks (clams, snails, cephalopods), and plants of woody, flowering, and terrestrial plants (angiosperms), along with fish teeth. The Panoche Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Pattiway Formation

Fossil mollusks have been recovered from the Pattiway Formation exposed in the Caliente Range. The Pattiway Formation is assigned a moderate PFYC Class 3a (Deméré and Donohue 2015).

Lodo Formation

The Lodo Formation has not produced fossils within the Project Area but has produced fossils elsewhere in California. These include fossils of marine mollusks and marine vertebrates (sharks, rays, bony fishes). The Lodo Formation is assigned unknown moderate PFYC Class 3a for its potential to produce fossils (Deméré and Donohue 2015).

Tejon Formation

The Tejon Formation has produced a wealth of well-studied fossil remains from several areas along the southern and western margins of the San Joaquin Valley. The most common fossils recovered include marine mollusks (clams, snails, and tusk shells), but marine vertebrate fossils are also known. The Tejon Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Avenal Sandstone

The Avenal Sandstone has not produced fossils within the Project Area. Elsewhere in California, marine mollusks (clams, snails, and tusk shells) and plants have been recovered from this rock unit. The Avenal Sandstone is assigned an unknown PFYC Class 3b for its potential to produce fossils (Deméré and Donohue 2015).

Kreyenhagen Shale

No macro-invertebrate or vertebrate fossils are known from the Kreyenhagen Formation. The Kreyenhagen Formation is assigned a low PFYC Class 2 (Deméré and Donohue 2015).

San Emigdio Formation

The San Emigdio Formation has produced fossils of marine mollusks, particularly bivalve clams, snails, and tusk shells in California. The San Emigdio Formation is assigned a moderate PFYC Class 3a (Deméré and Donohue 2015).

Wagonwheel Formation

The Wagonwheel Formation has produced an unusual assemblage of marine invertebrates dominated by articulated lucinid clams that represent a cold-seep paleoenvironment. The Wagonwheel Formation is assigned a moderate PFYC Class 3a, based on the occurrence of its limited, but rare and scientifically significant invertebrate fauna (Deméré and Donohue 2015).

Walker Formation

Fossils are rare in the Walker Formation and include silicified wood (e.g., sycamore and oak), leaf impressions of broadleaved trees, and shells of terrestrial pulmonate gastropods. The Walker Formation is assigned an unknown, PFYC Class 3b. The age and depositional environment of the Walker Formation suggest there is a possibility of finding significant paleontological resources in the future (Deméré and Donohue 2015).

Bealville Fanglomerate

No fossils are known from the Bealville Fanglomerate. The Bealville Fanglomerate is assigned a low PFYC Class 2 (Deméré and Donohue 2015).

Vedder Sand

The Vedder Sand has not produced macro-invertebrate or vertebrate fossils. However, based on its marine origin, known benthic foraminiferal assemblages, and unproven potential for containing marine vertebrate fossils the Vedder Sand is assigned an unknown PFYC Class 3b (Deméré and Donohue 2015).

Pleito Formation

Nearshore marine molluscan fossils are present within the lower and upper portion of the Pleito Formation in California. The Pleito Formation is given a moderate PFYC Class 3a (Deméré and Donohue 2015).

Simmler Formation

The Simmler Formation is generally considered to be unfossiliferous, but has produced fragmentary fossil plant remains and isolated vertebrate fossil remains. The Simmler Formation is

assigned an unknown PFYC Class 3b based on its potential to produce vertebrate fossils (Deméré and Donohue 2015).

Vaqueros Formation

Marine invertebrate fossils, including snails, scallops, oysters, and barnacles, have been recovered from this formation. In other areas of California, the Vaqueros Formation is also known for a diverse assemblage of marine vertebrate fossils. The Vaqueros Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Tecuya Formation

The Tecuya Formation has produced important remains of terrestrial mammals from several recorded fossil localities in Tecuya Canyon (near Grapevine Pass). Collected fossils include small mammals, such as rabbit, squirrel, mouse, mouse deer, and pikas, and large mammals, such as horse, oreodont, rhinoceros, and bear. Oyster fossils are also known in the western outcrops of the Tecuya Formation. The Tecuya Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Temblor Formation

The Temblor Formation has produced a rich diversity of marine invertebrate fossils, partially within the Project Area. Marine vertebrates are represented by fish scales, fish teeth, and shark teeth. A terrestrial assemblage including over 1,200 vertebrate fossils of terrestrial mammals, birds, reptiles, and amphibians, and included a new species of mustelid was recently recovered from the Temblor Formation at a site in central California. The Temblor Formation is given a high PFYC Class 4 (Deméré and Donohue 2015).

Freeman Silt/Jewett Sand

The undifferentiated Freeman Silt/Jewett Sand contains abundant molluscan fossils, including both gastropods and bivalves, along with early marine mammals, including pinnipeds, toothed whales, and baleen whales. Sparse remains of land mammals have also been recovered. The combined Freeman Silt/Jewett Sand is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Olcese Sand

Fossils are common to locally abundant in the Olcese Sand and are dominated by marine mollusks and a large assemblage of marine lower vertebrates consisting of sharks, skates, and rays, and more than 65 different types of bony fishes. Rare, important land mammals include a horned, deer-like artiodactyls, and a bear dog. Petrified logs and leaf impressions are known. The Olcese Sand is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Bena Gravel

Near Caliente Canyon east of Bakersfield, the Bena Gravel has produced rare marine fossils including an extinct sea lion, oysters, and barnacles. In the Tejon Hills mammals, including ancient horses, bone-crushing dog, oreodont, antilocaprid, and a deer-like mammal, have been recovered. The Bena Gravel is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Caliente Formation

The Caliente Formation is most notable for its abundant fossils of terrestrial mammals, including numerous small mammals (e.g., hedgehogs, shrews, squirrels, mice, hares, rabbits), carnivores (e.g., bone-crushing dogs, bear dogs, cats, weasels, ring tails), bats, camels, oreodonts, pronghorns, and a variety of species of ancient horses. The Caliente Formation is assigned a very high PFYC Class 5 (Deméré and Donohue 2015).

Round Mountain Silt

The densely concentrated occurrence of marine vertebrate fossils known as the Sharktooth Hill Bonebed east of Bakersfield is considered to be so significant that it was designated as a National Natural Landmark in 1976. Invertebrate fossils (e.g., clams, snails, crustaceans, and echinoderms) are present. The marine vertebrate fossil assemblage is especially significant and consists of numerous species of sharks and rays, bony fish, sea turtles, sea birds, and marine mammals (e.g., early walruses, extinct seals, ancestral dolphins, primitive sperm whales, archaic baleen whales, early sea cows, and bizarre hippo-like desmostylians). Rare remains of land mammals (e.g., cat, dear dog, tapir, horse, camel, and gomphothere) have also been recovered. The Round Mountain Silt is assigned a very high PFYC Class 5 (Deméré and Donohue 2015).

Monterey Formation

Although the Monterey Formation has produced extremely diverse assemblages of marine organisms including mollusks, sharks, rays, bony fish, sea birds, pinnipeds, toothed whales, baleen whales, sea cows, and hippo-like desmostylians the lithologic complexity of the formation and the wide range of styles of fossil preservation makes it difficult to assign a single PFYC class to this rock unit. Hard, brittle, siliceous shale strata are so well-cemented as to make recovery of individual fossil specimens unlikely, while soft, fissile, diatomite strata (e.g., Belridge Diatomite Member) are more likely to yield individual, well-preserved fossil specimens. As a consequence, strata of the Belrdige Diatomite are assigned a very high PFYC Class 5, while strata of the other members of the Monterey Formation are assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Santa Margarita Formation

The Santa Margarita Formation contains distinctive molluscan fauna that include several species of marine snails, large scallops, and a giant oyster. Strata of the Santa Margarita Formation exposed in the Temblor Range portion of the Western Subarea contain some of these typical fossils. The Santa Margarita Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Chanac Formation

This formation has produced important land mammal fossils in the North Tejon Hills. The recovered fossil assemblage consists of bones and teeth of saber-toothed carnivorans, hyaena-like dogs, horse, oreodont, large-horned deer-like ruminants, and pronghorn antelope. The Chanac Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Bitterwater Creek Shale

Fossils have rarely been reported from the Bitterwater Creek Shale, but include fish scales from the southwestern Temblor Range. The Bitterwater Creek Shale is assigned an unknown PFYC Class 3b based on its potential to produce vertebrate fossils (Deméré and Donohue 2015).

Kern River Formation

Fossils from the Kern River Formation include skeletal remains of an extinct honey badger, weasel-like carnivore, ring-tail, extinct horse, extinct rhino, camel, pronghorn, peccary, ground squirrel, field mouse, and rabbits. Fossils of a vulture and hawk are also known, as well as remains of fish, toads, lizards, snakes, and tortoises. Coarse-grained superficial sediments have not produced fossils. The Kern River Formation is assigned a high PFYC Class 4 for fine-grained deposits only (Deméré and Donohue 2015).

Unnamed Miocene Marine Deposits

No fossils are known in these sediments at the present time, but they appear to have potential. The unnamed Miocene marine sediments are assigned an unknown PFYC Class 3b based on their potential to produce invertebrate fossils (Deméré and Donohue 2015).

Etchegoin Formation

The Etchegoin Formation has not produced fossils in the Project Area, but abundant and well-preserved marine invertebrates, marine vertebrates, and terrestrial vertebrates are known in central California. Marine to estuarine fossils include a high diversity of invertebrates (e.g., coral, clams, scallops, mussels, sand dollars, snails, barnacles, crabs) and vertebrates (e.g., sharks, rays, bony fishes, turtle, baleen whale, dolphin, and fur seal). Occasional remains of terrestrial mammals (e.g., mastodon) and land plants (e.g., sycamore leaves) are also known. The Etchegoin Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Quatal Formation

The Quatal Formation is essentially unfossiliferous where it has previously been prospected. The Quatal Formation is assigned an unknown PFYC Class 3b based on its potential to produce vertebrate fossils (Deméré and Donohue 2015).

Unnamed Pliocene Deposits

Fossils have not been reported from deposits mapped as unnamed Pliocene sediments. The unnamed Pliocene sediments are assigned an unknown PFYC Class 3b based on their potential to produce invertebrate fossils (Deméré and Donohue 2015).

Paso Robles Formation

The Paso Robles Formation, in the northwestern corner of the Project Area, adjacent to State Route 46, has produced a single horse fossil. West of the Project Area in the Carrizo Plain, fragmentary fossil bones and teeth of large-bodied Pleistocene land mammals including camel, giant bison, mastodon, and along with horse, rodents, lizards, and a bird, have been recovered. Further marine mollusks and an extinct walrus are known. This formation has large exposure but only very fine-grained sedimentary rocks are known the produce fossils. The Paso Robles Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

San Joaquin Formation

The San Joaquin Formation has not produced fossils within the Project Area, but has produced abundant marine invertebrate and vertebrate fossils, as well as more sparse terrestrial vertebrate fossils in adjacent counties. Marine and estuarine fossils include a diversity of invertebrates (e.g., corals, clams, scallops, mussels, snails, barnacles, crabs, and sand dollars) and vertebrates (e.g., sharks, rays, bony fishes, sea turtle, baleen whale, dolphin, and walrus). Terrestrial fossils are less common in the San Joaquin Formation, but include well-preserved bones and teeth of land mammals (e.g., rodents, horse, camel, peccary, deer, mammoth, and mastodon) and occasional compressed leaves of land plants. The San Joaquin Formation is assigned a very high PFYC Class 5 (Deméré and Donohue 2015).

Morales Formation

Fossils are rare in the Morales Formation, and the only published paleontological record is the tooth of a three-toed horse from the eastern Caliente Range. The Morales Formation is assigned an unknown PFYC Class 3b based on its potential to produce vertebrate fossils (Deméré and Donohue 2015).

Tulare Formation

The Tulare Formation has produced fossils within the Project Area. The base of the formation contains important fossil remains of freshwater organisms including diatoms, ostracods, clams, mussels, snails, and bony fishes. Although the molluscan assemblage contains only a little over 30 species, it is considered to be the largest and most diverse late Cenozoic freshwater molluscan assemblage from the Pacific Coast. Bony fish remains include vertebrae, dense dorsal fin elements, and taxonomically diagnostic otoliths. Mammalian fossil remains include an extinct horse, an extinct bone-crushing dog, and a saber-toothed cat collected in the Cymric-McKittrick area. Pleistocene mammal remains are known from the Elk Hills area and include horses, tapirs, camels, deer, elk, ground sloths, coyotes, bears, rabbits, gopher, mice, wood rats, and squirrels.

Known plants include silicified wood and pond weed algae. The Tulare Formation is assigned a high PFYC Class 4 (Deméré and Donohue 2015).

Quaternary Brea Deposits

Quaternary brea deposits represent natural traps formed during the Pleistocene in areas where percolating hydrocarbons saturated poorly consolidated surficial sediments, such as those of the Tulare Formation. The McKittrick seeps have produced a very diverse terrestrial assemblage of insects, plants, birds, reptiles, amphibians, and over 43 species of mammals. Collected fossils are exceptionally well-preserved, and include thousands of specimens. The Maricopa seeps have produced a similarly impressive assemblage of plants, insects, and 97 different species of terrestrial vertebrates, including amphibians, reptiles, birds, and mammals. Quaternary brea deposits at McKittrick and Maricopa are assigned a very high PFYC Class 5 (Deméré and Donohue 2015).

Older Alluvial Deposits

Fossils are known within the Project Area in deposits of older alluvium (alluvial, fluvial and lacustrine deposits). A large assemblage of Pleistocene animals was recovered just south of the Kern River east of Bakersfield. Scattered fossils of similar antiquity are known from numerous localities in the San Joaquin Valley. Terrestrial vertebrate fossils, especially large-bodied mammals (e.g., mammoth, mastodon, horse, bison, ancient camel, short-faced bear, dire wolf, saber-toothed cat) are known (Deméré and Donohue 2015).

The distribution of vertebrate fossils in Quaternary older alluvial sediments is not uniform and typically varies with sediment grain size. Thus, fossils are more likely to be preserved and discovered in sandstone horizons rather than in coarser–grained conglomeratic horizons. Quaternary older alluvial sediments are assigned an unknown PFYC Class 3b due to their patchy occurrence (Deméré and Donohue 2015).

Holocene Deposits

Holocene sediments are assigned a low PFYC Class 2 due to the sediments being too young to contain fossils. However, these sediments frequently contain archaeological materials and overlie older sedimentary units that may contain fossils (Deméré and Donohue 2015).

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Cause a substantial adverse change in the significance of a historical resource, as defined in CEQA Guidelines Section 15064.5;
- Cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5;

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; or
- Disturb any human remains, including those interred outside of formal cemeteries.

Section 21083.2(g) of CEQA further defines "unique archaeological resource" for purposes of determination as to whether a project may have a significant effect on archaeological resources. As used in this section "unique archaeological resource" means an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;
- Has a special and particular quality, such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

CEQA does not define a unique paleontological resource, but for purposes of this EIR, a paleontological resource or site is considered "unique" if it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;
- Has a special and particular quality, such as being the oldest of its type or the best available of its type; or
- Is directly associated with a scientifically recognized important natural event.

According to CEQA Guidelines, CCR Title 14, 15064.5, a project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment (CCR Title 14, 15064.5(b)). The guidelines further state that a substantial adverse change in the significance of a resource means the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historic resource would be materially impaired. Actions that would materially impair the significance of a historical resource are any actions that would demolish or adversely alter those physical characteristics of a historical resource that convey its historical significance and qualify it for inclusion in the CRHR or in a local register or survey that meet the requirements of California PRC Sections 5020.1(k) and 5024.1(g).

Based on these thresholds, the effects of the project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

Impact 4.5-1: Cause a Substantial Adverse Change in the Significance of a Historical Resource, as Defined in CEQA Guidelines Section 15064.5

Future oil and gas exploration and production activities that would be authorized under the Project may adversely change the significance of historic resources, primarily during construction, by damaging the resource so that it no longer has integrity and is no longer representative of its period of significance. Potential construction impacts include damage to, or destruction of, historic resources from earthmoving, including vibration damage. During operations, if extant historic structures determined to be significant are avoided, no impacts are anticipated.

Historical (Euro-American) site density is one site per 60 acres, or about 40,000 of these sites total. Not all of these resources are significant or unique and, therefore, do not qualify as historical resources under CEQA or historical properties under Section 106 of the NHPA, and the distribution of intact/preserved historical resources is not uniform across the 2.4 million acres. Therefore, impacts could be significant if oil and gas activities were to be conducted in close proximity of the qualifying resource.

Camps, homesteads, ranch complexes, mines and other kinds of historical resources may, however, have research value (Criterion D). Intact historical oilfield equipment, such as wooden walking beam pump-jacks, intact brick boilers, wooden oil derricks, and intact historical buildings, are rare and therefore may have educational or other values, outside of the CEQA criteria. It is recommended that these site types be considered potentially CEQA Significant/Unique, with any potential adverse impacts mitigated through preservation in-place, removal and curation, or data recovery; specifically salvage excavation for historical archaeological sites. Data recovery for historical structures and equipment shall follow the guidelines of the Secretary of the Interior's Standards for Architectural and Engineering Documentation, thereby contributing to the HABS and/or HAER.

Historical buildings, structures, and built features that meet the CRHR criteria should be protected in place, removed and curated, or treated using appropriate data recovery procedures. Any oil and gas activity that damages or destroys a significant historical resource, thereby changing its integrity and representation of its period of significance, would be a significant adverse impact and would have to be mitigated in order to reduce the impact to less than significant. The potential for significant impacts would depend on the proximity of the oil and gas activity to the historical resource and the type of activity that would be occurring.

For the purposes of oil and gas industry cultural resources compliance, intact camps, historical structures, ranch and farm complexes and mines shall be categorically determined potentially significant. Potential adverse impacts to all such sites shall be mitigated by preservation in-place, removal and curation, or data recovery.

In summary, there could be significant impacts to historical resources as a result of the oil and gas exploration and production activities that would be authorized under the Project. The implementation of mitigation including archival research, surveys, evaluation for determination of eligibility, and applicable training, as described in MM 4.5-1, would decrease impacts to levels that are less than significant.

Mitigation Measures

MM 4.5-1 Prior to initiating ground disturbance activities for an activity for which a conformity review is required, the Applicant shall:

a. Have an archival records search completed by a qualified archaeologist. This shall include an examination of the California Historical Resources Information Files at the Southern San Joaquin Valley Information Center, California State University, Bakersfield, and a search of the Native American Heritage Commission Sacred Lands Files, Sacramento. The Applicant may rely on a previously performed records search for subsequent ground disturbing activities.

b. If an application location has been previously surveyed and no cultural resources have been recorded on it, no further cultural resources studies shall be required.

c. Implement either:

   1. If an application site plan is within a section that has experienced 100% previous ground-surface disturbance, as indicated by 300 or more existing oil wells or other agricultural, industrial or urban uses, and the records searches indicate that the parcel has been previously surveyed and no cultural or Native American resources are known on it, no further cultural resources studies shall be required. All other application locations shall be subject to intensive (100%) pedestrian ground-surface survey (Phase I survey/Class III inventory) by qualified archaeologists. The Applicant may rely on a previously performed ground surface survey for subsequent ground disturbing activities; or

   2. If an application location has not been previously surveyed based on the records search information, an intensive (100%) pedestrian ground-surface survey (Phase I survey/Class III inventory) by qualified archaeologists shall be required.

d. All prehistoric/Native American archaeological sites, whether identified during the records searches or during the intensive survey, shall be demarcated by a qualified archaeologist, fenced by the Applicant, and preserved in place.

e. Historical (Euro-American) archaeological sites that are potentially eligible for listing in the National Register of Historic Places shall be evaluated by a

qualified archaeologist and must meet the requirements of the National Historic Preservation Act of 1966 in order to qualify. Qualifying sites, structures and equipment that are identified during the records search or field survey shall be fenced and preserved in open-space, removed and curated, or treated using appropriate data recovery procedures.

f. Historical (Euro-American) archaeological site types relating to oil and gas activities that have been determined Not Significant/Unique shall require no archaeological study or treatment.

g. All oil and gas industry employees conducting work in the area identified on the Conformity Site Plan shall complete Worker Environmental Awareness Program training including training dedicated to cultural resources protection.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.5-2: Cause a Substantial Adverse Change in the Significance of a Unique Archaeological Resource, Pursuant to CEQA Guidelines Section 15064.5

Future oil and gas exploration and production activities that would be authorized under the Project may adversely change the significance of archaeological resources, primarily during construction, but also during operations. Potential construction impacts include damage to, or destruction of, archaeological resources from earthmoving and unauthorized collecting. Potential impacts during operations include unauthorized collecting from surface historic trash scatters, but other impacts are not anticipated. Archaeological resources include both prehistoric and historic period sites.

Prehistoric/Native American archaeological site density is estimated at one site per 463 acres, yielding an estimate of slightly more than 5,000 such sites within the Project Area. Historical (Euro-American) site density is one site per 60 acres, or about 40,000 of these sites total. Not all of these resources are significant or unique and, therefore, do not qualify as historical resources under CEQA or historical properties under Section 106 of the NHPA. In addition, the distribution of intact/preserved cultural resources is not uniform across the 2.4 million acres.

With respect to prehistoric/Native American sites, one hundred 640-acre sections (~3%) have no likelihood of containing resources, based on predictive modeling and previous oilfield development; 1,154 sections (~31%) have minimal likelihood; 182 sections (~4%) have moderate likelihood; and 2,258 sections (~61%) have a high likelihood. Regionally, 93% of the Eastern Subarea sections have high (86%) plus moderate (7%) site likelihoods. In the Central Subarea, a total of 54% have high (53%) plus moderate (1%) likelihoods. For the Western Subarea, the figures are 66% total (62% high plus 4% moderate). Whether calculated across the 2.4 million acres or within a specific Subarea, the clear majority of the 640-acre sections have high to moderate likelihoods of containing prehistoric/Native American sites. These likelihoods are

greatest on the eastern and western sides of the valley, where oilfield development is also most intensive.

All prehistoric/Native American archaeological sites are recommended as CEQA Significant/Unique, due to the facts that they have potential research value (Criterion D), and/or because they have high expressed heritage values to Native American tribes or individuals. Unmitigated impacts to these cultural resources would constitute significant and adverse project-related impacts. While impacts to research values could be mitigated with data recovery (salvage excavations), such mitigation could conflict with the religious and heritage values maintained by Native Americans, potentially representing further adverse impacts to these values. Preservation of all prehistoric/Native American sites in place, which is the preferred CEQA mitigation measure for cultural resources, would eliminate all significant adverse impacts to prehistoric/Native American archaeological sites.

This categorical significance determination for prehistoric/Native American archaeological sites does not apply to isolated artifacts not associated with a defined archaeological site (e.g., one or a few pottery shards or projectiles), which do not meet the criteria of historical significance or uniqueness under CEQA. Such artifacts may be removed and curated under the direction of a qualified archaeologist.

Historical archaeological sites are eight-times more common within the Project Area, with approximately 40,000 such sites estimated to be present in the 2.4 million acres. The large majority of these are oil industry-related and, therefore, are concentrated in the areas of the most intensive historical oilfield development and, thus, previous disturbance. These are the Eastern Subarea, particularly its northern half in the Kern River area, and the Western Subarea, primarily in a band that extends roughly from the South Belridge to the Midway-Sunset oilfields. The Central Subarea, in contrast, has had minimal historical oilfield development. Historical archaeological site density appears to be relatively low throughout this zone.

Not all of the historical archaeological sites are significant/unique, however. As described above, oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters lack appreciable research value (CEQA significance Criterion D), do not have significant associative values (Criteria A and B), are not exemplary of craftsmanship or representative of distinctive types (Criterion C), typically lack integrity due to DOGGR-mandated oilfield clean-ups, and have no identifiable heritage value to County residents. Previous SHPO and BLM evaluations of the significance and NRHP eligibility of these types of sites have consistently found them to be Not Eligible or Significant, including at the landscape level. These site types constitute approximately 70 to 80% of the historical sites in the Project Area as a whole, and likely higher proportions within the Eastern and Western Subareas specifically. Following PRC Section 21083.2, it is recommended that oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters be categorically determined Not Significant/Unique. Impacts to historical oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters would not constitute significant, adverse, project-related impacts to historical resources.

Intact camps, homesteads, ranch complexes, large refuse scatters, mines, and other kinds of historical sites may, however, have research value (Criterion D). It is recommended that these site types be considered potentially CEQA Significant/Unique, with any potential adverse impacts mitigated through preservation in-place, removal and curation, or data recovery, specifically salvage excavation for historical archaeological sites.

Significance standards are those for the California Register of Historical Resources (see regulatory environment section).

For the purposes of oil and gas industry cultural resources compliance, all prehistoric/Native American archaeological sites are categorically determined Significant. Any adverse impacts to these resources would comprise a significant adverse impact. Potential adverse impacts to all such sites shall be mitigated by preservation in-place. This categorical significance determination for prehistoric/Native American archaeological sites does not apply to isolated artifacts not associated with a defined archaeological site (e.g., one or a few pottery shards or projectiles) that do not meet the criteria of historical significance or uniqueness under CEQA. Such artifacts may be removed and curated under the direction of a qualified archaeologist.

For the purposes of oil and gas industry cultural resources compliance, historical oil derrick and pump-jack foundations, brick scatters, tanks, and small refuse scatters are categorically determined Not Significant/Unique. Impacts to or destruction of such features shall not constitute significant adverse impacts and no recording, documentation, assessment, treatment or management of such sites is required.

In summary, though not all of the historical archaeological sites are significant/unique some are and as such, there could be significant impacts to archaeological resources as a result of the oil and gas exploration and production activities that would be authorized under the Project. The implementation of mitigation including archival research, surveys, evaluation for determination of eligibility, and applicable training, as described in MM 4.5-1, would decrease impacts to levels that are less than significant.

Mitigation Measures

Implement MM 4.5-1, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation

Impact 4.5-3: Directly or Indirectly Destroy a Unique Paleontological Resource or Site or Unique Geologic Feature

Future oil and gas exploration and production activities that would be authorized under the Project have the potential to adversely impact unique paleontological resources. Adverse impacts may occur to paleontological resources due to grading, other earth disturbance, grubbing,

vehicular off-road travel, and other activities that disturb the ground surface, including the demolition of existing structures, facilities, and equipment.

Scientific significance of fossils must be evaluated by a qualified professional. Fossils can be considered to be of significant scientific interest if one or more of the following criteria apply:

1. The fossils provide data on the evolutionary relationships and developmental trends among organisms, both living and extinct;

2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;

3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical (plant) and paleozoological (animal) biotas;

4. The fossils demonstrate unusual or spectacular circumstances in the history of life; or

5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

Based on the background research and tabulations, about 65% of the approximately 2.4 million acres in the Project Area has rock units ranked very low or low (PFYC Class 1 or Class 2). These areas have limited paleontological resource potential. The remaining 35% of the lands are mostly of unknown, moderate, high or very high potential (PFYC Class 3, Class 4, or Class 5).

Most oil and gas activities are anticipated to be on the valley floor and the hills to the east and west, but not in the mountains. These activities will cause surface impacts to rock units ranked PFYC 3 or above; primarily, but not limited to: (1) the Tulare Formation including Quaternary brea deposits (Western Subarea); (2) the Quaternary older alluvial sediments (Central Subarea); and (3) the Kern River Formation and Round Mountain Silt (Eastern Subarea). All formations, their PFYC ranking, Subarea, environment, and probability of encounter are provided in Table 4.5-2. The probability of encounter is an interpretation based largely on the areas where the oil and gas activities are anticipated (as described above) along with the formations with PFYC 3 or above (also described above), and any rock unit that would likely overlay formations with a high potential to contain fossils.

Subsurface impacts will adversely affect additional rock units, particularly those with high potential for oil and gas deposits. The Monterey Formation is the source of oil and gas but both are known to filter into reservoir rock units (Gautier and Scheirer 2007). These reservoir rocks include the Temblor Formation, the Santa Margarita Formation, the Freeman Silt/Jewett Sand deposits, the Chanac Formation, the Kern River Formation, the Walker Formation, and the Kreyenhagen Formation (Table 4.5-2). On that basis, all of these rocks are also targets of oil and gas activities.

Table 4.5-2: Anticipated Impacts to Paleontological Resources

Rock Unit	Age (millions of years)	Subarea	PFYC	Environment	Probability of Encounter	Oil & Gas Potential
Monterey Formation	16-8	W	4	Marine	High	High
Temblor Formation	28-18	W	4	Marine	High	High
Santa Margarita Formation	12-8	W	3a	Marine	High	High
Freeman Silt / Jewett Sand	22-17	W	4	Marine	Moderate	High
Chanac Formation	11-9	E	4	Terrestrial	Moderate	High
Kern River Formation	8.5-2	E, C	4	Terrestrial	Moderate	High
Walker Formation	38-23	E	3b	Terrestrial	Moderate	Moderate
Kreyenhagen Shale	48-37	W	2	Marine	Moderate	Moderate
Quaternary brea deposits	0.4-0.1	W	5	Terrestrial	Moderate	Low Grade
Round Mountain Silt	16-13	E	5	Marine	Moderate	n/a
Olcese Sand	19-17	W	4	Marine	Moderate	n/a
Tulare Formation	2.5-0.6	W	4	Fluvio-Lacustrine	Moderate	n/a
Gravelly Flat Formation	150-75	W	3a	Marine	Moderate	n/a
Panoche Formation	75-68	W	4	Marine	Moderate	n/a
Bena Gravel	18-11	E	4	Marine/ Terrestrial	Moderate	n/a
older alluvial deposits	2.5-0.5	All	3b	Terrestrial	Moderate	n/a
unnamed Pliocene deposits	5-2.5	W	3b	Marine/ Terrestrial	Moderate	n/a
Franciscan Complex	160-68	W	2	Marine	Moderate	n/a
Vedder Sand	34-24	E	3b	Marine	Moderate	n/a
Caliente Formation	17-5	W	5	Terrestrial	Low	n/a
Wagonwheel Formation	38-35	W	3a	Marine	Low	n/a
Etchegoin Formation	5.5-4	W	4	Marine/ Estuarine/ Lacustrine	Low	n/a
San Joaquin Formation	4-2.2	W	5	Marine/ Estuarine/ Lacustrine	Low	n/a
Tejon Formation	49-39	W, E	4	Marine	Low	n/a
San Emigdio Formation	48-24	W	3a	Marine	Low	n/a
Pleito Formation	34-22	W	3a	Marine	Low	n/a
Vaqueros Formation	34-22	W	4	Marine	Low	n/a
Tecuya Formation	28-18	W, E	4	Marine	Low	n/a

Table 4.5-2: Anticipated Impacts to Paleontological Resources

Rock Unit	Age (millions of years)	Subarea	PFYC	Environment	Probability of Encounter	Oil & Gas Potential
Paso Robles Formation	5-0.1	W	4	Marine/ Terrestrial	Low	n/a
Lodo Formation	59-50	W	3a	Marine	Low	n/a
Avenal Sandstone	48-40	W	3b	Marine	Low	n/a
Simmler Formation	34-22	W	3b	Terrestrial	Low	n/a
unnamed Miocene marine	23-5	E	3b	Marine	Low	n/a
Bitterwater Creek Shale	10-5	W	3b	Marine	Low	n/a
Quatal Formation	5-2.5	W	3b	Lacustrine	Low	n/a
Morales Formation	4-0.1	W	3b	Fluvial	Low	n/a
Hex Claystone	145-100	W	3a	Marine	Low	n/a
Pattiway Formation	60-58	W	3a	Marine	Low	n/a
Bealville Fanglomerate	35-18	E	2	Marine	Low	n/a
Holocene deposits	0.1	all	2	Fluvial	High	n/a
Basement rocks	160-67	W, E	1	Igneous, Metamorphic	Low	n/a

Well drilling and operation of wells represent the majority of the Project's subsurface activities. These activities generate pulverized rock samples (including any contained fossils) from subsurface zones, and they typically affect only a small area (e.g., a well bore diameter) rather than large volumes of a fossil-bearing geologic stratum. Some shallow subsurface Project activities (e.g., installation of pipelines, typically at depths of less than 5-8 feet below surface) could result in disturbance of potentially fossil-bearing strata that have not been pulverized and, thus, may contain intact fossils.

In summary, there could be significant impacts to paleontological resources as a result of the oil and gas exploration and production activities that would be authorized under the Project.

The implementation of mitigation including applicable training and implementation of appropriate procedures should paleontological materials be discovered, as described in MM 4.5-2, and payment of mitigation fees, as described in MM 4.5-3, would decrease impacts to levels that are less than significant.

Mitigation Measures

MM 4.5-2 As part of any Worker Environmental Awareness Program training, all construction personnel shall be trained regarding the recognition of possible buried paleontological resources and protection of paleontological resources

during construction, prior to the initiation of construction or ground-disturbing activities. Training shall inform construction personnel of the procedures to be followed upon the discovery of paleontological materials. All personnel shall be instructed that unauthorized collection or disturbance of fossils is unlawful.

MM 4.5-3 All well permits that use Enhanced Oil Recovery or Well Stimulation methods shall pay a mitigation fee of $50 per well shall be paid to the Buena Vista Museum to fund the continued education and curation of paleontological resources and provide educational support regarding the paleontological history of the region.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.5-4: Disturb any Human Remains, Including Those Interred Outside of Formal Cemeteries

Any disturbance of human remains would be significant. Burials, prehistoric or historic, are below the surface and usually are not marked even in the case of historic burials as the original wooden markers have deteriorated. Health and Safety Code Section 7050.5 declares that, in the event of the discovery of human remains outside of a dedicated cemetery, all ground disturbance must cease and the County coroner must be notified. Section 7052 establishes a felony penalty for mutilating, disinterring, or otherwise disturbing human remains, except by relatives.

Potential impacts to human remains would most likely occur during construction. Earthmoving, such as grading, may reveal human skeletal materials and all work should cease upon discovery. Potential impacts to human remains are unlikely during operations except where new ground disturbance occurs.

In summary, there could be significant impacts to human remains as a result of the oil and gas exploration and production activities that would be authorized under the Project. If archaeological materials are encountered, the implementation of mitigation including avoidance (if possible through project redesign or preservation in place) or development of additional treatment measures and recovery/curation (if applicable), as described in MM 4.5-4, or coordination with the coroner or NAHC, as applicable, if human remains are uncovered, as described in MM 4.5-5, would decrease impacts to levels that are less than significant.

Mitigation Measures

MM 4.5-4 In the event archaeological materials are encountered during the course of ground disturbance or construction, the Project operator/contractor shall cease any ground disturbing activities within 50 feet of the find. The qualified archaeologist shall evaluate the significance of the resources and recommend appropriate treatment measures. Per California Environmental Quality Act Guidelines Section 15126.4(b)(3), Project redesign and preservation in place shall be the

preferred means to avoid impacts to significant historical resources. Consistent with California Environmental Quality Act Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures in consultation with the County, which may include data recovery or other appropriate measures. The Planning and Community Development Department shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. If after consultation it is deemed appropriate, archaeological materials recovered during any investigation shall be curated at an accredited curation facility. The qualified archaeologist shall prepare a report documenting evaluation and/or additional treatment of the resource. A copy of the report shall be provided to the Kern County Planning and Community Development Department and to the Southern San Joaquin Valley Information Center.

MM 4.5-5 If human remains are uncovered during Project construction, the Applicant shall immediately halt all work, contact the Kern County Coroner to evaluate the remains, and follow the procedures and protocols set forth in Section 15064.4 (e)(1) of the California Environmental Quality Act Guidelines. The Kern County Planning and Community Development Department shall be notified concurrently. If the County Coroner determines that the remains are Native American, the Project proponent shall contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by Assembly Bill 2641). The Native American Heritage Commission shall designate a Most Likely Descendant for the remains per Public Resources Code 5097.98. Per Public Resources Code 5097.98, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred with the most likely descendant regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. If the remains are determined to be neither of forensic value to the Coroner, nor of Native American origin, provisions of the California Health and Safety Code (7100 et. seq.) directing identification of the next-of-kin will apply.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.5.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to cultural and paleontological resources includes the area within a one-mile radius from the Project Area. Analysis of cumulative impacts takes into consideration the entirety of impacts that the proposed Project would have on cultural resources. Future development and construction could encounter potentially significant cultural and paleontological resources during ground-disturbing construction activities, including grubbing, grading, and excavation.

Potential impacts on cultural resources include the potential to be destroyed by construction equipment and Project-related vehicles, exposure of alluvium during construction that could subject the rocks to increased weathering and erosion, unauthorized collection of fossils by project personnel (as well as amateur and commercial collectors who would have greater access to the area), and vandalism. If a future development project is located within close proximity of a known cultural and/or paleontological resource, the County would ensure that potential impacts to those resources would be reduced to insignificant levels if the mitigation measures described in this section are implemented.

This geographic scope of analysis is appropriate because the archaeological, historical, and paleontological resources within this radius are expected to be similar to those in the Project Area because of their proximity; similar environments, landforms, and hydrology would result in similar land use and, thus, site types. Similar geology within this vicinity would likely yield fossils of similar sensitivity and quantity.

Impact 4.5-5: Cumulative Impacts to Historical, Archaeological, or Paleontological Resources and Human Remains

Cumulative impacts may result when paleontological, historical, and archaeological resources or human remains cannot be avoided by future projects. For paleontological and archaeological resources, it is important to recover a scientifically significant sample so the information can be preserved. For historic buildings and structures, detailed recordings, including measured drawings and photographs, can preserve the information. For human remains, reburial in a location not slated for future development can protect those remains from future disturbance. In summary, there could be significant impacts to paleontological, historical, and archaeological resources or human remains as a result of the oil and gas exploration and production activities that would be authorized under the Project.

Implementation of best professional practices would reduce many impacts to a less than significant level. However, it is anticipated that buried archaeological and paleontological resources may be damaged or destroyed. Direct mitigation using the measures above would reduce most of these impacts to a less than significant level; however, the exception is well stimulation or EOR activities that result in the destruction of subsurface fossils. Offset mitigation

appropriate for this is recommended as monetary assessment determined by the County to be paid to the Buena Vista Museum.

Mitigation Measures

Implement MM 4.5-1 through MM 4.5-5, as described above.

Level of Significance After Mitigation

Significant and unavoidable.

This page intentionally left blank.

Section 4.6

Geology and Soils

Section 4.6

Geology and Soils

4.6.1 Introduction

This section of the Environmental Impact Report (EIR) describes the affected environment and regulatory setting for geology and soils. It also describes the potential impacts on geology and soils that would result from implementing the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments of the Kern County Zoning Ordinance, future development of oil and gas resources pursuant to the Amended Ordinance, and mitigation measures that would reduce these impacts, if necessary.

Geologic and soil characteristics of the Project Area (Figure 4.6-1) and the potential impacts on geology and soils associated with construction and operation of the Project are described in this section. This section is based on the Preliminary Soil and Geology Study prepared by BSK Associates (BSK) in January 2015 (BSK 2015) located in Appendix Q of this EIR and incorporated by reference herein. The issues addressed in this section are risks associated with faults, strong seismic ground-shaking, seismic-related ground failure such as liquefaction, landslides, subsidence, and the potential for induced seismic events.

4.6.2 Environmental Setting

Regional

The Project Area, defined as shown in Figure 4.6-1 is located in the Great Valley Geomorphic Province of California, an alluvial plain, and includes most of the western half of Kern County, bordered on the east by the Sierra Nevada Mountains and on the west by the Temblor Range. The plain generally defines the San Joaquin Valley, which extends for about 50 miles east to west and 400 miles north to south between the Coast and Sierra Nevada Mountain Ranges. The Project Area is generally defined as the portion of Kern County below an elevation of 2,000 feet above mean sea level (AMSL). The Project Area is divided into three Subareas identified as Western, Central, and Eastern Subareas (Figure 4.6-1). The San Joaquin Valley is drained by the Sacramento and San Joaquin rivers, which ultimately drain to San Francisco Bay. The valley is a northwesterly trending trough filled with 40,000 feet of sediments deposited by the surrounding mountains. Streams flowing from the Sierra Nevada to the west have formed alluvial fans at the surface. The Kern River fan is the largest alluvial fan at the western base of the range and covers 300 square miles of the valley, extending to the west from an incised channel north of downtown Bakersfield.

Local

Physiographic Provinces

The northern portion of the Project Area is mostly in the San Joaquin Valley. This valley is surrounded by mountain ranges on all sides. The western edge of the valley is bordered by the Diablo and Temblor Ranges. These ranges reach elevations up to 4,332 feet (Mt. McKittrick). The eastern edge of the valley is bordered by the Sierra Nevada Range, which includes peaks of more than 14,000 feet and is deeply incised by stream and glacial erosion, particularly on the longer and less steeply inclined western face of the range. There are several perennial seasonal and intermittent streams and small drainageways flowing into the valley from the east and the west. The Southern Coast Range is located to the west of the Temblor and Diablo Ranges, and forms a barrier on the west side of the valley. The west and east sides of the valley also contain alluvial fans and plains. The alluvial materials on the west side were deposited by runoff from the Coast Range. The alluvial materials on the east side were deposited by runoff from the Sierra Nevada Range (USDA 1988).

Kern County is characterized by six physiographic provinces: the Coast Range, the Great Valley, the Transverse Range, the Sierra Nevada Range, the Mojave Desert, and the Basin and Range Provinces (Figure 4.6-2). The Project Area is predominantly within the Great Valley Province (San Joaquin Valley), and is bordered by the Coast Range to the west and the Sierra Nevada Range to the east.

The Western Subarea is evenly split longitudinally (north-south) between the Coastal Range Province on the west and the Great Valley Province on the east; the Central Subarea lies entirely within the Great Valley Province, and the Eastern Subarea is split longitudinally (north-south) between the Great Valley Province on the west (60% of the Subarea) and the Sierra Nevada Province on the east (40% of the Subarea).

Great Valley Province

The Great Valley Province is a 400-mile long and 50-mile wide alluvial plain (a largely flat landform created by the deposition of sediment over a long period of time by one or more rivers coming from highland regions) trending northwest/southeast between the Coast Range and Sierra Nevada Provinces. Kern County is located in the most southerly portion of the San Joaquin Valley, in the Great Valley Province. Landforms in the southern part of the San Joaquin Valley belong to four geomorphic types: dissected uplands, low plains and fans, flood plains and channels, and overflow lands and lake bottoms (Wood and Dale 1964). The valley represents a geosyncline (a subsiding linear trough caused by the accumulation of large amounts of sediments) filled with more than 40,000 feet of sediments along the valley axis. Sedimentary deposits in the Project Area consist predominantly of fan deposits, lake deposits, and Pliocene-Pleistocene non-marine deposits and, to a lesser extent, dune sand, basin deposits, and Pliocene marine deposits (Figure 4.6-3) (California Geological Survey 1964). The source of the sediments is the surrounding mountain ranges. Erosion of these ranges has resulted in alluvial fans at the base of the ranges. The largest alluvial fan has been formed by the Kern River and extends over

300 square miles. The Kern River flood plain consists of sand, silt, and clay deposits and is incised into the upper part of the fan, north of downtown Bakersfield, and spreads out across the broad, flat lower fan to the southwest.

Coast Range Province

The Coast Range Province lies to the west of the Great Valley Province and is also oriented northwest/southwest. It consists of several mountain ranges, including the Temblor Range, which extends for 70 miles from the northwest corner of Kern County southeastward along the county border to the San Emigdio Mountains near Cienaga Canyon and south of Maricopa (Wood and Dale 1964). Crystalline igneous and metamorphic rocks comprise the core of this range; sediments on the Temblor Range are predominantly Miocene, Eocene, and Cretaceous marine sediments (Figure 4.6-3) (California Geological Survey 1964). The most notable structural feature in this province is the San Andreas fault, which trends northwest/southeast from Humboldt County in Northern California to the Salton Sea near the Mexican border for about 650 miles. The fault extends along the western base of the Temblor Range in the western portion of the Project Area.

Sierra Nevada Range Province

The Sierra Nevada is a 370-mile long by 40- to 80-mile wide range extending from the north-central part of the state to the Tehachapi Mountains (Wood and Dale 1964). The Sierra Nevada Range consists of a large northwest/southeast trending block of the earth's crust that has been uplifted along a series of faults. The eastern face of the range is characterized by a sharp, steep scarp. Gentler slopes and alluvial fans occur along the western face. In Kern County and along the eastern border of the Project Area, the Sierra Nevada Range is composed predominantly of Mesozoic granitic rock, with lesser amounts of Tertiary volcanics and intrusive rocks, Miocene volcanics, pre-Cretaceous metamorphic rocks, Cretaceous metamorphic sedimentary rock, and pre-Cenozoic granitic and metamorphic rocks (Figure 4.6-3) (California Geological Survey 1964).

Geologic Setting

Kern County is a geologically complex and diverse area and is impacted by compressional forces created as the North American and Pacific tectonic plates slide past one another along the San Andreas fault, located at the western boundary of the Project Area. Plate tectonic forces and other geomorphic activity associated with the gradual westward rotation and elevation of the batholithic core of the Sierra Nevada create fractures or faults in the earth's crust to accommodate compressional strain. Earthquakes are produced in and near the Project Area from sudden movements along these faults, generating ground motion when the accumulated stress within the rocks is released as waves of seismic energy.

Faults and Seismic History

The San Andreas fault is the most prominent active fault system in the San Joaquin Valley. Other active fault systems in Kern County include the White Wolf fault, located about 20 miles

southeast of Bakersfield, the Breckenridge/Kern Canyon fault, located 20 miles east of Bakersfield; the Edison fault, located about 10 miles east-southeast of Bakersfield; and the Pond Poso fault located 11 miles northeast of Bakersfield. The San Andreas fault system in Kern County is located along the southwestern boundary of Kern and San Luis Obispo counties, with numerous other faults located northeast of the San Andreas fault and trending northwest to southeast. The locations of major faults or fault systems are shown in Figure 4.6-4.

White Wolf Fault. The White Wolf fault is a southeast dipping, left-lateral, oblique, reverse fault with a length of 45 miles. This fault is located 20 miles south of downtown Bakersfield and traverses the southeastern end of the San Joaquin Valley, from Wheeler Ridge to northeast of Caliente. On July 21, 1952, the White Wolf fault ruptured, producing an earthquake of magnitude 7.5 and, subsequently, an extensive sequence of aftershocks. Although a surface rupture formed along only 17 miles of the surface trace of this fault, a rupture probably occurred along most of its length. The magnitude 7.5 earthquake in 1952 is the only recorded rupture along the White Wolf fault in historic time. Significant features caused by the fault are the valley at the junction of SR-58 and SR-223 (sometimes called "White Wolf Valley"), and the Arvin cutoff along SR-223. This fault has been designated by the State as an Alquist-Priolo Special Studies Zone.

Breckenridge-Kern Canyon Fault. The Breckenridge-Kern Canyon fault is located in the southern Sierra Nevada Mountains, 20 miles east of downtown Bakersfield. It trends northward from the north end of Walker Basin to the north of Mount Whitney, a distance of 100 miles. Uncertainty exists as to the degree of activity of this fault system and its classification. It is designated by the state as an active system with a potential maximum credible earthquake of magnitude 8.0. This fault is capable of causing damage in the Bakersfield area. Areas along this fault have been designated by the State as Alquist-Priolo Special Studies Zones.

Edison Fault. The Edison fault is located about 10 miles east of Bakersfield. It is a normal fault that trends to the northwest-southeast over a distance of 6 miles. It is considered by the State to be a "potentially active" fault with evidence of surface displacement within the last 1.6 million years.

Poso Creek Fault. The Poso Creek fault is located 9 miles north of Oildale. It is a normal fault that dips to the south. The fault is known to extend about 9 miles in a west to northwest trend and may extend another 30 miles northwest to near the town of Wasco. (SCEDC 2014). The fault is considered by the State to be an active fault (BSK 2015).

Kern Gorge Fault. The Kern Gorge fault is located 12 miles northeast of Bakersfield. It is a normal fault that dips to the southwest. The fault extends 12 miles in a north-northwest trend (SCEDC 2014). The fault is considered by the State to be active; surface ruptures were observed in 1952 (BSK 2015)

San Andreas Fault. The San Andreas fault is a classic "strike-slip" transform fault that is caused by the movement of the North American and the Pacific tectonic plates along a 650-mile point of contact extending from the Mendocino Escarpment on the north to the Imperial Valley on the south. The eastern Pacific plate is generally trending north along the fault at a rate of 2 inches per year. The fault occurs 38 miles southwest of downtown Bakersfield and trends nearly north (350 degrees) throughout the Project Area, primarily along the western foot of the

Temblor Range. The San Andreas fault trends to the north through most of the Project Area. The fault trace bends to the east in the Tehachapi Mountains located south of the Project Area and continues in a more easterly direction along the San Gabriel and San Bernardino mountains. The northerly movement of the Pacific Plate creates significant compressional forces at the bend, including in the vicinity of Frazier Park in the uplands to the south of the Project Area. The last great earthquake on this segment was the 1857 Fort Tejon earthquake, which is believed to have caused a surface rupture extending 200 miles or more. The maximum credible earthquake that could occur along the fault has been estimated to be magnitude 8.3 on the Richter scale. Areas along this fault have been designated by the State as Alquist-Priolo Special Studies Zones.

As noted above, numerous other named and un-named faults are located within Kern County (Figure 4.6-4). The majority of these faults tend to be located around the perimeter of the San Joaquin Valley near the San Andreas fault system at the western edge of the Project Area; the Wheeler Ridge Anticline and Kern Front fault system located at the southern and eastern edge of the Project Area. However, other faults are found in many locations of the Project Area. Additional faults are shown on Figures 10-1 to 10-5 of the BSK 2015 report, Appendix Q.

Soils

The Project Area includes most of the western half of Kern County. Soil surveys of the county conducted by the United States Department of Agriculture Natural Resource Conservation Service (USDA-NRCS) have divided the county into four regions (Northwest, Southwest, Northeast, and Southeast). The Project Area overlies the Northwest and Southwest survey areas except for the northeast corner of the Project Area (east of Route 65 and north of Route 178) and a narrow strip in the southeastern portion of the Project Area (east of Arvin) that are included in the Northeast and Southeast survey areas (Figures 4.6-5a, 4.6-5b, and 4.6-5c).

Soil Map Units

The Kern County soil surveys have identified more than 434 different soil types in the Soil Survey Geographic (SSURGO) database for the Project Area. The SSURGO database contains information about soil as collected by the National Cooperative Soil Survey over the course of a century. This information is gathered by visual observations of the soil, and taking soil samples to be analyzed in laboratories. Soil maps outline areas, referred to as Map Units, which describe soils and other components that have unique properties, interpretations, and productivity. These soil units are contained in the 37 generalized soil units found in the STATSGO2 database for the Project Area. The STATSGO2 database is broad-based inventory of soils and non-soil areas that occur in a repeatable pattern on the landscape. The level of mapping is designed for broad planning and management uses covering state, regional, and multi-state areas (USDA 2015). Figures 4.6-5a, 4.6-5b, and 4.6-5c identify portions of the Project Area that have distinct soil, topographic relief, and drainage patterns. The soil survey maps are designed to compare the suitability of large areas for general land uses and are grouped into landscape categories for broad interpretive purposes (USDA-NRCS 2009). A summary of the soil map units in each Project Subarea is provided below, including the primary unit classification (Table 4.6-1).

Table 4.6-1: Acres of Soil Map Units in Each Subarea

Soil Type	Acres in Central Subarea	% of the Central Subarea	% of the Total Project Area	Acres in Eastern Subarea	% of the Eastern Subarea	% of the Total Project Area	Acres in Western Subarea	% of the Western Subarea	% of the Total Project Area

Western Subarea

The Western Subarea is comprised of 24 soil groups, 12 of which make up 99% of the area:

- Approximately 23.5% is composed of Wasco-Kimberlina soils—deep, nearly level, well-drained fine sandy loam and sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.
- Approximately 18% is composed of Panoche-Milham Kimberlina soils—deep, nearly level to moderately sloping, well-drained clay loam, and sandy loam—found mainly on alluvial fans, alluvial plains, and terraces of the western part of the San Joaquin Valley;
- Approximately 11% is composed of Mercey-Kettleman-Elkhills-Delgado-Cantua-Bitterwater soils—shallow to deep, rolling to very steep, somewhat excessively drained and well-drained soils underlain by weathered sandstone or shale that form thick stratified alluvium—found mainly on the foothills of the Temblor and Diablo Ranges.
- Approximately 10.5% is composed of Kilmer-Hillbrick-Aido soils—shallow to deep, gently rolling to very steep, well-drained sandy loam and loam—found mainly on the hills/mountains of the Temblor and Diablo Ranges.
- Approximately 10% is composed of Lokern-Buttonwillow soils—deep, nearly level, somewhat poorly drained clay—found mainly on the basins of the San Joaquin Valley.
- Approximately 8% is composed of Nacimiento-Los Osos-Balcom-Ayar soils—moderately deep well-drained—found mainly on the hills/mountains of the Temblor and Diablo Ranges.
- Approximately 8% is composed of Panoza-Kilmer-Hillbrick-Beam soils— shallow to deep, gently rolling to very steep, well-drained sandy loam and loam—found mainly on the hills/mountains of the Temblor and Diablo Ranges.
- Approximately 3.5% is composed of Yribarren-Twisselman-Panoche soils—deep, nearly level to gently rolling, well-drained clay, loam, and clay loam—found mainly on alluvial fans, alluvial plains, and terraces of the western part of the San Joaquin Valley.
- Approximately 2.5% is comprised of Reward-Pottinger-Aramburu soils—moderately deep and deep, undulating to very steep, well-drained shaley loam and very shaley clay loam—found mainly on the hills/mountains of the Temblor and Diablo Ranges;
- Approximately 2% is composed of Panoche-Garces soils—deep, nearly level, saline-alkali, well-drained silt loam and clay loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.
- Approximately 1% is composed of Twisselman-Nahrub-Lethent soils—deep, nearly level, well-drained to somewhat poorly drained clay and silt loam—found mainly on alluvial fans, alluvial plains, and terraces of the western part of the San Joaquin Valley.

- Approximately 1% is composed of Westhaven-Lerdo-Excelsior-Cajon soils—deep to nearly level and gently sloping, well-drained and somewhat excessively drained loamy sand and fine sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.
- The remaining <1% is composed of the Walong-Rock outcrop-Edmundston-Anaverde; Milham; Vaquero-Sagaser-Gaviota-Altamont; Mocho-Capay-Camarillo; Still-Riverwash-Metz; Vista-Cieneba-Andregg; Stutzville-Panoche-Metz; Modjeska family-Coarsegold-Aramburu variant; Marpa-Hilt-Arrastre; Los Gatos-Gamboa; Xerofluvents-Oak Glen-Dotta; and Polonio-Padres series soils scattered throughout the Subarea.
- Approximately 0.2% of additional unnamed soil series in this Subarea are associated with urban areas.

Central Subarea

The Central Subarea is comprised of 13 soil groups, 9 of which make up 99% of the study area:

- Approximately 33.5% is composed of Wasco-Kimberlina soils—deep, nearly level, well-drained fine sandy loam and sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.
- Approximately 20.5% is composed of Panoche-Garces soils—deep, nearly level, saline-alkali, well-drained silt loam and clay loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.
- Approximately 13% is composed of Twisselman-Nahrub-Lethent soils—deep, nearly level, well-drained or somewhat poorly drained clay and silt loam—found mainly on alluvial fans, alluvial plains, and terraces of the western part of the San Joaquin Valley;
- Approximately 11% is composed of Zerker-Premier-Delano-Chanac soils—deep, nearly level to hilly, well-drained coarse sandy loam and clay loam—mainly on terraces in the eastern part of the San Joaquin Valley;
- Approximately 6.5% is comprised of Milham soils—deep, nearly level, well-drained sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.
- Approximately 6% is composed of McFarland soils—deep, nearly level, well-drained sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley. Approximately 0.1% of this soil series is associated with urban areas.

- Approximately <5% is composed of Westhaven-Lerdo-Excelsior-Cajon soils—deep to nearly level and gently sloping, well-drained and somewhat excessively drained loamy sand and fine sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley.

- Approximately 3% is composed of Lokern-Buttonwillow soil—deep, nearly level, somewhat poorly drained clay—found mainly on the basins of the San Joaquin Valley;

- Less than 1.5% is composed of San Joaquin-Madera-Cometa soils—undulating, moderately deep to a hardpan, well- and moderately well-drained soils that formed in alluvium derived from mixed but dominantly granitic rock sources—found mainly on the eastern side of the San Joaquin Valley.

- The remaining <1% is composed of Panoche-Milham-Kimberlina and Westcamp-Houser-Gepford-Armona soil series.

- Approximately 0.5% of additional unnamed soil series in this Subarea are associated with urban areas.

Eastern Subarea

The Eastern Subarea is comprised of 17 soil groups, 14 of which make up 99% of the study area:

- Approximately 25.5% is composed of Zerker-Premier-Delano-Chanac soils—deep, nearly level to hilly, well-drained coarse sandy loam and clay loam—found mainly on terraces in the eastern part of the San Joaquin Valley. Approximately 1% of this soil series is associated with urban areas.

- Approximately 20% is composed of Wasco-Kimberlina soils—deep, nearly level, well-drained fine sandy loam and sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley. Approximately 2% of this soil series is associated with urban areas.

- Approximately 17.5% is composed of Wasioja-Hesperia-Arvin soils—very deep, well-drained soils that formed in alluvium from sedimentary, metasedimentary, and granitic rock sources—found on alluvial fans, valley plains and stream terraces, mainly in the lower San Joaquin Valley.

- Approximately 12% is composed of Torriorthents-Elkhills soils—deep, well-drained soils formed in mixed stratified alluvium from sedimentary and granitic rocks—found mainly in the southwest part of the southern part of the San Joaquin Valley.

- Approximately 8% is composed of Walong-Rock outcrop-Edmundston-Anaverde soils—outcrops and moderately deep, well-drained soils that formed in material weathered from metamorphic and granitic rocks—found mainly on hillslopes, mountain slopes, flood plains, stream terraces, alluvial fans, and fan remnants on the western and central slopes in the southern Sierra Nevada and Tehachapi mountains.

- Approximately 5% is composed of Soper-Rock outcrop-Jilson-Dunnlake—shallow to moderately deep, well-drained soils that formed in material weathered from conglomerate and sandstone—found mainly on foothill areas in the western part of southern and central California.

- Approximately 4% is composed of Walong-Tunis-Pleito-Chanac-Badland soils—shallow to very deep, well-drained to excessively drained soils that formed in material weathered from metamorphic and granitic rocks—found mainly on foothills of the southern Sierra Nevada and the Tehachapi Mountains and southern and central San Joaquin Valley.

- Approximately 2% is composed of Westhaven-Lerdo-Excelsior-Cajon soils—deep to nearly level and gently sloping, well-drained and somewhat excessively drained loamy sand and fine sandy loam—found mainly on alluvial fans, alluvial plains, basin rims, and flood plains in the eastern part of the San Joaquin Valley;

- Approximately 1.5% is composed of Lokern-Buttonwillow soils—deep, nearly level, somewhat poorly drained clay—found mainly on the basins of the San Joaquin Valley;

- Approximately 1% is composed of Panoche-Milham Kimberlina soils—deep, nearly level to moderately sloping, well-drained clay loam, sandy loam—found mainly on alluvial fans, alluvial plains, and terraces of the western part of the San Joaquin Valley. Approximately 0.1% of this soil series is associated with urban areas.

- Approximately 1% is composed of Vista-Rock outcrop-Cieneba soils—very shallow to moderately deep, well-drained soils to excessively drained soils that formed in material weathered from decomposed granitic rocks—found on hills and mountainous uplands, mainly on southern California mountains and Sierra Nevada foothills.

- The remaining 2.5% is composed of less than 1% each of Vista-Rock outcrop-Auberry-Ahwahnee, Porterville-Centerville, Rock outcrop-Friant-Coarsegold, Tehachapi-Steuber-Havala, and Nacimiento-Los Osos-Balcom-Ayar soils in various locations in this Subarea.

- Approximately 0.3% of additional unnamed soil series in this Subarea are associated with urban areas.

Potential Geologic Hazards

Seismic Hazards

Southern California is one of the most seismically active areas in the lower 48 states. Recorded earthquake history dates back to the mid-18th century. The first strong earthquake recorded in California occurred in the Los Angeles region in 1769, probably near the San Andreas fault. Four violent shocks were recorded during the Spanish Gaspar de Portola expedition at a camp located about 30 miles southeast of what is now downtown Los Angeles. Most authorities speculate, even though the record is very incomplete, that the 1769 event was a major earthquake (USGS 2014).

Major earthquakes have also been recorded in or near the Project Area in Kern County. The largest of these earthquakes was the July 1952 Kern County earthquake, which measured 7.5 in magnitude on the Richter scale and severely damaged the towns of Tehachapi and Arvin. Twelve persons died, many were injured, and $60 million in property damage was sustained. Damage to well-designed structures was slight, but old and poorly built buildings were cracked, and many collapsed. Reinforced tunnels with walls 18 inches thick near Bealville were cracked, twisted, and caved in. Rails were shifted and bent into S-shaped curves. Near Caliente, reinforced concrete railroad tunnels were destroyed. Many aftershocks occurred, three above magnitude 6 on the Richter scale. One aftershock on August 22 (magnitude 5.8) was centered near Bakersfield and resulted in two fatalities and extensive damage to many already weakened buildings. The Kern County earthquake, the largest with an epicenter in California since 1906, originated on the White Wolf fault.

The Fort Tejon earthquake of 1857 moment magnitude scale ($M_W = 7.9$) was one of the greatest earthquakes ever recorded in the U.S. and left a surface rupture scar more than 220 miles long along the San Andreas fault. As a result of the shaking, the current of the Kern River was turned upstream, and water ran 4 feet deep over its banks. The waters of Tulare Lake were thrown upon the shore, stranding fish miles from the original lake bed. The surface rupture caused by the quake was extensive. The San Andreas fault broke the surface continuously for at least 220 miles, possibly as much as 250 miles, with an average slip of 15 feet and a maximum displacement of about 30 feet (possibly greater) in the Carrizo Plain area (SCEDC 2014).

Other significant earthquakes include the Tejon Ranch earthquake in 1988, which measured 5.4 in magnitude and caused some damage to circuit breakers at the A.D. Edmonston Pumping Plant on the California Aqueduct causing the aqueduct to be temporarily shut down. Otherwise, damage was slight, although the quake was felt across much of southern and central California. The 5.2 magnitude Wheeler Ridge earthquake in 1993 was located between Bakersfield and Taft (SCEDC 2014). As a result of the Wheeler Ridge earthquake, some minor damage occurred at Pumpkin Center, near the epicenter, where ground-shaking was the strongest, but otherwise, this earthquake caused little damage, though it was noticed over a wide area of southern and central

California. Major earthquakes that have occurred within the Project Area are shown in Figure 4.6-6.

Earthquake intensities are measured using either the Modified Mercalli Intensity Scale or the Richter (or other) Magnitude scale. The Mercalli scale is based on observation of the results of an earthquake, such as the shaking and damage that people actually feel and see where I is the least intensive (not felt except by very few under especially favorable conditions); VI is in the middle of the intensity scale (felt by all—heavy furniture is moved and, in a few instances, plaster will fall); and XII is the most intensive (severe damage—lines of sight are distorted and objects are thrown in the air). The Richter scale measures the energy released in an earthquake by measuring the size of the seismic waves. Mercalli intensities do not correspond directly to Richter magnitudes. The following is a comparison of the Mercalli intensities to Richter magnitudes:

- Mercalli I to V = Richter < 5.5
- Mercalli VI and VII = Richter 5.5 to 6.1
- Mercalli VIII and IX = Richter 6.2 to 6.9
- Mercalli X = Richter 7.0 to 7.3
- Mercalli XI = Richter 7.4 to 7.9
- Mercalli XII = Richter > 8.0

The extent of potential ground shaking hazards from earthquakes in Kern County is illustrated in (Figure 4.6-7) (USGS 2008). Ground shaking is expressed as a percentage of the force of gravity (%g) generated by a seismic event. Figure 4.6-7 is centered on Bakersfield and shows the Project Area. Contour lines identify areas where a specific force of gravity level has a 10% chance of being exceeded in any given 50-year period. The applicable ground shaking risk ranges from 15% to 25% of the force of gravity over most of the Project Area, and increases to 30% to 40% of the force of gravity in the south, where compressional forces occur due to the bending of the San Andreas fault. A 10%g to 20%g quake equates to a Mercalli intensity of about VII (capable of breaking chimneys, etc.). An earthquake of 30%g to 40%g equates to an intensity of about VIII to IX (considerable damage in ordinary substantial buildings, with partial collapse of buildings moved off foundations; ground cracks are conspicuous, and underground pipes broken). The ground shaking risk contours indicate that the Project Area is subject to above average seismic risks compared with other locations in the United States.

USGS data was also used to prepare an earthquake probability map (Figure 4.6-8). As shown in Figure 4.6-8, the probability of an earthquake with a magnitude greater than 5.0 within the next 20 years is 50% to 60% throughout most of the Project Area. The percentage decreases to 30% to 40% near portions of the western and northern boundaries of the Project Area, which are located a greater distance from many of the major fault systems in the region.

Table 4.6-2 presents a summary of Southern California seismicity based on the Southern California Earthquake Data Center (SCEDC) instrument recorded earthquakes for 1932 to 2008 (Hutton, Woessner, and Hauksson 2010). According to Hutton, Woessner, and Hauksson, "the overall seismicity rate has remained fairly constant for the last 77 years, except for major aftershock sequences."

Table 4.6-2: Average Earthquake Rates Based on the Seismicity Catalog Recorded by the SCSN for 1932 through 2008

Magnitude Range	Number of Events	Number of Events/Yr.	Average Recurrence Rate
Average Earthquake Rates			
3.0+	19,707	~256/yr.	1/1.4 days
4.0+	2485	32.3/yr.	1/11.3 days
5.0+	253	3.29/yr.	1/111 days
6.0+	28	~0.36/yr.	1/2.75 yrs.
7.0+	3	~0.039/yr.	1/25.7 yrs.
Average Declustered Rates			
4.0+	881	11.4/yr.	1/31.9 days
5.0+	104	1.35/yr.	1/270 days
6.0+	19	0.25/yr.	1/4.05 yrs.
7.0+	3	0.039/yr.	1/27 yrs.

Fault Rupture

Surface ruptures are the result of movement along an existing fault, which breaks through the land surface. There are numerous faults throughout the Project Area and surface ruptures are present at many of these locations. Surface rupture may occur suddenly as the result of an earthquake or may be more gradual due to fault creep (slow displacement along a fault).

Induced Seismicity

The majority of earthquakes that occur each year throughout the world are the result of natural causes. Naturally occurring earthquakes generally are the result of the buildup of stresses caused by the lateral or vertical movement of blocks or plates moving and the subsequent buildup and release of energy. However, some earthquakes are the result of human activity and are called induced-seismic events or induced earthquakes. Human activities that can result in induced seismic events include injection and withdrawal of fluids, impoundment of reservoirs, mining and controlled explosions (including underground). Hydraulic fracturing is also capable of producing induced seismic events. Hydraulic fracturing involves the injection of fluid and

propellant into a targeted formation in an effort to fracture the rock and allow for fluid flow (i.e., oil or natural gas). Generally, hydraulic fracturing generates seismic events with a less than 2.0 magnitude. However, when faults are present, larger seismic events are possible (Holland 2011).

The California Council on Science and Technology (CCST), Lawrence Berkeley National Laboratory (LBNL), and Pacific Institute (PI) issued an August 28, 2014 report, Advanced Well Stimulation Technologies in California, An Independent Review of Scientific and Technical Information. As related to potential seismic impacts from hydraulic fracturing, the following was presented in the report:

> Current hydraulic fracturing activity is not considered to pose a significant seismic hazard in California. To date, only one felt earthquake attributed to hydraulic fracturing in a California oil or gas field has been documented, and that was an anomalous slow-slip event that radiated much lower energy at much lower dominant frequencies than normal earthquakes of similar size. (BSK 2015)

Similarly, the National Academy of Sciences (NAS) evaluated induced seismicity from both enhanced oil recovery (EOR) and hydraulic fracturing, concluding that the "potential for induced seismicity is low in EOR operations" and the "process of hydraulic fracturing a well as presently implemented for shale gas recovery does not pose a high risk for inducing felt seismic events" (NAS 2013).

Induced seismicity can also occur as a result of deep wastewater injection. This was first observed at the Rocky Mountain Arsenal in 1961, where the Army disposed of chemical waste fluids via underground injection into Precambrian crystalline rock beneath sedimentary rocks of the Denver basin. The well was drilled to a depth of 12,045 feet and fluid was injected at an average rate of 181,000 gallons per day. This resulted in several felt earthquakes in 1962 and more than 700 shocks recorded by 1965. Earthquake triggering by wastewater injection is the result of increasing the pressure of existing fluid in a formation and thereby decreasing the frictional resistance between rocks along an existing fault system (BSK 2015).

While wastewater injection has triggered earthquakes in other regions of the U.S., differences between California and other U.S. regions suggest that the likelihood of induced seismicity due to wastewater injection in California is low compared to other regions in the U.S. Since 1981, the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR) regulations under the Safe Drinking Water Act have prohibited over-pressuring injection well. In addition, as reported by the CCST:

> …present [wastewater] injection volumes [in California] are relatively small and injection intervals are shallow compared to other areas of the United States, the seismic hazard related to current wastewater injection is also likely to be relatively low. For example, California's disposed water volume per wastewater-injection well is about four times less and 1.5–2.7 km (4,700–7,700 ft) shallower than disposal into the wells in the vicinity of the Barnett Shale [in Texas] where induced events have occurred. (CCST 2014).

By comparison, the non-hydrocarbon producing zones that are used for wastewater injection in California are typically less than 6,000 feet deep and the "lack of reported felt seismicity for hydraulic fracturing in California is consistent with the relatively shallow injection depths and small injection volumes" (CCST 2014). The seimogenic zones, i.e., the zones at which the rocks are rigid enough to accumulate enough stress to cause significant earthquakes, are relatively deep in California and significantly deeper than the oil and gas development and wastewater disposal zones. Moreover, more oil and gas production in California occurs in sedimentary basins as compared to other parts of the U.S. These basins are less susceptible to induced seismicity from wastewater injection as compared to injection into fractured hard rock.

In California, injection wells have been a part of the oil and gas industry for more than 50 years, with 42,000 oilfield injection wells operating in California. Overall, seismicity rates have remained relatively constant for the last 77 years. The introduction of injection wells 50 years ago and an increase in the number of injection wells since that time has not increased the seismicity rate in Southern California. In addition, a review of locations of disposal injection wells in Northern and Southern California, obtained from DOGGR geographic information system (GIS) mapping data and compared to the spatial distribution of earthquake locations from the 1980s to 2012, found no relational pattern suggesting a link between disposal wells and induced earthquakes. If there were such a link, clustering of earthquakes would be expected closer to the disposal well, extended radially corresponding to an expanding pressure front. This type of earthquake pattern was not observed in the analysis area. Therefore, it appears that the operation of injection wells has had little effect on seismicity rates in Southern California, including Kern County (BSK 2015).

Well Failure

Well failure may occur as a result of natural seismic activity, deficient cementing practices, or defective casings. The CCST study on advanced well stimulation technologies in California (2014) indicated that leakage due to casing and cement failures represents one of the most likely pathways for unintentional well fluid migration to underground formations. Recent studies have indicated that well failure, or blowout rates in the Project Area have been significantly reduced over time by improved well construction technologies. Blowout rates due to well operations in California Oil and Gas District 4 from 1991 to 2005 ranged from one per 10,000 to one per 60,000 well-years, depending on the wellfield activity taking place at the time of the blowout. Well failure is discussed in more detail in Section 4.9.

Liquefaction

Liquefaction occurs when saturated, loose materials (e.g., sand or silty sand) are weakened and transformed from a solid to a near-liquid state due to increased pore water pressure. The increase in pressure is caused by strong ground motion from an earthquake. Liquefaction-related phenomena can include lateral spreading, ground oscillation, flow failure, loss of bearing strength, subsidence, and buoyancy effects. Four conditions are generally required for liquefaction to occur:

- The soil must be saturated (relatively shallow groundwater).
  - If a soil layer is within 50 feet of the ground surface, it is more likely to liquefy than deeper layers.
- The soil must be loosely packed (low to medium relative density).
  - If a soil layer is a fluvial, lacustrine, or aeolian deposit or more recent deposition, a greater potential for liquefaction exists than for till, residual deposits, or older deposits.
- The soil must be relatively cohesion-less (not clayey).
  - Liquefaction potential in a soil layer increases with decreasing fines content and plasticity of the soil. Generally, a soil saturation of at least 80% to 85% is deemed to be a necessary condition for soil liquefaction.
- Ground-shaking of sufficient intensity must occur to function as a trigger mechanism.

Seismic ground-shaking of relatively loose, granular soils that are saturated or submerged can cause the soils to liquefy and temporarily behave as a dense fluid. Liquefaction is caused by a sudden temporary increase in pore water pressure due to seismic densification or other displacement of submerged granular soils. Liquefaction occurs more often in areas underlain by young alluvium where the groundwater table is higher than 50 feet below ground surface (bgs). Although not the only factor in determining liquefaction potential, areas of high groundwater are located throughout the central portion of the Project Area (Figure 4.6-9). Additionally, deposits in the Project Area often consist of alluvial fan deposits and lacustrine (lake) deposits and, to a lesser extent, dune sand (aeolian) deposits (see Section 4.6.3, Regulator Setting). Currently, a liquefaction potential map has not been prepared for the Project Area.

Subsidence

Land subsidence is the gradual, local settling or shrinking of the earth's surface with little or no horizontal motion. Subsidence is normally the result of gas, oil, or water extraction; hydro-compaction; and/or peat oxidation and not the result of landslide or ground failure. In general, subsidence within the Project Area is primarily related to groundwater withdrawal. Extensive groundwater withdrawal from unconsolidated sediments within the San Joaquin Valley has caused widespread aquifer-system compaction and land subsidence from 1926 to 1970. In localized areas subsidence has been as much as 27 feet. Groundwater withdrawal has been primarily used for agricultural purposes. Beginning in the 1950s, surface water began being transported into the area through the construction of canals and aqueducts. The importation of surface water resulted in decreased groundwater usage, water level recovery, and ultimately reduced rate of compaction. However, drought conditions in the mid-1970s, late 80s and early 90s, as well as drought conditions and regulatory reductions in surface water deliveries from 2007 to 2010, caused increased pumping, water level decline and renewed compaction (USGS 2013). As mentioned above, groundwater use in the Project Area and other valley locations was reduced as surface water storage and conveyance facilities, including the State Water Project and the federal Central Valley Project, became operational and imported water supplies were used

for irrigation. As a result, rates of land subsidence related to groundwater withdrawals have slowed appreciably since 1972. During the periods of drought in 1977 and the early 1990s, however, additional subsidence occurred in response to the lack of imported supplies and increased groundwater use (USDA-NRCS 2009). Statewide, groundwater meets about 40% of the state's water demands in an average year. In 2014, statewide groundwater usage was closer to 65% because of that year's drought. Because aquifer systems respond to both climatic droughts and regulatory restrictions of water deliveries, current drought conditions will also increase compaction and subsidence rates as seen in the previous examples (Borchers and Carpenter 2014).

According to the Soil Survey of Kern County, Southwest Part, the maximum subsidence within the survey area totaled 8 feet by 1972. Other data indicates that maximum subsidence may be as much as almost 12 feet in areas south of Bakersfield. For comparison purposes, subsidence due to groundwater extraction in the northern part of the San Joaquin Valley, 115 miles northwest of the Project Area, has been measured at more than 30 feet between 1926 and 1970 (USGS 2013). Figure 4.6-10 depicts the areas of subsidence within the San Joaquin Valley. Throughout most of the survey area, subsidence has occurred so slowly and over such a broad area that its effects have gone largely unnoticed by most residents. Land subsidence is most prominent in the southwest portion of the county south of Bakersfield and east of Taft and to the north, near Delano.

Land subsidence as the result of hydrocompaction, i.e., excessive wetting, is a near-surface phenomenon. Studies have demonstrated that hydrocompaction occurs only in alluvial-fan sediments above the highest prehistoric water table and in areas where sparse rainfall and ephemeral runoff have penetrated below the zone subject to summer desiccation by evaporation and transpiration. High differential settlement of soils due to hydrocompaction of near-surface soils can cause significant damage to structures and equipment placed on susceptible soils. Areas of hydrocompaction are present in isolated locations in the southwest corner of the county.

The weight of sediments overlying a producing formation is supported partially by the rock matrix and partially by the fluid pressure in the rock pores. When the reservoir fluid pressure is depleted, more of the load is transferred to the rock matrix and the formation volume compacts. The primary control on this formation compaction is therefore influenced by the material pore volume compressibility and bulk compressibility, defined as the change in pore volume and bulk volume with respect to the pore pressure at constant confining pressure (Bruno and Bovberg 1992).

Land subsidence of less than 1 foot from oilfield withdrawals is known to occur in a few isolated areas in southwest Kern County. Generally, the extent and rate of oil and gas extraction subsidence is significantly less than subsidence caused by groundwater use because hydrocarbon extraction typically occurs at much deeper locations beneath the ground surface. In addition, a substantial amount of the material extracted by oil and gas activity includes briny water (commonly called "produced water") that is re-injected into oil-bearing locations after the oil has been recovered (USDA-NRCS 2009). DOGGR monitors subsidence in oil and gas fields and regulates oil and gas withdrawal and re-pressurizing of each oilfield. If oilfield subsidence is

observed, well operators are required to stabilize the ground by injecting additional produced water or reducing the volume of produced water being pumped during field operations.

Landslides

Landslides commonly occur in connection with other major natural disasters such as earthquakes, volcanic eruptions, wildfires, and floods; landslides also are caused by other factors such as strength of underlying material surface and groundwater conditions, surface vegetation, and seasonal rainfall. Landslides are associated with areas of steep slopes generally greater than 30%. Slopes greater than 30% are present along the eastern and southern boundaries of the Eastern Subarea and along the western boundary of the Western Subarea. Figure 4.6-11 depicts the areas of landslide incidences in Southern California (USGS 1978). Slope stability depends upon slope steepness and the strength of the underlying material. Developments on slopes over 30% are regulated according to Kern County Zoning Ordinance, Chapter 19.88 Hillside Development. The Hillside Development Chapter does not currently apply to oil and gas operations. Table 4.6-3 below shows the types of landslides and the environment in which they occur.

Table 4.6-3: Geologic Environments Likely to Produce Earthquake-Induced Landslides

Landslide Type	Type of Material	Minimum Slope	Remarks
Rock falls	Rocks weakly cemented, intensely fractured, or weathered; contain conspicuous planes of weakness dipping out of slope or contain boulders in a weak matrix.	40° 1.2:1 84%	Particularly common near ridge crests and on spurs, ledges, artificially cut slopes, and slopes undercut by active erosion.
Rock slides	Rocks weakly cemented, intensely fractured, or weathered; contain conspicuous planes of weakness dipping out of slope or contain boulders in a weak matrix.	35° 1.4:1 70%	Particularly common in hillside flutes and channels, on artificially cut slopes, and on slopes undercut by active erosion. Occasionally reactivate preexisting rockslide deposits.
Rock Avalanches	Rocks intensely fractured and exhibiting one of the following properties: significant weathering, planes of weakness dipping out of slope, weak cementation, or evidence of previous landsliding.	25° 2.1:1 47%	Usually restricted to slopes of greater than 500 feet (150 m) relief that have been undercut by erosion. May be accompanied by a blast of air that can knock down trees and structures beyond the limits of the deposited debris.
Rock slumps	Intensely fractured rocks, pre-existing rock slump deposits, shale, and other rocks containing layers of weakly cemented or intensely weathered material.	15° 3.7:1 27%	

Table 4.6-3: Geologic Environments Likely to Produce Earthquake-Induced Landslides

Landslide Type	Type of Material	Minimum Slope	Remarks
Rock block slides	Rocks having conspicuous bedding planes or similar planes of weakness dipping out of slopes.	15° 3.7:1 27%	
Soil falls	Granular soils that are slightly cemented or contain clay binder.	40 1.7:1 84%	Particularly common on stream-banks, terrace faces, coastal bluffs, and artificially cut slopes.
Disrupted soil slides	Loose, unsaturated sands.	15° 3.7:1 27%	
Soil avalanches	Loose, unsaturated sands.	25° 2.1:1 47%	Occasionally reactivate preexisting soil avalanche deposits.
Soil slumps	Loose, partly to completely saturated sand or silt; uncompacted or poorly compacted manmade fill composed of sand, silt, or clay, preexisting soil slump deposits.	10° 5.7:1 18%	Particularly common on embankments built on soft, saturated foundation materials, in hillside cut-and-fill areas, and on river and coastal flood plains.
Soil block slumps	Loose, partly or completely saturated sand or silt; uncompacted or slightly compacted manmade fill composed of sand or silt, bluffs containing horizontal or subhorizontal layers or loose, saturated sand or silt.	5° 11:1 8.7%	Particularly common in areas of preexisting landslides along river and coastal flood plains, and on embankments built of soft, saturated foundation materials.
Low earth flows	Stiff, partly to completely saturated clay and preexisting earth-flow deposits.	10° 5.7:1 18%	
Soil lateral spreads	Loose, partly or completely saturated silt or sand, uncompacted or slightly compacted manmade fill composed of sand.	0.3° 190:1 0.5%	Particularly common on river and coastal flood plains, embankments built on soft, saturated foundation materials, delta margins, sand dunes, sand spits, alluvial fans, lakeshores and beaches.
Rapid soil flow	Saturated, uncompacted or slightly compacted manmade fill composed of sand or sandy silt (including hydraulic fill earth dams and tailings dams); loose, saturated granular soils.	2.3° 25:1 4.0%	Includes debris flows that typically originate in hollows at heads of streams and adjacent hillsides; typically travel at tens of miles per hour or more and may cause damage miles from the source area.

Table 4.6-3: Geologic Environments Likely to Produce Earthquake-Induced Landslides

Landslide Type	Type of Material	Minimum Slope	Remarks
Subaqueous landslides	Loose, saturated granular soils.	0.5° 115:1 0.9%	Particularly common on delta margins.
Soil avalanches	Loose, unsaturated sands.	25° 2.1:1 47%	Occasionally reactivate preexisting soil avalanche deposits.
Soil slumps	Loose, partly to completely saturated sand or silt; uncompacted or poorly compacted manmade fill composed of sand, silt, or clay, preexisting soil slump deposits.	10° 5.7:1 18%	Particularly common on embankments built on soft, saturated foundation materials, in hillside cut-and-fill areas, and on river and coastal flood plains.
Soil block slumps	Loose, partly or completely saturated sand or silt; uncompacted or slightly compacted manmade fill composed of sand or silt, bluffs containing horizontal or subhorizontal layers or loose, saturated sand or silt.	5° 11:1 8.7%	Particularly common in areas of preexisting landslides along river and coastal flood plains, and on embankments built of soft, saturated foundation materials.
Low earth flows	Stiff, partly to completely saturated clay and preexisting earth-flow deposits.	10° 5.7:1 18%	
Soil lateral spreads	Loose, partly or completely saturated silt or sand, uncompacted or slightly compacted manmade fill composed of sand.	0.3° 190:1 0.5%	Particularly common on river and coastal flood plains, embankments built on soft, saturated foundation materials, delta margins, sand dunes, sand spits, alluvial fans, lakeshores and beaches.
Rapid soil flow	Saturated, uncompacted or slightly compacted manmade fill composed of sand or sandy silt (including hydraulic fill earth dams and tailings dams); loose, saturated granular soils.	2.3° 25:1 4.0%	Includes debris flows that typically originate in hollows at heads of streams and adjacent hillsides; typically travel at tens of miles per hour or more and may cause damage miles from the source area.
Subaqueous landslides	Loose, saturated granular soils.	0.5° 115:1 0.9%	Particularly common on delta margins.

Expansive Soils

Expansive soils are soils that expand (swell) and contract (shrink) as the result of variations in moisture content. Clay is the most common soil constituent that makes soils expansive because of its ability to retain large amounts of water. The expansiveness of clay depends upon the minerals in the clay. Expansive soils swell and shrink because the soil behaves like a sponge: it expands when it becomes saturated and it shrinks when it loses its water. Structures built on soils with high swelling potential may experience shifting, cracking, and breaking damage as these soils expand and contract (Muhirwa, Benda, and Sargent 2015). Thus, soils that are predominantly clay or have high clay content are considered potentially expansive. Expansive soil potential in the Project Area is described below.

Western Subarea

As shown on Figure 4.6-12a, 54% of the Western Subarea contains soils with expansive potential, mostly almost the entire southern half of the Western Subarea and along the boundaries of northern half of the Subarea.

Central Subarea

As shown in Figure 4.6-12b, 39% of the Central Subarea contains soils with expansive potential, predominantly in the northwest portion of the Central Subarea, with smaller areas along the northeastern border and in the southern tip of the Subarea.

Eastern Subarea

As shown in Figure 4.6-12c, 40% of the Eastern Subarea contains soils with expansive potential, predominantly in the northwest corner, along the east-central and west-central boundaries, and in the southern part of the Subarea.

Soil Erosion

Soil erosion is the removal of soil by wind and water at a rate greater than it is formed. Soil erosion is caused by a number of factors including:

- Lack of vegetation/roots to bind the soil
- Steep slopes
- Poor farming practices
  - Overgrazing
  - Deep ploughing two or three times/year
  - Lack of crop rotation
  - Planting crops down the contour instead of along it
- Catastrophic weather events
- Impacts from human activities

- Water erosion
  - This occurs in three ways: sheet erosion (where an entire surface of a field is gradually eroded in a uniform way); gully erosion (caused by concentrated runoff at the base of steep slopes that form a deep channel or gully); and rill erosion (smaller channels of water where water finds hollows in which to settle and low-lying channels through which to run). Wind erosion generally occurs where the land surface is bare, mainly in areas with low rainfall, which allows the ground to dry out, and land flat enough to allow wind to carry soil particles. (South Africa National Department of Agriculture 2015)

    The Kern County soil surveys use erosion potentials measured as K factors and T factors to determine a particular soil's susceptibility to erosion. K factors are the susceptibility of a soil to sheet and rill erosion by water, and T factors are an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. K factors are one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual soil loss by sheet and rill erosion in tons per acre per year. K factors are based on the percentage of silt, sand, and organic matter, and soil structure and permeability. In general, the higher the K factor, the greater the susceptibility to sheet and rill erosion.

- Slope length
  - Slope length has considerable influence over runoff and can potentially accelerate erosion. The RUSLE slope length is defined as the distance from the origin of overland flow to where the flow enters a concentrated flow area like an ephemeral gully, waterway, diversion, or stream. In general, steeper slopes result in higher length slope (LS) value, thus creating greater erosion potentials from water.

The Kern County soil surveys subdivide the soils into wind erodibility groups. Group 1 soils are the most susceptible to wind erosion, and Group 8 are least susceptible. Wind erodibility indexes are also used to assign a numerical value indicating the susceptibility of soil to wind erosion, or tons per acre per year that can be lost to wind erosion. The size and composition of the surface particles along with soil moisture and frozen soil layers are also factors in wind erosion. Wind erodibiity in the Project Area is described below.

Western Subarea

Approximately 44% of the Western Subarea contains soils exhibiting the highest K factor (>0.3) (Figure 4.6-13a). These soils generally occur in the north-central portion of the Subarea and extend to the mid-central portion of the Subarea. There is also a small area of highly susceptible soils near the southeast corner of the Subarea. Only 7% of the soils exhibit a higher length of slope factor (>50). These soils occur along the western and southern boundaries of the Western Subarea (Figure 4.6-14a).

Approximately 49% of the Western Subarea contains soils exhibiting moderate to high wind erosion susceptibility (>50 tons/acre/yr.) (Figure 4.6-15a). These soils generally occur in the southern portion of the Subarea (where water erosion susceptibility is low). Some additional areas of wind erosion-susceptible soils also occur along the north-west boundary and the north-east boundary of the Subarea.

Central Subarea

Approximately 49% of the Central Subarea contains soils exhibiting the highest K factor (>0.3) (Figure 4.6-13b). These soils generally occur in the northwestern portion of the Central Subarea and extend to the mid-western portion of the Subarea. There are no soils in the Central Subarea with high slope factors (Figure 4.6-14b).

Approximately 38% of the Central Subarea contains soils exhibiting moderate to high wind erosion susceptibility (>50 tons/acre/yr.) (Figure 4.6-15b). These soils generally occur in the southern portion of the Subarea (opposite of the highest water erosion susceptibility). Some additional areas of wind erosion susceptible soils also occur in the northwest corner, along the northern boundary, and a very small area in the north-central portion of the Subarea.

Eastern Subarea

Approximately 12% of the Eastern Subarea contains soils exhibiting the highest K factor (>0.3) (Figure 4.6-13c). These soils are concentrated in the central portion of the Subarea. Only 8% of the soils exhibit a higher slope factor (>50). These soils occur along the eastern and southern boundaries of the Subarea (Figure 4.6-14c).

Approximately 47% of the Eastern Subarea contains soils exhibiting moderate to high wind erosion susceptibility (>50 tons/acre/yr.) (Figure 4.6-15c). These soils generally occur throughout most of the Subarea except in the central/west-central portion of the Subarea (opposite of the highest water erosion susceptibility) and the northwest/north-central portion of the Subarea.

Corrosive Soils

Corrosive soils are soils that induce electrochemical or chemical action that dissolves or weakens concrete or uncoated steel. The Kern County soil surveys designate low, moderate, and high corrosive properties of each soil on both concrete and uncoated steel. Corrosive soils in the Project Area are described below.

Western Subarea

Approximately 68% of the Western Subarea contains soils exhibiting high corrosion potential for uncoated steel (Figure 4.6-16a). These soils generally occur in the northern half of the Subarea, with additional areas along the southwestern and southeastern boundaries and a minor amount along the southern boundary.

Approximately 5% of the Western Subarea contains soils exhibiting high corrosion potential for concrete (Figure 4.6-17a). These soils generally occur in isolated areas in the north/northeast and southeast/southwest portions of the Subarea.

Central Subarea

Approximately 88% of the Central Subarea contains soils exhibiting high corrosion potential for uncoated steel (Figure 4.6-16b). These soils generally occur in the northern two-thirds of the Subarea with an additional area near the southern portion of the Subarea.

Approximately 5% of the Central Subarea contains soils exhibiting high corrosion potential for concrete (Figure 4.6-17b). These soils generally occur in isolated areas in the north/northwest and southern portions of the Subarea.

Eastern Subarea

Approximately 53% of the Eastern Subarea contains soils exhibiting high corrosion potential for uncoated steel (Figure 4.6-16c). These soils generally occur in the northwest, west, and southeastern portions of the Subarea.

Approximately 2% of the Eastern Subarea contains soils exhibiting high corrosion potential for concrete (Figure 4.6-17c). These soils generally occur in isolated areas in the east-central and west-central southern portions of the Subarea.

Soil Permeability

Permeability is a measure of the rate of flow of a liquid or gas through a porous media. Soil permeability is controlled by structure, porosity, and texture. In general, permeability is influenced by grain size. Particle sorting (particle uniformity) is also a factor. The larger the grain size, and the better the sorting, the higher the permeability. The Kern County soil survey classifies soils in four hydrologic groups: Group A consists of soils with high infiltration rates, thus low runoff potential, and are composed of sands and gravelly sands; Group B consists of soils with moderate infiltration rates; Group C consists of soils with slow infiltration rates; and Group D consists of soils with very slow infiltration rates and thus high runoff potential and are composed mainly of clays. Group D soils may result in ponding and flooding, can affect tillage and earthmoving operations, and put limitations on septic tank and leach fields. Low permeability soil in each Subarea of the Project is described below.

Western Subarea

Approximately 13% of the Western Subarea contains low permeability soils (Figure 4.6-18a). These soils generally occur along the northwestern, northern, northeastern, and southern borders, with a larger area along the southeastern border extending to the west.

Central Subarea

Approximately 28% of the Central Subarea contains low permeability soils (Figure 4.6-18b), predominantly in the northwest portion of the Subarea, extending mid-way down the western border, with another area near the southern tip of the Subarea.

Eastern Subarea

Approximately 5% of the Eastern Subarea contains low permeability soils (Figure 4.6-18c). These low permeability soils occur predominantly along the northern border, and along the eastern and southern border in some localized areas, and a small area along the western border of the Subarea.

4.6.3 Regulatory Setting

Local jurisdictions generally follow state and federal jurisdictions when addressing geologic resources and geotechnical hazards. The conservation elements and seismic safety elements of city and county general plans contain policies for the protection of geologic features and avoidance of hazards.

The California Environmental Quality Act (CEQA) is the major environmental statute that guides the design and construction of projects on non-federal lands in California. This statute sets forth a specific process for environmental impact analysis and public review. In addition, the project proponent must comply with other applicable state and local statutes, regulations, and policies. Relevant and potentially relevant statutes, regulations, and policies are discussed below.

Federal

The Uniform Building Code categorizes earthquake hazards in different regions of the United States by seismic Zones 1 through 4. Zone 1 has the least seismic potential and Zone 4 has the highest seismic potential. The Project Area is within Seismic Zone 4; accordingly, any potential future oil development and construction would be required to comply with all design standards applicable to Seismic Zone 4.

Clean Water Act (CWA)

The Clean Water Act (CWA) (33 United States Code [U.S.C.] Section 1251 et seq.), formerly the Federal Water Pollution Control Act of 1972, was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the United States. Several provisions of the CWA regulate activities that could affect soil erosion and chemical composition of water. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and certain non-point source discharges to surface water. Those discharges are regulated by the National Pollutant Discharge Elimination System (NPDES) permit process (CWA Section 402). Projects that disturb one or more acre of land are required to obtain NPDES coverage under the NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (General Permit).

Construction General Permits are implemented and enforced by the California Water Resources Control Board under Order No. 2009-0009-DWQ. The General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP), which includes best management practices (BMPs) to protect storm water runoff.

Requirements of the federal CWA and associated SWPPP requirements are described in further detail in Section 4.9, Hydrology and Water Quality.

Bureau of Land Management Oil and Gas Leasing Requirements

The Bureau of Land Management (BLM) leases federal land within the Project Area for oil and gas exploration and recovery. The County does not have jurisdiction to regulate oil and gas operations on federal land, and BLM or other federal agencies do not regulate land use associated with oil and gas operations on non-federal land in Kern County. BLM oil and gas leasing requirements in Kern County are summarized below for informational purposes.

In August 2014, the BLM commissioned an independent study of the best available science regarding the potential impacts of using well stimulation technology, such as hydraulic fracturing (the use of high pressure fluids or chemicals in oil and gas wells to increase the yield of oil and gas from subsurface rock formation) in the unique geology of California. The report was prepared by the CCST, LBNL, and PI (CCST 2014). The study reached 11 conclusions, including the following:

1. Present day well stimulation practices in California differ significantly from practices used for unconventional shale reservoirs in states such as North Dakota and Texas, and the impacts of hydraulic fracturing observed in other states are not necessarily relevant to California.

2. Acid fracturing has comprised a small fraction of reported well stimulation to date in California, is usually applied in relatively rare carbonate reservoirs, and is not expected to lead to major increases in oil and gas development in the State.

3. The most likely scenario for expanded well stimulation in California is production in and near reservoirs that are currently using well stimulation and that contain oil that has migrated from source rocks and not from the Monterey Formation shales.

4. Current water demand for well stimulation operations is a small fraction of statewide water use and ranges from 450 to 1,200 acre-feet per year (AFY). Ninety-five percent of water currently used is fresh water; the remainder is produced water, and most of the demand occurs in the southwestern San Joaquin Valley.

5. Most chemicals used in reported well stimulation treatments for which toxicity information is available are considered to be of low toxicity or non-toxic. However, a few reported chemicals present concerns for acute toxicity, including biocides and mineral acids. Potential risks posed by chronic exposure to most chemicals used in well stimulation activities remain unknown.

6. There are no publicly recorded instances of subsurface release of contaminated fluids into potable groundwater in California, but a lack of studies, data collection, and reporting makes it difficult to fully evaluate this potential concern.

7. Current well stimulation practices could allow flowback water containing stimulation chemicals to be mixed with produced water for use in irrigation.

8. Estimated marginal criteria air emissions (e.g., NOx, $PM_{2.5}$, VOCs; see Section 5.2.1, Air Quality, of the Advanced Well Stimulation Technologies in California: An Independent Review of Scientific and Technical Information [CCST 2014]) directly related to well stimulation appear small compared with total oil and gas production emissions in the San Joaquin Valley, where the vast majority of hydraulic fracturing takes place.

9. Fugitive methane emissions from direct well stimulation in oil wells are likely to be small compared with the total greenhouse gas (GHG) emissions from oil and gas production in California.

10. Current hydraulic fracturing for oil and gas production in California is not considered to pose a significant seismic hazard. The disposal of produced water from oil and gas production in deep injection wells has caused seismic events that were felt in several states and could increase seismic hazards in California under certain conditions.

11. Overall, the direct impacts of current well stimulation practices appear to be limited and will likely be limited in the future if proper management practices are followed. Existing or as yet unidentified technologies might be developed to extract oil and gas from new locations, e.g., the Monterey Formation, and could generate different environmental impacts compared with the impacts associated with current well stimulation activities.

Earthquake Hazards Reduction Act

The National Earthquake Hazards Reduction Program (NEHRP) was established by the U.S. Congress when it passed the Earthquake Hazards Reduction Act of 1977, Public Law (P.L.) 95–124. At the time of its creation, Congress' stated purpose for NEHRP was "to reduce the risks of life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards reduction program." Congress recognized that earthquake-related losses could be reduced through improved design and construction methods and practices, land use controls and redevelopment, prediction techniques and early-warning systems, coordinated emergency preparedness plans, and public education and involvement programs. Since NEHRP's creation, it has become the federal government's coordinated long-term nationwide program to reduce risks to life and property in the United States that result from earthquakes. Four basic NEHRP goals are as follows:

- Develop effective practices and policies for earthquake loss reduction and accelerate their implementation
- Improve techniques for reducing earthquake vulnerabilities of facilities and systems

- Improve earthquake hazards identification and risk assessment methods, and their use
- Improve the understanding of earthquakes and their effects.

Congress has recognized that several key federal agencies can contribute to earthquake mitigation efforts. Today, there are four primary NEHRP agencies:

- Federal Emergency Management Agency (FEMA) of the Department of Homeland Security.
- National Institute of Standards and Technology (NIST) of the Department of Commerce (NIST is the lead NEHRP agency).
- National Science Foundation (NSF).
- USGS of the Department of the Interior.

Congress completed a review of NEHRP, resulting in the NEHRP Reauthorization Act of 2004, PL 108–360. PL 108–360 directed that NEHRP activities be designed to develop effective measures for earthquake hazard reduction; promote the adoption of earthquake hazards reduction measures by government agencies, standards and codes organizations, and others involved in planning and building infrastructure; improve the understanding of earthquakes and their effects through interdisciplinary research; and, develop, operate, and maintain both the Advanced National Seismic System (ANSS) and the George E. Brown, Jr. Network for Earthquake Engineering Simulation (NEES). In a major new initiative, PL 108–360 also directed that NEHRP support development and application of performance-based seismic design (PBSD).

Oil and Gas Pipelines

The Pipeline and Hazardous Material Safety Administration (PHMSA), under the U.S. Department of Transportation (DOT) is responsible for regulating and ensuring the safe and secure movement of hazardous materials to industry and consumers by all modes of transportation, including pipelines. The PHMSA's Office of Pipeline Safety (OPS) administers the DOT's national regulatory program to assure the safe transportation of natural gas, petroleum, and other hazardous materials by pipeline. The OPS develops regulations and other approaches to risk management to ensure safety in design, construction, testing, operation, maintenance, and spill response planning of pipeline facilities. Pipeline safety regulations are listed in the Code of Federal Regulations (CFR), Title 49 Parts 190 to 199.

State

Alquist-Priolo Earthquake Fault Zoning Act of 1972

Formerly the Special Studies Zoning Act, the Alquist-Priolo Earthquake Fault Zoning Act of 1972 (Public Resources Code [PRC] Div. 7, Ch. 2.5) regulates development and construction of buildings near active faults to protect human occupancy structures from the surface fault rupture hazards. This state law was the direct result of the 1971 San Fernando earthquake, which was associated with extensive surface fault ruptures that damaged numerous homes, commercial

buildings and other structures. The Alquist-Priolo Earthquake Fault Zoning Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The law requires the California State Geologist to establish regulatory zones (known as Earthquake Fault Zones) around the surface traces of active faults and to issue appropriate maps. Faults included in the Alquist-Priolo Earthquake Fault Zoning Program are classified by activity:

- Faults classified as "active" are those that have been determined to be "sufficiently active and well defined," with evidence of movement within Holocene time.
- Faults classified as "potentially active" have shown geologic evidence of movement during Quaternary time (within the last 1.6 million years).
- Faults considered "inactive" have not moved in the last 1.6 million years. (CGS 2007)

The resulting maps are distributed to all affected cities, counties, and state agencies for their use in planning and controlling new or renewed construction. Local agencies must regulate most development projects within the zones.

Local government agencies are mandated by the act to require site-specific geologic investigations for proposed projects located within a designated Alquist-Priolo Earthquake Fault Zone area. An evaluation and written report of a specific site must be prepared by a licensed geologist. Such investigations typically include subsurface trenching to determine the presence of faulting. The most recent movements on any observed fault are then determined by appropriate age-dating. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back from the fault. Fault rupture typically occurs within 50 feet of an active fault line and is limited to the immediate area of the fault zone where the fault breaks along the surface. Such a rupture could potentially displace and/or deform the ground surface. Any project that involves the construction of buildings or structures for human occupancy, such as an operations and maintenance building, is subject to review under the Alquist-Priolo Earthquake Fault Zoning Act, and any structures for human occupancy must be located at least 50 feet from any active fault.

Seismic Hazards Mapping Act of 1990

In accordance with Public Resources Code, Chapter 7.8, Division 2, the CDOC, Division of Mines and Geology (now California Geological Survey [CGS]) is directed to delineate Seismic Hazard Zones through the Seismic Hazards Zonation Program. The purpose of the Act is to reduce the threat to public health and safety and to minimize the loss of life and property by identifying and mitigating seismic hazards, such as those associated with strong ground shaking, liquefaction, landslides, other ground failures, or other hazards caused by earthquakes. Cities, counties, and State agencies are directed to use seismic hazard zone maps developed by CGS in their land-use planning and permitting processes. In accordance with the Seismic Hazards Mapping Act, site-specific geotechnical investigations must be performed prior to permitting most urban development projects within seismic hazard zones.

California Building Code (CBC 2013)

The state of California provides minimum standards for building design and construction relating to fire and life safety, structural safety, and access compliance through the California Building Code (CBC), California Code of Regulations, Title 24. CBC provisions provide minimum standards to safeguard life or limb, health, property, and public welfare by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all buildings and structures and certain equipment. The code incorporates by adoption the 2012 International Building Code (IBC) of the International Code Council (ICC). The 2013 edition of the California Building Standards Code (Title 24) became effective on January 1, 2014.

Among other provisions, the CBC requires that a grading permit be issued by applicable local land use authorities if more than 50 cubic yards of soil are moved during the implementation of a project, and Chapter 16 (Structural Design) of the code describes seismic load calculation and design.

California Division of Oil, Gas, and Geothermal Resources

DOGGR regulates production of oil and gas, as well as geothermal resources, in the state of California. DOGGR oversees the drilling, operation, maintenance, and plugging and abandonment of onshore and offshore oil, gas, and geothermal wells, to protect life, health, property, and natural resources; underground and surface waters suitable for irrigation or domestic use; and oil, gas, and geothermal reservoirs. Responsibilities of DOGGR are identified in the California Code of Regulations (CCR), Title 14, Division 2, Chapter 4, and include well design and construction standards, surface production equipment and pipeline requirements, and well abandonment procedures and guidelines.

Underground Injection Control Program

In California, wells that inject fluids associated with oil and natural gas production operations (Class II injection wells) also are regulated by DOGGR under its Underground Injection Control (UIC) Program. Injection operations regulated under the UIC Program include enhanced oil recovery through waterflood, steamflood, and cyclic steam wells, produced water disposal, and gas storage. DOGGR is authorized to regulate Class II injection wells under United States Environmental Project Agency (EPA) oversight, pursuant to the 1982 primacy agreement between the EPA and DOGGR under the federal Safe Drinking Water Act (SDWA). The requirements of DOGGR's UIC Program are found in the PRC, the SDWA, and in the State and federal regulations. The main features of the UIC Program include permitting, inspection, enforcement, mechanical integrity testing, plugging and abandonment oversight, data management, and public outreach. It is DOGGR's intent that the UIC Program will be administered consistently in each of DOGGR's six districts.

Field Rules

Pursuant to CCR Title 14, Division 2, Chapter 4, Section 1722 (k), the State Oil and Gas Supervisor may establish field rules for any oil and gas pool or zone in a field when sufficient geologic and engineering data are available from previous drilling operations. DOGGR has established field rules for those fields where geologic and engineering information is available to accurately describe subsurface conditions. These field rules identify downhole conditions and well-construction information that oil and gas operators should consider when drilling and completing onshore oil and gas wells.

Senate Bill 4 (Well Stimulation Treatment)

Section 1421(d) of the federal SDWA excludes "the underground injection of fluids or propping agents (other than diesel fuels) pursuant to hydraulic fracturing operations related to oil, gas, or geothermal production activities" from regulation under the UIC program. Effective January 1, 2014, California adopted several new and amended provisions of the Public Resources Code and Water Code to regulate any oil or gas well stimulation activity designed to enhance oil or gas production or recovery by increasing the permeability of the geologic formation that contains hydrocarbon deposits. Well stimulation activities covered by the new legislation include hydraulic fracturing and acid well stimulation treatments. The legislation, commonly referred to as Senate Bill (SB) 4, amended Sections 3213, 3215, 3236.5, and 3401 of, and added Article 3 to, Chapter 1 of Division 3 of the PRC; and added Section 10783 to the Water Code. SB 4 requires that DOGGR (1) promulgate emergency interim and adopt permanent regulations regulating well stimulation treatments by January 2015, to take effect no later than July 1, 2015; (2) complete a statewide EIR on well stimulation treatments by July 2015; (3) complete an independent scientific study of well stimulation by January 2015; and (4) consult and reach formal agreements with other regulatory agencies to provide regulatory accountability and public transparency for well stimulation treatments by January 2015. SB 4 also requires that the State Water Resources Control Board develop model criteria for oil and gas-related groundwater monitoring by July 2015.

DOGGR adopted interim well stimulation regulations in January 2014, and readopted the interim regulations in July 2014. Proposed permanent regulations were circulated for public review and comment in October 2014 and were finalized in January 2015. The final regulations will become effective in July 2015. A draft program EIR for well stimulation in California was published by DOGGR on January 14, 2015. The public comment period for the draft EIR ended on March 16, 2015, and the EIR is scheduled to be finalized by July 2015 in accordance with SB 4.

SB 4 and the related interim and proposed permanent regulations require that certain physical well inspections, documentation, and public notices and disclosures be completed prior to and after completing a well stimulation process. The proposed regulations define well stimulation to include "a treatment of a well designed to enhance oil and gas production or recovery by increasing the permeability of the formation. Well stimulation is a short term and non-continual process for the purposes of opening and stimulating channels for the flow of hydrocarbons.

Examples of well stimulation treatments include hydraulic fracturing, acid fracturing, and acid matrix stimulation" (CCR § 1761(a)(1)(A)). This definition "does not include routine well cleanout work; routine well maintenance; routine treatment for the purpose of removal of formation damage due to drilling; bottom hole pressure surveys; routine activities that do not affect the integrity of the well or the formation; the removal of scale or precipitate from the perforations, casing, or tubing; a gravel pack treatment that does not exceed the formation fracture gradient; or a treatment that involves emplacing acid in a well and that uses a volume of fluid that is less than the Acid Volume Threshold for the operation and is below the formation fracture gradient" (CCR § 1761(a)(1)(B)).

The California Natural Resources Agency commissioned the CCST and LBNL to conduct an independent scientific assessment of well stimulation treatments, including hydraulic fracturing, in California. The purpose of the report is to synthesize and assess the available scientific information associated with well stimulation treatments in California. The review will survey hydraulic fracturing, matrix acidizing, and acid fracturing as they are applied both onshore and offshore for oil and gas production in the State. The study is organized by three major areas, which will be documented in three separate report volumes. Volume I ("Geology and Well Stimulation Treatments") was released on January 14, 2015. Volume I provides the factual basis describing what well stimulation treatments are, how they are conducted in general and practiced in California, and where they have been and are being used for oil and gas production in the State. Volumes II and III are scheduled for release on July 1, 2015. Volume II ("Generic and Potential Environmental Impacts of Well Stimulation Treatments") will assess the potential impacts of well stimulation treatments with respect to water, air quality, and GHG emissions, as well as induced seismicity, ecology, traffic, and noise. Volume II will incorporate input from Volume I, as the nature of the technology will define the types of potential environmental impacts that have to be assessed. Volume III ("Case Studies with Selected Evaluations of Environmental and Public Health Risk") will present case studies to assess environmental issues and qualitative hazards for specific geographic regions, based on findings in Volumes I and II. The assessment builds upon the 2014 report undertaken for the BLM concerning well stimulation in California by the CCST, LBNL, and PI (CCST 2014). Whereas, the 2014 report for the BLM exclusively addressed well stimulation for onshore oil production in California, the analysis of the subject report is planned to include both oil and gas production in California for onshore and offshore environments and to incorporate new information derived from newly released data and research.

The regulations, studies, and interagency agreements required by SB 4 are intended to regulate water quality and potential geological hazards that could be associated with well stimulation (e.g., earthquakes or ground instability resulting from bedrock fracturing or acidization). Water quality regulatory requirements associated with SB 4 are described in further detail in Section 4.9, Hydrology and Water Quality.

SB 4 and the related interim and proposed permanent regulations require that certain physical well inspections, documentation, and public notices and disclosures be completed prior to and after completing a well stimulation. The proposed regulations define well stimulation to include

"a treatment of a well designed to enhance oil and gas production or recovery by increasing the permeability of the formation. Well stimulation is a short term and non-continual process for the purposes of opening and stimulating channels for the flow of hydrocarbons. Examples of well stimulation treatments include hydraulic fracturing, acid fracturing, and acid matrix stimulation." This definition does not include "routine well cleanout work; routine well maintenance; routine treatment for the purpose of removal of formation damage due to drilling; bottom hole pressure surveys; routine activities that do not affect the integrity of the well or the formation; the removal of scale or precipitate from the perforations, casing, or tubing; or a treatment that does not penetrate into the formation more than 36 inches from the wellbore."

Before well stimulation, an operator must evaluate the cement outside of the well production casing to ensure zonal isolation during and following the treatment or, if necessary, remediate the cement before the well stimulation (CDOC 2014).

A well stimulation treatment area analysis must also be conducted to demonstrate that there is no potential conduit for fluid to migrate out of the hydrocarbon zone where the well stimulation treatment will occur. The proposed regulations require that the results of these assessments be integrated into a well stimulation treatment design.

Each well operator must obtain a permit from DOGGR in advance of a well stimulation treatment and must submit an application that includes the identification and location of the well; the time period during which the well stimulation treatment is planned to occur; a water management plan; a list of the anticipated identity and concentration of the chemical constituents of the well stimulation treatment fluids the operator plans to use; modeling of the well stimulation treatment and identification of plugged and abandoned wells and geologic faults within the modeled treatment area; indication that the operator is developing a groundwater monitoring plan meeting the criteria of the applicable Regional Water Quality Control Board (Regional Board) (operations cannot begin unless a plan has been approved); an estimate of treatment-generated waste materials that are not addressed in the water management plan; identification and contact information of the operator; the depth of the base of fresh water; and the results of specified evaluation and modeling.

Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within a specified distance from the wellhead and horizontal projection of the applicable well at least 30 days before beginning a well stimulation treatment. Notified property owners may request baseline and follow-up water quality testing at the operator's expense, and prior notice of any such testing must be provided to the applicable Regional Board to allow for the opportunity to observe the water sampling process. Well operators must also pressure test a well and meet certain integrity requirements before beginning a well stimulation treatment. An operator may conduct the stimulation activity identified in an approved application and notice within one year from DOGGR approval.

The proposed regulations require the operator to monitor the surface injection pressure, slurry rate, proppant concentration, fluid rate, and pressure of each annuli of the well during a well

stimulation treatment. Two thresholds have been proposed that would require the operator to terminate the well stimulation treatment, report the incident to the Division, and conduct diagnostics. Notices of any termination must be provided to DOGGR and other state agencies, including the Regional Board. Tracking seismic activity during and after well stimulation treatment incorporates the use of the California Integrated Seismic Network and requires evaluation if an earthquake larger than a 2.7 magnitude occurs within the vicinity of a well stimulation treatment. Finally, the proposed regulations require operators to perform ongoing monitoring of a well after a stimulation treatment and to immediately inform DOGGR and the Regional Board of the threshold exceedance(s), conduct diagnostics, and take all appropriate measures to prevent contamination of protected water or loss of hydrocarbon resources.

SB 4 requires that each well operator disclose, within 60 days after a well stimulation treatment is completed, information regarding the source, volume, and composition and disposition of well stimulation fluids, including, but not limited to, hydraulic fracturing fluids, acid well stimulation fluids, and flowback fluids. The disclosures are provided to DOGGR and must be available online in a format that allows for searching and aggregating the information. For operations that do not meet the definition of well stimulation treatment, use of acid or the application of pressure to stimulate the formation must be briefly described and submitted for inclusion in the permanent well file maintained by DOGGR. DOGGR has proposed to maintain a searchable index of those reports so that the public can easily review such information.

As of February 25, 2015, 1,413 well stimulation notices and 633 well stimulation completion disclosures have been filed with DOGGR and posted on applicable websites throughout California, including notices and disclosures in the Project Area (http://maps.conservation.ca.gov/doggr/iwst_index.html and http://www.conservation.ca.gov/dog/Pages/WellStimulationTreatmentDisclosure.aspx).

Senate Bill 1281 (Inventory of Surface Oil and Gas Industry Disposal Sumps and Ponds)

SB 1281, effective January 2015, amended Sections 3226.3 and 3227 of the Public Resources Code to require that (1) DOGGR provide the State Water Resources Control Board with an annual "inventory of all unlined oil and gas field sumps," and (2) well operators provide DOGGR with quarterly information regarding the source and disposition of water produced by or used in oil and gas production in addition to existing obligations to report gas and oil production and produced water information on a monthly basis. The new quarterly reporting requirements include information regarding (a) the source and volume of any water, including produced water (also subject to monthly reporting) used to generate or make up the composition of any injected fluid or gas, identified by water source if more than one water source is used; (b) the volume of untreated water suitable for domestic or irrigation purposes used in oil and gas operations; (c) the treatment of water and the use of treated or recycled water in oil and gas field activities, including, but not limited to, exploration, development, and production; and (d) the specific disposition of all water used in or generated by oil and gas field activities, including water produced from each well as reported in an operator's monthly reports, and separated by volume of disposition if more than one disposition method is used. The first quarterly reports

pursuant to SB 1281 are due to be filed by well operators by June 1, 2015. DOGGR has indicated that the information required by SB 1281 would be published after the close of each quarterly reporting period. SB 1281 and associated water quality regulations are described in further detail in Section 4.9, Hydrology and Water Quality.

Uniform Building Code

The Uniform Building Code (UBC) was first published in 1927 by the International Council of Building Officials, a non-governmental organization. It was intended to promote public safety and provided standardized requirements for safe construction. Updated editions of the code were published every three years until 1997, which was the final version of the code. Since that time, the UBC, published by the ICC since 1997, has been adopted by many jurisdictions, including the State of California, in their building codes. Some jurisdictions continue to refer to the UBC, including Kern County and Bakersfield. The UBC defines different regions of the United States, categorizing them by Seismic Zones 1 through 4, with Zone 1 having the least seismic potential and Zone 4 having the highest seismic potential. The Project Area lies within Seismic Zone 4.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element and the Safety Element of the KCGP include goals, policies, and implementation measures related to geology and soils that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.3. Physical and Environmental Constraints

Policies

Policy 1. Kern County will ensure that new developments will not be sited on land that is physically or environmentally constrained (Map Code 2.1 [Seismic Hazard], Map Code 2.2 [Landslide], Map Code 2.3 [Shallow Groundwater], Map Code 2.5 [Flood Hazard], Map Codes from 2.6 – 2.9, Map Code 2.10 [Nearby Waste Facility], and Map Code 2.11 [Burn Dump Hazard]) to support such development unless appropriate studies establish that such development will not result in unmitigated significant impact.

Policy 2. In order to minimize risk to Kern County residents and their property, new development will not be permitted in hazard areas in the absence of implementing ordinances and programs. These ordinances will establish conditions, criteria, and standards for the approval of development in hazard areas.

Policy 3. Zoning and other land use controls will be used to regulate and, in some instances, to prohibit development in hazardous areas.

Policy 6. Regardless of percentage of slope, development on hillsides will be sited in the least obtrusive fashion, thereby, minimizing the extent of topographic alteration required and reducing soil erosion while maintaining soil stability.

Policy 7. Ensure effective slope stability, wastewater drainage, and sewage treatments in areas with steep slopes are adequate for development.

Implementation Measures

Implementation Measure B. A seismic analysis may be required for those areas in Kern County that are susceptible to landslides.

Implementation Measure E. Development proposed in areas with steep slopes (Map Code 2.4) will be reviewed for conformity to Chapter 19.88, Hillside Development Ordinance, or Chapter 19.52, Special Planning (SP) District, to ensure that appropriate soil stability, drainage, and sewage treatment will result.

Chapter 4. Safety Element

4.3. Seismically Induced Surface Rupture, Ground Shaking, and Ground Failure

Surface Fault Rupture

Surface fault ruptures are designated on the maps in the Seismic Hazard Atlas (available through the County Engineering and Survey Services Department), as well as some faults that are not apparent at the surface. It must be recognized that some faults may not have been recognized, either because the evidence for detecting them has not been preserved or because there has not been enough work in the area to detect their presence. Several atlas maps have a special note to this effect in order to call the users' attention to this lack. It could be said that all maps need additional work because all surface and subsurface information has not been collected and/or analyzed. This statement of fact should not prevent the use of the information that is available. As new geological and geophysical data are collected and analyzed that are pertinent to this study, they should be added to the maps. Known faults must be considered in planning and land use activities. The faults identified as active deserve special consideration. No structure should be built astride an active fault. Utilities that cross such faults, both underground and on the surface, must be designed to remain operable if at all possible after fault movement. The Seismic Hazard Atlas maps show the approximate location of these features. Building permit applications must identify the exact location of proposed structures so that proper evaluation may be accomplished by the building official prior to the issuance of any permits.

Ground Shaking

Kern County is located in one of the more seismically active areas of California and may, at any time, be subject to moderate-to-severe ground shaking. This hazard exists because elastic strains

that accumulate deep within the earth become so great that the rock can no longer be contained. When this happens, movement along a fracture zone occurs, releasing enormous amounts of energy. At any given location, the amount of the resulting shaking motion caused by the sudden movement depends to a large extent on local ground conditions – e.g., the degree of water saturation. In some instances, the shock wave may actually increase in amplitude as it travels away from the source. It may cause greater damage at a location some distance from the actual rupture than at the point of surface displacement.

Ground Failure

Small landslides are common in the County's mountain areas as loose material moves naturally downslope or fires have caused loss of soil-stabilizing vegetative cover. In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground failure. Some of the natural non-seismic causes of ground instability are steam and lakeshore erosion, heavy rainfall, and poor quality natural materials. Human activities contribute to soil instability by grading steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Policies

Policy 1. The County shall require development for human occupancy to be placed in a location away from an active earthquake fault in order to minimize safety concerns.

Implementation Measures

Implementation Measure B. Require geological and soils engineering investigations in identified significant geologic hazard areas in accordance with the Kern County Code of Building Regulations.

Implementation Measure C. The fault zones designated in the Kern County Seismic Hazard Atlas should be considered significant geologic hazard areas. Proper precautions should be instituted to reduce seismic hazard, whenever possible in accordance with State and County regulations.

Implementation Measure G. Route major lifeline components such as highways, utilities, petroleum or chemical pipelines around areas of high groundwater whenever possible. Where they must cross an area of high groundwater, plans, and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure H. Require that plans and permits for installation of major lifeline components such as highways, utilities, petroleum, or chemical pipelines incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of essential services or threat to health and safety.

Implementation Measure I. Design significant lifeline installations, such as highways, utilities, and petrochemical pipelines that cross an active fault to accommodate potential fault movement without prolonged disruption of essential services or creating threats to health and safety.

4.5. Landslide, Subsidence, Seiche, and Liquefaction

Hazard Identification

Landslides

Landslides are shown on the maps in the Seismic Hazard Atlas. Additional landslide areas may subsequently be identified and should be added to these maps. Development in landslide areas is an unwise practice that imposes an unnecessary risk on life and property. The slide-prone area may have reached a state of equilibrium and become stable for a number of years; however, the factors that caused the original slide could recur and cause additional movement. Added moisture injected into the soil by water and sewer systems tends to be detrimental in unstable areas, thus increasing the probability of slides. Landslide-prone areas can be identified with great accuracy by geologic studies and, when mapped in sufficient detail, can be used for reference in land use planning. The severity of landslide problems depends upon the local bedrock and soil conditions, including moisture content, slope, and vegetation. Losses due to landslides can be almost totally eliminated by a combination of geologic investigations, engineering practice, use of hazard area zoning, and effective enforcement of the Zoning and Grading Ordinances.

Land Subsidence

Land subsidence is occurring within the San Joaquin Valley. This type of ground failure can be aggravated by ground shaking. It is most often caused by the withdrawal of large volumes of fluids from underground reservoirs, but it can also occur by the addition of surface water to certain types of soils (hydrocompaction). Subsidence from any cause accelerates maintenance problems on roads, lined and unlined canals, and underground utilities. All new installations in areas suspected of subsidence should be engineered to withstand such subsidence. The usual remedial action is that of raising the water table by injecting water or by reducing groundwater pumpage. This increases the fluid pressure in the aquifer and, in most instances, subsidence decreases or stops after a period of time. Four types of subsidence occur in Kern County.

- Tectonic subsidence, a long-term, very slow sinking of the valley, which is significant only over a geologic time period.

- Subsidence caused by the extraction of oil and gas. This type of subsidence is still too small to be of serious concern. The DOGGR monitors subsidence in oil and gas fields and regulates oil and gas withdrawal and repressurizing of the fields.

- Subsidence caused by withdrawal of groundwater in quantities much larger than replacement can occur, causing a decline of the water level. This type of subsidence is of major concern and should be regulated and reduced, especially in urbanized areas. This

practice has lowered the ground level over a large area south of Bakersfield and in other areas of the County.

- Subsidence caused by hydrocompaction of moisture-deficient alluvial deposits. This is a one-time densification from collapse of the soil structure in near-surface strata where the rainfall or other moisture has not penetrated for a long period of time. Parts of the California aqueduct were constructed through and over hydrocompacted deposits after compaction had occurred through ponding. The areas where hydrocompaction exists and suspect areas should be mapped, studied, and evaluated. Any development on these areas of damaging subsidence requires corrective measures.

Clay Soils

Fine-grained, cohesive clay soils that expand when moisture is added tend to lose their ability to support building foundations. The weight of these structures squeezes the water-saturated clays laterally from under the foundations. A soils report, prepared by a soils engineer, should be required for every new building permit in suspect areas. This report should be based upon adequate test borings, excavations, and soil and chemical tests; approved by the Building Official; and should include recommendations for corrective measures when necessary. The Building Official may waive the requirement for a soils report if it is determined there is adequate information on the soil qualities of a particular lot available for review by DOGGR.

Liquefaction

Liquefaction can occur in certain types of soils that are associated with a shallow water table. It has been observed in many areas of the world that ground shaking produced by earthquakes tends to cause liquefaction to the extent that buildings have fallen over on their sides due to the lack of ground support. Some buildings designed to withstand earthquake shock waves, have been deemed inhabitable due to earthquake-triggered liquefaction. The building designs were adequate but the foundations failed because liquefaction occurred during an earthquake. The CDOC has mapped liquefaction hazard areas in Los Angeles County. Near Rosamond, the liquefaction hazard extends to the Kern County border.

Erosion

Erosion is the general process whereby the materials of the earth's crust are worn down, removed by weathering, and deposited in other places by water or air. Losses due to erosion can be greatly reduced by a properly engineered design, construction, and effective enforcement of regulations relative to grading, landscaping, and drainage (Uniform Building Code). Lakeshore erosion via wave action is a special problem but can be practically eliminated by proper engineering, construction, and soil stabilization through vegetative cover. Within urbanized areas, the major cause of erosion is from the continued need to remove sediment from drainage systems and basins. Erosion induced by seismic activity occurs on gentle-to-steep slopes covered by loose sediments. Fissures, steep slopes, and offsets along a fracture zone may enhance seismically induced erosion. It could become a significant hazard in many areas of the

County. A flood management program should provide protection against this type of geologic hazard.

Seiche

A seiche is a standing wave in an enclosed or partly enclosed body of water. Seiches are normally caused by earthquake activity and can affect harbors, bays, lakes, rivers, and canals. In the majority of instances, earthquake-induced seiches do not occur close to the epicenter of an earthquake but hundreds of miles away because earthquake shock waves close to the epicenter consist of high-frequency vibrations, while those at much greater distances are of lower frequency, which can enhance the rhythmic movement in a body of water. The biggest seiches develop when the period of the ground shaking matches the frequency of oscillation of the water body; seiches create a "sloshing" effect on bodies of water. This effect can damage anchored boats, piers, and facilities close to the water. Secondary problems, including landslides and floods, are related to accelerated water movements and elevated water levels.

Policies

Policy 1. Determine the liquefaction potential at sites in areas of shallow groundwater (Map Code 2.3) prior to discretionary development and determine specific mitigation to be incorporated into the foundation design, as necessary, to prevent or reduce damage from liquefaction in an earthquake.

Policy 2. Route major lifeline installations such as highways, utilities and petrochemical pipelines that cross an active fault around potential areas of liquefaction or otherwise protect them against significant damage from liquefaction in an earthquake.

Policy 3. Reduce the potential for exposure of residential, commercial, and industrial development to hazards of landslide, land subsidence, liquefaction, and erosion.

Implementation Measures

Implementation Measure B. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation design to mitigate potential damage to buildings on sites with liquefaction potential.

Implementation Measure C. Develop and maintain maps, at an appropriate scale, showing the location of all geologic hazards, including active faults, Alquist-Priolo Earthquake Fault Zones, 100-year flood hazard boundary, the extent of projected dam failure inundation and time arcs, depth of inundation, land subsidence, slope failure and earthquake-induced landslides, high groundwater, and liquefaction potential.

Implementation Measure D. Discretionary actions will be required to address and mitigate impacts from inundation, land subsidence, landslides, high groundwater areas, liquefaction and seismic events through the CEQA process.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to geology and soils.

Chapter V. Conservation Element

C. Soils and Agriculture

Seismic Goals and Policies

Goals:

Goal 2. Promote soil conservation and minimize development of prime agricultural land as defined by the following criteria:

- Capability Class I and/or II irrigated soils
- 80-100 Storie Index rating
- Gross crop return of $200 or more per acre per year
- Annual carrying capacity of 1 animal unit per acre per year

Goal 3. Establish urban development patterns and practices that promote soil conservation and that protect areas of agricultural production of food and fiber crops, and nursery products.

Policies

Policy 7. Land use patterns, grading, and landscaping practices shall be designed to prevent soil erosion while retaining natural watercourses when possible (I-4).

Policy 12. Prohibit premature removal of ground cover in advance of development and require measures to prevent soil erosion during and immediately after construction (I-4).

Chapter VIII. Safety Element

A. Seismic Safety

Overview of Existing Conditions

A detailed overview of existing conditions summarizing physiographic setting, hydrologic features, and geologic features, including faults, is presented in the Metropolitan Bakersfield General Plan.

Seismic Hazards

The south end of the San Joaquin Valley is bordered by major, active fault systems, making Bakersfield a historically active seismic area of California. These fault systems are the San Andreas, Breckenridge, Kern Canyon, Garlock, and White Wolf faults. Active faults capable of causing damage to the Bakersfield area are summarized in Table VIII-1 and illustrated in Figure VIII-1 of the Metropolitan Bakersfield General Plan. Seismic hazards are discussed below.

Strong Ground Shaking

The principal seismic hazard affecting the planning area is the potential for strong ground shaking from any of the four major faults in the region. The most vulnerable structures in an earthquake are the unreinforced masonry buildings in Bakersfield, which were built before seismic codes were first instituted in the city and county. Other building types that may pose substantial hazards in an earthquake include pre-cast concrete tilt-up buildings and predominantly multi-story buildings of non-ductile concrete frame and composite pre-cast concrete construction.

The Uniform Building Code was revised in 1998 to:

- Upgrade the level of ground motion used in the seismic design of buildings;
- Add site amplification factors based on local soils conditions; and
- Improve the way ground motion is applied in detailed design.

SB 547, enacted in 1986, required local jurisdictions to inventory existing unreinforced masonry buildings and develop structural hazards reduction programs for such buildings by January 1, 1990. A complete inventory of unreinforced masonry buildings was completed and the city conducted a seismic retrofit construction program after 1990. The County has performed a similar inventory and notified owners of the status of their buildings.

Fault Rupture

The Alquist-Priolo earthquake fault zones shown in detail on the Alquist-Priolo Earthquake Fault Zone Maps on file with the City of Bakersfield and Kern County have been designated by the state as areas where planning should consider the possibility of fault rupture along specific active or potentially active faults. Special studies are required prior to building structures for human occupancy within earthquake fault zones. Active faults may potentially exist outside

these zones. For critical and important developments proposed outside of these zones, additional fault investigation may be necessary.

Liquefaction

Liquefaction is a transformation of a granular material from a solid state into a liquefied state as a consequence of increased pore-water pressures. Areas of high groundwater are at a greater risk for liquefaction of soils during a major earthquake due to the settling of the foundations of homes, buildings, irrigation equipment, roads, and freeways. High groundwater is known to exist at depths of 5 to 15 feet bgs on portions of the Lamont quadrangle at R 28 E, T 30 S. This area, in south Bakersfield between about Brundage Lane and DiGiorgio Road (Figure VIII-2 of the Metropolitan Bakersfield General Plan), could experience local areas of liquefaction during a strong earthquake, with attendant ground rupture and potential sinking or tilting of large buildings. Areas of high groundwater are rare elsewhere in the area.

Earthquake-Induced Landslides

A strong earthquake could trigger landslides or slope failures on steeper slopes in the foothills and along the Kern River Canyon and floodplain. The common types of landslides induced by earthquakes are bluff and stream bank failures, rock falls, and soil slips on steep slopes. Deep-seated landslides are not necessarily reactivated in an earthquake.

Other Geologic Hazards

Landslides

Slopes subject to failure within the Bakersfield area are predominantly found along the river terraces, bluffs, and foothills to the northeast and east of the city. Investigations to date have documented two landslides in the foothills northeast of the city. Only limited exposure to landslides is predicted for the urban areas of Bakersfield because of constraints on slope-side development. Some construction, however, on sloping terrain could inadvertently trigger landslides unless appropriate precautions are use on a site-specific basis.

Land Subsidence

Land subsidence is the gradual, local settling or sinking of the earth's surface with little or no horizontal motion. Subsidence is normally the result of gas, oil or water extraction, hydrocompaction, or peat oxidation, not the result of landslide or ground failure. The southern part of the planning area has been undergoing gradual land subsidence, with up to 4 feet of subsidence over a 40-year period. Although subsidence is not considered a significant hazard, wells, foundations, and underground utilities may be damaged.

Issues

The following issues have been identified regarding geologic and seismic hazards:

- The planning area is susceptible to moderate to extreme ground shaking from a number of seismic sources in the region.

- The eastern part of the planning area contains an active fault, the White Wolf fault, which has been designated by the State as an Alquist-Priolo earthquake fault zone.
- An area of high ground water in the southern part of the planning area may be subject to liquefaction in an earthquake.
- More information is needed on the geographic extent of high groundwater.
- In the event of an earthquake, unacceptable risks to public health and safety can occur if sufficient standards are not incorporated into the design of critical facilities

Goals

Goal 1. Substantially reduce the level of death, injury, property damage, economic, and social dislocation and disruption of vital services that would result from earthquake damage.

Goal 2. Ensure the availability and effective response of emergency services following an earthquake.

Goal 3. Prepare the planning area for effective response to, and rapid, beneficial recovery from, an earthquake.

Goal 4. Prevent loss of life from the failure of critical facilities in an earthquake and ensure the continued functioning of essential facilities following a disaster.

Goal 5. Protect essential lifelines and prevent casualties and major social and economic disruption due to liquefaction in an earthquake.

Goal 6. Provide a continuously improving data base and reference source for evaluation of seismic and geologic hazards.

Goal 7. Protect land uses from the risk of dam failure inundation, including assurances that the functional capabilities of essential facilities are available in the event of a flood; hazardous materials are not released; effective measures for mitigation of dam failure inundation are incorporated into the design of critical facilities; and the rapid and orderly evacuation of populations in the inundation area will occur.

Policies

Fault Rupture Policies

Policy 10. Prohibit development designed for human occupancy within 50 feet of a known active fault and prohibit any building from being placed astride an active fault (I-14, I-15).

Policy 11. Require site-specific studies to locate and characterize specific fault traces within an Alquist-Priolo Earthquake Fault Zone for all construction designed for human occupancy (I-13).

Policy 12. Design significant lifeline installations such as highways, utilities and petrochemical pipelines that cross an active fault, to accommodate potential fault movement without prolonged disruption of an essential service or creating a threat to health and safety (I-16).

Liquefaction Policies

Policy 13. Determine the liquefaction potential at sites in areas of high groundwater prior to development and determine specific mitigation to be incorporated into the foundation design, as necessary to prevent or reduce damage from liquefaction in an earthquake (I-17 through I-19).

Policy 14. Route major lifeline installations around potential liquefaction areas or otherwise protect them against significant damage from liquefaction in an earthquake (I-20).

Information Policies

Policy 15. Compile information on areas of potential hazards and field information developed as part of CEQA investigations and geologic reports and keep geologic reviews and policy development current and accessible for use in report preparation (I-21, I-22, I-23, I-25).

Policy 16. Encourage and support local, state and federal research program for delineation of geologic and seismic hazards so that acceptable risk may be continually reevaluated and kept current with state-of-the-art information and contemporary values (I-24).

Dam Failure Inundation Risk Policies

Policy 18. Design discretionary critical facilities located within the potential inundation area for dam failure in order to mitigate the effects of inundation on the facility; promote orderly shut-down and evacuation (as appropriate); and prevent on-site hazards from affecting building occupants and the surrounding communities in the event of dam failure (I-26).

Policy 19. Design discretionary facilities in the potential dam inundation area used for the manufacture, storage or use of hazardous materials to prevent on-site hazards from affecting surrounding communities in the event of inundation (I-27).

Policy 20. Require emergency response structures that are within the plan area and are subject to Building Department review to adhere to the most current seismic standards adopted as part of the Uniform Building Code.

Implementation Measures

Implementation Measure 2. Require detailed site studies for ground shaking characteristics, liquefaction potential, dam failure inundation and flooding potential, and fault rupture potential as background to the design process for critical facilities under city and County discretionary approval.

Implementation Measure 3. Require structures that are within the plan area and are subject to Building Department review to adhere to the most current seismic standards adopted as part of the UBC.

Implementation Measure 16. Require plans and permits for installation of major lifeline components such as for highways, utilities, and petroleum or chemical pipelines to incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure 17. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation designs to mitigate potential damage to buildings on sites with liquefaction potential.

Implementation Measure 18. Develop specific guidelines for the collection of data for determination of liquefaction potential at a site.

Implementation Measure 20. Route major lifeline components such as highways, utilities and petroleum or chemical pipelines around areas of high groundwater wherever possible. Where an area of high groundwater must be crossed, plans and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure 21. Compile maps showing the location of all geologic hazards, including active faults, Alquist-Priolo earthquake fault zones, 100-year flood hazard, extent of projected dam failure inundation and time arcs, depth of inundation, land subsidence, slope failure and earthquake-induced landslides, high groundwater and liquefaction potential.

Implementation Measure 22. Compile information on areas of potential hazard. Field information developed as part of CEQA investigations and geologic reports by the city/county geologists should be kept current and accessible for use in report preparation, geologic reviews, and policy development.

Implementation Measure 23. Update the County's Seismic Hazards Atlas as necessary.

Implementation Measure 24. Encourage and support local, state, and federal research programs for delineation of geologic and seismic hazards so that acceptable risks may be continually reevaluated and kept current with state-of-the-art information and contemporary values.

Implementation Measure 26. Develop procedures for the discretionary review of critical facilities proposed in an area of potential dam inundation. Approvals shall include requirements that emergency shut-down and facility evacuation plans be developed, maintained, and exercised for each facility, and the potential effects of inundation on essential facility functions and the safety of occupants and the community in general are addressed.

Implementation Measure 27. Facilities used for the manufacture, storage, or use of hazardous materials shall comply with the uniform fire code, with requirements for siting or design to prevent on-site hazards from affecting surrounding communities in the event of inundation.

Implementation Measure 28. Incorporate specific plans for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans.

Implementation Measure 29. Maintain effective disaster response and earthquake response plans and update on a regular basis.

Implementation Measure 30. Require the city and county to maintain effective mutual aid agreements for fire, police, medical response, emergency morgue, mass care, heavy rescue, and other functions as appropriate

Implementation Measure 31. Require emergency response plans and disaster exercise scenarios to include contingencies for the problems listed below; earthquake response exercises shall be conducted at least once a year.

- Rupture of any active fault within 40 miles of Bakersfield.
- Collapse of 50 buildings or more, including some mid-rise structures, some essential facilities, and numerous un-reinforced masonry buildings.
- Ground rupture and attendant property damage due to pockets of liquefaction in areas of high groundwater.
- Complete evacuation of the potential inundation area.
- Many aftershocks, continuing for many weeks or months.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3 in the Land Use and Planning section, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County Code of Building Regulations – Title 17

All construction in Kern County is required to conform to the Kern County Building Code (Chapter 17.08, Building Code, of the Kern County Code of Regulations). Kern County has adopted the CBC, 2010 Edition, with some modifications and amendments. The entire County is in Seismic Zone 4, a designation previously used in the UBC to denote the areas of highest risk to earthquake ground motion. California has established an Unreinforced Masonry program that details seismic safety requirements for Zone 4. Seismic provisions associated with Seismic Zone 4 have been adopted.

According to the Kern County Code of Building Regulations "Section 17.08.060 Section 105.2 amended – Work exempt from permit," building permits shall not be required for the accepted oilfield activities listed below. The exemption does not apply where construction is part of a processing plant, refinery, cogeneration facility, or other similar activities as determined by the building official:

a. Tanks that meet American Petroleum Institute (API) or American Water Works Association (AWWA) standards and are supported directly upon grade (grade being the final ground surface elevation of the site prior to installation of the tank) with associated foundations if the ratio of height to diameter or width in the shortest direction does not exceed two to one. This also includes the associated equipment such as piping, walkways, stairs, guardrails, handrails and ladders which are covered by the Occupational Safety and Health Administration (OSHA).

b. Processing equipment and pressure vessels which meet API, American Society of Mechanical Engineers (ASME), or ANSI standards and are supported directly upon grade (grade being the final ground surface elevation of the site prior to installation of the equipment or vessel) with associated foundations if the ratio of height to width in the shortest direction does not exceed one and one-half to one. This also includes the associated equipment such as piping, walkways, stairs, guardrails, handrails and ladders which are covered by OSHA.

c. Miscellaneous equipment that meets API, ASME, or ANSI standards and is mounted on skids or supported on flanges. Placement of this equipment on an at-grade concrete slab or similar foundation, without attaching it to resist uplift or overturning is considered part of the exempted activity.

d. Flatwork or non-supporting concrete slabs.

e. One-story detached accessory buildings that do not contain a work station and are used as storage sheds, or, typically, unattended control or electrical enclosures or gauging sheds, provided the floor area does not exceed 120 square feet (11 square meters).

f. Oil derricks, artificial lift equipment, and associated foundations.

g. Pipe racks and associated foundations, if the structure height does not exceed 8 feet (2,438 millimeters).

h. Process piping.

i. Oilfield containment walls not over 4 feet (1,219 millimeters) measured from the bottom of the footing to the top of the wall.

Exemption from a building permit does not abrogate the responsibility for obtaining clearance or permits from any other entity having jurisdiction over oilfield activities. Construction of new or modifications to existing office buildings or any buildings intended for human occupancy are

not exempt. HVAC replacements, or any other electrical or mechanical alteration or replacement that are subject to the California Energy Efficiency Standards are not exempt.

Chapter 17.28 of Kern County Grading Code

The purpose of the Kern County Grading Code is to safeguard life, limb, property, and the public welfare by regulating grading on private property. In accordance with paragraph 11 of subsection 17.28.040(B) of the Kern County Grading Code, grading permits are not required for oilfield activities related to oilfield drilling, such as oilfield roads, drilling pads, and sumps used for drilling mud, and grading required for the setting of production equipment.

All requirements of the Kern County Grading Code will be applied during implementation of the project. Any required grading permit(s) for auxiliary facilities (i.e., buildings meant for human occupancy or auxiliary facilities requiring a grading permit under the Kern County Building Code) shall be obtained prior to commencement of construction activities.

4.6.4 Impacts and Mitigation Measures

This section describes the methodology used in conducting the CEQA impact analysis for geology and soils; the thresholds of significance used in assessing impacts on geology and soils; and the assessment of impacts on geology and soils, including relevant Mitigation Measures.

Methodology

The analysis in this section is largely based on Volume 1, Soil and Geology Study Amendment to Title 19 – Kern County Zoning Ordinance, focused on Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance for Oil and Gas Local Permitting Kern County, California, prepared by BSK in January 2015 (BSK 2015). The scope of tasks for this Phase I study included a review of available published references to collect available information on soils and geology, mineral resources, and induced seismicity for the proposed Amendments to Kern County Zoning Ordinance.

This section describes the potential geology and soils impacts associated with development of the Project. This analysis first established baseline conditions for the affected environment relevant to geology and soils, as presented above in Section 4.6.3, Environmental Setting.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving
  - Rupture of a known earthquake fault
  - Strong seismic ground shaking,

  - Seismic-related ground failure, including liquefaction, or
  - Landslides
- Result in substantial soil erosion or the loss of topsoil;
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in onsite or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse;
- Be located on expansive soil, as defined in Table 18-1-B of the UBC (1994), creating substantial risks to life or property; and
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems in areas where sewers are not available for the disposal of wastewater.

Based on these standards, the effects of the project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

Impact 4.6-1: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving the Rupture of a Known Earthquake Fault

The Project Area is located in a seismically active area containing active fault systems. This includes such fault systems as the San Andreas fault system located near the western portion of the Project Area. An expression of seismic faults may include a surface rupture, which are the result of movement along an existing fault, which breaks the land surface.

Induced Seismicity. Project activities including high volume hydraulic fracturing and injection of waste water from drilling activities have the potential to induce seismicity. Hydraulic fracturing by its very nature (injection of high pressure fluid to fracture rock formations) physically affects the geologic formations and may generate seismic events. However, these seismic events have a relatively low magnitude (<2.0) and are not "felt" events. Larger events are possible in areas where faults are present. However, only one felt earthquake attributed to hydraulic fracturing in an oil and gas field has been documented. In 2011, hydraulic fracturing was identified as the likely source of induced seismicity in a test well in Lancashire, England. Earthquakes of magnitude 2.3 and 1.4 were reported on April 1 and May 27, 2011 (de Pater and Baisch 2011). The induced seismicity was the result of intersecting an unknown fault. Therefore, the potential for hydraulic fracturing to cause felt induced seismic events is considered to be low unless hydraulic fracturing occurs in active fault zones which may result in a felt seismic event. Outside active fault zones, although it is anticipated that over 1,000 wells would be hydraulically fractured per year, significant induced seismicity is not anticipated.

Induced seismicity may also be caused by deep wastewater injection. This was first observed in a Colorado injection well drilled in 1961 (USGS 2015a). Most recently, waste water injection has resulted in seismic activity in north Texas and in eastern Ohio (Weingarten et al. 2015). In 2011, wastewater injection in Youngstown Ohio may have contributed to a series of earthquakes with the largest earthquake measuring a magnitude of 4.0 (Fountain 2012). However, as discussed above, wastewater injection in California occurs at much shallower depths (4,700 to 7,700 feet) than in other parts of the U.S. and the volume of wastewater injected in California is about four times less than wells in other locations where induced seismic events have occurred. The seismogenic zones at which rocks are sufficiently rigid to accumulate stress and cause significant earthquakes are relatively deep in California and significantly deeper than the oil and gas development and wastewater disposal zones. In addition, more oil and gas production in California occurs in sedimentary basins that are less susceptible to induced seismicity from wastewater injection as compared to injection into fractured hard rock. Moreover, in California, injection wells have been in use for more than 50 years, with 42,000 oilfield injection wells currently operating, and seismicity rates have remained relatively constant for the last 77 years. Thus, the seismic hazard related to current wastewater injection practices in California is low (BSK 2015).

Ground Shaking. Strong seismic activity could damage current and/or future oil and gas exploration and production activities, such as drilling, well stimulation, and EOR. In addition, well and production infrastructure could be damaged resulting in the degradation of well casing or seals, as well as plugs of abandoned wells. Pipelines transporting oil, gas, waste gas, and/or produced could crack and begin to leak. Damage to active or abandoned well could result in the leakage to underground formations. Although the 2014 CCST study on advanced well stimulation technologies in California indicated that well failure, or blowout rates in the Project Area have been significantly reduced over time by improved well construction technologies, a significant ground shaking event could still potentially cause well failure or other damage to Project-related infrastructure.

In addition, future oil and gas exploration and production activities that would be authorized under the Project would involve the installation of buildings and infrastructure that could be occupied by people. As per the Alquist Priolo earthquake law and Metropolitan Bakersfield General Plan, structures intended for human occupancy cannot be located on or within 50 feet of the confirmed location of an active fault trace. All Project-related permanent facilities would have to be designed and built to California Building Code standards that take into account seismic activity. Although building codes would have to be implemented in the infrastructure, there would still be a risk of impacts associated with project activities resulting in the rupture of a known earthquake fault and, therefore, impacts could be significant.

Mitigation Measures

MM 4.6-1 Prior to beginning a ground disturbance activity, the Applicant shall comply with the following regulations (as applicable) and confirm compliance in its Site Plan Conformity Review application documentation:

a. Alquist-Priolo Earthquake Fault Zoning Act.

b. California Building Code.

c. Division of Oil Gas and Geothermal Resources regulations, as identified in the California Code of Regulations, Title 14, Division 2, Chapter 4, including regulations implementing Senate Bill 4 as applicable. If hydraulic fracturing is conducted for any well associated with the Site Plan Conformity Review, the Applicant shall comply with requirements to monitor the California Integrated Seismic Network for indication of an earthquake of magnitude 2.7 or greater for the period of 10 days following the end of hydraulic fracturing. The earthquake search radius shall be consistent with Division of Oil Gas and Geothermal Resources Senate Bill 4 regulations. The data will be submitted to Division of Oil Gas and Geothermal Resources for an evaluation of the risks and actions consistent with the Division of Oil Gas and Geothermal Resources Senate Bill 4 regulations.

d. Additionally, the Applicant shall:

1. Avoid placement of structures intended for human occupancy on or within 50 feet of any active faults designated and mapped pursuant to the Alquist-Priolo Earthquake Fault Zoning Act where the fault breaks the surface.

2. Have a professional geologist prepare a fault rupture hazard evaluation according to guidelines in California Geological Survey Special Publication 42, 2007 for new developments with structures that are intended for human occupancy.

3. All Class II injection wells shall be authorized, and shall comply with all applicable legal requirements, Underground Injection Control Program Approval permit conditions, and be operated according to the California Code of Regulations Title 14 requirements, as described in the mitigation measures for Hydrology and Water Quality.

4. Ensure that active fault trace placement restrictions are in place for all permanent tanks and storage reservoirs used to store, treat, or transport hazardous materials or materials that are considered pollutants to surface water and groundwater, located in an Earthquake Fault Zone.

Ensure that all pipelines designated for the transportation of hazardous materials are engineered and constructed in compliance with the requirements of the pipeline safety regulations, 49 Code of Federal Regulations Parts 192 and 195.f) Ensure that all new pipelines designated for or water used for fire suppression are engineered and constructed in compliance with the requirements of California Building Code Chapter 9, Fire Protection Systems, and the California Fire Code to address potential fault rupture displacements.

MM 4.6-2 All structures designed for human occupancy shall be designed to withstand substantial ground shaking in accordance with applicable California Building Code seismic design standards and Kern County Building Code.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-2: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Strong Seismic Ground Shaking

As discussed above, project activities of hydraulic fracturing and deep wastewater injection have the limited potential to induce seismic activity. However, there are no cases where strong seismic shaking (>4.0) have occurred as a result of induced seismicity. In California, there is limited case history with respect to induced seismicity from hydraulic fracturing or historical wastewater injection. The National Academy of Sciences found that the "potential for felt seismicity due to secondary recovery and EOR is low" and that hydraulic fracturing as presently implemented "does not pose a high risk for inducing felt seismic events" in California (NAS 2013). In addition, the California Council on Science and Technology concluded: "Current hydraulic fracturing activity is not considered to pose a significant seismic hazard in California" (CCST 2014). Even in other areas of the country, where induced seismicity from hydraulic fracturing and wastewater injection has occurred, the seismic events have not exceeded levels that would damage structures.

Significant impacts would occur if the magnitude of earthquakes from strong ground shaking rose to a level that could cause damage to structures or facilities. However, to minimize the effects to people, DOGGR regulates operation of injection wells. Over-pressuring of injected zones is controlled by operating all injection wells according to CCR Title 14, Division 2, Chapter 4, Subchapter 1, Article 3 Requirements.

Mitigation Measures

Implement MM 4.6-1 and MM 4.6-2, as described above.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-3: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Seismic-Related Ground Failure, Including Liquefaction

Liquefaction occurs when saturated, loose materials are weakened and transformed from a solid to a near liquid state due to increased pore water pressure caused by strong ground motion from an earthquake. As discussed above, project activities such as hydraulic fracturing and deep waste water injection are unlikely to cause induce strong seismic events and their impact is considered a less than significant. However, naturally occurring earthquakes have the potential to cause liquefaction and cause damage to structures. Liquefaction generally can occur in areas of high groundwater (<50 feet) and fine sandy or silty soils and typically consist of more recent Holocene deposits. In the Project Area, areas of high groundwater are located mainly in the northwest portion and southern tip of the Central Subarea and east-central and southeast portions of the Western Subarea. Most of the deposits in the Project Area tend to be more recent deposits. Although impacts from liquefaction have been observed from many major earthquakes around

the world including the 1964 earthquakes in China and Alaska, the Christchurch, New Zealand earthquake in 2011, and more recently, the 2015 earthquake in Nepal, the Project is not expected to be the cause of any significant seismic events, and thus, the liquefaction potential from any project activities is low. Impacts could be significant; however, implementation of MM 4.6-1 and MM 4.6-2 would further reduce the potential for adverse effects as a result of liquefaction; therefore, the impact would be less than significant with mitigation.

Impacts to the Project as a result of ground failure are discussed in Impact 4.6-1.

Mitigation Measures

Implement MM 4.6-1 and MM 4.6-2, as described above.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-4: Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Landslides

Landslides occur due to a number of natural and man-made factors. In general, most landslides occur in connection with other major natural disasters such as earthquakes, volcanic eruptions, wildfires, and floods. Landslides also are caused by other factors such as strength of underlying material surface and groundwater conditions, surface vegetation, seasonal rainfall (i.e., soil saturation), and areas of steep slopes (generally greater than 30%). They can also occur from anthropogenic practices such as vegetation removal. Landslides caused by project activities are not expected as the area of disturbance for each well pad is relatively small (< 3 acres).

As stated above, the Project Area is located in a seismically active area containing several active fault systems; however, volcanic activity is not likely. Wildfires and flooding can occur in localized areas, therefore, the potential for landslides in the Project Area may exist if the other factors are present (steep slopes, ground saturation, and lack of vegetation).

As shown in Figure 4.6-10, the only area of high landslide incidence (where 15% of the area is involved in landsliding), is the southern border of the Project Area (Western, Central, and Eastern Subareas), typically in areas with steep slopes. Development in this area could result in potentially significant adverse effects to people and property in this area; however, it is likely that oil and gas development would not occur on these steep slopes and therefore unlikely that oil and gas activities would induce landslides if these areas would be avoided.

Mitigation Measures

MM 4.6-3 Operators shall avoid siting structures on slopes greater than 30% unless the Applicant determines that mineral recovery is infeasible from a different location, and site-specific Professional Engineering certification is submitted concluding that the new equipment will not cause landslides.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-5: Result in Substantial Soil Erosion or the Loss of Topsoil

Soil erosion is caused by a number of factors including: lack of vegetation/roots to bind the soil (from farming, overgrazing, other development); steep slopes and long slope lengths, poor farming practices, catastrophic weather events, everyday water and wind erosion, as well as other anthropogenic influences. In the Project Area, soils with high water erosion factors occur in 44% of the Western Subarea, 49% of the Central Subarea, and 12% of the Eastern Subarea and soils with high wind erosion factors occur in 49%, 38%, and 47%, respectively. Only a small percentage (7%, 0%, and 8%, respectively) exhibit areas with significant slope lengths. Project activities that would involve earth movement include constructing roads to a well site, grading a well pad, constructing pits/sumps, trenching for pipelines, and other excavations. Disturbed areas have a high potential for either wind or water driven erosion. Well pads are expected to have a small 1 to 5 acre footprint. The potential for erosion would be greatest in portions of the Project Area where there are both the high erosion factors and significant slope lengths. In these areas, there could be substantial soil erosion or topsoil loss, resulting in significant adverse effects. Erosion control measures would be necessary to reduce potential for soil erosion.

Mitigation Measures

Implement stormwater mitigation measures, described in Section 4.9, Hydrology and Water Quality.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-6: Be Located on a Geological Unit or Soil that is Unstable, or that Would Become Unstable as a Result of the Project, and Potentially Result in Onsite or Offsite Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse

Portions of the Eastern and Western Subareas in the foothill area have sufficiently steep slopes that may potentially expose structures to slope instability or landslides that could cause significant damage or collapse. Grading or construction activities that alter the slope gradient or add loads to slopes could potentially cause slope instability and failure resulting in damaging structures. Structures built on potentially unstable slopes could result in a potentially significant impact. In addition, structures built on liquefiable soils could collapse or be significantly deformed causing structural collapse or be damaged such that the structural integrity is compromised. This would be considered a potentially significant impact. Differential settlement of soils from hydrocompaction of near surface soils that may result in damage to Project-related

structures placed on susceptible soil would be a potentially significant impact. Subsidence due to oilfield fluid withdrawal activities (water withdrawal) could be a potentially significant impact.

Mitigation Measures

Implement MM 4.6-3 and MM 4.6-4, as described above, and the following:

MM 4.6-4 The Applicant shall confirm compliance with, and shall implement, a Division of Oil Gas and Geothermal Resources approved re-pressuring plan as required by Division 3, Chapter 1, Article 5.5 of the Public Resources Code, commencing with Section 3315. In developed areas where subsidence is confirmed or suspected, subsidence monitoring shall be required using Synthetic Aperture Radar studies and/or other methods as approved by the Division of Oil Gas and Geothermal Resources to quantify and evaluate the potential effect on the area.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-7: Be Located on Expansive Soil, as Defined in Table 18-1-B of the Uniform Building Code (1994), Creating Substantial Risks to Life or Property

Structures built on soils with high swelling potential may experience shifting, cracking, and breaking damage as these soils expand and contract Thus, soils that are predominantly clay or have high clay content are considered potentially expansive. As discussed above in the Potential Geologic Hazards subsection, 54% of the Western Subarea, 39% of the Central Subarea, and 40% of the Eastern Subarea contain soils with expansive potential. Therefore, structural damage to project infrastructure due to inadequate soil and foundation engineering or the placement of oil and gas structures directly on expansive soils could cause potentially significant impacts.

Mitigation Measures

MM 4.6-5 The Applicant shall avoid building infrastructure on expansive soils unless the Applicant determines that mineral recovery is infeasible from a different location, and site-specific Professional Engineering certification is submitted concluding that the new equipment will not cause substantial risks to life or property.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

Impact 4.6-8: Have Soils Incapable of Adequately Supporting the Use of Septic Tanks or Alternative Wastewater Disposal Systems Where Sewers are not Available for the Disposal of Wastewater

Potential project activities such as installation of oil and gas well, construction of pipelines and other oilfield related jobs may require the housing of temporary employees or an increase in

permanent residents requiring residential structures. While well pad activities would generally utilize portable sanitation units, company structures offices and any temporary housing may require the use of septic systems where public water systems would not be available. The placement of septic systems in areas of slow to very slow infiltration rates may cause adverse impacts to soils and soil stability including areas of saturated soil. There are areas of slow to very slow infiltration rates within the Project Area, typically in upland areas along the perimeter of the Project Area and in some instances in the Central Subarea. Most of the Project Area has high to moderate infiltration rates. Thus, the installation of septic systems in soils with slow to very slow infiltration rates could have significant impacts; however, all new septic system installations require permitting from the County to restrict such impacts.

Future oil and gas exploration and production activities could result in a need for temporary housing for workers. This increase in residential structures could have an impact on soils incapable of adequately supporting the use of septic tanks. Wastewater disposal from temporary housing and from oil and gas production activities could also impact soils and soil stability. All new septic system installations require permitting from the County, therefore, such impacts would be less than significant.

Mitigation Measures

Implement MM 4.6-1, as described above.

Level of Significance After Mitigation

The impact would be less than significant after mitigation.

4.6.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to geologic and soil resources includes the area within six miles of the external Project Area boundary, and areas (e.g., incorporated cities) within the Project Area. While projects in a larger area may affect some of the same resources as the Project, by focusing on projects within the Project Area and six miles outside of the Project Area, the analysis of cumulative impacts can be made on those projects that would most comparably affect the same resources as the Project.

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7, of Chapter 3, Project Description. Implementation of these plans and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions within with each related project is located. This includes compliance with the environmental review requirements of the CEQA and/or the National Environmental Policy Act (NEPA). Should potential geologic and soil-related impacts be identified, appropriate mitigation would be prescribed.

Impact 4.6-9: Cumulative Impacts to Geologic and Soil Resources

Proposed oil and gas production development in the Project Area would alter landforms through activities such as site grading and road construction. In addition, hydraulic fracturing and deep waste water injection may cause low level induced seismicity, but not at a level that would be expected to result in structural damage. Cumulative impacts may occur if multiple seismic inducing activities occurred simultaneously. However, for reasons stated above, although it is anticipated that over 1,000 wells will be hydraulically fractured annually, significant induced seismicity has not been observed and is not anticipated. In addition, although in California, injection wells have been in use for more than 50 years, with 42,000 oilfield injection wells currently operating, seismicity rates have remained relatively constant for the last 77 years and are not anticipated to change. Under these circumstances, oil and gas activities are unlikely to induce multiple seismic events at a level that would cumulatively cause significant damage. Therefore, the contribution of Project-related activities to cumulative impacts on geologic resources and soils would be less than significant.

Naturally occurring impacts to soils and geology, such as naturally occurring earthquakes, may also expose workers and structures to geologic hazards that could result in cumulatively considerable or significant impacts. In these instances, conducting mitigation measures described above would result in cumulative impacts that are less than significant. Prior to beginning project activities, the Applicant would have to comply with all appropriate rules, mitigation measures, and regulations as described above.

Mitigation Measures

Implement MM 4.6-1 through MM 4.6-5, as described above.

Level of Significance After Mitigation

Cumulative impacts from project activities would be less than significant after mitigation

Geologic Legend

- E: Shale, sandstone, conglomerate, and minor limestone; in part Oligocene and Paleocene.
- Ep: Sandstone, shale, and conglomerate; mostly well consolidated
- J: Shale, sandstone, minor conglomerate, chert, slate, limestone; minor pyroclastic rocks
- KJf: Franciscan complex: Cretaceous and Jurassic sandstone with smaller amounts of shale, chert, limestone, and conglomerate. Includes Franciscan melange, except where separated--see KJfm.
- Kl: Lower Cretaceous sandstone, shale, and conglomerate
- Ku: Upper Cretaceous sandstone, shale, and conglomerate
- M: Sandstone, shale, siltstone, conglomerate and breccia; in part Pliocene and Oligocene.
- Mc: Sandstone, shale, conglomerate, and fanglomerate; in part Pliocene and Oligocene.
- Mzv: Undivided Mesozoic volcanic and metavolcanic rocks. Andesite and rhyolite flow rocks, greenstone, volcanic breccia and other pyroclastic rocks; in part strongly metamorphosed. Includes volcanic rocks of Franciscan Complex: basaltic pillow lava, diabase, g
- O: Sandstone, shale, and conglomerate; in part Miocene and Eocene.
- Oc: Sandstone, shale, and conglomerate; in part Miocene and Eocene.
- P: Sandstone, siltstone, shale, and conglomerate; in part Pleistocene and Miocene.
- Q: Alluvium, lake, playa, and terrace deposits; unconsolidated and semi-consolidated. Mostly nonmarine, but includes marine deposits near the coast.
- QPc: Pliocene and/or Pleistocene sandstone, shale, and gravel deposits; in part Miocene.
- Qls: Selected large landslides, such as Blackhawk slide on north side of San Gabriel Mountains; early to late Quaternary.
- Tc: Undivided Tertiary sandstone, shale, conglomerate, breccia, and ancient lake deposits.
- Tv: Tertiary volcanic flow rocks; minor pyroclastic deposits.
- gb: Gabbro and dark dioritic rocks; chiefly Mesozoic
- grMz: Mesozoic granite, quartz monzonite, granodiorite, and quartz diorite
- ls: Limestone, dolomite, and marble whose age is uncertain but probably Paleozoic or Mesozoic
- m: Undivided pre-Cenozoic metasedimentary and metavolcanic rocks of great variety. Mostly slate, quartzite, hornfels, chert, phyllite, mylonite, schist, gneiss, and minor marble.
- sch: Schists of various types; mostly Paleozoic or Mesozoic age; some Precambrian.
- um: Ultramafic rocks, mostly serpentine. Minor peridotite, gabbro, and diabase. Chiefly Mesozoic unit 2
- um: Ultramafic rocks, mostly serpentine. Minor peridotite, gabbro, and diabase. Chiefly Mesozoic unit 3

Hydrologic Groups (SSURGO)

Group A - Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B - Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C - Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture
or fine texture.These soils have a slow rate of

Group D - Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

Section 4.7

Greenhouse Gas Emissions and Global Climate Change

Section 4.7

Greenhouse Gas Emissions and Global Climate Change

4.7.1 Introduction

This section describes the affected environment and regulatory setting for greenhouse gases (GHG) and global climate change. It also describes the GHG and global climate change impacts that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance (Project) and related amendments, and mitigation measures that would reduce these impacts, if necessary.

4.7.2 Environmental Setting

Climate change and global warming are sometimes used interchangeably but the differences are significant. Climate change is a change in the statistical distribution of weather patterns when that change lasts for an extended period of time (i.e., decades to millions of years). Climate change is essentially a phrase to describe any significant change in the measures of climate lasting for an extended period of time, such as major changes in temperature, precipitation, or wind patterns, among other effects, that occur over several decades or longer. Natural climate change is caused by factors such as biotic processes, variations in solar radiation received by Earth, plate tectonics, and volcanic eruptions. In contrast, global warming is a post-industrial age and ongoing trend of consistent rising of global average temperatures that has been determined to be significantly influenced by anthropogenic sources (EPA 2015a).

There is general scientific consensus that climate change is occurring and that human activity contributes in some measure to that change. Man-made emissions of GHGs, if not sufficiently curtailed, are likely to contribute further to continued increases in global temperatures. Increases in global temperatures will cause a reduction in polar ice caps and an increase in sea level, which will result in flooding in low-lying areas of the world. Additionally, climate change will shift rainfall patterns, which will cause significant impacts to agriculture and fresh water availability worldwide.

Greenhouse Gases

Constituent gases that trap heat in the earth's atmosphere are called GHGs, analogous to the way a greenhouse retains heat. GHGs play a critical role in earth's radiation budget by trapping infrared radiation emitted from the earth's surface, which would otherwise escape into space. Without the natural heat-trapping effect of GHGs, the earth's surface would be about 34°F cooler (CAT 2006). This natural phenomenon, known as the "greenhouse effect," is therefore responsible for maintaining a habitable climate. However, anthropogenic emissions of these GHGs in excess of natural ambient concentrations are responsible for the augmentation of the

"greenhouse effect," and have led to a trend of unnatural warming of the earth's natural climate known as global warming.

The standard definition of GHGs includes six substances identified in the Kyoto Protocol – carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6) – plus chlorofluorocarbons and other chlorine or bromine-containing gases phased out under the Montreal Protocol. CO_2 is undoubtedly the most important GHG, and collectively CO_2, CH_4, and N_2O amount to 80% of the total radiative forcing from well-mixed GHGs (CARB 2014d).

CO_2, CH_4, and N_2O concentrations have increased in the atmosphere since pre-industrial times, and this increase is the main driver of climate change. Globally, CO_2 increased by 40% from 278 parts per million (ppm) circa 1750 to 390.5 ppm in 2011. During the same time interval, CH_4 increased by 150%, from 722 parts per billion (ppb) to 1,803 ppb, and N_2O by 20%, from 271 ppb to 324.2 ppb in 2011. In fact the National Oceanic and Atmospheric Administration (NOAA's) Earth System Research Laboratory indicates the CO_2 levels at Mauna Loa averaged over 400 ppm for the first time during the week of May 26, 2013 (NOAA 2015). These concentrations of CO_2 exceed by far the natural range over the last 650,000 years (180 to 300 ppm) as determined from ice cores.

Several factors determine how a particular GHG will affect the earth's climate. One factor is the length of time that the gas remains in the atmosphere. A second factor is each gas's unique ability to absorb energy. By considering both of these factors, scientists calculate a gas's global warming potential (GWP), which measures how much a given amount of the GHG is estimated to contribute to global warming over a specific period of time (for example, 100 years) after being emitted. For purposes of comparison, GWP values are calculated in relation to CO_2, which is assigned a GWP equal to 1. Table 4.7-1 describes GWPs as presented in the 2007 Intergovernmental Panel on Climate Change (IPCC) Fourth Assessment Report (AR4), which is the version used by the California Air Resources Board (CARB) for the 2000-2012 emission inventory (IPCC 2013). Previous versions of the inventory used GWPs from the 1995 IPCC Second Assessment Report (SAR).

Table 4.7-1: 100-Year Global Warming Potentials from the Intergovernmental Panel on Climate Change Fourth Assessment Report (AR4)

Greenhouse Gas	Atmospheric Lifetime (years)	Global Warming Potential (100-year)
Carbon dioxide (CO_2)	variable (5 to 200)	1
Methane (CH_4)	12	25
Nitrous oxide (N_2O)	114	298
Chlorofluorocarbons (CFCs)	(0.7 to 1,700)	(5 to 14,400)
Sulfur hexafluoride (SF_6)	3,200	22,800

Table 4.7-1: 100-Year Global Warming Potentials from the Intergovernmental Panel on Climate Change Fourth Assessment Report (AR4)

Greenhouse Gas	Atmospheric Lifetime (years)	Global Warming Potential (100-year)
Hydrofluorocarbons (HFCs)	(1 to 270)	(124 to 14,800)
Perfluorocarbons (PFCs)	(2,600 to 50,000)	(7,390 to 12,200)

Source: IPCC 2013

The principal GHGs resulting from human activity that enter and accumulate in the atmosphere are listed below.

- **Carbon Dioxide (CO_2)** is a colorless, odorless gas consisting of molecules made up of two oxygen atoms and one carbon atom. CO_2 is produced when an organic carbon compound (such as wood) or fossilized organic matter, (such as coal, oil, or natural gas) is burned in the presence of oxygen. CO_2 is removed from the atmosphere by CO_2 "sinks," such as absorption by seawater and photosynthesis by ocean-dwelling plankton and land plants, including forests and grasslands. However, seawater is also a source of CO_2 to the atmosphere, along with land plants, animals, and soils, when CO_2 is released during respiration. Whereas the natural production and absorption of CO_2 is achieved through the terrestrial biosphere and the ocean, humankind has altered the natural carbon cycle by burning coal, oil, natural gas, and wood. Since the industrial revolution began in the mid-1700s, each of these activities has increased in scale and distribution.

- **Methane (CH_4)** is a colorless, odorless nontoxic gas consisting of molecules made up of four hydrogen atoms and one carbon atom. CH_4 is combustible, and it is the main constituent of natural gas – a fossil fuel. CH_4 is also released when organic matter decomposes in low oxygen environments. Natural sources include wetlands, swamps and marshes, termites, and oceans. Human sources include the mining of fossil fuels and transportation of natural gas, digestive processes in ruminant animals such as cattle, rice paddies, and the buried waste in landfills. Over the last 50 years, human activities, such as growing rice, raising cattle, using natural gas, and mining coal, have added to the atmospheric concentration of CH_4. Other anthropogenic sources include fossil-fuel combustion and biomass burning.

- **Nitrous Oxide (N_2O)** is a colorless, non-flammable gas with a sweetish odor, commonly known as "laughing gas," and sometimes used as an anesthetic. N_2O is naturally produced in the oceans and in rainforests. Man-made sources of N_2O include the use of fertilizers in agriculture, nylon and nitric acid production, cars with catalytic converters and the burning of organic matter. Concentrations of N_2O also began to rise at the beginning of the industrial revolution.

- **Chlorofluorocarbons (CFCs)** are gases formed synthetically by replacing all hydrogen atoms in CH_4 or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically un-reactive in the troposphere (the level of air at the earth's surface). CFCs have no natural source but were first synthesized in 1928. It was used for refrigerants, aerosol propellants, and cleaning solvents. Because of the discovery that they are able to destroy stratospheric ozone, an ongoing global effort to halt their production was undertaken and has been extremely successful, so much so that levels of the major CFCs are now remaining steady or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.

- **Sulfur Hexafluoride (SF_6)** is an extremely potent greenhouse gas. SF_6 is very persistent, with an atmospheric lifetime of more than a thousand years. Thus, a relatively small amount of SF_6 can have a significant long-term impact on global climate change. SF_6 is human-made, and the primary user of SF_6 is the electric power industry. Because of its inertness and dielectric properties, it is the industry's preferred gas for electrical insulation, current interruption, and arc quenching (to prevent fires) in the transmission and distribution of electricity. SF_6 is used extensively in high-voltage circuit breakers and switchgear, and in the magnesium metal casting industry.

- **Hydrofluorocarbons (HFCs)** are synthesized chemicals that are used as a substitute for CFCs. Out of all of the GHGs; HFCs are one of three groups with the highest GWP. HFCs are synthesized for applications such as automobile air conditioners and refrigerants.

- **Perfluorocarbons (PFCs)** have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. Because of their molecular stability, PFCs have very long lifetimes, between 10,000 and 50,000 years. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.

GHGs, in most cases, have both natural and anthropogenic sources. Natural mechanisms already exist as part of the "carbon cycle" for removing GHGs from the atmosphere (often called land or ocean sinks). Levels of GHGs, due to the increase in anthropogenic sources, have exceeded the normal rates of natural absorption. This has resulted in increased atmospheric concentrations of GHGs and potentially human-induced global warming.

Climate change, by its nature, is a cumulative impact resulting from innumerable GHG sources around the world. For this reason, global solutions are required to truly address the impacts of climate change. The U.S. Environmental Protection Agency (EPA) and CARB regulate GHG emissions nationally and within the state of California, respectively. While CARB has the primary regulatory responsibility within California, local agencies can also adopt policies for GHG emission reduction. The San Joaquin Valley Air Pollution Control District (SJVAPCD) is the responsible local agency for this Project. A description of local policies for GHG reductions is provided in Section 4.7.3, Regulatory Setting.

GHG Emission Levels

According to the World Resources Institute (WRI), in 2011 total worldwide GHG emissions were estimated to be 43,810 (M) million metric tons (MT) of carbon dioxide equivalent (CO_2e) ($MMTCO_2e$) and GHG emissions per capita worldwide was 6.29 $MTCO_2e$ (WRI 2015). These emissions exclude GHG emissions associated with the land use, land-use change, and forestry sector and bunker fuels. The WRI reports that in 2011, total GHG emissions in the United States were 6,550 $MMTCO_2e$, with average GHG emissions per capita of 21.02 $MMTCO_2e$; total GHG emissions in California were 402 $MMTCO_2e$, with average GHG emissions per capita of 9.69 $MMTCO_2e$.

Statewide GHG Inventories

According to CARB, as of 2012, California's total gross GHG emissions were 458.68 $MMTCO_2e$ (CARB 2014); 85% of the emissions were in the form of CO_2. The transportation sector is 37% of that total and industrial sources make up another 22%. Electrical generation sources provide 11% from in-state sources and 10% from imports. The current GHG emissions inventory for the state (2014 edition) covers years 2000 to 2012. The emission estimates are statewide estimates that rely on state, regional or national data sources, and on aggregated facility-specific emission reports. Tables 4.7-2 and 4.7-3 show the GHG emissions inventory by GHG and economic sector for the period 2005-2012.

Table 4.7-2: Statewide Greenhouse Gas Emissions Inventory

Gas	GHG Emissions ($MMTCO_2e$)							
	2005	**2006**	**2007**	**2008**	**2009**	**2010**	**2011**	**2012**

Table 4.7-4 shows California Oil and Gas Extraction GHG inventory, which accounts for approximately 16.7% of the Year 2012 statewide GHG emissions for the industrial sector. Most of the GHG emissions quantified by the CARB are due to CO_2 from combustion, and about 7 to 8% are from sources categorized as fugitive and include process losses, petroleum gas seeps, or venting from storage tanks. The industrial subcategory for oil and gas extraction does not include pipeline transmission or rail/ship transportation of oil and gas to processors, refiners, intermediaries, or customers (DOGGR 2015).

Table 4.7-4: Statewide Oil and Gas Extraction Greenhouse Gas Emissions

Oil and Gas Extraction Subcategory[3]			GHG Emissions ($MMTCO_2e$)[1,2]			
			2009	2010	2011	2012

MMT= million metric tons
N_2O = nitrous oxide

Kern County GHG Inventory

In 2012, the SJVAPCD prepared a communitywide GHG inventory for all of Kern County (SJVAPCD 2012). Year 2005 was used as the base year; GHG emissions were estimated to be 27 $MMTCO_2e$. The Fossil Fuel Industry sector represented 40% of the 2005 total, followed by the Electricity Consumption sector at 22%. GHG emissions from electricity generation in Kern

County were included in the County-wide GHG emissions, but not added in the totals The County's 2005 GHG emissions, not including subtraction of sequestration sectors, are presented in Table 4-7.5.

Table 4.7-5: 2005 Kern County Baseline Greenhouse Gas Emissions

Category	GHG Emissions ($MMTCO_2e$)	Percent of Total
Electricity Production	13,002,127	(*)
Electricity Consumption	6,039,114	22%
Residential/Commercial/Industrial Combustion	1,281,498	5%
Transportation	4,569,913	17%
Fossil Fuels Industry	10,928,153	40%
Industrial Processes	1,852,124	7%
Waste Management	120,494	< 1%
Agriculture Fugitives	2,024,470	7%
Forestry and Land Use	11,028	<1%
Other Sources	218,823	1%
Total	**27,045,617**	

Source: SJVAPCD 2012
Note:
(*) The Kern County Communitywide GHG emissions inventory Included emissions from electricity production for completeness purposes only, this sector was not included in further descriptions of the County's emissions.
Key:
CO_2e = carbon dioxide equivalent

MMT = million metric tons

Kern County GHG Emissions from the Oil and Gas Production Sector

GHG emissions resulting from crude oil and natural gas production and processing in Kern County were determined from emission inventories submitted by oil and gas operators to the CARB pursuant to the Mandatory Reporting Regulation (MRR) (see Section 4.7.3, Regulatory Setting). The MRR requires the reporting of GHG emissions resulting from fuel combustion, process vents, sources of fugitive emissions and other source categories associated with crude oil and natural gas extraction and processing, including emissions from portable equipment used for well drilling completions and workover. In addition, the MRR requires the reporting of GHG emissions from refineries suppliers of transportation fuels, suppliers of CO_2, and suppliers of natural gas, natural gas liquids, and liquefied natural gas. Table 4.7-6 summarizes the direct and supplier GHG emissions reported from oil and gas facilities subject to MRR in Kern County during year 2012. Facilities and sources that are subject to MRR and are listed in Table 4.7-6 are considered "large" sources.

To account for emissions for smaller sources that are not subject to MRR, an additional 10% of the emissions reported under MRR were added to the total of MRR-reported emissions to calculate the value for total oil and gas production stationary source emissions for Baseline Year 2012. Total baseline emissions include those that are and are not covered under the California Cap-and-Trade Regulation described in Section 4.7.3, Regulatory Setting. Emissions reported by oil and gas producers pursuant to the MRR include only direct and supplier emissions from stationary equipment and operations. GHG emissions from combustion of fuel used in motor vehicles and portable equipment are not included in Table 4.7-6. See Tables 4.7-8 and 4.7-9 (Section 4.7.4, Impact Analysis) for additional information.

Potential Global Climate Change Effects

This subsection summarizes the global warming trends and changes in the climate system observed over the past century and how global climate change may impact California's natural resources, public health, and infrastructure.

Worldwide, average temperatures are likely to increase by 3°F to 7°F by the end of the 21st century (IPCC 2013). However, a global temperature increase does not directly translate to a uniform increase in temperature in all locations on the earth. Regional climate changes are dependent on multiple variables, such as topography. One region of the earth may experience increased temperature, increased incidents of drought, and similar warming effects, whereas another region may experience a relative cooling.

Even though climate change is a global problem and GHGs are global pollutants, the specific potential effects of climate change on California have been studied. The California Natural Resources Agency summarized the best known science on climate change impacts in seven specific sectors and provided recommendations on how to manage against those threats (CNRA 2009). Generally, research indicates that California should expect overall hotter and drier conditions with a continued reduction in winter snow (with concurrent increases in winter rains), as well as increased average temperatures, and accelerating sea-level rise. In addition to these changes, the intensity of extreme weather events is also changing. The impacts assessment indicates that extreme weather events, such as heat waves, wildfires, droughts, and floods are likely to be some of the earliest climate impacts experienced. It is anticipated that average annual temperatures in California could increase 5°F by 2050 and 9°F by 2100. Precipitation is expected to increase by 35% by 2050 and sea levels are expected to rise by 18 inches by 2050 and by 55 inches by 2100.

Notes:

(1) Several companies report their emissions through MRR for all of their activities in the San Joaquin Valley, and there is no way to identify only those emissions from activities in Kern County. As a result, this Table, as well as Tables 4.7-8 and 4.7-9, are conservative in that they include GHG emissions from oil and gas production in, and to a some extent outside of, Kern County.

(2) Corresponds to direct GHG resulting from the combustion of fossil fuels, chemical and physical processes, vented emissions, geothermal emissions, and CH_4 and N_2O emissions (converted to CO_2e using global warming potentials) from non-biogenic fuel combustion.

(3) Corresponds to GHG emissions reported by suppliers of transportation fuels, suppliers of carbon dioxide, and suppliers of natural gas, natural gas liquids, and liquefied natural gas. This field represents the emissions that would result from the complete combustion of all reportable fuels supplied. The column includes both fossil and biogenic emissions.

(4) Corresponds to direct CO_2 emissions resulting from combustion of biogenic fuels such as biogas or forest-derived wood.

(5) "Covered emissions" which are computed by CARB, mean all emissions included in a compliance obligation under section 95852 through 95852.2 of the Cap-and-Trade Regulation, regardless of whether the Cap-and-Trade Regulation imposes a compliance obligation for the data year. Covered emissions are equal to the Total CO_2e emissions minus emissions from sources or substances that are not considered covered emissions (such as biofuels). Covered emissions are only displayed for reports subject to the Cap-and-Trade requirements, and a value of "0" (zero) is displayed for reports which do not have covered emissions under the Cap-and-Trade program.

Key:

CARB = California Air Resources Board

CO_2e = carbon dioxide equivalent

MT = metric tons

4.7.3 Regulatory Setting

In 1988, the United Nations and the World Meteorological Organization established the IPCC to evaluate the impacts of global warming and to develop strategies that nations could implement to curtail global climate change. In 1992, the United Nations Framework Convention on Climate Change established an agreement with the goal of controlling GHG emissions, including methane. As a result, the Climate Change Action Plan was developed to address the reduction of GHGs in the United States. The plan consists of more than 50 voluntary programs. In October 1993, President Bill Clinton announced his Climate Change Action Plan, which had a goal to return GHG emissions to 1990 levels by the year 2000. This was to be accomplished through 50 initiatives that relied on innovative voluntary partnerships between the private sector and government aimed at producing cost-effective reductions in GHG emissions (CAPCOA 2008).

On March 21, 1994, the United States joined a number of countries around the world in signing the United Nations Framework Convention on Climate Change. Under the Convention (UNFCCC), governments do the following: gather and share information on GHG emissions, national policies, and best practices; launch national strategies for addressing GHG emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change (UNFCCC 2014b).

A particularly notable result of the UNFCCC efforts was a treaty known as the Kyoto Protocol, which was negotiated in December 1997. The agreement came into force on February 16, 2005, following ratification by Russia on November 18, 2004. When countries sign the treaty, they demonstrate their commitment to reduce their emissions of GHGs or engage in emissions trading. As of July 2012, a total of 195 countries and other governmental entities have ratified the agreement (UNFCCC 2014a). Notable exceptions include Australia and the United States. Although United States Vice President Al Gore symbolically signed the Protocol in 1998, in order for the Protocol to be formally ratified, it must be ratified by the United States Congress and this has not occurred to date. Other countries, like India and China, which have ratified the Protocol, are not required to reduce carbon emissions under the present agreement despite their relatively large populations.

On September 27, 2006, Assembly Bill (AB) 32, the California Global Warming Solutions Act, of 2006 was enacted by the State of California. The legislature stated that "global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California" (AB 32). The Act caps California's GHG emissions at 1990 levels by 2020. The Act defines GHG emissions as all of the following gases: CO_2, CH_4, N_2O, HFCs, PFCs and SF_6. AB 32 establishes the first economy-wide GHG regulatory program in the United States. While acknowledging that national and international actions will be necessary to fully address the issue of global warming, AB 32 lays out a program to inventory and reduce GHG emissions in California and from power generation facilities located outside the state that serve California residents and businesses (CAPCOA 2008).

AB 32 charges the CARB with responsibility to monitor and regulate sources of GHG emissions in order to reduce those emissions. CARB staff recommended an amount of 427 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) as the total statewide GHG 1990 emissions level and 2020 emissions limit. The CARB approved the 2020 limit on December 6, 2007. This limit is an aggregate statewide limit, rather than sector- or facility-specific. On October 20, 2011, CARB approved a Cap-and-Trade Program as part of AB 32, with compliance obligations that became effective in 2013. For compliance years 2013 and 2014, an initial cap was implemented for the electrical sector and large industrial sources that emit more than 25,000 metric tons of CO_2e emissions per year. Transportation fuels and natural gas usage were added to the Cap-and-Trade Program beginning in 2015, and the cap was adjusted to account for the inclusion of these new emission sources. Over time, the cap will be reduced by about 3% per year.

Federal

U.S. Environmental Protection Agency

On April 2, 2007, in Massachusetts v. EPA, 549 U.S. 497 (2007), the Supreme Court found that GHGs are air pollutants covered by the Clean Air Act (CAA). The Court held that the EPA must determine whether emissions of GHGs from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare. On April 17, 2009, the Administrator signed proposed endangerment and cause or contribute findings for GHGs under Section 202(a) of the CAA. The EPA found that six GHGs in combination endanger both the public health and the public welfare of current and future generations. The EPA also found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that endangers public health and welfare under CAA section 202(a). These findings became effective on January 14, 2010.

Specific GHG regulations that the EPA has adopted to date are provided below.

40 Code of Federal Regulations (CFR) Part 98. Mandatory Reporting of Greenhouse Gases Rule. This rule requires mandatory reporting of GHG emissions for facilities that emit more than 25,000 $MTCO_2e$ emissions per year. CO_2e is a quantity that describes, for a given mixture and amount of GHG, the amount of CO_2 that would have the same GWP, when measured over a specified timescale (generally, 100 years). It is also a measure for comparing CO_2 with other GHGs (which generally have a higher GWP), based on the amount of those other gases multiplied by the appropriate GWP factor, commonly expressed as $MTCO_2e$. CO_2e is calculated by multiplying the metric tons of gas by the appropriate GWP. Additionally, reporting of emissions is required for owners of SF_6- and PFC-insulted equipment when the total nameplate capacity of these insulating gases is above 17,280 pounds. The Project would not be expected to trigger GHG reporting according to the rule; however, GHG emissions of the Project are quantified in this Environmental Impact Report (EIR).

40 CFR Part 52. Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule. The EPA mandated application of the Prevention of Significant Deterioration

(PSD) requirements to facilities whose stationary source CO_2e emissions exceed 75,000 tons per year.

National Climate Action Plan. In June 2013, the President enacted a national Climate Action Plan (Plan) that consisted of a wide variety of executive actions and had three pillars discussed below (EOP 2013).

- **Cut Carbon in America** – The Plan consists of actions to help cut carbon by deploying clean energy such as cutting carbon from power plants, promoting renewable energy, and unlocking long-term investment in clean energy innovation.

- **Prepare the United States for Impacts of Climate Change** – The Plan consists of actions to help prepare for the impacts through building stronger and safer communities and infrastructure by supporting climate resilient investments, supporting communities and tribal areas as they prepare for impacts, and boosting resilience of building and infrastructure; protecting the economy and natural resources by identifying vulnerabilities, promoting insurance leadership, conserving land and water resources, managing drought, reducing wildfire risks, and preparing for future floods; and using sound science to manage climate impacts.

- **Lead International Efforts** – The Plan consists of actions to help the United States lead international efforts through working with other countries to take action by enhancing multilateral engagements with major economies, expanding bilateral cooperation with major emerging economies, combating short-lived climate pollutants, reducing deforestation and degradation, expanding clean energy use and cutting energy waste, global free trade in environmental goods and services, and phasing out subsidies that encourage wasteful use of fossil fuels and by leading efforts to address climate change through international negotiations.

In June of 2014, the Center for Climate and Energy Solutions (C2ES) published a one-year review of progress in implementation of the Plan (C2ES 2014). The C2ES found that the administration had made marked progress in its initial implementation. Notable areas of progress included steps to limit carbon pollution from power plants; improve energy efficiency; reduce CH_4 and HFC emissions; help communities and industry become more resilient to climate change impacts; and end U.S. lending for coal-fired power plants overseas.

Greenhouse Gas Endangerment Findings

As of January 14, 2010, the EPA's finding that six GHGs, taken in combination, endanger the public health and the public welfare of current and future generations became effective. The EPA also found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that endangers public health and welfare under CAA Section 202(a). Subsequently, federal agencies have adopted specific GHG-related regulations and initiatives, including:

Transportation/Mobile Sources

EPA and National Highway Traffic Safety Administration Standards to Cut Greenhouse Gas Emissions and Fuel Use for New Motor Vehicles: coordinated steps to enable the production of a new generation of clean vehicles.

Renewable Fuel Standard Program: transportation fuel sold in the United States is required to contain a minimum volume of renewable fuel.

Stationary Sources

Carbon Pollution Standards for Power Plants: In September 2013, the EPA proposed a rule to reduce carbon emissions from new power plants. On June 2, 2014, the EPA issued a proposal to cut carbon pollution from existing power plants (the "Clean Power Plan"). EPA's May 2015 "Unified Agenda" indicates that both of these rules are expected to be issued in August, 2015.

Final Greenhouse Gas Tailoring Rule: On May 13, 2010, the EPA set GHG emissions thresholds to define when permits under the New Source Review PSD and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule "tailors" the requirements of these CAA permitting programs to limit covered facilities to the nation's largest GHG emitters: power plants, refineries, and cement production facilities.

Timing of Applicability of the PSD Permitting Program to GHGs: On March 29, 2010, the EPA completed its reconsideration of the December 18, 2008, memorandum entitled "EPA's Interpretation of Regulations that Determine Pollutants Covered by Federal Prevention of Significant Deterioration (PSD) Permit Program" (the so-called "Johnson memo"). The final action confirmed that GHGs become covered under the PSD program on January 2, 2011, when the cars rule took effect.

In June 2014, the U.S. Supreme Court ruled that the EPA cannot classify facilities as major PSD or Title V sources based solely on its GHG emissions meeting the major source threshold. However, the Supreme Court said that the EPA could continue to require that PSD permits, required due to criteria pollutant emissions, contain Best Available Control Techniques (BACT) limits for GHG emissions. This ruling struck down Step 2 of the Tailoring Rule but kept in effect Step 1 (EPA 2014a).

Emissions Reporting

GHG Reporting Program: This program collects reported GHG emissions from facilities that emit more than 25,000 $MTCO_2e$ emissions per year. Additionally, reporting of emissions is required for owners of SF_6- and PFC-insulated equipment when the total nameplate capacity of these insulating gases is above 17,280 pounds. The Petroleum and Natural Gas Systems source category consists of onshore production; offshore production; natural gas processing; natural gas transmission; underground natural gas storage; natural gas distribution; liquefied natural gas import and export terminals; and liquefied natural gas storage equipment.

Notification Requirements for Gas Well Completions (40 CFR Parts 60 and 63): Air pollution standards established by the EPA under the New Source Performance Standard, Final Rule August 16, 2012, for oil and gas production require companies to provide notifications of natural gas well completions. The EPA expects to use the notifications required by the 2012 standards and ongoing technical studies through 2014 to make a foundation for determining how best to require additional control of methane and other air pollutants from the oil and gas sector, including completions and associated gas from ongoing production and hydraulically fractured oil wells (EPA 2015b).

Other Related Actions

Oil and Natural Gas Air Pollution Standards: The final action includes the review of four rules for the oil and natural gas industry: a new source performance standard for volatile organic compounds (VOCs); a new source performance standard for sulfur dioxide; an air toxics standard for oil and natural gas production; and an air toxics standard for natural gas transmission and storage. Although this rule is intended for control of hazardous air pollutants, emissions of CH_4 would be reduced from the implementation of control measures, such as reduced emission completions (RECs), or the use of completion combustion devices to control flowback emissions (New Source Performance Standards [NSPS] 40 CFR 60, Subpart OOOO, Section 60.5375). Because this regulation addresses natural gas completions, the EPA is separately researching techniques available to reduce emissions from oil well completions (EPA 2015c).

White papers released by the EPA on April 2014 outline potential emission reduction techniques for CH_4 during completions of hydraulic fractured or refractured oil wells. Hydraulically fractured oil wells also may produce natural gas along with oil, which is often vented during production (EPA 2014b). Combustion control or flaring for control of associated gas emissions has been demonstrated as effective in the oil and gas industry. However, flaring results in the destruction of CH_4, which may be recoverable for alternate use.

EPA Natural Gas STAR Program: This voluntary program encourages oil and natural gas companies to adopt cost-effective technologies and practices to improve operational efficiency and prevent emissions from methane. The Natural Gas STAR program defines protocols for methane control at natural gas production facilities (EPA 2015d).

As of January 14, 2015, the EPA announced an additional strategy for a series of steps it plans to take to address CH_4 and smog-forming VOC emissions from the oil and gas industry (EPA 2015d). The steps include building on commonsense standards for CH_4 and VOC emissions to help avoid anticipated increase in methane emissions from new sources; reducing additional pollution in areas with ozone problems by issuing Control Techniques Guidelines that provide an analysis of the available, cost-effective technologies for controlling VOC emissions from covered oil and gas sources; and providing additional support for industry actions to reduce methane emissions including several voluntary efforts to address these sources that already are underway Voluntary efforts include EPA's plans to expand the successful Natural Gas STAR Program by launching a new partnership in collaboration with key stakeholders later in 2015 (EPA 2015d).

State

A variety of statewide rules and regulations have been implemented or are in development in California that mandate the quantification or reduction of GHGs. Several gubernatorial Executive Orders (EOs) establish statewide GHG reduction goals. As a result of Senate Bill 97, the California Environmental Quality Act (CEQA) requires an analysis and mitigation of emissions of GHGs and climate change in relation to a proposed Project, where a project will result in a significant increase of GHG emissions. Certain Air Pollution Control Districts have proposed their own levels of significance. See the discussion of SJVAPCD significance thresholds on page 4.7-23 and on Section 4.7.4, Impact Analysis.

Executive Order S-3-05 – Statewide Emission Reduction Targets

EO S-3-05 was established by Governor Arnold Schwarzenegger in June 2005. EO S-3-05 establishes statewide emission reduction targets through the year 2050:

- by 2010, reduce GHG emissions to 2000 levels;
- by 2020, reduce GHG emissions to 1990 levels; and
- by 2050, reduce GHG emissions to 80% below 1990 levels.

Executive Order Executive Order B-30-15 – 2030 Statewide Emission Reduction Target

EO B-30-15 was signed by Governor Jerry Brown Jr. on April 29, 2015. This EO establishes an interim statewide GHG reduction target of 40% below 1990 levels by 2030, which is necessary to guide regulatory policy and investments in California in the midterm, and put California on the most cost-effective path for long-term emission reductions. Under this EO, all state agencies with jurisdiction over sources of greenhouse gas emissions will need to continue to develop and implement emissions reduction programs to reach the state's 2050 target and attain a level of emissions necessary to avoid dangerous climate change. According to the Governor's Office, this EO is in line with the scientifically established levels needed in the United States to limit global warming below 2°C - the warming threshold at which scientists say there will likely be major climate disruptions such as super droughts and rising sea levels (Office of Governor 2015).

Assembly Bill 1493 – Pavley

In 2002, California legislature adopted regulations to reduce GHG emissions in the transportation sector, the state's largest source of GHG emissions. In September 2004, pursuant to AB 1493, the CARB approved regulations to reduce GHG emissions from new motor vehicles beginning with the 2009 model year. In September 2009, CARB adopted amendments to the Pavley regulations to reduce GHG from 2009 to 2016. CARB, EPA, and the U.S. Department of Transportation's National Highway Traffic and Safety Administration (NHTSA) have coordinated efforts to develop fuel economy and GHG standards for model 2017-2025 vehicles. The GHG standards are incorporated into the "Low Emission Vehicle" (LEV) Regulations.

California Governor's Executive Order B-16-2012

EO B-16-2012 (March 2012) specifically focuses on reducing emissions from California's vehicle fleet and directs that California achieve a 2050 target for GHG emission reductions from the transportation sector equaling 80% less than 1990 levels. This would be accomplished by achieving benchmarks by 2020 and 2025 for advancements of zero-emission vehicle (ZEV) infrastructure and technology advancement.

Assembly Bill 32

AB 32, also known as the California Global Warming Solutions Act of 2006, was established to mandate the quantification and reduction of GHGs to 1990 levels by the year 2020. The law establishes periodic targets for reductions, and requires certain facilities to report emissions of GHGs annually. The legislation authorizes CARB to reduce emissions from certain sectors that contribute the most to statewide emissions of GHGs.

Assembly Bill 32 Scoping Plan

The AB 32 Scoping Plan identifies the strategies for achieving the maximum technologically feasible and cost-effective GHG reductions by 2020, and to maintain and continue reductions beyond 2020. The scoping plan includes a range of GHG emission reduction actions, which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a Cap-and-Trade system, and an AB 32 cost of implementation fee regulation to fund the program. The initial scoping plan was approved at the CARB Board hearing on December 12, 2008. CARB approved the First Update to the Scoping Plan in May 2014.

Assembly Bill 32 Scoping Plan Control Strategies for Oil and Gas

The Scoping Plan's GHG control measures specific to oil and gas sources include the following applicable for the Project:

Scoping Plan Measure I-2: Oil and Gas Extraction GHG Emission Reduction. The 2008 AB 32 Scoping Plan identified a potential reduction of 0.2 $MMTCO_2e$ from this measure, which involves the potential use of controls for fugitive GHG sources that range from applying simple fixes to existing technologies, to deploying new technologies, to replace inefficient equipment and detect leaks. CARB has started a rulemaking process to implement this measure, with the final rule expected to be adopted by September 2015. The rule is expected to specify improvements at new and existing wells, including those undergoing well stimulation treatments (CARB 2014c).

Scoping Plan Measure I-3: GHG Leak Reduction from Oil and Gas Transmission. The 2008 AB 32 Scoping Plan identified a potential reduction of 0.9 $MMTCO_2e$ from this measure. This measure is also under review by the CARB, but expected to improve operating practices to reduce emissions when compressors along the pipeline are taken offline, installing compressor rod packing systems, and replacing and replacing older equipment along pipelines.

Mandatory Greenhouse Gas Emissions Reporting (17 CCR 95100-95158)

Reporting of greenhouse gases by major sources is required by AB 32. A newly revised MRR was approved and became effective January 1, 2015. The MRR is applicable to industrial facilities, fuel suppliers, and electricity importers. Sources related to Petroleum and Natural Gas Systems are subject to mandatory reporting if combustion or process emissions for the facility exceed 10,000 $MTCO_2e$ per calendar year or if stationary combustion, process, fugitive, and vented emissions equal or exceed 25,000 $MTCO_2e$ per year (Section 95151). Certain well stimulation treatments at gas wells are included in Section 95153(f) of this regulation, although oil wells are not specifically addressed for well completions. Moreover, Section 95153 (j) includes methodologies for estimating GHG from well testing and flaring, and clarifies that reporting procedures apply to both oil and gas wells.

All GHG emissions data reports must comply with the regulatory requirements and be submitted via the California Electronic Greenhouse Gas Reporting Tool (Cal e-GGRT) reporting system.

Cap-and-Trade Program (17 CCR 95800 to 96022)

On October 20, 2011, CARB approved the California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation (Cap-and-Trade Program) as part of the AB 32 implementation measures.

Cap-and-trade is a market based regulation that is designed to reduce GHGs from multiple sources, including operators of Petroleum and Natural Gas Systems facilities (Section 95852(h)). It is viewed as an environmentally effective and economically efficient response to climate change. Cap-and-trade sets a firm limit, or cap on GHG emissions from all sources in the Cap-and-Trade Program, and minimizes the compliance costs of achieving AB 32 goals. The initial cap was established in 2013 for the electrical sector and any large industrial source emitting more than 25,000 $MTCO_2e$ per year. Oil and gas production activities are considered to be industrial activities and production facilities are included in the Cap-and-Trade Program when their emissions exceed the 25,000 metric ton threshold. Beginning in 2015, the cap was expanded to include GHG emissions from the combustion of transportation fuels and natural gas. The cap declines approximately 3% each year. In the market, a price on carbon is established for GHGs. Trading and market forces create incentives to reduce GHGs below allowable levels through investments in technological innovation in clean technologies. California has linked its Cap-and-Trade Program with a similar program adopted by Quebec in order to help deliver cost-effective emission reductions.

Senate Bill 605 - Short-Lived Climate Pollutants (SLCP)

Short-lived climate pollutants (i.e., black carbon, fluorinated gases, and methane) are powerful climate forcers that remain in the atmosphere for a much shorter period of time than longer-lived climate pollutants. Their relative potency, when measured in terms of how they heat the atmosphere, can be tens, hundreds, or even thousands of times greater than that of CO_2. The impacts of short-lived climate pollutants are especially strong over the short term. Reducing these emissions can make an immediate beneficial impact on climate change (CARB 2014a). Governor

Brown signed SB 605 on September 21, 2014, directing ARB to develop a Short-Lived Climate Pollutant Strategy by January 1, 2016. On May 7, 2015, CARB released a concept paper for reducing emissions of these substances.

Senate Bill 4

On September 30, 2013, Governor Brown signed into law Senate Bill 4 (SB 4). It provides for Well Stimulation Treatment Regulations to be finalized and implemented no later than January 1, 2015. By March, 1, 2015, owner/operators were required to submit a completed well history that includes required information. By July 1, 2015, the California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) shall certify an EIR is certified and that all related activities fully conform on or before December 31, 2015.

However, effective January 1, 2014, an interim set of regulations require oil and gas operators to submit to DOGGR notification of well stimulation treatments and chemical disclosure of well stimulation fluids. All information submitted will be made available to the public (DOGGR 2015). In June 2014, SB 4 was amended in order to allow the interim rules to remain in effect until July 1, 2015.

Section 3160 (a) of SB 4 required the California Natural Resources Agency (CNRA) to conduct and complete an independent scientific study on well stimulation treatments in California, which includes consideration to the potential GHG emissions associated with well stimulation treatments. Pursuant to SB 4, the CNRA commissioned the California Council on Science and Technology (CCST) and Lawrence Berkeley National Laboratory (LBNL) to conduct this independent scientific assessment of well stimulation. The full independent scientific assessment will be issued in three volumes. On January 14, 2015, CCST released Volume I of the assessment to the public. Volumes II and III will be released in July 2015. Volume II will assess the potential impacts of well stimulation treatments with respect to water, air quality, and GHG emissions, as well as induced seismicity, ecology, traffic, and noise (DOC 2015a).

Other Mobile Source Reduction Requirements

Several other State provisions address the GHG emissions reduction targets set by CARB for mobile sources, including trucks, passenger vehicles, trains, and ships. These measures include:

- Low Carbon Fuel Standard (EO S-01-07)
- Advanced Clean Cars Program
- SmartWay Truck Efficiency Regulation
- AB 32 Cap-and-Trade Program as applicable to transportation fuel suppliers (beginning January 1, 2015)
- SB 375 (Land Use Planning) including the development of a Sustainable Communities Strategy as part of a Metropolitan Planning Organization's Regional Transportation Plan.

In particular, SB 375 requires the Air Resources Board to set regional targets for GHG emission reductions from passenger vehicles and light duty trucks, and requires each regional Metropolitan Planning Organization (MPOs) to adopt a Sustainable Communities Strategy (SCS) into its regional transportation plan that would allow the region to meet its GHG emission reduction target. The Kern County Council of Governments adopted the SCS for Kern County as part of its Regional Transportation Plan (RTP) in 2014. The RTP and SCS incorporate forecasted development patterns, modeling and measures designed to integrate land use and transportation planning to reduce local and regional GHG emissions. Oil and gas resources, as well as other land uses, are components of the SCS. While SB 375 does not require local governments to amend their General Plans to implement the SCS, it provides incentives for them to do so. Implementation of SB 375 is expected to substantially reduce GHG emissions in the County and throughout the state.

Local

San Joaquin Valley Air Pollution Control District

In August 2008, the SJVAPCD adopted its Climate Change Action Plan (CCAP). The CCAP directed the District to develop guidance to assist CEQA lead agencies, project proponents, permit applicants, and interested parties in assessing and reducing the impacts of project GHG emissions on global climate change (SJVAPCD 2008). In December 2009, the SJVAPCD Board approved two guidance documents:

- Guidance for Valley Land-use Agencies in Addressing GHG Emission Impacts for New Projects under CEQA ("Land Use GHG Guidance"); and

- District Policy: Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency.

These policies provide that "Projects complying with an approved GHG emission reduction plan or GHG mitigation program which avoids or substantially reduces GHG emissions within the geographic area in which the Project is located would be determined to have a less than significant individual and cumulative impact for GHG emissions" (Land Use GHG Guidance, p. 4). Under the guidance, projects implementing Best Performance Standards would have less than significant impacts for GHG emissions, as would projects that reduce or mitigate their GHG emissions by at least 29% as compared to Business as Usual (BAU).

On June 25, 2014, the SJVAPCD issued a guidance document titled "CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation" (Policy APR-2025; "CEQA Cap-and-Trade Policy"). This policy is to be followed when the District is "providing technical guidance to lead agencies and the public regarding significance of project specific GHG emissions." The policy states the District's conclusion that "GHG emission increases subject to ARB's Cap-and-Trade Regulation would have a less than significant individual and cumulative impact on global climate change." Noting that GHG emissions from combustion of transportation fuels are covered under the Cap-and-Trade Program beginning in 2015, the policy also states that

"GHG emission increases caused by fuel use (other than jet fuels) are determined to have a less than significant impact on global climate change under CEQA."

Under the District's 2014 policy for stationary source impacts, "the District's determination of significance of project-specific GHG emissions is founded on the principal that projects with GHG emission reductions consistent with AB 32 emission reduction targets are considered to have a less than significant impact on global climate change" (SJVAPCD 2014). This policy employs a tiered approach to determining the CEQA significance of a project's GHG emissions. The first level is compliance with an approved GHG emission reduction plan that is specified in law and supported by a CEQA-compliant environmental review document. The SJVAPCD has determined that GHG emissions covered under the Cap-and-Trade Program cannot constitute significant increases under CEQA, for two reasons. First, the Cap-and-Trade Program is an approved GHG mitigation plan that meets the requirements set forth in the District's policy on stationary source GHG emission impacts (SJVAPCD 2014, pages 4-5.) Second, any increase in GHG emissions from the oil and gas production sector must be accounted for under the statewide GHG emissions cap in the Cap-and-Trade Program, and that cap decreases over time. As a result, the Cap-and-Trade Program will fully mitigate any project emission increases for emissions included under the cap (SJVAPCD 2014).

Where an approved GHG emission reduction program is not in place, or the Project will not comply with it, the guidance documents next rely on the use of performance based standards, otherwise known as Best Performance Standards (BPS), as a basis for assessing the significance of Project GHG emissions on global climate change under CEQA. BPS consist of established specifications or Project design elements that are used as a method of determining significance of Project-specific GHG emission impacts. BPS are defined as the most effective achieved-in-practice means of reducing or limiting GHG emissions from a GHG emissions source. BPS for stationary source projects include equipment type, equipment design, and operational and maintenance practices for the identified service, operation, or emissions unit class or category (SJVAPCD 2009a).

Table 4.7-7 describes the SJVAPCD BPS applicable to the Project. The District recommends use of BPS for assessing climate change impacts to streamline the process of determining significance under CEQA. BPS are not intended as a required emission reduction measure. Under SJVAPCD guidance, projects implementing BPS would be determined to have a less than cumulatively significant impact on global climate change.

Projects that do not comply with an approved GHG emission reduction plan or use BPS must demonstrate a 29% reduction in GHG emissions from (BAU) in order to be determined to have a less than cumulatively significant impact on global climate change. BAU is determined by multiplying 2002-2004 emission factors by the activity expected to occur in 2020.) The guidance does not limit a lead agency's authority to establish its own process and guidance for determining significance of Project-related impacts on global climate change (SJVAPCD 2009b).

While no appellate court decision has yet addressed reliance on statewide GHG Cap-and-Trade Program compliance as a method of determining the significance of project GHG emissions for

CEQA purposes, several cases have addressed the so-called BAU methodology which is similarly based on AB 32 compliance Under the BAU approach, GHG emissions from a project are considered to have an insignificant impact if they are more than 29% below modeled emissions under a BAU scenario, where 29% is roughly the magnitude of the statewide GHG reduction anticipated to be achieved in compliance with AB 32 by 2020. Reliance on the BAU-based significance threshold was specifically upheld as a proper exercise of agency discretion in Citizens for Responsible Equitable Environmental Development v. City of Chula Vista (2011) 197 Cal. App. 4th 327, 336-37 (CREED). Two subsequent cases concurred with the approach in CREED. Friends of Oroville v. City of Oroville (2013) 219 Cal. App. 4th 832, 841-42; Center for Biological Diversity v. Dept. of Fish and Wildlife (2014) 224 Cal. App. 4th 1105. Though Friends of Oroville criticized the lead agency's application of the BAU-based threshold in that particular case, the court found the methodology to be appropriate in itself. See Friends of Oroville, 219 Cal. App. 4th at 841: "The problem is the City improperly applied this proper standard in concluding that the Project's environmental impacts from GHG emissions are less than significant. [CREED] exemplifies the model, showing us a proper way to apply the Assembly Bill 32 threshold-of-significance standard." The Center for Biological Diversity case is currently pending appeal before the California Supreme Court.

By analogy to the BAU cases, a project's compliance with the Cap-and-Trade Regulation is also an appropriate means of determining the significance of the Project's GHG emissions because in either case, the 29% reduction in emissions anticipated by AB 32 will occur. As CARB set the statewide annual GHG allowance cap at levels low enough to assure that the overall AB 32 statewide emission reduction goal would be achieved, compliance with the Cap-and-Trade Regulation assures that a project will not cause a GHG emission increase that would cause the state to miss its GHG emission reduction goals.

Table 4.7-7: SJVAPCD Best Performance Standards Applicable to the Project

Class	Category	Best Performance Standard	Percentage Achieved GHG Emission Reduction Relative to Baseline Emissions	
Components at Light Crude Oil and Natural Gas Production, Natural Gas Processing Facilities, Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants (Approved 07/01/2010)	Components Subject to Rules 4409 and 4555 Requirements	Minimize GHG emissions by applying leak standards and I&M requirements to components subject to Rules 4409 and 4455 requirements	Light Crude Oil and Natural Gas Production	60%
			Natural Gas Processing	82%
			Refineries	86%
			Gas Liquid Processing	89%

Table 4.7-7: SJVAPCD Best Performance Standards Applicable to the Project

Class	Category	Best Performance Standard	Percentage Achieved GHG Emission Reduction Relative to Baseline Emissions	
	Components Not Subject to Rules 4409 and 4555 Requirements	Minimize fugitive GHG emissions by applying leak standards and I&M requirements to components not subject to Rules 4409 and 4455 requirements	Components not subject to Rules 4409 and 4455 Requirements	91%
Thermally Enhanced Oil Recovery (Approved 07/01/2010)	Components Subject to Rule 4401	Minimize fugitive GHG emissions by applying leak standards and I&M to components subject to Rule 4401	28%	
	Components Not Subject to Rule 4401	Minimize fugitive GHG emissions by applying leak standards and I&M to components not subject to Rule 4401	48%	
Steam Generators (Approved 06/24/2010)	Oilfield	Very high efficiency generator design with: 1. A convection section with at least 235 square feet of heat transfer surface area per MMBtu/h of maximum rated heat input (verified by manufacturer) or a manufacturer's overall thermal efficiency rating of 88%. and 2. Variable frequency drive high efficiency electrical motors driving the blower and water pump.	13%

Key:
GHG = greenhouse gas
I&M = inspection and maintenance
MMBtu/h = million British thermal units per hour

Kern County General Plan

The Project Area is located within the KCGP area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element of the KCGP includes goals, policies, and implementation measures to the Project that would indirectly impact GHG emissions through the reduction of fossil fuel use, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.10. General Provisions

1.10.2. Air Quality

Policies

Policy 19. In considering discretionary projects for which an Environmental Impact Report must be prepared pursuant to the California Environmental Quality Act, the appropriate decision making body, as part of its deliberations, will ensure that:

a. All feasible mitigation to reduce significant adverse air quality impacts have been adopted; and

b. The benefits of the proposed Project outweigh any unavoidable significant adverse effects on air quality found to exist after inclusion of all feasible mitigation. This finding shall be made in a statement of overriding considerations and shall be supported by factual evidence to the extent that such a statement is required pursuant to the California Environmental Quality Act.

Policy 22. Kern County shall continue to work with the San Joaquin Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District toward air quality attainment with federal, state, and local standards.

Policy 23. The County shall continue to implement the local government control measures in coordination with the Kern Council of Governments and the San Joaquin Valley Unified Air Pollution Control District.

Implementation Measures

Implementation Measure F. All discretionary permits shall be referred to the appropriate air district for review and comment.

Implementation Measure G. Discretionary development projects involving the use of tractor trailer rigs shall incorporate diesel exhaust reduction strategies including, but not limited to:

a. Minimizing idling time.

b. Electrical overnight plug-ins.

Implementation Measure H. Discretionary projects may use one or more of the following to reduce air quality effects:

a. Pave dirt roads within the development.

b. Pave outside storage areas.

c. Provide additional low Volatile Organic Compounds (VOC) producing trees on landscape plans.

d. Use of alternative fuel fleet vehicles or hybrid vehicles.

e. Use of emission control devices on diesel equipment.

f. Develop residential neighborhoods without fireplaces or with the use of Environmental Protection Agency certified, low emission natural gas fireplaces.

g. Provide bicycle lockers and shower facilities on site.

h. Increasing the amount of landscaping beyond what is required in the Zoning Ordinance (Chapter 19.86).

i. The use and development of park and ride facilities in outlying areas.

j. Other strategies that may be recommended by the local Air Pollution Control Districts.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to GHG emissions.

Chapter V. Conservation Element

E. Air Quality

Goals

Goal 1. Promote air quality that is compatible with health, well-being, and enjoyment of life by controlling point sources and minimizing vehicular trips to reduce air pollutants.

Goal 2. Continue working toward attainment of federal, state, and local standards, as enforced by the San Joaquin Valley Air Pollution Control District.

Goal 3. Reduce the amount of vehicular emissions in the Planning Area.

Policies

Policy 1. Comply and promote SJVAPCD control measures regarding Reactive Organic Gases (ROG). Such measures are focused on (a) steam-driven well vents, (b) pseudo-cyclic wells, (c) natural gas processing plant fugitives, (d) heavy oil test stations, (e) light oil production fugitives, (f) refinery pumps and compressors, and (g) vehicle inspection and maintenance.

Policy 2. Encourage land uses and land use practices that do not contribute significantly to air quality degradation.

Policy 10. Implement the Transportation System Management Program for the Metropolitan Bakersfield to improve traffic flow, reduce vehicle trips, and increase street capacity.

Policy 12. Encourage the use of mass transit, carpooling, and other transportation options to reduced vehicle miles traveled.

Policy 13. Consider establishing priority parking areas for carpoolers in projects with relatively large number of employees to reduce vehicle miles traveled.

In conjunction with the MBGP Update efforts, City staff is securing additional funding to develop a CCAP for the Metropolitan Bakersfield Update. Local Sustainable Planning will be the focus for the CCAP. CCAP will be Bakersfield's mechanism for county-wide and region-wide efforts for addressing SB 375, provide community-wide sustainability, and implementing AB 32 GHG emission reduction targets. The CCAP will include energy efficiency and conservation strategies for long-term land use planning. Even though the Bakersfield CCAP is unfinished, the advancement of renewable energy is often a cornerstone for climate action strategies.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern Sustainable Communities Strategy

The SCS is a part of the 2014 RTP developed by the Kern Council of Governments. The SCS (Kern COG 2014) strives to reduce air emissions from passenger vehicle and light duty truck travel by better coordinating transportation expenditures with forecasted development patterns and, if feasible, help meet CARB GHG targets for the region (Kern COG 2014). The SCS does not regulate the use of land nor does it supersede the land use authority of the cities or county within the region.

One goal of the SCS is to "Quantify the reduction in GHG emissions projected to be achieved by the SCS and set forth the difference, if any, between the amount of that reduction and the target for the region established by CARB." CARB set targets for lowering GHG emissions in the San Joaquin Valley from 2005 levels by 5% for passenger vehicles and light trucks by 2020, and a reduction of 10% from 2005 to 2035 through land use and transportation planning. SCS strategies are expected to reduce GHG emissions from 2005 levels by 14.1% by 2020 and 16.6% by 2035, thus exceeding the targets set by CARB.

Some of the SCS proposals to reduce GHG emissions from vehicles include:

- Construct new transit lines;
- Expand bus and passenger rail service;
- Promote carpooling and vanpooling;
- Implement employer-based trip reduction strategies;
- Promote walking and biking; and
- Implement intelligent transportation systems (ITS)/traffic management.

CAPCOA White Paper

In January 2008, the California Air Pollution Control Officers Association (CAPCOA) issued a "white paper" on evaluating GHG emissions under CEQA (CAPCOA 2008). The CAPCOA white paper strategies are guidelines and have not been adopted by any regulatory agency. The white paper serves as a resource to assist lead agencies in evaluating GHGs in environmental information documents. [The CAPCOA White Paper (CEQA and Climate Change) specifically includes a disclaimer on its first page that reads: "[t]his paper is intended as a resource, not a guidance document. It is not intended and should not be interpreted, to dictate the manner in which an air district or Lead Agency chooses to address GHG emissions in the context of its review of projects under CEQA. This paper has been prepared at a time when California law has been recently amended by the Global Warming Solutions Act of 2006 (AB 32) and the full programmatic implications of this new law are not yet fully understood." The methodologies used in this GHG analysis are consistent with the CAPCOA guidelines and with the SJVAPCD's guidance for projects subject to the statewide Cap-and-Trade Regulation.

4.7.4 Impacts and Mitigation Measures

This section describes the methodology used in conducting the CEQA impact analysis for GHG emissions; the thresholds of significance used in assessing impacts to GHG emissions; and the assessment of impacts to GHG emissions and global climate change, including relevant mitigation measures.

Methodology

The GHG analysis methodology used in this EIR quantifies direct GHG emissions from permitted and non-permitted facilities, as well as combustion, venting, and fugitive sources associated with construction, well production and stimulation, and well abandonment proposed as part of the Project. Emissions from vehicles used for transportation of personnel, materials, and equipment during construction and operation are also included in the analysis. The indirect effects of the Project are also discussed as part of the overall Project GHG impacts.

The baseline for purposes of this analysis is considered to be the physical conditions existing as of 2012. GHG baseline emissions for year 2012 were determined from the CARB Annual

Summary of GHG Mandatory Reporting Non-Confidential Data for Calendar Year 2012 for all reporting oil and gas facilities in Kern County. The change in the environment subject to analysis under this EIR results from oil and gas production and processing activities conducted between 2015 and 2035.

GHG emissions impacts associated with the Project are separated by construction and operational emissions. Refer to Table 4.3-10 for further detail on data sources and assumptions used to estimate emissions from GHG and air criteria pollutants associated with construction activities.

GHG emissions from construction activities associated with the Project were estimated in three categories, as follows:

- Construction of new facilities for crude oil and natural gas production and processing, such as crude oil dehydration facilities and new steam generator plants;
- Construction of permit-exempt sources; and
- Construction activity related to wells

Operational emissions sources include emissions from oil and gas production facilities which are subject to MRR, estimated emissions from sources exempt from MRR, emissions from routine well operations and maintenance, and emissions from mobile sources, such as routine business travel. The analysis that follows is consistent with the recommendations of the SJVAPCD's March 2015 Guidance for Assessing and Mitigating Air Quality Impacts.

The GHG analysis to support this evaluation uses a baseline level of 43,028 wells that were operating in 2012 and an assumed number of 82,136 wells operating in 2035. The assumed number of new wells constructed spans from 3,966 in 2015 to 4,083 in 2035. The number of wells projected to be built in 2035 exceeds the number of wells that are projected to be authorized under this Project and therefore these estimates are considered conservative. Kern County does not anticipate authorizing more than 3,647 new well permits in a single year

As stated previously, climate change is a cumulative and global issue causing global impacts. Thus, the study area for climate change and the impact analysis of GHG emissions is broad because climate change is influenced by global emissions and their associated effects. Those effects of climate change can also have localized impacts on resources and ecosystems in California. Despite that fact that climate change is a global issue, CEQA only requires that an EIR address indirect impacts that are not speculative.

Section 4.7.3, Regulatory Setting, shows the applicable laws and regulations that ensure management and ongoing reductions of GHG at a state, regional, and local levels. All activities related to oil and gas well stimulation treatments proposed as part of the Project must comply with applicable federal, state, and local laws and regulations and will be subject to review by the SJVAPCD. Additionally, the CARB expects to adopt an Oil and Natural Gas Methane Regulation

in 2015 to achieve GHG emissions reductions from oil and gas extraction and transmission activities.

Note that analytical tools have not been developed that can determine the effect on worldwide global warming from a particular Project-specific increase in GHG emissions, or the effect of global GHG emissions on the climate at a particular location

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist, following the "Environmental Checklist Form," Appendix G to the Statewide CEQA Guidelines as amended by the CNRA and effective on March 18, 2010, state that a project would have significant impacts on GHG emissions if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

Kern County has not developed a quantitative threshold of significance for GHG emissions, but a project found to contribute to a net decrease in GHG emissions and found to be consistent with the adopted implementation of the CARB Climate Change Scoping Plan is presumed to have less-than-significant GHG emission impacts (CARB 2014b).

As indicated in Section 4.7.3, Regulatory Setting, the SJVAPCD has adopted guidance documents for assessing and mitigating GHG impacts on global climate change. Rather than establishing specific numeric thresholds of significance (as in the case of criteria pollutant emissions), the SJVAPCD guidance utilizes a tiered approach to assess cumulative impacts on global climate change. First, a project can demonstrate compliance with an approved GHG emissions reduction program (such as CARB's statewide GHG Cap-and-Trade Program). Second, a project can demonstrate implementation of BPS to reduce GHG emissions. Finally, a project can demonstrate achievement of a 29% reduction in GHG emissions from BAU.

SJVAPCD's CEQA Cap-and-Trade Policy also recommends that projects that are required to comply with CARB's GHG Cap-and-Trade Program be determined to have a less than cumulatively significant impact on global climate change. This policy is included in the SJVAPCD's December 2009 CEQA GHG policies (described above) and its March 19, 2015 Final "Guidance for Assessing and Mitigating Air Quality Impacts" which states that a project whose emissions have been reduced or mitigated consistent with the California Global Warming Solutions Act of 2006 (AB 32) should be considered to have a less than significant impact on global climate change (SJVAPCD 2015).

This approach would include both the CARB's GHG Cap-and-Trade Program and other adopted GHG-reducing regulations (such as the oil and gas methane rule now in development) as adopted

GHG emissions reduction plans. Under the SJVAPCD's tiered approach in assessing significance of project-specific GHG emission increases, projects complying with an approved GHG emission reduction plan or GHG mitigation program which avoids or substantially reduces GHG emissions within the geographic area in which the Project is located would be determined to have a less than significant individual and cumulative impact for GHG emissions (SJVAPCD 2015).

Project Impacts

As discussed previously, climate change impacts are inherently global and cumulative, and not project specific. The SJVAPCD's March 2015 Guidance for Assessing and Mitigating Air Quality Impacts observes that:

"It is widely recognized that no single project could generate sufficient GHG emissions to noticeably change global climate temperature. However, the combination of GHG emissions from past, present and future projects could contribute substantially to global climate change. Thus, project specific GHG emissions should be evaluated in terms of whether or not they would result in a cumulatively significant impact on global climate change" (SJVAPCD 2015, section 8.9.).

Impact 4.7-1: Generate Greenhouse Gas Emissions, Either Directly or Indirectly, that may have a Significant Impact on the Environment

Construction of New Facilities

GHG emissions would occur during all aspects of oil and gas activities, including the construction and operation of permitted sources, and the operation of non-permitted sources in the Western, Central, and Eastern Subareas. New facilities that could be constructed under this Project include crude oil and natural gas production and processing plants, such as crude oil dehydration facilities and new steam generator plants. Equipment that was assumed would be built included boilers, process heaters, internal combustion engines, steam generators, production tanks, and flaring facility. Equipment assumed to be used during construction of new facilities includes graders, tractors/loaders/backhoes, concrete/industrial saws, rubber-tired bulldozers, cranes, forklifts, cement and mortar mixers, pavers, rollers, and air compressors. Total emissions resulting from the construction of new facility equipment during a project year (i.e., any year between 2015 and 2035), and the construction of facilities over the Project period (2015 - 2035) are summarized below in Tables 4.7-8 and 4.7-9.

GHG construction emissions include those related to small permit-exempt oil and gas production settings that would be constructed on an as-needed basis over time and would typically occupy less than 0.5 acre. Future production activities would entail the construction of these types of small facilities throughout the proposed Project Area. No information is available on the number and location of permit-exempt equipment and small production settings that would be constructed or installed during the Project years 2015 – 2035. Due lack of data and because GHG emissions from sources not subject to mandatory GHG reporting are known to be small in quantity, they were assumed to be equivalent to be 5% of the construction GHG emissions for large facilities.

Emissions from Well Activities

Combustion processes associated with the removal and processing of the recovered oil and gas would be the largest source of GHG emissions from the Project. Other GHG emissions would result from the use of off-road equipment typically used in drilling, construction of processing facilities, and operational activities that include diesel-powered pumps, cranes, generators, and blenders, along with truck-mounted storage tanks and vessels that may release methane by venting. Typical mobile sources include vehicles being used offsite to access oil and gas fields for commuting and materials delivery during well construction and operation. These include moving equipment and hauling water, wastewater, well drilling and stimulation fluids, other materials and byproducts, or off-hauling produced oil and gas to processing facilities (DOGGR 2015).

In addition to off-road and mobile sources associated to well construction and operations, the use of well stimulation treatments during the proposed oil and gas development could increase the potential for vented and fugitive GHG losses. Vented emissions are intentional releases of vapors to the atmosphere. Fugitive emissions are unintentional releases of vapors to the atmosphere. Both vented and fugitive emissions could occur during aspect of the Project, such as well completion or while wells are in production, either by additional fuel burning equipment required for the increased production of a given well, or as a result of fugitive losses from sumps and pits, valves and fittings, pumps, compressors, and well heads. The contributions of vented and fugitive sources to overall GHG emissions from oil and gas production are more difficult to quantify than combustion-related emissions, which are a function of fuel burning.

Operational Emissions

GHG emission from the operations of the Project include those facilities subject to MRR, an allowance (10%) for emissions from small facilities not subject to MRR, and emissions from mobile sources associated with well operations and maintenance and routine business travel. Emissions from facilities subject to MRR are estimated based on a projection from the baseline level (2012) and the estimated number of active wells per year.

Table 4.7-8 presents the estimated annual GHG emissions associated with proposed Project construction and operation of the Project. Table 4.7-9 presents baseline emissions (Year 2012) and emissions from the Project at full build-out (Year 2035).

GHG emissions from non-permitted sources and activities are calculated based on emissions within the state. For comparison purposes, construction emissions are amortized over the Project development timeframe (2015 – 2035). For the purposes of this EIR, the anticipated emissions levels anticipated after consideration of compliance with regulatory standards such as the AB 32 Cap-and-Trade Program are considered mitigated emissions.

Table 4.7-8: Proposed Project Annual Greenhouse Gas Emissions

Emission Source	Project Annual Direct GHG Emissions by Subarea ($MMTCO_2e$/year)[1]			
	Western	Central	Eastern	Project Area
Construction Emissions				
Construction of New Facilities[3]	0.29	0.01	0.34	0.68
Construction Related to Wells[4]	0.81	0.17	0.31	1.29
Subtotal Construction Emissions	1.10	0.19	0.65	1.97
Operational Emissions				
Facilities subject to MRR (Average 2015-2035)	11.26	0.35	9.94	21.55
GHG Emissions Allowance for Small Facilities (+10%)	1.13	0.03	0.99	2.15
Operational Mobile Sources[5]	0.15	0.005	0.13	0.28
Subtotal Operational Emissions	12.53	0.39	11.07	23.99
Annual Direct GHG Emissions[6]	**13.63**	**0.57**	**11.72**	**25.96**

Sources: Vector 2015a, 205b; CARB 2013
Notes:
(1) For the purposes of this DEIR, annual emissions have been estimated as an average of GHG emissions for all project sources emissions over the proposed Project lifetime (2015-2035).
(2) For comparison purposes, construction of new facilities emissions are amortized over the proposed Project lifetime (2015-2035).
(3) Construction of new facilities emissions include the following source categories: Process Heater, Production Tanks, VOCDD (Flare), Internal Combustion Engines (RICE), and Steam Generators. Number of units per Subarea is detailed in Appendix J.
(4) Emissions from construction related to wells include the following sources: drilling, rework, stimulation, and abandonment.
(5) Operational mobile sources include emissions form routine well operations and maintenance, and routine business travel.
(6) Unmitigated emissions are the anticipated emissions levels anticipated before consideration of compliance with regulatory standards such as the AB 32 Cap-and-Trade Program and the mitigation measures set forth in this section.

MRR = Mandatory Reporting Regulation
GHG = greenhouse gases
$MMTCO_2e$ = million metric tons of carbon dioxide equivalent

Emissions shown in Table 4.7-9 for the Project build-out in 2035 are expected to be a decrease from BAU levels as regulatory initiatives are phased in to reduce GHG emissions from sources across the state. On a per-well basis, GHG emissions from oil production would be reduced over time due to GHG emission reductions required under multiple programs, including California's GHG Cap-and-Trade Program, California's pending rule limiting methane emissions from oil and gas production, and implementation of the EPA's Reformulated Fuels Standard (RFS-2). The total anticipated GHG emissions from oil and gas operations in Kern County are projected to increase from 2012 to 2035 due to a projected increase in the number of wells. However, GHG emissions from construction and operation of oil and gas wells will continue to be subject to CARB's AB 32 Cap-and-Trade Program and other regulatory mandates, so that oil and gas production in Kern County would not conflict with statewide GHG emissions goals and objectives.

GHG Reductions from the California GHG Cap-and-Trade Program. As discussed above, CARB's Cap-and-Trade Regulation establishes a set of rules that limit GHG emissions from the state's largest sources of GHGs by applying a statewide aggregate GHG allowance budget to covered entities (17 CCR 95800 to 96023). The regulation also provides a trading mechanism for compliance instruments (17 CCR 95920 et seq.). The Cap-and-Trade Program imposes an enforceable statewide cap on GHG emissions at covered facilities (including refineries, electric power providers, cement production facilities, and oil and gas production facilities, and expanded to include fuel suppliers beginning in 2015) that steadily declines over time. For each compliance period (2013-2014, 2015-2017, and 2018-2020), each covered facility ultimately is required to surrender GHG compliance instruments (emission allowances or offset credits) equal to its GHG emissions during the compliance period (with limited exceptions for GHG emissions that are not subject to a compliance obligation). The quantity of compliance instruments required to be surrendered is the facility's compliance obligation. Since a facility's compliance obligation is equal to its actual GHG emissions during the relevant compliance period, the compliance

obligation can be reduced by implementing programs within the facility to reduce GHG emissions.

An allowance is a tradable permit to emit 1 $MTCO_2e$ GHG emission. Covered entities may also use a limited number of CARB offset credits to meet their compliance obligation. A covered facility may obtain GHG compliance instruments by any or all of the following methods:

- Receiving free allowances allocated by CARB;
- Purchasing allowances at CARB quarterly allowance auctions;
- Purchasing allowances from other covered facilities or entities in the program;
- Purchasing GHG offset credits generated by emission reduction activities at other facilities; and
- Purchasing compliance instruments (allowances or credits) from other GHG trading programs formally "linked" to California's Cap-and-Trade Program.

If a covered facility does not surrender sufficient compliance instruments to meet its GHG emissions compliance obligation by the applicable deadline following the end of a compliance period, the facility has a limited time following the deadline in which to provide additional compliance instruments to cover its shortfall in surrendering compliance instruments. The shortfall must be covered by providing allowances (not offset credits) in an amount equal to four times the amount of the shortfall.

In general, the total number of allowances available statewide for each calendar year decreases annually through 2020, thus establishing the cap. (The total quantity of allowed emissions actually increased for 2015 to account for the addition of fuel suppliers and additional electricity importers to the program. However, the net effect of the Cap-and-Trade rule is to reduce statewide GHG emissions from covered sources.) The cap will decline approximately 3% each year beginning in 2013, representing an 18% reduction from the statewide 1990 baseline (CARB 2015; DOGGR 2015).

A certain number of allowances are allocated without cost to the recipient (the "direct allocation"), based on rules in the Cap-and-Trade Regulation and depending on the type of facility. The quantity of direct allowances allocated to covered facilities engaged in crude petroleum and natural gas extraction activities is determined using a product output-based allocation methodology, which is based on barrel efficiency benchmarks (17 CCR 95891). The direct allocation to a given facility may be less than the facility's compliance obligation. The remainder of allowances required for annual compliance must be purchased through auctions managed by CARB, from other owners of GHG allowances, or from third-party traders, as discussed above.

California petroleum and natural gas system processes or operations, including onshore oil and gas production, with covered emissions of 25,000 MT or more of CO_2e per data year are covered under the Cap-and-Trade Program 17 CCR 95811(a)(9), 95852(h), 95802(a)(143)(C) ("Where a person or entity owns or operates more than one well in a [hydrocarbon] basin, then all onshore petroleum and natural gas production equipment associated with all wells that the person or entity owns or operates in the basin would be considered one facility."), 95802(a)(258). See also 17 CCR 95812(c) (4), 95101(e) (2). An onshore petroleum or natural gas production facility that does not exceed the inclusion threshold of 25,000 MT or more of CO_2e per data year may elect to voluntarily opt-in to the Cap-and-Trade Program. The entity with operational control over a covered source (a facility within a covered sector and with covered emissions that meet or exceed the applicability threshold) bears responsibility for meeting the Cap-and-Trade compliance obligations 17 CCR 95811(a), 95802(a)(258) (For onshore petroleum and natural gas production, the operator is the operating entity listed on the state well drilling permit, or a state operating permit for wells where no drilling permit is issued by the state).

With respect to the proposed Project's permitted source GHG emission impacts, operators of covered facilities are required to comply with the Cap-and-Trade Program (e.g., by reducing GHG emissions within their facilities or by surrendering GHG allowances, offset credits, or other compliance instruments to offset the GHG emissions identified in Table 4.7-8).

With regard to onshore oil and natural gas production, only facility emissions (e.g., emissions resulting from combustion of fossil or other fuel and certain process and vented emissions) create a Cap-and-Trade compliance obligation for a covered facility (17 CCR 95852). For an onshore petroleum and natural gas production facility, the operator must report CO_2, CH_4, and N_2O emissions from the following source types on a well-pad, associated with a well-pad or associated with equipment to which an emulsion (a mixture of crude oil, condensate, or produced water in any proportion [17 CCR 95102(a)(147)]) is transferred : (1) metered natural gas pneumatic device and pump venting; (2) non-metered natural gas pneumatic device venting; (3) acid gas removal vents; (4) dehydrator vents; (5) well venting for liquids unloading; (6) gas well venting during well completions and workovers; (7) equipment and pipeline blowdowns; (8) dump valves; (9) well testing venting and flaring; (10) associated gas venting and flaring; (11) flare stack or other destruction device emissions; (12) centrifugal compressor venting; (13) reciprocating compressor rod packing venting; (14) enhanced oil recovery (EOR) injection pump blowdown; (15) crude oil, condensate and produced water CO_2 and CH_4; (16) equipment leaks from valves, connectors, open-ended lines, pressure relief valves, pumps, flanges, and other equipment leak sources (such as instruments, loading arms, stuffing boxes, compressor seals, dump lever arms, and breather caps); and (17) stationary or portable equipment including equipment which is integral to the extraction, processing, and movement of oil and/or natural gas; such as well pad construction equipment, well drilling and completion equipment, equipment used for abandoned well plugging and site reclamation, workover equipment, natural gas dehydrators, natural gas compressors, electrical generators, steam boilers, and process heaters (17 CCR 95152(c)). These emissions are reported under MRR lead to the Cap-and-Trade compliance obligation.

Other process, vented, and fugitive emissions, including, but not limited to, emissions from storage tanks used in petroleum and natural gas production, emissions from natural gas transmission storage tanks used in petroleum and natural gas production, and emissions from produced water do not count toward a covered entity's compliance obligation under the Cap-and-Trade Program because they are specifically identified as exempt emissions (17 CCR 95852.2 (b) (3), (5)). Following the reasoning in the SJVAPCD "CEQA Cap-and-Trade Policy," stationary source emissions that are exempt from Cap-and-Trade and from facilities with emissions below the Cap-and-Trade applicability threshold are considered insignificant.

Other categories of Project-related GHG emissions do not contribute to the covered facility's Cap-and-Trade Program GHG compliance obligation, including emissions from fuel combustion in construction equipment and other mobile sources used in connection with Project construction and operation, and indirect emissions from electricity generation. While these emissions do not create a compliance obligation for oil and gas production facilities, they are covered by the Cap-and-Trade Regulation in connection with the activities of other source categories, such as electricity generation or import and fuel suppliers. To the extent that fuels are supplied from fuel suppliers that are not subject to the Cap-and-Trade Regulation because emissions from the quantities of fuel supplied would not exceed the Cap-and-Trade applicability threshold, the SJVAPCD's CEQA Cap-and-Trade Policy states: "As did the ARB when excluding such sources from the Cap-and-Trade Regulation, the District considers GHG emissions resulting from the combustion of all fuels supplied by those fuel suppliers not subject to the Cap-and-Trade Regulation to be insignificant. Therefore, it is reasonable to apply this policy to GHG emissions resulting from the combustion of all fuels in the State of California."

As described above, the Project will result in an overall increase in GHG emissions from oil and gas production activities within the County. GHG emissions not covered by the Cap-and-Trade Program and fugitive emissions also contribute to a net increase of GHGs in the region. For example, the use of enhanced recovery and well stimulation treatments could increase the GHG emissions from oil and gas production by increasing the potential for vented and fugitive losses during well completion or while in production, by increasing the production of a given well, and by requiring additional fuel burning equipment. Nevertheless, the Project would be consistent with the Cap-and-Trade Regulation because all significant facility emissions are subject to the Cap-and-Trade Regulation, either as stationary source emissions for which the facility operator has a compliance obligation, or as emissions from fuel combustion, for which the fuel supplier has a compliance obligation; methane emissions will be limited by the new CARB methane rule expected to be adopted by the end of 2015.

However, GHG emissions not covered by Cap-and-Trade Regulations and the BPS, and fugitive emissions may contribute a net increase of GHG in the region that would be a potentially significant impact. To account for additional sources of Project-related GHG emissions not estimated in this analysis (i.e., indirect sources, fugitive emissions), the County has determined to conservatively mitigate project direct GHG emissions to net zero.

GHG emissions from the Project would be potentially significant. Implementation of Mitigation measures MM 4.7-1 to 4.7-4 would reduce impacts to a less than significant level.

Mitigation Measures

MM 4.7-1 An Applicant with permitted stationary sources shall comply with the Cap-and-Trade regulation (e.g., by reducing greenhouse gas emissions within their facilities or by surrendering greenhouse gas allowances, offset credits, or other compliance instruments to offset the greenhouse gas increases), and implement Best Performance Standards applicable to greenhouse gas reduction for Components at Light Crude Oil and Natural Gas Production, Natural Gas Processing Facilities, Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants (San Joaquin Valley Air Pollution Control District 2010), Thermally Enhanced Oil Recovery Wells (San Joaquin Valley Air Pollution Control District 2010a), Steam Generators (San Joaquin Valley Air Pollution Control District 2010b), and Front-line Organic Liquid Storage Tanks (San Joaquin Valley Air Pollution Control District 2011).

MM 4.7-2 Each Applicant shall comply with applicable Cap-and-Trade regulations, and other applicable greenhouse gas emission control and reduction regulations as these may be adopted or amended over time, to reduce, avoid, mitigate and/or sequester greenhouse gas emissions from Project-related air emissions.

MM 4.7-3 Each Applicant shall implement methods to recover for reuse or destroy methane existing in associated gas and casinghead gas, as follows:

a. Recover all associated gas produced from the reservoir via new wells, regardless of the well type, except for gas produced from wildcat and delineation wells or as a result of start-up, shutdown and maintenance activities (whether planned or unplanned), system failures, and emergencies in accordance with San Joaquin Valley Air Pollution Control District regulations (Rule 4401 and 4409), as this may be amended over time.

b. Compliance with the expected California Air Resources Board methane regulation.

MM 4.7-4 Each Applicant shall offset all greenhouse gas emissions not covered by the Cap-and-Trade program or other mandatory greenhouse gas emission reduction measures through Applicant reductions of greenhouse gas emissions as verified by the San Joaquin Valley Air Pollution Control District, through acquisition of offset credits from the California Air Pollution Control Officers Association Exchange Register or other third party greenhouse gas reductions as verified by the San Joaquin Valley Air Pollution Control District, or through inclusion in an Emission Reduction Agreement, to offset Project-related greenhouse gas emissions that are not included in the Cap-and-Trade program to assure that no net increase in greenhouse gas emissions from the Project.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.7-2: Conflict with any Applicable Plan, Policy, or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gas

The Project regulatory setting (Section 4.7.3, Regulatory Setting) describes the applicable plans, policies, and regulations adopted at federal, state, and local levels for the purpose of reducing GHG emissions from oil and gas sources in Kern County. The primary requirements for oil and gas activities in the Project Area would include the MRR, the Cap-and-Trade Program, the low carbon fuel standard (LCFS) (applies to all providers of transportation fuels in California), and the SJVAPCD requirements established in rules, BPS, and the CCAP.

As mentioned previously, covered facilities associated with the Project are subject to CARB's GHG Cap-and-Trade Program, which imposes an enforceable cap on regulated facilities that declines over time. Under the program, the facility operator will be required to reduce GHG emissions within the facility or to surrender GHG allowances, offset credits, or other compliance instruments to offset any permitted source GHG emission increases associated with the proposed Project. Similarly, suppliers of transportation fuels used in Project-related construction and other vehicle use associated with the Project must also surrender compliance instruments equal to the GHG emissions from the combustion of all fuels that they supply. This will ensure that the proposed Project's permitted and mobile source GHG emission increases will be consistent with California's Cap-and-Trade Program for reducing GHG emissions under AB 32.

Electric utilities supplying power to the facilities also are subject to the GHG Cap-and-Trade Program. This will ensure that these emissions will be consistent with California's AB 32 program for reducing GHG emissions.

Non-permitted sources/activities associated with the proposed Project could also be affected by the following California Climate Change Scoping Plan measures:

E-3 (Achieve a 33% Renewables Mix by 2020). This measure is being implemented by the California Energy Commission and the California Public Utilities Commission under Senate Bill X1-2 (Simitian), signed by Governor Brown in April 2011. The Public Utilities Commission reports that the State's three large investor-owned utilities collectively served 19.6% of their 2012 retail electricity sales with renewable power (CPUC 2014):

- Pacific Gas and Electric: 19%;
- San Diego Gas and Electric: 20.3%; and
- Southern California Edison: 19.9%.

It is expected that electricity providers will comply with the mandated 33% renewables standard.

T-2 (Low Carbon Fuel Standard). CARB approved the LCFS in April 2009, and it became effective in 2010. Since its adoption, the LCFS has faced legal and regulatory challenges. To the extent that the LCFS becomes fully effective and low-carbon fuels come to the California marketplace, locomotive, truck, and other vehicle operators are expected to purchase such fuels.

T-4 (Vehicle Efficiency Measures). Vehicle efficiency measures include low friction oil, tire pressure regulation, tire tread program, and solar reflective automotive paint/window glazing. The tire pressure regulation has been approved and the tire tread program is under evaluation by CARB. CARB reports that the low friction oil component already has been achieved in practice. Potential reductions through design are to be considered as part of CARB's Advanced Clean Cars measure. Truck and other motor vehicle operators are expected to comply with such measures as technology required by the program comes to the California marketplace.

On a per-well basis, Project-related GHG emissions are expected to decrease over time as regulatory initiatives are phased in to reduce GHG emissions from many sources across the state. Although GHG emissions from oil production activities that constitute the Project may increase over time due to an increase in the number of active wells, as discussed above, numerous initiatives by the State of California will reduce statewide GHG emissions and certain emissions associated with oil and gas production facilities, including the Pavley rules that will reduce emissions from automobiles, regulations that will reduce emissions from heavy duty trucks, the Renewable Portfolio Standard (RPS) that will reduce emissions from electricity, the LCFS that will reduce emissions from heavy duty trucks and off-road mobile equipment, and the CARB rules discussed in Section 4.3, Air Quality.

Several policies, including recent EOs calling for increased GHG reductions in future years (e.g., 2030) and for specific sectors (e.g., transportation fuels) are anticipated to result in a significant decrease in the demand for oil. Oil is a global commodity, and is historically produced in sufficient quantities to meet global demand, although various factors influence pricing and availability of this commodity at any one time. Oil produced in California is subject to stringent environmental, workplace safety, and public safety standards and, unlike oil produced elsewhere, does not require transportation (and transportation-based GHG emissions) to reach the California market. It is anticipated that oil produced in California will continue to help supply state and regional needs, and potentially serve an increasing share of the market as overall consumption of oil is reduced over time to meet GHG reduction policies.

Based on the foregoing, the proposed Project will be consistent with California's adopted California Climate Change Scoping Plan, CARB's GHG Cap-and-Trade Program, and other applicable adopted standards and regulations. Impacts are therefore anticipated to be less than significant.

Impacts from the Project on applicable plans, policies, or regulations adopted for the purpose of reducing the emissions of GHG emissions would be potentially significant. While implementation of MM 4.7-1 through MM 4.7-3 and the 2014 RTP mitigation measures would encourage reduction in GHG emissions at a regional level, they do not provide a mechanism that guarantees GHG emission reductions on a cumulative basis. Kern County also lacks the jurisdiction and control over the many cumulative sources of GHG emissions, and over the global source of GHG emissions, that collectively contribute to climate change. Many other agencies with the requisite jurisdiction are taking steps to reduce GHG emissions; however, the County cannot assure that these steps will ultimately be implemented or sufficient to address global climate change. Therefore, Impact 4.7-2 would remain significant and unavoidable.

Mitigation Measures

Implement MM 4.7-3, as described above.

Level of Significance After Mitigation

Impacts would be significant and unavoidable.

4.7.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

As discussed previously, impacts associated with GHG emissions are cumulative in nature, rather than Project-specific. Refer to Section 4.7.1, Introduction, for a discussion of the cumulative setting for GHG emissions.

Under AB 32, CARB, which is the agency in charge of regulating sources of emissions of GHGs in California, has been tasked with adopting regulations for the reduction of GHG emissions. The effects of this Project are evaluated based not upon the quantity of emissions, but rather on whether the Project is consistent with reduction strategies identified in AB 32, the governor's EOs S-3-05 and B-30-15, or other strategies to help toward reducing GHGs to the proposed levels. If so, it could reasonably follow that the Project would not result in a significant contribution to the cumulative impact of global climate change.

The geographic scope for cumulative impacts for GHGs includes the area within 6 miles of the external Project Area boundary, and areas (e.g., incorporated cities) within the Project Area. While projects in the region and the larger area affect the volume of GHG in the atmosphere, by focusing on plans scheduled to be implemented within the Project Area and in the vicinity of the Project Area, the analysis of cumulative impacts can be given a regional context.

Impact 4.7-3: Cumulative Greenhouse Gas Emissions Impacts

The Kern County 2005 base year GHG emissions inventory was estimated to be 27 $MMTCO_2e$/year, of which the Fossil Fuel Industry sector represents 40%, followed by the Electricity Consumption sector at 22% (Table 4.7-5). The 2020 forecasted GHG emissions inventory was estimated to be 27 $MMTCO_2e$/year of which the Electricity Consumption sector represents 31% followed by the Fossil Fuel Industry sector at 26% (SJVAPCD 2012).

As shown in Table 4.7-9, Project-related unmitigated GHG emissions in 2012 (i.e., emissions before the application of AB 32 Cap-and-Trade Program and other GHG reduction requirements) were 16.95 $MMTCO_2e$/year and would be 32.40 $MMTCO_2e$/year in 2035. The total for mitigated emissions in 2035 would be lower, after application of emission reduction credits and mitigation.

Plans considered in this analysis include the Kern Council of Governments (COG) Regional Transportation Plan (RTP) (see Section 4.7.3, Regulatory Setting, for description) which provides regional-scale measures to regulate, monitor, and control GHG emissions in Kern County. The

RTP is based on an analysis that considers the entire County, and includes all projects involving changes in regional growth and land use in Kern County, as well as the countywide vehicle traffic projections. Cumulative GHG emissions analyzed in the RTP were compared to regional GHG thresholds and analyzed under statewide plans and regulations. This analysis concluded that the projected increase in GHG emissions from existing conditions to 2040 would primarily be due to changes in regional growth/land use; however, the RTP achieves GHG emissions reduction targets from mobile sources from 2005 levels by implementing a mix of land use strategies, transportation management, economic factors, and road projects.

As discussed previously, impacts associated with GHG emissions are cumulative in nature, rather than Project-specific. These impacts are addressed above under Impact 4.7-1 and Impact 4.7-2. As discussed under Impact 4.7-1, all significant Project GHG emissions are subject to the statewide GHG Cap-and-Trade program. Further, as discussed under Impact 4.7-2, the Project is anticipated to be consistent with the adopted California Climate Change Scoping Plan, CARB's GHG Cap-and-Trade Program, and other applicable adopted standards and regulations.

The Kern COG RTP recommends the implementation of six mitigation measures that would reduce cumulative GHG emissions through the adoption of measures and policies that encourage GHG emissions reduction in regional plans, adoption of Climate Action Plans by local agencies, and using BACT during construction and operation of implemented projects.

Consistency with EO S-3-05 and EO B-30-15

As described above, EO S-3-05 establishes a goal that statewide GHG emissions be reduced to 80% below 1990 levels by 2050. EO B-30-15 sets forth an interim goal for reduction in GHG emissions to 40% below 1990 levels by 2030. This analysis considers the Project's consistency with the GHG emission reduction goals set forth in both EOs. This analysis is provided consistent with the recent appellate court decision in Cleveland National Forest Foundation, et al. v. San Diego Association of Governments (2014) 231 Cal.App.4th 1056 (SANDAG) (currently pending review by the California Supreme Court), which concluded that CEQA requires an EIR to analyze whether a project's GHG emissions are consistent with the emission reduction goals set forth in EO S-3-05.

This consistency analysis is provided for informational purposes only; the County has not established the statewide goals set forth in the EOs as thresholds of significance. The County does not believe that the 2050 target or the 2035 interim target are appropriate significance criteria for this Project. Rather, AB 32, which requires a reduction of statewide GHG emissions to 1990 levels by 2020, and which also imposes the legal obligation to continue existing policies and maintain emission reductions beyond 2020, is the current law in California. The County is not in a position to speculate as to how the Legislature will move the State forward from the 2020 mandate to achieve further reductions in future years. In addition, as an independent political subdivision of the State the County has independent authority, under both its police power and pursuant to CEQA, to establish thresholds of significance.

The County does not believe that the general directives in the EOs to reduce statewide GHG emissions from 1990 levels by 40% in 2030 and 80% in 2050 are legal mandates or required to be included as a significance threshold under the CEQA.

Further, the 2030 target of 40% below 1990 emissions and the 2050 target of an 80% reduction are general statewide goals. While AB 32 has a similar statewide goal, AB 32 been implemented on a detailed, sector-by-sector basis, with different sectors being responsible for different levels of reductions. It is impossible for the County to predict what percentage of reduction would be required of the oil and gas industry to help achieve the statewide 2030 and 2050 targets. Assigning an across-the-board 40% or 80% reduction from 1990 levels to the oil and gas industry in Kern County is not consistent with the manner in which GHG reductions have been and are being achieved under AB 32.

Based on current projections, it is anticipated that Project GHG emissions from the oil and gas industry in Kern County will result in additional GHG emissions as set forth in Table 4.7-9.

CARB designed the Cap-and-Trade Program so that most of the future cumulative GHG emission reductions from the oil and gas sector and other covered industries ensure the State achieves AB 32's 2020 GHG reduction target and continues a downward trajectory of emissions post-2020, consistent with the EOs' long-term GHG emission reduction goals. As stated in the Scoping Plan Update, "the Cap-and-Trade Regulation provides assurances that California's 2020 limit will be met because the regulation sets a firm limit on 85% of California's GHG emissions" (Scoping Plan Update, pp. 86-87). While the current cap is set to ensure California complies with AB 32's emission reduction target of returning to 1990 levels by 2020, the Scoping Plan also makes clear that the AB 32 GHG reduction program "will continue to be a vital component in achieving California's longer-term climate change goals" (Id. at p. 87). Consistent with AB 32, the Cap-and-Trade Program will be used "to maintain and continue reductions in emissions of greenhouse gases beyond 2020" (Health & Saf. Code, § 38551, subd. (b); see also Climate Change Scoping Plan, p. ES4 ["Looking out into the future, the Cap-and-Trade Program will play a critical role in keeping California on the right emissions reduction trajectory to meet ongoing reduction targets at the lowest possible cost."]) Thus, the Cap-and-Trade Program constitutes an existing flexible and adaptive approach capable of ensuring oil and gas operations within the State will allow the State to achieve either EO B-30-15's 2030 GHG target or EO S-3-05's 2050 GHG target. As a result, the County finds that the proposed Project will not interfere with the ability of the State to achieve either EO B-30-15's 2030 GHG target or EO S-3-05's 2050 GHG target. The County concludes that the proposed Project as mitigated is consistent with the goals of both EOs.

Note that there are numerous Legislative proposals to adopt interim targets, and long-term targets, for GHG reductions remain pending as of issuance of this Draft EIR (DEIR). If enacted, new legal mandates will be addressed in the Final EIR (FEIR).

Impacts from the Project on cumulative GHG emissions would be potentially significant. While implementation of MM 4.7-1 through MM 4.7-3 and the 2014 RTP mitigation measures would encourage reduction in GHG emissions at a regional level, they do not provide a mechanism that guarantees GHG emission reductions on a cumulative basis. Kern County also lacks the

jurisdiction and control over the many cumulative sources of GHG emissions, and over the global source of GHG emissions, that collectively contribute to climate change. Many other agencies with the requisite jurisdiction are taking steps to reduce GHG emissions; however, the County cannot assure that these steps will ultimately be implemented or sufficient to address global climate change. Therefore, Impact 4.7-3 would remain significant and unavoidable.

Mitigation Measures

Implement MM 4.7-4, as described above.

Level of Significance After Mitigation

Impacts would be significant and unavoidable.

Section 4.8

Hazards and Hazardous Materials

Section 4.8

Hazards and Hazardous Materials

4.8.1 Introduction

This section describes the affected environment and regulatory setting for hazards and hazardous materials. It also describes the hazards and hazardous materials impacts that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance (Project) and related ordinances, and mitigation measures that would reduce these impacts, if necessary.

Hazards associated with seismic conditions are addressed in Section 4.6, Geology and Soils, of the Environmental Impact Report (EIR). Although this section does address the impacts of releases of hazardous materials, the impacts of the effects of potential releases relating to water quality and biological resources are also discussed in Section 4.9, Hydrology and Water Quality, and Section 4.4, Biological Resources, of the EIR.

4.8.2 Environmental Setting

This section defines the existing potential hazards within the Project Area to establish a baseline from which impacts associated with the Project can be measured. A complete description of the proposed Project Area including the regional location, project boundary, and surrounding land uses can be found in Chapter 3, Project Description, of this EIR. The environmental setting for hazardous materials, air traffic, low frequency noise, disease vectors, fire hazards, and the unearthing or exposure of hazardous wastes and contaminated soil or groundwater that have the potential to affect human health are presented in this section.

Hazardous Materials and Waste

A hazardous material is any substance that, because of its quantity, concentration, or physical or chemical properties, may pose a hazard to human health and the environment. Under Title 22 of the California Code of Regulations (CCR), the term "hazardous substance" refers to both hazardous materials and hazardous wastes. Both of these are classified according to four properties: (1) toxicity; (2) ignitability; (3) corrosiveness; and (4) reactivity (CCR Title 22, Chapter 11, and Article 3). A hazardous material is defined in CCR, Title 22 as:

A substance or combination of substances which, because of its quantity, concentration, or physical, chemical or infectious characteristics, may either (1) cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported or disposed of or otherwise managed (CCR, Title 22, Section 66260.10).

Hazardous materials in various forms can cause death, serious injury, long-lasting health effects, and damage to buildings, homes, and other property. Hazards to human health and the environment can occur during production, storage, transportation, use, or disposal of hazardous materials.

The California Department of Toxic Substances Control (DTSC) defines hazardous waste as a waste with properties that make it potentially dangerous or harmful to human health or the environment. They can be the by-products of manufacturing processes, discarded used materials, or discarded unused commercial products, such as cleaning fluids (solvents) or pesticides. In regulatory terms, a hazardous waste is a waste that exhibits one of the four characteristics of a hazardous waste: ignitability, corrosivity, reactivity, or toxicity. However, materials can be hazardous waste even if they are not specifically listed or do not exhibit any characteristic of a hazardous waste. For example, "used oil," products, which contain materials on California's M-list (which includes certain wastes known to contain mercury, materials regulated pursuant to the mixture or derived-from rules, and contaminated soil generated from a "clean up,") can also be hazardous wastes.

Transportation of Hazardous Materials

Hazardous materials could be shipped to, through, or from Kern County via truck, rail, and pipeline. The exact point of origin of hazardous materials that are used in the oilfields is not known. Individual companies or operators use different suppliers or oilfield services companies that could produce materials locally or transport them from wholesalers throughout the country or world.

Crude oil is transported to Kern County via truck, pipeline, or rail. However, no oil or gas produced in Kern County is shipped by rail. It is either trucked out or transported via pipelines.

Natural gas liquids are stored and sold through a natural gas liquids tanker truck loading facility or sales pipelines. A natural gas liquids loading facility typically consists of tank storage and tanker truck loading racks for delivery to offsite purchasers. Natural gas is delivered to these facilities via pipelines from gas processing facilities. Processed natural gas is then either transported through sales pipelines to sales metering stations to natural gas purchasers, or may be combusted as fuel for gas-fired equipment, or re-injected in oilfield operations for reservoir pressure maintenance.

The transportation of hazardous materials within the state of California is subject to various federal, state, and local regulations. The California Highway Patrol (CHP) restricts transportation of hazardous materials to specific routes. Information on CHP requirements and regulatory authority is provided in Section 4.8.3, Regulatory Setting, below.

The following paragraphs provide more details about the modes of hazardous material transport in the Project Area.

Trucks

Truck transportation of hazardous materials is commonly utilized for transporting smaller quantities of a product compared to the volume of materials that could be transported by rail or pipeline.

Crude oil is distributed to refineries or to offsite storage facilities using tanker trucks. Two to 5% of crude oil produced in Kern County is transported via tanker trucks to central facilities. Trucks may carry crude oil to local refineries or to a facility where it is placed into a pipeline system. In either case, crude oil would be loaded into tanker trucks directly from the operation's onsite storage facility. The three refineries and related storage distribution facilities in Kern County are equipped to accept oil from tanker trucks. Crude oil at storage distribution facilities would later be pumped into a distribution pipeline or tanker trucks to transport the crude oil to offsite locations.

A typical tanker truck is able to transport 9,000 gallons of crude oil. The transportation of crude oil via tanker truck is regulated by the California Department of Transportation (Caltrans) and U.S. Department of Transportation (USDOT) motor carrier regulations.

Pipelines

Crude oil is transported from the Project Area to refineries via pipeline. Refineries are located throughout the state including within the Project Area. Figure 4.8-1 illustrates the locations that transport crude oil and refineries where it could be processed. Inland California crude oils are typically first piped to local refineries in Bakersfield and Santa Maria due to their proximity. The balance of the inland crude oils are piped to Northern and Southern California refineries (Sheridan 2006).

In the Project Area, pipelines connect wells to tanks that separate oil from the other extracted liquids (primarily "produced water" from the same geologic strata as the oil or gas, along with water and additives that may be injected as steam or liquid to help extract the oil). Wells also have waste gas collection lines. Aboveground pipelines connect the thermal generator to the injection sites used for thermal enhanced oil recovery production. Pipelines are also required to pump water, steam, or other substances into the reservoir during well stimulation and enhanced oil recovery procedures. Types of pipelines in the Project Area include those discussed in Chapter 3, Project Description, and include flow lines, injection lines, steam lines, casing vapor recovery gas lines, gathering lines, and headers. In general, most pipelines are installed aboveground but may be installed underground to cross roadways. Some portions of pipelines are installed aboveground on the surface of the well pad.

Figure 4.8-2 depicts a fluid flow line from a well to a tank battery at San Joaquin Facilities Management (San Joaquin Facilities Management Production Facility Spill Contingency Plan). Figures 4.8-3 and 4.8-4 depict pipelines with other oil and gas facilities.

Rail

Rail is used as one of the modes of transport for hazardous materials utilized in oil and gas

activities within the Project Area, and is used to transport crude oil to the Project Area, but not to transport crude oil generated within the Project Area. Rail transportation of hazardous materials in the United States is a primary method of moving large quantities of chemicals over long distances. Recent statistics show that the rail industry's safety performance is improving. The majority of hazardous materials shipped by rail tank car annually arrive without incident. For all hazardous materials, in the 12 years from 1994 through 2005, hazardous materials released in railroad accidents resulted in a total of 14 fatalities. In the same period, hazardous materials released in highway accidents resulted in a total of 116 fatalities (FRA 2015a). The number of train derailments per year has been reduced by over 46% nationwide from 2005 to 2014. In 2014, there were 1,242 derailments nationwide including all modes of rail transit. In that same year, 7,532 railcars carried hazardous materials. Rail incidents in 2014 resulted in 15 releases of hazardous materials, representing a 61% reduction from 2005. Kern County specifically has seen a 25% reduction in train accidents from 2005 to 2014 across all modes of rail transport. From 2005 to 2014, 516 railcars passed through the County carrying hazardous materials, but only three were involved in incidents resulting in a release (FRA 2015b).

Hazardous Materials Used During Oil and Gas Drilling

To facilitate drilling and completions operations, temporary facilities, equipment, and materials may be set up and stored on the well pad (e.g., drilling mud supplies, water, drilling materials and casing, crew support trailers, pumps and piping, portable generators, field flares, fuels and lubricants). Containments (i.e., temporary pits, operations sumps, and/or portable tanks) may be set up to store drilling fluids, wellbore cuttings, and drilling wastes. Portable tanks may also be set up to mix and store other needed liquids or slurries, such as drilling fluids and completion fluids.

Table 4.8-1 provides a representative list of materials used in Kern County oil and gas drilling in 2014.

Table 4.8-1: Representative List of Potentially Hazardous Materials Used in Kern County Oil and Gas Drilling and Production in 2014 Excluding Well Stimulation

Type of Material	Examples of the Material Type
Aerosol	Degreaser, Paints
Compressed Gases	Acetylene, Air, Ammonium Chloride, Anhydrous Ammonia, Argon, Butane, Calibration Gas, CO_2, CO, Chlorine, Helium, Nitrogen, Oxygen, Ethane, Fire Extinguishing Agent, Hydrogen, Isobutane, Butane, Propane, Methane, Nitric Oxide, Mixed Gases Pentane, Sulfur Hexafluoride, Stargon, Welding Gas
Fuel, Oils, and Lubricants	Motor Oils (10/40, 30, 40, 80-90), Gear Oil/Grease/Gear Lube Oil Lube Oil, Synthetic Grease, Diesel (Clear, RRR, #1, #2, Red), Crankcase Oil, Gas Engine Oil (40, 80W90), Cylinder Oil, Compressor Oil, Rock Drill Oil, Turbine Oil, Hydraulic oil, Heat Tran/Oil, Industrial Oil, Jet Oil, Refrigeration Oil, Hydraulic Fluid
Liquid	Acetic Acid, Hydrochloric Acid, Citric Acid, Emulsifiers, Ammonium Products, Biocides, Anti Foam, Antifreeze, Urea Solution, Aromatic Fluid, Dispersant, Inhibitors, Bacteriacide, Corrosion Inhibitor, Demulsifier, Sulfur

Table 4.8-1: Representative List of Potentially Hazardous Materials Used in Kern County Oil and Gas Drilling and Production in 2014 Excluding Well Stimulation

Type of Material	Examples of the Material Type
	Scavenger, Water Clarifier, Scale Inhibitor, Water Additive, Degreaser, Emulsion Breaker, Biocide, Bleach, Flocking Agent, Reverse Emulsion Breaker, Reverse Demulsifier, Asphalt Emulsions, Caustic Soda Liquid, Chlorine, Chelant, Cleaner, Coolant, Defoamer, Anti-Sludging Agent, pH Balancer, Oxygen Scavenger, Cooling Water Treatment, Microbiocide, Paint, Ethylene Glycol, Ethyl Mercaptan, Glycol, H2S Scavenger, Hydrogen Peroxide, Isopropanol, Isopropyl Alcohol, Naptha, Parafin Inhibitor, Methanol, Mineral Spirits, Paraffin Dispersant, Polymer, Radiator Fluid, Scale Remover, Soap, Sodium Hydroxide, Sodium Hypochlorite, Sulfide Scavenger, Sulfuric Acid, Surfactant, Triethylene Glycol, Water Clarifier
Liquid Solvent	Cleaning Solvents, Aromatic Solvent, Paraffin Solvent, Cleaning Solvent, Perchloroethylene, Petroleum Distillate, Safety Solvent, Solvents, Stoddard Solvents
Natural Gas	Compressed Natural Gas Liquefied Natural Gas
Natural Gas Condensate	Condensate Treater EA301
Radioactive	Calibration Nuclide V997, Well Logging Nuclide Cy4, Well Logging Nuclide
Solid	Shape Charges, Detonators, Blasting Caps, Polymers, Resins, Batteries, Bactericide, Ignitors, Barite, Acids, Breakers, Emulsifiers, Caustic Soda, Chelating Agents, Stabilizers, Coal, Corrosion Inhibitor, Crosslinkers, Catalysts, Dispersing Agents, Mercaptan, Surfactant, FLOCTREAT, Bulbs, Solvents, Gelling Agents, Graphite, Extender, Acids, Intensifier, Absorbents, Curing Agents, Anti Microbials, Diverting Agent, Wetting Agents, Oil Filters, Perlite, Explosives, Phase Treat, Polypropylene, Propellants, Primer Cord, Sack Black, SCALE TREAT, SCAVTREAT, Sludge, Soda Ash, Sodium Products, Degreaser,

Source: Prepared from hazardous materials inventories obtained from the Kern County Environmental Health Division (KCEH)

Other nonhazardous materials used during oil and gas drilling include, but are not limited to, clays, sands, cements, diatomaceous earth, salts, cellulose, proppants, limestone, fire retardants, coal, fibers, gums, and fly ash.

Based on hazardous materials inventories obtained from Kern County Environmental Health Division (KCEH), the following table summarizes the maximum volumes and maximum container size of hazardous and acutely hazardous substances that are stored on site at oilfields in Kern County. Businesses in California must include a hazardous material inventory disclosure as part of their business plan. The chemicals in the hazardous materials inventory must be reported in gallons, pounds or cubic feet at standard temperature and pressure. The selected units for each substance are commodity based, reportable quantities or on how the material is stored.

Table 4.8-2: Maximum Daily Onsite Volumes

Substance	Maximum Onsite Volume	Maximum Container Volume
Produced Water	2,520,000 Gallons	840,000 Gallons
Crude Oil	12,096,000 Gallons	672,000 Gallons
Condensate	89,274,490 Pounds	9,916,100 Pounds
Natural Gas	25,316 Cubic Feet	25,316 Cubic Feet
Gasoline/Diesel	20,000 Gallons	10,000 Gallons
Acetic Acid	22,730 Pounds	2,640 Pounds
Sulfuric Acid 93%	750 Gallons	750 Gallons
Sodium Hydroxide	82,740 Gallons	42,000 Gallons
Explosives	4,000 Pounds	4,000 Pounds
Liquefied Natural Gas	19,000 Gallons	19,000 Gallons
Butane	808,500 Gallons	808,500 Gallons
Acutely Hazardous Materials		
Anhydrous Ammonia	16,500 Pounds	15,000 Pounds
Hydrochloric Acid	831,572 Pounds	15,000 Pounds
Oxygen Difluoride (compressed gas)	500 Cubic Feet	500 Cubic Feet
Acetic Acid 80% in Water (KCEH 2014- Peracetic Acid)	990 Gallons	55 Gallons

Hazardous Materials Used for Well Stimulation

Oil well stimulation can involve using pressure, heat, or chemicals to increase the flow of oil and/or gas to wells. Steam injection and waterflooding had been the methods used historically in California (Ritzius 1993). Well stimulation treatments (WST) as defined by SB 4 are designed to enhance oil and gas production or recovery by increasing the permeability of the formation. WST operations are one form of well completion operations. The operations are a short-term and non-continual process for the purposes of opening and stimulating channels for the flow of hydrocarbons. WST is used in Kern County and is necessary in certain formations in order for the wells to produce oil and natural gas. WST used in Kern County are described in Section 3.5.3 Construction Activities in Detail. The primary methods used in Kern County are acid-based well stimulation and hydraulic fracturing.

Acid-based WST operations as defined by SB 4 use either hydrochloric acid or hydrofluoric acids and mud acids. Flowback fluids, including produced water and oil, are sent to production facilities

for treatment, after which some flowback waters are disposed of in injection wells or through evaporation and percolation ponds. Some of the same chemicals used in acid-based WST are also used in non-SB 4 routine maintenance activities, though at reduced volumes that do not trigger the application of SB 4. Hydraulic fracturing uses a variety of hazardous and nonhazardous materials. The materials used for hydraulic fracturing vary from company to company and field to field. Table 4.8-3 lists the calculated total weights of the hydraulic fracturing fluid components used in greatest quantity and those with the highest toxicity in Kern County over the three-year period of available data. To determine the quantities of hazardous and nonhazardous compounds used in hydraulic fracturing in Kern County, estimates were calculated based on component concentrations and water volumes used by oil and gas applicants in Kern County as reported on their voluntary well disclosure forms obtained at https://fracfocus.org/, and accessed on January 28, 2015 (Fracfocus 2015).

According to a September 3, 2014, *Draft Kern Oil and Gas EIR* prepared by WZI, Inc., 81% of oil and gas wells in Kern County are owned by six operators: Aera Energy, LLC; Chevron USA, Inc.; Occidental Oil and Gas (now California Resources Corporation); Berry Petroleum; San Joaquin Facilities Management; and Vintage Production of California. The remaining 19% of wells in the Project Area are owned by a number of other operators. (The identified companies and estimated percentages are subject to change as a result of commercial transactions in the industry since 2014.) For wells that were hydraulically fractured, average volumes of water used in hydraulic fracturing were calculated by randomly selecting 10 disclosure forms for each operator who filed forms and calculating their average per well water use. Forms were obtained from a three-year time period where data was available for all of the largest operators who submitted forms from January 2012 through December 2014. Of the top six oil and gas operators, notification forms were only available from Aera Energy, LLC; Chevron USA, Inc.; California Resources Corporation (previously Occidental Oil and Gas); and Vintage Production of California. Because each operator reported a similar mixture of components on most all of its notification forms, the component concentrations used to calculate component quantities were taken from one of the notification forms for each operator that appeared to be representative. Average water use for each operator was converted into pounds then converted into a total average volume of fracturing fluid used by each operator using the reported total additive concentrations from the representative disclosure forms.

Component concentrations are reported on the disclosure forms by weight percent of total fluid, so the total weight of components used could be calculated by multiplying the average fluid volumes by the component concentrations. The calculated weights of fluid components were then multiplied by the total number of well disclosure forms submitted by each operator over the three-year time period where data were available. The weights of all reported components represent the total weight of each used during the three-year period ending December 2014. Because 19% of the wells drilled in Kern County are owned by operators for which data were not obtained, the calculated weights of component materials used in hydraulic fracturing should be increased by a factor of 0.25 to account for all operators and all wells in Kern County under the assumption that the remaining 19% of fractured wells by operators not represented in the data set have similar water and component use as the available data. Appendix R, Table C-1 presents a list of all compounds used in hydraulic fracturing in Kern County from December 2013 through May 18, 2015, reported to the California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) through representative interim WST notices.

Hazardous Waste Generated During Oil and Gas Activities, Transport, and Disposal

Table 4.8-4 summarizes the types of waste generated by the oil and gas industry in Kern County. The hazardous materials/waste inventory data for 2014 was collected from the KCEH Division. These records were obtained for the oil and gas industry by identifying the inventories of all businesses who reported oil- and gas-related standard industry classification (SIC) code of 1311, 1321, 1382, or 1389.

Table 4.8-4: Wastes Reported in Kern County Oil and Gas Exploration and Production in 2014

Batteries: Spent Alkaline Batteries, Spent Nicad Batteries, Lead Acid Batteries; Spent Alkaline Batteries, Spent Lead Acid Batteries, Waste Batteries, Auto Battery, Lithium Thionyl Chloride Batteries
Fluorescent Lights: Used Fluorescent Light Tubes, Spent Fluorescent Lights
Filters: Waste - Filters Fuel, Waste - Filters Oil/Glycol, Waste - Spent Filter Media, Waste Oil/Fuel Filters, Waste Oil Filter
Aerosol Cans: Aerosol Paints, Spent Aerosol Cans, Used Aerosol Cans, Universal Waste - Aerosol Cans

Source: Prepared from hazardous materials inventories obtained from KCEH

Under this Project, an estimated 267 pounds of classified waste would be generated per well drilled in Kern County. The actual amount will depend on the depth of the well. As discussed in the Regulatory Setting section, U.S. Environmental Protection Agency (EPA) regulations exempt drilling fluids, produced waters, and other wastes associated with the exploration, development, or production of crude oil and natural gas (oilfield wastes) from hazardous waste requirements under the Resource Conservation and Recovery Act (RCRA). California regulations exempt oilfield wastes from being designated a California Non-RCRA hazardous waste based on toxicity characteristics. However, California did not adopt the federal exemption and does not offer a blanket exemption from state hazardous waste requirements. Oifield wastes in California may be considered state hazardous waste and potentially subject to regulation, depending on how they are managed. The generator of the waste has an obligation to properly characterize the waste, either based on generator knowledge of the waste stream or waste-generator process, or by testing representative samples of the waste.

Oifield-related wastes that exhibit hazardous waste characteristics or that are listed hazardous wastes (e.g., spent solvents), and that are not otherwise excluded or exempt, are typically sent offsite for disposal at facilities authorized by the DTSC or are sent out of state for disposal. All hazardous waste transported from the oilfields must be transported by a state-certified transporter and taken to a state-certified hazardous waste facility. Two commercial hazardous waste disposal facilities used for waste disposal by producers are located in the vicinity of the Project Area: the Clean Harbors Buttonwillow Landfill operated by Clean Harbors, and the Waste Management Kettleman Hills facility in Kettleman City. The Clean Harbors Buttonwillow Landfill Facility conducts physical and chemical treatment, solidifies/stabilizes, landfills, neutralizes, and provides transportation services. The Kettleman Hills facility also solidifies/stabilizes, neutralizes, and landfills, but conducts fuel blending, chemical oxidation/precipitation, cyanide destruction, and polychlorinated biphenyl (PCB) services (Environmental, Health, and Safety Online 2015). Hazardous wastes from oil and gas activities are primarily sent to these facilities, with some specialized wastes sent to other facilities.

Nonhazardous Oil and Gas Waste - Storage, Transport, Disposal

Solid and Liquid Wastes

During production, nonhazardous solid wastes fall into two categories: (1) drilling and other wastes associated with exploration and production (E & P); and (2) other wastes. This discussion addresses drilling wastes. Wastes, such as construction material and other solid wastes, are discussed in Section 4.17, Utilities and Service Systems.

Drilling sumps are used to collect drilling fluids and cuttings, also known as "drilling muds," which are produced during drilling operations. Drilling muds are nonhazardous. Drilling sumps are typically located adjacent to the well pad. Drilling muds must first be dried prior to back-filling. Operations sumps are used to store fluids and solids, which are produced during the life of the operational well as well as potential workover activities. Operations sumps can range from small pits located next to the well to centralized sumps that collect workover fluids at the well site and for transfer to centralized sumps for processing. The Central Valley Regional Water Quality Control Board (CVWRQCB) permits the operations of drilling sumps pursuant to statewide general orders, while operations sumps are permitted through site specific Waste Discharge Requirements (WDR).

Produced Water

Drilling for oil and gas in California yields a mixture of oil, gas, and water from the formation; the water is separated from the oil and gas and stored in tanks and pits. This water is called "produced water" and is usually very brackish and unsuitable for human use. The water is commingled naturally in the same zone with the oil and natural gas. Produced water is brought up from the formation during oil or gas production and is not considered a hazardous waste. Because it was commingled with hydrocarbons in the formation, the water typically contains chemicals associated with the formations, such as salts, oils and greases, inorganic and organic chemicals, and naturally occurring radioactive material, that exceed state and federal standards for drinking water.

Produced water is managed in a number of ways, including reinjection for disposal or reuse for other purposes, such as steam generation, to support oil and gas production operations. In standard reinjection operations, injection wells may be located within the oilfield. The oil is separated from the water and the water is reinjected into the same formation from which it was originally recovered. In other instances, the produced water may be trucked from treatment tanks onsite to commercial injection facilities located apart from the oilfield operations.

Produced water may also be transported, via truck or pipeline to existing wastewater treatment facilities permitted to receive production water for disposal. Produced water collected in tanks is typically re-used for further extraction purposes, stored in surface impoundments where it percolates into groundwater and/or evaporates, or disposed of by injection well. The percolation ponds operate under WDRs issued by CVRWQCB. Some produced water requires treatment prior to disposal, and some produced water is treated and reclaimed for other purposes, as discussed further in Chapter 3, Project Description, Section 4.9, Hydrology and Water Quality, and Section 4.17, Utilities and Service Systems.

Flowback

For WSTs, once the hydraulic fracturing procedure is completed, fluid flow reverses and the well is "cleaned up" by allowing oil and gas, produced water, base fluids, and excess proppant to flow back through the well to the surface. This process and the returned fluids are referred to as "flowback." Flowback may contain only a portion of the water originally used, as well as the same materials as were used in the fracturing fluids and naturally occurring constituents from the formation. Some materials in the fracturing fluids are consumed in the well (e.g., strong acids) or react during the fracturing process to form different chemicals (e.g., polymer precursors) (NYDEC 2011). Flowback may also be oil and gas and the associated produced water.

As discussed in Section 3.5.3 Construction Activities in Detail, after an acid well stimulation is performed, the used acid and sediments removed from the reservoir are washed out of the well. The flowback fluid from WSTs is handled in a number of different ways. In mature, developed field operations, the most likely scenario is that the well is connected to the field's oil and gas and produced water handling system, which would pipe the flowback fluid directly into this system. Once it is commingled with other fluids, separated, and treated, the spent acid, sediments and, in some cases, the produced water are disposed of using the common disposal practice of that field. As discussed elsewhere in this document, fluid disposal could be facilitated through waste injection wells or percolation ponds.

Waste Gas

Some of the produced gas stream associated with oil production may contain constituents that make it unsuitable for resale or use in onsite facilities. In these instances, the produced gas stream is gathered via small pipelines using a system of vapor recovery units. Waste gas can be transported via pipeline to a dedicated "waste gas" injection well that disposes of the gas into depleted oil reservoirs. Waste gas injection wells are permitted by DOGGR as Class II injection wells. Waste gas may also be transported from the processing facility via pipelines and flared or

used for fuel in steam generators. Figure 4.8-5 illustrates the location of a flare.

There are thousands of feet of pipelines conveying oil and gas byproducts, including waste gas, throughout the Project Area. All such pipelines are subject to inspection and testing procedures as required by the DOGGR regulations adopted pursuant to Assembly Bill (AB) 1960 (see CCR, tit. 14, § 1774.1.). Under the regulations, "operators shall visually inspect all aboveground pipelines for leaks and corrosion" at least once per year. In addition, DOGGR may order any tests or inspections it deems necessary to establish the reliability of any pipeline system. Following pipeline inspection, repair, replacement, or cathodic protection may be required. Any pipeline that has had a leak in the past, resulting in the release of a reportable quantity, shall be pressure tested by the operator to verify the integrity of the pipe prior to being placed back into active service.

Consistent with the pipeline inspection requirements of the AB 1960 regulations, all operators are required to prepare a pipeline management plan for all pipelines, that lists information on each pipeline as well as a description of the testing method and schedule for all pipelines (see CCR, tit. 14, § 1774.2.). Moreover, all operators must establish and comply with a written preventative maintenance plan for the prevention of corrosion and leakage, consistent with CCR, Title 14, Section 1777.

Accidents, Upsets, and Safety Issues

General Safety in the Oil and Gas Sector

According to the U.S. Department of Labor, over 450,000 workers were employed in the oil and gas extraction and support industries in 2011. Between 2003 and 2010, 823 oil and gas extraction workers were killed on the job. The fatality rate for oil and gas extraction workers has been consistent since at least the early 1990s. Safety and health hazards and dangerous conditions that can result in fatalities for oil and gas workers include:

- Vehicle Accidents
- Struck-By/Caught-In/Caught-Between
- Explosions and Fires
- Falls
- Confined Spaces
- Chemical Exposures (U.S. Department of Labor 2015a).

Oil and gas well drilling and servicing activities involve the use and production of potentially hazardous materials. Potential health hazards that OSHA and NIOSH have identified include the following:

- Hydrogen Sulfide
- Silica
- Noise

- Diesel Particulate Matter
- Hazardous Chemicals
- Naturally Occurring Radioactive Material (NORM)
- Temperature Extremes
- Fatigue (U.S. Department of Labor 2015b).

Table 4.8-5 presents the number of workplace fatalities and the rates of workplace injuries and illnesses per 100 full-time workers in the oil and gas extraction industry in the United States. An injury or illness is work-related if an event or exposure in the work environment either caused or contributed to the resulting condition or significantly aggravated a pre-existing condition.

Table 4.8-5: Safety Record in the Oil and Gas Industry

	2010	2011	2012	2013
Fatalities				
Number of fatalities	12	13	26	(P) 12
Rate of injury and illness cases per 100 full-time workers				
Total recordable cases	1.2	0.9	1.5	1.3
Cases involving days away from work, job restriction, or transfer	0.7	0.5	0.8	0.7
Cases involving days away from work	0.5	0.4	0.7	0.5
Cases involving days of job transfer or restriction	0.2	0.1	0.1	0.2

(P) Preliminary Source: BLS 2015a.

Records for occupational injuries and fatalities associated with the oil and gas extraction sector in California are not specific. In a review of OSHA data on fatalities in the oil and gas sector from 2003 to 2013, only three fatalities were reported, all of which occurred in 2006. However, OSHA notes that no data were available or the available data did not meet OSHA's criteria for publication. With respect to non-fatal occupational injuries and illnesses in oil and gas extraction, the data for 2004 to 2013 do not meet the publication guidelines (BLS 2015b).

Safety Incidents in the Oil and Gas Sector in Kern County

The oil and gas sector in Kern County has experienced incidents, such as blowouts, sink holes, and pipeline ruptures. While the incidents described below are not typical of safety incidents in Kern County, they illustrate the types of risks that can occur in extreme circumstances.

Blowouts

An uncontrollable blowout is a rare but worst-case scenario type of spill at an oilfield. Such blowouts have occurred in Kern County. Crude oil accumulates in porous rock formations where

geologic structures create a dome-like feature with an impermeable rock layer referred to as a cap rock overlying a porous layer containing oil, water, and/or gas referred to as a reservoir rock. In certain instances the pressure of oil, gas, and/or water rising against the cap rock can create high fluid pressures in the reservoir. An uncontrolled blowout condition can occur when drilling through the cap rock into the reservoir where fluid pressure in the reservoir exceeds the fluid pressure in drilling fluids. Dense materials are commonly added to drilling mud to increase fluid pressure in the drilling fluid and help reduce blowout conditions. However, the unpredictable nature of fluid pressures in oil reservoirs make drilling fluid density control an imperfect solution to preventing uncontrolled blowouts. Current regulations require the use of blowout prevention devices on all oil and gas wells during drilling.

The first big blowout, or "gusher," in Kern County was a Klondike Oil Company well called the Shamrock Gusher, which flowed at a rate of 1,300 barrels (54,600 gallons) a day in 1896 (San Joaquin Valley Geology 2014).

One of the largest blowouts was in the Lost Hills oilfield on November 23, 1998. The Bellevue Resources, Bellevue No. 1 (17-26S-21E) blew out at a depth of 17,657 feet and erupted into flame. The well burned high-pressure condensate at estimated rates of 40 to 100 million cubic feet (MCF) of gas per day for 14 days. No people working on the rig were hurt, but the rig and mud log trailer and all other equipment at the well site were damaged beyond repair. The flames were visible from 40 miles away and reached heights of 300 feet. Water began to flow with the gas after 16 days, extinguishing the fire, while condensate and water flowed for another six months. Flow ended when another well was drilled to intercept the well bore of the blowout and injected drilling fluid (mud) (San Joaquin Valley Geology 2014).

Well blowout rates in oilfields undergoing thermally enhanced recovery (via steam injection) in California Oil and Gas District 4 from 1991 to 2005 were on the order of one per 1,000 well construction operations, one per 10,000 active wells per year, and one per 100,000 shut-in/idle and plugged/abandoned wells per year (Jordan and Benson 2008).

Sink Holes

On June 21, 2011, a fatality occurred at the Chevron Midway-Sunset Oil Field in Kern County. Steam had been seen that day emanating from a previously open sink hole (referred to by DOGGR as the Well 20 surface expression). An engineered subsurface containment structure had been recently constructed to capture fluid and steam from the subsurface. Three employees went to examine the steam emanating from the ground, the ground gave way, and one person slipped into the hole that was created. He could not be reached without endangering others. Chevron representatives, DOGGR, Kern County Sheriff's and Fire Department, and California Occupational Safety and Health Administration (Cal/OSHA) responded to the incident (DOGGR 2012). The following day, a large surface expression occurred on the adjacent property and oil/water fluid flowed from the location. Another surface expression was re-activated near the Chevron containment structure. Localized changes in ground surface elevation and slope had occurred in the days leading up to the fatality in the vicinity of the surface expression (DOGGR 2012).

On August 4, 2011, a large explosive eruption expelled rocks, water, and oil to a distance of 150 feet from the original crater site. In addition, two new surface expressions occurred on the adjacent TRC Operating Company, Inc. (TRC) property. On August 17, 2011, a larger eruption occurred from the Well 20 crater expelling fluid and spray to a height of 100 feet and a steam plume to an even greater distance. On September 29, 2011, Cal/OSHA issued a work exclusion zone order prohibiting access to the Well 20 surface expression area (DOGGR 2012).

DOGGR issued three orders following the incident to Chevron and the operator of the adjacent property, TRC, to restrict steam injection activities around Well 20 to ultimately 1,500 feet. The crater continued to grow until November 2011 (DOGGR 2012). Chevron has contested the factual conclusions in DOGGR's 2012 report.

Arvin Waste Gas Pipeline Rupture

On March 11, 2014, Southern California Edison Gas Company was in Arvin conducting routine checks for natural gas line leaks when its instruments detected a gas release. Workers realized the next day that the leak was not from their pipeline and notified the City of Arvin. Kern County Public Health spent several days trying to determine who owned the pipeline but there is no database that maps all underground pipelines.

On March 17, 2014, the leak was identified. Gas leaking from the pipeline had saturated the soil and spread into the backyards of eight homes on Nelson Court in Arvin. Although the location of the leak was identified, local officials could not determine how long the pipeline had been leaking. The line that ruptured was a low-pressure pipeline that carried waste gas from one oilfield to another where it could be flared off. The owner of the pipeline, Petro Capital Resources (PCR) stated that although it had been using this line every day, their maps indicated that the line traveled along a different route than the line actually occupied. According to the City of Arvin these homes were built in the 1990s and DOGGR indicated that the pipeline was laid in the 1970s, never knowing that the pipelines would run beneath a residential area. DOGGR reported that the line has been shut down, purged, and tested. PCR made plans to permanently abandon the line per DOGGR regulations.

On March 18, 2014, a total of 47 people were evacuated from their homes, first to hotels then to apartments, for almost nine months. PCR financed the evacuated residents, including per diems for meals and incidentals. During the months prior to identification of the leak, residents had been experiencing headaches, coughing, dizziness, and bloody noses. Although PCR provided security, a few of the homes were burglarized during the evacuation. During the next several months while the homes were evacuated, PCR and their contractors performed several rounds of residential indoor air monitoring and collected soil samples. The contractor installed temporary vapor extraction systems in each yard in an attempt to reduce the amount of contaminated air released. Residential air sampling results determined that the contamination within the homes was 13 times higher than what the EPA deemed as safe. Compounds detected in the air and soil samples included benzene, naphthalene, n-hexane, traces of methane, heptane, and n-octane.

In October 2014 the fire department lifted the evacuation order. However the residents petitioned

and were granted the option for a second opinion on whether the cleanup that was performed was sufficient. The second set of results deemed the area clear and the residents were allowed to move home. Although it has been a year since the leak occurred the families continue to feel ill. Over 200 claims have been filed on the behalf of 100 people who live near the Arvin neighborhood where the pipeline leak occurred. The claims allege that the City of Arvin and Kern County fail to properly and safely regulate the pipelines being utilized within their jurisdictions and seek financial compensation.

Unauthorized Spills, Discharges, and Incidents from Oil and Gas Production Activities in Kern County

Cleanup and Abatement and Cease and Desist Orders

Certain wastes generated during oil exploration or production are not considered hazardous wastes, but operators can be cited with cease and desist orders or cleanup and abatement orders if petroleum products or hazardous materials contaminate soil and/or groundwater. Some examples are discussed in the following paragraphs.

Operations at the Harlan and Corbin Prine Sevenex Lease in the Mountain View Oil Field in 2006 resulted in a cleanup and abatement order (R5-2006-0716) because the operators were using two unlined ponds for the disposal of oilfield production wastewater, but the ponds also contained crude oil. Crude oil pools also were found on the ground between the storage tanks and in ditches leading to the impoundments. The dischargers were ordered to clean up the waste. The cleanup was completed within several months (Creedon 2006a, 2006b).

Reported Spills in the Kern County Oilfields

Table 4.8-6 summarizes reported spills that have occurred in Kern County oilfields in the past five years. Spills associated with PHMSA-regulated pipelines are discussed in the following section.

Table 4.8-6: Spills in Kern County Oilfields between January 2009 and June 2014 Not Associated with PHMSA-Regulated Pipelines

	Number of Spills	Range of the Spill Volume Gallons (BBL)	Average Spill Volume Gallons (BBL)
Oil	403	0.126 – 27,300 (0.003 – 650)	1,126 (26.8)
Produced Water	263	2.1 – 126,000 (0.05 – 3,000)	6,888 (164.0)
Acid	9	33.2 - 7,333 (0.79 – 174.6)	2,633 (62.7)
Diesel	2	1,323 – 2,688 (31.5 – 64)	2,003 (47.7)
Condensate	2	42 - 84 (1 – 2)	63 (1.5)
Drilling Mud	2	336 - 4,023 (8 – 96)	2,352 (56)

Table 4.8-6: Spills in Kern County Oilfields between January 2009 and June 2014 Not Associated with PHMSA-Regulated Pipelines

BBL – Barrels

Pipeline Spills in Kern County associated with PHMSA-Regulated Pipelines

A total of 27 unintentional releases of crude oil from PHMSA-regulated pipelines in Kern County occurred from 2010 to 2014 (see Appendix R, Table A-1). These incidents were not associated with any fatalities, injuries, explosions, or evacuations. They also did not impact wildlife, aquatic habitats, or birds, or cause any water contamination; however, most resulted in some soil contamination. The average spill size associated with these events was 8,820 gallons (210 barrels [bbls]), but the median value was 2 bbls (84 gallons). Only one ignition occurred, in association with an incident at the Chevron facility in May 2014. Most of the oil was recovered. The causes of the incidents were mostly attributed to equipment failure, material failure of a pipe or weld, or due to corrosion; this led to leaks, ruptures, overfill, and overflow, among other issues. Leaks resulted from, among other things, cracks, connection failures, pinholes, and seal or packing failure. Incidents also resulted from incorrect operation and damage from a vehicle impact (PHMSA 2015a).

Between 2002 and 2009, there were 57 incidents associated with all hazardous liquid pipelines. In all incidents, crude oil was spilled. Spills ranged from 5 to 53,550 gallons (210 to 1,275 bbls). In the majority of cases, most of the crude oil was recovered, but in two cases more than 21,000 gallons (500 bbls) could not be recovered. These incidents were not associated with any fatalities, injuries, evacuations, explosions, or ignitions. Causes included corrosion, excavation damage, material or weld failures, incorrect operation, earth movement, other outside force damage, and equipment failure. More than half the incidents resulted in a temporary shutdown of operations. Soil was contaminated in all incidents except one where water was impacted. Where water was impacted, an estimated 210 gallons (five bbls) of crude oil entered an irrigation canal so floating barriers, commonly referred to as booms, were deployed to contain the oil and facilitate its removal (PHMSA 2015b, 2015c).

Between 2004 and 2013, no incidents attributable to oil and gas producers were associated with natural gas gathering or transmission lines (PHMSA 2015c, 2015d).

Groundwater Quality and Well Stimulation Treatment Fluids

As discussed in greater detail in Section 4.9.2, Environmental Setting, no confirmed degradation of groundwater in the Project Area has been attributed to WST operations although analyses conducted to date generally recommend that additional groundwater data be developed to further assess this issue. In August 2014, the CCST, the Lawrence Berkeley National Laboratory (LBNL), and the Pacific Institute published an assessment of well stimulation activities in California for the Federal Bureau of Land Management (BLM) (CCST 2014). The BLM leases land in Kern County for oil and gas E & P. The study identified chemical constituents used in at least 2% of the reported WSTs in California, generally for the period 2012 through 2014, and identified oral toxicity information where available for these constituents. The majority of the well stimulation chemicals considered in the CCST report, such as guar gum, a gelling agent, or ethanol, a common solvent, were determined to have low hazard potential in terms of oral toxicity. Certain chemicals, such as biocides (e.g., tetrakis [hydroxymethyl] phosphonium sulfate; 2,2-dibromo-3-nitrilopropionamide; and glutaraldehyde), corrosion inhibitors (e.g., propargyl alcohol), and mineral acids (e.g., hydrofluoric acid and hydrochloric acid) were found to present concerns for acute toxicity.

As discussed in Section 4.9, Hydrology and Water Quality, in June 2015, U.S. Environmental Protection Agency (EPA) released a public review draft of a study titled Assessment of the Potential Impacts of Hydraulic Fracturing for Oil and Gas on Drinking Water Resources (EPA 2015). The study is a public review draft, and may be modified in response to public review comments.

The USEPA study, focused on potential impacts to drinking water resources that could occur from the following above-ground and underground potential mechanisms associated with the hydraulic fracturing process or cycle: :

- Water withdrawals at times or in locations of low water availability;
- Spills of hydraulic fracturing fluid, chemicals, or produced water;
- Inadequate treatment and discharge of hydraulic fracturing wastewater;
- Movement of liquids and gases via the production well into underground drinking water resources; and
- Movement of liquids and gases from the fracture zone to underground drinking water resources via pathways in subsurface rock formations.

In its report, the EPA concluded that it did not find evidence that the mechanisms it identified by which hydraulic fracturing could have impacts on drinking water resources in the U.S. have led to widespread, systemic impacts. The number of cases where drinking water resources were impacted is small in relation to the number of hydraulically fractured oil and gas wells. The apparently small number of cases where impacts to drinking water resources were identified could reflect the rarity of effects on drinking water or may be an underestimate as a result of several limiting factors. The EPA noted data limitations and uncertainties associated with its study, which preclude a determination of the frequency of impacts with any certainty (EPA 2015).

Use of Underground Injection Wells

A March 2015 report by the California Environmental Protection Agency (CalEPA) found that underground injection wells had been discharging to aquifers that met the exemption criteria for Underground Sources of Drinking Water (USDWs), but had not been exempted by EPA in accordance with applicable requirements and thus remained classified as USDWs. In Kern County, wells in this category include 1,721 wells used for enhanced oil recovery in active hydrocarbon production zones and 388 disposal wells in the Project Area (CalEPA 2015; DOGGR 2015). DOGGR, in collaboration with the State Water Resources Control Board (SWRCB) is conducting a statewide analysis of all injection operations that were permitted outside of the aquifer exemption boundaries established in the 1980s. Operators with wells in these areas have been directed to prepare technical and geologic reports validating that the aquifers qualify for exemption. The reports will be used to determine where the exemption boundaries from the 1980s need to be updated. DOGGR has adopted emergency regulations prescribing a timeline by which injection into nonexempt aquifers must cease unless, based on the review of the technical reports and other information, the EPA approves exemptions for these aquifers. As of March 2015, 23 injection wells in the Project Area were ordered to cease operations while the review was ongoing due to proximity to drinking or agricultural water supplies. Based on statements published by the agencies, no contamination or adverse impacts to groundwater was observed from the operation of the 23 wells, and no contamination of water used for drinking or agricultural purposes related to underground injection by the oil and gas industry has been detected in testing of water supply wells by the SWRCB. DOGGR and the SWRCB completed initial review of the 176 higher priority injection wells in May 2015 and SWRCB is awaiting additional test data before making a determination as to whether to seek shut-in of additional wells before the October 15, 2015, compliance date specified in the emergency regulations (DOGGR 2015). Refer to Section 4.9, Hydrology and Water Quality, for more information.

Hazardous Materials Release Sites in the Area – Cortese List

The State of California compiles a Hazardous Waste and Substances Sites (Cortese) List (Government Code §65962.5). A search was conducted on January 21, 2015. This database search included sites that did not necessarily contain contaminated soil or groundwater but were identified in federal or state databases for compliance with or enforcement of environmental regulations. For example, the list includes sites that are regulated by the EPA because they either generate, store, transport, or dispose of hazard waste; are recyclers; or contain underground or aboveground storage tanks. The list contains 229 sites in the Project Area including 78 that have been closed or need no action or no further action. Eighty-five are active, being referred to another agency, or undergoing closure. Two have post-closure permits. The full list is included in Appendix R. The following paragraphs describe those sites where there is known soil and/or groundwater contamination. Figure 4.8-6 provides the locations of sites that are not closed, or designated no action, no action required, no further action, or certified as of January 21, 2015.

The Brown and Bryant Arvin Facility (B&B) is a federal superfund site located in Arvin, California, and it is the only superfund site known to be present in the Project Area. The facility was used for the storage and sale of liquid fertilizer, insecticides, herbicides, fumigants and

defoliants. Operations began in 1960. Contamination resulted from poor waste disposal practices and poor housekeeping of pesticides, herbicides, fumigants, and defoliant. Wastewater was disposed in a poorly lined pond and two concrete sumps. Both groundwater and soil were contaminated. The EPA listed the site on the National Priority List (NPL) on October 4, 1989. The facility is not operating and access is restricted (California DTSC 2007a). Groundwater treatment and routine groundwater monitoring are on-going. Restrictions are in place to prohibit drilling within 0.5 mile of the site (Ramirez 2013).

Twenty facilities in the Project Area have at one time been RCRA hazardous waste facilities, two have operating permits, and six are undergoing case closure. Eight of the 20 facilities are closed, but two of the eight have land restrictions. Two facilities have post closure permits. Two facilities are classified as non-operating. There are three non-RCRA hazardous waste sites; two are closed and one is undergoing closure. There are 21 corrective action sites; five are active; three have certified land-use restrictions; one has been referred to the EPA, three were referred to the RWQCB, one was referred to the Site Mitigation and Brownfields and Reuse Program (SMBRP); and six require no further action or no action (California DTSC 2015).

Schools

Numerous schools are located within the Project Area, as discussed in Section 4.14, Public Services. California State law has established requirements for siting of new schools. The school site selection standards, and Title 5 CCR Section 14010(h), state that school sites should not be located near an aboveground water or fuel storage tank or within 1,500 feet (0.28 miles) of the easement of an aboveground or underground pipeline that can pose a safety hazard, as determined by a risk analysis study conducted by a competent professional.

Air Traffic and Military Aviation

There are 18 public and private airports located within the Project Area. In addition there are three United States military airbases outside the Project Area that utilize military operation airspace (MOA) within a small portion of the Project Area for military aircraft operations. Airport locations are based on airport information accessed on January 15, 2015, at https://www.airnav.com (AirNav 2015). The boundaries of the MOA were obtained from a November 13, 2012, Kern County Airports Land Use Compatibility Plan (ALUCP), prepared by the Kern County Planning and Community Development Department (PCDD; PCDD 2012). Airports located in the Project Area and the boundary of the MOA are shown on Figure 4.8-7. The following airports are located within the Project Area.

- Delano Municipal Airport, Delano
- Bakersfield Municipal Airport, Bakersfield
- Taft Airport, Taft
- Wasco-Kern Airport, Wasco
- Elk Hills-Buttonwillow Airport, Buttonwillow

- Lost Hills-Kern County Airport, Lost Hills
- Poso-Kern County Airport, Famoso
- Shafter Airport (Minter Field), Shafter
- Paradise Lakes Airport, Bakersfield
- Skydive San Joaquin Valley Airport, Bakersfield
- Tejon Ag Airport, Lebec
- Creekside Airport, Arvin
- Di Giorgio Ranch Landing Strip, Di Giorgio
- Meadows Field Airport, Bakersfield
- Majors Airport, Bakersfield
- Cashen Strip Airport, Wasco
- Belridge Strip Airport, South Belridge
- Paramount Farms Airport, Lost Hills

Kern County's (2012) ALUCP has no specific provisions to limit oil and gas industry activities around airports. Airport influence zones restricting or prohibiting specific land uses, development height, lighting, and radio communications exist around each of the 18 public use and private airports identified in the ALUCP. Restrictions on development within the established airport influence zones surrounding the airports described in the ALUCP are implemented through zoning restrictions described in the Kern County Zoning Ordinance, Chapter 19.76 – Airport Approach Height (H) combining district. Only certain land uses are compatible in the airport influence zones immediately surrounding airports specifically described in the ALUCP. Zone A is located immediately surrounding each airfield and height limitations in this zone generally limit structures and vegetation to no more than 35 feet in height. The H combining district requires that a proponent of development within an airport influence Zone A apply for and obtain a conditional use permit as well as development plan review/approval through the director of the Kern County PCDD. Individual airports have their own restrictions as described in the ALUCP.

A number of private airstrips are also located throughout western Kern County including Tejon Ag and Paradise Lakes airfields located south of Bakersfield; Majors Airfield north of Bakersfield; Joe Gottlieb Field Airport west of Bakersfield; and Cashen Airport northwest of Wasco (AirNav 2015; PCDD 2012). The ALUCP does not apply to private airstrips that are not designated for public use. The locations of airports in the Project Area are shown with respect to oil and gas fields in Kern County on Figure 4.8-7.

The China Lake Naval Air Weapons Station and Edwards Air Force Base are located outside the Project Area in the northeastern and southeastern corners of Kern County, respectively. In addition, the Lemoore Naval Air Station is located in Tulare County to the north of Kern County and routinely conducts training exercises in Kern County. The flying missions of aircraft attached

to these military installations require flying beyond the installation boundaries at supersonic speeds and as low as 200 feet above the ground. To minimize flight hazards to commercial aircraft, military aircraft attached to the two Kern County military installations fly within restricted airspace known as the Joint Service Restricted R-2508 Complex (R-2508 Complex). The boundary of the R-2508 Complex is shown with respect to the Project Area boundaries and administrative boundaries of oil and gas fields on Figure 4.8-7. To avoid development that could compromise the missions of military installations, the ALUCP requires that those installations be notified of development proposed within and near the R-2508 Complex. Specific to oil and gas E & P development, the ALUCP requires that the China Lake Naval Air Weapons Station and Edwards Air Force Base be notified of development that falls within any of the following categories:

- Any Structure within 75 miles of the R-2508 Complex that is greater than 50 feet tall.
- Any project within 50 miles of the R-2508 Complex that emit radio and communication frequencies.
- Any project that would create environmental impacts, such as visibility or elevated obstructions within 25 miles of the R-2508 Complex.

Fire Hazard

The California Department of Forestry and Fire Protection (CALFIRE), characterizes the fire risks of areas. CALFIRE produces fire hazard severity zone maps that assign a hazard score based on the factors that influence fire likelihood and behavior. Many factors are considered, such as fire history, existing and potential fuel (natural vegetation), flame length, blowing embers, terrain (steep terrain has a greater fire hazard severity), topography, and typical weather for the area. The 2008 fire hazard severity zone maps include areas where local governments have financial responsibility for wildland fire protection, known as Local Responsibility Areas. Only lands zoned with a very high fire hazard were identified within Local Responsibility Areas. Using these methods, CALFIRE divided the state responsibility areas into three hazard zones: moderate, high and very high (CALFIRE 2007).

The portion of the Project Area located in the San Joaquin Valley is classified as mostly less than moderate fire severity. The hills peripheral to the San Joaquin Valley have moderate to very high fire severity. However, the majority of the Project Area falls within a Local Responsibility Area and is not classified within the state's Fire Hazard Severity Zones (see Figure 4.8-8).

Disease Vectors

A disease vector is an insect or animal that carries a disease-producing micro-organism from one host to another. The Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) defines the term vector as:

…any organism capable of transmitting the causative agent of human disease or capable of producing human discomfort or injury, including mosquitoes, flies, fleas, cockroaches, or other insects and ticks, mites or rats.

The accumulation of organic wastes would act as attractors for various vectors. In addition any depressed areas, ponds, or drainage channels would provide areas for the breeding of mosquitoes.

Mosquitoes

Mosquitoes are of particular concern because of their abundance and distribution. In Kern County, mosquitoes are most abundant and active between May and October. Mosquitoes require standing water to breed and can be prolific in areas with standing water, such as wetlands.

Adult female mosquitoes can deposit eggs in a variety of aquatic habitats and other sources that contain water. The immature stages of each mosquito species develop in particular habitats. In general, there are four mosquito habitat groups: agricultural, industrial, domestic, and natural sources. Typical sites within these habitat groups include:

- Agricultural Sources: irrigated pastures, dairies, and orchards.
- Industrial Sources: sewage treatment ponds and drain ditches.
- Domestic Sources: containers, debris in and around ponds, bird baths, pet watering dishes, animal troughs, septic tanks, catch basins, roadside ditches, leaky sprinkler systems, and stagnant swimming pools.
- Natural Sources: wetlands, floodplains, and rain pools.

All species of mosquitoes require standing water to complete their growth cycle. Therefore, any standing body of water represents a potential mosquito breeding habitat. Although mosquitoes will typically stay close to suitable breeding habitat and blood-meal hosts, they are known to travel up to 10 miles under breezy conditions. The breeding period for mosquitoes depends on temperature but generally occurs in March through October.

Water quality also affects mosquito reproduction. Generally, poor-quality water (e.g., water with limited circulation, high temperature, and high organic content) produces greater numbers of mosquitoes than high-quality water (e.g., water with high circulation, low temperature, and low organic content). Typically, water bodies with water levels that slowly increase or recede produce greater numbers of mosquitoes than water bodies with water levels that are stable or that rapidly fluctuate.

In Kern County, the Kern Mosquito and Vector Control District is responsible for vector control; however, there is no established vector control district in the area of Kern County where the Project would be located.

Mosquito Hazards

Mosquito-Borne Diseases

Mosquitoes are known to be the carriers of many serious diseases.

West Nile virus is the most important mosquito-borne disease affecting Kern County. In 2010, there were 111 human West Nile virus infections in California and six deaths (California

Department of Public Health 2012). Of these cases, 15 (14%) were in Kern County.

In September 2002, the Kern County Department of Health formed a West Nile Virus Task Force and has subsequently released reports documenting cases, developed strategies to prevent the occurrence of West Nile virus, and generated public education information, such as information pamphlets. Statewide, there are 52 local agencies, including local mosquito abatement districts and the California Department of Health Services Arbovirus Field Testing Stations, that work cooperatively to routinely conduct surveillance and control of mosquitoes and the diseases they transmit throughout California.

Mosquito Species of Concern

In Kern County, two species of mosquito are primary targets for suppression. These two species, *Culex pipiens quinquefasciatus* and *Culex tarsalis*, are potential vectors of encephalitis and West Nile virus. Other species of mosquitoes exist in Kern County that can cause a substantial nuisance in surrounding communities, but the *Culex* mosquito is the primary vector species of concern.

Although the West Nile virus can be transmitted by a number of mosquito species, *Culex* is the most common carrier. This disease is thought to be a seasonal epidemic that flares up in the summer and fall. West Nile virus is spread when mosquitoes that feed on infected birds bite humans and other animals.

The encephalitis mosquito (*Culex tarsalis*) breeds in almost any freshwater pond. Birds appear to be the primary blood-meal hosts of this species, but the insect will also feed on domestic animals and humans (Bohart and Washino 1978). This species is the primary carrier in California of western equine encephalitis, St. Louis encephalitis, and California encephalitis, and is considered a significant disease vector of concern in the state.

The house mosquito (*Culex pipiens quinquefasciatus*) usually breeds in waters with a high organic material content. This species is often identified by its characteristic buzzing. Although its primary blood-meal host is birds, the house mosquito may also seek out humans. The house mosquito is a vector of St. Louis encephalitis.

Flies

Nuisance flies have a life cycle comprised of an egg stage, three larval stages, a pupal stage, and an adult stage. Eggs are laid by a mature female fly onto a substrate appropriate for larval development. A single female can lay hundreds of eggs during her life. Nuisance fly larvae (grubs) are generally white in color and are blunt ended. They develop in wet substrates, especially dung pats and manure and wet or rotting feed, hay, and bedding straw, where they feed on food particles found on the substrate. Fly larvae are not capable of developing in truly aqueous habitats; they need wet, but not overly wet, substrates.

Within the confines of a pupal case, the developing fly will undergo further changes to become a winged adult fly that will eventually emerge from the pupal case and disperse from the site. The length of time required to complete the development from egg to adult is temperature dependent

and may be as short as seven days during the summer months in California.

Some nuisance flies are blood feeders and can inflict a painful bite while feeding on animals or humans. Blood feeding (or biting) flies include the stable fly and horn fly. Other flies do not bite (non-biting flies), instead feeding on body secretions or liquefied organic matter. Non-biting flies include the house fly, face fly, and garbage fly.

Adult flies are generally active during daylight hours and inactive at night. Nuisance flies are known to disperse from their development sites into surrounding areas; however, the distance and direction of dispersal are not well understood. Non-biting nuisance fly species are likely to disperse further than those fly species that require animal blood meals. The habitat surrounding a breeding site will play a role in the distance of nuisance fly dispersal. Nuisance flies will likely disperse further in open habitats typical of rangeland and low agricultural crops than they will in urban or forested/orchard areas that contain substantially more vertical structure on which flies may rest and that provide shade and higher humidity on hot summer days.

Most nuisance flies are not known to disperse great distances. Studies using marked house flies show that 60% to 80% of house flies were captured within 1 mile of their release point; 85% to 95% were caught within 2 miles of the release site within the first four days after they were turned loose. A few flies have been shown to travel further, but in general, fly control efforts for a community problem are focused within 1 mile of the source.

Rodents

The accumulation of organic waste presents the potential for significant populations of mice and rats. Rodents can spread or accelerate the spread of disease from contaminated areas to uncontaminated areas via their droppings, feet, fur, urine, saliva, or blood. In addition, mice provide a food source that could attract wild predatory animals (e.g., skunks, foxes, coyotes, and stray dogs), which could pose other disease problems.

Mice are generally nocturnal and secretive animals with keen senses of taste, hearing, smell, and touch. They are small enough to enter any opening larger than one quarter of an inch. Mice prefer cereal grains, if available, but will eat garbage, insects, meat, and even manure. Mice reproduce at high rates, making early control important in minimizing the potential for infestation. Although the life span of a mouse is only nine to 12 months, a female mouse can have five to 10 litters per year with five or six young in each litter. Mice do not consume large quantities of food but can cause significant economic damage due to physical structure damage and site contamination.

Valley Fever

Coccidioidomycosis, commonly known as Valley Fever, is primarily a disease of the lungs that is common in the southwestern United States and northwestern Mexico. The disease is of critical concern to Kern County. Valley Fever is caused by the fungus *Coccidioides immitis*, which grows in soils in areas of low rainfall, high summer temperatures, and moderate winter temperatures. These fungal spores become airborne when the soil is disturbed by winds, construction, farming, and other activities. In susceptible people and animals, infection occurs when a spore is inhaled.

Valley Fever symptoms generally occur within three weeks of exposure. Valley Fever is not a contagious disease, and secondary infections are rare.

It is estimated that more than four million people live in areas where Valley Fever fungus is prevalent in the soils. Residents of Bakersfield, California, and Phoenix, Arizona, have shown positive skin-test reaction rates of 30 to 40%, meaning that about one-third of residents tested have had Valley Fever sometime in the past. Among those who have never had Valley Fever, the chance of infection is about 3% per year, but the longer one resides in an endemic area, the greater the risk. In the southwestern U.S., there are 100,000 new infections each year.

People working in certain occupations, such as construction, agriculture, and archaeology, have an increased risk of exposure and disease because these jobs result in the disturbance of soils where fungal spores are found. Valley Fever infection is highest in California from June to November. In addition, many domestic and native animals are susceptible to the disease, including dogs, horses, cattle, coyotes, rodents, bats, and snakes. Most Valley Fever cases are very mild. It is estimated that 60% or more of infected people either have no symptoms or experience flu-like symptoms and never seek medical attention.

4.8.3 Regulatory Setting

Federal

U.S. Environmental Protection Agency (EPA)

The EPA was established in 1970 to consolidate in one agency a variety of federal research, monitoring, standard-setting, and enforcement activities to ensure environmental protection. The EPA's mission is to protect human health and to safeguard the natural environment - air, water, and land - upon which life depends. The EPA works to develop and enforce regulations that implement environmental laws enacted by Congress, is responsible for researching and setting national standards for a variety of environmental programs, and delegates to states and tribes the responsibility for issuing permits and for monitoring and enforcing compliance. Where national standards are not met, the EPA can issue sanctions and take other steps to assist the states and tribes in reaching the desired levels of environmental quality.

National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR §300)

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP), was first developed in 1968. The NCP is administered by the EPA. Its purpose is to provide the organizational structure and procedures for preparing for and responding to discharges of oil and releases of hazardous substances, pollutants, and contaminants.

It applies to oil discharges into or on navigable waters of the United States as well as hazardous substances releases into the environment that may present an imminent or substantial danger to public health or welfare of the United States. It specifies responsibilities among the federal, state, and local governments and requires the establishment for federal, regional, and area contingency plans. It summarizes state and local emergency planning requirements under the Superfund

Amendments and Reauthorization Act (SARA). It also provides the procedures for undertaking removal actions pursuant to Section 311 of the Clean Water Act (CWA) and response actions pursuant to Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).

Comprehensive Environmental Response, Compensation, and Liability Act/Superfund Amendments and Reauthorization Act (CERCLA)

CERCLA, commonly known as Superfund, was enacted by Congress on December 11, 1980. This law (U.S.C. Title 42, Chapter 103) provides broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites; provides for liability of persons responsible for releases of hazardous waste at these sites; and, establishes a trust fund to provide for cleanup when no responsible party can be identified. CERCLA also enables the revision of the NCP. The NCP (40 Code of Federal Regulations [CFR], Part 300) provides the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, and/or contaminants. The NCP also established the NPL. CERCLA was amended by the SARA on October 17, 1986.

Emergency Planning and Community Right-to-Know Act

Under the Emergency Planning and Community Right-to-Know Act, or Title III of the SARA, the EPA requires local agencies to regulate the storage and handling of hazardous materials and requires development of a plan to mitigate the release of hazardous materials. Businesses that handle any of the specified hazardous materials must submit to government agencies (i.e., fire departments or public health departments), an inventory of the hazardous materials, an emergency response plan, and an employee training program. The business plans must provide a description of the types of hazardous materials/waste onsite and the location of these materials. The information in the business plan can then be used in the event of an emergency to determine the appropriate response action, the need for public notification, and the need for evacuation.

In 1990, Congress passed the Pollution Prevention Act which requires facilities to report additional data on waste management and source reduction activities to the EPA under the Toxics Release Inventory Program. The goal of the Toxics Release Inventory is to provide communities with information about toxic chemical releases and waste management activities and to support informed decision making at all levels by industry, government, non-governmental organizations, and the public.

Clean Water Act (CWA)/Spill, Prevention, Control, and Countermeasure (SPCC) Rule

The CWA (33 U.S.C. Section 1251 et seq., formally the Federal Water Pollution Control Act of 1972), was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the United States. As part of the CWA, the EPA oversees and enforces the Oil Pollution Prevention regulation contained in Title 40 of the CFR, Part 112 (40 CFR Part 112), which is often referred to as the "SPCC rule" because the regulations describe the

requirements for facilities to prepare, amend, and implement SPCC plans. A facility is subject to SPCC regulations if a single oil storage tank has a capacity greater than 660 gallons, or the total aboveground oil storage capacity exceeds 1,320 gallons, or the underground oil storage capacity exceeds 42,000 gallons, and if, due to its location, the facility could reasonably be expected to discharge oil into or upon the "navigable waters" of the United States.

Other federal regulations overseen by the EPA relevant to hazardous materials and environmental contamination include Title 40 CFR Chapter 1, Subchapter D – Water Programs and Subchapter I – Solid Wastes. Title 40 CFR Chapter 1, Subchapter D, Parts 116 and 117 designate hazardous substances under the CWA. Title 40 CFR Part 116 sets forth a determination of the reportable quantity for each substance that is designated as hazardous. Title 40 CFR Part 117 applies to quantities of designated substances equal to or greater than the reportable quantities that may be discharged into waters of the United States.

The Safe Drinking Water Act of 1974 (42 U.S.C. §300f et seq.)

The Safe Drinking Water Act (SDWA) regulates the amount of toxic substances in drinking water sources. The SDWA requires the EPA to develop minimum federal requirements for Underground Injection Control (UIC) programs and other safeguards to protect public health by preventing injection wells from contaminating USDWs. The UIC sections are:

1421 – Identifies what state regulations must include in their UIC program.

1422 – Outlines the process for state primacy applications including timelines and public participation requirements.

1423 – Sets forth enforcement of the program.

1425 – Describes optional demonstrations a state may make for the portion of the UIC Program relating to oil and natural gas operations.

1426 – Requires the administrator to determine the applicability of monitoring methods.

1431 – Authorizes emergency powers for EPA to take action in a state if there is an imminent and substantial endangerment.

1442 – Addresses the EPA's authority to conduct research, studies, training and demonstrations, specifically looking at improved methods for protecting USDWs.

1443 – Establishes grants for primacy programs.

The EPA developed the UIC Program requirements, but states, territories, and tribes can obtain primary enforcement responsibility, or primacy. State regulations must be as stringent as federal requirements, but may be more stringent. As discussed in detail in Section 4.9, Hydrology and Water Quality, the EPA has delegated responsibility to DOGGR for implementing UIC Program requirements for Class II wells in California.

Of importance to this project are Class II wells. Class II wells are used for the injection of produced water and other fluids associated with oil and gas production either as a means of disposal of produced fluids, as an enhanced recovery fluid, or for purposes of hydrocarbon storage. The Class II UIC Program dictates well construction standards and mechanical integrity monitoring, as well as the types and composition of fluids that can be injected, all of which information is publicly available. The definition of "underground injection" in the SDWA excludes hydraulic fracturing (except for hydraulic fracturing utilizing diesel fuels).

Clean Air Act Amendments of 1990: Section 112(r) (40 CFR 68)

The EPA requires facilities that handle listed regulated substances to develop Risk Management Plans (RMP) to prevent accidental releases of these substances. RMP materials are submitted to both local agencies (generally the fire department) and the EPA. Stationary sources with more than a threshold quantity of a regulated substance shall be evaluated to determine the potential for, and impacts of, accidental releases of that substance. Under certain conditions, the owner or operator of a stationary source may be required to develop and submit an RMP. RMPs consist of three main elements: a hazard assessment that includes an off- site consequence analysis and a five-year accident history; a prevention program; and an emergency response program.

Liquid Pipelines and Oil Facilities

United States Department of Transportation

The USDOT was established by an act of Congress in 1966. It is mandated to oversee hazardous liquid pipeline safety under the U.S.C. Title 49, Chapter 601. The Pipeline and Hazardous Materials Safety Administration (PHMSA) acting through the Office of Pipeline Safety (OPS) administers the national regulatory program to ensure the safe transportation of refined petroleum products and other hazardous materials by pipeline. It develops safety regulations and other approaches to risk management that ensure safety in the design, construction, testing, operation, maintenance, and emergency response of pipeline facilities in conjunction with the Technical Hazardous Liquids Pipeline Safety Standards Committee (THLPSSC) which provides peer review.

Many of these regulations are written as performance standards, which set the level of safety to be attained and allow the pipeline operator to use various technologies to achieve safety. Pipelines are inspected and monitored by the western region of the PHMSA or by the state delegated officials. Inspectors conduct inspections during construction to ensure that the design, materials, construction methods, welding procedures, and testing meet the USDOT standards. Following construction, PHMSA inspectors inspect the pipeline. The inspections include a review to ensure compliance with 49 CFR 195, specifically, the inspections review the operation and maintenance procedures, abnormal and emergency operating procedures, damage prevention and public education procedures, and the inspection ensures the pipeline repair and operations are in compliance.

The National Response Framework (NRF) is part of the National Strategy for Homeland Security. The NRF formally replaced the National Response Plan (NRP) in March 2008. Building on the

principles outlined in the National Incident Management System (NIMS) as well as the Incident Command System (ICS), the NRF's coordinating structures are effective procedures for the coordination of any level at any time, for the response activities among federal, state, and local response agencies (e.g., police, firefighting, emergency management, and first responder). The Oil and Hazardous Materials Incident Annex (ESF #10) of the NRF directs the federal, state, and local authorities to conduct training, plan and execute field exercises, share lessons learned, and, in general, develop and maintain specific procedures for responses to incidents of regional and national significance.

Transportation of Hazardous Liquids by Pipeline, 49 CFR 195, includes detailed requirements on a range of safety and environmental protection issues related to liquids pipelines. Part 195.30 incorporates many of the applicable national safety standards of the American Petroleum Institute (API), American Society of Mechanical Engineers (ASME), American National Standards Institute (ANSI), and American Society for Testing and Materials (ASTM). Table 4.8-7 lists portions of 49 CFR 195 that are relevant to this Project.

Table 4.8-7: Key Elements of the Transportation of Hazards Liquids by Pipeline Regulations

Component of 49 CFR 195	Key Elements and Thresholds; Applicable Permits
Part 195.50 Reporting Accidents	Requires reporting of accidents by telephone and in writing for: • Explosion or fire not intentionally set by the operator; • Spills of five gallons or more or five barrels if confined to company property and cleaned up promptly; • Daily loss of five barrels a day to the atmosphere; • Death or injury necessitating hospitalization; or • Estimated property damage, including cleanup costs, greater than $50,000
Subpart C Design Requirements Parts 195.100 through 195.120	Design requirements for the temperature environment, variations in pressure, internal design pressure for pipe specifications, external pressure and external loads, new and used pipe, valves, fittings, and flanges, internal inspection devices
Subpart D Construction Parts 195.200-195.266	Construction requirements for standards such as compliance, inspections, welding, siting and routing, bending, welding and welders, inspection and nondestructive testing of welds, external corrosion and cathodic protection, installing in-ditch and covering, clearances and crossings, valves, pumping, breakout tanks, and construction records
Subpart E – Pressure Testing Parts 195.300-195.310	Minimum requirements for hydrostatic testing, compliance dates, test pressures and duration, test medium, and records
Subpart F-Operation and Maintenance Parts 195.400-195.466	Minimum requirements for operating and maintaining steel pipeline systems, including: • Correction of unsafe conditions within a reasonable time; • Procedural manual for operations, maintenance, and emergencies; • Training; • Maps; • Maximum operating pressure; • Communication system; • Cathodic protection system;

Table 4.8-7: Key Elements of the Transportation of Hazards Liquids by Pipeline Regulations

Component of 49 CFR 195	Key Elements and Thresholds; Applicable Permits
	• External and internal corrosion control; • Valve maintenance; • Pipeline repairs; • Overpressure safety devices; • Firefighting equipment; and • Public education program for hazardous liquid pipeline emergencies and reporting

Gathering lines are small diameter pipelines that transport petroleum products or natural gas from a production facility or wellhead to a central collection point. They often operate at relatively low pressures and flow, and are significantly smaller in diameter than transmission lines. Gathering lines in rural oilfield settings are regulated by DOGGR under the AB 1960 regulations. The PHMSA regulates gathering lines for hazardous liquids in non-rural areas. Rural gathering lines for hazardous liquids are regulated if they are of a certain size and pressure and are located within a ¼ mile of unusually sensitive areas, such as key drinking water sources or critical ecological communities. Operators must determine if an onshore pipeline (or part of a connected series of pipelines) is an onshore gathering line using the API Recommended Practice 80, "Guidelines for the Definition of Onshore Gas Gathering Lines," (first edition, April 2000). This is done using criteria that determine when a gas gathering pipeline is close enough to a number of homes or areas/buildings where people congregate, in which an accident on the pipeline could impact them. If the criteria are met, these natural gas gathering pipelines, that operate at lower pressures, must comply with a subset of the requirements specified in 49 CFR 192.9 (PHMSA 2015e). This section contains the required gathering line information for the operators of on-shore, off-shore, Type A, or Type B lines. An operator of a new, replaced, relocated, or otherwise changed line must be in compliance with the applicable requirements in this section by the date the line goes into service.

Pipeline Safety Improvement Act

In 2002, the U.S. Congress passed the Pipeline Safety Improvement Act (PSIA) of 2002, HR 3609, to strengthen the nation's pipeline safety laws. Under the PSIA, gas transmission operators are required to develop and follow a written integrity management program containing all the elements described in Part 192.911 of the USDOT regulations (49 CFR) to address the risk on all transmission pipeline segments of High Consequence Areas (HCAs). Specifically, the law establishes an integrity management program that applies to all HCAs.

The USDOT's OPS outlines pipeline design requirements that are based on population density in the region and, generally, more stringent design requirements correspond to areas with higher population densities (49 CFR 192.1). Areas in the vicinity of the pipeline are divided into "class location units." A unit is defined in 49 CFR 192 as "an on-shore area that extends 220 yards on either side of the centerline of any continuous 1-mile length of pipeline." Class location units are therefore confined to the area within 660 feet of 1 mile of contiguous pipeline. Class location units

are considered HCAs if the area contains 46 or more buildings intended for human occupancy; is within 100 yards of either a building, or a small well-defined outside area, such as a playground, recreation area, outdoor theater, or other place of public assembly; or where buildings with four or more stories aboveground are prevalent.

Hazardous Liquid Pipeline Safety Act

The Hazardous Liquid Pipeline Safety Act of 1979 and amendments authorize the USDOT to regulate pipeline transportation of hazardous liquids (including crude oil, petroleum products, anhydrous ammonia, and carbon dioxide). Key elements of the Hazardous Liquid Pipeline Safety Act of 1979 and amendments are summarized below in Table 4.8-8.

Table 4.8-8: Key Elements of the Pipeline Safety Regulations

Law/Regulation	Key Elements
Federal	
Pipeline Inspection, Protection, Enforcement, and Safety Act of 2006 (PIPES- Public Law 109-468, December 2006)	Provides for advanced safety and environmental protection in pipeline transportation. Increases the transparency of pipeline safety evaluation. Provides funding for future pipeline safety studies.
Pipeline Safety Act of 1994 49 U.S.C. § 60101 et seq.	Defines the framework for pipeline safety regulation in the U.S.
49 CFR Part 195- Transportation of Hazardous Liquids by Pipeline	This section describes the safety standards and reporting requirements for hazardous liquid pipelines. These regulations include detailed requirements on a range of topics related to the safety and environmental protection. This section also includes the minimum requirements for operator qualification of individuals performing tasks required by the regulations.

Hazardous Waste Handling Requirements

Hazardous Materials Transportation Act (P.L. 93-933, January 1975)

The Hazardous Materials Transportation Act (HMTA) is the federal legislation that regulates transportation of hazardous materials. The primary regulatory authorities are the USDOT, the Federal Highway Administration, and the Federal Railroad Administration (FRA). The Secretary of the USDOT receives the authority to regulate the transportation of hazardous materials from the HMTA, as amended and codified in 49 U.S.C. 5101 et seq. The PHMSA (formerly the Research and Special Provisions Administration [RSPA]) was delegated the responsibility to write the hazardous materials regulations, which are contained in 49 CFR Parts 100-180. The HMTA requires that carriers report accidental releases of hazardous materials to the USDOT at the earliest practical moment but no later than 12 hours after the occurrence of any incident (49 CFR Subtitle B, Chapter 1, Subchapter C, Part 171.15 Subpart B). Other incidents that must be reported include deaths, injuries requiring hospitalization, and property damage exceeding $50,000.

Under the HMTA, the USDOT regulates the transportation and handling of "reportable quantities" of hazardous substances. These regulations focus on the transportation of hazardous materials by:

- Carriers by rail, aircraft, and vessel
- Interstate and foreign carriers by motor vehicle
- Intrastate carriers by motor vehicle so far as the regulations relate to hazardous wastes, hazardous substances, and flammable cryogenic liquids in portable tanks and cargo tanks.

The transportation of hazardous materials within the state of California is subject to various federal, state, and local regulations. It is illegal to transport explosives or inhalation hazards on any public highway not designated for that purpose, unless the use of the highway is required to permit delivery or the loading of such materials (California Vehicle Code §§ 31602[b], 32104[a]).

The CHP designates through routes to be used for the transportation of hazardous materials. Transportation of hazardous materials is restricted to these routes except in cases where additional travel is required from that route to deliver or receive hazardous materials to and from users. Information on CHP requirements and regulatory authority is provided in Section 4.8.3, Regulatory Setting, below.

Resource Conservation and Recovery Act (40 CFR §240-299)

The Federal Toxic Substances Control Act (1976) and the RCRA of 1976 established a program administered by the EPA for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA was amended in 1984 by the HSWA, which affirmed and extended the "cradle to grave" system of regulating hazardous wastes. Hazardous waste is regulated under the RCRA subtitle C. The RCRA established the system for controlling hazardous waste from its point of origin to its final disposal, specifically the handling, storage and disposal requirements. A RCRA hazardous waste is a waste that appears on one of the four hazardous wastes lists (F-list, K-list, P-list, or U-list), or exhibits at least one of four characteristics—ignitability, corrosivity, reactivity, or toxicity. The Hazardous Waste Manifest System includes a set of forms, reports, and procedures designed to seamlessly track hazardous waste from the time it leaves the generator facility where it was produced, until it reaches the offsite waste management facility that will store, treat, or dispose of the hazardous waste. Operating records, for example, must be kept on site for the duration of the facility's operation. Recordkeeping and reporting requirements are found at 40 CFR Part 264 subpart E and 40 CFR Part 265 Subpart E.

Associated Hazardous and Solid Waste Amendments (HSWA) (40 CFR 260)

Under RCRA, individual states may implement their own hazardous waste programs instead of RCRA, as long as the state program is at least as stringent as the federal RCRA requirements. California's DTSC administers and enforces the federal hazardous waste regulations, in addition to more stringent state hazardous waste regulations. In the state chapter in this section is the Hazardous Waste Control Act of 1972. This Act is the California Waste Management program, which is similar to, but more stringent than RCRA program requires.

RCRA was amended by the Associated Hazardous and Solid Waste Amendments (HSWA), which affirmed and extended the concept of regulating hazardous wastes from generation through disposal. HSWA specifically prohibits the use of certain techniques for the disposal of some hazardous wastes. 40 CFR, Part 260.1 and Part 260.2 provide the guidelines to establish a Hazardous Waste Management System. Part 260.1 defines the terminology, requirements and guidelines necessary to track hazardous waste activities, treatment, storage, and disposal, facility and keep certain records plus submit reports to the EPA at regular intervals. Part 260.2 addresses the availability or confidentiality of information available to the public including both written and electronic hazardous waste manifest.

Exploration and Production Exemption from RCRA

While RCRA was enacted to regulate hazardous waste from industrial, commercial, mining, agricultural, and community activities, certain hazardous wastes which are exempted from the Subtitle C regulations are regulated under RCRA Subtitle D. Congress exempted "drilling fluids, produced waters, and other wastes associated with the exploration, development, or production of crude oil or natural gas or geothermal energy" from regulation under RCRA Subtitle C as hazardous wastes (RCT 2001).

The exempted oil and gas wastes are unique because they are generated in large quantities, but are relatively low in toxicity. Produced waters make up about 98% of all oil and gas wastes. The exemption only applies to wastes generated from the exploration, development, and production of oil and gas associated with primary field operations. Primary field operations include primary, secondary, and tertiary production of oil or gas (RCT 2001).

Primary field operations include activities at or near the wellhead or production facility, but before the point where the custody of the oil is transferred from an individual field facility or a centrally located facility to a carrier for transport to a refiner. If no custody transfer occurs, the primary field operation ends at the last point of separation. Crude oil stock tanks are considered separation devices for the purpose of defining areas of primary field operations (RCT 2001).

With respect to natural gas production, primary field operations are activities occurring at or near the wellhead, production facility, or gas plant (including gathering lines to the plant), but before the point of transfer of the gas from an individual field facility, a centrally located facility, or a gas plant to a carrier for transport to market, or before the point of the use of natural gas in a manufacturing process (RCT 2001).

In order to be covered, wastes from primary field operations must also be unique to E & P operations, such as produced water and drilling fluid are unique. However, other wastes commonly generated that are also generate by other types of industries, such as cleaning wastes, painting wastes, and waste lubricating oil are not exempt (RCT 2001).

Many of the wastes generated during oil and gas-related activities are exempt from RCRA, but some are not. Wastes that are exempt include:

…waste materials intrinsically derived from primary field operations associated with the

exploration, development, or production of crude oil and natural gas. The phrase "intrinsically derived from primary field operations" is intended to distinguish exploration, development, and production operations from transportation and manufacturing operations (EPA 2002).

The RCRA exempt oil and gas wastes are not regulated as hazardous wastes under federal law. The following table lists the RCRA nonexempt and exempt wastes from oil and gas E & P. All exempt waste must be generated in primary field operations.

Table 4.8-9: Example RCRA Nonexempt and Exempt Wastes Generated during Oil Exploration and Production

RCRA Nonexempt Oil and Gas Wastes
Oil and gas service company wastes, such as empty drums, drum rinsate, vacuum truck rinsate, sandblast media, painting wastes, spent solvents, spilled chemicals, and waste acids
Waste compressor oil, filters, and blowdown
Waste solvents
Boiler cleaning wastes
Unused fracturing fluids or acids
Painting wastes
Vacuum truck and drum rinsate from trucks and drums transporting or containing nonexempt waste
Liquid and solid wastes generated by crude oil and tank bottom reclaimers
Refinery wastes
Gas plant cooling tower cleaning wastes
Boiler refractory bricks
Incinerator ash
Sanitary wastes
Radioactive tracer wastes
Used equipment lubrication oils
Used hydraulic fluids
Waste in transportation pipeline-related pits
Caustic or acid cleaners
Boiler scrubber fluids, sludges, and ash
Laboratory wastes
Pesticide wastes
Drums, insulation, and miscellaneous solids
Oil and Gas Wastes Exempt from RCRA Hazardous Waste Regulation

Table 4.8-9: Example RCRA Nonexempt and Exempt Wastes Generated during Oil Exploration and Production

Drilling fluids and cuttings from offshore operations disposed on-shore
Well completion, treatment, and stimulation fluids
Basic sediment and water and other tank bottom sludge from storage facilities that hold product and exempt waste
Accumulated materials such as hydrocarbons, solids, sand, and emulsion from production separators, fluid treating vessels, and production impoundments
Produced water
Drilling fluids and drill cuttings
Workover wastes
Pit sludges and contaminated bottoms from storage or disposal exempt wastes
Gas plant sweetening wastes for sulfur removal, including amine, amine filters, amine filter media, backwash, precipitated amine sludge, iron sponge, and hydrogen sulfide scrubber liquid and sludge
Spent filters, filter media, and backwash (assuming the filter itself is not hazardous and the residue in it is from an exempt waste stream)
Produced sand
Pipe scale, hydrocarbon solids, hydrates, and other deposits removed from piping and equipment prior to transportation
Wastes from subsurface gas storage and retrieval, except for the listed nonexempt wastes
Liquid hydrocarbons removed from the production stream but not from oil refining
Gases removed from the production stream, such as hydrogen sulfide and carbon dioxide, and volatilized hydrocarbons
Light organics volatilized from exempt wastes in reserve pits or impoundments or production equipment
Geothermal production fluids
Gas plant dehydration wastes, including glycol-based compounds, glycol filters, filter media, backwash, and molecular sieves
Cooling tower blowdown
Packing fluids
Hydrocarbon-bearing soil
Pigging wastes from gathering lines
Constituents removed from produced water before it is injected or otherwise disposed of
Materials ejected from a producing well during blowdown
Waste crude oil from primary field operations and production
Rigwash

Table 4.8-9: Example RCRA Nonexempt and Exempt Wastes Generated during Oil Exploration and Production

Sources: Adapted from Tables 1 and 2 from RCT 2001 and EPA 2002
Note:
*All exempt waste *must* be generated in primary field operations.

The E & P exemption is incorporated into California regulations, 22 CCR, Section 66261.4(b)(2) and 66261.24(a)(1), but it is limited in scope. The exemption applies only where the waste is hazardous solely by meeting the federal characteristic for toxicity under the Toxicity Characteristic Leaching Procedure (TCLP). The exemption does not apply if toxicity is determined based on criteria other than TCLP, or the waste meets any of the other three characteristics of hazardous waste codified in 22 CCR, Article 3, Sections 66261.20 et seq., namely ignitability, corrosivity, and reactivity (Nagy 2002).

The California DTSC conducted a study of E & P wastes, produced water, drilling waste, oily sludges, and foam wastes to determine whether they could have hazardous waste characteristics that are not covered by the exemption. The data indicated that oily sludges may exhibit hazardous waste characteristics not covered by the exemption. The DTSC report concluded that depending on formation characteristics or facility operations, certain E & P wastes, such as oily sludges, may be regulated by the State as hazardous wastes even if they are exempted from hazardous waste regulation under federal law. It is the generator's responsibility to determine which waste streams are hazardous in California and manage them accordingly (Nagy 2002).

Pollution Prevention

The Oil Pollution Act of 1990 (33 U.S.C. 2701 et seq.)

Under the authority of §311 of the CWA, the Oil Pollution Act (OPA) of 1990 prescribes a prevention, response, liability and compensation program for oil pollution from vessels, offshore facilities, pipelines, and onshore facilities. The OPA requires contingency plans be developed and includes reporting requirements to ensure the earliest possible notice of discharges of oil and hazardous substances and imminent threats of such discharges to the appropriate state and federal agencies. The Bureau of Safety and Environmental Enforcement (formerly part of Mineral Management Service [MMS]), U.S. Coast Guard, and EPA are involved in the implementation of OPA. In June of 1996, the EPA issued a Spill Prevention and Reporting Compliance Guidance Plan Document which integrated all the various related rules and regulations into one compliance program (WZI 2014a).

Oil Pollution Prevention Regulation; Non-Transportation-Related Onshore and Offshore Facilities (40 CFR §112)

These regulations establish procedures, methods, and equipment requirements to prevent the discharge of oil from onshore and offshore facilities into or upon the navigable waters of the United States. These regulations apply only to non-transportation-related facilities. The U.S. Coast Guard and the EPA share responsibility for Federal On-Scene Commander oversight for spills. The

Spill Prevention, Control, and Countermeasure (SPCC) plan requirement discussed above under the CWA, are included within these regulations.

Chemical Facility Anti-Terrorism Standards (6 CFR Part 27)

The Federal Department of Homeland Security established the chemical facility anti-terrorism standards in 2007. This rule established risk-based performance standards for the security of chemical facilities. Petroleum refineries can be considered chemical facilities. This regulation requires covered chemical facilities to prepare security vulnerability assessments, which identify facility security vulnerabilities, and to develop and implement site security plans.

In addition to regulatory standards, there are a number of industry codes and standards that are used in the design, construction, operation, and maintenance of hazardous liquid pipelines. Organizations that have developed these standards and codes include:

- API
- ASME
- National Fire Protection Association
- National Association of Corrosion Engineers

Hazardous Materials Transportation

The Hazardous Materials Transportation Act, 49 CFR 171, Subchapter C

The USDOT, Federal Highway Administration, and the FRA regulate transportation of hazardous materials at the federal level (state requirements are discussed in following sections). The HMTA requires that carriers report accidental releases of hazardous materials to the USDOT at the earliest practical moment. Other incidents that must be reported include deaths, injuries requiring hospitalization, and property damage exceeding $50,000. The USDOT also specifies the types of cars that must be used to ship crude oil and other materials.

The FRA authorizes the Hazardous Materials Division to administer a safety program, under the Federal Hazardous Materials transportation law (49 U.S.C. § 5101 *et seq.*), that oversees the movement of hazardous materials (including dangerous goods), such as petroleum, chemical, and nuclear products, throughout the Nation's rail transportation system. The FRA's hazardous materials inspection program is primarily responsible for monitoring compliance pursuant to the hazardous materials regulations found in 49 CFR Parts 171–180, including in particular, 49 CFR Part 174, Carriage By Rail. Part 174 include restrictions on the types of hazardous materials that may be shipped, tank car specifications, requirements for labeling, handling, loading, unloading and storage, and requirements for safety and security inspections. In addition, specific handling and tank car requirements are prescribed for explosives, gases, flammable liquids, and poisonous and radioactive materials. FRA inspectors are authorized to inspect railroad or other facilities and all pertinent documents related to hazardous materials transportation to verify compliance with the hazardous materials regulation. Additionally, the FRA has an obligation to investigate possible

violations at points where shipments originate and monitor compliance on a regular basis (FRA 2011).

Worker Health and Safety

Occupational Safety and Health Act, (29 U.S.C. 651-678)

Under the authority of the Occupational Safety and Health Act of 1970, the Occupational Safety and Health Administration (OSHA), a division of the Department of Labor, established health and safety standards for the workplace, including the accidents and occupational injuries reporting requirements. Relevant regulations include those related to hazardous materials handling, employee protection requirements, first aid, and fire protection, as well as material handling and storage. Relevant portions are summarized below.

Hazard Communication, 29 CFR 1910.1200

The purpose of this section is to ensure that the hazards of all chemicals produced or imported are classified, and that information concerning the classified hazards is transmitted to employers and employees. The requirements of this section are intended to be consistent with the provisions of the United Nations Globally Harmonized System of Classification and Labeling of Chemicals (GHS), Revision 3. The transmittal of information is to be accomplished by means of comprehensive hazard communication programs, which are to include container labeling and other forms of warning, safety data sheets and employee training.

Process Safety Management (PSM) of Highly Hazardous Materials, 29 CFR 1910.119

This regulation establishes requirements for preventing or minimizing the consequences of catastrophic releases of toxic, flammable, reactive or explosive materials. The PSM regulation requires compiling process safety information, conducting process hazard analyses, written operating procedures, employee training and participation programs, pre-startup safety reviews, evaluation of mechanical integrity of critical equipment, contractor requirements, written procedures for managing change, hot work permit systems, incident investigations, emergency action plans, and compliance audits.

Airports

Federal Aviation Administration (FAA)

The FAA regulates aviation at regional, public, private, and military airports. The FAA regulates objects affecting navigable airspace and structures taller than 200 feet according to Federal Aviation Regulation 14 CFR Part 77. The U.S. and California Departments of Transportation also require the proponent to submit FAA Form 7460-1, Notice of Proposed Construction or Alteration. According to 14 CFR Part 77.5, notification allows the FAA to identify potential aeronautical hazards in advance, thus preventing or minimizing any adverse impacts on the safe and efficient use of navigable airspace. Any structure that would constitute a hazard to air navigation, as defined in 14 CFR Part 77, requires issuance of a permit from the California Department of Transportation's Aeronautics Program. The permit is not required if the FAA aeronautical study determines that the structure has no impact on air navigation.

State

Federal statutes establish national standards for the transportation, emission, discharge, and the disposal of harmful substances; however, implementation and enforcement of many of the large programs has been delegated to the states by the EPA. In general, states set stricter standards than those required by federal law. Some of the programs delegated to the states are the emissions standards, the water quality standards and the National Pollution Discharge Elimination System (NPDES) Programs under the CWA, the hazardous waste program under RCRA, and the drinking water and UIC programs under the SDWA (Brown n.d.). In addition, state laws address gas and liquid pipelines, oil and gas facilities and hazardous materials and waste. Each of these is discussed below.

Hazardous Materials and Hazardous Waste

Whether a material is deemed a hazardous material and/or a hazardous waste determines which state regulation will apply to it. According to Health and Safety Code § 25124, materials become waste when the material is disposed of, burned or incinerated, or accumulated, stored or treated before or in lieu of being disposed of, burned or incinerated. Recyclable materials that are managed as provided in Health and Safety Code § 25143.2 and 25143.9 are excluded from classification as waste. A hazardous waste is a waste that because of its quantity, concentration, or physical, chemical, or infectious characteristics may either:

- Cause or significantly contribute to an increase in mortality or an increase in serious irreversible or incapacitating reversible illness.
- Pose a substantial present or potential hazard to human health or the environment, due to factors including, but not limited to, carcinogenicity, acute toxicity, chronic toxicity, bioaccumulative properties, or persistence in the environment, when improperly treated, stored, transported, disposed of, or otherwise managed. (Health and Safety Code § 25117; 25141).

Hazardous Materials Release Response Plans and Inventory Act of 1985

The Hazardous Material Release Response Plans and Inventory Act, (HSC, Division 20, Chapter 6.95, Sections 25500-25547.8) also known as the Business Plan Act, (HSC, Division 20, Chapter 6.95, Sections 25500-25519) requires businesses using hazardous materials to prepare a plan that describes their facilities, inventories, emergency response plans, and training programs. Hazardous materials are defined as raw or unused materials that are hazardous and are part of a process or manufacturing step. Specifically, the California Health and Safety Code Sections 25503 and 25505 require facilities that store hazardous materials in excess of 55 gallons, 500 pounds, or 200 cubic feet to submit Hazardous Materials Business Plans (HMBPs) to the Certified Uniform Program Agency. This plan must include a hazardous materials inventory and address emergency response, planning, training, and evacuation.

Uniform Fire Code--Hazardous Materials Management Plan, Hazardous Materials Inventory Statement

The Uniform Fire Code (UFC) prescribes regulations that are consistent with best practices to address fire and explosion hazards that can arise from the storage, handling and use of hazardous substances, materials and devices. The State Fire Marshal has adopted the UFC, with amendments, as the California Fire Code. Local fire departments are required to adopt local fire codes that are no less stringent than the California Fire Code (Brown n.d.).

According to Section 8001.3.1, a permit is required to store, use, or handle hazardous material in excess of specified quantities. A local fire chief may require permit applicants to prepare a Hazardous Materials Management Plan (HMMP) (Section 8001.3.2a) and Hazardous Materials Inventory Statement (HMIS) (Section 8001.3.3a). These documents are consistent with the HMBP (Brown n.d.).

Hazardous Materials Transportation in California

California regulates the transportation of hazardous waste originating or passing through the state in Title 13 of the CCR. The CHP and Caltrans have primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies. Caltrans sets standards for trucks in California. The regulations are enforced by the CHP. Common carriers are licensed by the CHP, pursuant to the California Vehicle Code, §32000.5. This section requires licensing of every motor (common) carrier who transports in excess of 500 pounds of hazardous materials at one time or hazardous materials shipments that require placards.

Under the RCRA, the EPA sets standards for transporters of hazardous waste. In addition, California regulates the transportation of hazardous waste originating or passing through the state; state regulations are contained in the CCR, Title 13. Hazardous waste must be regularly removed from generating sites by licensed hazardous waste transporters. Transported materials must be accompanied by hazardous waste manifests and spills or discharges must be reported.

Hazardous Waste Control Act of 1972 (HSC Division 20, Chapter 6.5)

The Hazardous Waste Control Act established the state hazardous waste management program, which is similar to, but more stringent than RCRA program requirements. The Hazardous Waste Control Law regulates the management of hazardous waste under Health and Safety Code, Division 20 Chapter 6.5. This law defines hazardous wastes and the procedures for the handling, transportation, and disposal of hazardous waste. The implementing regulations prescribe management practices for hazardous wastes; establish permit requirements for hazardous waste treatment, storage, disposal, and transportation; and identify hazardous wastes that cannot be disposed of in landfills. Hazardous waste is tracked from the point of generation to the point of disposal or treatment using hazardous waste manifests. The manifests list a description of the waste, its intended destination, and regulatory information about the waste. The hazardous waste control program is administered by the state DTSC and by local CUPAs.

Title 22 of the CCR Division 4.5, Environmental Health Standards for Management of Hazardous Waste provides the regulatory requirements for the implementation of the law. Chapter 11 defines a waste as hazardous if it has any of the following characteristics: ignitability, corrosivity, reactivity, and toxicity. Article 3 provides detailed definitions of each characteristic. Articles 4 and 5 provide lists of RCRA hazardous wastes, non-RCRA hazardous wastes, hazardous wastes from specific sources, extremely hazardous wastes, hazardous wastes of concern, and special wastes. Chapters 12, 13, and 14 provide the standards for hazardous waste generators and transporters as well as for the owners of transfer, treatment, storage, and disposal facilities.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program)

Senate Bill 1082 of 1993 (Health and Safety Code Chapter 6.11) required the Secretary of the CalEPA to establish a "unified hazardous waste and hazardous materials management" regulatory program (Unified Program) by January 1, 1996. Currently, there are 83 Certified Unified Program Agencies (CUPA) in California. All counties have been certified by the Secretary. The *Unified Program* consolidates, coordinates, and makes consistent six existing programs.

The Unified Program provides for local implementation of the following six state and federal regulatory programs:

- The Aboveground Storage Tank program (and its SPCCs)
- The Hazardous Materials Release Response Plan and Inventory Program (HMRRP) (Business Plan)
- The California Accidental Release Prevention Program (CalARP)
- The California UFC, HMMP, and HMIS
- The Underground Storage Tank program (UST)
- The Hazardous Waste Generator and Onsite Hazardous Waste Treatment program (tiered permitting)

The local implementing agencies are known as CUPAs (certified unified program agencies) or PAs (participating agencies) (Brown, n.d.).

Aboveground Petroleum Storage Act

The Aboveground Petroleum Storage Act (APSA) requires reporting of any spill or leak in excess of one barrel as the hazardous materials release regulations (19 CCR §2620-2734). The CUPAs are responsible for its implementation. In Kern County, the Kern County Public Health Services Department Environmental Health Division is the responsible party (WZI 2014a).

Hazardous Waste and Substances Sites (Cortese) List (California Government Code §65962.5)

This state code requires the state to compile a hazardous waste and substance list. The Cortese List is a planning document used to comply with the California Environmental Quality Act (CEQA) requirements by providing information about the location of hazardous materials release sites. The CalEPA must update the Cortese List annually (California DTSC 2007b).

California Accidental Release Prevention (CCR 2745.1, 1997)

CalARP is designed to minimize the risk of extremely hazardous substances that potentially cause immediate harm to the public and the environment by requiring business owner/operator handling one or more regulated substance over the state and/or federal threshold to evaluate and determine the potential impacts of an accidental release. The CalARP mirrors the Federal Risk Management Program under the federal Clean Air Act Section 112(r), except that it includes external events and seismic analysis to the requirements and includes facilities with lower inventories of materials.

Facilities subject to the CalARP requirements must submit a RMP to the CUPA. The RMP must contain required elements, similar to those required under the federal RMP program, the specific requirements of which are determined by the CalARP "program level" that applies to the facility. For example, the RMP typically must include safety information, process hazard analysis, or hazard review, written operating procedures, training, maintenance, compliance audits, and incident investigations.

Emergency Services Act of 2009

Under the Emergency Services Act, the state developed an emergency response plan to coordinate emergency services provided by federal, state, and local agencies. Rapid response to incidents involving hazardous materials or hazardous waste is an important segment of the plan administered by the CalOES, formerly the California Emergency Management Agency. CalOES is responsible for the coordination of overall state agency response to major disasters in support of local government. The office is responsible for assuring the state's readiness to respond to and recover from all hazards – natural, manmade, war-caused emergencies and disasters – and for assisting local governments in their emergency preparedness, response, recovery, and hazard mitigation efforts (CalOES 2011a).

The CalOES Hazardous Materials (HazMat) Section coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats (CalOES 2011b).

Releases of oil that in any way causes harm or threatens to cause harm to public health and safety, the environment, or property, require immediate notification and must be made to the CalOES Warning Center. In addition, any discharge or threatened discharge of oil into state waters must be reported to CalOES. No notification is needed if the release of oil is on land and is not discharged or threatening to discharge into state waters; and (a) does not cause harm or threaten to cause harm to the public health and safety, the environment, or property; and (b) is under 42 gallons (CalOES 2014).

The Porter-Cologne Water Quality Control Act, California Water Code Sections 13300-13999 and Title 23 of the California Administrative Code

This Act is analogous to the federal CWA and regulates discharges that may affect the quality of the state's waters. Unlike the federal CWA, which defines "waters of the United States" to exclude groundwater, "waters of the state" as defined under the Porter-Cologne Act include groundwater. The SWRCB and the nine Regional Water Quality Control Boards (RWQCBs) are responsible for planning, permitting, and enforcement. The State Board formulates policies for water-quality control and implements the required permit system (Brown n.d.).

This Act also establishes reporting requirements for unintended discharges of any hazardous substance, sewage, or oil or petroleum products. Any discharge of one barrel of oil or greater requires reporting to the Office of Emergency Services (WZI 2014a).

The State and Regional Water Boards have enforcement authority under the Porter-Cologne Water Quality Control Act; the Toxic Pits Cleanup Act of 1984; Chapters 6.67, 6.7, and 6.75 of Division 20 of the Health and Safety Code regarding underground and aboveground tanks; Health and Safety Code section 25356.1; and Chapter 6 of Division 3 of the Harbors and Navigation Code. They can take action for:

- Violation of an effluent limit, receiving water limit, or discharge prohibition contained in an order or Water Quality Control Plan (Basin Plan).
- An unauthorized spill, leak, fill, or other discharge.
- Failure to perform an action required by the State Water Board or a Regional Water Board (Brown, n.d.).

The Porter-Cologne Act gives the CVRWQCB the authority to regulate discharges of waste to land in Kern County. The CVRWQCB has established waste classifications, site classifications, and WDRs. The CVRWQCB implements the regulations through issuance of WDRs and general orders for the waste management unit. Waste management units, permitted by the CVRWQCB for the E & P industry, include evaporation ponds, percolation ponds, and sumps. As discussed in Section 4.9, Hydrology and Water Quality, drilling muds and boring wastes associated with oil and

gas development currently are regulated under SWRCB General Order 2003-0003-DWQ which addresses low-threat discharges to land. The CVRWQCB staff has indicated it intends to prepare General WDRs for drilling sumps, but has not yet proposed tentative or final WDRs. If adopted, such WDRs – rather than the SWRCB General Order – would regulate the evaporation ponds, percolation ponds, and/or sumps covered by the WDRs.

Lempert-Keene-Seastrand Oil Spill Prevention and Response Act of 1990

This chapter, Article 3.5 (Section 8574.1) of Chapter 7 of the Government Code, and Division 7.8 (Section 8750) of the Public Resources Code, known as the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act, seeks to protect the waters of the state from oil pollution and to plan for the effective and immediate response, removal, abatement, and cleanup in the event of an oil spill. It also requires immediate cleanup of spills following approved contingency plans and fully mitigating impacts on wildlife.

The Act assigns primary authority to California Department of Fish and Wildlife and Office of Spill Prevention and Response (CDFW-OSPR) to direct prevention, removal, abatement, response, containment, and cleanup efforts with regard to all aspects of any oil spill in the marine waters of the state.

The Act was amended in 2014 by Senate Bill 861 to expand application of its provisions to all waters of the state, and not solely coastal and marine waters. The bill requires CDFW-OSPR to amend the state's oil spill contingency plan to provide for the best achievable protection of all state waters, and to submit the plan to the governor and the legislature on or before January 1, 2017. The amendments also expand the fee requirements under the Act by deleting a provision that would have reduced the oil spill prevention and administration fee, and also deleting a fee exception for independent crude oil producers. The bill also imposes the oil spill prevention fee on pipeline operators transporting petroleum products into the state by means of a pipeline operating across, under, or through any waters of the state. The amendments also impose the fee on persons owning crude oil or petroleum products at the time the crude oil or petroleum products are received at a refinery by any mode of delivery that passed over, across, under, or through waters of the state, whether from within or outside the state. Prior law imposed the fee only on crude oil arriving at a marine terminal via tanker.

Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65; Health and Safety Codes Sections 25249.5 et seq.)

The Act requires businesses to notify Californians about significant amounts of chemicals that are released into the environment. It also requires the development of health-protective exposure standards for different media (air, water, land) to recommend to regulatory agencies.

CalEPA Office of Environmental Health Hazard Assessment (OEHHA) is responsible for implementing this Act. The OEHHA evaluates currently available scientific information on substances considered for placement on the Proposition 65 list. Proposition 65 is enforced by the attorney general, district attorneys, and the private citizens acting in the public interest.

California Environmental Protection Agency (CalEPA)

The CalEPA was created in 1991, which unified California's environmental authority in a single cabinet-level agency and brought the California Air Resources Board (CARB), SWRCB, RWQCBs, California Department of Resources Recycling and Recovery (CalRecycle) - formerly the Integrated Waste Management Board (IWMB), DTSC, OEHHA, and Department of Pesticide Regulation (DPR) under one agency. These agencies were placed within the CalEPA "umbrella" for the protection of human health and the environment and to ensure the coordinated deployment of state resources. Their mission is to restore, protect, and enhance the environment, to ensure public health, environmental quality, and economic vitality.

Department of Toxic Substance Control (DTSC)

The DTSC is a department of CalEPA and is the primary agency in California that regulates hazardous waste, cleans-up existing contamination, and looks for ways to reduce the hazardous waste produced in California. The DTSC regulates hazardous waste in California primarily under the authority of the federal RCRA and the California Health and Safety Code (primarily Division 20, Chapters 6.5 through 10.6, and Title 22, Division 4.5). Other laws that affect hazardous waste are specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning.

Government Code §65962.5 (commonly referred to as the Cortese List) includes DTSC-listed hazardous waste facilities and sites, DHS lists of contaminated drinking water wells, sites listed by the SWRCB as having UST leaks and which have had a discharge of hazardous wastes or materials into the water or groundwater, and lists from local regulatory agencies of sites that have had a known migration of hazardous waste/material.

California Office of Emergency Services (CalOES)

In order to protect the public health and safety and the environment, the CalOES is responsible for establishing and managing statewide standards for business and area plans relating to the handling and release or threatened release of hazardous materials. Basic information on hazardous materials handled, used, stored, or disposed of (including location, type, quantity, and the health risks) needs to be available to firefighters, public safety officers, and regulatory agencies. The information needs to be included in business plans in order to prevent or mitigate the damage to the health and safety of persons and the environment from the release or threatened release of these materials into the workplace and environment. These regulations are covered under Chapter 6.95 of the California Health and Safety Code Article 1–Hazardous Materials Release Response and Inventory Program (Sections 25500 to 25520) and Article 2– Hazardous Materials Management (Sections 25531 to 25543.3).

CCR Title 19, Public Safety, Division 2, Office of Emergency Services, Chapter 4– Hazardous Material Release Reporting, Inventory, and Response Plans, Article 4 (Minimum Standards for Business Plans) establishes minimum statewide standards for HMBPs. These plans include the following: (1) a hazardous material inventory in accordance with Sections 2729.2 to 2729.7; (2) emergency response plans and procedures in accordance with Section 2731; and (3)

training program information in accordance with Section 2732. Business plans contain basic information on the location, type, quantity, and health risks of hazardous materials stored, used, or disposed of in the state. Each business shall prepare a HMBP if that business uses, handles, or stores a hazardous material or an extremely hazardous material in quantities greater than or equal to the following:

- 500 pounds of a solid substance;
- 55 gallons of a liquid;
- 200 cubic feet of compressed gas;
- A hazardous compressed gas in any amount; or
- Hazardous waste in any quantity.

California Highway Patrol (CHP)

A valid Hazardous Materials Transportation License, issued by the CHP, is required by the laws and regulations of State of California Vehicle Code Section 3200.5 for transportation of either:

- Hazardous materials shipments for which the display of placards is required by state regulations; or
- Hazardous materials shipments of more than 500 pounds, which would require placards if shipping greater amounts in the same manner.

Additional requirements on the transportation of explosives, inhalation hazards, and radioactive materials are enforced by the CHP under the authority of the State Vehicle Code. Transportation of explosives generally requires consistency with additional rules and regulations for routing, safe stopping distances, and inspection stops (Title 14, CCR, Chapter 6, Article 1, Sections 1150-1152.10). Inhalation hazards face similar, more restrictive rules and regulations (Title 13, CCR, Chapter 6, Article 2.5, Sections 1157-1157.8). Radioactive materials are restricted to specific safe routes for transportation of such materials.

Regulatory Programs that Have Both a Federal and State Nexus Relevant to this Project

This section synthesizes information provided above for two topic areas that have multiple state and federal requirements, hazardous material releases and reporting, and discharges to underground injection wells.

Hazardous Materials Releases and Reporting

In California, emergency release reporting and response requirements extend across several federal statutes and numerous state laws:

- Comprehensive Environmental Response, Compensation and Liability Act (U.S.)

- Emergency Planning and Community Right-to-Know Act (U.S.)
- CWA (U.S.)
- RCRA (U.S.)
- The Waters Bill (H.R.6204)
- The Hazardous Waste Control Law (CA)
- The Porter-Cologne Water Quality Protection Act (CA)
- The APSA (CA)
- The UST laws (CA)
- The Occupational Carcinogens Control Act (CA)

These laws differ as to what releases must be reported (e.g., releases to "the environment" vs. releases to "waters of the state"), and which materials or chemicals that are subject to regulations. The Waters Bill represents the minimum reporting burden for state-only releases because of the broadness of the "hazardous materials" and "release" definitions. Regulations implementing hazardous materials inventories and release reporting provisions have been adopted by the Office of Emergency Services (19 CCR §2620-2734). Kern County primarily administers these provisions (WZI 2014a).

CalARP's goal is to prevent accidental releases of substances that pose the greatest risk of immediate harm to the public and the environment. Kern County conducts inspections at CalARP facilities and reviews RMPs. Cogeneration anhydrous ammonia plants are an example of this facility type in an oilfield (WZI 2014a).

Hazardous materials handlers must report significant releases. Handlers must orally report as soon as possible without impeding control of the release and a written follow-up report must be made to the local agency and to the Office of Emergency Services (WZI 2014b).

In reporting hazardous materials releases, facilities must report, at a minimum: (1) the location of the release; (2) the hazardous materials are involved; (3) the quantity of material involved; (4) the potential hazards; (5) when the release occurred; and (6) the responsible party (WZI 2014b).

California regulates underground storage tanks through the California Health and Safety Code. Should an unauthorized release occur, the regulations require release reporting, investigation and abatement by the Owner. The release must be reported to the local administering agency, Kern County and to DTSC or the California Regional Water Quality Control Board (CRWQCB) within 24 hours of discovery. A full written report is required by the owner within five days. (WZI 2014b).

Additionally, the EPA maintains the Emergency Response Notification System (ERNS) database. This database is updated weekly and provides a record of all phone calls made to the National Response Center (NRC). The NRC is notified regarding any number of different types of spills or releases (WZI 2014b).

Discharges to Injection Wells

State and federal authorities regulate the subsurface injection of waste. The Porter-Cologne Act regulates subsurface injection discharges that could affect the quality of "waters of the state" and requires dischargers to file a Report of Waste Discharge with the local Regional Board and comply with issued WDRs (WZI 2014a).

The federal SDWA regulates underground injection to protect usable drinking water supplies from contamination. States can apply to the EPA to regulate this program within their own boundaries. For wells associated with oil and gas production (referred to as "Class II" wells), California has a EPA-approved UIC program. DOGGR administers the Class II UIC program pursuant to a "Primacy Agreement and Memorandum of Understanding" with the EPA that was established in 1983. The current status and recent developments regarding the Class II UIC program administered by DOGGR are discussed below and in Section 4.9, Hydrology and Water Quality. For classes of wells other than Class II, California does not have an EPA-approved UIC program and EPA Region IX administers the UIC program directly (WZI 2014a).

Liquid Pipelines and Oil Facilities

Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR)

DOGGR regulates statewide oil and gas activities. It supervises the drilling, operation, maintenance, and plugging and abandonment of onshore and offshore oil, gas, and geothermal wells, preventing damage to: (1) life, health, property, and natural resources; (2) underground and surface waters suitable for irrigation or domestic use; and (3) oil, gas, and geothermal reservoirs. Division requirements encourage wise development of California's oil, gas, and geothermal resources while protecting the environment (DOGGR 2015).

The Division's programs include: well permitting and testing; well stimulation; safety inspections; oversight of production and injection projects; environmental lease inspections; idle-well testing; inspecting oilfield tanks, pipelines, and sumps; hazardous and orphan well plugging and abandonment contracts; and subsidence monitoring (DOGGR 2015).

Section 3000 of the California Public Resources Code and Title 14, Chapter 4 of the CCR addresses issues, such as well spacing, blowout prevention devices, casing requirements, plugging and abandonment of wells, maintenance of facilities and safety systems, and inspection frequency and reporting requirements.

DOGGR has published instruction manuals related to, among other topics, the testing of oil and gas wells for water shutoff (Manual 06), blowout prevention requirements (Publication No. 07) and drilling oil, gas, and geothermal wells in an H_2S environment (M10). The Blowout Prevention in California Manual (Publication No. 07) assists the user with the equipment selection and testing for all well types.

In California, all Class II injection wells are regulated by the DOGGR under the State Public

Resources Code and the federal SDWA. Class II injection wells fall under the Division's UIC program, which is monitored and audited by the EPA. In 1983, the Division received the EPA's primary authority, primacy, to regulate Class II wells. The main features of the UIC program include permitting, inspection, enforcement, mechanical integrity testing, plugging and abandonment oversight, data management, and public research. Currently DOGGR and EPA are working together to strengthen DOGGR's administration of the UIC program to ensure it complies with federal requirements and to update aquifer exemption boundaries. As part of this process DOGGR is reviewing Class II wells and their relative risk to groundwater resources. In addition, DOGGR will be releasing new guidance on the aquifer exemption process, considering aquifer exemption applications and issuing rulemakings for corrective action and Class II UIC program improvements, including the creation of a searchable injection well database. The current status and recent developments regarding the Class II UIC program administered by DOGGR are discussed in more detail in Section 4.9, Hydrology and Water Quality.

Assembly Bill 1376 (Bustamante) Field Rule

In 1998 under Assembly Bill 1376 (Bustamante), the DOGGR, RWQCB, and California Department of Fish and Game established the "field rule" for oil spill reporting in the San Joaquin Valley. The threshold for reporting in the San Joaquin Valley is:

- All spills of five barrels of crude oil or more unless the spill is within containment;
- All spills of 10 barrels or more within containment; and
- Any spill of one barrel of oil or more to land or any amount that causes a sheen on the water under the following conditions:
    - Any lease or site without appropriate or adequate containment as required by Subchapter 2, Section 1750 through 1779 of the CCR or without a current oil spill contingency plan,
    - Urban areas,
    - Into waters of the state or any place where the spill can pass into waters of the state, and
    - Any field or area designated specifically by DOGGR, DFW, or RWQCB (DOC 1998).

AB 1960 Public Resources: Oil Production Facilities and Oil Spills

Under this bill, DOGGR is required to regulate the minimum facility maintenance standards for production facilities. The regulations that accompany this bill (14 CCR Sections 1722 – 1777.3) require operators to develop and implement spill contingency plans where condensate storage volume exceeds 50 barrels or at facilities that produce at least one barrel per day. The implementing regulations provide specific requirements for the spill contingency plan that include emergency contacts, available safety equipment, checklist for spill response, maps of the facility, a list of chemicals at the facility, containment features, corrosion prevention techniques, and the sensor and alarm systems. These plans may be fulfilled by SPCC plans if the SPCC plan is deemed

adequate by DOGGR. Relevant portions of the AB 1960 implementing regulation include:

- 1773.1 Production Facility Secondary Containment: Production facilities storing and/or processing fluids, with specific exceptions, shall have secondary containment that is capable of containing the volume of liquids from the container with the largest gross capacity within the secondary containment and should be able to confine the liquid for 72 hours.

- 1773.2 Tank Construction and Leak Detection. All new tanks shall be constructed and designed with sufficient space between tanks to facilitate maintenance, inspection, testing, and repair. New tank foundations shall support the tank, maintain the tank level, and drain fluid away from the tank. The sub-base of the foundation shall have an impermeable barrier designed to prevent downward fluid migration and to allow leaks to drain away from the tank and be detected by inspection.

- 1773.3. Tank Maintenance and Inspections. Operators shall inspect in-service tanks at least once a month for leaks at any location that could leak to evaluate the presence of corrosion; the condition of the foundation; and the condition of paint, insulation, and grounding systems.

- 1774.1. Pipeline Inspection and Maintenance. Operators are subject to pipeline inspection and testing procedures, including requirements to "visually inspect all aboveground pipelines for leaks and corrosion" at least once per year, perform tests or inspections that DOGGR may order to establish the reliability of any pipeline system, and repair, replace, or install cathodic protection as required. Any pipeline that has had a leak in the past, resulting in the release of a reportable quantity, shall be pressure tested by the operator to verify the integrity of the pipe prior to being placed back into active service.

- 1774.2. Pipeline Management Plans. Operators shall prepare a pipeline management plan for all pipelines that lists information on each pipeline as well as a description of the testing method and schedule for all pipelines.

- 1777. Maintenance and Monitoring of Production Facilities, Safety Systems, and Equipment. Operators are required to maintain production facilities in good condition to prevent leakage and corrosion and to safeguard life, health, property, and natural resources. Specifically operators must implement and comply with a preventative maintenance program which requires operators to conduct at least monthly visual inspections of aboveground facilities, excluding pipelines, for leaks and corrosion.

A blowout prevention and control plan may be necessary for certain critical or high-pressure wells. There are reporting requirements for blowouts, fires, serious accidents and significant gas or water leaks.

In addition, these regulations address oilfield sumps; production facilities containment, maintenance, and testing; pipeline construction and maintenance; maintenance and monitoring of

production facilities, safety equipment, and equipment.

California Pipeline Safety Act of 1981 (Cal. Gov. Code § 51010)

This California Pipeline Safety Act gives regulatory jurisdiction to the state Fire Marshal for the safety of all intrastate hazardous liquid pipelines and oil interstate pipelines used for the transportation of hazardous or highly volatile liquid substances. The law establishes the federal Hazardous Liquid Pipeline Safety Act (49 U.S.C. Sec. 2001 et seq.) and federal pipeline safety regulations as the governing rules for intrastate pipelines. This statute also authorizes the state Fire Marshal by agreement with the United States Secretary of Transportation, to implement the federal Hazardous Liquid Pipeline Safety Act and federal pipeline safety regulations as to those portions of interstate pipelines located within the state. It also establishes the civil penalties for violations of the act or its regulations.

California Pipeline Safety Regulations

The state Fire Marshal has adopted hazardous liquid pipeline safety regulations that comply with federal laws relating to hazardous liquid pipeline safety, including inspection and maintenance provisions.

The state Fire Marshal may exempt the application of regulations when it is determined that the risk to public safety is slight and the probability of injury or damage remote.

Any new pipeline needs to be designed and constructed in accordance with Subparts C and D of 49 CFR Part 195, and shall include a means of leak detection and cathodic protection which the state Fire Marshal determines is acceptable.

Any new pipeline shall be designed to accommodate the passage of instrumented internal inspection devices, and shall have leak mitigation and emergency response plans and equipment as the state Fire Marshal may require.

Oil Pipeline Environmental Responsibility Act (Assembly Bill [AB] 1868)

The Oil Pipeline Environmental Responsibility Act requires every pipeline corporation qualifying as a public utility and transporting crude oil in a public utility oil pipeline system to be held strictly liable for any damages incurred by "any injured party which arise out of, or are caused by, the discharge or leaking of crude oil or any fraction thereof . . . ." The law only applies to public utility pipelines completed after January 1, 1996, or the part of an existing utility pipeline relocated after 1996 and more than 3 miles in length.

Damages for which a pipeline corporation is liable under this law include all response, containment, cleanup, removal, and treatment, including monitoring and administration costs. Other costs can include, but are not limited to, injury or economic losses resulting from destruction of, or injury to, real or personal property; injury to, destruction of, or loss of natural resources, including but not limited to, the reasonable cost of rehabilitating wildlife habitat, and other resources and the reasonable cost of assessing that injury, destruction, or loss, in any action

brought by the state, county, city, or district; loss of taxes, royalties, rents, use, or profit shares caused by the injury, destruction, loss, or impairment of use of real property, personal property, or natural resources; and loss of use and enjoyment of natural resources and other public resources or facilities in any action brought by the state, county, city, or district.

In addition, a pipeline corporation shall immediately clean up all crude oil that leaks or is discharged from a pipeline.

Natural Gas Pipelines

California Public Utilities Commission (CPUC) – General Order 112-E and Proposed Amended General Order 112-F

In addition to 49 CFR Parts 190, 191, 192, and 199, natural gas pipelines that are subject to 49 CFR Part 192 are subject to the rules and regulations of the CPUC including General Order 112-E, "State of California Rules Governing Design, Construction, Testing, Operation, and Maintenance of Gas Gathering, Transmission, and Distribution Piping Systems." General Order 112-E establishes reporting requirements including incident reports, annual reports, safety-related condition reporting, installation reports, and reporting of changes in maximum allowable operating pressure (MAOP). General Order 112-E also establishes construction and safety standards for gas pipelines, and testing requirements. CPUC General Order 112-E is presently undergoing revision by the CPUC in its proposed amended General Order 112-F. The amendments proposed in General Order 112-F would double the frequency of transmission system leak surveys, provide guidance on prioritizing leak repair, qualifying training facilities, protecting gas pipelines from encroachments, and facilitating emergency communications, provide testing pressures for all pipeline, and adopt clearance requirements not specified in federal regulations.

CPUC General Order 112-E, and its proposed amendment General Order 112-F, do not apply to pipelines for onshore gas gathering if operated at less than 0 pounds per square inch gauge or if not a "regulated onshore gathering line" as determined per 49 CFR 192.8. A pipeline is a "regulated onshore gathering line" if it meets the API RP 80 definition of "onshore gathering line" and is "regulated" if the pipeline has specified features and is in specified locations per 49 CFR 192.8(b). The specified features include material and hoop stress expressed as a percentage of SMYS created by MAOP. The specified locations include Class 2, 3, and 4 areas, which are generally more densely populated areas.

Health and Safety

California Occupational Safety and Health Administration (Cal/OSHA)

Cal/OSHA is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA standards are generally more stringent than federal regulations. The employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR Sections 337-340). The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and

hazardous substance exposure warnings.

California Occupational Safety and Health Act of 1973 –Labor Code Section 6300-6332

Cal/OSHA is responsible for developing and enforcing the workplace safety regulations in Title 8 CCR. This includes ensuring worker safety in the handling and use of chemicals in the workplace. Cal/OSHA hazardous materials regulations include requirements for safety training, availability of safety equipment, hazardous substance exposure warnings, and emergency action and fire prevention plan preparation. Cal/OSHA requires businesses to prepare Injury and Illness Prevention Plans and Chemical Hygiene Plans.

Cal/OSHA also enforces hazard communication program regulations, which contain training and information requirements, including procedures for identifying and labeling hazardous substances. The hazard communication program also requires that Material Safety Data Sheets (MSDSs) be available to employees and that employee information and training programs be documented. Workers must be informed of the hazards associated with the materials they handle and manufacturers are required to label containers and provide worker training.

Local

Kern County General Plan (KCGP)

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element, Circulation Element, Safety Element, and Energy Element of the KCGP includes goals, policies, and implementation measures related to hazards and hazardous materials that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element.

1.4 Public Facilities and Services

Goals

Goal 9. Serve the needs of industries and Kern County residents in a manner that does not degrade the water supply and the environment and protect the public health and safety by avoiding surface and subsurface nuisances resulting from the disposal of hazardous wastes, irrespective of the geographic origin of the waste.

Implementation Measures

Implementation Measure N. Secure complete and accurate information on all hazardous wastes generated, handled, stored, treated, transported, and disposed of within or through Kern County.

Implementation Measure O. Reduce to the greatest degree possible the amount of waste to be disposed of by encouraging private industry to construct and manage a high quality system of

transfer stations, recycling facilities, treatment plants, and incinerators located near the generators of hazardous waste.

Implementation Measure R. Roads and highways utilized for commercial shipping of hazardous waste destined for disposal will be designated as such pursuant to Vehicle Code Sections 31303 et seq. Permit applications shall identify commercial shipping routes they propose to utilize for particular waste streams.

Chapter 2. Circulation Element

2.5. Other Modes

2.5.2. Airport Land Use Compatibility Plan (ALUCP)

Goals

Goal 1. Plan for land uses that are compatible with public airport and military bases and mitigate encroachment issues.

Policies

Policy 1. Plan for land uses that are compatible with public airport and military bases and mitigate encroachment issues.

Policy 2. To the extent legally allowable prevent encroachment on public airport and military base operations from incompatible, unmitigated land uses.

Implementation Measures

Implementation Measure A. Review discretionary land use development applications within the airports influence area and the military base operating area as shown in the Airport Land Use Compatibility Plan (ALUCP) for consistency.

Implementation Measure B. Coordinate and cooperate with airport operators, the County Department of Airports, the California Department of Transportation, Division of Aeronautics, affected cities, Edwards Air Force Base, NAWS China Lake, and the U.S. Department of Defense on ALUCP, review of land use applications, public education, and encroachment issues.

2.5.4. Transportation of Hazardous Materials

Goals

Goal 1. Reduce risk to public health from transportation of hazardous materials.

Policies

Policy 1. The commercial transportation of hazardous material, identification and designation of appropriate shipping routes will be in conformance with the adopted Kern County and

Incorporated Cities Hazardous Waste Management Plan.

Policy 2. Kern County and affected cities should reduce use of County-maintained roads and city-maintained streets for transportation of hazardous materials.

Chapter 4. Safety Element

4.2. General Provisions

Goals

Goal 4. The County shall encourage extra precautions be taken for the design of significant lifeline installations, such as highways, utilities, and petrochemical pipelines.

4.3. Seismic Safety

Policy

Policy 1. The County shall require development for human occupancy to be placed at a location away from an active earthquake fault in order to minimize safety concerns.

Implementation Measures

Implementation Measure I. Design significant lifeline installations, such as highways, utilities, and petrochemical pipelines which cross an active fault, to accommodate potential fault movement without prolonged disruption of essential service or creating threat to health and safety.

4.4. Dam Failure, Flooding, and Inundation

Policy

Policy 2. Design discretionary critical facilities in the potential dam inundation area used for the storage, or use of hazardous materials to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measures

Implementation Measure A. Facilities used for the manufacture, storage, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

4.9. Hazardous Materials

Policies

Policy 2. Innovative technologies to manage hazardous waste streams generated in Kern County will be encouraged.

Implementation Measures

Implementation Measure A. Facilities used to manufacture, store, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measure B. The proposed siting or expansion of hazardous waste facilities will be in conformance with the adopted Kern County and Incorporated Cities Hazardous Waste Management Plan.

Chapter 4.6. Wildland and Urban Fire

Hazard Identification

Access and Evacuation Routes - Good planning principles, as well as existing policies and laws, dictate that all developments must be planned with circulation routes that will assure safe access for fire and other emergency equipment. The circulation routes must include secondary means of ingress and egress, consistent with topography, to meet emergency needs.

The general circulation routes are provided throughout the County by federal, state, and County-maintained road systems which are adequate for access and evacuation. State and County laws regulate the standards for new public circulation routes.

Private circulation routes that are not maintained by the state or County are subject to the standards set forth in Kern County Ordinance No. G-1832.

Clearance of Vegetative Cover for Fire Control - In 1963 the State of California enacted the Public Resources Code clearance law. This is a minimum statewide clearance law of flammable vegetative growth around structures, especially in brush- and tree-covered watershed areas. The enactment of a local ordinance is necessary where more restrictive fire safety clearance measures are desirable to meet local conditions.

Fuel Breaks and Firebreaks - Fuel breaks and/or firebreaks separating communities or clusters of structures from the native vegetation may be required. Such fuel breaks may be "greenbelts," as all vegetation need not be removed but thinned or landscaped to reduce the volume of fuel.

All fuel and firebreaks are required to meet the minimum design standards of the Kern County Fire Chief.

The Fire Department's Chief may require a fire plan for a development during the critical fire season. This plan should reflect the proposed course of action for fire prevention and suppression.

The parcel size and setback distances of buildings placed thereon should be such that adequate clearance of flammable vegetation cover may be performed within the limits of the owner's parcel of land.

Should the owner of a property fail to apply the required firebreak clearance, following proper

notice, the County may elect to clear the firebreak vegetation and make the expense of the clearing a lien against the property upon which the work was accomplished.

Hazardous Fire Area - The Hazardous Fire Areas consists mainly of wildlands, which are mountain and hill land in an uncultivated, more or less natural state, covered with timber, wood, brush, and grasslands. This area includes some urban influence and agricultural use, such as exists around Isabella Lake and the Kern River, Woody/Glennville, Tehachapi/Cummings Valley, and Lebec/Frazier Park/Lake of the Woods.

The wildlands provide prime habitats for deer, mountain lions, bears, kit foxes, quail, chucker, wild turkeys, and condors. They also harbor fifteen identified and important rare botanic communities and vegetation associations.

The Kern County Hazardous Fire Area was established by an amendment to the Uniform Fire Code, Section 1.49H under Section 4016 of the Kern County Ordinance Code.

The boundaries of the Hazardous Fire Area are determined and publicly announced before the start of each annual "fire season" and is normally the period from April 15 to December 1 of each year, except when the Fire Chief extends this period.

The wildlands include valuable watersheds that must be preserved for receiving and passing water into surface streams and underground storage. Protection of the watersheds will prevent erosion and flood damages.

For the protection of our wildlands we must consider all factors which will aid in fulfilling the policy stated in the California Environmental Quality Act, Public Resources Code Section 21000 et seq., to "create and maintain conditions under which man and nature can exist in productive harmony to fulfill the social and economic requirements of present and future generations."

In implementing their Fire Prevention Program, Fire Department personnel periodically inspect the areas around all buildings for accumulations of flammable material and closure of openings of vacant buildings.

Policies

Policy 1. Require discretionary projects to assess impacts on emergency services and facilities.

Policy 2. The County will encourage the promotion of public education about fire safety at home and in the work place.

Policy 3. The County will encourage the promotion of fire prevention methods to reduce service protection costs and costs to taxpayers.

Policy 4. Ensure that new development of properties have sufficient access for emergency vehicles

and for the evacuation of residents.

Policy 5. Require that all roads in wildland fire areas are well marked and that homes have addresses prominently displayed.

Policy 6. All discretionary projects shall comply with the adopted Fire Code and the requirements of the Fire Department.

Implementation Measures

Implementation Measure A. Require that all development comply with the requirements of the Kern County Fire Department or other appropriate agency regarding access, fire flows, and fire protection facilities.

Chapter 5. Energy Element

5.3. Petroleum Resources and Development

5.3.3. Waste Disposal in Petroleum Development

Goals

Goal. To encourage the safe recycling, transportation, and disposal of wastes associated with petroleum production and processing, and to provide for the siting of disposal facilities in locations with proper access, while minimizing adverse impacts on the environment and on public health and safety.

Policies

Policy 1. The County shall continue to acknowledge the necessity to site nonhazardous oilfield waste disposal sites near petroleum development to minimize transportation hazards and expenses, consistent with the provisions of the Kern County and Incorporated Cities Integrated Waste Management Plan.

Policy 2. The County shall encourage recycling and new treatment methods for hazardous and nonhazardous oilfield wastes.

Policy 3. The County shall work cooperatively with appropriate state and regional agencies to provide for the proper siting of oilfield waste disposal facilities.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on

unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to hazards and hazardous materials.

Chapter VIII. Safety Element

Goals

Goal 1. Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.

Goal 4. Assure that fire, hazardous substance regulation and emergency medical service problems are continuously identified and addressed in a proactive way, in order to optimize safety and efficiency

Goal 7. Protect land uses from the risk of dam failure inundation including the assurances that: the functional capabilities of essential facilities are available in the event of a flood; hazardous materials* are not released; effective measures for mitigation of dam failure inundation are incorporated into the design of critical facilities; and the rapid and orderly evacuation of populations in the inundation area will occur.

Policies

Policy 2. Require discretionary projects to assess impacts on police and fire services and facilities

Policy 6. Promote fire prevention methods to reduce service protection costs and costs to the taxpayer.

Policy 7. Enforce ordinances regulating the use/manufacture/sale, transport/disposal of hazardous substances, and require compliance with state and federal laws regulating such substances.

Policy 8. The Kern County and Incorporated Cities Hazardous Waste Management Plan and Final Environmental Impact Report serves as the policy document guiding all facets of hazardous waste.

Policy 12. Where recommended by appropriate local, state or federal agencies for discretionary projects, soils shall be tested for concentrations of agricultural chemicals prior to grading permit approval whenever feasible. Contaminated soils shall be excavated and disposed of at a certified hazardous waste disposal facility whenever necessary.

Policy 16. All new discretionary development projects shall be subject to environmental and design review on a site-specific, project-by-project basis, including but not limited to an assessment to determine whether hazardous materials present potential health effects to human health as required by the Department of Environmental Services.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These

Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County Certified Unified Program Agency

The Certified Unified Program Agency (CUPA) was developed to consolidate the administration of hazardous materials programs. In the Kern County, the CUPA is the Environmental Health Services Division. The city of Bakersfield's CUPA is the Bakersfield Fire Department. Under CUPA, site inspections of aboveground storage tanks, underground storage tanks, hazardous waste treatment, hazardous waste generators, hazardous materials management and response plans, and the California Fire Code are consolidated in a single inspection. These departments also provide emergency response to hazardous materials events.

Kern County Fire Code

Kern County has adopted, by reference, portions of the California Building Standards Code and the UFC, with modifications and amendments, in Chapter 17.32 of the Kern County Code of Building Regulations (Fire Code). The purpose of this code is to prescribe the minimum requirements necessary to establish a reasonable level of fire safety to protect life and property from hazards created by fire, explosion, and dangerous conditions.

The Kern County Fire Code defines a hazardous fire area as any land that is covered with grass, grain, brush, or forest and situated (e.g., in an inaccessible location) so that a fire originating upon such land would present an abnormally difficult job of suppression and would result in great and unusual damage through fire or the resulting erosion.

Kern County Multi-Hazard Mitigation Plan

The purpose of the multi-hazard mitigation plan is to reduce or eliminate long-term risk to people and property from natural hazards and their effects in Kern County, California. The plan was updated in 2012 to help Kern County become less vulnerable to losses from future disasters. The multi-jurisdictional plan includes the County, and the incorporated municipalities of Arvin, Bakersfield, California City, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi, and Wasco. This plan also covers 53 special districts that include school, recreation and park, water, community service, and other districts.

Among the items assessed, the plan evaluated the risks associated with seismic events, dam failure, severe weather, and wildfire on oil and gas facilities.

Kern County Hazardous Waste Management Plan

State Assembly Bill 2948 (1986) authorized local governments to develop comprehensive

hazardous waste management plans. The intent of each plan is to ensure that adequate treatment and disposal capacity is available to manage the hazardous wastes generated within the local government's jurisdiction. The Kern County and Incorporated Cities Hazardous Waste Management Plan (Hazardous Waste Plan) was first adopted by Kern County and each incorporated city before September 1988 and was subsequently approved by the California Department of Health Services. The Hazardous Waste Plan was updated and incorporated by reference into the KCGP in 2004 as permitted by Health and Safety Code Section 25135.7(b), and thus must be consistent with all other aspects of the KCGP.

The Hazardous Waste Plan provides policy direction and action programs to address current and future hazardous waste management issues that require local responsibility and involvement in Kern County. In addition, the Hazardous Waste Plan discusses hazardous waste issues and analyzes current and future waste generation in the incorporated cities, County, and state, and federal lands. The purpose of the hazardous Waste Plan is to coordinate local implementation of a regional action to effect comprehensive hazardous waste management throughout Kern County. The action program focuses on development of programs to equitably site needed hazardous waste management facilities; to promote onsite source reduction, treatment, and recycling; and to provide for the collection and treatment of small quantity hazardous waste generators. An important component of the Hazardous Waste Plan is the monitoring of hazardous waste management facilities to ensure compliance with federal and state hazardous waste regulations. The siting criteria and any subsequent environmental documentation required pursuant to the CEQA would also ensure the mitigation of adverse impacts associated with the siting of any new hazardous waste facility.

Lake Isabella Dam Failure Evacuation Plan

The purpose of the dam failure evacuation plan is to establish a process and procedures for the mass evacuation and short-term support of populations at risk below the Lake Isabella Dam from a potential failure of the dam. The inundation area includes portions of Kern County; the unincorporated communities of Lake Isabella and Bodfish; and the city of Bakersfield. In the event of a dam failure, flood waters would flow down the narrow Kern Canyon until reaching the city of Bakersfield where topography flattens and the flood waters would be expected to spread out over much of Bakersfield. The plan identifies emergency evacuation routes from the inundation zone in the event of a dam failure. The inundation zone is shown with respect to oilfields in Kern County on Figure 4.8-9. The plan was last updated in 2009.

Kern County Airport Land Use Compatibility Plan (ALUCP)

The purpose of the Kern County ALUCP is to establish procedures and criteria by which the County of Kern and the affected incorporated cities can address compatibility issues when making planning decisions regarding airports and military operations areas and the land uses around them. In general, the plan describes and maps influence areas in the vicinity of public use airports in Kern County where development restrictions are established to prevent the construction or placement of structures or objects which may be an obstruction to air navigation. The plan covers airports in the unincorporated portions of the County and the affected incorporated cities of

Bakersfield, California City, Delano, Shafter, Taft, Tehachapi, and Wasco. The plan was last updated in 2012.

Kern County Code of Ordinances Chapter 19.76 – Airport Approach Height (H) Combining District

The purpose of the Kern County Airport Height (H) Combining District is to minimize aviation hazards by regulating land uses, restricting the height of buildings and vegetation, and specifying design criteria necessary to promote aviation safety and to implement the requirements of the adopted ALUCP. The H district may be applied to areas within the vicinity of any public or general-use airport as provided for in the ALUCP. The H district design standards restrict the types of lighting, surface reflectivity, types and heights of structures and electrical or radio interference with air navigation communications. The H district design standards also require that storage of more than 2,000 gallons of non-aviation liquid fuel at privately-owned airports in the B-1 and B-2 airport land use compatibility zones be restricted to underground storage tanks. The H district further requires that except for the construction of single-family dwellings and permitted residential accessory structures on existing lots of record, no use, building, structure, plant, or tree shall be established until and application for site development plan review has been submitted to and approved by the Planning Director.

Best Management Practices (BMPs)

Best management practices (BMPs) are practices that industries and other organizations compile to suggest how companies can operate effectively within the regulatory requirements. The API develops equipment and operating standards for the oil and natural gas industry. API maintains an inventory of over 600 standards and recommended practices. API standards are designed to assist industry professionals improve the efficiency and cost-effectiveness of their operations, comply with legislative and regulatory requirements, safeguard health, and protect the environment. API publications that are relevant to hazardous materials and wastes and other topics discussed in this chapter include:

- API 2009. Environmental Protection for Onshore Oil and Gas Production Operations and Leases. API Recommended Practice 51R. First Edition, July 2009;
- API Order No. G00004 Guidelines for Commercial Exploration and Production Waste Management Facilities (2001); and
- API Recommended Practice 80, "Guidelines for the Definition of Onshore Gas Gathering Lines," (First Edition, April 2000).

The State Review of Oil and Natural Gas Environmental Regulations (STRONGER) is a non-profit organization whose mandate is to educate regulators and the public as to the appropriate elements of a state oil and gas E & P waste management regulatory program and to compare state programs against STRONGER guidelines and those accepted by the Interstate Oil and Gas Compact Commission. STRONGER has developed guidelines for states to assess and improve their regulations for all aspects of E & P waste management, abandoned sites, NORM, storm water

management, and hydraulic fracturing. Among others, they have developed technical criteria for the design, construction and operations of pits; regulatory and operational requirements for land-spreading, burial, landfilling, and road-spreading; and construction, operations, and closure of tanks not regulated under the SPCC program. Technical requirements in the STRONGER 2014 Guidelines can serve as BMPs.

In addition to API and STRONGER, federal agencies, including the EPA and BLM, have published recommended practices for the oil and gas industry for E & P. In its Exemption of Oil and Gas Exploration and Production Wastes from Federal Hazardous Waste Regulations, the EPA suggests the following E & P waste management practices be used at oil and gas E & P sites:

- Size reserve pits properly to avoid overflows;
- Use closed loop mud systems when practical, particularly with oil-based muds;
- Review MSDSs of materials used, and select less toxic alternatives when possible;
- Minimize waste generation, such as by designing systems with the smallest volumes possible (e.g., drilling mud systems);
- Reduce the amount of excess fluids entering reserve and production pits;
- Keep nonexempt wastes out of reserve or production pits;
- Design the drilling pad to contain stormwater and rig-wash;
- Recycle and reuse oil-based muds and high density brines, when practical;
- Perform routine equipment inspections and maintenance to prevent leaks or emissions;
- Reclaim oily debris and tank bottoms when practical;
- Minimize the volume of materials stored at facilities;
- Construct adequate berms around materials and waste storage areas to contain spills;
- Perform routine inspections of materials and waste storage areas to locate damaged or leaking containers; and
- Train personnel to use sensible waste management practices (EPA 2002).

BLM's Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book provide the following guidelines for hazardous waste and pollution control during exploration and development:

- Sufficiently impervious secondary containment, such as containment dikes, containment walls, and drip pans, should be constructed and maintained around all qualifying petroleum facilities, including tank batteries and separation and treating areas consistent with the EPA's SPCC regulation (40 CFR 112). The containment structure must have sufficient volume to contain, at a minimum, the content of the largest storage tank containing liquid hydrocarbons within the facility/battery and sufficient freeboard to contain precipitation, unless more stringent protective requirements are deemed necessary

by the authorized officer. Drip pans should be routinely checked and cleaned of petroleum or chemical discharges and designed to prevent access by wildlife and livestock.

- Chemical containers should not be stored on bare ground, exposed to the sun and moisture. Containers and labels are subject to degradation and punctured drums could leak contents on the ground.
- Chemicals containers should be maintained in good condition and placed within secondary containment in case of a spill or high velocity puncture.
- Containment dikes are not to be constructed with topsoil or coarse, insufficiently impervious spoil material. Containment is strongly suggested for produced water tanks. Chemicals should be placed within secondary containment and stored so that the containers are not in contact with soil or standing water and product and hazard labels are not exposed to weathering.
- Maintain a clean well location. Remove trash, junk, and other materials not in current use (BLM 2007).

BMPs do not have the weight of regulations, unless they are cited in regulations. However, depending on the BMP, they serve as an accepted standard of practice and provide the guidelines for oil and gas operators to operate effectively and adhere to regulatory requirements. Not all BMPs would be applicable to all oil and gas activities. In addition, BMPs are updated periodically. Therefore, compliance with specific BMPs is not assumed to occur in the impact analysis.

4.8.4 Impacts and Mitigation Measures

Methodology

To evaluate the potential impacts of the proposed Project with respect to the thresholds of significance outlined in the following section, each threshold of significance was evaluated at a Project level. The primary issues associated with the Project that could impact public health are whether the anticipated oil and gas activity would increase risks to public safety and the environment. To evaluate these risks, present practices, regulatory requirements, and accidents/spills/releases were considered.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;

- Emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school;
- Create a hazard to the public or the environment as a result of being a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5;
- For a project located within the adopted Kern County Airport Land Use Compatibility Plan, result in a safety hazard for people residing or working in the Project Area;
- For a project within the vicinity of a private airstrip, result in a safety hazard for people residing or working in the Project Area;
- Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan;
- Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands; or
- Generate vectors (flies, mosquitoes, rodents, etc.) or have a component that includes agricultural waste. Specifically, would the Project exceed the following qualitative threshold:

  The presence of domestic flies, mosquitos, cockroaches, rodents, and/or any other vectors associated with the Project is significant when the applicable enforcement agency determines that any of the vectors:

  i. Occur as immature stages and adults in numbers considerably in excess of those found in the surrounding environment; and,
  ii. Are associated with design, layout, and management of project operations; and,
  iii. Disseminated widely from the property; and,
  iv. Cause detrimental effects on the public health or wellbeing of the majority of the surrounding population.

Based on these standards, the effects of the Project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

Impact 4.8-1: Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials

Transport of Hazardous Materials

Construction and Operations

The routine transport, use, and/or disposal of hazardous materials can cause significant hazards to the public or the environment if not handled or contained properly. The primary method of transporting hazardous material to construction sites would be by truck. However, hazardous materials could be shipped to Kern County by rail for use in oil and gas activities. Pipelines are used during operations to transport hazardous and nonhazardous materials from wells to treatment and processing facilities as well as to transport materials to refineries and other facilities.

Regulations for the transportation of hazardous and other regulated substances are covered under the Federal Hazardous Materials Transportation Law (49 U.S.C. 5101-5127) and the Hazardous Materials Regulations (49 CFR Parts 171-180). Under these regulations, hazardous materials must be transported pursuant to materials classification, hazard communication, packaging requirements, operational rules, training and security, and registration. All hazardous materials being transported must be handled, packaged, labeled, and transported in a manner that is consistent with the Hazardous Materials Regulations set forth for each categorized hazardous material/waste.

The following subsections discuss potential impacts associated with each mode of transport.

Trucks

Trucks could be used to transport hazardous materials to oilfields or processing facilities or to transport crude oil, natural gas condensates, produced water to treatment facilities or refineries or to transport hazardous waste to a commercial hazardous waste facility in Kern County, elsewhere in the California, or out of state. Every time hazardous materials are moved from the site of generation, there are opportunities for accidental (unintentional) releases. Because the Project authorizes an increase in oil and gas production activity in the County for the duration of the Project compared to baseline level activities, it is possible that the number of trucks trips involving hazardous materials could increase. These truck trips would continue to be regulated as described below.

The Federal Motor Carrier Safety Administration (FMCSA) requires all motor carriers to obtain a Hazardous Materials Safety Permit (HMSP) prior to the transportation of hazardous materials. The motor carrier company transporting the hazardous materials responsibilities include:

- Employee training;
- Determine whether a material meeting the definition of a "hazardous material;"

- Shipping Papers, Proper shipping name, Class/Division, Identification Number;
- Hazard Warning Label, Packaging, Marking;
- Emergency Response Information and Contact Numbers;
- Certification, Capability, Blocking and Bracing Placarding; and
- Security Plan and Incident Reporting.

The USDOT conducted a study on the risks of hazardous materials and nonhazardous materials and nonhazardous materials truck shipment incidents and accidents. The FMCSA compared the risks of hazardous and nonhazardous materials truck shipment accidents and incidents. The estimated accident rate for nonhazardous material trucks was 0.73 per million miles traveled, which was almost double the average accident rate for hazardous material trucks of 0.32 per million miles traveled. Not all accidents involving hazardous materials transport result in releases of hazardous materials (FMCSA 2001).

Trucks transporting any hazardous materials would be required to comply with the above laws. The statistics suggest that truck transportation of hazardous material is safer than routine truck transportation, but is not without incident. Transportation accidents involving vehicles transporting hazardous materials can result in fires, explosions, clouds of vapors and gasses, or spills to land and water. Hazardous materials containers that are breached during an accident near a source of ignition pose a fire hazard. Containers involved in an accident that are not breached but are exposed to fire could potentially explode. According to cargo tank rollover prevention information from the FMCSA, over 78% of roll-over accidents involving cargo tank trucks involve driver error (FMCSA 2015). During routine operations, accidents could occur, such as collisions or roll-overs. The potential impact would reflect the amount of the release and type of material released. A release that results in the soil or water contamination or exposure of the public to hazardous material would be significant.

Pipelines

Pipelines supporting oil and gas activities that could be authorized under this Project would transport crude oil, produced water, natural gas, waste gas, and other hazardous and nonhazardous substances. Larger pipelines and pipelines operating at higher pressures would be regulated federally, but many oil and gas collection pipelines (transporting oil from wells and tank farms to Kern refineries, or to terminals for shipment outside the region) in rural areas with low population densities would not. Federally regulated pipelines must comply with 49 CFR 195 which specify design, construction, testing, operation and maintenance, and accident reporting requirements.

Pipelines transporting crude oil that are not federally regulated would be low pressure and would be located more than 0.25 mile from drinking water sources and ecologically sensitive areas. However, under AB 1960's implementing regulations Section 1774 (Pipeline Construction and Maintenance), "[n]ewly installed pipelines shall be designed, constructed, and all pipelines shall be tested, operated, and maintained in accordance with good oilfield practice and applicable standards, such as set forth in either the API (API Rec. Prac. 1110, 3rd Ed., Dec. 1991, and API Spec. effective 1990), or ASTM (ASTM Designation Stand. Spec., 1991), or 49 CFR Part 192, or

other methods approved by the Supervisor…"

This regulation applies to all pipelines greater than 1 inch in diameter through which crude oil, hydrocarbons, combustible gases, and/or produced water flows from one point to another within the administrative boundaries of an oil and gas field. Therefore, some of the pipelines currently in oilfields and those that would be installed under this Project would be subject to these regulations. Under these regulations, operators would have to implement the following practices at a minimum:

- Use corrosion prevention methods to minimize external and internal corrosion;
- Use pipeline coating or external wrapping for new or replaced buried or partially buried pipelines to minimize external corrosion. The coating should have a high electrical resistance, be an effective moisture barrier, have good adhesion to the pipe, and be able to resist damage during handling;
- Use, where practical, equipment such as high and low pressure or level alarms, automatic notification devices, and safety shut-down devices to minimize spill volume in the event of a leak; and
- If feasible, locating aboveground, preferably on supports or racks, any new pipelines or parts of a pipeline system that are being relocated or replaced.

Operators must visually inspect all aboveground pipelines for leaks and corrosion at least once a year. Any pipeline that has had a leak resulting in the release of a reportable quantity shall be pressure tested to verify integrity prior to being placed back into service. A mechanical integrity test shall be performed on all active environmentally sensitive pipelines that are gathering lines, and all urban pipelines over 4 inches in diameter, every two years. Pipelines less than 10 years old are exempt from the two-year testing requirement.

In addition, operators must prepare and implement a pipeline management plan for all pipelines that have not been abandoned to the standards specified in AB 1960 Section 1776(f). The plan shall be updated within 90 days of whenever pipelines are acquired, installed, altered, or at the request of DOGGR. The pipeline management plan shall include the following:

- Information on each pipeline including, but not limited to: pipeline type, grade, actual or estimated installation date of pipeline, design and operating pressures, and any available leak, repair, inspection, and testing history.
- A description of the testing method and schedule for all pipelines.
- Pipelines regulated by AB 1960 are also subject to regular pipeline inspection and maintenance requirement pursuant to 14 CCR 1774.1, including tests or inspections that DOGGR may order to establish the reliability of any pipeline system.
- Natural gas pipelines are subject to federal regulations as well as CPUC regulations if the pipelines are considered regulated onshore gas gathering lines or if operated at less than 0

pounds per square inch gauge. The federal regulations establish requirements for corrosion control, testing, emergency planning, investigation of failures, MAOP, maintenance and repair, record-keeping, pipeline integrity management, and reporting. CPUC rules require additional testing, inspection, and reporting. Pending amendments to CPUC General Order 112-E would increase the frequency of testing, provide guidance on prioritizing leak repair, qualifying training facilities, protecting gas pipelines from encroachments, and facilitating emergency communications, and provide testing pressures and clearance requirements for all pipeline.

The effect of any release from a pipeline would depend on its location and the type and quantity of materials released. Workers could be exposed to hazardous materials at levels in excess of OSHA and Cal/OSHA standards and the public could be exposed to hazardous materials.

However, as discussed in the Environmental Setting, a total of 84 unintentional releases of crude oil from pipelines in Kern County occurred from 2002 to 2014 from PHMSA regulated pipelines (see Appendix R, Table A-1). In most cases, most of the crude oil was recovered, but in two cases more than 21,000 gallons (500 barrels) could not be recovered. These and other pipeline incidents are discussed in the following impact; however, the frequency with which these events have occurred (an average of seven per year) suggest that historical implementation of the existing regulations has not eliminated releases. Many of the incidents reported above occurred before enactment of AB 1960 in January 2009 and prior to implementation of the AB 1960 regulations on January 29, 2011, which were enacted to improve, among other things, leak detection, corrosion prevention, and pipeline integrity. However, since it is possible that a pipeline could still leak or malfunction even with implementation of existing regulations, impacts could be significant if a release occurred from a malfunctioning or leaking pipeline.

Railroad

Crude oil is transported to Kern County via truck, pipeline or rail. However no oil or gas that would be produced in Kern County under this Project would be shipped by rail. Hazardous materials to support oil and gas drilling or operations could be shipped to Kern County via rail. As stated in the Environmental Setting, statistics show that the majority of hazardous materials shipped by rail tank car annually arrive without incident (FRA 2015b). The FRA regulates the transportation of hazardous materials at the federal level as described in the Regulatory Setting section. Implementation of these regulations would result in impacts that would be less than significant.

Use of Hazardous Materials

Construction

The potential exists for an accidental release of hazardous materials during routine construction activities. Improper management or maintenance of hazardous materials containers, handling of hazardous materials (transfer between containers and equipment), storage, or disposal could result in leaks or larger releases which result in the contamination of soil or potentially surface water bodies, depending on the location of the release. Oil and gas construction activities also have the potential to result in exposure to these hazardous materials by workers, or by the public, if access to the construction site is not adequately controlled or if the materials are not properly handled and contained.

Oil and gas construction activities that could be authorized under this Project include, among other activities, well pad preparation; access road construction; drilling; well completion; construction of oil, gas, and water treatment facilities; construction of sumps, evaporation ponds, and percolation ponds; construction of other facilities; construction of fencing, tanks, and containment structures; as well as well stimulation activities, which are addressed separately.

Vehicles and equipment used for construction would contain or require the short-term use of small amounts of potentially hazardous materials including, but not limited to, fuels, lubricating oils, solvents, antifreeze, hydraulic fluid, and compressed gasses. Portable generators often are used so diesel tanks could be used. Other construction activities would likely use gasoline, diesel fuel, and lubricants for fueling vehicles and paints, adhesives, and solvents for the construction of the facilities buildings. Other specialized chemicals that are potentially hazardous substances could also be used depending on the type of construction activity. These could include compressed gases; fuels, oils, and lubricants; acids; bases; demulsifiers; bactericides; and solvents. These and other products may be stored at the well pad to support the drilling process (see Table 4.8-1).

In general, large quantities of hazardous materials are not stored on construction sites. Materials that are used regularly are re-supplied by oilfield servicing companies. At any construction site to comply with federal and state regulations, hazardous materials should be stored in their original containers in a designated area that is protected from the weather and that is lined and bermed to contain any leaks or spills and prevent a release to soil or waters. The Occupational Safety and Health Standards 1910 Subpart H Hazardous Materials provides guidelines by which hazardous materials should be handled and stored in the workplace. Specific requirements are provided for many different chemicals. In addition, the California Fire Code prescribes regulations that address the storage, handling and use of hazardous substances, materials, and devices within the state. California Health and Safety Code section 25504(a-c) and 22 CCR part 66265.16 require an owner or operator to complete and submit an HMBP if the facility handles a hazardous material or mixture containing a hazardous material that has a quantity at any one time during the reporting year equal to or greater than 55 gallons of liquid; 500 pounds of a solid; 200 cubic feet at standard temperature and pressure of a compressed gas; any quantity of hazardous waste; and amounts of radioactive materials requiring and emergency plan pursuant to Parts 30, 40, or 70 of Title 10 CCR. Most applicants would have to develop HMBPs, because diesel fuel is regularly stored in

bulk at construction sites to fuel generators, hazardous waste is likely to be generated, and radioactive materials are used during drilling. In addition, storage of fuel or other petroleum products during construction in aboveground tanks or other containers with individual volumes greater than 55 gallons and that have a total volume of more than 1,320 gallons would be subject to the SPCC Plan requirements of 40 CFR Part 112, if waters of the United States are present. These regulations are designed, in part, to ensure that hazardous materials and oil and petroleum products are properly managed and contained to minimize the potential for a release to the environment, thereby limiting the potential for related exposure to the environment, workers, and the public.

Oil and gas activities authorized under the Project also would be required to comply with Cal/OSHA standards for worker safety in the handling and use of hazardous materials and hazardous wastes. These standards (found at 8 CCR Sections 337-340) require an employer to monitor worker exposure to hazardous substances and notify workers of exposure to hazardous substances. The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substances exposure warnings. These requirements would limit the potential for unhealthful exposure of workers to hazardous materials during Project construction.

Temporary pits and sumps and portable tanks may be used to store drilling fluids and wastes. For these, applicants would have to comply with the AB 1960 implementing regulations. These address Spill Contingency Plan requirements; oilfield sumps; production facilities containment, maintenance, and testing; pipeline construction and maintenance; maintenance and monitoring of production facilities, safety equipment, and other equipment.

Finally, oilfields have specific field rules established by DOGGR. These are specific requirements for the field and may address issues associated with hazards.

Adherence to the regulations and requirements described in the preceding paragraphs would limit the potential for exposure from routine use of hazardous materials during construction such that unhealthful levels of exposure by workers at a construction site, or to the general public located outside of Project construction areas, would not be expected. Furthermore, adherence to these regulations and requirements would limit the potential for hazardous materials to be released to the environment due to routine use. With adherence to these requirements, routine use related to Project construction would have a low likelihood of resulting in health or environmental consequences from exposure to a hazard by the public offsite or to construction workers onsite. Therefore, with adherence to these requirements, the risk of health or environmental consequences from exposure to a hazard by the public offsite or to construction workers onsite would be less than significant.

Well Stimulation

WST operations are considered a construction activity under this Project, but are addressed separately because of the high level of public interest associated with the issue.

Hazardous materials, such as fuel and motor oil used in construction equipment, hydraulic oil and hydraulic fracturing fluid components (cross-linker, scale treatments, breaker, activator, and pH

control), acids, biocides, and other well treatment chemicals would be used in downhole applications during the WST operations. Well stimulation in Kern County is used to complete wells in certain formations. Not all of the wells drilled and completed in Kern County require completion using WST operations as defined by SB 4, however. Well stimulation in California is regulated by DOGGR under SB4, WST Regulations. While the EPA has not issued any generally applicable federal regulations concerning WST activities, on March 26, 2015, the BLM issued its Final Rule for Oil and Gas; Hydraulic Fracturing on federal and Indian Lands, which is codified at 43 CFR Part 3160.

Under the SB 4 WST regulations, any operator must apply for and obtain a permit to use well stimulation techniques. In the application, the operator must describe:

- The composition of the fluids to be used;
- The chemicals to be used and their concentrations;
- The disposal method of recovered water;
- The anticipated procedures to comply with the Hazardous Waste Control Law; and
- An estimate of the volume of generated waste materials and how they will be disposed of.

Further, all applicants applying to conduct a defined well stimulation operation would be required to store and manage hydraulic fracturing fluids in compliance with all applicable requirements of the RWQCB, the DTSC, the Air Resources Board, the Air Pollution Control District, the CUPA, and any other state or local agencies with jurisdiction over the location of the well stimulation activities. In addition, the Applicant would be required to adhere to Storage and Handling of WST Fluids and Wastes regulations that require that fluids be stored with secondary containment, with certain exceptions. The Applicant must have a Spill Contingency Plan that accounts for all production facilities outside of secondary containment and include specific steps to be taken and equipment available to address a spill outside of secondary containment. In addition, the Applicant would have to comply with testing, inspection, and maintenance requirements for production facilities containing WST fluids. All fluids must be accounted for in the operator's Spill Contingency Plan, cannot be stored in containers and shall not be stored in sumps or pits. If an unauthorized release occurs, the Applicant must immediately implement its Spill Contingency Plan; notify the appropriate response entities for the location and the type of fluids involved, as required by all applicable federal, state, and local laws and regulations; and perform clean up and remediation of the area, and dispose of any cleanup or remediation waste, as required by all applicable federal, state, and local laws and regulations. In addition, the Applicant would have to report the release within five days.

During well stimulation procedures, applicants would have to continuously monitor and record specific parameters. Operators must terminate stimulation and immediately report to DOGGR if certain critical pressure thresholds are reached or if there is a potential breach of the well casing. If an unauthorized release occurs, the operator must implement its Spill Contingency Plan, notify the appropriate authorities, cleanup or remediate, and report to DOGGR. Potential release of hydraulic fracturing fluids to an aquifer is addressed in Section 4.9, Hydrology and Water Quality.

Unauthorized releases have occurred and would likely continue to occur during well stimulation activities. The potential effect of the release would depend on its size, its location in the well bore, and the proximity to either aquifers or surface sensitive receptors; therefore, the potential impacts could be significant.

Operations

Operational activities that could be authorized under this Project include, among others, production of oil and natural gas, treatment of produced water, oil, and gas; water and waste management; enhanced oil recovery activities; use of injection wells, sumps, percolation and evaporation ponds; control of vegetation; maintenance and testing of well, pipeline, tank and vessels; maintenance of access roads; separation of oil and water; and distribution of crude oil.

During oil and gas production, a wide range of laboratory chemicals is used in oilfield testing laboratories, crude oil is stored in large quantities before shipment, natural gas and natural gas condensates are stored, fractionated, and treated in large quantities, well treatment chemicals are used to maintain well integrity, and motor fuels and fluids are stored as part of routine equipment and well maintenance. Production and processing can include treatment facilities, tank farms, compressors, generators, laboratories, and pipelines. Oils, fuels, solvents, paint, and treating chemicals could be used during production.

The largest volume of materials stored on a production site would be contained in tank farms or tank batteries. As described above, a tank farm is required to have secondary containment in order to contain releases and onsite personnel would have to be trained on how to prevent, stop, and abate any spills. SPCC requirements and plans would have to be implemented as well as those to comply with AB1960. Under 40 CFR 112, operators also are required to have emergency response procedures, and they must train their personnel in these procedures. Under the implementing regulations of AB1960, applicants would have to address requirements for Spill Contingency Plan; oilfield sumps; production facilities containment, maintenance, and testing; pipeline construction and maintenance; and maintenance and monitoring of production facilities, safety equipment, and equipment.

As discussed above under the Construction subheading of Use of Hazardous Materials, all hazardous chemicals would have to be stored according to OSHA and state fire code requirements. Operators would have to develop and file Consolidated Contingency Plans with Kern County Environmental Health Services Division to address the storage of crude oil, storage of produced water, well treatment chemicals, laboratories, and storage of wastes, such as tank bottoms.

In Kern County, the Kern County Environmental Health Services Division implements the Unified Program for businesses to comply with the following requirements:

- Hazardous Material Response Plans and Inventory Program;
- UFC Plans and Inventory requirements;
- Hazardous Waste Generator and Onsite Hazardous Waste Treatment Programs;

- CalARP Program;
- UST Program; and
- Aboveground Petroleum Storage Tank SPCC Plan.

These forms provide the County with information about the hazardous materials, regulated substances, storage tanks, and hazardous waste generated at a facility. This hazardous material inventory requires a description of all hazardous materials that will be stored onsite, how much is stored on a daily basis, and the type of storage container. In addition, the amount and type of hazardous wastes generated, how it is stored, and how it is disposed of must be provided as well. Businesses also must provide a Consolidated Contingency Plan which must be implemented whenever there is a fire, explosion, or release of hazardous material or waste that could threaten public health or the environment. The plan must detail the business' standard operating procedures for addressing potential releases including prevention measures and how a spill would be stopped and cleaned up. Included must be a list of available emergency equipment and the training that personnel must receive. Also included are site maps to identify where hazardous materials and wastes are stored and where emergency response equipment is located as well as emergency evacuation routes.

Adherence to the regulations and requirements described in the preceding paragraphs would limit the potential for exposure from routine use of hazardous materials during operations such that unhealthful levels of exposure by workers at a work site, or to the general public located outside of Project work areas, would not be expected. Furthermore, adherence to these regulations and requirements would limit the potential for hazardous material to be released to the environment due to routine use. In general, adherence to these requirements would result in routine use related to Project operations having a low likelihood of health or environmental consequences from exposure to a hazard by the public offsite or to construction workers onsite. However, as discussed in Table 4.8-6, spills can occur during oil and gas activities. The most commonly spilled materials are crude oil and produced water, but acids, condensates, and drilling muds are also spilled. In general, spills have historically been small and have been cleaned up immediately, but some have not been able to be cleaned up immediately because of their size. Therefore, historical precedent suggests that future oil and gas activities could have significant impacts from routine use of hazardous materials.

Oil and Gas Generated Wastes

Table 4.8-10 provides a list of the general types of waste that could be generated during each phase of the oil and gas drilling process.

Table 4.8-10: Potential Waste Generated during Each Phase of the Oil and Gas Drilling and Production Process

Activity	Potential Waste Generated
Construction	
Site preparation and construction	Debris, lubricating oil, contaminated soil and/or rainwater
Drilling activities (operation of the rig, drilling mud system, and drill string)	Pipe dope, hydraulic fluids, used oils and oil filters, rigwash, spilled fuel, drill cuttings, drums and containers, spent and unused solvents, paint and paint wastes, sandblast media, scrap metal, solid waste, and garbage
Drilling mud (fluid used to maintain hydrostatic pressure in the well, carry drill cuttings to the surface, cool and lubricate the drill bit)	Soda ash, calcium carbonate, caustic soda (NaOH), magnesium hydroxide. Drilling fluid additives (used and unused), spilled chemicals, empty containers, spilled chemicals, or surplus chemicals
Reserve pits (reserve pit receive drill cutting and solids and other materials)	Drill cuttings and solids, used drilling fluids, rigwash, mud-weighting materials
Operations	
Flowing wells (wellhead assembly and equipment for well treatment)	Paraffin, slop oil, oil and produced water-contaminated soils, produced water, scale, treating chemicals, sand, and paint
Wells with artificial lift (using beam pumps, gas lift, or submersible pumps)	Used lubrication oil and filters, gas lift engine fuel, released crude oil (from stuffing box), paraffin, slop oil, produced water contaminated soils, produced water, scale, treating chemicals, sand, and paint
Flare pits (used to collect unburned materials from a flare)	Overflow hydrocarbon condensate, produced water (condensed from flare)
Flow lines (use to move produced oil to treatment and storage facilities)	Paraffin, produced water, treating chemicals, contaminated soil, scale, and other materials collected in pig traps. Scale may be contaminated by naturally occurring radioactive material (NORM)
Separation and processing at gathering points (2- or 3- phase separation of produced water, free water knockouts, heater or electrostatic treaters, filters, desanders)	Separator bottoms, blowdown, skim oil, produced water, produced sand and scale, bottom sludges, oil absorption media, used filters, filter media, back wash
Tank batteries consisting of separation and treatment equipment	Produced sand, scale, and basic sediment and water, spilled crude oil, crude oil-contaminated soil
Produced water management	Solids, oil, used lubricating oil and filters, produced water filters and filter media, filter backwash, produced water-contaminated soil, and unused or spent chemicals

Source: Adapted from Tables 1 and 2 from RCT 2001

During drilling, the most commonly generated wastes are drilling fluids, drill cuttings, and municipal waste. The largest volume of waste generated during drilling includes cuttings and produced water/oil. In general, wastes generated during E & P are not classified as hazardous, but are contained such that they are not released to the environment. Wastes generated during WST operations primarily consist of flow-back well fluids. Wastes generated during oil and gas production include a wide range of laboratory wastes, universal wastes, large quantities of produced water, and tank bottoms. During oil and gas well abandonment, wastes generated include well fluids and municipal waste. Table 4.8-4 details the type of wastes that could be generated during oil and gas production. Many of these wastes would not be classified as RCRA hazardous wastes, but some could be classified as California hazardous wastes. Each operator would have to ensure that all wastes generated are classified and subsequently disposed of appropriately. Exempt and nonexempt waste streams should be stored separately because if they mix, the exempt waste stream could become classified as a hazardous waste. Discarding a listed hazardous waste (e.g., a half-empty container of a listed solvent) in a reserve pit could cause the exempt pit contents to become a hazardous waste and result in the closing of the reserve pit under RCRA hazardous waste regulations (STRONGER 2014).

Hazardous Waste

Under this Project, an estimated 267 pounds of classified waste would be generated per well drilled in Kern County. The actual amount and type would depend on the depth and location of the well. Examples of hazardous waste include waste batteries, waste chemicals, paint waste, waste petroleum product (used oil, lubricants, grease), and contaminated solid waste.

Releases or improper management of hazardous materials could result in contamination of soils or waters or exposure of the public. Applicants would adhere to RCRA and California Hazardous Waste Control Laws for hazardous waste handling, storage, management, transport, treatment and disposal of hazardous wastes at properly designed and permitted facilities. Compliance with federal and state regulations are designed to ensure that employees and the public would be safe from the routine use of hazardous materials and generation of hazardous waste; however, these requirements do not specify how operations should be conducted. Although large spills are unlikely, small-scale spills and releases could occur and depending on the location of the release and how quickly it is cleaned up, adverse effects could occur to water bodies or sensitive habitats. Therefore, impacts are potentially significant.

Other Wastes

An estimated 1,610 pounds of Non-RCRA drilling wastes, including drilling muds, drill cuttings, wash water, and other related waste, would be generated per well drilled in in Kern County. The actual amount will depend on the depth of the well. Wastes, such as construction material and other solid wastes, are discussed in Section 4.17, Utilities and Service Systems.

In Section 3.5.3 Construction Activities in Detail, the different solid wastes generated during oil and gas activities are described, as is how such nonhazardous solid wastes are disposed of on or offsite. Methods used include: injection wells; onsite burial in pits and landfills; land treatment; evaporation; surface discharge; and recycling. All disposal methods would have to comply with

local, state, and federal regulations. Specific disposal methods for drilling muds, waste fluids in operations sumps, produced water, flowback water, and waste gas are discussed below.

Drilling sumps are used to collect drilling muds and boring wastes which are nonhazardous. Drilling muds must be dried prior to back-filling of the sump. Operations sumps are used to store fluids and solids, which are produced while a well is operational. Waste fluids in operations sumps can be transferred to centralized sumps for processing or evaporation ponds. Management of sumps is regulated by DOGGR and the CVRWQCB and discussed in detail in Section 4.9, Hydrology and Water Quality.

Produced water is not considered a hazardous waste. It typically contains chemicals associated with the formations, such as salts, oils and greases, inorganic and organic chemicals, and naturally occurring radioactive material. Produced water is managed in several different ways, including treated for use in enhanced oil steam generation activities or other beneficial purposes, reinjected into the reservoir from which it was produced or into a zone permitted to accept Class II injection, or disposed of in permitted percolation pond facilities. The disposition of produced water (including the status of the exempt aquifer determinations being made under the UIC program) is discussed above, and in detail in Section 4.9, Hydrology and Water Quality.

Flowback fluid from WST operations is typically managed through the oilfield's oil and gas and produced water handling system, which would pipe the flowback fluid directly into these systems. Once it is commingled with other fluids, separated, and treated, the spent acid, sediment, and, in some cases, the produced water are disposed of using the common disposal practice of that field. Any oil that is collected as part of the flowback is sent through the production facility. As discussed in Section 4.9, Hydrology and Water Quality, fluid disposal also could occur through waste injection wells or percolation ponds.

Waste gas is disposed of in dedicated "waste gas" injection wells that dispose of the gas into depleted oil reservoirs. Waste gas injection wells are DOGGR permitted as Class II injection wells. Other waste gas is transported from the processing facility via pipelines and flared or used as fuel in steal generators. There are thousands of feet of pipelines conveying oil and gas byproducts, including waste gas, throughout the Project Area.

All such pipelines are subject to inspection and testing procedures as required by the DOGGR regulations adopted pursuant to AB 1960 (See CCR, tit. 14, § 1774.1.). Under the regulations, "operators shall visually inspect all aboveground pipelines for leaks and corrosion" at least once per year. In addition, DOGGR may order any tests or inspections it deems necessary to establish the reliability of any pipeline system. Following pipeline inspection, repair, replacement, or cathodic protection may be required. Any pipeline that has had a leak in the past, resulting in the release of a reportable quantity, shall be pressure tested by the operator to verify the integrity of the pipe prior to placement back into active service. Finally, AB 1960 regulations require a "mechanical integrity test" to be performed on "all active environmentally sensitive pipelines that are gathering lines, and all urban pipelines over 4 [inches] in diameter, every two years" (CCR 14 § 1774.1(e).).

Consistent with the pipeline inspection requirements of the AB 1960 regulations, all operators are required to prepare a pipeline management plan for all pipelines, that lists information on each pipeline as well as a description of the testing method and schedule for all pipelines (CCR 14 § 1774.2). Moreover, all operators must establish and comply with a written preventive maintenance plan for the prevention of corrosion and leakage, consistent with CCR, Title 14, Section 1777.

However, it is possible that, even with implementation of existing regulations, a pipeline could have an inadvertent or accidental release.

Summary

Regulations governing the transportation of hazardous material via truck and pipelines are comprehensive and serve to prevent or mitigate releases of hazardous materials in many situations. As discussed above, historical data suggest that releases have occurred at a frequency such that they occur during routine operations, though the vast majority of these releases have been minor. Further, many of the incidents reported above occurred before enactment of AB 1960 in January 2009 and prior to implementation of the AB 1960 regulations on January 29, 2011, which were enacted to improve, among other things, leak detection, corrosion prevention, and pipeline integrity. Nevertheless, potential releases have the potential to contaminate the environment or expose the public to hazardous materials and, therefore, the impacts could be significant.

The use, handling, and storage of hazardous materials is also regulated. Similar to the discussion above, despite the implementation of federal and state regulations, releases or spills have occurred in the Project Area and would be expected to continue to occur in oil and gas activities authorized under this Project. Since these potential releases could contaminate the environment or expose the public to hazardous materials, the impacts could be significant.

The disposal of hazardous materials/wastes is regulated under RCRA and California Hazardous Waste Laws. As discussed above, despite the implementation of these laws and regulations, spills and releases have occurred and would likely occur in oil and activities that would be authorized under this Project. These releases could result in significant impacts to the environment or the public, therefore, the impacts could be significant.

Mitigation Measures

MM 4.8-1 The Applicant shall provide a comprehensive Worker Environmental Awareness Program to the County with its first Site Plan Conformity Review permit application in each calendar year. The program shall include all training requirements identified in Applicant Best Management Practices and mitigation measures, and include training for all field personnel (including Applicant employees, agents and contractors). The Worker Environmental Awareness Program shall include hazardous materials and hazardous waste management, and emergency preparedness, release reporting, and response requirements.

MM 4.8-2 The Applicant shall arrange for transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act. Drivers transporting hazardous materials or wastes should follow the measures recommended by the Federal Motor Carrier Safety Administration for avoiding roll-over accidents. To avoid roll-over accidents involving cargo tank trucks:

a. Avoid sudden movements that may lead to roll-overs.

b. Control your load in turns and on straight roadways.

c. Identify high risk areas on roads.

d. Remain alert and attentive behind the wheel.

e. Control speed and maintain proper "speed cushions."

MM 4.8-3 The Applicant shall implement the following practices:

a. Construction activities shall be conducted to allow for easy clean-up of spills. Construction crews shall have sufficient tools, supplies, and absorbent and barrier materials to contain and recover spilled materials.

b. Fuels and lubricants shall be stored only at designated staging areas. Fuel and lubricant tanks shall have appropriate secondary spill containment (e.g., curbs).

c. Storage of fuel and lubricants in the staging area shall be at least 100 feet away from the edge of water bodies. Refueling and lubrication of equipment shall be restricted to upland areas at least 100 feet away from stream channels and wetlands.

d. Any fuel truck shall carry an oil spill response kit and spill response equipment at all times.

e. Applicants shall be required to perform all routine equipment maintenance at the well pad, and promptly collect and lawfully dispose of wastes at an authorized recycling, treatment or disposal facility.

f. Berms and/or dikes (secondary containment) shall be constructed around the permanent above-ground bulk tanks and the foundations shall be installed with a passive leak detection system, so that potential spill materials shall be contained and collected in specified areas isolated from any water bodies. Tanks shall not be placed in areas subject to periodic flooding or washout.

g. A sufficient supply of sorbent and barrier materials shall be maintained on construction sites, and sorbent and barrier materials shall also be utilized to contain runoff from contaminated areas.

    1. Shovels and drums shall be stored at each well pad or readily available. If small quantities of soil become contaminated, shovels shall be used to

collect the soil and the material shall be stored in 55-gallon drums. Large quantities of contaminated soil may be bio-remediated on-site or at a designated remediation facility, subject to government approval, or collected utilizing heavy equipment, and stored in drums or other suitable containers prior to disposal. Should contamination occur adjacent to staging areas as a result of runoff, shovels and/or heavy equipment shall be utilized to collect the contaminated material. Contaminated soil shall be disposed of in accordance with state and federal regulations.

2. Above-ground tanks, valves and other equipment shall be visually inspected monthly and when the tank is refilled. Inspection records shall be maintained. Applicants shall periodically check tanks for leaks or spills.
3. Drain valves on temporary tanks shall be locked to prevent accidental or unauthorized discharges from the tank.
4. Equipment maintenance shall be conducted in staging areas to the extent practical.
5. The Applicant shall maintain equipment in operating condition to reduce the likelihood of fuel or oil line breaks and leakage. Any vehicles with chronic or continuous leaks shall be removed from the construction site and repaired before being returned to operation.

MM 4.8-4 The Applicant shall implement the following measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations.

a. The Applicant shall identify gas, oil and produced water pipelines to be used for each new or reworked well site in its Site Review Plan, and shall show the location of any sensitive receptor located within 200 feet of any such pipeline. For any pipeline located within 200 feet of a sensitive receptor, the Applicant shall present evidence that each such pipeline has been integrity tested using pressure testing or other accepted test methods by a qualified professional within a two-year period prior to submittal of the Site Review Plan, and shall provide a copy of the test result to the County. For all waste gas lines less than or equal to 4 inches in diameter, a Pipeline Management Plan shall be developed and implemented in accordance with Division of Oil Gas and Geothermal Resources regulations Title 14, Division 2, Chapter 4, Section 1774.2. The Pipeline Management Plan shall include:

   1. A listing of information on each pipeline including, but not limited to:
      i. Pipeline type.
      ii. Grade.
      iii. Installation date of pipeline.
      iv. Design and operational pressure.

v. Any leak, repair, inspection and testing history.

2. A description of the testing method and schedule for all pipelines.

b. The Applicant shall notify the County of reportable quantities of fuel, gas, petroleum or hazardous materials leaks to the County within 48 hours of discovery, and to other applicable agencies as required by other laws. The Applicant shall immediately contain the leak (e.g., by isolating or shutting down the leaking equipment), clean up contaminated media (e.g., soils), and repair the leak prior to recommencing operations. The Applicant shall report the status and progress of the leak repair and remediation work to the County on monthly intervals until the repair has been completed, and any contaminated media has been remediated.

MM 4.8-5 If, during grading or excavation work, the Applicant observes visual or olfactory evidence of contamination or if soil contamination is otherwise suspected, work near the excavation site shall be terminated, the work area cordoned off and appropriate health and safety procedures implemented for the location by the contractor's Health and Safety Officer. Samples shall be collected by a trained and qualified individual. Analytical data from suspected contaminated material shall be reviewed by the contractor's Health and Safety Officer. If the sample testing determines that contamination is not present, work may proceed at the site; however, if contamination is detected above regulatory limits, the Kern County Public Health Services Department shall be notified. All actions related to encountering unanticipated hazardous materials at the site shall be documented and submitted to the Kern County Public Health Services Department.

MM 4.8-6 The Applicant shall implement the most up-to-date best management practices as part of their normal operations. Specifically, operators and/or their contractors shall implement measures to prevent the release or accidental spillage of solid waste, garbage, construction debris, sanitary waste, industrial waste, naturally occurring radioactive materials, oil and other petroleum products, and other wastes into water bodies or water sources. The best management practices in the most up-to-date versions of the following documents shall be followed: Exemption of Oil and Gas Exploration and Production Wastes From Federal Hazardous Waste Regulations (EPA 2002).

a. Classify the various oil and gas exploration and production wastes for proper disposal as described in United States Environmental Protection Agency 2002.

b. Size reserve pits properly to avoid overflows.

c. Use closed loop mud systems when practical, particularly with oil-based muds.

d. Review safety data sheets of materials used, and select less toxic alternatives when possible.

e. Minimize waste generation, such as by designing systems with the smallest volumes possible (e.g., drilling mud systems).

f. Reduce the amount of excess fluids entering reserve and production pits.

g. Keep non-exempt wastes out of reserve or production pits.

h. Design the drilling pad to contain stormwater and rigwash.

i. Recycle and reuse oil-based muds and high density brines, when practical.

j. Perform routine equipment inspections and maintenance to prevent leaks or emissions.

k. Reclaim oily debris and tank bottoms when practical.

l. Minimize the volume of materials stored at facilities.

m. Construct adequate berms around materials and waste storage areas to contain spills.

n. Perform routine inspections of materials and waste storage areas to locate damaged or leaking containers.

o. Train personnel to use sensible waste management practices.

MM 4.8-7 Conduct exploration and development activities as described in Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book (Bureau of Land Management 2007). The following specific measures should be undertaken at a minimum:

a. Sufficiently impervious secondary containment, such as containment dikes, containment walls, and drip pans, should be constructed and maintained around all qualifying petroleum facilities, including tank batteries and separation and treating areas consistent with the Environmental Protection Agency's Spill Prevention, Control, and Countermeasures regulation (40 Code of Federal Regulations 112). The containment structure must have sufficient volume to contain, at a minimum, the content of the largest storage tank containing liquid hydrocarbons within the facility/battery and sufficient freeboard to contain precipitation, unless more stringent protective requirements are deemed necessary by the authorized officer. Drip pans should be routinely checked and cleaned of petroleum or chemical discharges and designed to prevent access by wildlife and livestock.

b. Chemical containers should not be stored on bare ground, exposed to the sun and moisture. Containers and labels are subject to degradation and punctured drums could leak contents on the ground.

c. Chemicals containers should be maintained in good condition and placed within secondary containment in case of a spill or high velocity puncture.

d. Containment dikes are not to be constructed with topsoil or coarse, insufficiently impervious spoil material. Containment is strongly suggested for produced water tanks. Chemicals should be placed within secondary containment and stored so that the containers are not in contact with soil or standing water and product and hazard labels are not exposed to weathering.

e. Maintain a clean well location. Remove trash, junk, and other materials not in current use

MM 4.8-8 Applicants shall use the appropriate American Petroleum Institute Standards, or other recognized sources imposing the same or equivalent standards, for their facility, such as the following:

a. Use cements and well materials in well completions as described in Specifications for Cements and Materials for Well Cementing (American Petroleum Institute 2011).

b. Prior to start-up of all new facilities, verify and prove the construction, installation, integration, testing, and preparation of systems have been completed as designed following the practices described in Facilities Systems Completion Planning and Execution (American Petroleum Institute 2013a).

c. When the use of centralizers and stop-collars are required during well completion activities, follow the installation and testing requirements described in Recommended Practice for Centralizer Placement and Stop-collar Testing (American Petroleum Institute 2010a).

d. Limit the environmental footprint of oil and gas exploration and production and reduce the incidence of releases of hazardous substances following the practices described in Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009).

e. Minimize improper disposal by following the practices described in American Petroleum Institute Order No. G00004, Guidelines for Commercial Exploration and Production Waste Management Facilities (American Petroleum Institute 2001) or other recognized methods. These guidelines discuss the relevant regulations and permitting requirements; siting, construction, and technical consideration for various waste disposal options; as well as mitigation options.

f. Minimize the environmental footprint of exploration and production activities following the practices described in Land Drilling Practices for Protection of the Environment (American Petroleum Institute 2010b) or other recognized sources.

g. Prior to pressurizing or re-pressurizing petroleum product pipelines, ensure the integrity of pipelines following the practices described in Recommended Practice for the Pressure Testing of Steel Pipelines for the Transportation of Gas, Petroleum Gas, Hazardous Liquids, Highly Volatile Liquids, or Carbon Dioxide (American Petroleum Institute 2013b) or other recognized sources.

h. To minimize releases of hazardous substances during oilfield construction, pit and sump operations shall be conducted in accordance with State Water Resources Control Board General Orders or appropriate Regional Water Quality Control Board waste discharge requirements or general orders.

MM 4.8-9 For all operations subject to the Oil and Gas Conformity Review, the Applicant shall comply with the pipeline management plan, including inspection and maintenance requirements, as administered by the Division of Oil Gas and Geothermal Resources pursuant to 14 California Code of Regulations 1774.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.8-2: Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment

Oil and gas activities could result in spills from accidents or improper handling or disposal of fuels or hazardous materials. Spills, release, overflow of tanks, or breach of containment can occur from operator error or limited storage capacity, water ingress from stormwater or floods, poor construction or failure of tanks and/or liners, or pipeline failure. A spill or release could expose workers and the public to levels of hazardous materials in excess of applicable regulations. Several reasonably foreseeable upset/accident conditions are known to occur:

- Spills of reportable quantities of materials that occur during exploration, operations, or decommissioning;
- Spills or releases at transmission, gathering, or collector pipelines; and
- Short-circuiting of crude oil and produced water to the ground surface during steam recovery enhancement operations and well blow-out.

As discussed above, all operators are required to maintain hazardous materials in staging or storage areas in proper storage containers and with sufficient secondary containment in accordance with federal and state regulations. Transmission and some gathering pipelines must be operated according to PHMSA regulations. Therefore, this section discusses when those laws and regulations fail to prevent spills. To mitigate the effects of potential oil and chemical spills, the

following BMP is proposed for spill prevention and remediation:

Oil and chemical spills shall be cleaned up in accordance with the SPCC Plan for the site to protect personnel, wildlife, and habitat; provided, however, that nothing herein contained shall be construed to alter operator's obligations under existing laws and regulations. When a spill occurs, emergency actions to stop the spill or leak as soon as possible and ensure the safety of personnel shall be taken.

Spills/Releases at Oilfields and Processing Facilities

As discussed above, spills can occur during oil and gas operations and from pipelines. A worst-case scenario would be a breach at central processing facility where petroleum products or hazardous materials are stored in bulk. As shown in Table 4.8-2, the maximum container size for crude oil is 672,000 gallons. Some acutely hazardous materials, such as anhydrous ammonia and hydrochloric acid, are stored in 15,000 pound containers. As discussed previously, structures containing these hazardous materials must comply with California Building Codes, California Fire Code, and OSHA, and must have sufficient secondary containment to contain a breach of the largest container. In addition, facilities must have Spill Contingency Plans to address potential breaches.

As shown in Table 4.8-6, spills occur during oil and gas activities. The most commonly spilled materials are crude oil and produced water, but also acids, condensates, and drilling muds. The most common causes are from most to least common:

- Production line failure due to corrosion, but also from the use of PVC lines instead of steel lines;
- Equipment failure mostly from valves, fittings, storage tanks, and pumps;
- Human error mostly from valves left open;
- Surface break-through by drilling mud, crude oil, and produced water during steam treatment of wells for enhanced oil recovery. Break-through occurred at nearby wells, abandoned wells, hillsides, and at a well during drilling.

Although the new production lines associated with the implementation of this Project would not be subject to corrosion right away, the number of spills from existing facilities could increase as those facilities age. Equipment failure and human error would still be possible; therefore, there could be leaks or releases that could have a significant impact to public safety and the environment.

Pipelines

Between 2004 and 2013, no incidents attributable to oil and gas producers were associated with PHMSA-regulated natural gas gathering or distributions lines (PHMSA 2015c, 2015d). However, in 2014, an unregulated waste gas pipeline in Arvin ruptured resulting in saturation of the soil in backyards of eight homes on Nelson Court in Arvin.

A total of 27 unintentional releases of crude oil from PHMSA-regulated hazardous liquid pipelines

in Kern County occurred from 2010 to 2014 and 57 occurred between 2002 and 2009. The causes of the incidents were mostly attributed to equipment failure, material failure of a pipe or weld or corrosion, incorrect operations, earth movement, and other damage. More specifically, incidents occurred due to leaks, ruptures, overfill, overflow, and other unspecified causes. Leaks resulted from cracks, connection failures, pinholes, seal or packing failure, and valves not being properly closed (PHMSA 2015a, 2015b).

As discussed above, some of the pipelines in Kern County's oilfields are regulated under PHSMA and operators would be required to implement PHMSA guidelines with respect to materials required, pressure limitations, testing, safety, and reporting. However, as is demonstrated by the number of unintentional releases of crude oil, releases occur despite regulatory oversight. In addition, many gathering lines in the Kern County oilfields are not regulated by PHSMA, but are subject to the AB 1960 regulations concerning pipeline integrity, monitoring, testing, as well the requirement to prepare a pipeline management plan.

The effect of any potential release would depend on its location, particularly if the release occurred on land or entered a water body. Workers could be exposed to hazardous materials at levels in excess of OSHA and Cal/OSHA standards and the public could be exposed to hazardous materials directly or indirectly. Therefore, a spill or release could result in a significant impact.

Blowouts and Steam-Related Events

The amount of cyclic steaming could increase compared to baseline levels consistent with the general increase in oil and gas activities that might occur pursuant to the Project. Cyclic steaming at or above the fracture gradient into zones with low permeability (e.g., tight reservoirs) has the potential to increase the occurrence of inadvertent releases of oil, water, steam, or mud to the surface. These releases are commonly referred to as "surface expressions." Naturally occurring seeps may also occur within oilfields. "Seeps" refers to the natural geologic flow of fluids to the surface through a fracture network or outcrop. A blowout is the worst-case surface expression. As discussed in the Environmental Setting, well blowout rates in oilfields undergoing thermally enhanced recovery (via steam injection) in California Oil and Gas District 4 from 1991 to 2005 were on the order of one per 1,000 well construction operations, one per 10,000 active wells per year, and one per 100,000 shut-in/idle and plugged/abandoned wells per year (Jordan 2008).

At a minimum, operators must use DOGGR's blowout prevention guidance document "*Blowout Prevention in California: Equipment Selection and Testing*" (DOGGR 2006) which provides DOGGR's requirements for blowout prevention equipment (BOPE), details the components of BOPE, and describes the inspection and testing procedures. In addition, operators should employ oilfield best practices, such as API's guidance on BOPE that state:

1. All BOPE should be selected, installed, and properly maintained in order to prevent uncontrolled releases to the environment.

2. All BOPE should have a working pressure that exceeds the maximum expected surface pressure.

3. Training exercises or drills should be held as necessary to ensure crew familiarity and that the BOPE is in good working order (API 2009).

DOGGR recognizes the potential impacts associated with possible surface expressions related to oil and gas operations and has provided site-specific conditions in their Project approval letters to minimize the potential for these types of events. The need for site-specific mitigations is dependent on the depth of the formation and geologic properties of the overlaying formations, which determine whether to ensure that the injection fluid is confined to the intended zone or zones of injection.

Due to the potentially catastrophic events that can occur to public safety and the environment if blow-outs or a pressure/steam-related event occur, impacts could be significant if a blowout or pressure/steam related event were to occur.

Mitigation Measures

Implement MM 4.8-1 through MM 4.8-9, as described above, and

MM 4.8-10 The Applicant shall incorporate annual maintenance checks for leaks and corrosion that cause releases into current operations, maintenance, and inspection schedules as provided by the Division of Oil Gas and Geothermal Resources pursuant to 14 California Code of Regulations Sections 1774.1 and 1774.2, the Applicant shall visually inspect all above-ground pipelines for leaks and corrosion at least once per year, comply with the pipeline testing requirements included therein, shall maintain records of such inspections and testing; and shall make inspection and testing records available to the County for review upon request.

MM 4.8-11 As part of the Hazardous Materials Business Plan and the spill prevention, control, And countermeasures Plan, the Applicant shall require annual worker training requirements to: increase awareness of the most common types of failures and methods to avoid mistakes, shall maintain records of employee training, and shall make such records available to the County for review upon request.

MM 4.8-12 An Applicant who plans to perform cyclic steam injection activities above reservoir fracture levels shall conduct such activities in accordance with the requirements set forth in the Division of Oil Gas and Geothermal Resources site-specific Project Approval Letter for the injection project. The following requirements from a Project Approval Letter for an injection project are examples of the types of conditions that would be triggered if a surface expression were to occur, though such conditions may be modified by the Division of Oil Gas and Geothermal Resources to reflect site-specific conditions and changing regulatory requirements.

a. Cease cyclic steaming operations in accordance with the site-specific Project Approval Letter. Streaming can resume following the Division of Oil Gas and Geothermal Resources specifications outlined in the Project Approval Letter.

b. All new or reactivated surface expressions that discharge oil in a reportable quantity shall be reported as an oil spill to the California Emergency Management Agency at (800) 852-7550.

c. Any measures to address surface expressions from the well and associated Project shall be reviewed by the Division of Oil Gas and Geothermal Resources prior to initiating.

d. Immediately control any water, steam, or oil flowing from a surface expression and contained. All discharged material shall be removed and disposed of in a manner approved by all state and local agencies.

e. Cordon off and clearly mark all surface expressions to prevent inadvertent access.

f. Conduct air sampling of any emissions associated to a recent surface expression in accordance to the local air board requirements to ensure a health hazard condition does not exist.

g. Report immediately to the Division of Oil Gas and Geothermal Resources all surface expressions within 300 feet of the Project site. If the surface expression continues to flow after five days, all wells within a 300-foot radius shall cease steaming until the surface expression ceases to flow. If the surface expression continues to flow, the damage will be evaluated at the Supervisor's discretion, as assigned by Section 3106 of the Public Resources Code and existing laws and regulations.

MM 4.8-13 The Applicant shall comply with the Division of Oil Gas and Geothermal Resources requirements for assuring safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements, and all other provisions of 14 California Code of Regulations 1744 and other applicable Division of Oil Gas and Geothermal Resources regulations. The Applicant shall also reduce the incidence of well control loss by following the practices described in Recommended Practice for Well Control Operations (American Petroleum Institute 2012).

MM 4.8-14 The Applicant shall report contamination caused by oil and gas activities, including previously unknown injection wells, of a reportable quantity of hazardous substances, as specified in the Code of Federal Regulations Title 40 and/or the California Code of Regulations Titles 22 and 23, which is discovered during Project construction activities and operations. Notification must be made to Kern County Environmental Health and the appropriate implementing regulatory agency that has responsibility or oversight of the

specific contamination conditions. The Applicant shall remediate such contamination outside Tier 1 areas as required by the Kern County Environmental Health and the appropriate implementing regulatory agency.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.8-3: Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within One-Quarter Mile of an Existing or Proposed School

The CEQA requires that proposed projects near schools evaluate potential health impacts resulting from the emission of or handling of hazardous or acutely hazardous material, substances, or waste. This also includes extremely hazardous materials and wastes. Emissions associated with the implementation of the ordinance amendment and potential risks associated with emissions of toxic air contaminants (TACs) are addressed in the Air Quality Section. This discussion focuses on hazardous and acutely hazardous materials, substances, or wastes.

Definitions for extremely hazardous materials and wastes and acutely hazardous materials are provided below.

- "Extremely hazardous material" means a substance or combination of substances which, if human exposure should occur, may likely result in death, disabling personal injury or serious illness caused by the substance or combination of substances because of its quantity, concentration, or chemical characteristics.

- "Extremely hazardous waste" means any hazardous waste or mixture of hazardous wastes which, if human exposure should occur, may likely result in death, disabling personal injury or serious illness caused by the hazardous waste or mixture of hazardous wastes because of its quantity, concentration or chemical characteristics (Title 19 CCR).

- Acutely hazardous materials include chemicals at or above the specified threshold quantities or a process which involves a Category 1 flammable gas or a flammable liquid with a flashpoint below 100 °F (37.8 °C) onsite in one location, in a quantity of 10,000 pounds (4535.9 kg) or more according to 8 CCR Section 5189, Appendix A.

Some of the acutely hazardous materials that have been used in oil and gas activities in Kern County include anhydrous ammonia, hydrochloric acid, oxygen difluoride (compressed gas), peracetic acid (acetic acid over 60%), hydrogen sulfide, and nitric oxides. During all phases of oil and gas activities, acutely or extremely hazardous materials would have to be transported according the Hazardous Materials Transport Act, handled and stored according to OSHA and California Fire Code, and disposed of according to RCRA and California Hazardous Waste regulations. Most oil and gas activities do not require the long-term storage of hazardous or acutely hazardous materials. Some of these types of chemicals would be used during acid-based WST

operations defined by SB 4, as well as non-SB 4 routine maintenance operations and generally during the production process.

California State law requires that new schools should not be located near an aboveground water or fuel storage tank or within 1,500 feet (0.28 miles) of the easement of an aboveground or underground pipeline that can pose a safety hazard as determined by a risk analysis study. Therefore, new schools would not be sited near oil and gas operations or pipelines. Currently, oil and gas wells cannot be drilled within 300 feet of a school, but that does not preclude other oil and gas activities from occurring within 300 feet of a school, such as the installation of pipelines or other operational activities. Although state and federal regulations safeguard the handling of acutely hazardous materials during routine operations and these should prevent releases, accidents do occur. Schools and other locations where people congregate are particularly vulnerable to accidents. Therefore, impacts could be significant.

Health Risk Assessment

A Health Risk Assessment (HRA) was completed to assess the potential health effects of the Project. A detailed discussion of the risk assessment and its results are included in Impact 4.3-4 and a copy of the risk assessment in included in Appendix M.

The HRA shows that the potential cancer risk exceeds the CEQA significance thresholds of 10 in 1 million for drilling a 10,000-foot well in 2015 to a distance 367 feet, and for drilling a 5,000-foot well in year 2015 to a distance of 116 feet, and for operations of the oil processing equipment to a distance of 701 feet. By 2018, due to emission reductions resulting from compliance deadlines occurring from CARB current diesel regulations, the risks associated with drilling a 5,000-foot (or shallower) well would not exceed the 10 in one million threshold. This analysis suggests that at 0.25 mile, risks from construction activities would be less than the CEQA significance threshold; however, there could be health risks for schools located less than 700 feet from oil processing equipment and located less than 367 feet from drilling of a 10,000-foot well. Therefore, impacts could be significant. Implementation of the setback requirements in Sections 4.3, Air Quality would ensure that oil and gas activities would not occur in close proximity to schools and, therefore, the impact would be less than significant with mitigation.

Mitigation Measures

Implement toxic air contaminant setback mitigation measures, as described in Section 4.3, Air Quality, and

MM 4.8-15 The Applicant who intends to use acutely hazardous chemicals, including chemicals at or above the specified threshold quantities or a process which involves a Category 1 flammable gas or a flammable liquid with a flashpoint below 100 degrees Fahrenheit (37.8 degrees Celsius) on site in one location, in a quantity of 10,000 pounds (4535.9 kilograms) or more according to 8 California Code of Regulations Section 5189, Appendix A, within 0.25 mile from a school must:

a. Evaluate whether other alternative chemicals that are less hazardous could be used.

b. Ensure that the smallest quantity of necessary acutely hazardous materials are stored on site.

c. Notify the occupants of the buildings when and where acutely hazardous materials would be used.

d. Notify Kern County Fire Department about the details of the use of acutely hazardous materials (e.g., when, where, how much).

e. Ensure that all employees who would contact the acutely hazardous materials are trained on the handling, transport, storage, and disposal of the materials.

f. Ensure that all employees who would contact the acutely hazardous materials are trained and are provided the proper personal protective equipment.

g. Ensure that all employees who would contact the acutely hazardous materials are trained and have exercised on the Spill Prevention, Control, and Countermeasures P Plan that addresses these chemicals.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.8-4: Create a Hazard to the Public or the Environment as a Result of Being a Site that is Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Code Section 65962.5

Government Code Section 65962.5 requires CalEPA to compile a hazardous materials release sites called the Cortese List. This list is housed in a database called ENVIROSTOR. The list for the Project Area includes locations that are under evaluation, need evaluation, active, inactive, undergoing closure, closed, and closed with land use restrictions. Most of the current sites are located within Bakersfield or other municipalities, but some are located within or near oilfields (see Figure 4.8-6). The list of sites changes as sites are cleaned up or are designated hazardous waste sites. Appendix R contains the list as of January 21, 2015. In addition, there are multiple locations where there has been petroleum product contamination including within oilfield operating areas.

Oil and gas activities, such as preparation of new sites; exploratory drilling; drilling of production wells; excavation of onsite soils for building foundations, pits, sumps, or other facilities, have the potential to disturb soils or cross aquifers. Unearthing of pre-existing contaminated soil at an identified hazardous waste site, causing pre-existing contamination in one groundwater aquifer to enter another, or disturbing formerly contaminated areas that have been capped has the potential to expose the public or the environment to contamination and therefore impacts could be a significant impact.

Mitigation Measures

Implement MM 4.8-14, as described above, and MM 4.8-17 and MM 4.8-18, as described under Impact 4.8-5.

Level of Significance after Mitigation

Impacts would be less than significant with mitigation.

Impact 4.8-5: For a Project Located within the Adopted Kern County Airport Land Use Compatibility Plan, Result in a Safety Hazard for People Residing or Working in the Area

Currently, 10 oilfields are located within 2 miles of a public use airport (see Figure 4.8-7). The proposed amended ordinance does not have any specific restrictions associated with land use restrictions near airports or private airstrips; therefore, additional oil and gas activities could occur within close proximity of public use airport or private airstrip.

The Kern County ALUCP specifies restrictions within designated zones surrounding airports to ensure that activities within those zones are compatible with the safe operation of the airport. If oil and gas-related development activities are proposed in the vicinity of one of the 16 airports identified in the Kern County ALUCP, some activities may not be compatible with the ALUCP and, therefore, would have a significant impact. Drilling rigs and storage tanks could exceed height limits in certain airport influence zones. Lighting on drilling rigs, tanks, roads, pumps, and other facilities could exceed restrictions on lighting type, design, and placement in certain airport influence zones. Whether oil and gas activities would pose a hazard to navigation would be determined by the FAA in response to notification of that agency of a proposed project. Therefore, oil and gas development related equipment heights and lighting placement/design could create a significant hazard to aviation safety, with attendant potential impacts to people and the environment, in the vicinity of a public use airport.

Mitigation Measures

MM 4.8-17 The Applicant shall determine whether any proposed construction or alteration meets requirements for notification of the Federal Aviation Administration. If a proposed construction or alteration is found to require notification, the Applicant shall notify the Federal Aviation Administration and request that the Federal Aviation Administration issue a Determination of No Hazard to Air Navigation. If the Federal Aviation Administration determines that the construction or alteration would result in a potential hazard to air navigation, the Applicant would be required to work with the Federal Aviation Administration to resolve any adverse effects or airport operations. The Applicant shall notify the Federal Aviation Administration and the nearest Airport, by completing and submitting Federal Aviation Administration Form 7460-1 if oil and gas related exploration, production, or associated development activities are planned that meet one or more of the following

criteria:

a. Any construction or alteration exceeding 200 feet above ground level.

b. Any construction or alteration within 20,000 feet of all public use airports except Poso-kern Airport which exceeds a 100:1 surface from any point on the runway.

c. Any construction or alteration within 10,000 feet of the Poso-Kern Airport which exceeds a 50:1 surface from any point on the runway.

d. Any construction or alteration within 5,000 feet of a public use heliport which exceeds a 25:1 surface.

e. When requested by the Federal Aviation Administration.

f. Any construction or alteration located on a public use airport or heliport regardless of height or location.

MM 4.8-18 The Applicant shall determine the distance from the proposed operation to the nearest boundary of the Joint Service Restricted R-2508 Complex, using a map of this Complex provided by the County. The Applicant shall notify the Joint Service Restricted R2508 Complex representative identified by the County if oil and gas related exploration, production, or associated development activities are planned that meet one or more of the following criteria:

a. Any structure within 75 miles of the R-2508 Complex that is greater than 50 feet tall.

b. Any project within 50 miles of the R-2508 Complex that emit radio and communication frequencies.

c. Any project that would create environmental impacts such as visibility or elevated obstructions within 25 miles of the R-2508 Complex.

MM 4.8-19 All oil and gas related development activities shall review the Kern County Airport Land Use Compatibility Plan for compliance with all applicable policies.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation

Impact 4.8-6: For a Project within the Vicinity of a Private Airstrip, Result in a Safety Hazard for People Residing or Working in the Project Area

Oil and gas activities occur near private airstrips, such as the Di Giorgio Ranch Landing Strip. No known accidents have occurred. However, similar to the above discussion, oil and gas activities proposed in the vicinity of a private airstrip could affect the safety of operations at the airstrip. Drilling rigs and storage tanks can be of heights that could represent a hazard to navigation. In

addition, lighting on drilling rigs, tanks, roads, pumps, and other facilities may not be consistent with navigation lighting. Because oil and gas development related equipment heights and lighting placement/design could create a significant hazard to aviation safety, with attendant potential impacts to people residing or working in the Project Area in the vicinity of a private airstrip, the impact would be less than significant.

Mitigation Measures

None required.

Level of Significance

Impacts would be less than significant.

Impact 4.8-7: Impair Implementation of, or Physically Interfere with, an Adopted Emergency Response Plan or Emergency Evacuation Plan

The only emergency response plan in place in the Project Area is for evacuation if the Lake Isabella Dam fails. The plan specifies evacuation routes and evacuation zones. Lake Isabella is located approximately 21 miles northeast of the point where the Eastern Subarea crosses the Kern River. The Lake Isabella inundation zone includes most of the city of Bakersfield; most of the Bowerbank oil and gas field near its northwestern extent, most of the Coles Levee oil and gas fields near its western extent, abutting the northern boundary of the Rio Viejo field at its southern extent, a small northwestern portion of the Mountain View oil and gas field near its eastern extent, and most of the Rio Bravo oil and gas field near its northern extent.

Oil and gas-related development activities are unlikely to result in a significant impact to the implementation of or to interfere with the only emergency response or evacuation plan affecting the Project Area. While oil and gas development-related equipment may be present along emergency evacuation routes, setback distances from public roadways, residences, and other structures in the vicinity of oil and gas-related development would ensure that oil and gas activities would not impair the implementation of or physically interfere with this emergency response plan. The potential impact would be less than significant and no mitigation measures would be required.

Mitigation Measures

None required.

Level of Significance

Impacts would be less than significant.

Impact 4.8-8: Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Wildland Fires, Including Where Wildlands are Adjacent to Urbanized Areas or Where Residences are Intermixed with Wildlands

The Project Area is characterized by the mostly agricultural floor of the San Joaquin Valley, forest or grassland covered hills, and urban environments, each of which has an associated fire risk. The combination of seasonally hot weather, dry climate, wind, and fuel load result in areas of moderate to very high fire severity as indicated in the Kern Multi-Jurisdiction Hazard Mitigation Plan. According to the Kern Multi Jurisdiction Hazard Mitigation Plan, areas of the San Joaquin Valley are mostly mapped as having a fire severity rating of less than moderate due to the lack of fuel. Hills surrounding the San Joaquin Valley are rated with mostly moderate and high severity with areas of very high severity near the southern and northwestern boundary of the Project Area. Most oilfields are located in areas with moderate fire hazard severity or are located in non-wildland/non-urban areas.

Construction and operational activities, such as brush clearing, welding, cutting, grinding, and blasting, could occur anywhere in the Project Area. In certain locations, these activities could increase the potential for wildland fires. Although the exact location of future oil and gas development is not known within the Project Area, activities associated with the implementation of the Project could result in a significant risk of wildland fires that could result in loss, injury, or death.

Mitigation Measures

MM 4.8-20 The Applicant is required to implement the following measures:

a. Comply with Kern County Fire Codes.

b. Maintain firefighting apparatus and supplies required by the Kern County Fire Department.

c. Maintain of a list of all relevant fire-fighting authorities for each work site.

d. Have available equipment to extinguish incipient fires and or construction of a fire break, such as: chemical fire extinguishers, shovels, axes, chain saws, etc.

e. Carry water or fire extinguishers and shovels in non-passenger vehicles in the field.

f. Have and maintain an adequate supply of fire extinguishers for welding, grinding, and brushing crews.

g. Protect individual safety to contain any fire that occurs and notify local emergency response personnel.

h. Remove any flammable wastes generated during oil and gas activities regularly.

i. Store all flammable materials used in oil and gas activities away from ignition sources and in approved containers.

j. Allow smoking only in designated smoking areas.

k. Prohibit smoking where flammable products are present and when the fire hazard is high. Train personnel regarding potential fire hazards and their prevention.

l. All internal combustion engines, stationary and mobile, shall be equipped with spark arresters. Spark arresters shall be in good working order.

m. Light trucks and cars with factory-installed (type) mufflers shall be used only on roads where the roadway is cleared of vegetation. Said vehicle types shall maintain their factory-installed (type) muffler in good condition.

n. Fire rules shall be posted on the Project bulletin board at the contractor's field office and areas visible to employees.

o. Equipment parking areas and small stationary engine sites shall be cleared of all extraneous flammable materials.

p. Personnel shall be trained in the practices of the Fire Safety Plan relevant to their duties. Construction and maintenance personnel shall be trained and equipped to extinguish small fires in order to prevent them from growing into more serious threats.

MM 4.8-21 The Applicant should restrict the use of chainsaws, chippers, vegetation masticators, grinders, tractors, torches, and explosives at its locations, and ensure the sites where this equipment is used are equipped with portable or fixed fire extinguishers and/or a water tank, with hoses, fire rakes, and other tools to extinguish and or control incipient stage fires. The Worker Environmental Awareness Program shall include fire prevention and response training for workers using these tools.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.8-9: Generate Vectors or Have a Component that Includes Agricultural Waste Exceeding Adopted Qualitative Thresholds

Oil and gas activities that would be authorized under this project do not involve the generation of agricultural or food waste; however, implementation of the Project would involve construction and operations that could result in standing water, trash piles, or open containers that could provide breeding areas for mosquitoes, flies, or rodents. These potential disease vectors could pose a potential hazard to personnel or the public.

Construction of the Project would occur in an area favorable to the growth of the Valley Fever vector, the fungus *Coccidioides immitis*, which grows in soils in areas of low rainfall, high summer temperatures, and moderate winter temperatures. Project construction would disturb the soil and cause the fungal spores to become airborne, potentially putting construction personnel and wildlife at risk of contracting Valley Fever; however, most Valley Fever cases are very mild, and more than half of infected people either have no symptoms or experience flu-like symptoms and never seek medical attention. In addition, mitigation for dust control, as described in Section 4.3, Air Quality, would minimize the spread of fungal spores. Oil and gas activities that would be authorized under this project have the potential to generate disease vectors which could pose a hazard to personnel or the public, therefore, impacts could be significant.

Mitigation Measures

Implement dust control and Valley Fever education and mask measures as described in Section 4.3, Air Quality, and.

MM 4.8-22 Applicants shall ensure that trash is stored in closed containers and removed from the site at regular intervals. Open containers shall be inverted and construction ditches shall not be allowed to accumulate water. Construction and maintenance operations shall not generate standing water. Naturally occurring depressions, drainages, or pools at the site shall not be drained or filled without consulting with the appropriate resource agency (Kern County, United States Army Corps of Engineers, United States Fish and Wildlife Service, California Department of Fish and Wildlife) as applicable, and obtaining the appropriate permits.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.8.5 Cumulative Setting, Impacts, and Mitigation Measures

The geographic scope for cumulative impacts associated with hazards and hazardous materials is the Project Area. Because incidents with hazardous materials are, in general, confined to location where that has been a release or spill, the cumulative impact analysis considers the combined hazardous materials impacts associated with the Project and with nearby related projects. The potential hazards associated with the operation of oil and gas activities are only expected to occur in close proximity within oilfields or where distributions lines exist. Due to the nature of oil and gas operations, upset conditions at one oilfield could affect operations at adjacent oilfield, but are unlikely to extend beyond oilfield boundaries. Therefore, the hazard impacts associated with the Proposed Project are not expected to overlap with other hazards.

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7 Cumulative Projects. Implementation of these plans and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions

within with each related project is located. This includes the possibility of being required to undergo environmental review, in compliance with the requirements of the CEQA and/or the NEPA. Should potential impacts be identified, appropriate mitigation would be prescribed.

Impact 4.8-10: Contribute to Cumulative Hazards and Hazardous Materials Impacts

Since oil and gas activities could occur anywhere in the Project Area, it is not possible to analyze what would the combined impacts of hazards or a release of hazardous materials and wastes from the Project and existing or reasonably foreseeable projects at a specific location.

With regard to the creation of a hazard through the routine transport, use, or disposal of hazardous materials (Impact 4.8-1), a potentially significant impact could result if a spill or leak were to occur during oil and gas construction or operation activities; however, compliance with state and county regulations and the mitigation measures outlined above would ensure that impacts would remain less than significant. This impact does not have the potential to combine with contamination from spills from other projects within 0.5 mile of the site to result in a cumulative impact due to the site-specific nature of soil contamination and the mitigation measures that would ensure proper cleanup and disposal of contaminated soil. Cumulative contamination of groundwater is discussed in Section 4.9, Hydrology and Water Quality. Therefore, impacts of the Project would not be expected to make a cumulatively considerable contribution, in combination with impacts from past, present, or reasonably foreseeable projects, to result in a cumulative impact.

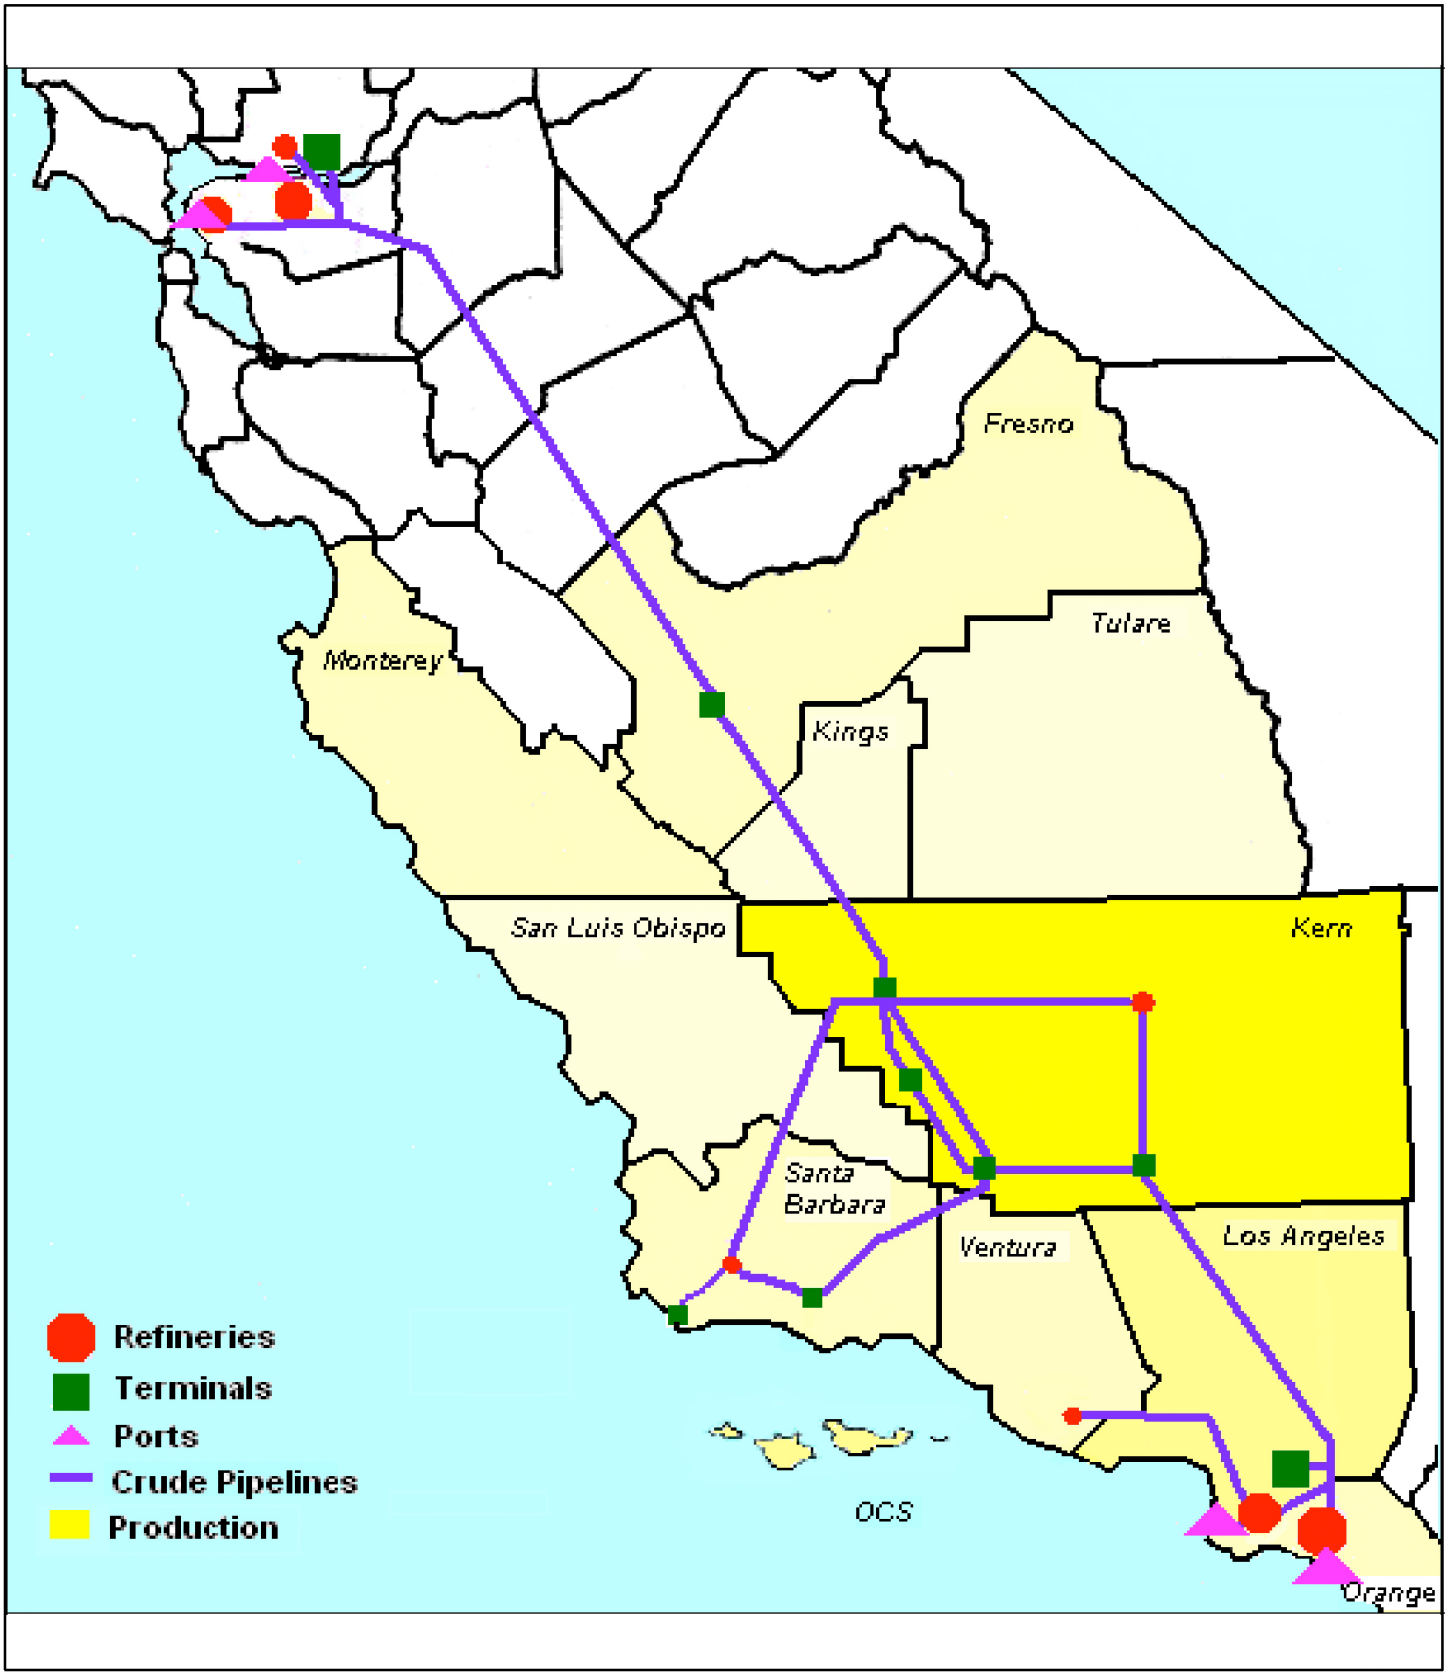
With regard to creation of a hazard through upset or accident conditions involving a hazardous material release (Impact 4.8-2), the potential exists for oil and gas activities through the implementation of the Project to result in the release of hazardous materials in the soil resulting in exposure of personnel and other sensitive receptors to contaminant levels that could result in short-term and/or long-term health effects. Additionally, releases from pipelines could pose a hazard to personnel and the public; however, conformance with existing state and county regulations, project safety design features, and implementation of the mitigation measures identified above would render this impact less than significant. This impact does not have the potential to combine with impacts of other projects because of the localized nature of the impacts, and because appropriate safety, cleanup, and disposal methods would be implemented to reduce the impact to a level that would not combine with impact of other projects. Therefore, impacts of the Project would not have the potential to make a cumulatively considerable contribution in combination with impacts from past, present, or reasonably foreseeable projects to result in a cumulative impact.

With regard to creation of a hazard to the public or the environment as a result of being located on a site that is included on a list of hazardous material sites compiled pursuant to government code section 65962.5, although the exact location of new oil and gas development is not known, implementation of MM 4.8-3 and 4.8-15 would ensure that the Applicant not only has a method to address unanticipated contamination, but they have also proactively evaluated whether there is a potential hazardous waste site where they would be operating and have made measure to avoid disturbing it. Therefore, impacts of the Project would not have the potential to combine with impacts from past, present, or reasonably foreseeable projects to result in a cumulative impact.

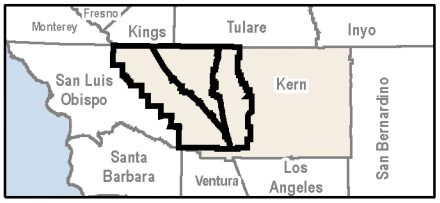
With regard to the creation of a safety hazard for a project located within the Kern County ALUCP, oil and gas activities could occur within the Kern County ALUCP, and therefore, do have the potential to result in creation of a safety hazard to air navigation. However, the Project would be required to comply with County zoning requirements and FAA regulations to ensure that impacts remain less than significant (Impact 4.8-4). With the implementation of MM 4.8-14, 4.8-17, and 4.8-18, in conjunction with compliance with existing rules, the Project does not have the potential to combine with impacts of other projects. Therefore, impacts of the Project would not have the potential to make a cumulatively considerable contribution, in combination with impacts from past, present, or reasonably foreseeable projects, to result in a cumulative impact.

With regard to interference with an adopted emergency response plan or emergency evacuation plan (Impact 4.8-5), it would be unlikely that Project-related activities would interfere with the Lake Isabella emergency response/evacuation. The Project's less-than-significant impact has the potential to combine with other current and future projects that would generate high volumes of traffic on area roadways by creating a cumulative traffic burden on regional roadways; however, given the overall rural nature of the Project Area, and the fact that the Kern Council of Governments Regional Transportation Plan took in account traffic volumes from anticipated projects, the potential for a considerable contribution to a cumulative impact to emergency response is unlikely to occur, and would therefore be less than significant.

With regard to exposing people or structures to a wildland fire hazard (Impact 4.8-6), construction and maintenance would increase the likelihood of wildfire ignition; however, implementation of MM 4.8-19 outlined above would substantially reduce the possibility of a Project-related ignition, rendering this impact less than significant. Mitigation would reduce this impact to a level that would not combine with other projects. Therefore, impacts of the Project would not have the potential to make a cumulatively considerable contribution, in combination with impacts from past, present, or reasonably foreseeable projects, to result in a cumulative impact.



With regard to generating disease vectors (Impact 4.8-7), oil and gas construction activities could disturb the Valley Fever vector or attract other disease vectors by allowing standing water, trash piles, or open containers to accumulate at the Project site, potentially resulting in a hazard to construction personnel or the general public. However, implementation of the MM 4.8-20 described above would reduce this impact to a less than significant level. Mitigation would reduce this impact to a level that would not combine with other projects, therefore, impacts of the Project would not have the potential to make a cumulatively considerable contribution, in combination with impacts from past, present, or reasonably foreseeable projects, to result in a cumulative impact.



Mitigation Measures

Implement MM 4.8-1 through MM 4.8-22, as described above, and dust control and toxic air contaminant setback mitigation measure, as described in Section 4.3, Air Quality, risk reduction measures, as described in Section 4.6, Geology and Soils, , and mitigation measures to maintain water quality, as described in Section 4.9, Hydrology and Water Quality.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Section 4.9

Hydrology and Water Quality

Section 4.9

Hydrology and Water Quality

4.9.1 Introduction

This section describes the affected environment and regulatory setting for hydrology and water resources. It also describes the impacts on water resources that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related amendments to the Kern County Zoning Ordinance together with future oil and gas development activities pursuant to the Amended Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

This section was informed, in part, by the Hydrology and Water Quality Technical Report (see Appendix S) and Water Supply Assessment (see Appendix T), both prepared by Kennedy/Jenks Consultants. Additional information was obtained from the Water Quality Control Plan for the Tulare Lake Basin (CVRWQCB 2004), Groundwater Quality in the Kern County Subbasin, California (Burton and Belitz 2012), Status and Understanding of Groundwater Quality in the Two Southern San Joaquin Valley Study Units, 2005-2006: California GAMA Priority Basin Project (Burton et al. 2012), and California's Groundwater Bulletin (DWR 2006).

4.9.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is defined on Figure 3-1 (see Chapter 3, Project Description) and is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north; Santa Barbara and San Luis Obispo counties to the west; the Tehachapi Mountains and the Sierra Nevada Mountains to east; and the northern boundary of the Los Padres National Forest to the south.

The environmental setting section describes the current hydrology, hydrogeology, and water quality within the Project Area, including the primary watersheds and surface water and groundwater quality data. In general, the Project Area includes most of the San Joaquin Valley floor within Kern County up to an elevation of 2,000 feet. The Project Area is described in detail in Chapter 3 of this Environmental Impact Report (EIR).

Climate

The Project Area is characterized by low rainfall. On average, the valley floor receives 8.32 inches of precipitation per year, most of which falls between November and April (Appendix T). Average temperatures are relatively high, and total evaporation exceeds total precipitation. Winter is generally mild, but an occasional freeze does occur and may cause substantial agricultural damage. The majority of rainfall occurs between January and March. Summers are characterized as dry, with high temperatures and low humidity. Average high temperatures range

from 57.4 degrees Fahrenheit (°F) in January to 98.6°F in July. Average low temperatures range from 38.5°F in December and January to 69.2°F in July (Western Regional Climate Center 2015).

A "water year" in California runs from September 30 to October 1 of the following year. According to the California Department of Water Resources (DWR), precipitation in water years 2012 and 2013 was drier than normal, and the 2014 water year was one of the driest on record (DWR 2014). California typically receives 50% of its precipitation in the months of December, January, and February in the form of snow in the Sierras. The snowpack in the Sierras typically stores water throughout the winter months and then releases it beginning in the spring.

Topography and Hydrology

The major topographic feature in the Project Area is the southern San Joaquin Valley, where the topography is generally flat. Steeper, mountainous topography is present in the Sierra Nevada Mountains to the east, the San Emigdio and Tehachapi Mountains to the south, and the Coast Range Mountains to the west.

The Project Area is located within the Tulare Lake Basin. The Tulare Lake Basin comprises the drainage area of the San Joaquin Valley south of the San Joaquin River and encompasses 17,650 square miles. The DWR periodically publishes maps and information regarding specific groundwater basins within California (DWR 2006). The DWR has identified 12 distinct groundwater basins in the Tulare Lake Basin, and there are seven watershed management areas or subbasins in the Southern San Joaquin Valley: Kings, Westside, Pleasant Valley, Kaweah, Tulare Lake, Tule, and Kern County. Each area is defined by the DWR as a designated groundwater basin (Figure 4.9-1).

The natural hydrology of the Tulare Lake Basin has been extensively modified over the last 150 years by irrigation, flood control, and land reclamation. Dams and reservoirs have been constructed on all of the large rivers that drain into the basin for flood control, water supply, and hydroelectric generation. State, federal, local, and privately-owned water conveyance facilities, such as aqueducts, pipelines, ditches, and canals, have also been constructed throughout the region to facilitate the movement of water into and out of the Tulare Lake Basin (EPA 2007).

The Kern River is the southernmost of the four major rivers in the Tulare Lake Basin and is the major surface water feature in the Kern River Basin, flowing from the Sierra Nevadas in the northeast to the Central Valley in the southwest (Figure 4.9-2). The riverbed extends through urban Bakersfield and is typically dry except during storm events and under wet hydrologic conditions when water is being released upstream from Lake Isabella for flood management or local water banking purposes. Lake Isabella was created by a dam completed by the U.S. Army Corps of Engineers (USACE) in 1953. The Lake Isabella dam consists of the main dam and an auxiliary dam, which are located 2,000 feet apart. The dam is located 33 miles east of the valley floor in at the junction of the mainstem and south fork of the Kern River. The main earthfill dam is 185 feet high and 1,725 feet long, while the auxiliary earthfill structure is 100 feet high and 3,275 feet long. The gross storage capacity of both dams is 568,100 acre-feet (AF). The total capacity may be operated to control snowmelt floods. As discussed below, the dam is being

managed by the USACE to reduce potential structural failure risks during an ongoing safety modification program that is scheduled to be completed in 2022.

From the Lake Isabella dam, the Kern River flows southwest until it emerges from a deep canyon northeast of Bakersfield. Water flowing from the canyon is diverted into canals by several weirs for use in the city of Bakersfield. During wetter conditions, surface water is released downstream for groundwater recharge operations. Depending on the amount and timing of rainfall and snowmelt, surface water from the Kern River that is not diverted or used for groundwater recharge may ultimately flow into the Buena Vista lakebed, the Kern River Intertie, and the California Aqueduct, or north towards the historical Tulare Lake Basin via the flood canals. The westerly portions of the Kern River, and several of the diversion, recharge, and flood facilities that capture or convey river flows, are located within the Project Area.

Poso Creek is located to the north of the Kern River and intermittently conveys rainfall and snowmelt from the Greenhorn Mountains to the valley floor. The creek flows west through portions of the Project Area and terminates at the federally-owned Kern National Wildlife Refuge in the northwest portion of the County. The primary constructed water conveyance facilities in and near the Project Area are: (1) federally owned and operated facilities associated with the Central Valley Project (CVP), including the Friant-Kern Canal, which transports water from Sierra Nevada streams, the Sacramento Delta, and other sources to Kern County; and (2) facilities associated with the California owned and operated State Water Project (SWP), including portions of the California Aqueduct, which transport water south to Kern County and other locations from the Sacramento Delta. Major groundwater recharge and storage facilities include the 30-square-mile Kern Water Bank, owned and operated by the Kern Water Bank Authority, the Pioneer Project, owned by the Kern County Water Agency, and storage and banking facilities that are owned and operated by several incorporated water districts in the Project Area.

Hydrogeology

The San Joaquin Valley is filled with thousands of feet of marine and continental sediments of Tertiary and Quaternary age derived from the surrounding Sierra Nevada Range and Coast Ranges, and their southern extensions. The sediment thickness increases from the valley margins toward the center. The sequence of sediments forming the basin is asymmetrical, with the thickest sediments occurring along the western side of the valley where up to 30,000 feet of sediments are found in the southwestern portion of Kern County (Page 1986).

Figure 4.9-3 provides the general geologic map for the Project Area. Two structural blocks, the Sierra Nevada Range on the east and the Coast Ranges on the west, have contributed mineralogically-distinct sediments that interfinger in the subsurface (Bartow and McDougall 1984; Bartow 1991; Page 1986; Wood and Dale 1964). The valley floor is underlain by coalescing Quaternary alluvial fans that have formed along the mountain fronts, resulting in heterogeneous and discontinuous lenses of gravels and sands with increasing silt and clay content towards the center of the basin. The metamorphic and igneous rocks of the Sierra Nevada Batholith are exposed to the east. To the west are the faulted and folded Tertiary-aged sediments that comprise the Coast Ranges (shown as Pliocene, Miocene, Oligocene, Eocene and Paleocene

sediments on Figure 4.9-3). Along the southern boundary, the metamorphic and igneous rocks underlie the Tehachapi Mountains (Sierra Nevada block) whereas faulted and folded sedimentary rocks underlie the San Emigdio Mountains (Coast Ranges block).

Basin sedimentation in the southern San Joaquin Valley began in the Jurassic Period, with the erosion of the rising Sierra Nevadas in the east. Sediments were deposited onto the shelf edge of a shallow sea. Because the Coast Ranges orogeny had not yet begun, lands to the west were open to the ocean. Deposits accumulated in the deeper water to the west, resulting in the very thick Franciscan Formation that was later uplifted, forming the Coast Ranges. Deposition proceeded throughout the Mesozoic Era, which is represented by more continuous units and an absence of deformation (Wood and Dale 1964; Croft 1972).

Tectonic activity associated with the uplift of the Coast Ranges began in the Tertiary Period and resulted in folding and faulting of sediments along the west side and a deepening of the valley floor. Thick sequences of marine sediments were deposited as the Coast Ranges orogeny continued. By the late Tertiary Period (Pliocene Epoch), the mountains had cut off the connection to the sea and marine waters had been drained from the valley. As deposition continued, non-marine (continental) sediments were deposited across the valley (Bartow and McDougall 1984; Bartow 1991).

The Pleistocene Epoch was dominated by brackish and freshwater lakes resulting in thick deposits of clay, as represented throughout the upper Tulare Formation. These include the widespread Corcoran Clay, which has been mapped over much of the San Joaquin Valley, and its equivalents, which have been correlated to clays beneath the Kern and Buena Vista dry lake beds in the southern Project Area as well as the Tulare Lake sediments on the northern boundary of the County (Wood and Dale 1964; Croft 1972).

The San Joaquin Valley is an asymmetrical syncline (Figure 4.9-3) or trough that runs north-south with the center along the western side of the valley. Although the San Joaquin Valley constitutes part of a discrete geomorphic province, the geology is internally variable in both stratigraphy and style of deformation. Stratigraphically, the greatest variation is the thick section of marine sediments in the southern part of the basin that grades to thinner, non-marine sediments north of Kern County. Structurally, the greatest differences are between the highly-folded sedimentary layers on the west and the little-deformed sedimentary cover on the east side of the valley (Bartow 1991).

Tectonic activity in the area has produced numerous geologic faults, many of which remain active today. Notable faults and folds are shown on Figure 4.9-3. Figure 4.9-3 also illustrates the position of the major oilfields in the Project Area relative to major structural features, such as the Bakersfield Arch and the Cenozoic Basin depositional axis. Two generalized west-to-east cross-sections are presented on Figure 4.9-4 and Figure 4.9-5 to further illustrate the variability in geology across the Project Area.

The Bakersfield Arch (Figure 4.9-3) separates the San Joaquin Valley in the Project Area into northern and southern areas. The arch does not have appreciable structural relief, but does have an influence on sedimentation. The thickest sequences of Tertiary sediments of these basins occur

approximately coincident with the Pleistocene and Holocene Buena Vista and Kern Lake basins in the south and the Tulare Lake basin in the north. The Mesozoic and early Tertiary Great Valley sequence, on the other hand, thins southeastward and is apparently absent south of the Bakersfield Arch (Bartow 1991).

The highly-folded western margin of the valley north of the Bakersfield Arch is characterized by Cenozoic folds and faults that trend, for the most part, slightly oblique to the San Andreas Fault in the southwest. The southeast boundary of the fold belt is arbitrarily placed east and south of Elk Hills where the fold trends change from northwest to west (Figures 4.9-4 and 4.9-5). The east boundary deviates from the valley syncline axis to include the subdued anticlines that, although lying east of the valley axis, are structurally more akin to the west-side fold belt than to the less-deformed eastern margin (Figure 4.9-5). The intensity of deformation increases southeastward along the fold belt as well as southwestward across the belt toward the San Andreas Fault. The increased intensity is evidenced by tighter folds and an increased number of reverse and thrust faults (Bartow 1991).

Normal faults along the east side of the valley are concentrated in the area of the Bakersfield Arch. These faults generally trend northwest to north, although a secondary west to west-northwest trend is apparent (Figures 4.9-4 and 4.9-5). The net displacement is down to the southwest, although down-to-the-northeast faults are present (Bartow and McDougall 1984; Bartow 1991).

South of the Bakersfield Arch, the structural trends are variable, but there is a general west trend along the southern margin of the basin (Figure 4.9-3). The northwest fold trends of the west side change to west-northwest where that region merges with the deformed belt at the south end of the valley. The northeast-trending White Wolf fault is the dominant structure (Figure 4.9-3). The White Wolf fault and the smaller Springs fault to the southeast both trend approximately parallel to the Garlock fault, which lies along the southeast side of the Tehachapi Mountains. Both faults, like the Garlock, show some geologic evidence of left-lateral movement. Farther northeast, the northwest-to-west-trending Edison fault is an older Tertiary normal fault (Bartow and McDougall 1984; Bartow 1991).

For the purposes of this EIR, the Project Area is analyzed with reference to three Subareas, the Western, Central, and Eastern Subareas. The following paragraphs provide an overview of the hydrogeology in these areas:

- The Western Subarea is bounded by the Coast Range hills in western Kern County and by Interstate 5 on the east. As discussed below, due to the hydrogeology of this region, which includes marine sediments that readily dissolve into groundwater, water quality in the Western Subarea is relatively poor compared with the Central and Eastern Subareas). The Corcoran Clay, or an equivalent clay barrier separating aquifers into deeper and shallower zones, is present in the eastern portion of this Subarea and separates shallow and deep groundwater zones. The geologic cross-section presented on Figure 4.9-5 illustrates the occurrence of saline groundwater west of the Lost Hills (generally west of Interstate 5).

- The Central Subarea primarily includes the largely flat, gently sloping alluvial sediments located in the southern San Joaquin Valley floor portion of the Project Area east of Interstate 5 and west of Highway 65. Agriculture is the predominant land use, and groundwater production accounts for a substantial amount of the agricultural irrigation and municipal and industrial water use in this area. The Corcoran Clay is present throughout much of the Subarea and separates shallow and deep groundwater zones. The geologic cross-section presented on Figure 4.9-5 illustrates that the groundwater in the upper several hundred to over one thousand feet is relatively fresh, making this the primary aquifer for the region.

- The Eastern Subarea is bounded by the West Sierra Foothills, up to an elevation of approximately 2,000 feet above mean sea level, portions of the gently sloping alluvial sediments downslope of the West Sierra Foothills, and the valley floor up to Highway 65. The geologic cross-section included as Figure 4.9-5 illustrates that the sediments thin towards the east as they overlay onto the granitic basin. In the West Sierra Foothills, the local geology is characterized by tight, poorly draining, low-solubility igneous and metamorphic rocks, which tend to have less impact on water composition of streams draining the area as compared to the geology of the Western Subarea. Groundwater wells in this area do not produce at rates comparable with the Central Subarea and are mostly used to meet domestic (i.e., private well) and small community demand. The alluvial areas are similar geologically to the Central Subarea, but are distinguished from the Western and Central Subareas, in part, by the absence of the Corcoran Clay. Groundwater production in the alluvial portion of the Subarea is more substantial than in the foothill areas.

The Project Area is located in the southern extreme of the San Joaquin Valley structural trough, which is filled with marine and continental sediments deposited during periodic inundation by the Pacific Ocean and by erosion of the surrounding mountains. Continental deposits shed from the surrounding mountains form an alluvial wedge that thickens from the valley margins toward the axis of the structural trough to about 30,000 feet. The thickest alluvium occurs in the south-central portion of Kern County, including locations in the Project Area (DWR 2006). Freshwater generally occurs in the uppermost 3,000 feet of the alluvium, and brackish water is typically found in deeper locations (Shelton et al. 2008).

The Kern County Subbasin has the largest surface area of any basin designated by the DWR in California. The Kern County Subbasin is bounded to the north by the Kern County line and Tule Groundwater Subbasin, on the east and southeast by the Sierra Nevada Foothills and the Tehachapi Mountains, and on the southwest and west by the San Emigdio Mountains and Coast Ranges (Shelton et al. 2008). In the Kern County Subbasin, aquifers commonly occur in loosely compacted soil that is saturated with groundwater. These aquifers are generally characterized as unconfined or confined aquifers. Unconfined aquifers occur where the water table is exposed to the atmosphere through openings in overlying materials. Confined aquifers occur below a low permeability geologic unit that impedes vertical movement of groundwater. Groundwater in a confined aquifer is often under higher atmospheric pressure conditions. Geologic structures, such

as bedrock or faults, can also constrain the lateral or vertical movement of groundwater. Groundwater generally flows westward out of the Sierra Nevada and Tehachapi Mountains toward the center of the San Joaquin Valley. North of the Kern River, groundwater flows west then north toward the Tulare Lakebed. South of the Kern River, groundwater flows toward the southwest (Burton et al. 2012).

The primary aquifers in the Kern County Subbasin consist of alluvium in the shallower aquifers, and marine and continental deposits in the deeper aquifers. The public supply wells in the primary aquifers are generally screened from 275 to 450 feet to 600 to 800 feet below the ground surface (Burton and Belitz 2012).

Water Bearing Formations

Sedimentary deposits in the San Joaquin Valley are divided, from oldest to youngest, into the Olcese and Santa Margarita formations, the Tulare (western subbasin) and Kern River formations (eastern subbasin), Older Alluvium/Stream and Terrace Deposits, and Younger Alluvium/Flood Basin Deposits (DWR 2006).

The Olcese and Santa Margarita formations are current or potential sources of drinking water only in the northeastern portion of the subbasin where they occur as confined aquifers. They are Miocene-age deposits that vary from continental to marine in origin from east to west across the subbasin. The Olcese Formation is primarily sand and ranges in thickness from 100 to 450 feet. The Santa Margarita Formation consists of coarse sand and ranges in thickness from 200 to 600 feet (DWR 2006).

Both the Tulare and Kern River formations are moderately to highly permeable and yield moderate to large quantities of water. These units are both Plio-Pleistocene age and represent a west/east facies change across the subbasin. The Tulare Formation (western subbasin) contains up to 2,200 feet of interbedded, oxidized to reduced sands; gypsiferous clays; and gravels derived predominantly from Coast Range sources. The Kern River Formation includes 500 to 2,000 feet of poorly sorted, lenticular deposits of clay, silt, sand, and gravel derived from the Sierra Nevadas (DWR 2006).

The Older Alluvium/Stream and Terrace Deposits are moderately to highly permeable and yield large quantities of groundwater. The deposits are composed of up to 250 feet of Pleistocene-age lenticular clay, silt, sand, and gravel that are loosely consolidated to cemented and are exposed mainly at the subbasin margins. This sedimentary unit is often indistinguishable from the lower Tulare and Kern formations. Most of the freshwater aquifers in the Kern County occur in the Older Alluvium/Stream and Terrace Deposits, and the Tulare and Kern formations (DWR 2006).

The Younger Alluvium/Flood Basin Deposits are Holocene in age and vary in character and thickness around the subbasin. At the eastern and southern subbasin margins, this unit is composed of up to 150 feet of interstratified and discontinuous beds of clay, silt, sand, and gravel. In the southwestern subbasin, it is finer-grained and less permeable as it grades into fine-grained flood basin deposits underlying the historic beds of Buena Vista and Kern lakes in the southern

subbasin. The flood basin deposits consist of silt, silty clay, sandy clay, and clay interbedded with poorly permeable sand layers. These flood basin deposits are difficult to distinguish from underlying fine-grained older alluvium and the total thickness of both units may be as much as 1,000 feet.

Recharge and Storage

Natural groundwater recharge in the Project Area is primarily from the Kern River, but is also generated by infiltration from intermittent streams along the edge of the basin (DWR 2006; Burton and Belitz 2012). Conjunctive use and groundwater banking programs are widely used in the Kern County Subbasin area. Groundwater banking is the storage and recharge of excess water supplies into aquifers during wet periods for later withdrawal/recovery for use during dry periods. Historically, during wet periods, after surface water imports have been used to meet irrigation and urban water needs, imported water has been recharged to groundwater aquifers. The groundwater is pumped and extracted through private and publicly owned facilities wells during dry periods when local or imported surface water supplies are insufficient to meet regional water demand. Public and privately operated groundwater banking facilities, and infiltration from agricultural and municipal irrigations, much of which uses surface water imported to the Kern County Subbasin, currently accounts for a much larger amount of recharge than from natural sources (Burton et al. 2012; Burton and Belitz 2012). Groundwater banking programs are located throughout most of the central portion of the Kern County Subbasin (Figure 4.9-6).

The Kern Water Bank Authority (KWBA) owns and operates the Kern Water Bank (KWB), located to the southeast of Bakersfield along the Kern River. The KWB is the largest water banking program in the world and has stored over 2 million AF of water since operations began in 1995. Other water banking facilities in or near the Project Area include:

- City of Bakersfield 2800 Acre Ground Water Recharge Project;
- Berrenda Mesa Banking;
- Pioneer Banking;
- Semitropic Water Storage District Banking;
- Arvin-Edison Water Storage District Banking;
- Kern Tulare and Rag Gulch Water Districts Banking;
- Buena Vista Water Storage District Banking;
- Rosedale-Rio Bravo Water Storage District Banking;
- Kern Delta Water District Banking; and
- Cawelo Water District Banking.

The maximum annual recharge capacity in the Kern County Subbasin area has been estimated at 1.5 million AF per year (AFY), with a maximum recovery of 900,000 AFY (KCWA 2011a). The

KCWA estimates that 40,000,000 AF of groundwater is stored and that an additional 10,000,000 AF of groundwater storage capacity is located within and in the vicinity of the Project Area (DWR 2006). The region's total storage capacity is 50,000,000 AF, and 10,000,000 AF is available for conjunctive use and groundwater banking operations. As of 2011, approximately 5,400,000 AF was in managed groundwater storage in the Kern County Subbasin.

Between 1926 and 1970, groundwater extraction resulted in more than 8 feet of subsidence in the north-central portion of the subbasin, and 9 feet in the south-central area. The basin experienced a 15-foot decrease in water level from 1970 through 1978, a 15-foot increase from 1978 through 1988, and an 8-foot decrease from 1988 through 1997. The average subbasin water level, however, remained essentially unchanged from 1970 to 2000, subject to significant local variability ranging from increases of over 30 feet at the southeast valley margin and in the Lost Hills/Buttonwillow areas to decreases of over 25 and 50 feet in the Bakersfield area and McFarland/Shafter areas, respectively (DWR 2006). Data collected by the Kern County Water Agency (KCWA) indicate that average groundwater levels decreased by 2.5 feet in 2013 (KCWA 2013).

In 2009, the California Water Code was amended to require that the DWR develop and implement a new California statewide groundwater elevation monitoring (CASGEM) program. The CASGEM program collects data on groundwater levels and use for 515 designated basins in the state, including the Kern County Subbasin that underlies most of the Project Area. The program also ranks the severity of each basin's groundwater impacts on the basis of several factors, including subbasin population growth, reliance on groundwater, and level of extraction. Additional legislation enacted in 2014 requires that regional groundwater sustainability plans (GSPs) be adopted for state subbasins in accordance with a compliance schedule based on the severity of the CASGEM rankings. The Kern County Subbasin currently is considered to be the 21st most impacted of 515 subbasins in the state and a CASGEM "high" priority basin. Consequently, a GSP for the subbasin must be adopted by 2020.

In November 2014, the DWR prepared a Public Update for Drought Response (DWR 2014) pursuant to an April 2014 proclamation by Governor Jerry Brown of a continued state of emergency resulting from persistent drought conditions over much of the state. California's 2014 water year was one of the driest in decades and followed two consecutive dry years throughout the state. As a result of continued drought, groundwater use has increased to meet demand. With the increasing use of groundwater, notable decreases in water table elevations were observed. From the fall of 2013 to the fall of 2014, water table elevations declined substantially in the Tulare Lake Basin. Although the DWR's water table elevation data collected under the CASGEM program do not provide full coverage of Project Area aquifers, substantial portions of the Tulare Lake Basin show declines in water table elevation in the range of 25 to more than 50 feet. A number of water banking projects located in the Project Area are designed to recharge the aquifer for later use in dry years. Although groundwater in the Tulare Lake Basin is managed for withdrawal of groundwater during dry years, the magnitude of water table decline during the 2014 water year indicates the basin has experienced some of the largest withdrawals of

groundwater in the state and substantial withdrawals from groundwater that had been previously stored for future use.

The state of California obtains about one-third of its water supply from the snowmelt in the Sierra Nevada Mountains. Snow melt is the primary source for water that is delivered to the Project Area through state and federal canal projects. As of March 12, 2015, the Sierra snowpack stands at only 17% of the historical average for the time of year. With continued dry conditions as of March 12, 2015, reductions in groundwater storage are likely to continue in the Project Area. On January 17, 2014, the Governor Brown proclaimed a drought state of emergency and directed state officials to take all necessary actions to prepare for these drought conditions (State of California 2014). On April 1, 2015, the Governor issued an executive order requiring 25% cutbacks in potable water use statewide, additional water conservation and planning measures, and the potential installation of salinity barriers in the Sacramento Delta in response to historically low snowpack levels in the state (State of California 2015). The executive order also requires that CASGEM groundwater elevation monitoring be implemented throughout the state, including the Project Area, by the end of 2015. It is likely the drought will continue into a fourth year (DWR 2014, 2015a).

On April 1, 2015, Governor Brown issued an executive order directing the State Water Resources Control Board (SWRCB) to impose a 25% reduction on the state's 400 local water supply agencies. The agencies will be responsible for implementing restrictions to cut back on water use and for monitoring compliance. The order would impose varying degrees of cutbacks on water use affecting homeowners, farms, and other businesses, as well as the maintenance of cemeteries and golf courses.

Oil and Gas Production and Water Resources

Overview

Groundwater that naturally exists in oil and gas reservoirs is brought to the surface when oil and gas are extracted from these reservoirs. This water is known as "produced water." Water is also used for various purposes to conduct oil and gas exploration and production activities in the Project Area. This section summarizes the existing amounts, sources, and uses of water for oil and gas exploration and production. Urban and agricultural water supply and demand planning in California is generally analyzed with reference to AF, which is the amount of water that covers one acre to a depth of one foot and contains about 325,851 gallons. For clarity and comparison purposes, this EIR discusses oil and gas production and exploration water use and supply in terms of AF, although the industry typically reports fluid volumes in terms of "barrels." There are 42 gallons in a barrel, and about 7,758 barrels in an AF. Potential impacts to surface or groundwater quality and other hydrological resources that could occur from the extraction, conveyance, use, and disposal of water resources are discussed in Section 4.9.4, Impacts and Mitigation Measures. Potential water supply impacts are discussed in Section 4.17, Utilities and Service Systems, of this EIR. Potential subsidence, seismic, and other geological impacts are discussed in Section 4.6, Geology and Soils.

Oil-bearing formations in the Project Area include a mixture of usually saline or other poor-quality groundwater and hydrocarbons. Production wells extract a mixture of water and hydrocarbons that is separated in surface facilities, typically a series of tanks or "tank batteries," where lighter oil and gas compounds are isolated and skimmed from the heavier water. Residual water generated by the hydrocarbon separation process is generally referred to as "produced water" in the context of oil and gas exploration and production. As oilfields mature in the Project Area, the ratio of produced water to extracted hydrocarbon resources has tended to increase, in part because the volume of the hydrocarbon deposits remaining in the subsurface formations has been reduced by prior extraction, and also due to the injection of steam or water to mobilize heavier, more viscous deposits for pumping to the surface.

Figure 4.9-7 and Table 4.9-1 show the amount of oil and produced water generated in the Project Area from 2002 through 2013. Oil production in the Project Area declined from about 25,630 AF (198.8 million barrels) in 2002 to 18,260 AF (141.6 million barrels) in 2013. Over the same period, produced water increased from about 149,400 AF to 231,250 AF by 2013.

Table 4.9-1: Project Area 2012 Oil and Gas Exploration and Production - Water Supply and Demand (acre-feet)

Water Supplied

All values subject to rounding and may vary slightly from Table 28.

Figure 4.9-7 shows that the ratio of produced water to oil recovered from Project Area oil and gas activities increased from just under 6 units (gallons, barrels, or AF) of produced water for each unit of oil recovered in 2002 to nearly 13 units of produced water for each unit of oil recovered in 2012 and 2013. The total amount of produced water extracted from hydrocarbon-bearing formations in the Project Area during 2012 was about 234,959 AF (Table 4.9-1).

Produced water comprises the single largest source of water supply for oil and gas exploration and production activities in the Project Area. After the hydrocarbons are separated from the mixture of oil and water that is pumped from a well, the produced water is conveyed by pipelines or by truck from the tanks and separation facilities for use in other oil and gas operations, including reinjection into oil-bearing formations in the form of steam or water to mobilize hydrocarbon deposits. Enhanced oil recovery (EOR) is a production technique used to increase the mobility of oil, most commonly through steam injection techniques that reduce the viscosity of the hydrocarbons and allow produced fluids to flow. There are three major types of EOR operations: thermal (steam-flood, cyclic steam, and in-situ combustion); carbon dioxide or other gas (miscible and immiscible); and chemical/polymer flooding (alkaline flooding or micellar-polymer flooding). Steam flooding involves injecting a continuous rate of steam into the reservoir through dedicated wells (steam injectors) to heat heavier oil to the point it can flow to the wellbore (producers). Cyclic steam involves intermittent injection of steam through producing wells. Water flooding is the process of injecting water into the reservoir via an injection well for the purposes of "sweeping" the hydrocarbons to a nearby production well where they can be recovered to the surface.

Produced water used for EOR purposes, particularly in the form of steam, is often subject to treatment in oilfield facilities to reduce certain constituent levels, such as calcium or magnesium, and to "soften" or reduce the hardness of the produced water prior to heating. Produced water is also used for well maintenance activities, including use of coil tubing spooled into a wellbore, dust control, and surface facility construction. About 89,000 AF of produced water was reinjected into oil-bearing formations for EOR or used for maintenance and construction purposes in the Project Area during 2012 (Table 4.9-1).

In addition, produced water is treated and conveyed to water districts and blended for irrigation purposes. About 32,771 AFY of treated produced water from wellfields in the Eastern Subarea was supplied to and reused for agricultural irrigation by the Cawelo Water District in 2012. The produced water is treated by oilfield facilities to remove residual hydrocarbons and certain other constituents, and is mixed with other district water supplies to reduce the total dissolved solid (TDS) or salt concentrations prior to irrigation use.

Produced water that is not reused for oilfield operations, including EOR, maintenance, or construction, or that is not treated and supplied to other users for agricultural irrigation, is disposed by oilfield operators in surface impoundments (ponds) in accordance with Waste Discharge Requirements (WDRs) issued by the Central Valley Regional Water Quality Control Board or is injected into Class II injection wells (discussed in more detail below) permitted by the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR). About 30,223 AF of produced water was disposed into surface ponds and 84,500 AF of produced water was disposed by injection into Class II wells in the Project Area during 2012 (Table 4.9-1).

Certain oil and gas exploration and production activities require the use of higher-quality water supplies than can typically be obtained from produced water sources. Water for these activities comes from a variety of sources, including groundwater and imported or other surface water that could also be used for agricultural or municipal and industrial (M&I) purposes. These activities include supplemental steam generation for EOR use, drilling and cementing processes for new well construction, well stimulation treatments, and well maintenance and abandonment. Water sources (other than produced water) that are used for oil and gas exploration and production in the Project Area are referred to as "M&I water" in this EIR.

In 2012, about 8,778 AF of M&I water was used for oil and gas exploration and production in the Project Area. Most of these supplies were used for new well construction, well stimulation treatments, and supplemental EOR steam generation (Table 4.9-1). As discussed in Section 4.17, Utilities and Service Systems, oil and gas producers obtain M&I water from a variety of sources that vary from year to year, including private groundwater wells owned by oil and gas operators, Project Area water districts that have contracted to supply certain oil and gas operators with M&I or similar quality water, or by spot purchases from Project Area water users on an as-needed and as-available basis.

Table 4.9-1 summarizes the primary sources of oil and gas exploration and production water supply and water use in the Project Area during 2012.

Table 4.9-1 shows that total oil and gas production and exploration water demand in the Project Area during 2012 was about 97,590 AF, including 88,812 AF of produced water that was used for EOR and coil tubing, dust control, and surface facility construction purposes, and 8,778 AF of M&I water that was used for new well construction, well stimulation treatments, supplemental EOR steam generation, maintenance, abandonment, and oilfield domestic and sanitary water uses. Produced water accounted for about 91% and M&I water accounted for 9% of total oil and gas production and exploration demand in 2012. About 114,794 AF of produced water was disposed

of as waste in the Project Area during 2012, of which 74% (84,571 AF) was injected into Class II injection wells and 26% (30,223 AF) was discharged into percolation or evaporation ponds. About 32,771 AF of produced water generated primarily from the Kern River and adjacent oilfields in the Eastern Subarea was treated, blended with other water supplies, and used by the Cawelo Water District for agricultural irrigation in 2012.

Project Subarea Overview

This section summarizes the primary sources of oil and gas exploration and production water supply and water use and disposal in each of the three Project Subareas during 2012.

Western Subarea

Table 4.9-2 summarizes the primary sources of oil and gas exploration and production water supply and water use and disposal in the Western Subarea during 2012.

Table 4.9-2: Western Subarea 2012 Oil and Gas Exploration and Production Water Supply and Demand

All values subject to rounding and may vary slightly from Table 28.

Table 4.9-2 shows that total oil and gas production and exploration water demand in the Western Subarea during 2012 was about 83,776 AF, including 75,419 AF of produced water reused for EOR and coil tubing, dust control, and surface facility construction purposes and 8,358 AF of M&I water for new well construction, well stimulation treatments, supplemental EOR steam generation, maintenance, abandonment, and oilfield domestic and sanitary water uses. Produced water accounted for about 90% and M&I water accounted for 10% of total oil and gas production and exploration demand in the Western Subarea during 2012. About 53,432 AF of produced water was disposed as waste in the Western Subarea during 2012, of which 76% (40,482 AF) was injected into Class II injection wells and 24% (12,950 AF) was disposed into percolation or evaporation ponds. No treated produced water was used for agricultural irrigation in the Western Subarea.

Central Subarea

Table 4.9-3 summarizes the primary sources of oil and gas exploration and production water supply and water use and disposal in the Central Subarea during 2012.

Notes:
Includes a water balance closure factor for the net difference between estimated water inputs and outputs of -294 AF.
All values subject to rounding and may vary slightly from Table 28.

Table 4.9-3 shows that total oil and gas production and exploration water demand in the Central Subarea during 2012 was about 883 AF, including 820 AF of produced water reused for EOR and coil tubing, dust control, and surface facility construction purposes, and 63 AF of M&I water for new well construction, well stimulation treatments, maintenance, abandonment, and oilfield domestic and sanitary water uses. Produced water accounted for about 93% and M&I water accounted for 7% of total oil and gas production and exploration demand in the Central Subarea during 2012. About 2,359 AF of produced water was disposed as waste in the Central Subarea Area during 2012, of which 92% (2,170 AF) was injected into Class II injection wells and 8% (189 AF) was disposed into percolation or evaporation ponds. No treated produced water was used for agricultural irrigation in the Central Subarea.

Eastern Subarea

Table 4.9-4 summarizes the primary sources of oil and gas exploration and production water supply and water use and disposal in the Central Subarea during 2012.

Table 4.9-4: Eastern Subarea 2012 Oil and Gas Exploration and Production Water Supply and Demand

Source: Appendix T (WSA), Table 28
Notes:
Includes a water balance closure factor for the net difference between estimated water inputs and outputs of -3,613 AF
All values subject to rounding and may vary slightly from Table 28.

Table 4.9-4 shows that total oil and gas production and exploration water demand in the Eastern Subarea during 2012 was about 12,931 AF, including 12,574 AF of produced water reused for EOR and coil tubing, dust control, and surface facility construction purposes, and 357 AF of M&I water for new well construction, well stimulation treatments, maintenance, abandonment, and oilfield domestic and sanitary water uses. Produced water accounted for about 97% and M&I water accounted for 3% of total oil and gas production and exploration demand in the Eastern Subarea during 2012. About 59,003 AF of produced water was disposed as waste in the Eastern Subarea Area during 2012, of which 71% (41,919 AF) was injected into Class II injection wells, and 29% (17,084 AF) was disposed into percolation or evaporation ponds. About 32,771 AF of treated produced water was used for agricultural irrigation in the Eastern Subarea by the Cawelo Water District, representing about 72% of the total amount of produced water recycled in the Eastern Subarea.

Well Stimulation

Well stimulation treatments (including hydraulic fracturing, acid fracturing, and acid matrix stimulation) enhance oil and gas production or recovery by increasing the permeability of the geologic formation where hydrocarbons occur (California Code of Regulations [CCR] Section 1761(a)). Well stimulation treatments do not include routine well cleanout work, routine maintenance, routine removal of formation damage due to drilling, bottom hole pressure surveys, or routine activities that do not affect the integrity of the well or the formation. The well stimulation treatments fracture or chemically alter a geologic formation so that hydrocarbon deposits collect and concentrate for extraction. A single well may be subject to more than one stimulation treatment depending on the underlying formation and hydrocarbon deposit. Well stimulation treatments are subject to interim regulations under state law (Senate Bill [SB] -4) through June 2015 and will be subject to final regulations adopted by the state that become effective in July 2015. Well stimulation treatments subject to the interim and final state regulations include hydraulic fracturing, acid matrix stimulation, and acid fracturing. The use of acid for routine well cleanout, maintenance, and removal of formation damage is not regulated as a form of well stimulation under state law. Well stimulation may be conducted within new wells or during the reworking of an existing well to improve performance.

Hydraulic fracturing (also known as hydrofracturing, "fracking," or "fracing") is the injection of a mixture of water, chemicals, and substances (primarily silica sand) called "proppants" into a well at pressures greater than the fracturing pressure of the oil-bearing formation. Hydraulic fracturing causes microscopic fractures to propagate away from the well boring and increases the surface area of the geologic formation that is connected with the well. Proppants are deposited into the fractures during the stimulation process to ensure that the fractures remain open and collect oil or gas. Oil or natural gas flows through the fractures to the well for surface recovery (DOGGR 2013). As discussed below, the average fracturing operation in California uses about 0.38 AF of water compared with much greater amounts of water used in many other parts of the country. California operations require smaller volumes of water because operators in this state fracture in relatively shallow vertical wells (usually less than 2,000 feet deep), with shorter treatment intervals than the horizontal wells that are more common elsewhere. Hydraulic fracturing also uses cross-linked gels in California compared to less viscous gels and slick-water in other parts of

the country that require a greater volume of water to complete the fracturing process (CCST 2015).

Acid fracturing and acid matrix stimulation inject acid into the oil-bearing formation to increase permeability. An acid fracturing treatment involves pumping fluids into a well to enhance the flow and production of oil or gas by dissolving carbonate reservoir rock along existing fractures, thereby increasing permeability and fluid flow. An acid matrix stimulation involves pumping fluids into a siliciclastic reservoir formation utilizing the chemical properties of the pumped fluids to increase the permeability of the reservoir near the well. Increasing permeability in the reservoir increases the flow and production of oil and gas. The primary mechanism responsible for increasing permeability as a result of acid matrix stimulation is the dissolution of drilling mud in the pores of the reservoir near the well. Acid matrix stimulation is utilized in some oilfields in the Project Area on a limited basis (CCST 2014).

California's SB-4 well stimulation regulations require that all oil and gas well operators file notices with DOGGR and provide notice to neighboring landowners at least 30 days before a stimulation treatment is conducted. Within 60 days after a well stimulation treatment is completed, a disclosure must also be filed with DOGGR identifying the source, volume and composition, and disposition of well stimulation fluids, including, but not limited to, hydraulic fracturing fluids, acid well stimulation fluids, and flowback fluids. As of March 24, 2015, 1,367 notices of proposed well stimulation treatments and 673 disclosures for completed treatments were available on the online DOGGR database maintained under the new state regulations. As shown on Figure 4.9-8, almost all of the stimulation notices and treatment disclosures were located in the Western Subarea, except for 23 notices with disclosures in the Rose field, five notices in the Shafter North field, and one notice with one disclosure in the Stockdale field. The Rose, Schafter North, and Stockdale fields are located in the Central Subarea. No well stimulation notices or disclosures were filed for the Eastern Subarea.

In February 2015, the California Council on Science and Technology (CCST) published the first volume of a three-volume analysis of well stimulation activity and potential impacts in California (CCST 2015), as required by newly adopted California well stimulation laws and regulations. Appendix T of the CCST study summarized available information for 1,986 well stimulation notices and disclosures that occurred in the Project Area (DOGGR District 4) from March 2011 to May 2014. As shown in Table 4.9-5, during this period, hydraulic fracturing accounted for 1,687 well stimulation treatments, acid matrix treatments were used in 295 wells, and acid fracturing was used in four wells.

Table 4.9-5: Summary of Well Stimulation Information Compiled by CCST for Project Area, March 2011-May 2014

	Number of Treatments	Average Water Use per Treatment (AF)
Hydraulic Fracturing	1,687	0.40
Acid Matrix	295	0.24
Acid Fracturing	4	0.14
TOTAL	**1,986**	**0.38**

Source: CCST 2015, Appendix T

The CCST data also indicate that the average well stimulation treatment in the Project Area used about 0.38 AF (122,130 gallons) of water. Hydraulic fracturing treatments generally used more water (0.4 AF on average) than acid matrix or acid fracturing treatments (0.24 to 0.14 AF on average). About 744 AF of water was used in the Project Area for all well stimulation activities over March 2011 to May 2014, an average of less than 250 AFY. These estimates are consistent with statewide well stimulation data compiled by DOGGR for the period January to September 2014, which indicate that 433 treatments used 123.34 AF of water, an average of about 0.29 AF per treatment. The DOGGR data also estimated that 66% of the statewide well stimulation treatment water supply during January to September 2014 was obtained from surface water sources, including imported supplies, 25% was obtained from groundwater wells, and about 9% was obtained by reusing produced water (DOGGR 2015a, Table 10.14-7).

Kern County completed a study in June of 2015 with the following objectives:

- Identify differences in the most prominent plays across the nation,
- Identify the subsequent drilling and stimulation techniques that would apply to wells being drilled in Kern County as compared to those in other shale plays and conventional oil and gas operations conducted across the nations, and
- Highlight the differences between them.

The study is attached as Appendix U. Three general areas of impact (water quality, seismic, and radiological impacts) were examined in the study. One key factor identified in the study was that drilling in Kern County that is associated with hydraulic fracturing is vertical (or follows conventional methods). In the majority of other oil and gas fields in the Country where hydraulic fracturing takes place, the method is associated with horizontal drilling or unconventional methods. Horizontal drilling presents more vulnerabilities in drilling and well construction for a variety of reasons including the potential of intersecting existing fractures and faults that could serve as unintended fluid or gas pathways.

Water quality impacts, although limited in scope, have been identified associated with unconventional gas development in the Marcellus and Barnett Shales. Limited, detailed

investigation appears to associate impacts with well issues rather than through hydraulic fracturing, itself. Although characteristics of these plays vary with respect to the Monterey Shale and conventional oil and gas plays in Kern County it appears well construction may be a more important factor for potential impacts to water quality.

Other comparisons that speak to the likelihood of water quality impacts can be made between the Kern County plays and the Marcellus and Barnett Shales. The following bullets are categorized into factors that are more protective of water quality in the Kern County plays versus those that are less protective:

Comparison of factors influencing potential for water quality impacts:

- Distance between source shale and base of fresh water aquifer is greater in Kern County than in the Marcellus and Barnett Shale plays.
- Both oil and gas are being produced in Kern County. The Marcellus and Barnett Shales produce gas only, which is more mobile than oil.
- Significantly less water is used in conventional drilling and production in Kern County than in the Marcellus and Barnett Shales.

Several studies by a variety of authors indicate that induced-seismic events are more commonly associated with wastewater disposal/injection than with hydraulic fracturing. In addition, induced-seismic events appear to be more common when wastewater is injected into bedrock rather than in sedimentary formations with higher porosities and permeabilities. In California, wastewater disposal/injection is in sedimentary formations and, unlike other parts of the United States, increased induced-seismicity has not been observed with hydraulic fracturing and other unconventional drilling methods.

The development of unconventional natural gas in the Marcellus Shale in Pennsylvania was found to have the potential to exacerbate several pathways for entry of radon into buildings. The U.S. Geological Survey (USGS) reported 91,020 Becquerels per cubic meter (Bq/^{m3}) as the median radium concentration in produced water from Marcellus wells (Rowan et al. 2011), which is nearly 500 times the federal drinking water limit (185 Bq/m^3) and exceeds the industrial discharge limit of 2,220 Bq/m^3. Radon can collect in porous geological formations as well as in natural gas production wells (Gogolak 1980). Shales tend to contain higher concentrations of uranium (3.7-40 parts per million [ppm]) than other geologic formations. Natural gas production wells completed in shales would therefore be expected to have higher concentrations of radon in their natural gas (Gogolak 1980). This phenomenon was reported by USGS in preliminary data from 11 wellheads in Pennsylvania ranging from 37 to 2,923 Bq/m3 (Rowan and Kraemer 2012), which suggests that shale gas may have higher radon levels than other natural gas sources (Casey et al. 2015).

In Kern County, the DOGGR surveyed various oil and gas facilities for Naturally Occurring Radioactive Material (NORM) in 1994. In its 1996 report, DOGGR made the following conclusions:

- Facilities with radiation levels greater than 15 picocuries per gram (pCi/g) should be evaluated to determine if protective measures are necessary to control the ingestion or inhalation of NORM by workers;
- Simple protective measures should be taken, where necessary, to minimize exposures and keep exposures as low as reasonably achievable;
- In gas processing facilities where separation of the more volatile fractions occur, personnel should not remain for long periods near the propanizer reflux pumps while those pumps are in operation; and
- American Petroleum Institute Bulletin E2, Bulletin on Management of Naturally Occurring Radioactive Materials in Oil and Gas Production, should be adhered to by all operators, as necessary, and used as the primary guidance document. However, the appropriate State agency should be contacted before any disposal of NORM occurs.

The DOGGR found in its study of NORM that radiation readings exceeding 15 pCi/g (requiring further evaluation) were noted in District 4, which includes Kern County. Radium isotopes were detected at concentrations up to 1,182 pCi/g with the elevated results detected in pipe scale, soil, and spent resin (CA DOC 1996).

Surface Water and Groundwater Quality

This section summarizes available information concerning existing surface water and groundwater quality and the effects of historical oil and gas exploration and production in the Project Area. As will be discussed in Section 4.9.3, Regulatory Setting, surface water and groundwater quality is subject to regulation under several federal, state, County, and local laws, regulations, and programs. Certain regulatory programs utilize different criteria to define "fresh" water supplies or "drinking water." Not all water that is identified as "fresh" water in certain regulatory contexts is suitable for use as drinking water. The federal Safe Drinking Water Act (SDWA) defines a groundwater aquifer with TDS concentrations of up to 10,000 milligrams per liter (mg/L) or ppm as an "underground source of drinking water" (USDW). The identification of the depth to the base of "fresh" water in many DOGGR summaries of active oilfields typically refers to groundwater with a TDS level of up to 3,000 mg/L. However, almost no drinking water supplied to urban consumers in California contains TDS levels above 500 mg/L, the secondary (recommended, but not mandatory) maximum contaminant level (MCL) applicable to drinking water under state and federal law. Water supplies with TDS levels significantly above 1,000 mg/L are also less commonly used for most non-potable and agricultural irrigation in the Project Area because of the risk that dissolved ions, commonly called "salts" in high TDS water, will accumulate in and degrade the productivity of agricultural topsoils.

USGS conducts periodic analyses of Project Area water quality in conjunction with state agencies and generally defines water quality in terms of the relative amount of TDS, or salt compounds. The USGS classifies water supplies as follows (USGS 2015):

- Fresh water as a supply with up to 1,000 ppm TDS;
- Slightly saline water as a supply with 1,000 ppm to 3,000 ppm TDS;
- Moderately saline water as a supply with 3,000 ppm to 10,000 ppm TDS; and
- Highly saline water as having 10,000 ppm to 35,000 ppm TDS.

In 1998, DOGGR conducted a study of potential oil and gas activity groundwater impacts that utilized a 1962 federal classification of water quality by use. As summarized in the study, "Class I" surface and subsurface waters are considered usable for all domestic and agricultural purposes and have TDS levels below 700 mg/L. "Class 2" waters are considered unfit for human consumption, possibly harmful to some crops, and have TDS levels ranging from 700 to 2,000 mg/L. "Class 3" surface and subsurface waters contain chemical concentrations that are unfit for human consumption and almost all crop use, and have TDS levels above 2,000 mg/L (DOGGR 1998). Seawater generally has a TDS content of 35,000 mg/L. Based on the USGS and DOGGR classifications, the 10,000 mg/L TDS criterion for identifying a potential USDW under the federal SDWA represents a conservative threshold that is within the range of "moderate" to "highly" saline water and could contain TDS at levels up to 20 times higher than the applicable secondary drinking water MCL. Significant treatment, potentially similar to industrial-scale water desalination facilities, would be required before water with TDS levels near 10,000 mg/L could be used for potable or most non-potable irrigation purposes.

The California SWRCB sets statewide policies for the protection of surface water and groundwater quality under federal and state laws that are implemented in specific regions of the state by nine Regional Water Quality Control Boards (RWQCBs) through the adoption and enforcement of water quality control plans, commonly called "basin plans" (CVRWQCB 2004). The Central Valley Regional Water Quality Control Board (CVRWQCB) regulates water quality in the Project Area under the Tulare Lake Basin Water Quality Control Plan (Tulare Lake Basin Plan or Basin Plan). The Tulare Lake Basin Plan designates existing and potential beneficial uses for surface waters and groundwater in the plan area, including municipal (drinking), agricultural, industrial, recreational, and fish and wildlife uses. A list of the beneficial use designations, and the acronyms that identify these uses in the Tulare Lake Basin Plan is provided in Table 4.9-6.

Table 4.9-6: Tulare Lake Basin Plan Beneficial Use Summary

Abbreviation	Name	Description
MUN	Municipal and Domestic Supply	Uses of water for community, military, or individual water supply systems including drinking water supply
AGR	Agricultural Supply	Uses of water for farming, horticulture, or ranching, including, but not limited to, irrigation, stock watering, or support of vegetation for range grazing
IND	Industrial Service Supply	Uses of water for industrial activities that do not depend primarily on water quality, including mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, and oil well repressurization
PRO	Industrial Process Supply	Uses of water for industrial activities that depend primarily on water quality
POW	Hydropower Generation	Uses of water for hydropower generation
REC-1	Water Contact Recreation	Uses of water for recreational activities involving body contact with water where ingestion of water is reasonably possible, including swimming, wading, water-skiing, skin and scuba diving, surfing, white-water activities, fishing, and use of natural hot springs
REC-2	Non-Contact Water Recreation	Uses of water for recreational activities involving proximity to water but where there is generally no body contact with water or any likelihood of ingestion of water, including picnicking, sunbathing, hiking, beachcombing, camping, boating, tide pool and marine life study, hunting, sightseeing, and aesthetic enjoyment in conjunction with the above activities
WARM	Warm Freshwater Habitat	Includes support for reproduction and early development of warm water fish
COLD	Cold Freshwater Habitat	Uses of water that support cold water ecosystems, including preservation or enhancement of aquatic habitats, vegetation, fish, and wildlife, including invertebrates
WILD	Wildlife Habitat	Uses of water that support terrestrial or wetland ecosystems, including preservation and enhancement of terrestrial habitats or wetlands, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), and wildlife water and food sources
RARE	Rare, Threatened, or Endangered Species	Uses of water that support aquatic habitats necessary, at least in part, for the survival and successful maintenance of plant and animal species established under state or federal law as rare, threatened, or endangered
SPWN	Spawning, Reproduction, and/or Early Development	Uses of water that support high quality aquatic habitats suitable for reproduction and early development of fish (limited to cold water fisheries)

Table 4.9-6: Tulare Lake Basin Plan Beneficial Use Summary

Abbreviation	Name	Description
GWR	Ground Water Recharge	Uses of water for natural or artificial recharge of groundwater for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers
FRSH	Freshwater Replenishment	Uses of water for natural or artificial maintenance of surface water quantity or quality

Source: CVRWQCB 2004

The Basin Plan also identifies applicable numerical and narrative water quality objectives that are necessary to protect each designated beneficial use and implementation programs that will achieve the applicable objectives. Commonly regulated constituents in the Tulare Lake Basin Plan include ammonia, oil and grease, salinity, suspended materials, and turbidity. The Tulare Lake Basin Plan incorporates state and federal anti-degradation policies, which require that whenever the existing quality of surface water or groundwater is higher than applicable objectives, existing water quality levels must be maintained unless it has been demonstrated that the change in water quality is consistent with the maximum benefit to the people of the state, will not unreasonably affect present and anticipated beneficial use of the water, and will not cause the water to exceed applicable water quality objectives (SWRCB Resolution No. 68-16 1968). Discharges that would reduce water quality must be specifically permitted by the CVRWQCB through the issuance of WDRs (CVRWQCB 2004).

The Tulare Lake Basin Plan identifies several watershed drainage areas, or hydrologic units that contain streams, ephemeral drainages and other surface waters in the Project Area. As shown on Figure 4.9-9, streams in the eastern Subarea are generally within hydrologic units 554 and 555. Western Subarea streams are included in hydrologic units 556 and 559, and valley floor waters, including surface water in the central Subarea, are located in hydrologic units 557 and 558.

The designated beneficial uses for surface waters in each hydrologic unit in the Project Area are summarized in Table 4.9-7. Several surface waters have been designated for more than one beneficial use.

Groundwater beneficial uses are designated in the Tulare Lake Basin Plan for detailed analysis units (DAUs), which are subunits that have been identified within the overall region. The locations of the DAUs as mapped by the CVRWQCB within the Project Area are shown on Figure 4.9-10.

The designated beneficial uses for each DAU groundwater unit in the Basin Plan are summarized in Table 4.9-8. Groundwater in several areas has been designated for more than one beneficial use.

Consistent with state drinking water policy (SWRCB 1988), the Tulare Lake Basin Plan designates all groundwater within the Project Area for municipal (MUN) beneficial use, subject

to the potential removal of, or exception to this designation in specific locations by means of a formal Basin Plan amendment process. The CVRWQCB considers the following criteria for making exceptions to the groundwater MUN beneficial use designation: (1) TDS levels in an aquifer must exceed 3,000 mg/L (or an equivalent measure of electrical conductivity) and the aquifer cannot be reasonably expected to supply a public water system; (2) there is contamination, either by natural processes or by human activity (unrelated to a specific pollution incident), that cannot reasonably be treated for domestic use using either best management practices (BMPs) or best economically achievable treatment practices; (3) the water source cannot provide sufficient water to supply a single well capable of producing an average, sustained yield of 200 gallons per day; or (4) the aquifer is regulated as a geothermal energy producing source or has been exempted administratively pursuant to the federal underground injection control (UIC) program for the production of hydrocarbon or geothermal energy, provided that injected fluids do not constitute a hazardous waste. Figure 4.9-11 shows approved groundwater beneficial use aquifer exemptions.

Notes:

[a] Ground water contained in the lower Transition Zone and Santa Margarita formation within 3,000 feet of the Kern Oil and Refining Company proposed injection wells in Section 25, T30S, R28E, MDB&M, is not suitable, or potentially suitable, for municipal or domestic supply (MUN).

[b] Ground water contained in the basal Etchegoin formation, Chanac formation, and Santa Margarita formation within, and extending to one-quarter mile outside the administrative boundary of the Fruitvale Oil Field, as defined by the State of California, Department of Conservation, Division of Oil and Gas in *Application for Primacy in the Regulation of Class II Injection Wells Under Section 1425 of the Safe Drinking Water Act*, dated April 1981, is not suitable, or potentially suitable, for municipal or domestic supply (MUN). However, the upper ground water zone (ground water to a depth of 3,000 feet) retains the MUN beneficial use.

[c] Ground water and spring water within 0.5-mile radius of the McKittrick Waste Treatment (formerly Liquid Waste Management) site in Section 29, T30S, R22E, MDB&M, have no beneficial uses.

[d] Ground water in the San Joaquin, Etchegoin, and Jacalitos formations within 0.5 mile of existing surface impoundments P-1, P-2, P-3, P-4, P-4 1/2, P-5, P-6, P-7, P-8, P-9, P-10, P-11, P-12/12A, P-13, P-14, P-15, P-16, P-17, P-18, P- 19, and P-20, and proposed surface impoundments P-21, P-24, P-25, P-27, P-28, and P-29 at the Kettleman Hills Facility (Sections 33 and 34, T22S, R18E, and Section 3, T23S, R18E, MDB&M) of Chemical Waste Management is not a municipal or domestic supply (MUN).

Key:
DAU = detailed analysis unit.

The SWRCB has adopted a "sources of drinking water" policy that states that all ground and surface waters of the state are considered suitable or potentially suitable for municipal or domestic water supply and should be so designated by each RWQCB, subject to certain exceptions. One exception listed in the policy includes an aquifer that "is regulated as a geothermal energy producing source or has been exempted administratively pursuant to 40 Code of Federal Regulations (CFR), Section 146.4 for the purpose of underground injection of fluids associated with the production of hydrocarbon or geothermal energy, provided that these fluids do not constitute a hazardous waste under 40 CFR 261.3" (SWRCB Resolution No. 88-63 [1988], as amended by Resolution No. 2006-0008 [2006]). As discussed below, state and federal agencies are currently updating the status of aquifer exemptions in the Project Area. Figure 4-9.11 identifies the locations in the Project Area where the groundwater MUN beneficial use has been removed by the CVRWQCB in the Basin Plan.

The Tulare Lake Basin Plan identifies waters that are not attaining applicable water quality standards, or impaired waters, after technology-based limits and the best available technology used for pollutant management have been implemented in accordance with Section 303(d) of the Clean Water Act (CWA). There are no impaired water bodies listed under Section 303(d) of the CWA in the Project Area.

Surface water resources in the Project Area primarily consist of rainfall and snowmelt flows in natural streams and watercourses, generally originating from the eastern side of the Tulare Lake Hydrologic Basin and springs and upland watersheds in the Sierra Nevada range, and imported water delivered to the region through the SWP and federal CVP water recovery and conveyance facilities. Ephemeral watercourses are located in the western portion of the Project Area and carry water for brief periods only during significant storm events. The distribution of surface waters within the Project Area is discussed in more detail in Section 4.4, Biological Resources, and is shown on Figure 4.4-3. The SWP and CVP systems are discussed in more detail in Section 4.17, Utilities and Service Systems. As shown in Table 4.9-1, in 2012, oil and gas production utilized about 8,358 AFY of M&I water in addition to 234,959 AF of produced water. In an average year, urban water demand is about 235,000 AFY, and agricultural demand is about 2.67 million AFY in the Project Area. The amount of Project Area surface water supplies that are used for oil and gas exploration and production varies from year to year in accordance with hydrologic conditions. In drier years, groundwater is used to a greater extent than surface supplies (see Section 4.17, Utilities and Service Systems).

In June 2015, U.S. Environmental Protection Agency (EPA) released a public review draft of a study titled Assessment of the Potential Impacts of Hydraulic Fracturing for Oil and Gas on Drinking Water Resources (EPA 2015a). The study is a public review draft and may be modified in response to public review comments.

The EPA study, focused on potential impacts to drinking water resources that could occur from the following above-ground and underground potential mechanisms associated with the hydraulic fracturing process or cycle: :

- Water withdrawals at times or in locations of low water availability;

- Spills of hydraulic fracturing fluid, chemicals, or produced water;
- Inadequate treatment and discharge of hydraulic fracturing wastewater;
- Movement of liquids and gases via the production well into underground drinking water resources; and
- Movement of liquids and gases from the fracture zone to underground drinking water resources via pathways in subsurface rock formations.

The study did not find evidence that these potential mechanisms have led to widespread, systemic drinking water impacts. The number of cases where drinking water resources were impacted was found to be small in relation to the number of hydraulically fractured oil and gas wells. The EPA study noted that this result could reflect the rarity of hydraulic fracturing effects on drinking water or may be an underestimate of these effects due to several limiting factors. Potentially limiting factors could include insufficient pre- and post-hydraulic fracturing water quality data, other causes of contamination, the short duration of existing studies, and inaccessible information related to hydraulic fracturing activities. As a result, while the study determined that hydraulic fracturing has not led to systemic and widespread drinking water impacts in the United States, information on the identity, frequency of use, physiochemical, and toxicological properties of the chemicals associated with the hydraulic fracturing water cycle is not complete, which limits the understanding of potential impacts (EPA 2015a).

Surface Water Quality Data

Surface water quality data for the Project Area and each Subarea was obtained by identifying available analysis results for current and historical river, creek and stream sampling locations maintained by the state Surface Water Ambient Monitoring Program (SWAMP), the state Irrigated Lands Regulatory Program (ILRP) (SWRCB 2012), the California Environmental Data Exchange Network (SWRCB 2012), the USGS National Water Information System (NWIS) (USGS 2014), and the EPA Storage and Retrieval (STORET) Legacy Data Center (EPA 2014). Sampling data from agricultural canals or tile drains was not utilized because constructed facilities used in crop production are not representative of natural water quality conditions in the Project Area. The locations of the water sampling sites that were used in the surface water quality analysis are shown on Figure 4.9-12.

The extent of the available surface water quality data and coverage varies for each Project Subarea. There are 15 unique and 17 total sampling sites in the Eastern Subarea, and current water quality data are available for six of these locations. The remaining sampling sites are no longer in use, and historical data for these locations were obtained from the EPA STORET database. There are two unique and three total surface water sampling stations in the Central Subarea. Eleven surface water quality sample sites were identified in the Western Subarea, but none is currently in operation and historical data for these locations were obtained from the EPA STORET database.

Tables 4.9-9 and 4.9-10 summarize water quality data for the Kern River at four locations during 2004 through 2006 and for Deer Creek, Poso Creek, and El Paso Creek at four locations during 2009 through 2012.

Table 4.9-11 summarizes water quality data available during 2002 through 2012, and Table 4.9-12 summarizes historical water quality data from samples taken during 1951 through 1991 for each of the Project Subareas. Surface water quality data for the Western Subarea are not available after 1991, and information for the Western Subarea is not included in Table 4.9-11.

Stream, river and creek data for the period 2002 to 2012 (Tables 4.9-9 to 4.9-11) do not indicate significant differences between the Central and Eastern Subareas. Surface water results in both Subareas exhibit similar levels of dissolved salts (TDS), hardness, chloride, sodium, and specific conductivity. The data suggest that surface water quality based on TDS levels, specific conductance or hardness is slightly higher in the Eastern Subarea, most likely due to the Subarea's closer proximity to stream and spring flows from the Sierra Nevada. On average, surface waters in the Central and Eastern Subareas have TDS levels below the secondary drinking water MCL of 500 mg/L.

Data from 1951 to 1991 (Table 4.9-12) is generally consistent with more recent surface water quality sampling results, and indicates that surface water quality improves from west to east in the Project Area. As shown in Table 4.9-12, TDS, alkalinity, nitrate, hardness, chloride, sodium, specific conductivity, and boron levels were typically higher in the Western Subarea than in the Central or Eastern Subareas. These results likely reflect the fact that watercourses on the western side of the Project Area flow only during periods of sustained rainfall and traverse through marine rocks and soils that contain salts and other compounds that rapidly dissolve in water. Surface water in the eastern Project Area generally flows more frequently and through granitic channels that do not mobilize constituents to the same extent.

As discussed in Section 4.17, Utilities and Service Systems, the SWP and CVP supply systems import water pumped from the southern edge of the Sacramento Delta and collected in reservoirs located along the western face of the Sierra Nevada range to the Project Area. Water quality data for the CVP system is maintained by the KCWA, the region's primary imported water wholesale supplier. Water quality data for the SWP system is maintained by the DWR. Table 4.9-13 summarizes available water quality data for CVP supplies, and Table 4.9-14 summarizes water quality data for SWP imports in the Project Area.

The sampling results in Table 4.9-13 and 4.9-14 show that SWP and CVP supplies exhibit high levels of water quality. CVP supplies have an average specific conductance (an alternative measure of dissolved inorganic materials and ions) of 210 microSiemens per centimeter (µS/cm) and TDS of 130 mg/L. SWP water has a slightly higher average specific conductance of 460 µS/cm and TDS concentration of 260 mg/L. These levels are below the secondary drinking water MCL for TDS. Other constituents in Project Area imported water are below applicable primary and secondary drinking water MCLs.

Notes:
Avg
[a] Minimum value calculated as the 5th percentile. When one or more result is ND, the minimum is reported as ND.
[b] Maximum value calculated as the 95th percentile.
[c] For Deer Creek at Road 120 and Deer Creek at Road 176, 76 additional pesticides were measured (N = 2 to 9) between 2009 and 2010 and were not detected. For Poso Creek at Zerker Road, 53 additional pesticides were measured (N = 1 to 3) in 2010 and were not detected. No pesticides data is reported for El Paso Creek.
Where "ND", average, median, minimum, and maximum are calculated assuming a value equal to one-half the reporting limit (RL).

Key:
Avg = Average
ILRP = Irrigated Lands Regulatory Program
Med = Median
N = number of results
ND = not detected above the method reporting limit
RWQCB = Regional Water Quality Control Board

Source: Appendix S (SWAMP and ILRP monitoring data available from CEDEN database (SWRCB 2012); KCWA 2011b, 2012, 2013, 2014)
Notes:
Statistics are calculated based on the composite historical results for each monitoring location, e.g., AVERAGE (average alkalinity for Station No. 1, average alkalinity for Station No. 2, etc.), MIN(minimum alkalinity for Station No. 1, minimum alkalinity for Station No. 2), etc.
MPN: Most Probable Number
For calculating statistics, ND is assumed to equal 1/2 RL if known or zero if unknown. Blank cells indicate data is not available.

[a] N is the number of monitoring stations on rivers or creeks in this geographic sub-area that have information on the indicated water quality parameter. In cases where N = 1, the average, median, minimum, and maximum are based on the historic results for the site from multiple sampling events. If N = 1 and there has been only one sampling event at the site, the (single) result is shown in place of the average (with no value for median, min, or max).

[b] Metals concentrations for Kern River reported by KCWA (2011b, 2012, 2013, 2014) are assumed to be dissolved metals except arsenic is assumed to be total arsenic (site located in Central Groundwater Basin sub-area).

Notes:

Statistics are calculated based on the composite historical results for each monitoring location, e.g., average alkalinity for Station No. 1, average alkalinity for Station No. 2, etc.), MIN(minimum alkalinity for Station No. 1, minimum alkalinity for Station No. 2, etc.).

Values of "0.0" are as shown in the data source and likely indicate non-detect (ND). Blank cells indicate data is not available.

[a] N is the number of monitoring stations on rivers or creeks in this geographic sub-area that have information on the indicated water quality parameter. In cases where N = 1, the average, median, minimum, and maximum are based on the historic results for the site from multiple sampling events. If N = 1 and there has been only one sampling event at the site, the (single) result is shown in place of the average (with no value for median, min, or max).

Notes:

[a] Statistics calculated based on four years of reported data. Where "ND", average, median, minimum, and maximum assume a concentration of zero (no reporting limit provided by data source).

[b] Minimum values calculated as 5th percentile. When one or more result is ND, the minimum is reported as ND.

[c] Maximum values calculate as 95th percentile.

[d] N = 4 based on four reports (KCWA 2011b; 2012; 2013; 2014) that each reported a single value for each parameter. The reports did not indicate whether the result was based on multiple measurements.

[e] 35 compounds were measured and were not detected. Complete list available from KCWA (2011b; 2012; 2013; 2014).

[f] 20 compounds were measured and were not detected. Complete list available from KCWA (2011b; 2012; 2013; 2014).

[g] Some parameters listed under above categories are also regulated by the SDWA.

[h] 27 compounds were measured and were not detected. Complete list available from KCWA (2011b; 2012; 2013; 2014). (i) 33 compounds were measured and were not detected. Complete list available from KCWA (2011b; 2012; 2013; 2014).

Key:

MFL = million fibers per liter
mrem/yr = millirems per year
ND = not detected
NTU = nephelometric turbidity units
pCi/L = picocuries per liter
SDWA = Safe Drinking Water Act

Water Quality Parameters	Units	Station Code: KA017226/Kettleman CK-21				
		Average	Median	Min[a]	Max[b]	N

Source: Appendix S from DWR 2014
Notes:
[a] Minimum value calculated as the 5th percentile. When one or more result is ND, the minimum is reported as ND.
[b] Maximum value calculated as the 95th percentile.
[c] Some parameters listed under General Water Quality and Metals are regulated by the SDWA.
[d] Trihalomethanes only.
[e] Results from regulated organics were below reporting limit except 2,4-D and Simazine.
Where "ND", average, median, minimum, and maximum are calculated assuming a value equal to one-half the reporting limit (RL).
Key:
N = number of results
NA = not applicable
ND = not detected above the method reporting limit
SDWA = Safe Drinking Water Act

Although TDS levels in SWP and CVP imported water are relatively low, the Tulare Lake Basin Plan states that the Project Area is a generally closed hydrological basin with little surface and subsurface outflow. As a result, salts contained in imported water remain and accumulate within due to imported water. The Basin Plan indicates that the paramount water quality problem in the Project Area is the accumulation of salts (CVRWQCB 2004).

Surface Water Quality and Existing Oil and Gas Operations

There have been no studies or reports indicating that current oilfield activities significantly affect Project Area surface water quality. Several decades ago, produced water from major Project Area oilfields was discharged into local watercourses, including the Kern River (Christie 1999). Subsequently enacted state and federal laws prohibit the discharge of solid wastes or fluids associated with oil and gas exploration and production into surface waters, except as may be allowed by an applicable permit. A review of publicly available discharge permits issued by the CVRWQCB did not identify any currently applicable permitted direct discharges of produced water or other materials associated with oil and gas exploration or production into Project Area surface waters. In 2007, the CVRWQCB issued waste discharge requirements (WDRs), a form of discharge permit under state law, for the discharge of up to 1.68 million gallons per day of treated produced water into an ephemeral tributary of Poso Creek. The permit was rescinded in 2013, and the produced water is now injected into wells regulated under the UIC program for EOR purposes or disposal (CVRWQCB 2013c, Order R5-2013-0087).

As discussed in Section 4.9.3, Regulatory Setting, to address chronic water supply concerns in arid portions of the country, regulations adopted under the federal CWA allow produced water that meets specified criteria to be used for agricultural or wildlife propagation purposes in onshore locations west of the 98th meridian (which extends through central Texas, Oklahoma, Nebraska, Kansas, and North and South Dakota east of the Rock Mountains). In 2007, the CVRWQCB issued WDRs for the delivery and blending of treated produced water to the Cawelo Water District in the eastern project Subarea for agricultural irrigation. The 2007 WDRs allowed for the discharge of the blended and treated produced water into certain canals and reservoirs

regulated by the CVRWQCB, and also for discharge into the Poso Creek system when supplies exceeded irrigation demand. In 2011, the CVRWQCB determined that the blended produced water discharges into the Poso Creek system exceeded applicable WDR arsenic concentration limits (CVRWQCB Order R5-2011-0900). In response, discharges of blended produced water to the Poso Creek system were eliminated by routing any excess supplies by pipeline to percolation ponds managed by the Famoso Groundwater Banking Project. In 2012, the CVRWQCB issued revised WDRs for the use of the Famoso facilities and determined that arsenic in the blended produced water would be retained in the soil surfaces of the percolation facility, and would not change or degrade groundwater quality (CVRWQCB Order R5-2012-0058).

Produced water is not currently used for agriculture or wildlife propagation in the Western or Central portions of the Project Area. The Kern-Tulare Water District has proposed to use 8,000 AF per year of treated produced water in the Western Subarea. A California Environmental Quality Act (CEQA) notice of preparation (NOP) for an EIR that will address potential environmental impacts related to the proposed produced water use was published in 2015 (SCH Number: 2015021024) (CEQAnet.ca.gov).The EIR will be prepared by the district. Additional use of treated produced water has been considered, but has not yet been formally proposed, in other Project Area locations, partially in response to the prolonged drought that has affected California and other portions of the western United States.

Well installation, drilling and related construction activities can result in the discharge of drilling mud and fluids to land surfaces around and adjacent to a well if the construction does not utilize a closed-loop system that captures and recirculates muds and fluids in portable storage tanks. Drilling muds and fluids in other construction operations are typically impounded in unlined, shallow ponds constructed adjacent to a well. Several constituents are used during the drilling process for lubrication, well stability, and mud evacuation, among other purposes. Table 4.9-15 lists the common chemicals used in Project Area oil and during gas well drilling operations.

Table 4.9-15: Chemicals Commonly Used in Drilling Fluid in Project Area

Ingredients[a]	
Water	Marble White
Asphsol Supreme	MDC
Barite	MI Gel
Calcium Carbonates	MI Wate
CF Desco II	Mix II F, M, C
Citric Acid	PolyPac

Note:
[a] As reported by Chevron USA

For several years, the CVRWQCB included oil and gas well drilling discharges as one of several Project Area activities that were considered to pose a low threat to water quality and for which requirements to file a report of waste discharge were waived. In 2013, the CVRWQCB declined to extend the waiver for the discharge of oil and gas-related drilling muds and fluids (CVRWQCB Resolution R5-2013-0145). In response, oil and gas well construction in the Project Area either utilize closed-loop systems that avoid any discharge of drilling muds and fluids, or obtain regulatory coverage under SWRCB General Order 2003-0003-DWQ, which addresses low-threat discharges to land (SWRCB 2003). The SWRCB maintains a list of Project Area and other oil and gas operators enrolled under General Order 2003-0003-DWQ (SWRCB 2015a). DOGGR maintains online copies of the CEQA documentation for oil and gas well permits approved since 2010 that include closed loop drilling systems for several well construction projects in the Project Area (DOGGR 2015b).

The SWRCB has adopted a statewide General National Pollutant Discharge Elimination System (NPDES) Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (the General Construction General Permit) (WQ Order No. 2009-0009–DWQ, as modified by 2010-0014-DWQ and 2012-006-DWQ) and a statewide General NPDES Permit for Storm Water Discharges Associated with Industrial Activities (Industrial General Permit) (Order 97-03-DWQ, expiring June 30, 2015, and Order 2014-0057-DWQ [effective July 1, 2015]). Where applicable, the Construction General Permit and the Industrial General Permit require the preparation of a stormwater pollution prevention plan (SWPPP), the implementation of BMPs, and other monitoring and management measures to reduce water quality impacts that could result from discharges of contaminated stormwater from the covered activities. Oil and gas

exploration, construction and operational activities are subject to these general permits, with some exceptions as discussed below.

Under the CWA, stormwater runoff from oil and gas operations is exempt from the NPDES permitting requirements so long as: (1) it is composed entirely of "flows which are from conveyances or systems of conveyances" (i.e., pipes, conduits, ditches, and channels) used for the collection of runoff; and (2) it is not contaminated by and has not come into contact with "any overburden, raw material, intermediate products, finished product, byproduct, or waste products located on the site of such operations" CWA Section 402(*l*)(2). As a result of legislative and regulatory developments and related legal challenges over the past 10 years (described in Section 4.9.3, Regulatory Setting), the EPA interprets this exemption to apply only if there have been no reportable discharges of hazardous substances or of harmful quantities of oil from the facility; and the runoff does not contribute to a violation of a water quality standard, as determined through the application of best available technology. Based on these highly restrictive conditions for exemption, most construction–related stormwater discharges from oil and gas construction sites that are one acre in size or more are subject to the Construction General Permit. Sites that are very small (less than one acre in size and not part of a "common plan" disturbing more than one acre) and that are determined to have no potential to contribute to a water quality standards violation are exempt from the Construction General Permit. None of these exemptions is self-executing, meaning that a discharger in the Project Area must obtain a waiver or exemption from the CVRWQCB. The SWRCB summarizes stormwater construction activity associated with oil and gas exploration online (SWRCB 2015b). An EPA Fact Sheet addressing permitting requirements for oil and gas stormwater discharges is available online (EPA 2009).

Oil and gas production and exploration coverage under and compliance with the Construction General Permit varies significantly by individual operator and facility throughout the Project Area, depending on the size and nature of the construction activity and the physical setting of each site, including its proximity and hydrologic connection to waters of the United States). DOGGR maintains online copies of the CEQA documentation for several oil and gas well permits approved since 2010 showing that several permitted activities in the Project Area were considered to be exempt or subject to waiver from some or all of the Construction General Permit requirements (DOGGR 2015b).

Oil and gas operations are considered "industrial activities" and are subject to the Industrial General Permit. In appropriate circumstances, an operator may apply reduce or avoid compliance requirements by filing and certifying a notice of non-applicability (NONA) supported by No Discharge Technical Report prepared by a state-licensed engineer. Oil and gas facilities may qualify for a NONA if they are: (1) engineered and constructed to contain the maximum historic precipitation event (or series of events) so that there will be no discharge of industrial stormwater to waters of the United States; or (2) located in basins or other physical locations that are not hydrologically connected to waters of the United States. As discussed in Section 4.4, Biological Resources, the regulatory definition of "waters of the United States," in general, and the delineation of any such waters in the Project Area under the existing and proposed new rules, is also subject to significant and ongoing legal uncertainty. As a result, the extent to which oil and

gas production and exploration activities in the Project Area must obtain coverage under and comply with the Industrial General Permit is evolving.

Groundwater Quality Data

Groundwater quality data for the Project Area and each Subarea was obtained by utilizing the most recent legislatively mandated study (SWRCB 2013) of impaired drinking water wells maintained by the California Department of Public Health, summaries of two Groundwater Ambient Monitoring and Assessment (GAMA) well water quality research reports prepared by the USGS (Shelton et al. 2008; Burton et al. 2012), and an analysis of available online water quality sampling results for shallower and deeper wells in the Project Area during 2007 through 2012. As discussed above, a generally impermeable clay layer located primarily in the Western and Central Subareas physically divides many Project Area groundwater resources from deeper oil-bearing reservoirs. According to the California Water Plan Update 2013 (DWR 2013), human activities have generally not affected water quality in the deeper San Joaquin valley aquifers, including groundwater located under the regional clay layer. Evidence of anthropogenically related constituents is more likely to be detected in shallower groundwater zones throughout the valley and above the clay layer.

Oil and gas activity groundwater impacts were analyzed in a 1989 DOGGR study, which concluded that many constituents know to occur in oilfield produced water and other wastes, such as carbonates, bicarbonates, hydroxides, borates, silicates, phosphates, and organic substances, are also associated with municipal sewage and many industrial wastes. Groundwater quality in the Project Area has been affected by the use of imported water, overdraft, and soil salt that increase net TDS loads to surface soils, present and past climate conditions, and by the rocks and sediments that come into contact with water. The DOGGR report noted that produced oilfield water seldom contains significant or detectable amounts of ammonia, nitrate, heavy metals or phosphate, while agricultural activity, including the application of fertilizers and pesticides, do not generally contain high amounts of boron or chloride. Consequently, elevated boron or chloride levels could indicate oil and gas production and exploration activity impacts to groundwater. However, the DOGGR study also found that these constituents were detected in high concentrations in locations where no historical groundwater injection or production has occurred (Mitchell 1989). As a result, the analysis concluded that elevated boron and chloride can occur in Kern County from sources other than oil and gas production and exploration activities.

The federal secondary MCL for chloride is 250 mg/L. Secondary MCLs are based on consumer acceptance and are not enforced by the federal government. No primary or secondary MCL has been established for boron. The California Department of Public Health (CDPH) has adopted health-based advisory notification levels for chemicals in drinking water that are not subject to an MCL. The notification level for boron is 1,000 micrograms per liter, or 1 mg/L.

California Water Code Section 10782 required the SWRCB to prepare and submit a report to the California legislature identifying communities that rely on contaminated groundwater as a primary source of drinking water. The SWRCB completed the report in January 2013, which included an analysis of wells within the Project Area that did not meet at least one drinking water

MCL on two occasions during 2002 through 2010 (SWRCB 2013). Appendix S, Table 3-10 summarizes the results of the study for wells in the Project Area. As noted by the SWRCB in the report, over 98% of Californians that are served by public water suppliers are provided with safe drinking water. Although many water suppliers draw from contaminated groundwater sources, most are able to treat or blend the water with cleaner supplies to meet applicable standards.

The report identified public water systems that draw from one or more contaminated groundwater wells prior to any treatment or blending. As a result, the report provides a conservative assessment of Project Area drinking water because it excludes all wells that met applicable MCLs prior to subsequent treatment or blending. As shown in Appendix S, Table 3-10 about 79 wells in the Project Area exceeded at least one drinking water MCL on two occasions during 2001 through 2010. The most commonly detected constituent above applicable MCLs in Project Area drinking water wells in the SWRCB study was arsenic, which occurs naturally in the regional aquifers. Radionucleatides, generally from natural sources, and nitrates and other chemicals, likely associated with agricultural activity, were also detected in several Project Area wells.

The USGS has prepared two studies of groundwater quality in the Project Area based on the results of the state GAMA program, which tests and provides water quality results for more than 200,000 wells located throughout the state. Data is reported for multiple groundwater levels, including: (1) shallow wells located in regulated cleanup sites or used for private domestic water; (2) intermediate depth water supply wells; and (3) deeper wells ranging from hundreds to thousands of feet below the ground used for public water supply and agricultural irrigation. The USGS developed summaries of water quality in the Project Area by identifying about 47 wells to facilitate a randomized grid-based statistical analysis of water quality testing results generated in 2006. The locations of the wells used in the two USGS studies are shown on Figure 4.9-13.

The first USGS analysis of the well data was published in 2008 to provide a statistically valid representation of groundwater quality parameters in the Project Area (Shelton et al. 2008). Table 4.9-16 summarizes the results of the 2008 study.

Table 4.9-16: USGS GAMA Well Water Quality Data Summary

Water Quality Parameter	Units	Average	Median	Min[a]	Max[b]	N

Notes:
[a] Minimum value calculated as the 5th percentile. When one or more result is ND, the minimum is reported as ND.
[b] Maximum value calculated as the 95th percentile.
[c] Some parameters listed under above categories are also regulated by the SDWA.
Where "ND", average, median, minimum, and maximum are calculated assuming a value equal to one-half the reporting limit (RL), or equal to zero if result reported as 0.0, i.e., no detection limit provided.
Key:
N = number of results (reported for a subset of grid wells as defined by Shelton et al., 2008)
ND = not detected above the method reporting limit, refer to Burton and Belitz (2012)
pCi/L= picocuries per liter

The 2008 USGS study found that the detections of most inorganic constituents were below health-based thresholds. Nitrate and arsenic were detected above MCL levels in two wells, and

vanadium was detected above California notification levels in one sample. The USGS found that volatile organic compounds (VOCs) and pesticides were detected in about 60% of the grid wells, and that all of these detections were below health-based thresholds except for a fumigant (1,2-dibromo-3-chloropropane [DBCP]) used in agriculture detected above the applicable MCL in one sample. None of the data for the wells in the USGS study reported chloride above the secondary MCL level (250 mg/L) or boron in concentrations above the state notifications level (1 mg/L). A second analysis of the Project Area well grid data was published by the USGS in 2012 and compared the concentration distributions for individual water quality parameters with applicable federal and state regulatory MCL thresholds for protecting human health, secondary MCLs, or human health advisory levels. The data from the grid was interpolated to approximate constituent concentrations in the primary aquifer underlying the analysis area (Burton et al. 2012). The USGS designated concentrations as "high" if they were greater than an applicable threshold, and "moderate" if they were greater than one-half of the applicable threshold or at least 10% of applicable thresholds for organic and special-interest constituents. The study characterized non-detections and concentrations less than moderate levels as "low." The primary findings of the 2012 USGS study included the following:

- TDS levels were estimated to be high in 14% and at moderate levels in 17% of the primary Project Area aquifer.
- Sulfate was estimated to occur in high concentrations in 8% and at moderate concentrations in 6% of the primary aquifer.
- Chloride was estimated to be present at high concentrations in 2% and at moderate concentrations in 4% of the primary aquifer.
- Iron and/or manganese were present at high concentrations in 13% and at moderate concentrations in 6% of the primary aquifer.
- Trace or minor elements were found to be present at high concentrations in 20% and at moderate concentrations in 27% of the primary aquifer. More specifically:
  - Fluoride was reported at high concentrations in 4% and at moderate concentrations in 2% of the primary aquifer.
  - Arsenic, antimony, boron, and vanadium occurred at high concentrations in 2% of the primary aquifer, mainly near the southern Tehachapi mountains.
  - Lead, thallium, and selenium were detected at high concentrations in less than 2% of the primary aquifer.
  - Nitrate was found at high concentrations in 5% and at moderate concentrations in 13% of the primary aquifer. The USGS study did not determine whether high and moderate nitrate detections were related to natural background conditions, agricultural and livestock operations, or septic tank systems.
  - Solvents, including carbon tetrachloride and trichloroethene, were reported at high concentrations in less than 1% and at moderate concentrations in 4% of the primary aquifer.

- Trihalomethanes, a constituent potentially attributable to municipal water disinfection and chlorinated landscape irrigation water were present at moderate concentrations in 4% of the primary aquifer.
- VOCs (e.g., organic synthesis reagents and gasoline hydrocarbons) were not detected at high concentrations and were found in moderate concentrations (specifically for benzene) in 2% of the primary aquifer.
- The fumigant DBCP was reported at high concentrations in 2% of the primary aquifer, and DBCP and other fumigants were found at moderate concentrations in 4% of the primary aquifer.
- Perchlorate, an inorganic constituent, and NDMA, a semi-volatile organic compound (SVOC), were not found at high concentrations in the primary aquifer, but perchlorate was detected at moderate concentrations in 6% of the aquifer.
- Naturally-occurring radioactive constituents, primarily radium and uranium, were detected at high concentrations in 6% and at moderate concentrations in 13% of the primary aquifer.

Water quality testing data available online from 2007 to 2013 were compiled for GAMA, CDPH, DWR, and other wells that are monitored for public drinking and M&I water supplies, agricultural irrigation, and other purposes in each of the Project Subareas. The dataset includes wells that are screened in shallower locations, generally above the depth of the impermeable clay layer in the region, and deeper wells screened below the clay boundary. The locations of the wells for which 2007 through 2012 water quality data were analyzed are shown on Figure 4.9-14.

Table 4.9-17 summarizes the data results for shallow wells in the 2007-2013 dataset. The shallower wells were generally installed above the level of the Corcoran Clay or equivalent clay layers in the Project Area.

The shallow well data for 2007 through 2013 shows that, in general, the Western Subarea has significantly lower groundwater quality than is typical of the Central and Eastern Subareas. TDS levels in the Western Subarea averaged 12,433 mg/L, compared with an average of 931 mg/L in the Central Subarea and 5,789 mg/L in the Eastern Subarea. Average chloride, bicarbonate, selenium, and vanadium levels were several times higher in the Western Subarea than in the Central and Eastern Subareas. Boron was detected in the Central Subarea, but not in the Western and Eastern Subareas where oil activities occur to a much greater extent. Arsenic levels were higher in the Eastern Subarea, a result consistent with the elevated arsenic levels detected in blended produced water supplied to the Cawelo Water District discussed above. Expanded monitoring of blended produced water and other irrigation water is also being required more generally in the Project area (Cart 2015a).

Table 4.9-18 summarizes the data results for the deeper wells in the 2007-2013 dataset. These wells were generally located at depths below the Corcoran Clay or equivalent clay layers in the Project Area.

The deeper well data for 2007 through 2013 exhibit less variation among the Project Subareas, although most constituent concentrations were higher in the Western Subarea. Average iron and bicarbonate levels were highest in the Eastern Subarea. Average and median chloride levels in the deeper well dataset were below the secondary MCL (250 mg/L) in all locations. Boron was detected in some Western Subarea wells above the California notification level of 1 mg/L.

The 2007-2013 groundwater quality data are generally consistent with the USGS data summaries and indicate that groundwater quality improves from west to east in the Project Area. The observed groundwater quality differences between the three Subareas are influenced, in part, by geologic factors. Streams recharging groundwater in the Eastern Subarea and in most of the Central Subarea originate in the Sierra Nevadas and flow for longer, more sustained periods of time through channels underlain by low-solubility igneous and metamorphic rocks. As a result, Eastern and Central Subarea water composition tends to exhibit a calcium-carbonate character, with lower TDS levels. Groundwater recharge in the Western Subarea is mainly a function of infrequent runoff carried by ephemeral channels incised into the Coast Ranges. The channels flow through marine-derived sedimentary materials that are more easily dissolved and mineralize surface flows and underlying groundwater. For example, sulfate is present at elevated concentrations in west subbasin groundwater due to contact with gypsum-containing sediments. Elevated sodium concentrations in the Western Subarea also reflect the exchange of calcium and magnesium ions for sodium and potassium ions initially bound to clay minerals in the marine sediments.

As of 2012, there were 235 sites had active federal NPDES permits issued under the CWA, and 167 facilities had active WDRs (56 general WDRs and 112 individual WDRs) issued under state law in the Project Area and in adjacent urban and other locations. A list of the NPDES permits and WDRs issued within the Project Area is provided in Appendix S [Appendix B, Tables B-1 and B-2].

Groundwater Quality and Existing Oil and Gas Operations

Section IV of the Tulare Lake Basin Plan states that "[o]il field producers continue to use hundreds of sumps as oil/wastewater separators and as wastewater disposal sumps. Some oilfield wastewaters contain salts, oil and grease, metals, and organics which can present a threat to the beneficial uses of underlying good quality ground water." The Basin Plan also states that, "[d]ue to historical practices, degradation of ground water from oil field wastewater disposal occurred in some areas. The petroleum industry has been eliminating oilfield wastewater disposal sumps." In response, the Basin Plan indicates that "[w]ith the gradual elimination of the use of sumps for disposal, increased amounts of produced wastewater are being discharged to Class II injection wells" (CVRWQCB 2004).

Consistent with the Basin Plan summary of sump and pond use, since 1993, the volume of produced water and other permitted Class II well injection activities, including reuse and disposal in the Project Area, has nearly doubled from a low of about 104,900 AF in 2001 to 193,500 AF in 2013 (Figure 4.9-15).

As shown in Table 4.9-19, total Class II injection volumes in the Project Area rose by about 88,500 AF during 2001 through 2013. Produced water disposal accounted for over 61% of this increase (54,200 AF). About 38% of the net injection growth in the Project Area since 2001 was from increased cyclic steam and water flood EOR activities.

Table 4.9-19: Project Area Injection Volumes, 2001-2013 (Acre-Feet)

	2001	2013	Net Increase	Percent of Increase
Cyclic Steam EOR	9,727	19,712	9,985	11%
Steam Flood EOR	38,641	38,801	160	0.2%
Water Flood EOR	24,525	48,673	24,149	27%
Water Disposal	32,059	86,294	54,235	61%

Source: DOGGR 2014
Note:
Data is for all District 4 fields and includes a small amount of production activity outside of the Project Area.

Water quality in hydrocarbon zones and other aquifers beneath existing oilfields is compiled by DOGGR based on subsurface logs and drilling information reported on field data sheets. In many cases, the sheets identify hydrocarbon pools and water quality information that are located in more than one geologic formation. The datasheets and geologic cross-sections for Project Area oilfields are included in DOGGR's summary of California Oil Fields, Volume 1 - Central California (DOGGR 1998). The datasheets for Project Area well fields include formation, pool, and associated water quality information developed during various periods since the early 1900s. Some of the datasheets also identify the presence and depth to the base of "fresh" water resources located above the hydrocarbon formation. As discussed above, the definition of fresh water is

subject to variation in different regulatory contexts. The DOGGR oilfield data generally identify fresh water as an aquifer with TDS levels of less than 3,000 mg/L.

A summary of the primary formations, hydrocarbon bearing pools, stratigraphic information, and average pool depth for Project Area oilfields by Subarea is included in Appendix S, Table 2.1. Table J-11 in the DOGGR draft EIR (DOGGR 2015a) summarizes available salinity data and TDS concentrations in the hydrocarbon-bearing zones and the depth to the base of freshwater for each of the oilfields in the Project Area. These data indicate that groundwater quality in hydrocarbon bearing zones that would generate produced water during oil and gas production varies from field to field and in different formations within a single field.

In 1989, DOGGR conducted a study of the effects of oilfield operations on USDWs in Kern County (Mitchell 1989). The study included water quality data derived from groundwater samples in 18 Project Area oilfields. Table 4.9-20 summarizes the water quality analysis results of the DOGGR study for the 18 fields.

The range of oilfield groundwater quality data in the 1989 study results was similar to the results summarized in the California oilfields datasheets maintained by DOGGR. Average TDS levels in some fields were below 10,000 mg/L; in others, TDS levels approached the salinity levels associated with seawater (35,000 mg/L).

In 2015, Kennedy-Jenks reviewed existing WDRs for surface water discharges of produced water in the Project Area. Sixteen WDRs issued over the period from 2002 to 2012 were found to report data on produced water quality data (see Appendix S). Table 4.9-21 summarizes the reported TDS, chloride, boron, and benzene, toluene, ethylbenzene, and xylene levels in produced water at each location.

In 2002, the California Department of Toxic Substances Control (DTSC) published a report on the findings of a field research analysis of oil exploration and production wastes conducted in 2000 and 2001. The purpose of the study was to obtain scientific data about the characteristics of oil exploration and production (E&P) wastes, and determine whether the wastes were being properly managed in accordance federal and state law. The study collected E&P waste samples at six oil production facilities in Los Angeles County and two oil production facilities in Kern County, including samples of produced water, drilling waste, oily sludge, and foam treatment waste. The DTSC concluded that none of the E&P waste streams sampled and analyzed during the study were hazardous under federal or state laws. Produced water and oily sludges were found in certain cases to meet federal toxicity characteristic for hazardous waste, but were exempted from regulation as a hazardous waste by law. Ten of 36 oily sludge samples—primarily the concentrated residue in the bottom of tanks and similar impoundments—exhibited other characteristics of hazardous waste under state law. The DTSC report concluded that, depending on formation characteristics or facility operations, certain E&P wastes, such as oily sludges, may be subject to management by the state as hazardous wastes even if they are exempted from hazardous waste regulations under federal law (DTSC 2002).

As shown in Table 4.9-1, about 30,223 AF of produced water was disposed in Project Area-produced water ponds in 2012. Almost all of these ponds were unlined, earthen ponds constructed in upland locations. The CVRWQCB and DOGGR are in the process of conducting an inventory of active and inactive ponds used for disposal of produced water in the Project Area and other locations in the San Joaquin Valley. Published reports indicate that, as of March 2015, the CVRWQCB had identified 355 inactive ponds previously used for produced water disposal, 370 ponds that are active and permitted, and 208 active ponds that were not issued WDRs or other disposal permits. According to the Project applicants, the CVRWQCB's initial list was based, in part, on outdated aerial maps, and the agency is currently updating this list of permitted and unpermitted ponds based on new information supplied by the oil and gas industry. The CVRWQCB has indicated that it intends to bring all active produced water ponds into regulatory compliance or require closure of any produced water ponds that cannot meet applicable water quality standards by December 2016 (BakersfieldNow.com 2015).

The Tulare Lake Basin Plan states that historical use of produced water ponds is known to have affected groundwater in the Project Area. The CVRWQCB has determined that produced water discharges into unlined ponds have impacted downgradient groundwater in several Project Area locations, including ponds adjacent to the North Belridge oilfield (Order No. R5-2013-0054), the Section 29 surface impoundments at the Lost Hills oilfield (Order No. R5-2013-0056) and ponds adjacent to the South Belridge oilfield (Order No. R5-2013-0061). The produced water disposal facilities in these instances have been closed and are no longer in operation. The applicable CVRWQCB closure orders require monitoring and reporting programs to evaluate the extent of the groundwater impacts and to document that affected groundwater constituent levels have returned to ambient conditions. Although downgradient water quality impacts have been documented from certain ponds, to date there is no confirmed instance documented by a regulatory agency in which the use of a produced water pond has impaired operational agricultural or drinking water wells. However, in 2001, an almond grower that owned orchards downgradient from unlined ponds located in the western Subarea filed a lawsuit asserting that produced water disposed to the unlined ponds had contaminated the groundwater underlying the orchard and killed the almond trees. In 2009, a jury ruled in the grower's favor and awarded the grower $8.5 million in damages, but subsequent efforts to obtain additional punitive damages were unsuccessful (Barrios 2013).

Small unlined surface impoundments have been, and continue to be, used in the Project Area to capture drilling muds and drilling fluids during well construction when closed-loop systems that avoid discharges to land are not utilized. Unless specifically permitted to accept additional discharges, the drilling sumps may not be used to discharge other types of oilfield wastes, including well completion or well stimulation fluids and materials, or produced water. In 2013, a video of a well drilling operation north of the city of Shafter in the Central Subarea showing the discharge of non-drilling fluids to a drilling sump was posted online. In response, the CVRWQCB investigated the drilling operation, and the operator agreed to an administrative civil liability payment for 12 days of unpermitted discharges (Administrative Civil Liability Order R5-2013-0587).

In November 2013, the CVRWQCB also issued an investigative order to 78 oil and gas production and exploration operators requiring the submission of well drilling and well workover (repair and improvement) information during the period January 2012 to November 2013. In 2014, the CVRWQCB reported that all of the companies had responded and provided drilling information for 6,381 new wells and 8,291 workovers of existing wells (CVRWQCB 2014).

Based on the information submitted by oil and gas operators, the CVRWQCB determined that unpermitted discharges of well completion fluids, produced water, or stimulation fluids had occurred to drilling sumps in other Project Area locations. Certain operators subsequently agreed to stipulated settlements and the payment of administrative civil liabilities related to unpermitted drilling sump violations, including unpermitted drilling sump discharges in the Western Subarea (Administrative Civil Liability Orders R5-2014-0535 and R5-2014-0536) and the Poso Creek oilfield (Administrative Civil Liability Order R5-2014-0566) and, as of March 2015, a proposed civil liability settlement (Proposed Administrative Civil Liability Order R5-2015-0510) for the unpermitted discharge of well stimulation fluids in the South Belridge oilfield. To date, there are no confirmed reports of impacts to surface water or groundwater quality associated with unpermitted discharges to drilling sumps in the Project Area.

As shown on Figure 4.9-15 and in Table 4.9-19, oil and gas operators in the Project Area have significantly increased the use of Class II injection wells regulated under the UIC program under the federal SDWA in order to reduce the use of unlined surface ponds for produced water and other permitted disposal. Since 1983, DOGGR has administered the UIC program in California under the terms of a primacy agreement with the EPA and regulates all oil and gas EOR-related and produced water disposal injection activities in the Project Area. DOGGR and the SWRCB executed a memorandum of agreement (MOA) in 1988 that establishes DOGGR as the primary state agency for the approval of oil and gas production and exploration discharges in Class II wells. The MOA has been incorporated into the Tulare Lake Basin Plan (CVRWQCB 2004).

The primary objective of the SDWA and the UIC program is to protect existing and potential USDWs, which are defined by federal law to include aquifers with TDS concentrations of up to 10,000 mg/L. Injection wells used in connection with oil and gas exploration and production operations are regulated as "Class II" facilities under the UIC program. The SDWA prohibits any Class II well from injecting into a USDW unless the aquifer has been exempted in accordance with applicable criteria and regulatory requirements. Class II injection wells must be constructed to avoid any discharges into a non-exempt USDW, including the installation of multiple cement and pipe barriers to isolate well fluids from contact with USDWs that may be traversed by a well in shallower geologic formations.

In February 2015, the CCST published the first of three studies required by state legislation evaluating well stimulation, including a description of well construction requirements and technology used in California (CCST 2015). Multiple steps are required to install and secure wells with protective cement and pipe casing. The initial step is to install a steel pipe, or casing, with diameter slightly smaller than the borehole diameter as a well is drilled. The space between the pipe and the borehole wall, or the annulus, is then filled with cement to secure the casing. The cemented casing is designed to limit fluid movement in the well solely to the interior of the pipe,

prevent borehole collapse, and hydraulically isolate, or ensure the zonal isolation of, all internal well flows from contact with adjacent rock formations or aquifers. Different types of cements are used to secure the casing, depending on the depth, temperature, pressure, and chemical environment of a well. A series of pressure tests and wireline logging using sonic and ultrasonic tools are performed to verify that the well has been correctly cemented and contains no locations where well fluids can leak to the surrounding formations.

Several layers of casing are installed in a well. As shown on Figure 4.9-16, the first is called the conductor casing and consists of a pipe with a diameter larger than other well casings. The conductor casing prevents surface materials from collapsing into the drill hole and is either driven into the ground by a pile driver or placed in the hole after drilling. The next layer of casing is called the surface casing and protects freshwater aquifers from drilling mud as well as well fluids carried during the life of the well. The surface casing is smaller in diameter than, and is installed inside, the conductor casing. The conductor casing extends from the bottom of the borehole to the ground surface. Depending on the depth of a well, a production casing or an intermediate casing may be installed. An intermediate casing is used in deeper wells for additional support. The production casing is a pipe that extends through at least part of the surface casing in shallow wells or the intermediate casing in deeper wells to the top of the oil or gas producing zone or to the bottom of the drilled hole. In some instances, a production liner may be sealed to a length of intermediate casing.

The cementing process is completed after each casing segment is installed into the borehole. Dispersants and spacers are pumped down the casing and to the bottom of the well and travel back to the surface in the borehole annulus to prepare the formation and case pipe for cement bonding. Cement that is designed to withstand the operational temperature and physical stresses associated with the well is added through the casing and fills the annulus to the surface. Once the cement sets, the residual cement and any remaining items from the cement operation that are at the bottom of the hole are drilled out to continue deepening the borehole.

The CCST study indicated that leakage due to casing and cement failures represents one of the most likely pathways for unintentional well fluid migration to underground formations (CCST 2015). Recent studies have indicated that well failure, or blowout rates, in the Project Area have been significantly reduced over time by improved well construction technologies. Blowout rates due to well operations in California Oil and Gas District 4 from 1991 to 2005 ranged from one per 10,000 to one per 60,000 well-years, depending on the oilfield activity taking place at the time of the blowout. In District 4, the well blowout rate was one in 20,000 well-years for all wells in operation, with a rate of one per 15,000 well-years in thermal-recovery fields and one per 60,000 well years in non-thermal-recovery fields during this period.

The number of blowouts per year in District 4 declined by about 80% between 1991 and 2005. The decline in some rates has been statistically significant, with the well construction blowout rate down from one per 1,500 operations in the 1990s to one per 5,200 operations in the 2000s, and the steam injection well blowout rate down from one per 6,000 well-years in the 1990s to one per 100,000 well-years in the 2000s. There is circumstantial evidence that rates decreased due to improvements in production practices, such as improved cementing of steam-injection wells and

management of geomechanical processes in reservoirs. These downward trends do not correlate with changes in production activity in the district. This demonstrates that risk in the hydrocarbon industry has and can be significantly reduced with focused effort (Jordan and Benson 2009).

As of August 2014, the DOGGR online database indicated that there were 11,970 active wells in the Project Area used for steam flood, water flood, cyclic steam, or disposal injection. About 1,093 active injection wells were used for produced water and other disposal purposes. DOGGR has indicated that a total of 613 spills and 87 well leaks were reported in the Project Area (DOGGR District 4) from 2009 through 2014 (DOGGR 2015a). There have been no confirmed reports of drinking or agricultural groundwater quality impacts as a result of injection activity in the Project Area, although at least one Project Area grower has alleged that crops have been damaged by underground injection. In September 2014, a cherry orchard grower near Rosedale in the Central Subarea filed a lawsuit against the operators of injection wells located near the orchard and other parties alleging that oil-related produced water and other injection activities had contaminated groundwater and killed several trees. As of June 2015, the lawsuit was reported to remain pending in the Kern County Superior Court, and no determination has been made in the case (Cox 2015).

In 2011, the EPA published an independent audit of the California UIC program that identified a number of potential compliance issues, including the possibility that injection wells had been permitted to discharge into aquifers that met the USDW criteria but that had not been exempted in accordance with applicable requirements (Horsely-Witten Group 2011). A March 2015 report by the California Environmental Protection Agency (Cal/EPA) indicated that discharges to nonexempt USDWs were apparently permitted due to: (1) inconsistencies in the records maintained by state and federal officials regarding the exempt status of 11 aquifers located under oilfields that were operational in 1983 when DOGGR was granted primacy for the UIC program; and (2) other permitting errors, including: (a) border confusion regarding the aerial extent of exemptions granted in conjunction with the documentation in the early 1980s compared with the larger extent of most oilfield administrative boundaries; (b) expanding productive limits over time beyond the production portions of oilfields at the time when an aquifer was exempted; (c) depth confusion regarding the formations that are subject to exemption which resulted in injection above or below the exempt aquifer and into non-exempt zones; and (d) the fact that, in certain cases, only portions of an aquifer were exempted and not the entire aquifer (Cal/EPA 2015).

Eight of the 11 aquifers for which exemption records reflect inconsistencies are located in the Project Area. These aquifers are listed in Table 4.9-22 by oilfield and with reference to the formation in which the aquifers occur.

Table 4.9-22: Project Area Oilfields Subject to USDW Exemption Review

Oilfield	Geologic Formation
Blackwell's Corner	Tumey

The SWRCB and DOGGR have initiated a work plan to address the UIC program issues identified by the EPA review and subsequent analysis of oilfield operations. In February 2015, DOGGR provided the EPA, and publicly released, a list of 2,553 wells in the state that were injecting into non-exempt aquifers. As of March 2015, the list included 1,721 wells in the Project Area that inject steam or water for EOR purposes into active hydrocarbon production zones. The SDWA criteria for exempting a USDW from the prohibition against injection include, among other considerations, whether the aquifer: (1) is not currently serving as a source of drinking water; and (2) is located in a formation that is mineral, hydrocarbon, or geothermal energy producing, or can be demonstrated by a permit applicant as part of a permit application for a Class II operation to contain minerals or hydrocarbons that considering their quantity and location are expected to be commercially producible. As a result, DOGGR has indicated that EOR wells under review have relatively low priority because these facilities inject into existing hydrocarbon-bearing zones that could qualify for EPA exemption. The state intends to seek SDWA exemptions for aquifers subject to EOR injection to reflect current geologic conditions and oilfield boundaries (DOGGR 2015c).

In May 2015, the SWRCB and DOGGR published a letter to the EPA stating that "approximately 3,600 cyclic steam wells that had some injection reported in 2014" had been identified, and that DOGGR databases show these wells "as not being associated to a permitted injection project." Almost all of these cyclic steam wells are located in the Project Area. The May 2015 letter states, because that most of the cyclic steam wells inject steam for a limited duration and volume into "zones laden with hydrocarbons" or formations with "little or essentially no permeability, the wells are "very unlikely" to pose a threat to water supply wells. The state review of the 3,600 cyclic steam wells described in the May 2015 letter will be completed by July 2015 (DOGGR 2015d).

The March 2015 list of wells injecting into non-exempt aquifers also identified 532 disposal wells injecting into non-hydrocarbon producing zones, including 388 in the Project Area. These wells

were referred to as "Category 1" for review because they were permitted to inject Class II fluid for disposal purposes "into non-exempt, non-hydrocarbon-bearing aquifers" or "into the 11 aquifers that have historically been treated as exempt." DOGGR determined that 176 of the 532 wells were injecting into zones containing water with TDS levels of less than 3,000 mg/L. About 163 of these wells are identified by DOGGR as located in Region 4, which generally comprises the Project Area (DOGGR 2015d). Due to their proximity to relatively high-quality groundwater, the UIC work plan developed by DOGGR has initially focused on these 176 wells and injection wells within one mile at the surface and within 500 vertical feet underground of a drinking or agricultural water supply. As of March 2015, 23 injection wells in the Project Area were ordered to cease operations due to proximity to drinking or agricultural water supplies. DOGGR has indicated that it will complete the review of the 176 highest priority injection wells by June 2015 (DOGGR 2015c).

In May 2015, the SWRCB and DOGGR published a letter to the EPA that provided updated information concerning the priority (Category 1) well review process. The letter indicated that 80 of the 532 Category 1 wells identified in February 2015 had been removed from the Category 1 list for various reasons, including injection into an aquifer that did not meet the criteria for a USDW, wells that had not been completed, or wells that were injecting into exempted aquifers. About 21 of the 176 wells identified in February 2015 as injecting into aquifers with less than 3,000 mg/L of TDS were removed from the Category 1 list. The May 2015 letter also indicated that SWRCB staff had determined that 53 of the remaining 155 wells injecting into aquifers with less than 3,000 mg/L of TDS were "potentially impacting drinking water supply wells." As discussed above, 23 of these wells had been ordered to cease operations due to proximity to drinking or agricultural water supplies. The May 2015 letter states that DOGGR and the SWRCB are "awaiting receipt of additional test data" before determining whether to order a shut-down of any of the other 30 wells by the October 15, 2015 compliance date (DOGGR 2015d).

In February 2015, DOGGR and the SWRCB provided the EPA with a schedule for completing the regulatory review of the state UIC program and, in March 2015, the EPA responded to the agencies and identified deadlines and deliverables for the review process. The letters grouped potentially affected wells into three categories. Category 1 includes all water disposal wells injecting into non-exempt, non-hydrocarbon bearing aquifers, including the 11 statewide aquifers (eight within the Project Area) historically treated as exempt. Category 2 wells include all EOR wells injecting into non-exempt, hydrocarbon-bearing aquifers. Category 3 wells include disposal and EOR wells located inside the surface boundaries of exempted aquifers, but that may be injecting into a geological formation or zone that was not subject to exemption. The March 2015 EPA letter requires completion of the Category 1 well review by May 15, 2015, the Category 2 wells by July 31, 2015, and the Category 3 wells by February 15, 2016. The letters also identify timelines for state rulemaking and public outreach, an aquifer exemption application process, and the potential inclusion of cyclic steam wells in the review process (EPA 2015b). All injection into aquifers with TDS levels of less than 3,000 mg/L must cease by October 15, 2015, unless the state applies for and the EPA approves USDW injection exemptions for these aquifers. Injection into any of these aquifers may be prohibited prior to October 15, 2015, if it is determined that drinking or agricultural water supplies are threatened. All injection into non-exempt aquifers with

TDS levels of 3,000 to 10,000 mg/L must cease by February 15, 2017, unless the state applies for and the EPA approves USDW injection exemptions for these locations. As of February 2015, no contamination of water used for drinking or agricultural purposes related to underground injection by the oil and gas industry had been detected in water supply wells tested by the SWRCB (DOGGR 2015c). DOGGR adopted emergency regulations codifying the compliance dates in the regulatory review schedule, which went into effect on April 20, 2015.

In May 2015, two environmental groups, the Sierra Club and the Center for Biological Diversity, filed a lawsuit contending that the DOGGR rules and the UIC program compliance schedule through 2017 violate state and federal laws. As of May 2015, the lawsuit remains pending in the Alameda County Superior Court and no determination has been made in the case (California Oil and Gas Report 2015).

There have been no confirmed impacts to groundwater in the Project Area related to well stimulation, although analyses conducted to date generally recommend that additional groundwater data be developed to further assess this issue. In August 2014, the CCST, the Lawrence Berkeley National Laboratory (LBNL), and the Pacific Institute (PI) published an assessment of well stimulation activities in California for the federal Bureau of Land Management (BLM) (CCST 2014). BLM leases land in California, including land located in Kern County, for oil and gas exploration and production. The study identified chemical constituents used in at least 2% of the reported well stimulation treatments in California, generally for the period of 2012 through 2014, and identified oral toxicity information where available for these constituents. The majority of the well stimulation chemicals considered in the CCST report, such as guar gum, a gelling agent, or ethanol a common solvent, were determined to have low hazard potential in terms of oral toxicity. Certain chemicals, such as biocides (e.g., tetrakis [hydroxymethyl] phosphonium sulfate, 2,2-dibromo-3-nitrilopropionamide, and glutaraldehyde), corrosion inhibitors (e.g., propargyl alcohol), and mineral acids (e.g., hydrofluoric acid and hydrochloric acid) were found to present concerns for acute toxicity. Oral toxicity information was not available for about 30% of the constituents used in California well stimulation treatments. Table 4.9-23 lists the chemicals used in at least 2% of the reported well stimulation treatment chemicals for which chemical abstract service (CAS) oral toxicity data could be identified by the CCST. Table 4.9-24 lists the chemicals used in at least 2% of the reported well stimulation treatment chemicals for which CAS oral toxicity data could not be identified by the CCST.

The BLM study reached 11 conclusions regarding well stimulation activities in California:

1. Present-day well stimulation practices in California differ significantly from practices used for unconventional shale reservoirs in states such as North Dakota and Texas, and the impacts of hydraulic fracturing observed in other states are not necessarily applicable to California.

2. Acid fracturing has comprised a small fraction of reported well stimulation to date in California, is usually applied in relatively rare carbonate reservoirs, and is not expected to lead to major increases in oil and gas development in the state.

3. The most likely scenario for expanded well stimulation in California is production in and near reservoirs that are currently using well stimulation and that contain oil migrated from source rocks and not from the Monterey Formation shales.

4. Current water demand for well stimulation operations is a small fraction of statewide water use and ranges from 450 to 1,200 AF per year. Ninety-five percent of water currently used for well stimulation is fresh water; the remainder is produced water, and most of the demand occurs in the southwestern San Joaquin Valley.

5. Most chemicals used in reported well stimulation treatments for which toxicity information is available are considered to be of low toxicity or non-toxic. However, a few reported chemicals present concerns for acute toxicity, including biocides and mineral acids. Potential risks posed by chronic exposure to most chemicals used in well stimulation activities remain unknown.

6. There are no publicly recorded instances of subsurface release of contaminated fluids into potable groundwater in California; additional studies and data collection are needed to fully evaluate this potential concern.

7. Current well stimulation practices could allow flowback water containing stimulation chemicals to be mixed with produced water for use in irrigation.

8. Estimated marginal criteria air emissions (e.g., NOx, $PM_{2.5}$, and VOCs [see Section 4.3, Air Quality]) directly related to well stimulation are a small portion of the overall emissions in the San Joaquin Valley, where the vast majority of hydraulic fracturing takes place.

9. Fugitive methane emissions from direct well stimulation in oil wells are likely to be small compared to the total greenhouse gas (GHG) emissions from oil and gas production in California.

10. Current hydraulic fracturing for oil and gas production in California is not considered to pose a significant seismic hazard. The disposal of produced water from oil and gas production in deep injection wells has caused felt seismic events in several states and could increase seismic hazards in California under certain conditions if similar deep disposal wells were permitted.

11. Overall, the direct impacts of current well stimulation practices appear to be limited and will likely be limited in the future if proper management practices are followed. Existing or as yet unidentified technologies might be developed to extract oil and gas from new locations, such as the Monterey Formation, and could generate different environmental impacts compared with the impacts associated with current well stimulation activities.

In 2015, Kennedy-Jenks (see Appendix S) analyzed the chemicals reported in hydraulic fracturing and acid matrix well stimulation interim notices compiled by DOGGR through March 2014. Table 4.9-25 summarizes the chemicals and estimated concentrations of each constituent identified in the hydraulic fracturing well stimulation notices. Table 4.9-26 summarizes the chemicals and estimated concentrations of each constituent identified in the acid matrix well stimulation notices.

Notes:

[a] Chemicals lists were observed on DOGGR Interim Well Stimulation Notices, accessed March 13, 2014. This listing shows chemicals found in a sampling of hydraulic fracture notices from different fields. A chemical is only listed once, even if it shown on multiple notices.

[b] The estimated concentration listed is representative of a "typical" use, based on the information reviewed, and will vary between wells.

California has enacted several new laws pertaining to well stimulation, including significantly expanded pre- and post-treatment notice and disclosure requirements under SB-4. The notices and disclosures must include estimates of total water use by source, the types and amounts of chemicals used in each treatment, and an analysis of constituent levels in treatment flowback water recovered at the well head. In February 2015, the Los Angeles Times reported that high levels of benzene had been detected in produced water samples, based on flowback water test results reported in publicly available well stimulation notices and disclosures submitted to DOGGR (Cart 2015b). A 1993 DOGGR study of benzene in produced water generated by oil and gas activities in Kern County found that hydrocarbon-bearing formations contain benzene, and that the benzene concentrations tend to increase with the incidence of heavier (lower API gravity) oil deposits (Gamache 1993). A 2012 USGS study of geogenic sources of benzene in aquifers used for public supply generally concluded that benzene levels in state drinking water were low and that benzene occurs in groundwater mainly from geological factors, including proximity to hydrocarbon bearing formations (Landon and Belitz 2012). As shown in Table 4.9-21, and consistent with the USGS and DOGGR studies, benzene has been detected in produced water drawn from hydrocarbon bearing formations.

Floodplains and Drainages

A Federal Insurance Rate Map (FIRM) was developed by the Federal Emergency Management Agency (FEMA) for Kern County, California (unincorporated areas). The map identifies locations in the Project Area that are subject to a 100-year flood hazard risk, or inundation from flooding at least once over 100 years. Figure 4.9-17 shows the locations that are subject to a 100-year flood hazard risk and to undetermined but potential risks of flooding within the Project Area. Mapped and potential flood risk areas overlie several existing oilfields.

Portions of the Project Area could also be subject to inundation by upstream dam failures, particularly the potential failure of Lake Isabella dam. Lake Isabella is 35 miles northeast of Bakersfield. Lake Isabella was created by a dam completed by the USACE in 1953. The Lake Isabella dam consists of a main dam and an auxiliary dam, which are located 2,000 feet laterally apart. The main earthfill dam is 185 feet high and 1,725 feet long, while the auxiliary earthfill structure is 100 feet high and 3,275 feet long. The gross capacity of both dams is 568,100 AF.

The dam facilities have been determined to be substandard by the USACE, and a safety modernization program has been implemented to upgrade the dam by 2022. During the review process, the USACE prepared flood inundation maps identifying the potential inundation area and time-step of flood arrival, assuming both a full reservoir and complete failure of both dams (Kern County, n.d.). Figure 4.9-18 shows the potential peak elevation inundation depths that could occur from a dam failure under these highly conservative assumptions within the Project Area.

Additional information concerning Project Area drainages and wetland resources, and maps showing the locations of these resources in each Subarea, are provided in Section 4.4, Biological Resources.

4.9.3 Regulatory Setting

Federal

Clean Water Act (33 U.S.C. §1321 et seq.)

The 1972 Federal Water Pollution Control Act and its 1977 amendments, collectively known as the CWA, established national water quality goals and the basic structure for regulating discharges of pollutants into the waters of the United States. Section 402 of the CWA establishes the NPDES to regulate the discharge of pollutants into waters of the United States. Section 404 of the CWA regulates the discharge of fill or dredged materials to waters of the United States. (see Section 4.4, Biological Resources). Permits issued under the CWA limit the composition and, in some cases, the volume of a discharge and the concentrations of individual pollutants. Discharge requirements are based on available technology (technology-based effluent limits) and on the quality of the receiving waters (water quality-based effluent limits).

The CWA allows for the delegation of implementation authority to the states. Under the federal or delegated program, all the information required for permit application and monitoring for permit compliance are considered public, with the exception of certain confidential business information which may be considered "trade secret." In addition, the program requires delegated states to establish water quality standards for specific water bodies and to designate the types of pollutants to be regulated, including total suspended solids and oil and grease. In California, NPDES permitting authority is delegated to the SWRCB and nine RWQCBs. The Project Area is within the jurisdiction of the CVRWQCB.

Under the NPDES program, all point sources that discharge directly into waters of the United States are required to obtain a permit regulating their discharge. Each NPDES permit specifies effluent limitations for particular pollutants as well as monitoring and reporting requirements for the proposed discharge. Construction activities in the Project Area that could result in a discharge to waters of the U.S. are subject to the California NPDES General Permit for Stormwater Associated with Construction Activities (Construction Activity NPDES Storm Water General Permit, 2009-0009-DWQ and 2010-0014-DWQ). Other stormwater discharges could be subject to the Industrial General Permit issued under the NPDES program, or to a municipal separate

storm sewer system (MS4) NPDES permit issued for municipal locations, or to individual NPDES permits issued to specific landowners or land use operators. More information about NPDES permits that apply to oil and gas operations is provided in the discussion of state permitting below.

Section 401 of the CWA requires that an applicant requesting a federal permit for an activity that may result in a discharge into a water of the U.S. obtain state certification that the proposed activity will not violate state and federal water quality standards. State water quality standards are discussed below. The CVRWQCB implements Section 401 of the CWA in the Project Area.

Total Maximum Daily Loads

Under section 303(d) of the CWA, states, territories, and authorized tribes are required to develop lists of impaired waters (i.e., waters that exceed applicable water quality standards). The law requires that these jurisdictions establish priority rankings for waters on the lists and develop TMDLs for these waters. A TMDL is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards.

On December 5, 2013, the EPA announced a new collaborative framework for implementing the CWA Section 303(d) Program with States — A Long-Term Vision for Assessment, Restoration, and Protection under the Clean Water Act Section 303(d) Program. This Vision reflects collaboration among states and the EPA, which began in August 2011. While the Vision provides a new framework for implementing the CWA 303(d) Program, it does not alter state and EPA responsibilities or authorities under the CWA 303(d) regulations. There are no impaired waters listed within the Project Area, and no TMDLs have been established for surface waters in the Project Area.

Other Clean Water Act Programs Related to Oil and Gas Production

Several federal programs and regulations have been implemented under the authority of the CWA to regulate oil and gas production activities that could affect surface water quality.

The Oil Pollution Act of 1990 (33 United States Code [U.S.C.] §2701-2761) amended the CWA and established a single uniform federal system of liability and compensation for damages caused by oil spills in navigable waters, which are defined as waters of the United States. The Act requires the removal of spilled oil and establishes a national system of planning for and responding to oil spill incidents, including: improved national oil-spill prevention, preparedness, and response capabilities; limitations on liability for damages resulting from oil pollution; funding for natural resource damage assessments; a fund for damage compensation payments; and the establishment of an oil pollution research and development program.

Regulations promulgated under the Oil Pollution Act (40 CFR 112) require that a spill prevention control and countermeasures (SPCC) plan must be prepared for most facilities with a total aboveground oil storage capacity greater than 1,320 gallons or a total underground oil storage capacity of greater than 42,000 gallons. The purpose of an SPCC plan is to prevent oil from reaching waters of the United States and adjoining shorelines, and to contain discharges of oil.

SPCC plans must be prepared and certified by a professional engineer, and implemented for facilities that store, process, transfer, distribute, use, drill, produce, or refine oil or oil production. At a minimum, an SPCC plan must include: (1) procedures and methods for proper installation of equipment to prevent an oil release; (2) a training and drill program for all personnel addressing oil spill response; and (3) a plan that outlines steps to contain, clean up, and mitigate any effects that an oil spill may have on waterways. Facilities that could substantially harm waters of the United States are also required to prepare a facility response plan (FRP) to prevent and respond to discharges of oil or other materials.

Other CWA regulations specifically address discharges of point source effluents from offshore and onshore oil and gas extraction activities (40 CFR 435). There are no offshore facilities in the Project Area. The regulations prohibit any "discharge of waste pollutants into navigable waters from any source, other than produced water, associated with production, field exploration, drilling, well completion, or well treatment (i.e., drilling muds, drill cuttings, and produced sands)" unless authorized by other regulatory provisions. Section 435.50 allows for the discharge of produced water from oil and gas extraction in onshore locations west of the 98th meridian (which extends through central Texas, Oklahoma, Nebraska, Kansas, and North and South Dakota east of the Rock Mountains) of sufficient quality for use in agricultural or wildlife propagation. Any such discharge must be limited to produced water and not arise from other sources, such as drilling muds, drill cuttings, and produced sands. The discharge must not exceed a daily maximum oil and grease concentration of 35 mg/L. In 2012, about 32,771 AF of produced water was used for agriculture in the Eastern Subarea, pursuant to this regulation.

Additional regulations adopted under the CWA include the National Oil and Hazardous Substance Pollution Contingency Plan (NCP) (codified at 40 CFR 300). The NCP provides national guidance for responding to oil spills and hazardous substance releases, including response capability coordination among emergency responders and applicable contingency plans.

The Safe Drinking Water Act of 1974 (42 U.S.C. §300f et seq.)

The SDWA was originally passed by Congress in 1974 to protect public health by regulating the nation's public drinking water supply. The law was amended in 1986 and 1996, and requires many actions to protect drinking water and its sources: rivers, lakes, reservoirs, springs, and ground water wells. The SDWA authorizes the EPA to set national health-based standards for drinking water to protect against both naturally occurring and man-made contaminants that may be found in drinking water.

The EPA has authority under the SDWA to regulate the subsurface injection of fluids below, into, and above USDW and has established a UIC program by regulations promulgated under the Act (40 CFR 144-147). A USDW is defined as: (1) any aquifer that supplies a public water system; or (2) contains enough groundwater to supply a public water system and either currently supplies drinking water for human consumption or contains less than 10,000 mg/L of TDS. Injection wells are separated into six classes. Class I wells inject hazardous and non-hazardous wastes into deep, isolated rock formations that are separated from the lowest USDW by layers of impermeable clay and rock. Class II wells inject fluids associated with oil and natural gas production operations.

Class III wells inject super-heated steam, water, or other fluids into formations to extract minerals. Class IV wells inject hazardous or radioactive wastes into underground sources of drinking water and are prohibited under the UIC program. Class V injection wells include wastewater disposal wells used by the geothermal industry and shallow septic system and cesspool wells that drain liquid waste into the ground. Class VI wells include wells used for carbon sequestration and storage.

Class II wells are used for oil and gas production throughout the Project Area, including for enhanced oil recovery through the injection of brine, water, steam, polymers, or carbon dioxide into oil-bearing formations to recover oil and natural gas. Class II wells are also used to dispose of fluids associated with oil and gas production by injection into the same underground formation from which they were recovered, a similar formation, or other confined subsurface formations. In certain locations, Class II wells inject liquid hydrocarbons in underground formations (such as salt caverns) for storage. Production wells solely used to bring oil and gas to the surface, and well stimulation treatments, such as hydraulic fracturing, that do not use diesel fuels in fluids or propping agents, are not regulated under the UIC program. Class II wells allow for the disposal of briny produced water in deep underground formations to prevent surface contamination of soil and water and are increasingly used in lieu of surface ponds in the Project Area. In 2014, there were 10,952 active Class II water disposal, cyclic steam, steam flood, and water flood wells in the Project Area, including 8,916 wells in the Western Subarea, 99 wells in the Central Subarea, and 1,937 wells in the Eastern Subarea.

The regulations allow for disposal into aquifers that would otherwise meet the criteria for a USDW if the aquifers are determined to be exempt by the EPA in accordance with an exemption application and review process (40 CFR 146.4). For oil and gas production and Class II well operations, an aquifer may be designated as "exempted" if it does not currently serve as a source of drinking water and cannot currently or in the future serve as a source of drinking water because it is: (1) mineral, hydrocarbon, or geothermal energy producing, or can be demonstrated to contain commercially producible minerals or hydrocarbons; (2) situated at a depth or location which makes recovery of water for drinking water purposes economically or technologically impractical; or (3) so contaminated that it would be economically or technologically impractical to render the water fit for human consumption. Alternatively, an aquifer may be exempted from SDWA protection if the TDS content of the ground water is more than 3,000 and less than 10,000 mg/L and the aquifer is not reasonably expected to supply a public water system. Aquifers containing TDS greater than 10,000 mg/L are not considered underground sources of drinking water under the SDWA and do not need to be exempted in order for injection to occur.

In 1983, California was granted primacy to regulate Class II wells under the SDWA and must meet federal requirements for the UIC program, including construction, operating, monitoring and testing, reporting, and closure requirements for well owners or operators. All UIC injection activity in the state must be permitted by DOGGR. Class II well operators must meet well construction and conversion standards and perform regular testing and inspection to ensure well integrity. In general, the UIC regulations (40 CFR 146 et seq.) require that owners and operators of new Class II injection wells: (1) site wells in locations free of faults and other adverse

geological features; (2) drill to a depth that allows the injection into formations that do not contain USDWs, or that contain only exempt aquifers, and that are confined from any other formation that may contain potential drinking water sources; (3) inject fluids through an internal pipe (tubing) that is located inside another pipe (casing), with cement placed between the outside pipe and the well borehole; (4) test well integrity at the time of completion and at least every five years thereafter; and (5) continuously monitor well integrity. The DOGGR administers the UIC program for Class II wells in California (see below for more information about the state Class II well regulation program).

National Flood Insurance Program

The National Flood Insurance Program (NFIP) was enacted in 1968 to provide a federal program for participating communities to purchase flood insurance. The program is administered by FEMA, and applicable flood insurance rates are based on the flood hazards identified on FIRMs produced and updated by FEMA. A FIRM identifies the estimated limits of the 100-year flood hazard risk, and to participate in the NFIP, local communities must adopt regulations for floodplain development to reduce flood damage, including flood proofing, elevation on fill, or floodplain avoidance. Kern County participates in the NFIP. The currently applicable flood risks in the Project Area based on the FEMA maps are shown on Figure 4.9-17.

State

Porter-Cologne Water Quality Control Act (California Water Code §13000 et seq.)

The Porter-Cologne Water Quality Control Act (Porter-Cologne) provides the state and nine RWQCBs with the authority to regulate discharges of waste into waters of the state. Section 13050(e) of the Water Code defines waters of the state to mean "any surface water or groundwater, including saline waters, within the boundaries of the state." Porter-Cologne is administered in the Project Area by the CVRWQCB under the Water Quality Control Plan for the Tulare Lake Basin (Basin Plan) (CVRWQCB 2004). The Basin Plan identifies existing and future beneficial uses for surface water and groundwater within the Planning Area, such as municipal water supply or recreation, and numeric or narrative water quality objectives that will reasonably protect beneficial uses and prevent nuisances. Beneficial uses and water quality objectives in the Basin Plan also meet applicable federal regulatory criteria for water quality standards and are used to evaluate compliance with state and federal water quality requirements. The Basin Plan includes standards for ground waters that are not subject to federal regulation (CVRWQCB 2004). Tables 4.9-7 and 4.9-8 summarize the beneficial uses designated in the Basin Plan for surface and groundwater in the Project Area.

California Water Code §13260 requires that any person discharging waste, proposing to discharge waste, or operating or proposing to construct an injection well within any region that could affect the quality of the waters of the state, other than into a community sewer system, must submit a report of waste discharge to the applicable RWQCB. The CVRWQCB reviews reports of waste discharge submitted under Porter-Cologne and issues waste discharge requirements (WDRs) that

regulate the discharge unless such requirements are waived in accordance with the Water Code or regulations adopted thereunder. For example, discharges of waste into underground injection wells that are regulated under the UIC program are exempt from the requirement to submit a report of waste discharge and are exempt from SWRCB regulations applicable to discharges of waste to land (23 Cal. Code Regs. Section 2511(c)). As discussed above, the CVRWQCB also administers the federal NPDES permit system and, where required, issues water quality certifications for federal permits in the Project Area. If a discharge is also subject to a federal permit, the CVRWQCB will commonly incorporate state WDRs with the issuance of an NPDES permit or a water quality certification.

Stormwater Discharge Regulations

The State Board has adopted a general NPDES permit for construction activities that disturb more than one acre of land (NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities [2012]), Construction General Permit, Order No. 2012-0006-DWQ, NPDES No. CAS000002). The general permit applies to discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities. To comply with the general permit, a Notice of Intent (NOI) must be filed with the RWQCB, and a SWPPP must be implemented at the commencement of grading and remain in effect until construction is completed. Construction-related pollutants must be controlled with the best available technology economically achievable and best conventional pollutant control technology (the BAT/BCT standard). The Construction General Permit also requires effluent monitoring and reporting, receiving water monitoring and reporting, a rain event action plan, project site soil characteristics and monitoring, new and redevelopment performance standards for water quality and hydromodification impacts, technology-based numeric action levels, and risk-based permitting.

The 1987 federal Water Quality Act (WQA) amended the federal CWA to provide that federal and state agencies may not require federal NPDES permits for uncontaminated storm water discharges from oil and gas exploration, production, processing or treatment operations, or transmission facilities. In 2005, the Energy Policy Act added a new provision to the CWA defining the term "oil and gas exploration, production, processing, or treatment operations or transmission facilities" to mean "all field activities or operations associated with exploration, production, processing, or treatment operations, or transmission facilities, including activities necessary to prepare a site for drilling and for the movement and placement of drilling equipment, whether or not such field activities or operations may be considered to be construction activity" (33 U.S.C. §1362(24)).

On June 12, 2006, the EPA published a final rule to address the CWA amendments made by the 2005 Energy Policy Act. The regulation effectively exempted from NPDES permit requirements stormwater discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities unless stormwater from a facility resulted in a discharge of a reportable quantity of oil or hazardous substances. Shortly thereafter, the Natural Resources Defense Council (NRDC) petitioned the Ninth Circuit Court of Appeals (Ninth Circuit) for direct review of the rule, and on May 23, 2008,

the Ninth Circuit vacated the 2006 oil and gas construction stormwater regulation (Natural Resources Defense Council v. United States Environmental Protection Agency, 526 F.3d 591 [9th Cir. 2008]). The Ninth Circuit denied the EPA's request for a rehearing of the decision.

The EPA has indicated that, in the aftermath of the Ninth Circuit ruling, oil and gas operators are subject to the stormwater permitting requirements that existed prior to the 2006 rule, subject to the additional legislative provisions added to the CWA by the 2005 Energy Policy Act, and including the following provisions (EPA 2009):

- 40 CFR 122.26(a)(2): The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

- 40 CFR 122.26(e)(8): For any storm water discharge associated with small construction activity identified in paragraph (b)(15)(i) of this section, see 122.21(c)(1). Discharges from these sources, other than discharges associated with small construction activity at oil and gas exploration, production, processing, and treatment operations or transmission facilities, require permit authorization by March 10, 2003, unless designated for coverage before then. Discharges associated with small construction activity at such oil and gas sites require permit authorization by June 12, 2006.

- 40 CFR 122.26(c)(1)(iii): The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility: (A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at any time since November 16, 1987; or (B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or (C) Contributes to a violation of a water quality standard.

The Construction General Permit includes a Rainfall Erosivity Waiver process for sites that are between 1 and 5 acres and that demonstrate that construction activities will have no adverse water quality impacts. Site operators that meet the acreage requirements may seek a Rainfall Erosivity Waiver by submitting a NOI and Sediment Risk analysis to the applicable RWQCB certifying that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five. Compliance with permit requirements is generally waived in the event that an NOI is approved by the RWQCB.

The SWRCB has also adopted an Industrial General Permit for stormwater. The current permit (Industrial General Permit 97-03-DWQ) expires on June 30, 2015, and a new permit (Industrial General Permit 2014-0057-DWQ) becomes effective July 1, 2015. The Industrial General Permit includes new online reporting, monitoring, minimum BMPs, numerical action levels and response actions, and other new requirements. Attachment A to the new permit states that "Oil and Gas/Mining Facilities," including "oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with any overburden, raw material, intermediate products, finished products, by-products, or waste products located on the site of such operations" are subject to coverage. Potentially covered facilities can file a notice of nonapplicability (NONA) supported by a technical report prepared by a qualified engineer demonstrating that permit coverage is not required because: (a) the facility is designed to contain and avoid any discharge of storm water to waters of the United States; or (b) the facility is located in a basin or other location that is not hydrologically connected to waters of the United States. Facilities subject to coverage may also file a No Exposure Certification (NEC) and seek to obtain conditional exclusion from certain permit requirements for facilities that have no exposure of industrial activities and materials to storm water (40 CFR 122.26(g)).

Drilling Mud and Drilling Fluid Discharges to Land

Prior to 2013, discharges of drilling muds and fluids from oil and gas-related well drilling and reworking activity were subject to Central Valley Water Board Resolution No. R5-2003-0008 (General Waiver), which covered a number of low-threat wastes, including drilling mud and fluid discharges. In 2013, the CVRWQCB declined to extend the waiver for oil and gas-related drilling mud and fluid discharges (CVRWQCB Resolution R5-2013-0145). In response, oil and gas well construction in the Project Area must either utilize closed-loop systems that avoid any discharge of drilling muds and fluids into sumps, or obtain regulatory coverage under SWRCB General Order 2003-0003-DWQ, which addresses low-threat discharges to land, including:

- Wells/boring waste, well development discharge, monitoring well purge water discharge, boring waste discharge;
- Clear water discharges, water main/water storage tank/water hydrant flushing, pipelines/tank hydrostatic testing discharge, commercial and public swimming pools;
- Small/temporary dewatering projects (such as excavations during construction); and
- Miscellaneous, small inert solid waste disposal operations, and cooling discharge.

The general order allows the discharge of boring waste, drilling mud, and cuttings from well-drilling operations to onsite drilling sumps, but prohibits, among other activities, the discharge of: (a) any waste to surface waters; (b) waste classified as "hazardous" or "designated" as defined in Title 22 CCR Section 66261 and the California Water Code Section 13173; and (c) waste that causes, by itself or in combination with any other discharge, an exceedance of applicable Regional Board Basin Plan objectives for ground or surface waters. The general order also

provides that the boring waste, drilling mud, and cuttings may not contain halogenated solvents. At the end of drilling operations, the discharger is required to: (a) remove all wastes from the sump; or (b) remove all free liquid from the sump and cover residual solid and semi-solid wastes, provided that representative sampling of the sump contents after liquid removal shows residual solid wastes to be nonhazardous. Residual wastes must be disposed at a proper Title 27 CCR classified waste disposal facility or onsite. Residual wastes discharged onsite must meet the following requirements: (1) the discharge must be located greater than 5 feet above local groundwater level; (2) the discharge must be covered by a minimum of 1 foot of clean soil; and (3) the discharge must be located at least 100 feet from the nearest surface water. If a drilling sump has appropriate containment features, it may be reused.

On November 15, 2013, the CVRWQCB issued an order pursuant to California Water Code (CWC) §13267 requiring a large number of operators of oil and gas wells to provide information about discharges of drilling muds into sumps from January 1, 2012, to present. CWC §13267 authorizes the regional water board to require any person who has discharged waste to submit technical or monitoring program reports to assist the staff in its assessment of potential water quality impacts resulting from the discharge. The order identified for reporting those companies that had produced more than 1,000 barrels of oil or 10 million cubic feet of natural gas in a month or those companies that may have drilled exploratory wells. These operators were required to describe the procedures used to close unlined drilling sumps at new wells and to close smaller temporary operational sumps next to existing wells. If waste was solidified during closure of a sump, then the company was required to describe that solidification process in the report. The CVRWQCB staff reported on its progress to the Board on June 5-6, 2014, and again on February 5-6, 2015. According to the project applicant, both reports were informational and no written report has yet been issued. The CVRWQCB staff has indicated to the project applicants that it intends to prepare general WDRs for drilling sumps, but has not yet proposed tentative WDRs. If adopted, the general WDRs would supersede the need for coverage under the SWRCB General Order.

Produced Water Percolation and Evaporation Ponds

Produced water has been historically disposed of in unlined ponds (surface impoundments), in reliance on an exemption contained in the SWRCB regulations applicable to "discharges of [nonhazardous] wastewater to land, including but not limited to evaporation ponds, percolation ponds, or subsurface leachfields" where the discharge was in compliance with an adopted water quality control plan, including the Tulare Lake Basin Plan (23 CCR §2511(b)). According to the RWQCB's website, there are an estimated 933 produced water ponds in the CVRWQCB, many of which are located in the Project Area. Over 500 of these ponds have been issued WDRs.

The CVRWQCB is evaluating current and past discharges of produced water into surface ponds to determine whether they are permitted and operating in compliance with state regulations. In the future, unpermitted facilities will be required to obtain WDRs and to comply with other applicable requirements designed to protect groundwater quality. According to the Project Applicant, the CVRWQCB may adopt new general orders that could cover low threat facilities, moderate threat facilities, and no threat facilities. Other facilities may be required to obtain

individual WDRs based on site-specific circumstances. The CVRWQCB has indicated that it will issue enforcement orders to oil and gas disposal pond facilities as necessary to bring them into compliance with applicable laws and regulations. If beneficial uses of groundwater have been impaired as a result of historical usage of an unlined pond, investigation and remediation may be required. The CVRWQCB prepared a work plan for the review of Project Area and other central valley disposal ponds, and the review program is scheduled to be completed by November 2016.

In April 2015, the RWQCB issued orders under Water Code §13267 to a large number of operators. This section of the Water Code authorizes the RWQCB to require any person who has discharged waste to submit technical or monitoring program reports to assist the staff in its assessment of potential water quality impacts resulting from the discharge. The orders vary among sites but, generally, require the collection and analysis of wastewater samples from each of the listed ponds within the operator's control to characterize the discharge. The RWQCB also issued inspection reports and notices of violation to some operators in April 2015, which require the operators to file reports of waste discharge, submit closure plans where applicable, or take corrective actions.

Depending on the characteristics of the formation from which the water is produced, produced water could be classified either as "nonhazardous solid waste" or "designated waste" under the SWRCB's waste classifications applicable to discharges of waste to land. "Nonhazardous solid waste" includes "all putrescible and nonputrescible solid, semi-solid, and liquid wastes, including . . . industrial wastes" so long as they are not required to be managed as hazardous wastes and do not contain soluble pollutants in concentrations which exceed applicable water quality objectives, or could cause degradation of waters of the state" (27 CCR §20220(a)). "Designated waste" is defined as "nonhazardous waste that consists of, or contains, pollutants that, under ambient environmental conditions at a waste management unit, could be released in concentrations exceeding applicable water quality objectives or that could reasonably be expected to affect beneficial uses of the waters of the state as contained in the appropriate state water quality control plan" (27 CCR §20210; Water Code §13173).

Produced water that contains concentrations of constituents that exceed water quality objectives will likely be classified as designated waste and will be required to be managed in Class II surface impoundments. Class II surface impoundments must generally be constructed in locations where site characteristics and containment structures isolate wastes from waters of the state. CVRWQCB general orders or WDRs concerning such wastes will require compliance with the design, operating, monitoring, and reporting requirements included in Title 27 CCR §20200 et seq. for Class II surface impoundments. Exceptions to the containment standards may be made where groundwater with actual or reasonably foreseeable beneficial uses is not present or is present in insufficient quantities to serve as a source of water. Where waters with beneficial uses are present and could be adversely impacted, unlined impoundments may have to be retrofitted with liner systems consisting of low permeability natural geological materials (clay) or constructed base materials, such as high-density polyethylene.

Discharges to Injection Wells

Injection wells are subject to regulation under both the groundwater protection provisions of the Porter-Cologne Act and by DOGGR through the implementation of the federal UIC program in accordance with a 1983 primacy agreement with the EPA. In March 1988, the State Board and DOGGR entered into a MOA that outlines procedures for reporting proposed oil, gas, and geothermal field discharges and for prescribing permit requirements. The procedures are intended to provide a coordinated approach resulting in a single permit satisfying the statutory obligations of both agencies. The purpose of the MOA is to ensure that the construction or operation of Class II injection disposal wells and the land disposal of wastewaters from oil, gas, and geothermal production facilities does not cause degradation of waters of the state. The MOA provides that DOGGR has primary permit authority, subject to review and comment by the state and applicable regional boards, for injection activities regulated by the UIC program. Consistent with the MOA, SWRCB regulations exempt injection wells that are permitted by DOGGR from requirement to file a report of waste discharge or to obtain WDRs that are applicable to other discharges under state law Title 27 CCR §20090(c). The state and regional boards have primary permit authority, subject to review and comment by DOGGR, for all other oil and gas exploration and production regulated discharges. The MOA provides that the agencies will work together to review, prepare and coordinate permits and enforcement. The MOA is included as Appendix 15 of the Tulare Lake Basin Plan.

In 1983 DOGGR and the EPA entered into a primacy agreement which implements the federal UIC program in California for Class II wells. DOGGR regulates underground injection wells under 14 CCR §1724 et seq. and other regulations adopted in compliance with the state Public Resources Code and the grant of primacy from the EPA for the UIC program. All underground injection activities, whether for EOR or waste disposal, are subject to regulation under the UIC program. With the exception of hydraulic fracturing that uses diesel fuels, well stimulation activities are specifically excluded from the UIC program under federal law and are regulated under state law (see below). 14 CCR §1724.6 requires that DOGGR approve "any subsurface injection or disposal project," including all UIC Class II wells. 14 CCR §§1724.7 and 1724.8 lists the data an injection well operator must submit to DOGGR to obtain approval for cyclic steam projects. 14 CCR §1724.10 lists the filing, notification, operating, and testing requirements for underground injection projects.

In general, an injection well application must include a detailed engineering study that includes a statement of the primary purpose of the project; the reservoir and fluid characteristics of each injection zone; and the planned well drilling and plugging and abandonment program to complete the project, including a flood-pattern map showing all injection, production, and plugged and abandoned wells, and unit boundaries. The engineering study must also include casing diagrams for all idle, plugged and abandoned, and deeper-zone producing wells within the area affected by the project. The casing diagrams in the engineering study must provide evidence that plugged and abandoned wells in the area will not have an adverse effect on the project or cause damage to life, health, property, or natural resources (14 CCR § 1724.7(a)).

The area affected by a project is defined by the Area of Review (AOR) requirements in the federal UIC regulations, which include a minimum fixed radius of 0.25 mile from a well bore, unless an approved mathematical model, such as a modified "This equation" is used (40 CFR 146.6(a)). When the AOR is determined by using a 0.25-mile fixed radius, the analysis must consider the chemistry of the injected and formation fluids, hydrogeology, population, ground water use, and dependence and historical injection practices (40 CFR 146.6(b)). DOGGR nominally defines an AOR boundary for a proposed injection well as a ¼ mile perimeter around the portion of the well's path that lies within the approved zone of injection as projected on a horizontal plane at ground level. This boundary may be reduced or expanded based on pertinent information regarding a well's completion, the local geology, and other injection parameters, including approved mathematical modeling.

A geologic study and injection plan must also be submitted in support of an injection well application. The geologic study must include a structural and isopach map, a cross section, and a representative electric log that identifies all geologic units, formations, freshwater aquifers, and oil or gas zones (14 CCR §1724.7(b)). The injection plan must include a map showing all injection facilities, maximum anticipated injection pressure and volumes, monitoring system or method used to ensure that injection fluid is confined to the intended zone or zones of injection, method of injection, corrosion protective measures, the source, analysis, and treatment of the injection fluid, and the location and depth of water-source wells to be used in conjunction with the project (14 CCR §1724.7(c)). DOGGR may require additional information for projects that may be hazardous, large, unusual, or particularly complex (14 CCR §1724.7(e)). DOGGR must also approve any desired change or modification of originally-approved injection project operating methods or conditions, such as an increase in size, changed injection intervals, or injection pressure increases (14 CCR §1724.10 (a)).

The injection plan must ensure that injection fluids will be confined to the intended zone or zones of injection (14 CCR §1724.7(c)(3)). To confirm that injection fluid is confined to the approved zone or zones, and will not leak to other formations or zones during injection, mechanical integrity testing must be performed on each injection well when the project begins and periodically thereafter (14 CCR §1724.10(j)). The analysis must consider whether abandoned wells within the AOR could act as a conduit for injection fluid by determining whether adjacent wells include at least 100 linear feet of cement above the approved zone of injection, or a calculated 150 linear feet of cement above the approved zone of injection. When abandoning a well, injection well operators are also required to use every effort and endeavor to protect underground or surface water suitable for irrigation or domestic purposes from the infiltration of detrimental substances (Public Resources Code §3228).

All new wells must fill the annular space to at least 500 feet above oil and gas zones and anomalous pressure intervals (14 CCR §1722.4). All perforations in plugged and abandoned wells must be cemented across and plugged at least 100 feet above the top of a landed liner, the uppermost perforations, the casing cementing point, the water shutoff holes, or the oil and gas zone, whichever is highest (14 CCR §1723.1(b)). A minimum 200-foot plug is required across all fresh-saltwater interfaces. An interface plug may be placed wholly within a thick shale if the

shale separates the freshwater from the brackish or saltwater sands. If there is cement behind the casing across the fresh-saltwater interface, then a 100-foot plug is required inside the casing across the interface. Squeeze-cementing, a cavity shot, or other special plugging procedures may be required in certain circumstances (14 CCR §1723.2).

Injection well operators are required to maintain data establishing the performance and safety of an injection project and make that data available for periodic review by DOGGR (14 CCR §1724.10(h)). It is DOGGR's policy to review the data for each project on an annual basis to: (1) determine if the injection project is consistent with the permit conditions stated purpose; (2) ensure that all required testing has been performed; (3) determine if there have been any changes to the project, including any drilled, reworked, or abandoned, wells in the AOR, and that any such work was properly completed; (4) confirm that injection fluid is confined to the permitted zone of injection; and (5) confirm that no damage is occurring from the injection project.

The maximum allowable sustained surface injection pressure (MASP) for an injection project must be below the fracture pressure. Prior to sustained injection, a step-rate test must be conducted to determine the MASP (14 CCR §1724.10(i)). DOGGR must be notified in advance of the step-rate test so that it may be witnessed by DOGGR staff. Test pressure must be from hydrostatic to the pressure required to fracture the injection zone or the proposed injection pressure, whichever occurs first. Operators must monitor all injection wells to confirm that injection is at or below the approved MASP. If the injection pressure is above the approved MASP, the operator must immediately reduce the injection pressure. In March 2015, the Supervisor of the DOGGR published a letter in response to inquiries from and a hearing held by the state Senate Committee on Natural Resources and Water confirming that certain steam injections in brittle diatomite formations were known to fracture the diatomite. The letter indicated that DOGGR regulations concerning steam injection were outdated and would be subject to further review and revision in conjunction with other revisions to the UIC program in response to aquifer exemption concerns raised by the EPA (Bohlen 2015).

A Standard Annular Pressure Test (SAPT) must be performed for each injection well prior to commencement of injection and at least once every five years thereafter (14 CCR §1724.10(j)(1)). In addition, all injection piping, valves, and facilities must meet or exceed design standards for the maximum anticipated injection pressure, and must be maintained in a safe and leak-free condition (14 CCR §1724.10(f)). Where there is only a single string of casing across water protected by the SDWA (10,000 mg/L TDS or less), the SAPT must be tested at the approved MASP for the well. All tests shall be evaluated to ensure that there are no leaks in the casing and that the fluid is confined to the permitted zone.

The regulations for well construction include standards for the use of casing, mud, and cement and prevent fluid migration and the comingling of lesser quality fluids. In addition to cement above the oil and gas zones, injection wells must be cemented across and at least 100 feet above a base freshwater interface (BFW) (14 CCR §1723.2). The hole and casing annulus space between the top of the cement isolating the oil and gas zones and the base of the cement covering the BFW interface should include heavy mud to prevent the movement of fluids (14 CCR §§1722.6 and 1723(b)). For water disposal wells with proposed injection into a non-hydrocarbon zone, well

construction should be consistent with disposal well completed into depleted oil and gas zones. In order to ensure that injected fluids are confined to the intended zone, there must be 100 feet of cement across and above the top of the intended injection zone.

In 2011, the EPA published an independent audit of the California UIC program that identified a number of potential compliance issues, including the possibility that injection wells had been permitted to discharge into 11 oilfield aquifers or other locations that met the USDW criteria but that had not been exempted in accordance with applicable requirements (Horsely-Witten Group 2011). The May 2015 letter from DOGGR and the SWRCB to the EPA refers to these aquifers as "aquifers that had historically been treated as exempt" (DOGGR 2015d). The SWRCB and DOGGR initiated a work plan to address the UIC program issues identified by the EPA review and subsequent analysis of oilfield operations. In February 2015, DOGGR and the SWRCB provided the EPA with a schedule for completing the regulatory review of the state UIC program and, in March 2015, the EPA responded to the agencies and identified deadlines and deliverables for the review process. The letters grouped potentially affected wells into three categories. Category 1 includes all disposal wells injecting into non-exempt, non-hydrocarbon bearing aquifers and into the 11 aquifers (eight of which are within the Project Area) that have historically been treated as exempt. Category 2 wells include all EOR wells injecting into non-exempt, hydrocarbon-bearing aquifers. Category 3 wells include disposal and EOR wells located inside the surface boundaries of exempted aquifers, but that may be injecting into a zone that was not subject to exemption.

The EPA letter requires completion of the Category 1 well review by May 15, 2015, the Category 2 wells by July 31, 2015, and the Category 3 wells by February 15, 2016. The letters also identify timelines for state rulemaking and public outreach, an aquifer exemption application process, and the potential inclusion of cyclic steam wells in the review process (EPA 2015b). All injection into aquifers with TDS levels of less than 3,000 mg/L must cease by October 15, 2015 unless the state applies for and the EPA approves an aquifer exemption for these locations. Operators may be required to cease injection at an earlier date if it is determined that drinking or agricultural water supplies are threatened. All injection into non-exempt aquifers with TDS levels of 3,000 to 10,000 mg/L must cease by February 15, 2017, unless the state applies for and the EPA approves aquifer exemptions for these locations. On April 2, 2015, DOGGR issued draft emergency regulations that implemented these requirements and require that all injection activity into the 11 aquifers that were historically treated as exempt must cease by December 31, 2016 unless the state applies for and the EPA approves aquifer exemptions for these locations. DOGGR's emergency regulations went into effect on April 20, 2015. As of March 2015, no contamination of water used for drinking or agricultural purposes related to underground injection by the oil and gas industry had been detected in water supply wells tested by the SWRCB (DOGGR 2015c)

DOGGR and the SWRCB provided additional information about the well review process in a May 2015 letter to the EPA. The May letter indicated that: (a) 80 of the 532 Category 1 wells identified in the February 2015 letter had been removed from the Category 1 list for various reasons, including injection into an aquifer that did not meet the criteria for a USDW, wells that had not been completed, or wells that were injecting into exempted aquifers. About 21 of the 176

wells identified in February 2015 as injecting into aquifers with less than 3,000 mg/L of TDS were also removed from the Category 1 list. The May 2015 letter also indicated that SWRCB staff had determined that 53 of the remaining 155 wells injecting into aquifers with less than 3,000 mg/L of TDS were "potentially impacting drinking water supply wells." As discussed above, 23 of these wells had been ordered to cease operations due to proximity to drinking or agricultural water supplies, and the May 2015 letter states that DOGGR and the SWRCB were "awaiting receipt of additional test data" before determining whether to order a shut-down of any of the other 30 wells by the October 15, 2015 compliance date (DOGGR 2015d). In May 2015, two environmental groups, the Sierra Club and the Center for Biological Diversity, filed a lawsuit contending that the DOGGR rules and the UIC program compliance schedule through 2017 violate state and federal laws. As of May 2015, the lawsuit remains pending in the Alameda County Superior Court and no determination has been made in the case (California Oil and Gas Report 2015).

DOGGR directly regulates the exploration and production of oil and gas in Kern County for conformance with California's conservation laws. Pursuant to CCR, Title 14, Division 2, Chapter 4, Section 1722 (k), DOGGR establishes Field Rules which supplement more broadly applicable statutory and regulatory requirements regarding well operations in order to protect California's water resources and health and safety. Each Field Rule is specific to an administrative well field and, in many cases, to Areas and Zones or Pools within a field; the rules identify downhole conditions and well construction information to be considered by the oil and gas operators when drilling and completing oil and gas wells. Field Rules have been adopted for most zones and fields in Kern County and are available online.

California Toxics Rule

In 2000, the EPA promulgated federal water quality standards for the state of California after previously adopted water quality objectives for toxic pollutants were overturned in a court proceeding. These federal water quality standards are known as the California Toxics Rule (CTR) and have since been incorporated into regional basin plans, where applicable. The State Board has adopted a policy implementing the CTR (Resolution 2000-015, as amended by Resolution 2000-30). The CTR specifies water quality criteria for 128 priority pollutants based on toxicity to aquatic species, which are used as a basis for the establishment of effluent limitations in NPDES permits. The CTR is applicable to surfaced waters only.

Senate Bill 4 (Well Stimulation Treatment)

Section 1421(d) of the federal SDWA excludes "the underground injection of fluids or propping agents (other than diesel fuels) pursuant to hydraulic fracturing operations related to oil, gas, or geothermal production activities" from regulation under the UIC program. Effective January 1 2014, California adopted several new and amended provisions of the Public Resources Code and Water Code to regulate any oil or gas well stimulation activity designed to enhance oil or gas production or recovery by increasing the permeability of the geologic formation that contains hydrocarbon deposits. Well stimulation activities covered by the new legislation include hydraulic fracturing and acid well stimulation treatments. The legislation, commonly referred to

as SB-4, amended Sections 3213, 3215, 3236.5, and 3401 of and added Article 3 to Chapter 1 of Division 3 of the Public Resources Code, and added Section 10783 to the Water Code. SB-4 requires that DOGGR: (1) promulgate emergency interim and adopt permanent regulations regulating well stimulation treatments by January, 2015, to take effect no later than July 1, 2015; (2) complete a statewide EIR on well stimulation treatments by July 2015; (3) complete an independent scientific study of well stimulation by January 2015; and (4) consult and reach formal agreements with other regulatory agencies to provide regulatory accountability for, and public transparency to, well stimulation treatments by January 2015. SB-4 also requires that the SWRCB develop model criteria for oil and gas-related groundwater monitoring by July 2015. The regulations, studies, and interagency agreements required by SB-4 are intended to regulate water quality and potential geological hazards that could be associated with well stimulation, such as earthquakes or ground instability resulting from bedrock fracturing or acidization. Geology and soils regulatory requirements associated with SB-4 are described in further detail in Section 4.6, Geology and Soils.

DOGGR adopted interim well stimulation regulations in January 2014, and readopted the interim regulations in July 2014. Proposed permanent regulations were circulated for public review and comment in October 2014, and were finalized in January 2015. The final regulations will become effective in July 2015. A draft program EIR for well stimulation in California was published by DOGGR on January 14, 2015. The public comment period for the draft EIR ended on March 16, 2015, and the EIR is scheduled to be finalized by July 2015 in accordance with SB-4.

SB-4 and the related interim and proposed permanent regulations require that certain physical well inspections, documentation, and public notices and disclosures be completed prior to and after completing a well stimulation process. The proposed regulations define well stimulation to include "a treatment of a well designed to enhance oil and gas production or recovery by increasing the permeability of the formation. Well stimulation is a short-term and non-continual process for the purposes of opening and stimulating channels for the flow of hydrocarbons. Examples of well stimulation treatments include hydraulic fracturing, acid fracturing, and acid matrix stimulation" (14 CCR §1761(a)(1)(A)). This definition "does not include routine well cleanout work; routine well maintenance; routine treatment for the purpose of removal of formation damage due to drilling; bottom hole pressure surveys; routine activities that do not affect the integrity of the well or the formation; the removal of scale or precipitate from the perforations, casing, or tubing; a gravel pack treatment that does not exceed the formation fracture gradient; or a treatment that involves emplacing acid in a well and that uses a volume of fluid that is less than the Acid Volume Threshold for the operation and is below the formation fracture gradient" (14 CCR §1761(a)(1)(B)).

Each well operator must obtain a permit from DOGGR in advance of performing a well stimulation treatment and must submit an application that includes the following information: the identification and location of the well; the time period during which the well stimulation treatment is planned to occur; a water management plan; a list of the anticipated identity and concentration of the chemical constituents of the well stimulation treatment fluids the operator plans to use; modeling of the well stimulation treatment axial dimensional stimulation area

(ADSA) and identification of plugged and abandoned wells and geologic faults within the modeled treatment area; indication that the operator is developing a groundwater monitoring plan meeting the criteria of the applicable Regional Water Quality Control Board (operations cannot commence unless a plan has been approved); an estimate of treatment- generated waste materials that are not addressed in the water management plan; identification and contact information of the operator; the depth of the base of fresh water; the results of specified evaluation and modeling; casing designs (14 CCR §§1783, 1783.1, 1784).

Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within a specified distance from the wellhead and horizontal projection of the applicable well at least 30 days prior to commencing a well stimulation treatment. Notified property owners may request baseline and follow-up water quality testing at the operator's expense, and prior notice of any such testing must be provided to the applicable RWQCB to allow for the opportunity to observe the water sampling process. Well operators must also pressure-test a well and meet certain integrity requirements prior to commencing a well stimulation treatment. An operator may conduct the stimulation activity identified in an approved application and notice within one year from DOGGR approval (14 CCR §§1783.2-1783.3).

The regulations require that, prior to conducting well stimulation, an operator must perform a pressure test after all facilities that could be affected by a proposed well stimulate are in place (14 CCR §1784.1). In addition, a cement evaluation or remediation procedure must be performed to ensure that the cement outside of the well production casing meets applicable regulatory requirements and is sufficient to ensure the geologic and hydrologic isolation of the oil and gas formation during and following the well stimulation treatment (14 CCR §1784.2).

The regulations require the operator to monitor the surface injection pressure, slurry rate, proppant concentration, fluid rate, and pressure of each annuli of the well during a well stimulation treatment. The operator must terminate the well stimulation treatment, report the incident to the Division, and conduct diagnostics in event certain performance and pressure thresholds are exceeded. Notices of any termination must be provided to DOGGR and other state agencies, including the RWQCB (14 CCR §1785) Finally, the proposed regulations require operators to perform ongoing monitoring of a well after a stimulation treatment and to immediately inform DOGGR and the Regional Water Quality Control Board, conduct diagnostics, and take all appropriate measures to prevent contamination of protected water or loss of hydrocarbon resources. Tracking of seismic activity during and after well stimulation treatment must be performed using the California Integrated Seismic Network and require evaluation if an earthquake larger than magnitude 2.7 occurs within the vicinity of a well stimulation treatment (14 CCR §1785.1). Materials used in well stimulation are subject to storage, handling and reporting requirements (14 CCR §1786). Well monitoring must be performed after each well stimulation treatment is completed, including pressure data and diagnostic testing, to verify that the well has not been breached (17 CCR §1787).

Each well operator must disclose, within 60 days after a well stimulation treatment is completed, information regarding the source, volume and composition and disposition of well stimulation

fluids, including, but not limited to, hydraulic fracturing fluids, acid well stimulation fluids, and flowback fluids (14 CCR §1788). The disclosures are provided to DOGGR and must be available online in a format that allows for searching and aggregating the information. A well stimulation treatment report must also be filed with DOGGR, including any information concerning stimulation treatments that differ from what was anticipated in the well stimulation treatment design submitted to DOGGR under Section 1784(b) and whether the actual location of the well stimulation treatment differs from what was indicated in the stimulation permit application.

Senate Bill 1281, Disclosure of Oil and Gas Water Use and Disposal

Senate Bill 1281 (SB 1281), effective January 2015, amended Sections 3226.3 and 3227 of the Public Resources Code to require that: (1) DOGGR provide the SWRCB with an annual "inventory of all unlined oil and gas field sumps"; and (2) well operators provide DOGGR with quarterly information regarding the source and disposition of water produced by or used in oil and gas production in addition to existing obligations to report gas and oil production and produced water information on a monthly basis. The new quarterly reporting requirements include information regarding: (a) the source and volume of any water, including produced water (also subject to monthly reporting) used to generate or make up the composition of any injected fluid or gas, identified by water source if more than one water source is used; (b) the volume of untreated water suitable for domestic or irrigation purposes used in oil and gas operations; (c) the treatment of water and the use of treated or recycled water in oil and gas field activities, including, but not limited to, exploration, development, and production; and (d) the specific disposition of all water used in or generated by oil and gas field activities, including water produced from each well as reported in an operator's monthly reports, and separated by volume of disposition if more than one disposition method is used. The amendments retain certain previous monthly reporting requirements in Section 3227, including: (1) the amount and gravity of oil, gas and water, and the number of days fluid was produced from each well; (2) the number of drilling, producing, injecting, or idle wells owned or operated by a person subject to reporting requirements; (3) the disposition of gas produced from each field; (4) the disposition of produced water in each field; and (5) the amount of fluid or gas injected into each well used for enhanced recovery, underground storage of hydrocarbons, or wastewater disposal. DOGGR has collected and reported the monthly data described in Section 3227 for several years. The first quarterly reports pursuant to SB 1281 are due to be filed by well operators by June 1, 2015 (DOGGR 2015e). DOGGR has indicated that the new information required by SB 1281 would be published after the close of each quarterly reporting period. SB 1281 and associated water quality regulations are described in further detail in Section 4.6, Geology and Soils.

Sustainable Groundwater Management Act

In 2014, California enacted the Sustainable Groundwater Management Act (Water Code §10720 et seq.). The Act, and related amendments to California law, require that all groundwater basins designated as high or medium priority in the DWR CASGEM program, and that are subject to critical overdraft conditions, must be managed under a new GSP, or a coordinated set of GSPs, by January 31, 2020. High- and medium-priority basins that are not subject to critical overdraft conditions must be managed under a GSP by January 31, 2022. Where GSPs are required, one or

more local groundwater sustainability agencies (GSAs) must be formed to cover the basin and prepare and implement applicable GSPs. The Act does not apply to basins that are managed under a court-approved adjudication, or to low- or very low-priority basins.

A GSA has the authority to require registration of groundwater wells, measure and manage extractions, require reports and assess fees, and to request revisions of basin boundaries, including establishing new subbasins. The preparation of a GSP by a GSA is exempt from CEQA. Each GSP must include a physical description of the covered basin, such as groundwater levels, groundwater quality, subsidence, information on groundwater-surface water interaction, data on historical and projected water demands and supplies, monitoring and management provisions, and a description of how the plan will affect other plans, including city and county general plans.

The Sustainable Groundwater Management Act defines groundwater as "water beneath the surface of the earth within the zone below the water table in which the soil is completely saturated with water, but does not include water that flows in known and definite channels." A groundwater extraction facility is defined as "a device or method for extracting groundwater from within a basin" (Water Code §10721(g-h)). GSPs are reviewed by the DWR and to ensure that, over a period of 20 years, "sustainable groundwater management" is achieved. As defined by the Act, sustainable groundwater management means that groundwater use within basins managed by a GSP will not cause any of the following "undesirable results":

- Chronic lowering of groundwater levels (not including overdraft during a drought, if a basin is otherwise managed);
- Significant and unreasonable reductions in groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degradation of water quality;
- Significant and unreasonable land subsidence; and
- Surface water depletions that have significant and unreasonable adverse impacts on beneficial uses (Water Code Section 10721(w)).

The DWR must adopt regulations for the preparation of a GSP by January 2016, and GSAs must be formed for high and medium priority basins by June 2017. The current CASGEM maps identify virtually all of the valley floor groundwater basins in the Project Area as "high priority" basins (DWR 2015b). Unless subsequently revised, GSPs must be implemented for these basins by January 2020 where critical overdraft conditions have been identified, or by 2022. At present, no GSA has been formed and no GSP has been adopted for any portion of the Project Area. In April 2015, Governor Brown issued an executive order requiring that the CASGEM groundwater level monitoring requirements identified in Water Code §10933 be implemented by local agencies by the end of 2015 (State of California 2015).

As described further in Chapter 3, Project Description, under applicable provisions of the California Constitution and state law, as interpreted by the California Attorney General, the County's authority to regulate subsurface activities relating to oil and gas exploration and production is preempted by state and federal laws and regulations. As a result, the County neither directly regulates nor can it impose mitigation measures that directly regulate subsurface activities by oil and gas operators, including those that could affect water quality. The County retains jurisdiction to regulate and require mitigation for oil and gas exploration activities that are conducted at the surface, including those that may affect subsurface water quality.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element and the Safety Element of the KCGP include goals, policies, and implementation measures related to hydrology and water quality that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.3. Physical and Environmental Constraints

Policies

Policy 1. Kern County will ensure that new developments will not be sited on land that is physically or environmentally constrained ((Map Code 2.1 (Seismic Hazard), Map Code 2.2 (Landslide), Map Code 2.3 (Shallow Groundwater), Map Code 2.5 (Flood Hazard), Map Codes from 2.6 – 2.9, Map Code 2.10 (Nearby Waste Facility), and Map Code 2.11 (Burn Dump Hazard)) to support such development unless appropriate studies establish that such development will not result in unmitigated significant impact.

Policy 2. In order to minimize risk to Kern County residents and their property, new development will not be permitted in hazard areas in the absence of implementing ordinances and programs. These ordinances will establish conditions, criteria, and standards for the approval of development in hazard areas.

Policy 3. Zoning and other land use controls will be used to regulate and, in some instances, to prohibit development in hazardous areas.

Policy 6. Regardless of percentage of slope, development on hillsides will be sited in the least obtrusive fashion, thereby, minimizing the extent of topographic alteration required and reducing soil erosion while maintaining soil stability.

Policy 7. Ensure effective slope stability, wastewater drainage, and sewage treatments in areas with steep slopes are adequate for development.

Policy 8. Encourage the preservation of the floodplain's flow conveyance capacity, especially in floodways, to be open space/passive recreation areas throughout the County.

Policy 9. Construction of structures that impede water flow in a primary floodplain will be discouraged.

Policy 10. The County will allow lands which are within flood hazard areas, other than primary floodplains, to be developed in accordance with the General Plan and Floodplain Management Ordinance, if mitigation measures are incorporated so as to ensure that the proposed development will not be hazardous within the requirements of the Safety Element (Chapter 4) of this General Plan.

Policy 11. Protect and maintain watershed integrity within Kern County.

Implementation Measures

Implementation Measure H. Development within areas subject to flooding, as defined by the appropriate agency, will require necessary flood evaluations and studies.

Implementation Measure I. Designated flood channels and water courses, such as creeks, gullies, and riverbeds, will be preserved as resource management areas or in the case of urban areas, as linear parks whenever practical.

Implementation Measure J. Compliance with the Floodplain Management Ordinance prior to grading or improvement of land for development or the construction, expansion, conversion or substantial improvements of a structure is required.

Implementation Measure M. The State Water Resources Control Board and the Local Enforcement Agency (Environmental Health Services) shall be consulted when discretionary development has been proposed near a known burn dumpsite.

Implementation Measure N. Applicants for new discretionary development should consult with the appropriate Resource Conservation District and the California Regional Water Quality Control Board regarding soil disturbances issues.

1.4. Public Facilities and Services

Goals

Goal 5. Ensure that adequate supplies of quality (appropriate for intended use) water are available to residential, industrial, and agricultural users within Kern County.

Goal 9. Serve the needs of industries and Kern County residents in a manner that does not degrade the water supply and the environment and protect the public health and safety by

avoiding surface and subsurface nuisances resulting from the disposal of hazardous wastes, irrespective of the geographic origin of the waste.

1.9. Resource

Goals

Policy 10. To encourage effective groundwater resource management for the long-term economic benefit of the County the following shall be considered:

(a) Promote groundwater recharge activities in various zone districts.

(b) Support for the development of Urban Water Management Plans and promote Department of Water Resources grant funding for all water providers.

(c) Support the development of groundwater management plans.

(d) Support the development of future sources of additional surface water and groundwater, including conjunctive use, recycled water, conservation, additional storage of surface water and groundwater and desalination.

Policy 11. Minimize the alteration of natural drainage areas. Require development plans to include necessary mitigation to stabilize runoff and silt deposition through utilization of grading and flood protection ordinances.

Policy 12. Areas identified by the Natural Resource Conservation Service (formerly Soil Conservation Service) as having high range-site value should be conserved for Extensive Agriculture uses or as Resource Reserve, if located within a County water district.

Implementation Measures

Implementation Measure C. The County Planning Department will seek review and comment from the County Engineering and Survey Services Department on the implementation of the National Pollution Discharge Elimination System for all discretionary projects.

Policy 2. Design discretionary critical facilities in the potential dam inundation area used for the storage, or use of hazardous materials to prevent onsite hazards from affecting surrounding communities in the event of inundation.

1.10. General Provisions

1.10.6. Surface Water and Groundwater

Policies

Policy 34. Ensure that water quality standards are met for existing users and future development.

Policy 39. Encourage the development of the County's groundwater supply to sustain and ensure water quality and quantity for existing users, planned growth, and maintenance of the natural environment.

Policy 43. Drainage shall conform to the Kern County Development Standards and the Grading Ordinance.

Policy 44. Discretionary projects shall analyze watershed impacts and mitigate for construction-related and urban pollutants, as well as alterations of flow patterns and introduction of impervious surfaces as required by the California Environmental Quality Act (CEQA), to prevent the degradation of the watershed to the extent practical.

Implementation Measures

Implementation Measure U. The Kern County Environmental Health Services Department will develop guidelines for the protection of groundwater quality which will include comprehensive well construction standards and the promotion of groundwater protection for identified degraded watersheds.

Implementation Measure X. Encourage effective groundwater resource management for the long-term benefit of the County through the following:

i. Promote groundwater recharge activities in various zone districts.

iii. Support the development of Groundwater Management Plans.

iv. Support the development of future sources of additional surface water and groundwater, including conjunctive use, recycled water, conservation, additional storage of surface water, and groundwater and desalination.

Implementation Measure Y. Promote efficient water use by utilizing measures such as:

i. Requiring water-conserving design and equipment in new construction.

ii. Encouraging water-conserving landscaping and irrigation methods.

Chapter 4. Safety Element

4.4. Dam Failure, Flooding, and Inundation

Policies

Policy 1. Design discretionary critical facilities located within the potential inundation area for dam failure in order to mitigate the effects of inundation on the facility; promote orderly shutdown and evacuation (as appropriate); and prevent onsite hazards from affecting building occupants and the surrounding communities in the event of dam failure.

Policy 2. Design discretionary critical facilities in the potential dam inundation area used for the storage, or use of hazardous materials to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Policy 3. Require emergency response plans for the planning area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area.

Policy 4. Encourage critical and high occupancy facilities as well as facilities for the elderly, handicapped, and other special care occupants, located in the potential inundation area below the dam to develop and maintain plans for the orderly evacuation of their occupants.

Implementation Measures

Implementation Measure A. Facilities used for the manufacture, storage, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measure B. Discretionary critical facilities within potential inundation areas shall be designed to mitigate or prevent effects of inundation.

4.5. Landslides, Subsidence, Seiche, and Liquefaction

Policies

Policy 3. Reduce potential for exposure of residential, commercial, and industrial development to hazards of landslide, land subsidence, liquefaction, and erosion.

Implementation Measures

Implementation Measure B. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation design to mitigate potential damage to buildings on sites with liquefaction potential.

Implementation Measure D. Discretionary actions will be required to address and mitigate impacts from inundation, land subsidence, landslides, high groundwater areas, liquefaction and seismic events through the CEQA process.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to hydrology and water quality.

Chapter V. Conservation Element

A. Biological Resources

Policies

Policy 2. Preserve areas of riparian vegetation and wildlife habitat within floodways along rivers and streams, in accordance with the Kern River Plan Element and channel maintenance programs designed to maintain flood flow discharge capacity (I-4).

B. Mineral Resources

Goals

Goal 4. Protect land, water, air quality and visual resources from environmental damage resulting from mineral and energy resource development.

C. Soils and Agriculture

Policies

Policy 7. Land use patterns, grading, and landscaping practices shall be designed to prevent soil erosion while retaining natural watercourses when possible (I-4).

Policy 12. Prohibit premature removal of ground cover in advance of development and require measures to prevent soil erosion during and immediately after construction (I-4).

D. Water Resources

Goals

Goal 1. Conserve and augment the available water resources of the planning area.

Goal 2. Assure that adequate groundwater resources remain available to the planning area.

Goal 3. Assure that adequate surface water supplies remain available to the planning area.

Goal 4. Continue cooperative planning for and implementation of programs and projects which will resolve water resource deficiencies and water quality problems.

Goal 5. Achieve a continuing balance between competing demands for water resource usage.

Goal 6. Maintain effective cooperative planning programs for water resource conservation and utilization in the planning area by involving all responsible water agencies in the planning process.

Policies

Policy 6. Protect planning area groundwater resources from further quality degradation (I-7).

Policy 8. Consider each proposal for water resource usage within the context of total planning area needs and priorities-major incremental water transport, groundwater recharge, flood control, recreational needs, riparian habitat preservation and conservation (I-9).

Policy 9. Encourage and implement water conservation measures and programs (I-11).

Implementation Measures

Implementation Measure 6. Support the provision of adequate wastewater collection systems and treatment reclamation and disposal facilities which will prevent groundwater degradation by onsite wastewater systems.

Implementation Measure 7. Maintain industrial waste discharge regulation and monitoring programs which protect the planning area groundwater from contaminants.

Implementation Measure 10. Support additional water conservation measures and programs of benefit to the planning area.

Chapter VIII. Safety Element

A. Seismic Safety

Goals

Goal 7. Protect land uses from the risk of dam failure inundation including the assurances that: the functional capabilities of essential facilities are available in the event of a flood; hazardous materials* are not released; effective measures for mitigation of dam failure inundation are incorporated into the design of critical facilities; and the rapid and orderly evacuation of populations in the inundation area will occur.

Critical Facilities Policies

Policies

Policy 4. Encourage critical facilities in dam inundation areas to develop and maintain plans for safe shut-down and efficient evacuation from their facilities, as appropriate to the degree of flood hazard for each facility (I-26, I-31).

Liquefaction Policies

Policies

Policy 13. Determine the liquefaction potential at sites in areas of high groundwater prior to development and determine specific mitigation to be incorporated into the foundation design, as necessary to prevent or reduce damage from liquefaction in an earthquake (I-17 through I-19).

Policy 14. Route major lifeline installations around potential liquefaction areas or otherwise protect them against significant damage from liquefaction in an earthquake (I-20).

Dam Failure Inundation Risk Policies

Policies

Policy 18. Design discretionary critical facilities located within the potential inundation area for dam failure in order to: mitigate the effects of inundation on the facility; promote orderly shut-down and evacuation (as appropriate); and, prevent onsite hazards from affecting building occupants and the surrounding communities in the event of dam failure (I-26).

Policy 19. Design discretionary facilities in the potential dam inundation area used for the manufacture, storage or use of hazardous materials to prevent onsite hazards from affecting surrounding communities in the event of inundation (I-27).

Policy 20. Require emergency response plans for the planning area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area (I-28).

Implementation Measures

Implementation Measure 2. Require detailed site studies for ground shaking characteristics, liquefaction potential, dam failure inundation and flooding potential, and fault rupture potential, as background to the design process for critical facilities under city and county discretionary approval.

Implementation Measure 17. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation designs to mitigate potential damage to buildings on sites with liquefaction potential.

Implementation Measure 20. Route major lifeline components such as for Highways, utilities and petroleum or chemical pipelines around areas of high groundwater wherever possible. Where they must cross an area of high groundwater, plans and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure 26. Develop procedures for the discretionary review of critical facilities proposed in an area of potential dam inundation. Approvals shall include requirements that emergency shut-down and facility evacuation plans be developed, maintained and exercised for each facility, and the potential effects of inundation on essential facility functions and the safety of occupants and the community in general are addressed.

Implementation Measure 27. Facilities used for the manufacture, storage or use of hazardous materials shall comply with the uniform fire code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measure 28. Incorporate Specific Plans for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans.

B. Flooding

Goals

Goal 1. Minimize hazards to planning area residents resulting from flooding.

Goal 2. Reduce the risk of flooding to land uses.

Policies

Policy 1. Develop specific standards which apply to development located in flood hazard areas, as defined by Federal Flood Insurance maps and most recent information as adopted by the responsible agency (I-1, I-2).

Implementation Measures

Implementation Measure 2. Develop procedures for the review of proposed facilities which use, manufacture or store hazardous materials proposed in areas of identified flood hazard.

D. Storm Drainage

Goals

Goal 1. Ensure the provision of adequate storm drainage facilities to protect planning area residents from flooding resulting from storm water excess.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern River Plan Element

The Kern River Plan Element, which is included in both the KCGP and the MBGP, includes implementation measures related to hydrology and water quality. The implementation policies applicable to County land within the Kern River Plan Element area are outlined below.

3.2. Open Space Versus Development

Policies

Policy 11. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, areas designated as A.4 (Mineral and Petroleum) and electrical power

lines to oil wells, water wells, and water control devises in areas designated as 8.5 (Resource Management) unless otherwise required by law, and at River crossings, or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

3.4. Floodplain Management

Policies

Policy 9. Oil and mineral exploration and production shall be allowed within the secondary floodway, provided that adverse effects on riparian vegetation and wildlife habitat are minimized. Appurtenant facilities, such as tank farms and steam generators, shall be located outside any floodway; except that they may be allowed within the 8.4/2.5 (Mineral and Petroleum/Secondary Floodway) upon showing by the operator that no other location is reasonably available for then, the proposed location and extent of construction is necessary for the operation of wells in the immediate vicinity, and the intent of this plan for the secondary floodway is followed.

Policy 10. Resource extraction activities, such as sand and gravel removal, shall comply with the "California Surface Mining and Reclamation Act of 1975."

3.5. Private Property and Public Use

Policies

Policy 2. Open space qualities of the Kern River primary and secondary floodway shall be protected consistent with policies of this plan, regardless of whether the land is in public or private ownership.

3.6. Mineral and Petroleum

Goals

Goal. To provide for the continued production of petroleum resources and to ensure that future exploration activities can take place, while ensuring that other open space values in the River area are reasonably protected. Utilize sand and gravel resources of the River in such a way as to ensure that floodway, groundwater recharge, and wildlife habitat values are protected.

Policies

Policy 1. Sand and gravel removal shall be done in such a manner as not to degrade, or otherwise adversely affect, the natural and scenic qualities of the Kern River, riparian vegetation, or wildlife habitat except as is necessary or appropriate to maintain the required channel capacity for flood control in the primary floodway.

Policy 5. Mineral and petroleum exploration and extraction activities are permitted in the primary and secondary floodways subject to regulations, to be adopted within a two-year period by the County and City to accomplish the goals and policies of this Element and to mitigate adverse impacts which may otherwise result from construction of facilities and access thereto. Such regulations shall include, but need not be limited to, requirements limiting the impact of access

and facilities construction upon adjacent areas, prohibiting activities creating obstructions to floodflow, establishing minimal standards for flood proofing all wells, pumps and associated equipment, specifying spill prevention control and counter-measure plans and emergency procedures, and specifying site and access restoration.

Chapter IV. Map Provisions and Policies

The intent of this plan with regard to the Primary and Secondary Floodways of the Kern River is that:

- No development or physical improvements for uses in the Primary Floodway that would restrict flows, interfere with groundwater recharge, or increase the rise in water surface during high flows of the Kern River, or displace the primary floodway will be permitted.

- Limited development, with an emphasis on preserving open space within the area of the Secondary Floodway, with recognition of the potential flood hazard that exists therein, may be permitted.

Chapter V. Implementation Policies

B. Open Space and Development

Implementation Policies

Implementation Policy 2. Any new non-open space development, including projects by public agencies, shall not occur without prior city or County approval of a "Development Plan." The Development Plan shall be reviewed for completeness and consistency with the following guideline:

f. A certified delineation of the primary and secondary floodways, if applicable to the site, depicting both predevelopment conditions and future development conditions.

Implementation Policy 4. All new development and accessory uses, excepting wells, shall maintain a minimum setback of 90 feet from the primary floodway line. If not feasible to do so because of lot size or configuration, new development, including accessory uses, shall maintain a setback from the primary floodway line of 60% or greater of the distance between the primary floodway line and the point of the lot farthest from the primary floodway.

Floodplain Management

Kern County has adopted a Floodplain Management Ordinance (Chapter 17.48 of the Building and Construction Code) that applies to "any man-made change to improved or unimproved real estate, including, but not limited to, buildings or other structures, mining, dredging, filling, grading, paving, excavation, drilling operations, or storage of equipment or materials." The purposes of the ordinance include the promotion of "public health, safety, and general welfare, and to minimize public and private losses due to flood conditions" and compliance "with the requirements of the NFIP Regulations." Among other implementation measures, the ordinance:

(a) restricts or prohibits certain uses that are susceptible to flood damage or increase erosion and flood heights or velocities; (b) requires that uses vulnerable to floods be protected against flood damage at the time of initial construction; (d) controls the alteration of natural floodplains, stream channels, and natural protective barriers that accommodate or channel flood waters; (e) controls filling, grading, dredging, and other development which may increase flood damage; and (f) prevents or regulated the construction of flood barriers which will unnaturally divert flood waters or which may increase flood hazards in other areas.

The KCGP Safety Element indicates that the Primary Floodplain illustrated on relevant FIRMs be mapped with respect to any proposed development. The Primary Floodplain is the area that has a 1% probability of occurrence in any given year (the 100-year floodplain). Chapter 19.50 of the Kern County Zoning Ordinance establishes a Floodplain Primary (FPP) and a combining Floodplain Secondary (FPS) district with associated restrictions on land use. The FPP District prohibits construction of storage tanks, sumps (ponds), processing equipment, or other similar facilities related to oil and gas production not expressly permitted pursuant to Section 19.50.020 and Subsection C of Section 19.50.130 of Chapter 19.50 of the Kern County Zoning Ordinance. Subsection C provides that oil or gas wells, including pumps and all other associated equipment, and feasible remedial work, improvements and floodproofing of facilities are permitted within the FPP district if they will not obstruct flows, will not cause peripheral flooding of other properties, will not cause any increase in flood levels during the occurrence of the base flood discharge, will be resistant to flotation and immune to extensive damage by flooding, and will not endanger life or property.

4.9.4 Impacts and Mitigation Measures

Methodology and Assumptions

Potential project impacts to hydrological resources are primarily related to the volume and disposition of M&I and produced water and construction and operational activities that could affect surface water or groundwater quality. As discussed in Section 3.0, potential impacts are primarily evaluated in this EIR on the basis of the projected increase in production wells within each Subarea and Tier.

The project could result in the permitting of up to 2,697 new production wells each year, 64% of which would be located in the Western Subarea, 5% in the Central Subarea, and 31% in the Eastern Subarea. About 90.1% of all new production wells (2,430 wells) would be located in existing Tier 1 production areas, including 94.2% (1,630 of 1,730 new production wells) in the Western Subarea, 76.3% (100 of 131 new production wells) in the Central Subarea, and 83.7% (700 of 836 new production wells) in the Eastern Subarea. Up to 6.3% of the new production wells in the Project Area (169 wells per year) would be located in Tier 2 areas where agriculture is currently the predominant land use. Using the ground disturbance factors discussed in Appendix F, up to 4,856 acres of new disturbance could occur each year in the Project Area, of which 90.6% (4,400 acres) would occur in existing Tier 1 production areas, and 298 acres (6.13%) would occur in Tier 2 areas. About 158 acres of new disturbance could also occur in

Tiers 2 through 5. These estimates are conservative because new well construction and operations would likely utilize existing access roads and other oil and gas infrastructure to a greater extent than assumed in the impact projections, especially in more heavily developed Tier 1 areas.

The Applicant estimates that demand for water needed for oil and gas exploration and production activities would increase by about 37% from 2012 to 2035, based on anticipated increases in production activity. The methodology used to estimate future water demand is described in detail in Appendix T. The analysis indicates that M&I water demand would increase from 8,778 AF to 11,761 AF, and produced water demand for oil and gas uses would increase from 88,812 AF to 121,412 AF over this period. The Applicant's water demand estimates assume that 32,771 AF of treated produced water, the amount supplied for agricultural use in 2012, would continue to be supplied over the analysis period. As a result, total produced water demand in the Project Area for oil and gas and agricultural uses is anticipated to increase from 121,583 AF in 2012 (88,812 AF used for oil and gas activities plus 32,771 AF of agricultural reuse) to 154,183 AF in 2035 (121,412 AF used for oil and gas activities plus 32,771 AF of agricultural reuse) (Appendix T).

The extent to which future project-related M&I and produced water demand could affect surface water and groundwater quality, groundwater supply and hydrological resources is subject to several uncertainties, including: (1) the total amount of produced water that would be generated from future oil and gas exploration and production; (2) the amount of produced water reused for EOR and other oil and gas-related purposes and for agricultural irrigation; and (3) the amount of produced water that is disposed of in surface evaporation or percolation ponds or Class II injection wells. As shown on Figure 4.9.7, the ratio of produced water to recovered hydrocarbons has increased over time in the Project Area, but fell slightly between from 2012 to 2013. As existing oilfields become more depleted, it is generally expected that the volume of produced water per unit of extracted hydrocarbons would increase, but new technologies, or the potential development of new oil shale resources, may affect the future amount of produced water that is generated in the Project Area.

The amount of treated produced water available for agricultural or other non-oil and gas-related reuse, such as landscape irrigation, may also change over time in response the current drought, state policies to encourage water conservation and reuse, and in the event demand from agricultural or urban users increases. The amount of produced water disposed into surface ponds is also likely decrease in the future in response to the RWQCB and other efforts to reduce or eliminate disposal of produced water to surface ponds. As shown on Figure 4.9-15 and Table 4.9-19, the use of Class II injection wells for disposal increased since 2001, in part due to declining surface pond use.

Three projections of project-related water use in 2035 based on the Applicant's demand estimates were developed to analyze a range of potential water demand and supply outcomes. All of the scenarios assume that the amount of produced water generated by oil and gas exploration and production would increase by 38% by 2035 from 2012 levels. The three scenarios focus on potential variation in the amount of surface pond disposal, injection well disposal, and reuse of produced water that could occur under future conditions. The 2035 scenarios are summarized in Table 4.9-27.

Table 4.9-27: Oil and Gas Exploration and Production Produced and M&I Water Supply and Demand 2012 and 2035 (Scenarios 1, 2 and 3)

	2012	Scenario 1 Pro-Rata Increase	Scenario 2 50% Surface Disposal Reduction	Scenario 3 Full M&I Water Use Offset and 90% Surface Disposal Reduction
Water Supplied				
Produced Water	234,959	321,894	321,894	321,894
M&I Water	8,778	11,761	11,761	11,761
TOTAL	**243,737**	**333,655**	**333,655**	**333,655**
Water Use				
Treated Produced Water				
EOR water and steam injections, pressure maintenance and well pulling	88,668	121,215	121,215	121,215
Coil tubing, dust control, surface facility construction	144	197	197	197
Oil and gas produced water reuse	88,812	121,412	121,412	121,412

Sources: Based on Appendix T, Table 28 for 2012, and projected values for Scenarios 1-3.
Note:
All values subject to rounding error and may vary slightly from Table 28

Scenario 1

Scenario 1 assumes that produced and M&I water demand and use, and produced water disposal by injection and into surface ponds, would increase proportionately from 2012 levels. Agricultural use of treated produced water is assumed to remain at 32,771 AF per year. Under these assumptions, produced water generated in the Project Area would increase from 234,959 AF to 324,243 AF by 2035, and total demand for produced water for oil and gas activities and agricultural irrigation would increase from 121,583 AF to 154,183 AF per year, or about 48% of the available supply of produced water. The remaining 167,711 AF of produced water would be disposed into surface ponds and injection wells in the same proportion as in 2012. Surface disposal would increase from 30,223 AF to 41,806 AF, and injection well disposal would increase from 84,571 AF to 125,905 AF.

Scenario 2

Scenario 2 includes the same water supply and demand results as Scenario 1 except that the amount of produced water disposed into surface ponds is assumed to fall by 50% from 2012 levels in response to Basin Plan and other policies that discourage unlined surface pond use. Produced water that was previously disposed into surface ponds would instead be disposed into Class II injection wells. As shown in Table 4.9-27, under these assumptions produced water surface disposal would fall from 30,223 AF to 15,112 AF, and injection well disposal would increase from 127,177 AF to 152,600 AF by 2035.

Scenario 3

Scenario 3 analyzes the potential disposition of produced water assuming about 7% of the 168,983 AF of produced water subject to disposal in Scenarios 1 and 2 is treated and used for other purposes, including oil and gas operations, agricultural irrigation, or other M&I uses. This amount of additional produced water reuse would fully offset the projected oil and gas demand for 11,761 AF of M&I water in 2035. Scenario 3 also assumes that the volume of produced water disposed into surface ponds declines by 90% from 2012 levels as surface disposal is avoided except in relatively rare and unavoidable circumstances. Under these conditions, the amount of produced water that could be reused for agricultural purposes would rise from 32,771 AF to 444,532 AF, and total amount of produced water that could be used for oil and gas or agricultural activities would increase to 165,944 AF compared with 121,583 AF in 2012, and 154,183 AF by 2035 in Scenarios 1 and 2. The total amount of produced water subject to disposal would be reduced from 167,711 AF to 155,950 AF in 2035, and pond disposal would fall to 3,022 AF compared with 30,223 AF in 2012, 41,806 AF in Scenario 1, and 15,112 AF in Scenario 2. Produced water disposal by injection would be 152,928 AF, about the same as in in Scenario 2.

As discussed in Section 4.17, Utilities and Service Systems, the increased use of treated produced water to offset oil and gas M&I water use by 2035 might be pursued under the auspices of California's new Sustainable Groundwater Management Act, which requires that a groundwater sustainability plan be adopted for the project area by 2020, or by agreement between oilfield operators and other users. The feasibility of achieving the results in Scenario 3, and the extent to which additional produced water could be reused to offset oil and gas M&I water use in the

Project Area, depends on several factors, including produced water quality, treatment costs and requirements, the availability of conveyance capacity to route produced water to and from treatment facilities, and the availability of institutional mechanisms for managing produced water treatment and distribution. As discussed above, the CVRWQCB has determined that, in certain instances, even relatively high-quality produced water available from certain oilfields in the Eastern Subarea has, on occasion, not met applicable arsenic or oil and grease water quality standards. Additional management measures, including percolation into water banking facilities, have been required to address these water quality concerns (CVRWQCB Order R5-2011-0900 and CVRWQCB Order R5-2012-0058). The reuse of additional produced water, particularly supplies with lower quality than available in the Eastern Subarea, could require more intensive, technically demanding and more costly forms of treatment. It is possible that treatment requirements could have other environmental effects related to increased energy use and air quality and greenhouse gas emissions, or post-treatment waste stream disposal. Although the Kern-Tulare Water District has proposed to use 8,000 AF per year of treated produced water in the Western Subarea, no agreements to reuse produced water for agriculture other than with the CWD have been approved and implemented in the Project Area.

Oil and gas operators may be able to substitute additional produced water for M&I supplies to conduct certain oilfield activities, including EOR and steam production. EOR activities currently account for the largest share of oil and gas M&I water use. Certain EOR operations, such as steam generation, may require higher-quality water supplies than can be typically be obtained from treated produced water to avoid equipment corrosion or damage and potential chemical interactions. The use of produced water for other oilfield activities, such as discharge for dust suppression, would require additional permitting and approvals to avoid impacts to biological, water and other resources. The extent to which oilfield operators can feasibly increase produced water reuse and decrease M&I demand is uncertain. The Project Applicant has estimated that up to 1,200 well stimulation treatment operations subject to California's SB-4 regulations could occur per year, including 1,050 stimulations in the Western Subarea (88% of the total number of stimulations), 125 in the Central Subarea (10% of the total number of stimulations), and 25 in the Eastern Subarea (2% of the total number of stimulations). About 90.1% of all well stimulation treatments (1,081) would be located in existing Tier 1 production areas, and 6.3% (76) would be located in Tier 2. About 2,231 wells would be plugged and abandoned in accordance with DOGGR regulations each year, including 1,839 wells in the Western Subarea (82% of the total wells), 38 in the Central Subarea (2%), and 354 (16%) in the Eastern Subarea. About 90.1% of all new plugged and abandoned wells (2,010 wells) would be located in existing Tier 1 production areas, and 6.3% (141 wells) would be located in Tier 2.

The following sections evaluate potential project-related construction and operational impacts to hydrological resources, and identify appropriate mitigation where required and feasible, with reference to the thresholds of significance discussed below.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would have a significant impact on hydrology and water quality if it would:

- Violate any water quality standards or waste discharge requirements;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted);
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on site or off site;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site;
- Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- Otherwise substantially degrade water quality;
- Place housing within a 100-year flood hazard area as mapped on a federal flood hazard boundary or flood insurance rate map or other flood hazard delineation map;
- Place within a 100-year flood hazard area structures that would impede or redirect flood flows;
- Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam;
- Contribute to inundation by seiche, tsunami, or mudflow.

Project Impacts

Impact 4.9-1: Violate Any Water Quality Standards or Waste Discharge Requirements

As discussed in Chapter 3, Project Description, project-related construction activities include geophysical surveys, well pad preparation, drilling, well completion, testing, construction and use of temporary drilling sumps, access road construction, distribution line construction, pipeline construction, spill prevention activities, and also well re-working, well plugging and abandonment, and revegetation. Operational activities include geophysical monitoring, oil production (including enhanced oil recovery using steam and water flood and well stimulation treatments), oil and gas treatment, produced water treatment, routine well maintenance (excluding reworking and plugging and abandonment which are considered as part of construction

activities), pipeline maintenance, distribution line maintenance, wastewater treatment and injection, waste treatment and disposal, access road maintenance, vegetation maintenance and spill prevention activities.

Construction Impacts

Stormwater and Runoff Impacts

Construction activities related to well drilling, reworking, and plugging and abandonment would modify site soils and vegetation during the clearance and grading of well and related structural pads, access roads, utility infrastructure for pipeline subsurface or surface installation. Based on the conservative impact estimates described in Appendix F, the potential development of 2,697 new production wells per year in the Project Area could disturb up to 4,856 acres per year. Over 90%, or 4,400 acres, of this disturbance would be located in existing Tier 1 areas that are currently subject to the highest level of existing disturbance from current and historical oil and gas exploration and production activities. New well development could disturb up to 298 acres in Tier 2 areas, where agriculture is the predominant land use, and up to 158 acres in Tiers 3 through 5, which generally include constructed landscapes. Construction period activities that disturb soils and surface vegetation could mobilize sediment, debris and other site constituents that may be transported to surface water or percolate into groundwater due to storm event runoff, nuisance flows, or to a lesser extent by vehicle tracking, potentially causing exceedances of water quality standards if not controlled and therefore, there could be significant impacts.

As discussed above, oil and gas operations that are located in proximity to or hydrologically connected to waters of the United States are generally subject to the requirements of the Construction General Permit and Industrial General Permit adopted by the SWRCB unless otherwise subject to an exemption or waiver. These permits require strict compliance with water quality standards through the implementation of BMPs and other measures. To the extent that some oil and gas activities are exempt from either the Construction General Permit (e.g., due to the small area of land disturbance) or the Industrial General Permit, BMPs may still be utilized to prevent or minimize pollutants from becoming entrained in stormwater. The American Petroleum Institute (API) and other sources of applicable industry engineering standards publishes and regularly updates oil and gas industry standards and criteria for stormwater and runoff management. Significant impacts to water quality standards or WDRs could occur without the implementation of mitigation measures, specifically MM 4.9-1 and MM 4.9-2, described below.

Surface or Subsurface Discharges during Well Construction or Reworking Activities

Well construction and reworking utilize and generate drilling fluids and mud that could be accidentally discharged to surface water or groundwater, potentially causing exceedances of water quality standards if not controlled and therefore, there could be significant impacts. The primary potential well construction or reworking discharge risks include:

- Drilling mud or drilling fluid spills or equipment leaks at the surface from ruptured or leaking tanks, pipes, valves, hoses, and other process equipment;

- Temporary contact of drilling fluid, possibly comingled with oil or gas from oil-bearing formations, with subsurface aquifers prior to casing a well or in the event of a well failure or blowout during the drilling process or equipment leaks at the surface from ruptured or leaking tanks, pipes, valves, hoses, and other process equipment;

- Releases of drilling muds and fluids that are temporarily stored in drilling sumps or surface ponds when closed loop drilling systems are not utilized; and

- Corrosion inhibitor or scale inhibitors, lubricants, or surfactant chemical spills or equipment leaks during mixing, use or transport to the site from ruptured or leaking tanks, pipes, valves, hoses, and other process equipment.

As shown in Table 4.9-1, drilling and reworking construction activities consume the largest portion of the oil and gas production and exploration industry's M&I water demand in 2012 and utilized about 589 AF per year. By 2035, the industry has projected that M&I water use for drilling and reworking construction would increase to about 789 AF (Table 4.9-27).

Drilling muds and fluids are currently managed by either using a closed loop system of pumps, storage tanks and fluid and mud lines trucked to and temporarily staged on the construction site, or drilling mud sumps built near a well in accordance with the SWRCB low threat discharge general permit. Materials other than drilling muds and fluids may not be discharged into a drilling sump, and the sump must be dewatered and the dried mud either removed or compacted in place if nonhazardous upon completion of drilling operations. DOGGR regulations further require that all free fluids must be removed from drilling sumps within 30 days after a drill rig is disconnected from a well, that spill contingency plans be prepared (in addition to federal requirements, if applicable, to develop SPCC plans to prevent discharges to water of the United States), that secondary containment be provided for all onsite storage of hazardous materials, and that prompt notice of spills be provided to DOGGR. The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for the operation, maintenance, and inspection of drilling fluid and mud storage, handling and conveyance equipment. DOGGR has reported that 613 spills were reported in the Project Area from 2009 through 2014, and the volume of the spills ranged from extremely small (0.025 of a gallon) to 63,000 gallons. Almost all of the spills (85%) were related to crude oil and produced water (DOGGR 2015a). These data indicate that the incidence of drilling mud and fluid related spills in the Project Area is low and that potential drilling-related spill volumes would be relatively small, but could be a significant impact if a spill occurred.

The potential for surface or subsurface discharges from well-construction and reworking activity could be significant without the implementation of mitigations, specifically MM 4.9-1, MM 4.9-2, and MM 4.9-3.

Drilling muds and fluids could also come into contact with groundwater prior to the installation of well casing and cement or in the event of a well failure during well construction or reworking. Discharges to groundwater could occur in the event of a well failure or blowout during construction. Recent estimates indicate that well construction blowout rates in the Project Area

have declined from one per 1,400 wells in the 1990s to one per 5,200 wells by 2008 (Jordan and Benson 2009). These data suggest that a well construction failure could occur about once every two years assuming future construction of about 2,600 new wells per annum. Blowouts during construction could result in a greater amount of drilling fluid and mud contact with groundwater until the well can be stabilized. Under certain circumstances, drilling muds and fluids may be comingled with oil and or gas from hydrocarbon-bearing formations and contact subsurface aquifers before the well casing and cementing process is completed or in the event of a blowout.

As shown in Table 4.9.1 and Table 4.9-15, drilling operations primarily use M&I water in combination with low concentrations of other lubricants, surfactants and other constituents and mud to complete the well drilling or reworking process. Well reworking may also involve the use of scale or corrosion inhibitors or similar chemicals to address well conditions from prior operations. M&I water is generally of higher quality than produced water, and drilling activities do not typically utilize high concentrations of potential constituents of concern or high water volumes. Typical well construction and reworking in the Project Area utilizes 0.065 to 0.25 AF of water depending on well depth and structure. Typical drilling water additives used in the Project Area are listed in Table 4.9-15.

DOGGR regulations and industry standards require the use of freshwater based drilling muds until the borehole has extended below the base of freshwater and the installation of cemented casings across water bearing zones. Drilling pressures and volumes are also monitored during boring operations to detect changes that would indicate potential contact with water-bearing formations or blowouts. Drilling personnel are trained to respond quickly to indications of contact with groundwater or potential well failure conditions. Under state law, well operators must use every effort and endeavor to prevent blowouts by installing and maintaining blowout prevention equipment. As discussed below (see well stimulation flowback impacts), and in Section 4.8, Hazards and Hazardous Materials, surface containment vessels and secondary containment facilities must be maintained to applicable standards to prevent the accidental discharge of fluids recovered from well operations, including drilling-related flowback. In certain cases, DOGGR has issued field rules for specific oilfields that address well failure and blowout risks and site-specific drilling requirements.

The use of higher quality M&I water and the generally low concentrations of drilling or rework-related constituents added to drilling fluids reduces the likelihood that temporary drilling fluid and mud contact with water-bearing formations would cause a significant impact to groundwater quality. As noted above, well construction blowout rates have substantially declined over time in the Project Area, and recent data indicates that a well construction failure could occur about once every two years assuming future construction of about 2,600 new wells per annum. MM 4.9-1 requires that all applicants comply with applicable laws, regulations, and standards, including well drilling management, construction, monitoring, blowout prevention, fluid and mud containment, and emergency response measures. Compliance with these laws, regulations, and standards would reduce potential groundwater quality impacts from contact with drilling muds or fluids during drilling and construction to less than significant levels.

Surface spills or leaks could occur during the conveyance, mixing and application of fluids and other chemicals during construction. M&I water and necessary drilling and well development chemicals, including corrosion scale inhibitors, are trucked to the construction site and pumped into a mixing tank in applicable concentrations. Drilling and reworking fluids may also be mixed offsite and trucked to the wellhead. The fluids are then pumped and piped from the mixing or delivery tanks into the well to complete the construction process.

DOGGR regulations require the preparation of spill contingency plans (in addition to federal requirements, if applicable, to develop SPCC plans to prevent discharges to waters of the United States), secondary containment for stored materials onsite, 24-hour notice of spills to the DOGGR, or immediate notification in certain circumstances, and fluid and chemical storage and handling equipment inspections and maintenance. As discussed in Section 4.8, Hazards and Hazardous Materials, surface containment vessels and secondary containment facilities must be maintained to applicable standards to prevent the accidental discharge of fluids recovered from well operations, including fluid and chemical transport and mixing operations. The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for construction period fluid mixing, storage, handling, and conveyance equipment.

DOGGR has reported that 613 spills were reported in the Project Area from 2009 to 2014, and the volume of the spills ranged from extremely small (0.025 of a gallon) to 63,000 gallons. The Project Area accounted for about 54% of all reported oil spills in California from 2009 to 2014. According to DOGGR, 85% of the oilfield spills in the state were related to crude oil and produced water. About 15% of the reported oil spills included acids (hydrochloric, hydrofluoric, sulfuric), ammonia, antifreeze, chlorine, gasoline and diesel, ferric chloride, motor oil, hydraulic oil, transformer oil, hydrogen sulfide, diatomaceous earth, mineral oil, sewage, solvents, triethylene glycol, wastewater, paint, vegetable oil as well as drilling muds (DOGGR 2015a). Many of these constituents do not appear to be related to well drilling, reworking, and other construction activities. The reported spill data indicate that the incidence of drilling and reworking construction water and chemical mixing and conveyance is low and that potential mixing and conveyance-related spill volumes would typically be relatively small. MM 4.9-1 requires that all well drilling operations comply with applicable laws, regulations and standards, including construction period fluid and chemical conveyance, mixing and application activities, as well as DOGGR regulations. MM 4.9-2 further mitigates chemical mixing and conveyance spill risks related to stormwater and runoff.

Surface or Subsurface Discharges during Well Plugging and Abandonment

Plugging and abandonment activities include purging and cleaning existing pipes and tanks and equipment dismantling and removal, and the installation of cement plugs across formations in the well bore as required to protect groundwater zones, isolate oil and gas production zones, prevent surface discharges, and avoid public health and safety risks. An open hole must be plugged with cement from at least 100 feet below the bottom to at least 100 feet above the top of each zone from which oil or gas was produced. A minimum 200-foot-thick cement plug must be placed across all fresh-brackish water interfaces or within a thick shale if such a formation separates the

fresh water sands from the brackish water sands. All perforations in a cased well must be plugged with cement. The cement plug must extend at least 100 feet above the top of the highest location of any perforations, casing cementing points, water shut-off holes, or producing zones in a well. Cement must also be placed in at least the top 25 feet inside and outside the casing strings at the surface. Discharges of residual petroleum products, other fluids in wells or related equipment, or water used for purging and cement preparation could occur during well plugging and abandonment.

The applicant has projected that up to 2,231 wells may be plugged and abandoned per year in the Project Area. As shown in Table 4.9-27, M&I water is primarily used for purging and other activities associated with plugging and abandonment, and the amount of water used for these purposes is projected to increase from about 202 AF per year in 2012 to 279 AF per year in 2035.

Well plugging and abandonment technical and safety requirements, and the handling and conveyance of purged materials generated during the closure process, are regulated under state law. DOGGR must issue a permit before any well may be plugged and abandoned, and state regulations require that water and oil and gas zones be protected by cement plugs and the installation of blowout protection equipment as necessary during the plugging process. Toxic or hazardous materials that may be generated by equipment purging must be disposed in accordance with California law, including the regulations adopted by the DTSC for any wastes that exhibit hazardous waste characteristics. Any auxiliary holes, such as "rat holes," must be filled and compacted properly, all construction materials, cellars, production pads, and piers must be removed and excavations filled with compacted earth, well locations must be graded and cleared of equipment, trash, or other waste materials, and the site must be restored to as near a natural state as practicable within 60 days after a well has been plugged and abandoned. The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for well plugging and abandonment.

The relatively low volume of higher quality M&I water used for well plugging and abandonment, and the limited amount of potentially hazardous materials that could be purged during the closure process, reduces the risk that closure construction activities could significantly affect surface water or groundwater quality to less than significant with the mitigation described above. Inactive well blowout rates are extremely low, and have been recently been estimated to average about 1 per 150,000 well operation-years in the Project Area. Inactive well blowout rates fell from 1 per 83,000 well years in 1991 through 1998 to 1 per 520,000 well operation-years in 2001 through 2008 (Jordan and Benson 2009).

Operational Period Impacts

Stormwater and Runoff Impacts

Operational activities related to oil well and facility maintenance, oil or produced water conveyance by truck, the staging and completion of well stimulation treatments, including use of trucks, storage tanks, and pumps, and the conveyance and application of EOR-related steam or water, well reworking, and plugging and abandonment, could generate soils, debris or

constituents that could be mobilized by stormwater runoff, or vehicle tracking, and reach surface water or percolate into groundwater and could result in significant impacts to water quality. These activities would occur within the conservative estimated disturbance footprint of up to 4,856 acres per year in the Project Area derived by using the factors discussed in Appendix F, and assuming potential development of 2,697 new production wells per annum. Over 90% (4,400 acres) of the potential project-related operational activity disturbance would occur in existing Tier 1, 298 acres of disturbance could occur in Tier 2, and up to 158 acres of disturbance could occur in Tiers 3 through 5.

Significant adverse operational impacts could be mitigated through MM 4.9-1 and MM 4.9-2 requiring compliance with permits, BMPs, and standards to reduce potential stormwater and runoff impacts to less than significant levels.

Oil, Produced Water, Maintenance and Production (including EOR and Well Stimulation) Chemicals, M&I Water and other Constituent Leaks and Surface Spills or Equipment Leaks at the Surface from Ruptured or Leaking Tanks, Pipes, Valves, Hoses, and other Process Equipment

Operational activities include the conveyance, storage and treatment of oil and gas and produced water extracted from production wells and M&I water used in operations, such as for supplemental EOR steam generation and maintenance purposes. As shown in Table 4.9-1 and Figure 4.9-7, over 234,000 AF of produced water was extracted, 8,778 AF of M&I water was used, and over 18,000 AF of oil was produced from the Project Area in 2012. As shown in Tables 4.9-23, 4.9-24, and 4.9-25, a number of well stimulation, scale, and corrosion inhibitors and other chemicals were transported to wells, mixed with produced or M&I water, and used for production and maintenance purposes throughout the Project Area. The Project Applicant has estimated that produced water and M&I water use would increase by about 37% from 2012, and up to 1,200 well stimulation treatments per year may occur by 2035. An extensive network of pipelines, treatment facilities, stationary and non-stationary tanks, mixing vessels, trucks and other equipment, valves, pumps, hoses and other process equipment is currently used to manage the surface storage, treatment, mixing and preparation and conveyance of oil, gas, produced water, M&I water and other operational constituents. These facilities would be expanded as necessary to accommodate the projected increase in fluid volumes over time.

Oil, gas, and water extracted from hydrocarbon-bearing formations in the Project Area are primarily conveyed by pipelines to separation facilities, usually tanks where lighter oil and gas are skimmed from the water or separated in free-water knockout tanks, heater-treaters, or wash tanks, often with added emulsion breakers. Once separated, oil and gas are collected for shipment via pipeline or truck to refiners or other users. Produced water is conveyed by pipelines or truck for subsequent reuse or disposal. Produced water is often treated to remove salts and other constituents prior to being used for steam or water EOR activities (e.g., by routing through sand filters or induced gas flotation units and the addition of scale and corrosion inhibitors). Produced water used for agricultural irrigation is also filtered through walnut shells to remove residual oil and grease. Treated water for EOR use is usually conveyed by pipeline to steam generation or water flood (heating) facilities, and then delivered to the applicable well for injection. Produced

water that is not reused is conveyed by pipeline or truck to surface ponds or waste disposal injection wells. M&I water may be conveyed by truck, pipelines, local groundwater well systems, or Project Area water district facilities to oilfields for operational use. Produced water, oil, gas, M&I water, and operational period chemicals may be stored in tanks and other containment vessels during conveyance, treatment reuse, or disposal activities throughout the Project Area.

Surface spills or leaks could occur from ruptured or leaking tanks, pipes, valves, hoses, and treatment and other process equipment used during operational oil, gas, produced water, M&I water, and chemical site treatment, conveyance, storage, and mixing and preparation activities. As discussed above, 613 spills were reported in the Project Area from 2009 to 2014, including 148 spills attributed to corrosion, 180 caused by mechanical problems, and 268 involving a leaking tank or pipe. DOGGR has estimated that 85% of the reported oilfield spills statewide during 2009 to 2014 involved discharges of crude oil, produced water, or a mixture of crude oil and produced water. The average volume of reported statewide oil and produced water spills was 1,344 gallons (42 barrels), and the mean spill volume was 210 gallons (5 barrels). About 15% of the reported oil spills included acids (hydrochloric, hydrofluoric, sulfuric), ammonia, antifreeze, chlorine, gasoline and diesel, ferric chloride, motor oil, hydraulic oil, transformer oil, hydrogen sulfide, diatomaceous earth, mineral oil, sewage, solvents, triethylene glycol, wastewater, paint, vegetable oil and drilling muds (DOGGR 2015a). Certain constituents are associated with oil and gas operational activities. If these spills occurred adjacent to or in a surface waterbody or were allowed to infiltrate into the ground and reach shallow aquifers, significant impacts to water quality could occur.

Oil and gas-related pipelines, tanks, mobile conveyances (trucks), storage, separation and treatment facilities are subject to state and federal laws and regulations, including regulations promulgated by DOGGR and engineering standards published and regularly updated by API and other sources of industry standards and operational criteria, including construction, operational, inspection, maintenance and repair standards. DOGGR regulations include tank, pipeline inspection and testing requirements, the preparation of spill contingency plans (in addition to federal SPCC plans, if applicable), secondary containment for stored materials onsite, notice of spills to the DOGGR, and fluid and chemical storage and handling equipment inspections and maintenance. As discussed in Section 4.8, Hazards and Hazardous Materials, other state and federal agencies regulate the storage, treatment, road transportation and other activities involving crude oil, produced water and M&I water, production chemicals, and other similar materials for health, safety and hazard prevention purposes. On average, about 100 oil and produced water leaks and spills were reported each year in the Project Area. The statewide data reported by DOGGR indicates that the total annual volume of these spills ranged from 0.06 acre-foot using a reported mean spill volume of 210 gallons, to 0.4 acre-foot based on the reported average spill volume of 1,344 gallons. (DOGGR 2015a)

Given the history of spills in the area, spills would be expected to continue to occur under the Project. Depending on the location of future spills, water quality could be significantly impacted. MM 4.9-1 requires compliance with all applicable laws and regulations, including spill prevention and response measures. With this mitigation, potential impacts related to oil, produced

water, maintenance and production (including EOR and well stimulation) chemicals, M&I water and other constituent leaks and surface spills or equipment leaks at the surface from ruptured or leaking tanks, pipes, valves, hoses, and other process equipment would be less than significant.

Surface or Subsurface Discharges Related to Produced Water Reuse and Disposal

As shown in Table 4.9-1, produced water accounts for the largest volume of fluids generated by oil and gas exploration and production activities in the Project Area. Over 234,000 AF of produced water was extracted in 2012, and by 2035 the annual amount of produced water could increase to nearly 322,000 AF (Table 4.9-27). All three of the 2035 scenarios in Table 4.9-27 project that oil and gas industrial demand for produced water would increase from 88,812 AF to 121,412 AF over the same period. Most of this demand would be met by using treated produced water for EOR steam and water injection. Scenarios 1 and 2 assume that 32,771 AF per year of produced water, all in the Eastern Subarea, would continue to be treated and used for agricultural irrigation. Scenario 3 projects that agricultural reuse could increase to 44,532 AF if about 7% of the produced water that would otherwise be disposed in 2035 was treated and made available for reuse. As discussed above and in Section 4.17, Utilities and Service Systems, the increased use of produced water summarized in Scenario 3 could be pursued in part under the auspices of the groundwater sustainability planning process that must be completed for aquifers in the Project Area by 2020, but the feasibility of reusing significant additional amounts of produced water is uncertain due to potential water quality, treatment, conveyance and other potential constraints.

Disposed produced water volumes vary in each scenario depending on the extent to which surface disposal into ponds would be curtailed over time and, in Scenario 3, whether additional volumes of produced water are reused. Scenario 1 assumes that the relative volumes of produced water disposed to surface ponds and by underground injection, and the amount of agricultural reuse, remains constant over time. About 167,711 AF of produced water would be disposed under these assumptions compared with 114,794 AF in 2012, including 41,806 disposed to ponds, and 125,905 AF disposed by injection (Table 4.9-27). As discussed in the Basin Plan surface disposal is known to have impacted groundwater quality, and oil and gas operators have been utilizing injection for disposal to a much greater extent since 2001. Scenario 2 shows that if surface disposal volumes are reduced by 50% from 2012 levels, surface ponds would account for 15,112 AF of produced water disposal, and injection disposal would increase to 152,600 AF by 2035. Scenario 3 assumes surface disposal is reduced to 90% below 2012 levels and that additional produced water reuse would offset oil and gas industry M&I demand by 2035. Under these assumptions, surface disposal would fall to 3,022 AF and injection disposal would be 152,928 AF in 2035.

Produced Water Reuse for EOR Activities

As shown in Table 4.9-27, the use of produced water for EOR purposes is expected to increase from about 88,668 AF in 2012 to over 121,215 AF per year in 2035, or by 32,547 AF. Most of this increase would likely occur in the Western Subarea, which accounted for about 85% of produced water EOR use compared with 56% of the total produced water generated in the Project Area in 2012 (Tables 4.9-2 to 4.9-4). The Eastern Subarea accounted for about 14% of all EOR

use in 2012 compared with 43% of total Project Area produced water in 2012. More than 70% of the Subarea's produced water was treated and provided for agricultural irrigation. The Central Subarea accounted for 1% of the Project Area produced water generation and EOR use in 2012.

The purpose of EOR activities in the Project Area is to mobilize crude oil by injecting steam or heated or unheated water at varying pressures into the hydrocarbon-bearing formations. Produced water is obtained from hydrocarbon-bearing formations, and is subject to treatment for many EOR applications, including steam generation. As shown in Table 4.9-27, about 7,279 AF of M&I water was also used as a supplemental EOR steam supply in 2012, and this supply is projected to increase to about 9,754 AF by 2035. As a result, the EOR activities cycle water from hydrocarbon-bearing formations through treatment and EOR preparation processes, including heating or steam generation, back to the same or similar hydrocarbon-bearing formations. In certain instances, the produced water is blended with higher-quality M&I water before reinjection. Cycling produced water from and back into hydrocarbon-bearing formations, often after treatment or blending that improves water quality, would not significantly change or adversely affect water quality in EOR injection zones.

EOR activities could result in unintended discharges to groundwater in the event of a casing or well failure, which might allow injected steam or produced water to migrate from breach locations to other water-bearing formations. EOR activities can expose internal well structures to significant heat and pressure, which could increase the risk of well failure and groundwater impacts. Recent studies indicate that, partially in response to improved well construction practices implemented in the mid-1990s, Project Area blowout rates for steam injection wells were reduced from 1 per 5,900 well years in 1991 through 1998 to 1 per 100,000 well years in 2001 through 2008 (Jordan and Benson, 2009). Well collapse has been documented to occur in the Project Area during the last five years. As discussed in Section 4.8, Hazards and Hazardous Materials, and in a March 2015 letter from DOGGR to the state Senate Committee on Natural Resources and Water, in 2011 an EOR steam well failure collapsed the ground at the well surface and caused a fatality in the South Belridge oilfield (DOGGR 2012).

EOR activities are regulated by DOGGR as Class II injection under the state's federally approved UIC program. The DOGGR UIC regulations require that all injections, including EOR steam and water injections, be permitted by DOGGR and that all wells subject to EOR injection be regularly inspected and tested for structural integrity. The regulations also include EOR safety and fluid management requirements. The federal SDWA prohibits Class II injection, including EOR activities, into any aquifer that qualifies as a USDW unless that aquifer has been specifically exempted by the EPA. One of the statutory criterion for USDW exemption is the presence of commercially producible hydrocarbons. As discussed above, in February 2015, DOGGR identified 1,721 wells in the Project Area that were injecting EOR-related steam or water into formations that may meet SDWA standards but were not clearly exempted. DOGGR indicated in a letter to the EPA that because these wells injected into commercially active hydrocarbon-bearing formations, DOGGR would apply to have the EPA exempt the affected formations. The EPA has set a deadline of February 15, 2017, for the cessation of all injections into non-exempt aquifers unless the state applies for USDW injection exemptions are approved for the affected

locations. DOGGR adopted emergency regulations codifying the compliance dates in the regulatory review schedule, which went into effect on April 20, 2015.

In May 2015, the SWRCB and DOGGR published a letter to the EPA stating that "approximately 3,600 cyclic steam wells that had some injection reported in 2014" had been identified, and that DOGGR databases show these wells "as not being associated to a permitted injection project." Almost all of these cyclic steam wells are located in the Project Area. The May letter states that because most of the cyclic steam wells inject steam for a limited duration and volume into "zones laden with hydrocarbons" or formations with "little or essentially no permeability, the wells are "very unlikely" to pose a threat to water supply wells. The state review of the 3,600 cyclic steam wells described in the May 2015 letter would be completed by July 2015 (DOGGR 2015d). Although produced water use for EOR generally cycles water from hydrocarbon-bearing formations to the surface for treatment and reinjection into the same or similar hydrocarbon-bearing formations, injection into a non-exempt USDW could significantly impact water quality in or near the affected zones.

Produced Water Reuse for Agricultural Irrigation

As shown in Table 4.9-1, 32,771 AF of produced water was supplied to the Cawelo Water District (CWD) in the Eastern Subarea for agricultural irrigation in 2012. The water is treated by oil and gas operators prior to delivery to remove certain constituents, including oil and grease and dissolved solids. The treated water is conveyed through a system of canals and pipelines to CWD reservoirs, blended to further reduce constituent concentrations, and discharged for irrigation. As discussed above, the use of the treated produced water in the Project Area for agricultural irrigation is subject to permits issued by the CVRWQCB, and in certain instances, has exceeded allowable limits for arsenic and oil and grease. The permits require water quality monitoring, and corrective action, including percolation into water banking facilities to filter arsenic from the banked water, has been implemented to ensure compliance. Scenarios 1 and 2 are based on applicant projections that the current level of produced water use for agriculture would remain unchanged through 2035. Under these assumptions, the Project would not change, and would not result in any impacts to, existing produced water reuse for agriculture.

As discussed in more detail in Section 4.17, Utilities and Service Systems, California is experiencing a severe drought and has implemented unprecedented water use reduction measures to address historically low snowpack and rainfall levels. The drought has had substantial impacts in Kern County, which relies on imported surface water and groundwater to meet urban and agricultural demand. Due to drought-related reductions in surface water availability, regional aquifers have been depleted by extractions in lieu of surface water use to a substantial extent (DWR 2014). As shown in the regional water supply and demand projections, Project Area demand is projected to significantly exceed supplies in single dry and multiple dry years through 2035. The projections do not assume that the implementation of the new GSP process in the Project Area may reduce groundwater extraction levels to achieve legally applicable aquifer sustainability requirements. Should groundwater extractions be further limited by the GSP, the supply shortfalls could be greater than anticipated.

The amount of produced water that is not reused but is instead disposed to surface ponds or by injection in the Project Area is projected to increase from 114,794 AF in 2012 to 167,711 AF by 2035 in Scenarios 1 and 2 (Table 4.9-27). The feasibility of treating and reusing produced water that would otherwise be disposed of, in order to reduce regional demands for surface water and groundwater, varies throughout the Project Area due to such factors as the water quality of produced water from specific formations, the technical feasibility and cost of suitable treatment, the proximity of production wells to potential users, and the availability of storage, conveyance, treatment and related facilities. The reuse of about 7% of the amount of produced water that is projected to be disposed of in 2035 would fully offset all of the oil and gas industry's projected M&I water demand of 11,761 AF in that year. As discussed above and in Section 4.17, Utilities and Service Systems, however, the extent to which additional produced water can be reused is uncertain. It is possible that a regional approach for exploring the cost and feasibility of achieving this additional level of produced water reuse could be implemented as a component of the groundwater sustainability planning process. At least one Project Area water district has announced plans and has initiated the CEQA review process for the potential use of up to 8,000 AF of produced water in the Western Subarea. All produced water treatment and reuse for agricultural irrigation or other reuse that involves discharges to land is subject to regulation by the CVRWQCB.

Produced Water Conveyance and Disposal in Earthen Disposal and Percolation Ponds

As discussed above, the Basin Plan states that the disposal of produced water to earthen, unlined ponds in Project Area has impacted groundwater quality. The CVRWQCB has issued closure and monitoring orders for several ponds, primarily in the Western Subarea, where water quality impacts have been detected from pond use. The CVRWQCB is currently evaluating the location, identification, status and use of unlined ponds within the Project Area and has announced that it would increase the inspection of, update applicable permits for, or potentially require closure of many of these facilities.

As shown in Table 4.9-1, 30,223 AF of produced water was disposed to surface ponds in the project area during 2012. As shown in Table 4.9-27, the total amount of produced water generated in the Project Area is projected to increase by about 37% by 2035.

Scenario 1 projects that if surface disposal volumes increase to the same extent, 41,806 AF would be disposed to surface ponds in 2035, an increase of over 10,000 AF from 2012. Water quality impacts from the increased use of ponds that the CVRWQCB has determined to have affected groundwater quality would be significant without mitigation.

Scenario 2 assumes that surface disposal volumes are reduced to 50% of 2012 levels, or to 15,112 AF by 2035. Potential water quality impacts from pond use would be lower than under Scenario 1, but not necessarily avoided.

Scenario 3 assumes that surface disposal is reduced to 90% below 2012 levels or to 3,022 AF in 2035. This level of sump disposal could reflect the limited use of surface facilities in relatively

rare and unavoidable circumstances in the future. Potential water quality impacts from pond use levels in Scenario 3 would be lower than under Scenario 1, and Scenario 2, but impacts to groundwater quality could still occur from the remaining disposal to unlined surface impoundments. The extent to which surface disposal can be reduced by 90% as projected in Scenario 3 is uncertain.

Produced Water Conveyance and Disposal in Injection Wells

As discussed above, the Basin Plan states that, in lieu of ponds for disposal, oil and gas operators are increasingly discharging produced water to Class II injection wells. Table 4.9-19 shows that the volume of produced water disposed by injection wells in the Project Area rose from 32,059 AF in 2001 to 86,294 AF per year in 2013, a 269% increase.

The volume of produced water discharged to Class II injection wells is expected to increase by 2035 under all three scenarios. Scenario 1 shows that if 2012 surface and well injection disposal volumes increase by 37%, given the anticipated growth in total produced water generation for the Project Area, 125,905 AF would be injected in 2035, an increase of over 41,000 AF from 2012. Scenario 2 shows that, if surface disposal volumes are reduced to 50% of 2012 levels, produced water disposal by injection wells would increase to 152,600 AF by 2035. Scenario 3 shows that if surface disposal is reduced by 90% below 2012 levels, and produced water reuse increases to 44,532 AF, 152,928 AF of produced water would be disposed in injection wells by 2035.

The purpose of oil and gas-related waste injection is to safely dispose of produced water and other permitted Class II wastes into subsurface formations that are geologically isolated from, and that will contain and prevent potential future migration of the disposed materials to any USDW or other protected groundwater. Waste disposal wells may be located within oilfield boundaries, outside of active oilfields, and may be operated by oil and gas producers or independent entities on a commercial basis. As shown in Tables 4.9-2 to 4.9-4, due in part to conveyance costs, disposal injection volumes tend to, but may not necessarily occur, in the same general geographic locations where produced water and other injection wastes are generated. Injection well disposal formations can include the same or closely proximate zones from which produced water and other wastes were extracted, or in geologically distinct formations. In either case, the injection zone must be stable and prevent the migration of disposed materials to protected groundwater.

Injection well disposal could result in a discharge to groundwater in the event of a casing or well failure that allows injected materials to move from breach locations into other water-bearing formations. As the volume of waste disposal accumulates over time in specific zones, the discharge formation and portions of the well structure could become pressurized and subject to stresses that could increase the risk of well failure and groundwater impacts could increase. Recent studies have not specifically analyzed disposal injection well failure rates in the Project Area. Blowout rates for steam injection wells, which are often subject to pressurization as well as heated steam or water, fell from 1 per 5,900 well years in 1991 through 1998 to 1 per 100,000 well years in 2001 through 2008 (Jordan and Benson 2009). As discussed above, there is no data or confirmed evidence of drinking or agricultural well water contamination from current or historical oil and gas waste disposal by injection in the Project Area. As of May 2015, at least one

a lawsuit has been filed alleging injection well contamination to groundwater used by farm near Rosedale in the Central Subarea. The case is pending in the state Superior Court and no determination has yet been made in the matter.

Oil and gas waste disposal by well injection is regulated by DOGGR as a Class II injection under the federal UIC program. The DOGGR UIC regulations require that all injections, including waste disposal, be permitted by DOGGR and that all wells used for disposal be regularly inspected and tested for structural integrity. The regulations include injection well safety and fluid management requirements. The federal SDWA prohibits Class II injection, including waste disposal activities, into any aquifer that qualifies as a USDW unless the aquifer has been specifically exempted by the EPA.

As discussed above, in February 2015 DOGGR identified 532 Category 1 injection disposal wells, of which 388 were located in the Project Area, that were injecting into aquifers that could qualify as a USDW but were not clearly exempted. DOGGR also identified 176 wells, most of which were also in the Project Area, that were injecting into zones containing water with TDS levels of less than 3,000 mg/L. Due to their proximity to relatively high-quality groundwater, the UIC work plan developed by DOGGR initially focused on these 176 wells and identified injection wells within a mile at the surface and within 500 vertical feet underground of a drinking or agricultural water supply. As of March 2015, 23 injection wells in the Project Area or adjacent portions of Kern County were ordered to cease operations due to proximity to drinking or agricultural water supplies (DOGGR 2015c).

In March 2015, the EPA indicated that all injections into aquifers with TDS levels of less than 3,000 mg/L must cease by October 15, 2015, or sooner if it is determined that drinking or agricultural water supplies are threatened. Injection would only be allowed to continue into these sub-3,000 mg/L aquifers after October 15, 2015 if the aquifers were exempted by EPA. All injection into non-exempt aquifers with TDS levels of 3,000-10,000 mg/L will cease by February 15, 2017, unless the state applies for and the EPA approves USDW injection exemptions for these locations. On April 20, 2015, DOGGR emergency regulations went into effect, requiring that all injection activity into the 11 statewide and eight Project Area aquifers cease by December 31, 2016, unless the state applies for and the EPA approves USDW injection exemptions for these locations.

In May 2015, the SWRCB and DOGGR indicated that 80 of the 532 Category 1 wells identified in February 2015 had been removed from the Category 1 list for various reasons, including injection into an aquifer that did not meet the criteria for a USDW, wells that had not been completed, or wells that were injecting into exempted aquifers. About 21 of the 176 wells identified in February 2015 as injecting into aquifers with less than 3,000 mg/L of TDS were removed from the category 1 list. The May 2015 letter also indicated that SWRCB staff had determined that 53 of the remaining 155 wells injecting into aquifers with less than 3,000 mg/L of TDS were "potentially impacting drinking water supply wells." As discussed above, 23 of these wells had been ordered to cease operations due to proximity to drinking or agricultural water supplies. The May 2015 letter states that DOGGR and the SWRCB are "awaiting receipt of

additional test data" before determining whether to order a shut-down of any of the other 30 wells by the October 15, 2015 compliance date (DOGGR 2015d).

Waste disposal injection into a non-exempt USDW could significantly impact water quality in the affected zones. To reduce this potential impact to less than significant levels, MM 4.9-4 requires that for any activity for which Chapter 19.98 applies, the applicant shall not conduct any injection activity regulated by the UIC program, including EOR activities that discharge into any USDW unless the aquifer has been exempted by the EPA or injection has otherwise been authorized by the EPA or by DOGGR under delegated authority under the SDWA.

Surface or Subsurface Discharges Related to Well Stimulation Activities

As discussed in Chapter 3, Project Description, the applicant has projected that up to 1,200 well stimulation treatments per year could occur in the future, of which 88% (1,050) treatments would occur in the Western Subarea, 10% (125 well stimulation treatments) in the Central Subarea, and 2% (25 per year) in the Eastern Subarea. The projected distribution reflects the fact that well stimulation technologies are most effective in existing Western Subarea oilfield formations, and could be utilized to recover oil or gas from shale formations that occur in the Western and Central Subareas. Well stimulation technology is generally less effective in existing Eastern Subarea oilfield formations, and the Subarea contains a relatively smaller share of shale oil deposits. Consequently, although the Eastern Subarea accounted for about 35% of the Project Area's total oil production in 2012, only a limited number of well stimulations are projected to occur in that location under future conditions. As shown on Figure 4.9-8, as of March 2015, no well stimulation disclosures or notices were filed with DOGGR in the Eastern Subarea.

Well stimulations in the Project Area have primarily consisted of hydraulic fracturing and acid matrix treatments. These technologies are expected to account for most forms of well stimulation in the future. The purpose of well stimulation is to increase the permeability of a hydrocarbon-bearing formation so that oil can flow towards the well and be recovered at the surface. According to the CCST, the average water use for over 1,800 well stimulations in the Project Area during 2011 through 2014 was 0.38 AF of water. Most of the stimulation water was obtained from M&I sources. Assuming average stimulation water demand in the future could range 1-2 times the average level reported by the CCST (0.38 to 0.76 AF per stimulation) or about 456 to 912 AF per year could be used for well stimulation in the Project Area.

Well stimulation activities include staging trucks, tanks and water and chemicals at a wellhead, mixing and preparing stimulation fluids for injection into the hydrocarbon zone, the injection of treatment fluids often under pressure through the well and into the hydrocarbon zone, and temporary capping of the treatment zone during the treatment period, cap removal, the recovery of injection fluids that flow back from the treatment zone to the surface, and returning the treated well to production. Tables 4.9-23, 4.9-24, and 4.9-25, list the chemical constituents and other additives that have been identified in well stimulation disclosures and notices for the Project Area and other California locations. Potential impacts from surface discharges of well stimulation chemicals or water due to leaks or ruptures are discussed above in subsection 2, ("Oil, produced water, maintenance and production (including EOR and well stimulation) chemicals, M&I water

and other constituent leaks and surface spills or equipment leaks at the surface from ruptured or leaking tanks, pipes, valves, hoses, and other process equipment"). Other potential water quality impacts include unpermitted discharges of stimulation flowback fluids to drilling sumps or other surface impoundments, and unintended contact with groundwater due to well failures or casing leaks.

Oil and gas well stimulation activities are not regulated as underground injection under the UIC program. California has recently adopted several new and amended provisions of the Public Resources Code and Water Code (SB 4) to comprehensively regulate well stimulation activities including hydraulic fracturing and acid well stimulation treatments. Well stimulation treatments do not include routine well cleanout work, routine maintenance, routine removal of formation damage due to drilling, bottom hole pressure surveys, or routine activities that do not affect the integrity of the well or the formation. DOGGR adopted permanent regulations for well stimulation treatments in January 2015 that will become effective in July 2015. DOGGR has also published a draft statewide EIR on well stimulation treatments that must be certified by July 2015 (DOGGR 2015a), and in January 2015 the CCST published the first of three volumes that independently study well stimulation activities in accordance with state law (CCST 2015). The SWRCB is required to develop model criteria for oil and gas-related groundwater monitoring by July 2015.

The new state laws and DOGGR well stimulation regulations require that certain physical well inspections, documentation, and public notices and disclosures be completed prior to and after completing a well stimulation process. Each well operator must apply for and obtain a permit from DOGGR in advance of performing a well stimulation treatment. The application must include: the identification and location of the well; the time period during which the well stimulation treatment is planned to occur; a water management plan; a list of the anticipated identity and concentration of the chemical constituents of the well stimulation treatment fluids the operator plans to use; modeling of the well stimulation treatment axial dimensional stimulation area (ASDA) and identification of plugged and abandoned wells and geologic faults within the modeled treatment area; indication that the operator is developing a groundwater monitoring plan meeting the criteria of the applicable RWQCB (operations cannot commence unless a plan has been approved); an estimate of treatment- generated waste materials that are not addressed in the water management plan; identification and contact information of the operator; the depth of the base of fresh water; the results of specified evaluation and modeling; and casing designs.

Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within a specified distance from the wellhead and horizontal projection of the applicable well at least 30 days prior to commencing a well stimulation treatment. Notified property owners may request baseline and follow-up water quality testing at the operator's expense, and prior notice of any such testing must be provided to the applicable RWQCB to allow for the opportunity to observe the water sampling process. Well operators must also pressure-test a well and meet certain integrity requirements prior to commencing a well stimulation treatment. An

operator may conduct the stimulation activity identified in an approved application and notice within one year from DOGGR approval.

DOGGR regulations require the operator to monitor the surface injection pressure, slurry rate, proppant concentration, fluid rate, and pressure of each annuli of the well during a well stimulation treatment. The operator must terminate the well stimulation treatment, report the incident to the Division, and conduct diagnostics in event certain performance and pressure thresholds are exceeded. Notices of any termination must be provided to DOGGR and other state agencies, including the CVRWQCB. Well monitoring must continue after each stimulation treatment, including pressure data and diagnostic testing, to verify that the well has not been breached and that operators take all appropriate measures to prevent contamination of protected waters or the loss of hydrocarbon resources. Materials used in well stimulation are subject to storage, handling and reporting requirements.

Each well operator must disclose, within 60 days after a well stimulation treatment is completed, information regarding the source, volume and composition and disposition of well stimulation fluids, including, and flowback. A well stimulation treatment report must also be filed with DOGGR, including any information concerning stimulation treatments that differ from what was anticipated in the well stimulation treatment design submitted to DOGGR and whether the actual location of the well stimulation treatment differs from what was indicated in the stimulation permit application.

The volume of fluid that could be used for well stimulation in the Project Area could be over 900 AF per year if the average stimulation water use is double the consumption levels identified by the CCST for over 1,800 treatments in the Project Area. The level of activity amounts to substantially less than 1% of the volume of EOR and produced water disposal injections that are projected to occur in the Project Area. Well stimulation activities also would occur only in hydrocarbon-bearing zones that are not being used currently, and are unlikely to be used, in the future for M&I and other high-quality uses without significant treatment. DOGGR, the SWRCB and other state and federal agencies have developed comprehensive tools for monitoring and assessing the potential impacts well stimulation activities in the Project Area, and require that the stimulation process be continuously monitored and immediately terminated if there is any evidence of a well breach or other risk of an unintended discharge of stimulation fluids. As discussed above, stimulation fluids have been impermissibly discharged to drilling ponds, and certain recently posted flowback fluid testing results apparently indicate high levels of benzene and other chemicals returning to the wellhead after treatment. Although nearly 2,000 well stimulation treatments were performed in the Project Area during 2011 through 2014, there has never been a confirmed report of any well stimulation-related discharges to, or adverse effect, on surface or ground water although the potential exists for a release which could result in a significant impact.

Summary

Significant impacts could occur during both construction and operations that could result in a violation of water quality standards waste discharge requirements. With the implementation of

mitigation measures, construction and operational period impacts would be less than significant with mitigation.

Mitigation Measures

MM 4.9-1 The Applicant shall comply with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) obtaining coverage under the stormwater construction general permit and industrial general permit issued by the State Water Resources Control Board and complying with industry stormwater management standards for construction and operational activities.

MM 4.9-2 For any oil and gas activity that is not subject to state or federal stormwater management laws, regulations or general permits, the Applicant shall prepare a drainage plan that is designed to minimize runoff and minimize the potential for impeding or redirecting 100-year flood flows. The drainage plan shall be prepared in accordance with the Kern County Grading Code, the Green Code and approved by the Kern County Engineering, Surveying and Permit Services Department, Floodplain Management Section. The plan shall specify best management practices to prevent all construction pollutants from contacting stormwater, with the intent of keeping sedimentation or any other pollutants from moving offsite and into receiving waters. The requirements of the Plan shall be incorporated into design specifications. Recommended best management practices for the construction phase shall include the following:

a. Erosion Control -

    1. Scheduling of construction activities to avoid rain events.

    2. Limiting vegetation removal to the maximum extent practicable.

b. Sediment Control -

    1. Secure stockpiling of soil.

    2. Installation of a stabilized construction entrance/exit and stabilization of disturbed areas.

c. Non-stormwater Control -

    1. Proper fueling and maintenance of equipment and vehicles.

    2. Proper concrete handling techniques.

d. Waste and Material Management -

    1. Properly managing construction materials, designating construction staging areas in or around the Project site.

    2. Stockpiling and disposing of demolition debris, concrete, and soil properly.

    3. Aggressive control of litter.

4. Proper disposal of demolition debris, concrete and soil.
5. Proper protections for fueling and maintenance of equipment and vehicles.

e. Post-Construction Stabilization -

1. Ensuring the stabilization of all disturbed soils per revegetation or application of a soil binder.

MM 4.9-3 All drilling operations must either use a closed loop system to avoid discharges of drilling muds and fluids, or obtain coverage under the State Water Resources Control Board low threat discharge General Order (Waste Discharge Requirements General Order 2003-0003-DEW), obtain individual Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board for the unit, or obtain coverage under a general order issued by the Central Valley Regional Water Quality Control Board applicable to drilling ponds. Any surface ponds or sumps must be cleared of fluids and muds in accordance with the State Water Resources Control Board general order, applicable Water Discharge Requirements and Division of Oil Gas and Geothermal Resources regulations. Compliance with the State Water Resources Control Board or Central Valley Regional Water Quality Control Board low-threat discharge orders or Water Discharge Requirements, if closed-loop systems are not used, and applicable laws, regulations and standards will reduce potential surface water quality impacts from contact with drilling muds or fluids during drilling and construction to less than significant levels.

MW 4.9-4 For any activity for which Chapter 19.98 applies, the Applicant shall not conduct any injection activity regulated by the Underground Injection Control program, including enhanced oil recovery activities that discharge into any underground source of drinking water unless the aquifer has been exempted by the United States Environmental Protection Agency or injection has otherwise been authorized by the U.S. Environmental Protection Agency or by Division of Oil Gas and Geothermal Resources under delegated authority under the Safe Drinking Water Act.

MW 4.9-5 For any activity for which Chapter 19.98 applies, the Applicant shall not discharge produced water into any surface disposal facility unless the facility has received the Waste Discharge Requirements from the Central Valley Regional Water Quality Control Board, or the need for Water Discharge Requirements has been waived by the Central Valley Regional Water Quality Control Board.

MM 4.9-6 For any oil and gas activity within a mapped 100-year floodplain, the Applicant shall ensure that all constructed facilities are protected from the maximum potential elevation of flooding during a 100-year flood by elevating structures or by implementing containment berms or other protective measures in compliance with the standards in the Kern County Floodplain Management Code and Chapters 19.50 and 19.70 of the Kern County Zoning Code.

Level of Significance After Mitigation

Less than significant with mitigation

Impact 4.9-2: Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge such that there would be a Net Deficit in Aquifer Volume or a Lowering of the Local Groundwater Table Level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)

Potential Impacts to Groundwater Supply and Recharge from Produced Water Generation, Injection, and Well Stimulation

This section analyzes potential impacts to groundwater supplies and recharge that could be related to the generation and reinjection of produced water, the injection of other permitted Class II wastes, and well stimulation treatments. These activities represent the largest volume of subsurface water generation and reuse, and the oilfield activities that are most likely to introduce constituents of concern into groundwater, associated with Project Area oil and gas exploration and production activities. As shown in Table 4.9-28, produced water generation is projected to increase by 86,935 AF per year. As discussed in Section 4.17, Utilities and Service Systems, M&I water used for oil and gas exploration and production is supplied from varying sources each year. To provide a conservative assessment, this DEIR assumes that all oil and gas M&I water use is provided from Project Area groundwater. The Applicant has estimated that, in 2035, oil and gas exploration and production M&I water use would have increased by 2,983 AF from 2012 levels (Table 4.9-28).

Table 4.9-28: Produced Water Generation and M&I Water Use, 2012-2035 (acre-feet)

	Western Subarea	Central Subarea	Eastern Subarea	Total
Produced Water Generation				
2012	131,341	2,884	100,734	234,959
2035	179,937	3,951	138,006	321,894
Increase from 2012 Levels	**48,596**	**1,067**	**37,272**	**86,935**
M&I Water Use				
2012	8,358	63	357	8,778
2035	10,851	395	515	11,761
Increase from 2012 Levels	**2,493**	**332**	**158**	**2,983**

Source: Appendix T, Table 39
Note:
2035 total produced water volume assumed to be 37% above 2012 levels in each Subarea to reflect projected demand growth.

Produced water is extracted from oil-bearing formations in the Project Area and separated in tanks or other facilities to recover oil and gas. As shown in Tables 4.9-20 and 4.9-21, produced water quality varies throughout the Project Area and reflects formation- and site-specific chemical, hydrological, geological and other physical characteristics. Most produced water is saline and contains naturally-occurring hydrocarbon-related constituents, such as oil and grease, chloride, boron, benzene, toluene, ethylbenzene and xylene levels that preclude reuse for other purposes, including agricultural, residential, commercial or industrial uses, without substantial treatment. Produced water generated in the Eastern Subarea oilfields near the base of the Sierra Nevada foothills is generally higher in quality than in other Project Area locations, and 32,771 AF per year of treated produced water is supplied to the CWD for agricultural reuse under the terms of WDR permits issued by the CVRWQCB. Although the produced water is blended with other CWD supplies to further dilute post-treatment constituent levels, the CVRWQCB has required additional water quality control measures, including the infiltration of excess treated produced water supplies during winter months into a groundwater banking facility to remove naturally-occurring arsenic prior to irrigation use. Consequently, the reuse of even relatively high quality produced water requires significant treatment, blending, and continuous monitoring and management response to meet applicable water quality standards and requirements.

Other than reuse for oil and gas activities, and treated produced water used for agriculture in the Eastern Subarea, water resources in Project Area hydrocarbon-bearing formations do not support any existing land uses or planned uses in the Project Area. No drinking water, agricultural or other M&I water supply wells are located, or are likely to be installed in hydrocarbon-bearing formations due to the infeasibility and cost of treatment sufficient to render the water suitable for reuse. Oil and gas activities that cycle water from and to hydrocarbon-bearing formations are unlikely to impact the supply and recharge of groundwater that could be feasibly used for agricultural or M&I purposes.

Most of the water extracted from oil-bearing formations is also returned to the same or similar zones in the Project Area. As shown in Table 4.9-29, about 41% of the volume of produced water generated in the Project Area in 2012 was reinjected for EOR purposes. The same percentage of produced water is projected to be used for EOR purposes under future conditions. The percentage of produced water and other permitted wastes disposed by injection in 2035 is expected to increase from 2012 levels and could vary from 39% of the annual volume of produced water generated in the Project Area in Scenario 1, to 48% in Scenario 3. Consequently, depending on the reuse of produced water, oil and gas operations would re-inject 80 to 88% of the volume of produced water generated each year in the Project Area.

Table 4.9-29: Produced Water Generation and M&I Water Use, 2012-2035 (AF)

	2012	Scenario 1 Pro-Rata Increase	Scenario 2 50% Surface Disposal Reduction	Scenario 3 Full M&I Water Use Offset and 90% Surface Disposal Reduction
Total produced water generation	**234,959**	**321,894**	**321,894**	**321,894**
Total EOR Injection (produced water and M&I water sources)	**95,947**	**130,969**	**130,969**	**130,969**
Produced water EOR	88,668	121,215	121,215	121,215
M&I water EOR	7,279	9,754	9,754	9,754
Percent of Total Produced Water Generation	**41%**	**41%**	**41%**	**41%**
Injection Well Disposal	**84,571**	**125,905**	**152,600**	**152,928**
Percent of Total Produced Water Generation	**36%**	**39%**	**47%**	**48%**

Produced water EOR and disposal injections are regulated by DOGGR under the UIC program, which prohibits injection into an aquifer that meets the criteria for a USDW unless an exemption has been approved by the EPA. The UIC regulations provide that the EPA may only exempt an aquifer that meets the USDW criteria in the event that: (a) the aquifer does not currently serve as a source of drinking water; *and* (b) the aquifer cannot now and will not in the future serve as a source of drinking water because: (1) it is mineral, hydrocarbon or geothermal energy producing, or can be demonstrated to contain minerals or hydrocarbons that considering their quantity and location are expected to be commercially producible; (2) it is situated at a depth or location which makes recovery of water for drinking water purposes economically or technologically impractical; (3) it is so contaminated that it would be economically or technologically impractical to render that water fit for human consumption; or (4) it is located over a Class III well mining area subject to subsidence or catastrophic collapse; *or* (c) The total dissolved solids content of the ground water is more than 3,000 and less than 10,000 mg/L and it is not reasonably expected to supply a public water system (40 CFR 146.4).

As discussed above, in response to a program audit commissioned by the EPA, DOGGR and the SWRCB have determined that certain EOR and waste disposal injections in the Project Area were permitted in locations that may meet the USDW criteria but that were not clearly exempted by the EPA in accordance with UIC criteria. In February 2015, DOGGR and the SWRCB identified 2,021 EOR wells, including 1,721 wells in DOGGR District 4, which generally encompasses the Project Area that could be discharging into non-exempt aquifers (DOGGR 2015c). In May 2015, the SWRCB and DOGGR published a letter to the EPA indicating that "approximately 3,600 cyclic steam wells that had some injection reported in 2014" had been identified, and that DOGGR databases show these wells "as not being associated to a permitted injection project." Almost all of these cyclic steam wells are located in the Project Area. The May 2015 letter states, because that most of the cyclic steam wells inject steam for a limited duration and volume into "zones laden with hydrocarbons" or formations with "little or essentially no permeability, the wells are "very unlikely" to pose a threat to water supply wells. The state review of the 3,600

cyclic steam wells described in the May 2015 letter will be completed by July 2015 (DOGGR 2015d).

The May 2015 letter to the EPA also indicated that 53 Class II injection wells, most of which are in the Project Area, "are potentially impacting water supply wells." As discussed above, 23 of these wells have ceased operations pursuant to regulatory order or operator relinquishment, and the SWRCB has indicated that it is awaiting further test results to determine if any of the other 30 injection wells should cease operations prior to the October 15, 2015 compliance deadline (DOGGR 2015d). As of February 2015, DOGGR and the SWRCB indicated that, based water quality sampling results to date, there is no evidence that oil and gas-related injection regulated under the UIC program has affected any groundwater supplies used for drinking, agricultural or other M&I purposes in the Project Area (DOGGR 2015c).

Projected well stimulation activities in the Project Area could utilize from 456 AF of water based on the 2011 to 2014 average stimulation water use reported by the CCST (CCST 2015) to 912 AF if, on average, future stimulations use twice as much water as reported by the CCST. As shown in Table 4.9-30, 88% of all well stimulations are projected to occur in the Western Subarea. About 90.1% of all well stimulations in the Project Area would occur in existing Tier 1 areas.

Table 4.9-30: Projected Annual Project Area Well Stimulations By Subarea and Tier

	Western	Central	Eastern	Total
Total Well Stimulations	1,050	125	25	1,200
Tier 1	946	113	23	1081
Tier 2	66	8	2	76
Tier 3	27	3	1	31
Tier 4	9	1	0	11
Tier 5	1	0	0	1

Water quality data compiled by the USGS (Tables 4.9-16 to 4.9-18) indicate that, due in part to the presence of marine rocks and soils and runoff from the coastal ranges, groundwater quality in the Western Subarea is typically lower than in the rest of the Project Area. Tier 1 areas are also subject to the most significant existing oil and gas-related surface and subsurface disturbance, including oilfields that have been in continuous operation for decades.

As discussed in Impact 4.9-1 above, California has recently adopted several new and amended provisions of the Public Resources Code and Water Code to comprehensively regulate well stimulation activities including hydraulic fracturing and acid well stimulation treatments and DOGGR adopted permanent regulations for well stimulation treatments in January, 2015 that will become effective in July 2015. DOGGR has also published a draft statewide EIR on well stimulation treatments that must be certified by July 2015 and, in January 2015, the CCST published the first of three volumes that independently study well stimulation activities in

accordance with state law. The SWRCB is required to develop model criteria for oil and gas-related groundwater monitoring by July 2015.

The new state laws and DOGGR well stimulation regulations require that certain physical well inspections, documentation, and public notices and disclosures be completed prior to and after completing a well stimulation process. Each well operator must obtain a permit from DOGGR in advance of performing a well stimulation treatment. Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within a specified distance from the wellhead and horizontal projection of the applicable well at least 30 days prior to commencing a well stimulation treatment. Notified property owners may request baseline and follow-up water quality testing at the operator's expense, and prior notice of any such testing must be provided to the applicable RWQCB to allow for the opportunity to observe the water sampling process. Well operators must also pressure-test a well and meet certain integrity requirements prior to commencing a well stimulation treatment. An operator may conduct the stimulation activity identified in an approved application and notice within one year from DOGGR approval. DOGGR regulations require the operator to monitor the surface injection pressure, slurry rate, proppant concentration, fluid rate, and pressure of each annuli of the well during a well stimulation treatment. Well monitoring must continue after each stimulation treatment, including pressure data and diagnostic testing, to verify that the well has not been breached and operators take all appropriate measures to prevent contamination of protected waters. Materials used in well stimulation are subject to storage, handling and reporting requirements. The new regulations require that each well operator disclose, within 60 days after a well stimulation treatment is completed, information regarding the source, volume and composition and disposition of well stimulation fluids, including flowback fluids collected at the wellhead.

About 90% of all well stimulations are projected to occur in the Western Subarea and in existing Tier 1 locations. These areas are not currently, and are highly unlikely to become, significant sources of drinking, agricultural, or other M&I water supplies. The volume of fluids required to conduct the projected number of well stimulation per year in the Project Area is extremely small relative to groundwater supplies, extraction, and recharge in the Project Area.

According to the USGS, the primary sources of groundwater recharge in the Project Area include flows from the Kern River and artificial recharge within groundwater banking facilities (Figure 4.9-6). Secondary sources of recharge include return flows from agricultural and municipal irrigation and infiltration of flows from intermittent streams along the edge of the subbasin (USGS 2012). Using the ground disturbance factors discussed in Appendix F, up to 4,856 acres of new disturbance could occur each year in the Project Area. About 90.1% (4,400 acres) would occur in existing Tier 1 production areas, and 298 acres (6.13%) would occur in Tier 2 areas. About 158 acres of new disturbance could occur in Tiers 2 through 5, which generally include constructed landscapes. These estimates are conservative because new well construction and operations would likely utilize existing access roads and other oil and gas infrastructure to a

greater extent than assumed in the impact projections, especially in more heavily developed Tier 1 areas.

Potential project-related ground disturbance would not significantly affect the Project Area's primary sources of groundwater recharge from Kern River flows and water banking activities. As shown on Figure 3-4 (provided in Chapter 3, Project Description), existing Tier 1 areas are clustered in generally elevated portions of the Western and Eastern Subareas where little or no Kern River recharge or water bank percolation facilities are located. Except for relatively limited administrative or field-scale energy, treatment, storage and staging buildings and appurtenant structures, oil and gas exploration and production does not result in the urban-scale installation of permanent, impervious structures throughout a landscape. As discussed in Impacts 4.9-3 and 4.9-4, future oil and gas development in the Project Area would not significantly modify existing drainage patterns and infiltration and runoff rates or affect Project Area recharge activities and therefore would have a less than significant impact.

Groundwater Levels and Aquifer Volumes

As shown in Table 4.9-27, M&I water use for oil and gas exploration and production was about 8,778 AF per year in 2012 and is projected to increase to 11,761 AF per year, or by more than 2,980 AF per year, by 2035. As discussed in Section 4.17, Utilities and Service Systems, oil and gas operators obtain M&I water from several sources that vary from year to year in accordance with hydrological conditions, price and availability. To provide a conservative assessment, this EIR assumes that all oil and gas exploration and production M&I water demand is met by using groundwater of sufficient quality to potentially be utilized for agricultural, urban or other M&I activities. In normal years, the applicant has estimated that about 1.319 million AF of groundwater is withdrawn for various uses within the Project Area. In single dry and multiple dry years, groundwater withdrawals are projected to increase to 1.63 to 1.673 million AF due to the curtailment of surface supplies (Appendix T). During the current drought, CASGEM program data indicate that the Tulare Lake basin has experienced water table elevation declines of 25 to 50 feet, and among the largest groundwater withdrawals and storage reductions in California. The Kern County subbasin is considered to be the 21st most impacted of 515 subbasins in the state.

In 2012, oil and gas exploration and production M&I water use accounted for less than 1% of all water use in the Project Area and is projected to increase to about 1.2% of total water use by 2035. Assuming all M&I use was obtained from groundwater, oil and gas consumption would account for about 2% of existing normal year groundwater use in 2012, and 2.8% by 2035. The Groundwater Sustainability Management Act requires that a GSP for the Project Area must be adopted by 2020 to ensure that, over a period of 20 years, "sustainable groundwater management" is achieved. As discussed above, a GSP process has never previously been implemented in California, and regulations for the preparation of a GSP have yet to be adopted by the DWR. It is possible that groundwater use in the Project Area may be reduced from historical levels in accordance with the GSP to achieve the sustainable groundwater management requirements mandated by the new state legislation.

As discussed in Section 4.17, Utilities and Service Systems, although oil and gas use of groundwater is relatively small compared with total water and groundwater use, the volume of the industry's 2012 M&I water consumption amounted to about 4% of the total urban water demand in 2012 (8,778 AF compared with 217,226 AF for Project Area urban uses) and would be about 3.9% of projected urban demand in 2035 (11,761 AF compared with 301,736 AF for Project Area urban uses). The analysis summarized in Appendix T indicates that normal year Project Area water demand is roughly equal to available supplies under current conditions. In single dry and multiple dry years, the Project Area would experience significant supply shortfalls that could range from -315,626 AF to -817,127 AF by 2035, depending on hydrologic conditions (see Section 4.17, Utilities and Service Systems). These projections assume current levels of groundwater extraction will continue in the future, although extraction rates may be reduced by the GSP to meet statutory groundwater sustainability requirements. If groundwater extractions are more limited in the future, the supply shortfalls could be larger than projected. Under these circumstances, oil and gas exploration and production groundwater use, including an increase from 2012 levels of over 2,980 AF per year by 2035, would significantly affect available groundwater supplies in the Project Area on a Project-level and cumulative basis.

As discussed in Section 4.17, Utilities and Service Systems, potential groundwater impacts would be mitigated to less than significant levels if sufficient amounts of produced water otherwise subject to disposal were treated and reused to offset the consumption of M&I water for oil and gas exploration and production. As shown in Table 4.9-27, the industry's M&I water use is projected to be 11,761 AF, and the total volume of disposed produced water in Scenarios 1 and 2 would be 167,711 AF in 2035. About 7% of the amount of produced water that is projected to be disposed of in 2035 would be required reuse to fully offset oil and gas M&I demand in that year. It is possible that a portion of this offset could be achieved by agreement between individual oilfield operators and Project Area water districts. As discussed above, the Kern-Tulare Water District is evaluating the possibility of using 8,000 AF per year of produced water supplied from the Western Subarea oilfields. In addition, a regional produced water reuse strategy that could identify and utilize higher quality produced water to minimize treatment requirements and maximize the use existing conveyance and other infrastructure could be implemented under the auspices of the GSP. The GSP could also facilitate a regional mechanism for allocating the costs and managing the construction and operation of treatment, conveyance or other facilities that would be required to significantly increase produced water reuse. Oilfield operators could also utilize more produced water for well construction and steam production purposes to reduce M&I demand.

As discussed above and in Section 4.17, Utilities and Service Systems, the feasibility of achieving additional produced water reuse to offset oil and gas M&I water use in the Project Area, depends on several factors, including produced water quality, treatment costs and requirements, the availability of conveyance capacity to route produced water to and from treatment facilities, and the availability of institutional mechanisms for managing produced water treatment and distribution. As discussed above, the CVRWQCB has determined that, in certain instances, even relatively high-quality produced water available from certain oilfields in the Eastern Subarea has, on occasion, not met applicable arsenic or oil and grease water quality standards. Additional

management measures, including percolation into water banking facilities, have been required to address these water quality concerns (CVRWQCB Order R5-2011-0900 and CVRWQCB Order R5-2012-0058). The reuse of additional produced water, particularly supplies with lower quality than available in the Eastern Subarea, could require more intensive, technically demanding and more costly forms of treatment. It is possible that treatment requirements could have other environmental effects related to increased energy use, air quality, and GHG emissions, or post-treatment waste stream disposal. Although the Kern-Tulare Water District has proposed to use 8,000 AF per year of treated produced water in the Western Subarea, no agreement to reuse produced water for agriculture other than with the CWD has been approved and implemented in the Project Area.

Oil and gas operators may be able to substitute additional produced water for M&I supplies to conduct certain oilfield activities, including EOR and steam production. EOR activities currently account for the largest share of oil and gas M&I water use. Certain EOR operations, such as steam generation, may require higher-quality water supplies than can be typically be obtained from treated produced water to avoid equipment corrosion or damage and potential chemical interactions. The use of produced water for other oilfield activities, such as discharge for dust suppression, would require additional permitting and approvals to avoid impacts to biological, water and other resources. As discussed in Section 4.17, Utilities and Service Systems, MM 4.17-2 to MM 4.17-4 encourage the additional reuse of produced water The extent to which oilfield operators can increase produced water reuse and decrease M&I demand is uncertain.

Summary

Potential impacts to groundwater supply and recharge from produced water generation, injection, and well stimulation would be less than significant with the implementation of MM 4.9-1 through 4.9-6. However as discussed in Section 4.17, Utilities and Service Systems, while MM 4.17-2 through MM 4.17-4 would encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease M&I demand is uncertain. As a result, potential impacts to groundwater levels and aquifer volumes would be significant and unavoidable with mitigation.

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.

Level of Significance After Mitigation

Significant and unavoidable with mitigation.

Impact 4.9-3: Substantially Alter the Existing Drainage Pattern of the Site or Area, Including through the Alteration of the Course of a Stream or River, in a Manner that would Result in Substantial Erosion or Siltation On Site or Off Site

Based on the conservative impact estimates described in Appendix F, the potential development of 2,697 new production wells per year in the Project Area could disturb up to 4,856 acres per year. Over 90%, or 4,400 acres, of this disturbance would be located in existing Tier 1 areas that are currently subject to the highest level of existing disturbance from prior oil and gas exploration and production activities. New well development could disturb up to 298 acres in Tier 2 areas where agriculture is the predominant land use, and up to 158 acres in Tiers 3 through 5. As discussed in Impact 4.9-1, construction and operational activities could alter new well site topography and soil and vegetation conditions in a manner that could affect drainage patterns. Site preparation and the installation of wells and related equipment would also change the amount of impervious surfaces and runoff retention rates within new development areas.

The concentration of new well activity within existing Tier 1 areas would reduce potential impacts to drainage patterns because existing roads and infrastructure would likely be used to a greater extent in these areas and in a manner that minimizes the extent of new land disturbance. Apart from relatively limited administrative or field-scale energy, treatment, storage, and staging buildings and appurtenant structures, oil and gas exploration and production does not result in the construction of impervious surfaces on an urban scale. Most Tier 1 areas have sparse vegetation and relatively compacted soils from decades of disturbance. The projected annual acreage of potential Tier 2 disturbance amounts to less than 0.017% of the 1.791 million acres of predominantly agricultural Tier 2 land in the Project Area. Over 50 years, the projected impacts would affect 0.83% of the total Tier 2 acreage. Projected annual disturbance in Tiers 3 through 5 would affect 0.3% of the largely constructed and previously disturbed landscapes in these areas and therefore impacts would be less than significant

As discussed above, oil and gas operations that are located in close proximity with or on sites that are hydrologically connected to waters of the United States are generally subject to the requirements of the Construction General Permit and Industrial General Permit adopted by the SWRCB, unless otherwise subject to exemption or waiver. These permits require strict compliance with water quality standards through the implementation of BMPs and other measures. The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for stormwater and runoff management. MM 4.9-1 requires compliance with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) obtaining coverage under the stormwater construction general permit and industrial general permit issued by the SWRCB and complying with industry stormwater management standards for construction and operational activities. MM 4.9-2 requires that all applicants not otherwise subject to state or federal stormwater management laws, regulations or general permits implement a drainage plan as specified in the Kern County Grading Ordinance.

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.

Level of Significance After Mitigation

Less than significant with mitigation.

Impact 4.9-4: Substantially Alter the Existing Drainage Pattern of the Site or Area, Including through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner that would Result in Flooding On Site or Off Site

Based on the conservative impact estimates described in Appendix F, the potential development of 2,697 new production wells per year in the Project Area could disturb up to 4,856 acres per year. Over 90%, or 4,400 acres, of this disturbance would be located in existing Tier 1 areas that are currently subject to the highest level of existing disturbance from prior oil and gas exploration and production activities. New well development could disturb up to 298 acres in Tier 2 areas where agriculture is the predominant land use, and up to 158 acres in Tiers 3 through 5. Construction and operational activities, site preparation and installation of wells and related equipment could also change existing drainage patterns and runoff rates and result in on or offsite flooding.

As discussed in Impact 4.9-3, the concentration of new well activity within existing Tier 1 areas would reduce potential drainage-related flood risks because existing roads and infrastructure would be used to a greater extent in previously disturbed and actively operating oilfields. Apart from relatively limited administrative or field-scale energy, treatment, storage and staging buildings and appurtenant structures, oil and gas exploration and production does not result in the installation of urban-scale impervious structures throughout a site. Most Tier 1 areas also have sparse vegetation and relatively compacted soils from decades of disturbance. The projected annual acreage of potential Tier 2 disturbance amounts to less than 0.017% of the 1.791 million acres of predominantly agricultural Tier 2 land in the Project Area. Over 50 years, the projected impacts would affect 0.83% of the total Tier 2 acreage. New well construction in Tiers 3 through 5 would affect just 0.3% of the largely constructed and previously disturbed landscapes in these areas and therefore impacts would be less than significant

As discussed above, oil and gas operations that are located in close proximity with or on sites that are hydrologically connected to waters of the United States are generally subject to the requirements of the Construction General Permit and Industrial General Permit adopted by the SWRCB unless otherwise subject to exemption or waiver. These permits require strict compliance with water quality standards through the implementation of BMPs and other measures. The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for stormwater and runoff management.

With the implementation of MM 4.9-1 and MM 4.9-2, any potential impact would be further reduced.

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.

Level of Significance After Mitigation

Less than significant with mitigation.

Impact 4.9-5: Create or Contribute Runoff Water that would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Substantial Additional Sources of Polluted Runoff

About 97.4% of the Project Area consists of Tier 1 lands (10.1%) in which oil and gas activities are the predominant land use, or Tier 2 lands (87.3%) where agriculture is the predominant use. In addition, 97% of the projected annual disturbance of up to 4,856 acres would occur in Tier 1 (4,400 acres) or Tier 2 (298 acres) areas. Urban-scale constructed stormwater drainage systems occur to a limited extent in Tier 1 and Tier 2 areas. Most drainage is managed on a site-specific basis in Project Area oilfields and agricultural locations. Potential Project-related development in Tiers 3 through 5 could produce runoff to existing or planned regional or constructed stormwater drainage systems. The extent of the potential new development would affect at most 0.3% of the acreage in Tiers 3 through 5 per year and would not generate new sources of runoff that could significantly impact existing or planned drainage systems in these locations; therefore, impacts would be less than significant

Runoff water and potential polluted runoff risks would be managed by site-specific stormwater and runoff management measures. As discussed above, oil and gas operations that are located in close proximity with or on sites that are hydrologically connected to waters of the United States are generally subject to the requirements of the Construction General Permit and Industrial General Permit adopted by the SWRCB unless otherwise subject to exemption or waiver. These permits require strict compliance with water quality standards through the implementation of BMPs and other measures. The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for stormwater and runoff management.

With the implementation of MM 4.9-1 and MM 4.9-2, any potential impact would be further reduced.

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above.

Level of Significance After Mitigation

Less than significant with mitigation.

Impact 4.9-6: Otherwise Substantially Degrade Water Quality

The Basin Plan incorporates the SWRCB anti-degradation policy (SWRCB Resolution No. 68-16) and requires that "high-quality waters of the state" be maintained consistent with the maximum benefit to the people of the state. The purpose of this policy is to prevent or minimize degradation of high quality surface waters and groundwater. The Basin Plan also incorporates the SWRCB sources of drinking water policy (SWRCB Resolution No. 88-63), which provides that all surface and ground waters of the state "are considered to be suitable, or potentially suitable, for municipal or domestic water supply and should be so designated by the RWQCBs with the exception of" waters in which: (a) TDS levels exceed 3,000 mg/L (5,000 µmhos/cm electrical conductivity) and the aquifer cannot be reasonably expected to supply a public water system; (b) there is contamination, either by natural processes or by human activity (unrelated to a specific pollution incident), that cannot reasonably be treated for domestic use using either BMPs or best economically achievable treatment practices; or (c) the water source cannot provide sufficient water to supply a single well capable of producing an average, sustained yield of 200 gallons per day. The Basin Plan defines "groundwater" to mean "subsurface water that occurs beneath the ground surface in fully saturated zones within soils and other geologic formations."

To implement the SWRCB sources of drinking water policy, the Basin Plan has designated all ground waters in the Tulare Lake region, including all groundwater in the Project Area, as suitable for municipal (MUN) beneficial uses unless specifically exempted by the CVRWCB and approved for exemption by the SWRCB. The MUN beneficial use includes drinking water and water for domestic purposes. As discussed in the Basin Plan, factors the CVRWQCB considers when making exemptions to the MUN ground water designation include the exception criteria listed in Resolution No. 88-63 (discussed above), and whether a specific aquifer has been exempted by the EPA under the UIC program. As shown on Figure 4.9-11, based on the list of approved groundwater MUN designations in the Table II-2 of the Basin Plan, most of the Project Area groundwater is subject to a MUN beneficial use designation. The SWRCB sources of drinking water policy includes an exception for an aquifer that "is regulated as a geothermal energy producing source or has been exempted administratively pursuant to 40 Code of Federal Regulations, Section 146.4 for the purpose of underground injection of fluids associated with the production of hydrocarbon or geothermal energy, provided that these fluids do not constitute a hazardous waste under 40 CFR, Section 261.3" (SWRCB Resolution No. 88-63 [1988], as amended by Resolution No. 2006-0008 [2006]). As discussed below, state and federal agencies are currently updating the status of aquifer exemptions in the Project Area. Figure 4-9.11 identifies the locations in the Project Area where the groundwater MUN beneficial use has been removed by the CVRWQCB in the Basin Plan.

Except for a limited number of injection wells that are the subject of the UIC program review and revision process being conducted by DOGGR, the SWRCB, and the EPA, and one case in which surface disposal was judicially determined to impair water supplies used in an adjacent orchard,

oil and gas activities in the Project Area primarily affect groundwater with TDS levels substantially above 3,000 mg/L and that cannot be reasonably expected to supply a public water system. Groundwater in hydrocarbon-bearing zones has also been impacted by natural processes, including substantial deposits of oil, gas and other hydrocarbons and related constituents, and by human activity, including decades of prior oil and gas exploration and production activity. A substantial amount of the water that could be derived from hydrocarbon-bearing formation cannot reasonably be treated for domestic use. With the possible exception of the eight oilfield aquifers in the Project Area that DOGGR has determined were not clearly exempted under the UIC, aquifers subject to oil and gas injection, stimulation treatment or other discharges that may affect water quality would usually not meet the SDWA criteria for protection as an underground source of drinking water, or have been exempted in accordance with the UIC program.

The Basin Plan also discusses the March 1988 MOA between the SWRCB and DOGGR, under which DOGGR permits Class II injection wells in California subject to review and comment by the CVRWQCB and SWRCB. The Basin Plan indicates that the purpose of the MOA "is to ensure that the construction or operation of Class II injection disposal wells and the land disposal of wastewaters from oil, gas, and geothermal production facilities does not cause degradation of waters of the state." The Basin Plan further states that the MOA "provides a coordinated approach that results in a single permit satisfying the statutory obligations of both agencies."

The Basin Plan description of the MOA process, and the inclusion of specific MUN designation exception criteria in the 1988 SWRCB sources of drinking water policy, indicate that even if a MUN designation is applicable to most groundwater in the Project Area, permitted oil and gas activities would not degrade high-quality waters that could feasibly be used for MUN purposes and therefore the Project would have a less than significant impact to the water sources.

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.

Level of Significance After Mitigation

Less than significant with mitigation.

Impact 4.9-7: Place Housing within a 100-Year Flood Hazard Area as Mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other Flood Hazard Delineation Map

The proposed Zoning Code amendment would not affect the placement of housing within the Project Area, including within a mapped 100-year flood hazard area; therefore, the Project would result in no impacts.

Mitigation Measures

No mitigation measures are required since the Project does not include housing development.

Level of Significance

No impact.

Impact 4.9-8: Place within a 100-Year Flood Hazard Area Structures that would Impede or Redirect Flood Flows

As shown on Figure 4.9-17, about 73,000 acres of existing oil and gas administrative fields within the Project Area are within a 100-year flood hazard area identified by FEMA on applicable FIRMs. The portions of the Project Area that are located in a mapped 100-year floodplain primarily include: (a) Tier 2 lands in the northern part of the Central Subarea between Highway 46, Highway 99, Interstate-5, and the northern border of Kern County; (b) Tier 1 and Tier 2 lands in the three Subareas between northern foothills of the Tehachapi range and Highway 223; (c) Tier 1 and Tier 2 lands in the Eastern Subarea south of Bakersfield between Highway 99, Highway 223, Highway 58, and the eastern Project Area border in the Sierra Nevada foothills; (d) Tier 1 and Tier 2 lands in the Central Subarea and Western Subarea that are located within portions of the historical Kern River drainage to the west and north of Bakersfield; and (e) Tier 1 and Tier 2 lands in the far northern portion of the Western Subarea between Highway 46 and the northern border of Kern County. Project-related oil and gas exploration and production activity, including new wells, infrastructure, and oil, gas, produced water and chemical treatment and storage facilities, could occur within Project Area land that is subject to a 100-year flood risk and impede or redirect flood flows in these areas. Flooding could also damage affected structures, or mobilize constituents of concern in floodwaters that are used in and gas exploration and production and could result in significant impacts

KCGP Physical and Environmental Constraints Policy 9 discourages the construction of structures that impede water flows in a primary floodplain. Policy 10 allows for development in flood hazard areas other than primary floodplains in accordance with the KCGP and County Floodplain Management Ordinance, provided that mitigation measures are incorporated to ensure that proposed development would not be hazardous within the requirements of the KCGP Safety Element. Implementation Measure J requires compliance with the Floodplain Management Ordinance prior to grading or improvement of land for development or the construction, expansion, conversion or substantial improvements of a structure.

The Kern County Floodplain Management Ordinance (Chapter 17.48 of the Building and Construction Code) requires compliance with the NFIP regulations and: (a) restricts or prohibits certain uses that are susceptible to flood damage or increase erosion and flood heights or velocities; (b) requires that uses vulnerable to floods be protected against flood damage at the time of initial construction; (d) controls the alteration of natural floodplains, stream channels, and natural protective barriers that accommodate or channel flood waters; (e) controls filling, grading, dredging, and other development which may increase flood damage; and (f) prevents or regulates the construction of flood barriers which will unnaturally divert flood waters or which may increase flood hazards in other areas.

Chapter 4.4 of the KCGP Safety Element Flood states that damage to undeveloped areas may be intensified by structures located within a floodplain and that any further development within recognized floodplains will be required to pass adopted floodplain regulations. The Safety Element also requires that the most intensive flood hazard areas on documented FIRM maps include mapped "Primary Floodplain" areas, which are defined as the area of the floodplain bounded by floodway encroachment lines, including the land necessary to carry the design flood under conditions of full encroachment based on a 100-year flood (areas with a 1% probability of flooding in any given year). Flood hazard zoning under Chapter 19.70 of the Kern County Zoning Ordinance is required for flood hazard locations. Chapter 19.50 of the Kern County Zoning Ordinance establishes a FPP district and a combining FPS district with associated restrictions on land use. The FPP district prohibits construction of storage tanks, sumps, processing equipment, or other similar facilities related to oil and gas production not expressly permitted in Section 19.50.130(C) of the Kern County Zoning Ordinance. Subsection C provides that oil or gas wells, including pumps and all other associated equipment, and feasible remedial work, improvements and flood proofing of facilities are permitted within the FPP district if they will not obstruct flows, will not cause peripheral flooding of other properties, will not cause any increase in flood levels during the occurrence of the base flood discharge, will be resistant to flotation and immune to extensive damage by flooding, and will not endanger life or property.

Implementation of MM 4.9-1 through 4.9-6 would reduce the level of impacts to less than significant. These mitigations would requires that the applicant to comply with all applicable federal, state, regional, and local agency laws and regulations, and commonly utilized industry standards, including the Kern County Floodplain Management Ordinance, and KCGP and Zoning Code provisions related to floodplain risks. In addition, the applicant would have to implement management practices to avoid causing any adverse stormwater discharges and address potential impacts from potential oil and gas development in a 100-year floodplain:

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above.

Level of Significance After Mitigation

Less than significant with mitigation.

Impact 4.9-9: Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Flooding, Including Flooding as a Result of the Failure of a Levee or Dam

Flood risks related to precipitation, runoff and floodplain management are discussed in Impact 4.9-8. As shown on Figure 4.9-18, about 93,400 acres of existing oil and gas administrative fields within the Project Area are subject to potential inundation in the event the Lake Isabella dam facilities, located in the Sierra Nevadas, 40 miles northeast of Bakersfield, experienced a catastrophic failure under full storage conditions. In the event of a catastrophic failure, released water would flow southeast along the Kern River towards Bakersfield and eventually flood downstream locations, including valley floor portions of the Eastern Subarea south of the river,

most of the Central Subarea, and valley floor portions of the Western Subarea extending north along Interstate 5 (Figure 4.9-18). Project-related oil and gas exploration and production activities, including new wells, infrastructure, and oil, gas, produced water, and chemical treatment and storage facilities, could occur and expose people or structures to a risk of harm within Project Area that is subject to inundation from a catastrophic failure of the Lake Isabella dam.

In December 2012, the USACE issued a Record of Decision (ROD) for the implementation of the Isabella Lake Dam Safety Modification Project. The project is designed to improve the dam structure and reduce failure risks, which the Environmental Impact Statement (EIS) prepared by the USACE characterized as "unacceptable" compared with a minimum failure risk of 1 in 10,000 years. Storage and flow restrictions have been implemented and will continue to be utilized to reduce failure-related inundation risks until the safety improvements are completed as planned in 2022 (USACE 2015).

In 2008, the USACE analyzed the length of time that would elapse before potentially affected locations in the Project Area would be inundated to a depth of one foot. The analysis assumed that a catastrophic failure of the dam facilities would occur under full capacity conditions. The analysis shows that areas located near the eastern portion of the Kern River plain, and near Bakersfield, would reach one foot of inundation within 6 to 8 hours (Figure 4.9-19). One foot of inundation in the other potentially affected portions of the Project Area would occur over a period of from 8 to 36 hours.

KCGP, Chapter 4.4, Dam Failure, Flooding, and Inundation, Policy 3, requires emergency response plans for the Planning Area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area. Oil and gas facilities subject to potential flooding from a dam failure at full capacity would have at least 6 hours, and in most cases 8 to 36 hours, to evacuate affected areas before inundation would reach one foot in height. Oil and gas personnel would have sufficient time to safely evacuate affected sites after a dam failure occurred under the 2008 analysis performed by the USACE. The flow and risk management measures currently implemented for the dam, and the planned safety improvements, reduce potential inundation and failure risks from the scenarios considered in the 2008 study. Failure and inundation risks from the Lake Isabella dam will be permanently reduced to levels considered to be acceptable by the USACE after the safety improvement project is completed in 2022.

KCGP Chapter 4.4, Dam Failure, Flooding, and Inundation, Implementation Measure A requires that facilities used for the manufacture, storage, and use of hazardous materials must comply with the Uniform Fire Code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation. The greatest risks would be to business or residences located in close proximity to production facilities with tank farms or that store large quantities of hazardous materials. Risk would occur if these types of containers were breached during a flood event. Although unlikely, this could result in potentially significant impacts.

Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.

Level of Significance After Mitigation

Less than significant with mitigation.

Impact 4.9-10: Contribute to Inundation by Seiche, Tsunami, or Mudflow

None of the oil and gas exploration and production activities occurs or would occur in locations where seiche, tsunami, or mudflow inundation would occur. Therefore, there would be no impact.

Mitigation Measures

No mitigation measures are required.

Level of Significance

No impact.

4.9.5 Cumulative Setting, Impacts, and Mitigation Measures

Kern County has and is expected to continue to grow, with or without the Project, consistent with the growth projections included in the 2013 Kern Council of Government's (COG's) Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and accompanying EIR. This growth will be required to conform to all applicable federal, state, regional, and local agency laws and regulations that protect water quality, groundwater elevations and aquifer volumes (including the pending GSP development and implementation process), drainage patterns affecting siltation, erosion and flooding, the capacity of existing and planned stormwater drainage facilities, other water quality degradation, housing, people and structures in locations at risk of flood or dam-failure inundation, and other hydrological resources.

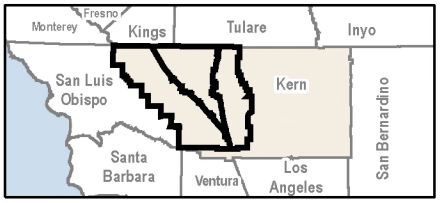
Impact 4.9-11: Contribute to Cumulative Hydrology and Water Quality Impacts

As described above, the ongoing production of oil and gas in Kern County, with the additional mitigation measures and other substantive and procedural requirements included in the proposed revisions to the County's oil and gas ordinances included in the Project, is not expected to result in significant impacts to hydrology and water other than to groundwater elevations and aquifer volumes. On a cumulative basis, these impacts would also be less than significant because the Project would not incrementally contribute to water quality, erosion risks, flooding, and other hydrology impacts. As discussed above, Project Area aquifers are historically overdrafted, and recent monitoring data indicates that groundwater storage and elevations have been reduced to historically low levels in many Project Area locations during the current drought (Appendix T). Project Area aquifers are identified as high priority basins in the state CASGEM program and a sustainable level of groundwater use must be determined and implemented for the region by 2020 under recently enacted state law. Oil and gas M&I water use, and the increased level of M&I

water demand projected for oil and gas activities by 2035, contributes to significant Project Area cumulative impacts to groundwater elevations and aquifer volumes.

Project impacts could result in cumulatively considerable impacts that would be considered significant. Implementation of MM 4.9-1 through MM 4.9-6 would reduce potential cumulative impacts to water quality, erosion risks, flooding and other hydrologic resources to less than significant with mitigation. Although groundwater mitigation measures (as described in Section 4.17, Utilities and Service Systems) encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease M&I demand is uncertain. As a result, cumulative impacts to groundwater would be significant and unavoidable.

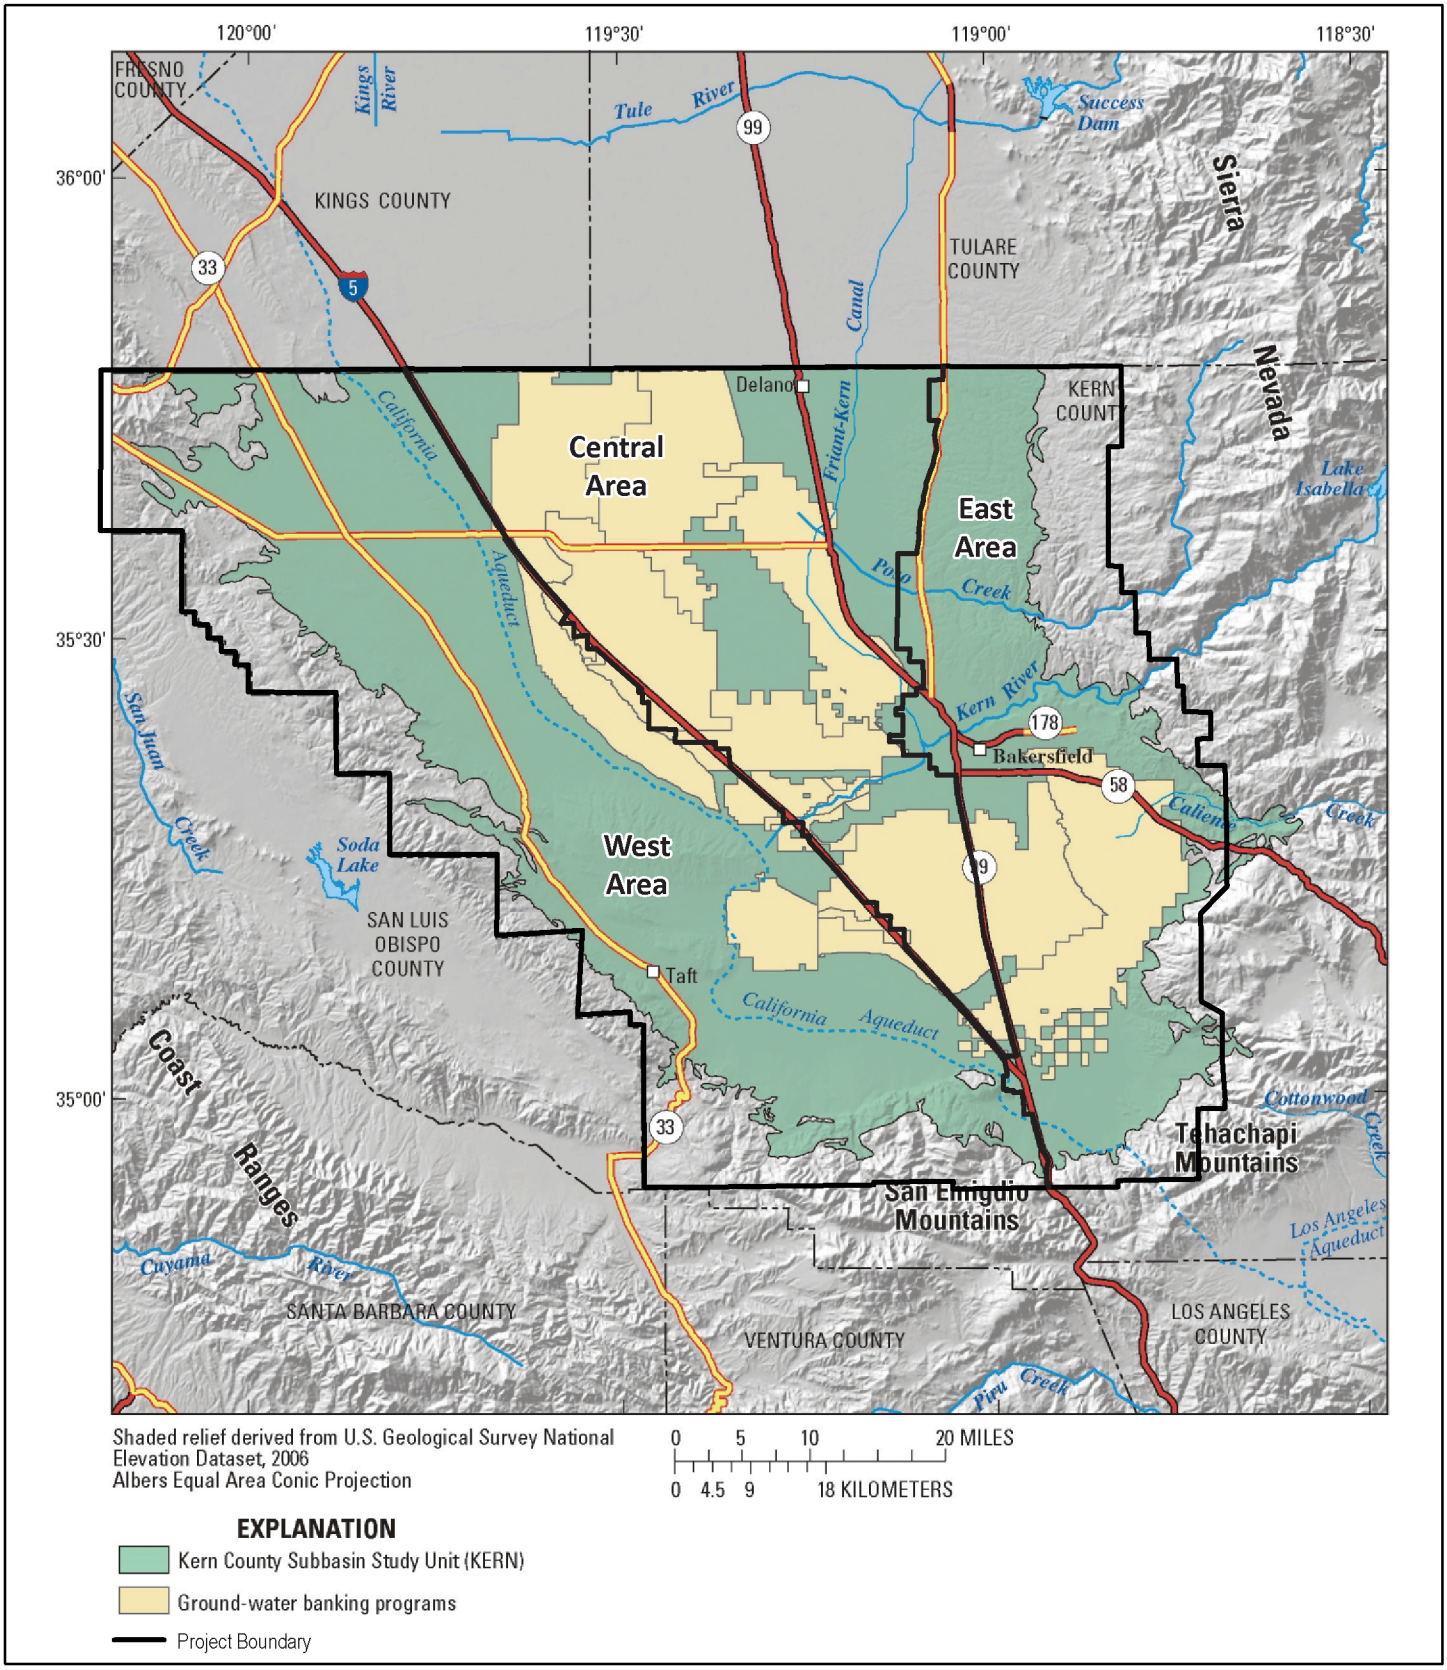
The County lacks jurisdiction and control over land conversions, and actions or approvals by other agencies that may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly, this impact remains significant and unavoidable.



Mitigation Measures

Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems. The County lacks jurisdiction and control over land conversions, and actions or approvals by other agencies that may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly this impact remains significant and unavoidable.

Level of Significance After Mitigation



Significant and unavoidable with mitigation.

Notes:
Groundwater Beneficial Use Exemptions as defined in the Water Quality Control Plan (Basin Plan) for the Tulare Lake Basin (CA RWQCB. 2004. Water Quality Control Plan for the Tulare Lake Basin, Second Edition. California Regional Water Quality Control Board, Central Valley Region (Region 5). [Available at: http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/index.shtml, retrieved 18 February 2014]), Table II-2:

1) Groundwater contained in the lower Transition Zone and Santa Margarita formation within 3,000 feet of the Kern Oil and Refining Company proposed injection wells in Section 25, T30S, R28E, MDB&M, is not suitable, or potentially suitable, for municipal or domestic supply (MUN).

2) Ground water contained in the basal Etchegoin formation, Chanac formation, and Santa Margarita formation within, and extending to one-quarter mile outside the administrative boundary of the Fruitvale Oil Field, as defined by the State of California, Department of Conservation, Division of Oil and Gas in Application for Primacy in the Regulation of Class II Injection Wells Under Section 1425 of the Safe Drinking Water Act, dated April 1981, is not suitable, or potentially suitable, for municipal or domestic supply (MUN). However, the upper ground water zone (ground water to a depth of 3,000 feet) retains the MUN beneficial use.

3) Ground water and spring water within 1/2 mile radius of the McKittrick Waste Treatment (formerly Liquid Waste Management) site in Section 29, T30S, R22E, MDB&M, have no beneficial uses.

Section 4.10

Land Use and Planning

Section 4.10

Land Use and Planning

4.10.1 Introduction

This section describes the affected environment and regulatory setting for land use and planning. It also describes the impacts on land use and planning that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

4.10.2 Environmental Setting

Kern County

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley, and is bounded by Kings and Tulare counties to the north, Santa Barbara and San Luis Obispo counties to the west, the Tehachapi Mountains and the Sierra Nevadas to east, and the northern boundary of the Los Padres National Forest to the south.

Lands analyzed under the Future Oil and Gas Development Scenario (see Chapter 3, Project Description) include all unincorporated County lands within the Project Area, including unincorporated County lands within the 409-square-mile Metropolitan Bakersfield Planning Area and covered under the Metropolitan Bakersfield General Plan (MBGP) (see Figure 3-2, Chapter 3, Project Description). Lands within the Metropolitan Bakersfield Planning Area that are under the jurisdiction of the City of Bakersfield are excluded from the Project Area. Lands under the jurisdiction of various state and federal agencies, including the Bureau of Land Management (BLM), the U.S. Fish and Wildlife Service (USFWS), and the California State Lands Commission (CSLC) are also excluded.

Kern County contains 11 incorporated cities, eight of which are adjacent to unincorporated County land within the Project Area, including Delano, Arvin, Shafter, McFarland, Wasco, Maricopa, Taft, and Bakersfield. The proposed Zoning Ordinance amendment would only be applicable to unincorporated County land. Therefore, land within the jurisdiction of incorporated cities is excluded from the Project Area. In addition to incorporated cities and towns, Kern County contains thousands of acres under the jurisdiction of various state and federal agencies. BLM manages more than 130 square miles (over 83,000 acres), USFWS manages 40 square miles (over 25,000 acres), and state agencies manage nearly 40 square miles (over 25,500 thousand acres). Federal and state lands are also excluded from the analysis.

Project Subareas

In order to facilitate detailed analysis, the Project Area is divided into three Subareas (Western, Central, and Eastern), as depicted in Figure 3-2 (see Chapter 3, Project Description). In general, the Project Subareas are divided along the major transportation corridors; however, the boundary varies where the California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) Administrative Boundaries are located on both sides of a freeway or highway. Land uses within each Subarea are described below. While this discussion includes a description of cities and land uses in the area to provide context and give an overview of adjacent land uses throughout the Project Area, the Project would not apply to lands located outside of Kern County's jurisdiction (i.e., incorporated cities or state or federal land). Description of the adopted and proposed habitat conservation plans in the Project Area are provided in Section 4.10.3, Regulatory Setting.

Western Subarea

The Western Subarea consists of 1,714 square miles (1,096,842 acres) and is generally bounded by the Kern County border on the north and west, Los Padres National Forest on the south, and by Interstate 5 on the east. The Western Subarea contains most of the large-scale, extraction-level operations in the County (Tier 1), including 47 administrative wellfields (39 active wellfields and eight abandoned wellfields). The Western Subarea also contains dispersed agricultural operations. The cities of Taft and Maricopa are located in the Western Subarea, along with the unincorporated communities of Buttonwillow, Lost Hills, South Taft, Ford City, Taft Heights, and McKittrick. Some of the largest producing oilfields in Kern County are located in the Western Subarea, including the Elk Hills, Midway Sunset, and Belridge Oil Fields. Land uses in the Western Subarea are predominantly based on oil extraction and production, but also include clay mineral extraction. Land uses also include agricultural operations interspersed with resource extraction activities (Tier 2) in both the northeastern and southeastern portions of this area. In addition, the Western Subarea contains several correctional facilities and the Tule Elks State National Reserve, along with a small portion of the Carrizo Plain National Monument (13,540 acres, or 5%).

Central Subarea

The Central Subarea consists of 1,025 square miles (656,003 acres) and is generally bounded by the Kern County border on the North, by Interstate 5 on the west, and State Routes 65 and 223 on the east. The Central Subarea contains 30 administrative oil and gas fields (21 active and nine abandoned), fewer than both the Western and Eastern Subareas. It should be noted, however, that several large-scale extraction operations are located in the Central Subarea within Tier 1 areas. The Central Subarea contains mostly agricultural operations interspersed with resource extraction activities (Tier 2). In addition, the Central Subarea contains parts of the unincorporated Metropolitan Bakersfield area, unincorporated Rosedale, Old River, Pumpkin Center, and Greenfield, and unincorporated areas around the cities of Shafter, Delano, Wasco, and McFarland. The Kern National Wildlife Refuge is also located in the Central Subarea, although it is under the jurisdiction of the USFWS. The Central Subarea also includes several correctional

facilities, industrial development, and commercial developments, and includes dispersed parcels under the jurisdiction of the State of California.

Eastern Subarea

The Eastern Subarea consists of 950 square miles (609,889 acres) and is generally bounded by the County border on the north, State Routes 65 and 223 on the west, and mountain ranges on the east and south. The Eastern Subarea contains 23 administrative oil and gas wellfields (20 active and three abandoned), including several large-scale oil and gas production areas, such as the Kern River Oil Field north of the city of Bakersfield (Tier 1) in the unincorporated Oildale area. The Eastern Subarea includes parts of the unincorporated Metropolitan Bakersfield Planning Area, and includes unincorporated areas around the city of Arvin and the unincorporated community of Lamont. The areas around Arvin and other unincorporated areas contain extraction operations interspersed with agricultural land (Tier 2).

Tiers

Oil and gas production in Kern County varies in intensity, depending on historic uses, surrounding land uses and zoning designations, and quality of agricultural land. In order to facilitate discussion, operations were broken down into five Tiers ranging from greatest to least levels of intensity. Figure 3-4 (see Chapter 3, Project Description) depicts the location of Tiers 1, 2, 3, 4, and 5 in the Project Area. Total land acreage within each Tier is depicted in Table 4.10-1.

Table 4.10-1: Tier Acreages Within the Project Area

Tier	Western Subarea	Central Subarea	Eastern Subarea	Total
Tier 1	163,227	3,002	40,518	206,747
Tier 2	800,443	523,071	467,789	1,791,303
Tier 3	2,043	2,801	11,359	16,203
Tier 4	5,423	10,413	18,614	34,450
Tier 5	772	-0-	1,740	2,512
Non-Jurisdictional	113,669	108,802	61,356	283,828
Other Areas	11,265	7,913	8,513	27,691
TOTAL	**1,096,842**	**656,003**	**609,889**	**2,362,733**

Tier 1

Tier 1 areas are defined as the areas in which current oil and gas activity is the primary land use, and well and activity densities preclude almost all other uses. Ninety percent of all oil and gas production in Kern County is produced in these areas. To define Tier 1 areas, geographic information system (GIS) well data was obtained from DOGGR and quarter-quarter sections with

a minimum of four wells were identified. Although Tier 1 lands may be zoned for agricultural use, there are no agricultural uses onsite, and any Important Farmland was removed from Tier 1 for inclusion in Tier 2. Tier 1 areas also exclude sensitive land uses, such as cemeteries, schools, and hospitals.

Tier 1 areas are predominantly clustered in the Eastern and Western Subareas. Examples of Tier 1 operations in the Eastern Subarea include the Chevron Kern River Oil Field and surrounding oilfields near the Oildale Area. Examples of Tier 1 operations in the Western Subarea include the Midway Sunset and Belridge Oil Fields near Taft and McKittrick. These areas have historically included intensive oilfield development and include some of the largest oilfields in the lower 48 states.

Tier 2

Tier 2 areas are defined as all lands zoned Exclusive Agriculture (A) and Limited Agriculture (A-1) that are not included in Tier 1. Tier 2 also includes Important Farmland (Prime Farmland, Farmland of Statewide Importance, Unique Farmlands, and Confined Animal Agriculture). Tier 2 areas are typically low- to medium-intensity, depending upon the quality of the agricultural land. Although more than 97% of unincorporated County land is zoned for agricultural purposes, including most of the land in Tier 1, an agricultural zoning designation does not necessarily indicate the presence of agricultural operations. Therefore, only 90% of A and A-1 land in the Project Area is included in Tier 2.

Tier 3

Tier 3 areas are defined as all Zone Districts where historic drilling activity has been approved as "Unrestricted" or "Ministerial," and those areas that are not categorized as Tiers 1 or 2. Tier 3 operations are typically low- to medium-intensity. These Zone Districts include:

Unrestricted

- Medium Industrial (M-2)
- Heavy Industrial (M-3)
- Natural Resource (NR)
- Floodplain Primary District (FPP)
- Special Planning District (SP)

Ministerial

- Light Industrial (M-1)
- Recreation-Forestry (RF)
- Drilling Islands (DI)
- Zone Districts that have the Petroleum Extraction (PE) Combining District

Tier 4

Tier 4 areas are defined as all Zone Districts where oil or gas exploration and production activities are currently allowed with a Conditional Use Permit (CUP). Tier 4 operations are low-intensity operations where oil and gas production is not the predominant land use. These Zone Districts include:

- Estate District (E)
- Low-density Residential (R-1)
- Medium-density Residential (R-2)
- High-density Residential (R-3)
- Commercial Office (CO)
- Neighborhood Commercial District (C-1)
- General Commercial District (C-2)
- Highway Commercial (CH)
- Platted Lands (PL)
- Mobile Home Park (MP)

Tier 5

Tier 5 are areas including Tejon Mountain Village, Tejon Industrial Complex – East, South Kern Industrial Complex, and Casa Loma Specific Plans, and all future Specific Plan boundaries either adopted with a Special Plan Zone District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities are allowed with a CUP or as permitted by the regulations contained within the adopted Specific Plan(s) in Tier 5 areas.

Core Areas

As described in Chapter 3, Project Description, Core Areas have been defined for the purposes of administering zoning requirements within and adjacent to DOGGR's Administrative Boundaries. Historically, more than 95% of oil and gas production has occurred within DOGGR's Administrative Boundaries; therefore, this EIR anticipates that this same percentage of production will occur in Core Areas, as defined below. The Core Areas within the Project Area are depicted in Figure 3-5 (see Chapter 3, Project Description).

In order to define the Core Areas in which oil and gas development would occur, the County made the following adjustments, as applicable, to each DOGGR Administrative Boundary:

1. Each DOGGR Administrative Boundary area was first defined as a "Core Area" for oil and gas production purposes;

2. Adjacent DOGGR Administrative Boundary areas were combined into a single Core Area;

3. Consistent with County zoning practice, the irregular boundaries of each Core Area were then "squared off" and defined by the nearest section and quarter section lines;

4. To accommodate the probability of continued expansion at the edges of these known producing areas, the Core Area was then extended at least one-half section from the DOGGR Administrative Boundary;

5. To accommodate known oil production activities that were adjacent to, but not yet within, a DOGGR Administrative Area, the Core Area was expanded to include adjacent sections that either contained at least two wells in the section, or contained two wells within a 640-acre area of the section; and

6. Where the Core Area mapping process described above left isolated islands or narrow strips of lands between Core Areas, the Core Area was combined to eliminate these orphaned areas.

Existing Land Uses

Existing land uses in the Project Area were determined from a visual survey of the Project Area, publicly available GIS data, and a review of the Kern County General Plan (KCGP), the MBGP, and adopted and proposed habitat conservation plans. Land uses vary widely throughout the Project Area; however, predominant land uses include agriculture and oil and gas development. In general, land uses can be grouped as follows:

- **Agriculture**. A majority of the lands within the Project Area are zoned for agricultural uses. Agricultural lands may also be interspersed with smaller oil and gas operations, such as individual drilling rigs.
- **Oil and Gas Development**. Mineral and petroleum extraction is also a predominant land use within the Project Area and is an allowable use under most zoning designations, as described below (see Table 4.10-1). The Natural Resource (NR) Zoning District designates areas with petroleum, mineral, or timber resources, and limits uses in such areas to resource exploration, production, and transportation, or compatible uses.
- **Non-Jurisdictional Land**. These lands are federal and state agency-owned lands and incorporated cities. For example, the BLM Hollister Field Office manages more than 83,000 acres of land within the Project Area, which is scattered predominantly throughout the western portion of the County. Federal and state lands within the Project Area are outside of Kern County's jurisdiction.
- **Public Facilities.** Public facilities are generally sited within incorporated cities, which would not be subject to the proposed Zoning Amendment, or on unincorporated land near established incorporated and unincorporated communities. Public facilities include schools, solid waste facilities, hazardous waste disposal facilities, correctional facilities, and recreational facilities. Recreational facilities, such as regional parks and campgrounds, may be sited at a greater distance from populated areas and are dispersed throughout the Project Area, as described below under "Parks, Open Space, and Conservation."
- **Special Treatment Areas**. These unique areas and communities have established localized land use planning (e.g., County-approved Specific Plans or Interim Rural Community Plans). Section 4.10.3, Regulatory Setting, provides a list of Specific Plans within the Project Area and relevant language related to oil and gas development within those areas.
- **Residential**. Residential uses are scattered throughout the Project Area, and are predominantly clustered near the Metropolitan Bakersfield Planning Area. Areas zoned for residential uses have varying allowable densities for residential development. A CUP is required for oil and gas exploration and production activities in areas zoned for Estate

uses (E), Residential uses (R), and on Platted Lands (PL). Oil and gas exploration and production activities are prohibited in areas zoned for Mobile Home Parks (MP). Residences are also permitted on lands zoned for Agricultural uses (A) and are scattered throughout the Project Area.

- **Commercial**. Lands designated for commercial uses have varying degrees of intensity (Regional, General, and Highway Commercial) and are scattered throughout the Project Area. In general, County-designated commercial lands are predominantly located within or near the Metropolitan Bakersfield Planning Area or along transportation corridors.
- **Industrial**. Industrial areas with varying intensities of industrial use (Light, Service, and Heavy Industrial) are scattered throughout the Project Area. Areas designated for industrial development can be associated with oil and gas exploration and production activities, among other uses, such as manufacturing facilities.
- **Parks, Open Space, and Conservation**. Although lands zoned as Open Space occur in several locations within the Project Area, the majority of Open Space lands are outside of the Project Area in the eastern portion of the County. However, the Project Area does contain unincorporated County parks, which are designated for Recreation. Drilling is not prohibited on land designated or zoned for recreation land uses; however, it is excluded on land zoned as Open Space. Some land within the Project Area is also managed for conservation purposes, such as the Kern National Wildlife Refuge, a portion of the Bitter Creek National Wildlife Refuge, Tule Elk State Natural Reserve, Wind Wolves Preserve, and various areas managed under adopted or proposed Habitat Conservation Plans (HCPs).

General Plan Land Use Designations

The KCGP provides the underlying land use designations within the Project Area. Table 4.10-2 lists the predominant land use designation applicable to the Project Area. The majority of the Project Area is subject to an agricultural land use designation (General Plan Designations 8.1 – 8.5). Figure 4.10-1 depicts County land use designations within the Project Area.

Table 4.10-2: General Plan Classifications within the Project Area

GP Code	GP Name
1.1	State or Federal Land
1.2	Incorporated Cities
3.1	Public or Private Recreation Areas
3.2	Educational Facilities
3.3	Other Facilities
3.4.1	Solid Waste Disposal Facility Buffer
3.4	Solid Waste Facilities

Table 4.10-2: General Plan Classifications within the Project Area

GP Code	GP Name
4.1	Accepted County Special Plan
4.3	Special Plan Required
5.1	Maximum 29 Units/Net Acre
5.2	Maximum 16 Units/Net Acre
5.3	Maximum 10 Units/Net Acre
5.4	Maximum 4 Units/Net Acre
5.5	Maximum 1 Unit/Net Acre
5.6	Minimum 2.5 Gross Acres/Unit
5.7	Minimum 5 Gross Acres/Unit
6.2	General Commercial
6.3	Highway Commercial
7.1	Light Industrial
7.2	Service Industrial
7.3	Heavy Industrial
8.1	Intensive Agriculture (Min. 20 Acres)
8.2	Resource Agriculture (Min. 20 Acres)
8.3	Extensive Agriculture (Min. 20 Acres)
8.4	Mineral and Petroleum (Min. 5 Acres)
8.5	Resource Management (Min. 20 Acres)

Existing Zoning

The Kern County Zoning Ordinance regulates land uses within the Project Area, implements the underlying KCGP land use designations for applicable locations in the County, and is consistent with the KCGP. The zoning classifications in the Project Area are listed in Table 4.10-3. Exploration drilling and production activities related to oil, gas, and other hydrocarbon substances are either permitted uses or conditionally permitted with the issuance of a CUP in all zoning classifications with the exception of the Mobile Home Park District and Open Space District where drilling is prohibited. Figure 4.10-2 depicts zoning within the Project Area.

Table 4.10-3: Kern County Zones where Oil and Gas Exploration Activities are Allowed

Zoning District		Permitted	Conditionally Permitted (CUP)	Prohibited
1. Agricultural Districts				
A	Exclusive Agriculture District	●		
A-1	Limited Agriculture District	●

Table 4.10-3: Kern County Zones where Oil and Gas Exploration Activities are Allowed

Zoning District	Permitted	Conditionally Permitted (CUP)	Prohibited

Source: Kern County Zoning Ordinance

Notes:

(1) Subject to Flood Damage Prevention Ordinance

(2) Allowed if use is consistent with General Plan Land Use designation and will not conflict with public health, safety or welfare.

Surrounding Land Uses

The Project Area is bordered on the west by San Luis Obispo County. The border between the two counties approximates the San Andreas Fault line. The Temblor Range forms a general barrier between the more industrial oil drilling operations on the Kern County side of the border verses the more rural and agricultural nature of neighboring San Luis Obispo County, with the exception of the Midway Sunset Oil Field, which crosses into neighboring San Luis Obispo County. The portion of the Midway Sunset Oil Field located within San Luis Obispo County is outside of the Project Area and is not subject to Kern County jurisdiction. Other oil and gas uses exist to the west of the Project Area; however, such activities are less intensive in nature and dispersed throughout a rural area.

To the north, the Project Area is bordered by the San Emigdo Mountains and the Tehachapi Mountains. The Project Area extends to the border of the Los Padres National Forest. The unincorporated community of Frazier Park is located in the uplands several miles south of the Project Area and west of the Interstate 5.

To the north, the Project Area is bordered by Kings and Tulare counties. The bordering areas of these two counties contain agricultural and oil and gas operations, as well as dispersed rural residences. The incorporated city of Delano is located on the northern border of Kern County, and adjacent land uses in Tulare County consist of large lot residential, agriculture, and industrial uses.

To the east, the Project Area is bordered by the foothills of surrounding mountain ranges, such as the Greenhorn Mountains and Tehachapi Mountains, as well as the Tejon Hills southeast of the incorporated city of Arvin. The Project Area also borders the Sequoia National Forest northeast of Bakersfield. Land uses along the border are generally rural in nature.

4.10.3 Regulatory Setting

Land use and planning for federal lands adjacent to the Project Area are regulated by a variety of federal agencies and programs, including National Forest management plans, federal preserve management plans, and land use regulations adopted by federal agencies for airports and by the

BLM to regulate oil and gas leases. The following discussion summarizes federal land use plans applicable to airports and BLM oil and gas leasing in more detail.

Federal

Federal Aviation Administration, Federal Aviation Regulation Title 14, Part 77

The Federal Aviation Administration (FAA) issues and enforces regulations related to air traffic control and the assignment and use of airspace. The FAA's regulations are found in the Federal Aviation Regulations (FAR). FAR Title 14, Part 77, establishes the standards for determining obstructions in navigable airspace, including height limitations on structures taller than 200 feet or within 20,000 feet (3.8 miles) of an airport.

The standards and notification requirements of FAR Title 14 Part 77 are intended to: 1) evaluate the effect of the construction or alteration of structures on airport operating procedures; 2) determine if the construction or alteration would result in a potential hazard to air navigation; and 3) identify measures to enhance safety. The FAA requires notification through the filing of the two-part FAA Form 7460 (7460-1 Notice of Proposed Construction or Alteration, and 7460-2 Supplemental Notice), if any of the following criteria are met due to implementation of a proposed action (Title 14 Part 77.13):

- Any construction or alteration [of a structure or object] of more than 200 feet in height above the ground level at its site.
- Any construction or alteration [of a structure or object] of greater height than an imaginary surface extending outward and upward at one of the following slopes:
  - 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport with at least one runway more than 3,200 feet in actual length, excluding heliports.
  - 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport specified with its longest runway no more than 3,200 feet in actual length, excluding heliports.
  - 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport.
- Any proposed highway, railroad, or other traverse way for mobile objects, with a height which would exceed the standards of Part 77.13 (a) (1), (2), or (3).
- When requested by the FAA, any construction or alteration [of a structure or object] that would be in an instrument approach area (defined in the FAA standards governing instrument approach procedures) and available information indicates it might exceed a standard of subpart C of this Part [Part 77].

- Any construction or alteration of a structure or object located on a public use airport or heliport that meets the criteria of Part 77.13 (a) (5).

Bureau of Land Management

The BLM leases federal land within the Project Area for oil and gas exploration and recovery. The County does not have jurisdiction to regulate oil and gas operations on federal land, and BLM or other federal agencies do not regulate land use associated with oil and gas operations on non-federal land in Kern County. BLM oil and gas leasing requirements in Kern County are summarized for informational purposes.

Bureau of Land Management, Bakersfield Office Resource Management Plan (December 2014)

The Bakersfield Resource Management Plan (RMP) provides direction for the management of approximately 400,000 acres of public lands and 1.2 million acres of mineral estate in Ventura, Santa Barbara, San Luis Obispo, Kings, Tulare, Madera, eastern Fresno, and western Kern counties in accordance with principles of multiple use and sustained yield, as mandated by the provisions of the Federal Land Policy and Management Act (FLPMA). The RMP provides a framework for managing public lands within the Bakersfield Field Office for recreation, travel management, oil and gas development, threatened and endangered species, grazing, and other resources (BLM 2014a). The RMP also provides management direction for acquired lands including the Piedras Blancas Light Station, Naval Petroleum Reserve 2 (adjacent to Elk Hills Oil Field), Atwell Island, and Cyrus Canyon. The RMP guides the Bakersfield Field Office in the implementation of all its subsequent management actions and site-specific activities.

While the RMP Planning Area encompasses the entire area within the boundaries of the Bakersfield Field Office, regardless of jurisdiction or ownership, decisions in the approved RMP apply only to BLM-administered surface and federal mineral estate. The decisions do not apply to private lands, state lands, tribal lands, and federal lands not administered by the BLM; they will not change existing rights or authority of private land owners or other surface management agencies.

The Bakersfield Decision Area encompasses about 400,000 acres of public lands surface and minerals, and 750,000 acres of mineral estate only. BLM public lands and mineral estate are scattered across the Project Area in numerous parcels of various size. The larger blocks of surface public land lie adjacent to the Carrizo Plan National Monument and in the Lake Isabella-Chimney Peak-Walker Pass region of Kern and Tulare counties. The Decision Area also includes subsurface minerals on approximately 550,000 acres of "split estate" (areas where the BLM manages federal subsurface minerals, but the surface is owned by a non-federal entity) as well as subminerals on approximately 200,000 acres where the surface is managed by other federal agencies. These combined areas (about 1.2 million acres) constitute the area for which the BLM has authority and makes decisions.

The new RMP puts in place new best management practices for oil and gas leasing to address air quality and water resources and ensure safe and environmentally responsible development. It also contains an updated Reasonable and Foreseeable Development for oil and gas production on federal land under BLM jurisdiction and incorporates best available science to inform analysis on new leasing and decision making. Additionally, the new RMP carries forward 4:1 mitigation requirements for habitat disturbance as well as operational restrictions to avoid impacts to sensitive species (BLM 2014a).

The RMP also incorporates several recreation management objectives to address the changing needs of the area's diverse user groups and improve management of the existing trail system. A Travel Management Plan that directs road and trail uses, including the popular east Temblors and Keyesville areas, is also included in the decision, enabling the BLM to better manage current use and increase opportunities for recreation within the Bakersfield area. The Travel Management Plan includes routes for off-highway vehicles and other types of recreation.

In addition, the plan includes key conservation provisions to address important biological and cultural resources including the protection of over 100,000 acres under the Bureau's Areas of Critical Environmental Concern (ACEC) designation. Management direction in this part of the plan in particular incorporated comments and feedback received from the public during public scoping, helping the BLM identify important areas for protection.

A Record of Decision (ROD) for the RMP was signed by BLM's California State Director on December 19, 2014.

Instruction Memorandum No. CA-2014-031

In August 2014, the BLM issued Instruction Memorandum No. CA-2014-031 (BLM 2014b) which modified the information required to process an Applications for Permit to Drill or Sundry Notice on federal land to include: (1) an air emissions inventory (and, if BLM identifies air quality concerns, a technical report on the impacts of the project on air quality written by an independent, third party air quality specialist); (2) a water management plan, including water sources, volumes, and proposed disposal/recycling of produced water (and if BLM identifies air quality concerns a technical report on the impacts of the project on water resources written by an independent, third party hydrologist or water quality specialist); and (3) a copy of state permit applications to perform well stimulation treatments and ground water monitoring plans submitted to state agencies, or state concurrence that no protected waters would be affected by the proposed activity.

State

Senate Bill 375

Senate Bill (SB) 375 requires the Air Resources Board to set regional targets for greenhouse gas (GHG) emission reductions from passenger vehicles and light duty trucks, and requires each regional Metropolitan Planning Organization (MPOs) to adopt a Sustainable Communities

Strategy (SCS) into its regional transportation plan that would allow the region to meet its GHG emission reduction target. The Kern County Council of Governments (COG) adopted the SCS for Kern County as part of its Regional Transportation Plan (RTP) in 2014. The RTP and SCS incorporate forecasted development patterns, modeling and measures designed to integrate land use and transportation planning to reduce local and regional GHG emissions. Oil and gas resources, as well as other land uses, are components of the SCS. While SB 375 does not require local governments to amend their General Plans to implement the SCS, it provides incentives for them to do so. Implementation of SB 375 is expected to substantially reduce GHG emissions in the County and throughout the state.

Local

Land use and planning for areas within and adjacent to the Project Area are regulated by a variety of jurisdictional planning agencies and programs depending on the specific area. These planning agencies and programs include the KCGP, the MBGP, 24 Specific Plans, and the Kern County Zoning Ordinance. Regional land use decisions within the Project Area are also influenced by the Kern COG 2014 RTP/SCS.

The plans, briefly discussed below, are characterized by goals, objectives, and policies, and provide an overall foundation for establishing land use patterns. For purposes of impact analysis, all relevant goals, objectives, and policies related to the proposed Project are included in the discussion.

Kern County General Plan

The Project Area is located within the KCGP area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element, Circulation Element, Noise Element, Safety Element, and Energy Element of the KCGP include goals, policies, and implementation measures related to land use and planning that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.2. Non-Jurisdictional Land

Goals

Goal 1. To promote harmonious and mutually beneficial uses of land among the various jurisdictions and land management entities present in Kern County.

Policies

Policy 3. The County retains the maximum discretion allowed by law over land use issues of local concern, which impact the development of private and public property in the County.

Policy 4. The County will solicit comments and coordinate with local governments, the military, and other federal or state jurisdictions on projects which are proposed within a peripheral area established mutual agreement between the County and the jurisdiction.

Policy 5. The County land use regulations do not apply to property administered by the state or federal government in the absence of Memorandums of Understanding indicating otherwise. However, County land use regulations may apply to other public entities subject to provisions of state law.

Policy 6. The County will solicit a city's comments on land use planning proposals within the city's adopted sphere of influence or within one mile of the city limits, whichever is greater.

1.3. Physical and Environmental Constraints

Goals

Goal 1. To strive to prevent loss of life, reduce personal injuries, and property damage, minimize economic and social diseconomies resulting from natural disaster by directing development to areas which are not hazardous.

Policies

Policy 1. Kern County will ensure that new developments will not be sited on land that is physically or environmentally constrained ((Map Code 2.1 (Seismic Hazard), Map Code 2.2 (Landslide), Map Code 2.3 (Shallow Groundwater), Map Code 2.5 (Flood Hazard), Map Codes from 2.6 – 2.9, Map Code 2.10 (Nearby Waste Facility), and Map Code 2.11 (Burn Dump Hazard)) to support such development unless appropriate studies establish that such development will not result in unmitigated significant impact.

Policy 2. In order to minimize risk to Kern County residents and their property, new development will not be permitted in hazard areas in the absence of implementing ordinances and programs. These ordinances will establish conditions, criteria, and standards for the approval of development in hazard areas.

Policy 3. Zoning and other land use controls will be used to regulate and, in some instances, to prohibit development in hazardous areas.

Policy 6. Regardless of percentage of slope, development on hillsides will be sited in the least obtrusive fashion, thereby, minimizing the extent of topographic alteration required and reducing soil erosion while maintaining soil stability.

Policy 7. Ensure effective slope stability, wastewater drainage, and sewage treatments in areas with steep slopes are adequate for development.

Policy 8. Encourage the preservation of the floodplain's flow conveyance capacity, especially in floodways, to be open space/passive recreation areas throughout the County.

Policy 9. Construction of structures that impede water flow in a primary floodplain will be discouraged.

Policy 10. The County will allow lands which are within flood hazard areas, other than primary floodplains, to be developed in accordance with the General Plan and Floodplain Management Ordinance, if mitigation measures are incorporated so as to ensure that the proposed development will not be hazardous within the requirements of the Safety Element (Chapter 4) of this General Plan.

Policy 11. Protect and maintain watershed integrity within Kern County.

Policy 13. Development, which is located adjacent to a burn dumpsite and requires a discretionary permit, shall be reviewed for land use compatibility and possible soil contamination.

Implementation Measures

Implementation Measure B. A seismic analysis may be required for those areas in Kern County which are susceptible to landslides.

Implementation Measure E. Development proposed in areas with steep slopes (Map Code 2.4) will be reviewed for conformity to Chapter 19.88 Hillside Development Ordinance or Chapter 19.52 Special Planning (SP) District to ensure that appropriate soil stability, drainage, and sewage treatment will result.

Implementation Measure H. Development within areas subject to flooding, as defined by the appropriate agency, will require necessary flood evaluations and studies.

Implementation Measure I. Designated flood channels and water courses, such as creeks, gullies, and riverbeds, will be preserved as resource management areas or in the case of urban areas, as linear parks whenever practical.

Implementation Measure J. Compliance with the Floodplain Management Ordinance prior to grading or improvement of land for development or the construction, expansion, conversion or substantial improvements of a structure is required.

Implementation Measure M. The State Water Resources Control Board and the Local Enforcement Agency (Environmental Health Services) shall be consulted when discretionary development has been proposed near a known burn dumpsite.

Implementation Measure N. Applicants for new discretionary development should consult with the appropriate Resource Conservation District and the California Regional Water Quality Control Board regarding soil disturbances issues.

1.4. Public Facilities and Services

Goals

Goal 1. Kern County residents and businesses should receive adequate and cost effective public services and facilities. The County will compare new urban development proposals and land use changes to the required public services and facilities needed for the proposed Project.

Goal 5. Ensure that adequate supplies of quality (appropriate for intended use) water are available to residential, industrial, and agricultural users within Kern County.

Goal 9. Serve the needs of industries and Kern County residents in a manner that does not degrade the water supply and the environment and protect the public health and safety by avoiding surface and subsurface nuisances resulting from the disposal of hazardous wastes, irrespective of the geographic origin of the waste.

Policies

Policy 1. New discretionary development will be required to pay its proportional share of the local costs of infrastructure improvements required to service such development.

Policy 3. Individual projects will provide availability of public utility service as per approved guidelines of the serving utility.

Implementation Measures

Implementation Measure C. Project developers shall coordinate with the local utility service providers to supply adequate public utility services.

Implementation Measure L. Prior to the approval of development projects, the County shall determine the need for fire protection services. New development in the County shall not be approved unless adequate fire protection facilities and resources can be provided.

Implementation Measure N. Secure complete and accurate information on all hazardous wastes generated, handled, stored, treated, transported, and disposed of within or through Kern County.

Implementation Measure O. Reduce to the greatest degree possible the amount of waste to be disposed of by encouraging private industry to construct and manage a high quality system of transfer stations, recycling facilities, treatment plants, and incinerators located near the generators of hazardous waste.

Implementation Measure R. Roads and highways utilized for commercial shipping of hazardous waste destined for disposal will be designated as such pursuant to Vehicle Code Sections 31303 et seq. Permit applications shall identify commercial shipping routes they propose to utilize for particular waste streams.

1.8. Industrial

Goals

Goal 1. Ensure that an adequate and geographically balanced supply of land is designated for a range of industrial purposes.

Goal 2. Promote the future economic strength and wellbeing of Kern County and its residents without detriment to its environmental quality.

Goal 3. Ensure compatibility with land use designations such as residential, commercial, or other land uses that may be affected by such activities.

Policies

Policy 1. Locations for new industrial activities shall be provided with adequate infrastructure (water, sewage disposal systems, roads, drainage, etc.) to minimize effects on County services.

Policy 3. The land areas best suited for industrial activity by virtue of their location and other criteria will be protected from residential and other incompatible development.

Policy 4. Protect existing industrial designations from incompatible land use intrusion.

Policy 5. Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors.

Policy 7. Require that industrial uses provide design features such as screen walls, landscaping, increased height and/or setbacks, and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound, and vibration.

Policy 9. Prior to approval, all new discretionary industrial projects located in the Airport Influence Areas will be reviewed for compatibility with the Airport Land Use Compatibility Plan.

Policy 12. All industrial development equal to or greater than 40 acres in a rural area will require the adoption of a Specific Plan prior to development approval.

Policy 13. Where feasible, locate future industrial activities in close proximity to railroad facilities and inter- and intra-State transportation corridors to minimize extensive travel through urban areas and to promote alternative transportation of goods.

Implementation Measures

Implementation Measure F. All General Plan Amendments, zone changes, conditional use permits, discretionary industrial developments, and variations from height limits established by zoning for properties which are located in the Airport Influence areas or near a military airport

shall be reviewed by the Planning Department for compatibility with the Kern County Airport Land Use Compatibility Plan.

Implementation Measure G. Require a Specific Plan for industrial land projects (as defined in the Assumptions Section of the Special Treatment Areas) to identify site specific issues and implementation, such as infrastructure, circulation, compatibility, and public services and facilities.

Implementation Measure I. Discretionary projects located within an Extreme, High, or Moderate Fire Hazard Zone shall abide by building materials and construction requirements set forth by the Kern County Fire Department and Office of Emergency Services.

1.9. Resource

Goals

Goal 1. To contain new development within an area large enough to meet generous protections of foreseeable need, but in locations that will not impair the economic strength derived from the petroleum, agriculture, rangeland, or mineral resources or diminish the other amenities that exist in the County.

Goal 2. Protect areas of important mineral, petroleum, and agricultural resource potential for future use.

Goal 3. Ensure the development of resource areas minimize effects on neighboring resource lands.

Goal 4. Encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decision and actions of other agencies as they affect energy development in Kern County.

Goal 5. Conserve prime agriculture lands from premature conversion.

Goal 6. Encourage alternative sources of energy, such as solar and wind energy, while protecting the environment.

Policies

Policy 1. Appropriate resource uses of all types will be encouraged as desirable and consistent interim uses in undeveloped portions of the County regardless of General Plan designation.

Policy 2. In areas with a resource designation on the General Plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of the particular resource will be considered to be consistent with this General Plan.

Policy 5. Areas of low intensity agriculture use (Map Code 8.2 (Resource Reserve), Map Code 8.3 (Extensive Agriculture), and Map Code 8.5 (Resource Management)) should be of an

economically viable size in order to participate in the State Williamson Act Program/Farmland Security Zone Contract.

Policy 7. Areas designated for agricultural use, which include Class I and II and other enhanced agricultural soils with surface delivery water systems, should be protected from incompatible residential, commercial, and industrial subdivision and development activities.

Policy 10. To encourage effective groundwater resource management for the long-term economic benefit of the County the following shall be considered:

a. Promote groundwater recharge activities in various Zone Districts.

b. Support for the development of Urban Water Management Plans and promote Department of Water Resources grant funding for all water providers.

c. Support the development of groundwater management plans.

d. Support the development of future sources of additional surface water and groundwater, including conjunctive use, recycled water, conservation, additional storage of surface water and groundwater and desalination.

Policy 11. Minimize the alteration of natural drainage areas. Require development plans to include necessary mitigation to stabilize runoff and silt deposition through utilization of grading and flood protection ordinances.

Policy 12. Areas identified by the Natural Resource Conservation Service (formerly Soil Conservation Service) as having high range-site value should be conserved for Extensive Agriculture uses or as Resource Reserve, if located within a County water district.

Policy 14. Emphasize conservation and development of identified mineral deposits.

Policy 15. Agriculture and other resource uses will be considered a consistent use in areas designated for Mineral and Petroleum Resource uses on the General Plan.

Policy 17. Lands classified as MRZ-2, as designated by the State of California, should be protected from encroachment of incompatible land uses.

Policy 21. The County shall encourage qualifying agricultural lands to participate in the Williamson Act program or Farmland Security Zone program.

Policy 25. Discourage incompatible land use adjacent to Map Code 8.4 (Mineral and Petroleum) areas.

Implementation Measures

Implementation Measure B. Areas designated as Resource Reserve (Map Code 8.2), Extensive Agriculture (Map Code 8.3), Resource Management (Map Code 8.5) that are under Williamson

Act Contracts or Farmland Security Zone Contracts will have a minimum parcel size of 80 acres until such time as a contract is expired or is cancelled, at which time the minimum parcel size will become 20 acres.

Implementation Measure C. The County Planning Department will seek review and comment from the County Engineering and Survey Services Department on the implementation of the National Pollution Discharge Elimination System for all discretionary projects.

Implementation Measure F. Prime agricultural lands, according to the Kern County Interim-Important Farmland map produced by the Department of Conservation, which have Class I or II soils and a surface delivery water system shall be conserved through the use of agricultural zoning with minimum parcel size provisions.

Implementation Measure G. Property placed under the Williamson Act/Farmland Security Zone Contract must be in a Resource designation.

Implementation Measure H. Use the California Geological Survey's latest maps to locate mineral deposits until the regional and statewide importance mineral deposits map has been completed, as required by the Surface Mining and Reclamation Act.

Implementation Measure I. Periodically review the Zoning Ordinance to reflect new technology and energy sources, and encourage these types of uses for new development.

Implementation Measure J. The County shall continue to monitor new legislation as it relates to energy production and periodically review the General Plan and Zoning Ordinance for any required updates.

Implementation Measure K. Protect oilfields and mineral extraction areas through the use of appropriate implementing Zone Districts: A (Exclusive Agriculture), DI (Drilling Island), NR (Natural Resource), or PE (Petroleum Extraction).

1.10. General Provisions

Goals

Goal 1. Ensure that the County can accommodate anticipated future growth and development while maintaining a safe and healthful environment and a prosperous economy by preserving valuable natural resources, guiding development away from hazardous areas, and assuring the provision of adequate public services.

Policies

Policy 6. The County shall ensure the fair treatment of people of all races, cultures, incomes and age groups with respect to the development, adoption, implementation and enforcement of land use and environmental programs.

Policy 8. The County shall ensure that new industrial uses and activities are sited to avoid or minimize significant hazards to human health and safety in a manner that avoids over concentrating such uses in proximity to schools and residents.

1.10.1. Public Services and Facilities

Policies

Policy 9. New development should pay its pro rata share of the local cost of expansions in services, facilities, and infrastructure which it generates and upon which it is dependent.

Policy 16. The developer shall assume full responsibility for costs incurred in service extensions or improvements that are required to serve the project. Cost sharing or other forms of recovery shall be available when the service extensions or improvements have a specific quantifiable regional significance.

Implementation Measures

Implementation Measure E. All new discretionary development projects shall be subject to the Standards for Sewage, Water Supply and Preservation of Environmental Health Rules and Regulations administered by the Environmental Health Services Department. Those projects having percolation rates of less than five minutes per inch shall provide a preliminary soils study and site specific documentation that characterizes the quality of upper groundwater in the project vicinity and evaluation of the extent to which, if any, the proposed use of alternative septic systems will adversely impact groundwater quality. If the evaluation indicates that the uppermost groundwater at the proposed site already exceeds groundwater quality objectives of the Regional Water Quality Control Board or would if the alternative septic system is installed, the applicant shall be required to supply sewage collection, treatment and disposal facilities.

1.10.2. Air Quality

Policies

Policy 19. In considering discretionary projects for which an Environmental Impact Report must be prepared pursuant to the California Environmental Quality Act, the appropriate decision making body, as part of its deliberations, will ensure that:

a. All feasible mitigation to reduce significant adverse air quality impacts have been adopted; and

b. The benefits of the proposed Project outweigh any unavoidable significant adverse effects on air quality found to exist after inclusion of all feasible mitigation. This finding shall be made in a statement of overriding considerations and shall be supported by factual evidence to the extent that such a statement is required pursuant to the California Environmental Quality Act.

Policy 20. The County shall include fugitive dust control measures as a requirement for discretionary projects and as required by the adopted rules and regulations of the San Joaquin

Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District on ministerial permits.

Policy 21. The County shall support air districts' efforts to reduce PM10 and PM2.5 emissions.

Policy 22. Kern County shall continue to work with the San Joaquin Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District toward air quality attainment with federal, state, and local standards.

Policy 23. The County shall continue to implement the local government control measures in coordination with the Kern Council of Governments and the San Joaquin Valley Unified Air Pollution Control District.

Implementation Measures

Implementation Measure F. All discretionary permits shall be referred to the appropriate air district for review and comment.

Implementation Measure G. Discretionary development projects involving the use of tractor trailer rigs shall incorporate diesel exhaust reduction strategies including, but not limited to:

a. Minimizing idling time.
b. Electrical overnight plug-ins.

Implementation Measure H. Discretionary projects may use one or more of the following to reduce air quality effects:

a. Pave dirt roads within the development.
b. Pave outside storage areas.
c. Provide additional low Volatile Organic Compounds (VOC) producing trees on landscape plans.
d. Use of alternative fuel fleet vehicles or hybrid vehicles.
e. Use of emission control devices on diesel equipment.
f. Develop residential neighborhoods without fireplaces or with the use of Environmental Protection Agency certified, low emission natural gas fireplaces.
g. Provide bicycle lockers and shower facilities on site.
h. Increasing the amount of landscaping beyond what is required in the Zoning Ordinance (Chapter 19.86).
i. The use and development of park and ride facilities in outlaying areas.
j. Other strategies that may be recommended by the local Air Pollution Control Districts.

1.10.3. Archaeological, Paleontological, Cultural, and Historical Preservation

Policies

Policy 25. The County will promote the preservation of cultural and historic resources which provide ties with the past and constitute a heritage value to residents and visitors.

Implementation Measures

Implementation Measure K. Coordinate with the California State University, Bakersfield's Archaeology Inventory Center.

Implementation Measure L. The County shall address archaeological and historical resources for discretionary projects in accordance with the California Environmental Quality Act (CEQA).

Implementation Measure M. In areas of known paleontological resources, the County should address the preservation of these resources where feasible.

Implementation Measure N. The County shall develop a list of Native American organizations and individuals who desire to be notified of proposed discretionary projects. This notification will be accomplished through the established procedures for discretionary projects and CEQA documents.

Implementation Measure O. On a project specific basis, the County Planning Department shall evaluate the necessity for the involvement of a qualified Native American monitor for grading or other construction activities on discretionary projects that are subject to a CEQA document.

1.10.5. Threatened and Endangered Species

Policies

Policy 27. Threatened or endangered plant and wildlife species should be protected in accordance with state and federal laws.

Policy 28. County should work closely with state and federal agencies to assure that discretionary projects avoid or minimize impacts to fish, wildlife, and botanical resources.

Policy 29. The County will seek cooperative efforts with local, state, and federal agencies to protect listed threatened and endangered plant and wildlife species through the use of conservation plans and other methods promoting management and conservation of habitat lands.

Policy 31. Under the provisions of the California Environmental Quality Act (CEQA), the County, as lead agency, will solicit comments from the California Department of Fish and Game and the U.S. Fish and Wildlife Service when an environmental document (Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report) is prepared.

Policy 32. Riparian areas will be managed in accordance with United States Army Corps of Engineers, and the California Department of Fish and Game rules and regulations to enhance the drainage, flood control, biological, recreational, and other beneficial uses while acknowledging existing land use patterns.

Implementation Measures

Implementation Measure Q. Discretionary projects shall consider effects to biological resources as required by the California Environmental Quality Act.

Implementation Measure R. Consult and consider the comments from responsible and trustee wildlife agencies when reviewing a discretionary project subject to the California Environmental Quality Act.

Implementation Measure S. Pursue the development and implementation of conservation programs with state and federal wildlife agencies for property owners desiring streamlined endangered species mitigation programs.

1.10.6. Surface Water and Groundwater

Policies

Policy 34. Ensure that water quality standards are met for existing users and future development.

Policy 35. Ensure that adequate water storage, treatment, and transmission facilities are constructed concurrently with planned growth.

Policy 36. Ensure that appropriate funding mechanisms for water are in place to fund the needed improvements resulting from growth and subsequent development.

Policy 38. Encourage utilization of wastewater treatment facilities which provide for the reuse of wastewater.

Policy 39. Encourage the development of the County's groundwater supply to sustain and ensure water quality and quantity for existing users, planned growth, and maintenance of the natural environment.

Policy 41. Review development proposals to ensure adequate water is available to accommodate projected growth.

Policy 43. Drainage shall conform to the Kern County Development Standards and the Grading Ordinance.

Policy 44. Discretionary projects shall analyze watershed impacts and mitigate for construction-related and urban pollutants, as well as alterations of flow patterns and introduction of impervious surfaces as required by the California Environmental Quality Act (CEQA), to prevent the degradation of the watershed to the extent practical.

Policy 45. New high consumptive water uses, such as lakes and golf courses, should require evidence of additional verified sources of water other than local groundwater. Other sources may include recycled stormwater or wastewater.

Implementation Measures

Implementation Measure U. The Kern County Environmental Health Services Department will develop guidelines for the protection of groundwater quality which will include comprehensive well construction standards and the promotion of groundwater protection for identified degraded watersheds.

Implementation Measure X. Encourage effective groundwater resource management for the long-term benefit of the County through the following:

i. Promote groundwater recharge activities in various Zone Districts.

iii. Support the development of Groundwater Management Plans.

iv. Support the development of future sources of additional surface water and groundwater, including conjunctive use, recycled water, conservation, additional storage of surface water, and groundwater and desalination.

Implementation Measure Y. Promote efficient water use by utilizing measures such as:

i. Requiring water-conserving design and equipment in new construction.

ii. Encouraging water-conserving landscaping and irrigation methods.

1.10.7. Light and Glare

Policies

Policy 48. Encourage the use of low-glare lighting to minimize nighttime glare effects on neighboring properties.

Implementation Measures

Implementation Measure AA. The County shall utilize CEQA Guidelines and the provisions of the Zoning Ordinance to minimize the impacts of light and glare on adjacent properties and in rural undeveloped areas.

1.10.9. Economic Development

Policies

Policy 58. Support and work toward the elimination of disincentives for business and industry to prosper in Kern County, and create special economic development programs to encourage commerce and industry to locate in Kern County.

Policy 62. Periodically review and update procedures for granting development approvals and permits and facilitate the processing of land use entitlements.

Implementation Measures

Implementation Measure DD. Utilize the County's Economic Strategy and the Economic Incentive Program to promote economic growth and to maintain a strong local economy.

1.10.10. Oak Tree Conservation

Policies

Policy 65. Oak woodlands and large oak trees shall be protected where possible and incorporated into project developments.

Policy 66. Promote the conservation of oak tree woodlands for their environmental value and scenic beauty.

Implementation Measures

Implementation Measure LL. The following applies to development of parcels having oak tree canopy cover of less than 10%, but containing individual oak trees equal to or greater than a 12-inch diameter trunk at 4.5 feet breast height.

a. Such trees shall be identified on plot plans.

b. Discretionary development shall avoid the area beneath and within the trees unaltered drip line unless approved by a licensed or certified arborist or botanist.

c. Specified tree removal related to the discretionary action may be granted by the decision making body upon showing that a hardship exists based on substantial evidence in the record.

Chapter 2. Circulation Element

Objective

Objective 1. To make certain that transportation facilities needed to support development are available. To ensure that these facilities occur in a timely manner so as to avoid traffic degradation.

Objective 5. Maintain a minimum Level Of Service (LOS) D for all roads throughout the County.

2.3. Highways

2.3.3. Highway Plan

Goals

Goal 5. Maintain a minimum Level of Service (LOS) D.

Implementation Measures

Implementation Measure B. Continuity and integrity of the arterial and collector system at the mountain/valley region and the mountain/desert region boundary must be reviewed and approved in conjunction with project adoption on an individual basis.

Implementation Measure C. Conformance to alignment minimum design standards, where roadways that deviate from section and mid-section lines intersect those lines, must be reviewed and approved in conjunction with project adoption on an individual basis.

2.3.4. Future Growth

Policies

Policy 2. The County should monitor development applications as they relate to traffic estimates developed for this plan. Mitigation is required if development causes affected roadways to fall below Level Of Service (LOS) D. Utilization of the CEQA process would help identify alternatives to or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs/housing balance if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion to an acceptable level.

Policy 4. As a condition of private development approval, developers shall build roads needed to access the existing road network. Developers shall build these roads to County standards unless improvements along state routes are necessary then roads shall be built to Caltrans standards. Developers shall locate these roads (width to be determined by the Circulation Plan) along centerlines shown on the circulation diagram map unless otherwise authorized by an approved Specific Plan Line. Developers may build local roads along lines other than those on the circulation diagram map. Developers would negotiate necessary easements to allow this.

Implementation Measures

Implementation Measure C. Project development shall comply with the requirements of the Kern County Zoning Ordinance, Land Division Ordinance, and Development Standards.

2.3.7. Setback Deviation Studies

Implementation Measures

Implementation Measure A. A setback deviation request shall report proposed setback distance. The Kern County Zoning Ordinance gives setback distance for permanent structures located along surveyed section and mid-section lines. Setback deviations may be authorized where it is demonstrated that expressway, arterial or collector construction will not occur while the structure in question is usable, or valuable. An entity pursuing a setback deviation shall submit an application with necessary justification to support the request. The application shall include fees to defray costs to prepare staff reports and administering the application.

2.3.8. Safety Hazards of Fog and Dust

Goals

Goal 2. To relieve blowing dust influences on driving safety in Kern County.

2.4. Priority Focus Area Topics - Highways

2.4.7. Taft Area

Goals

Goal 1. Upgrade road circulation in and around Taft.

Goal 2. Reduce the speeds and amount of commuters and truck traffic through the centers of rural communities based on engineering and speed surveys.

Policies

Policy 3. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.

Policy 4. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.

2.4.8. Delano – McFarland Area

Policies

Policy 5. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caldrons roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.

Policy 6. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.

2.4.9. Lerdo Area

Goals

Goal 3. Improve traffic safety relative to farm vehicles and equipment.

Goal 4. Provide for improved traffic flow adjacent to existing communities.

Policies

Policy 6. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.

Policy 7. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.

2.4.10. Rosamond – Willow Springs

None of the goals, policies, or implementation measures contained in Section 2.4.10 are applicable to the proposed Project.

2.4.11. Boron

None of the goals, policies, or implementation measures contained in Section 2.4.11 are applicable to the proposed Project.

2.5. Other Modes

2.5.1. Trucks and Highways

Goals

Goal 1. Provide for Kern County's heavy truck transportation in the safest way possible.

Goal 2. Reduce potential overweight trucks.

2.5.2. Airport Land Use Compatibility Plan (ALUCP)

Policies

Policy 2. To the extent legally allowable, prevent encroachment on public airport and military base operations from incompatible, unmitigated land uses.

Implementation Measures

Implementation Measure A. Review discretionary land use development applications within the airports influence area and the military base operating area as shown in the ALUCP for consistency.

2.5.4. Transportation of Hazardous Materials

Goals

Goal 1. Reduce risk to public health from transportation of hazardous materials.

Policies

Policy 1. The commercial transportation of hazardous material, identification and designation of appropriate shipping routes will be in conformance with the adopted Kern County and Incorporated Cities Hazardous Waste Management Plan.

Policy 2. Kern County and affected cities should reduce use of County-maintained roads and city-maintained streets for transportation of hazardous materials.

Chapter 3. Noise Element

3.2. Noise Sensitive Areas

Goals

Goal 1. Ensure that residents of Kern County are protected from excessive noise and that moderate levels of noise are maintained.

Goal 2. Protect the economic base of Kern County by preventing the encroachment of incompatible land uses near known noise producing roadways, industries, railroads, airports, oil and gas extraction, and other sources.

Policies

Policy 2. Require noise level criteria applied to all categories of land uses to be consistent with the recommendations of the California Division of Occupational Safety and Health (DOSH).

Policy 3. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise.

Policy 4. Utilize good land use planning principles to reduce conflicts related to noise emissions.

Policy 5. Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into the project design. Such mitigation shall be designed to reduce noise to the following levels: a) 65 dB Ldn or less in outdoor activity areas; b) 45 dB Ldn or less within interior living spaces or other noise sensitive interior spaces.

Policy 6. Ensure that new development in the vicinity of airports will be compatible with existing and projected airport noise levels as set forth in the ALUCP.

Policy 7. Employ the best available methods of noise control.

Implementation Measures

Implementation Measure A. Utilize zoning regulations to assist in achieving noise-compatible land use patterns.

Implementation Measure F. Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65 dB Ldn and interior noise levels in excess of 45 dB Ldn.

Implementation Measure J. Develop implementation procedures to ensure that requirements imposed pursuant to the findings of an acoustical analysis are conducted as part of the project permitting process.

Chapter 4. Safety Element

Goals

Goal 1. Minimize injuries and loss of life and reduce property damage.

Goal 8. Reduce the public's exposure to fire, explosion, blowout, and other hazards associated with the accidental release of crude oil, natural gas, and hydrogen sulfide gas.

4.2. General Policies and Implementation Measures, which Apply to More than One Safety Constraint

Policies

Policy 1. That the County's program of identification, mapping, and evaluating the geologic, fire, flood safety hazard areas, and significant concentrations of hydrogen sulfide in oilfield areas, presently under way by various County departments, be continued.

Policy 4. The County shall encourage extra precautions be taken for the design of significant lifeline installations, such as highways, utilities, and petrochemical pipelines.

Implementation Measures

Implementation Measure F. The adopted multi-jurisdictional Kern County, California Multi-Hazard Mitigation Plan, as approved by FEMA, shall be used as a source document for preparation of environmental documents pursuant to CEQA, evaluation of project proposals, formulation of potential mitigation, and identification of specific actions that could, if implemented, mitigate impacts from future disasters and other threats to public safety.

4.3. Seismically Induced Surface Rupture, Ground Shaking, and Ground Failure

Implementation Measures

Implementation Measure B. Require geological and soils engineering investigations in identified significant geologic hazard areas in accordance with the Kern County Code of Building Regulations.

Implementation Measure C. The fault zones designated in the Kern County Seismic Hazard Atlas should be considered significant geologic hazard areas. Proper precautions should be instituted to reduce seismic hazard, whenever possible in accordance with state and County regulations.

Implementation Measure G. Route major lifeline components such as highways, utilities, petroleum or chemical pipelines around areas of high groundwater whenever possible. Where they must cross an area of high groundwater, plans, and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure H. Require that plans and permits for installation of major lifeline components such as highways, utilities, petroleum or chemical pipelines to incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of essential service or threat to health and safety.

Implementation Measure I. Design significant lifeline installations, such as highways, utilities, and petrochemical pipelines which cross an active fault, to accommodate potential fault movement without prolonged disruption of essential service or creating threat to health and safety.

4.4. Dam Failure, Flooding, and Inundation

Policies

Policy 2. Design discretionary critical facilities in the potential dam inundation area used for the storage, or use of hazardous materials to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Policy 3. Require emergency response plans for the Planning Area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area.

Implementation Measures

Implementation Measure A. Facilities used for the manufacture, storage, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measure B. Discretionary critical facilities within potential inundation areas shall be designed to mitigate or prevent effects of inundation.

4.5. Landslide, Subsidence, Seiche, and Liquefaction

Policies

Policy 1. Determine the liquefaction potential at sites in areas of shallow groundwater (Map Code 2.3) prior to discretionary development and determine specific mitigation to be incorporated into the foundation design, as necessary, to prevent or reduce damage from liquefaction in an earthquake.

Policy 2. Route major lifeline installations around potential areas of liquefaction or otherwise protect them against significant damage from liquefaction in an earthquake.

Policy 3. Reduce potential for exposure of residential, commercial, and industrial development to hazards of landslide, land subsidence, liquefaction, and erosion.

Implementation Measures

Implementation Measure B. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation design to mitigate potential damage to buildings on sites with liquefaction potential.

Implementation Measure C. Develop and maintain maps, at an appropriate scale, showing the location of all geologic hazards, including active faults, Alquist-Priolo Earthquake Fault Zones, 100-year flood hazard boundary, the extent of projected dam failure inundation and time arcs, depth of inundation, land subsidence, slope failure and earthquake-induced landslides, high groundwater, and liquefaction potential.

Implementation Measure D. Discretionary actions will be required to address and mitigate impacts from inundation, land subsidence, landslides, high groundwater areas, liquefaction and seismic events through the CEQA process.

4.6. Wildland and Urban Fire

Policies

Policy 1. Require discretionary projects to assess impacts on emergency services and facilities.

Policy 3. The County will encourage the promotion of fire prevention methods to reduce service protection costs and costs to taxpayers.

Policy 5. Require that all roads in wildland fire areas are well marked, and that homes have addresses prominently displayed.

Policy 6. All discretionary projects shall comply with the adopted Fire Code and the requirements of the Fire Department.

Implementation Measures

Implementation Measure A. Require that all development comply with the requirements of the Kern County Fire Department or other appropriate agency regarding access, fire flows, and fire protection facilities.

4.8. Critical Facilities and Hazardous Buildings

Policies

Policy 5. Incorporate planning for incidents affecting critical facilities into contingency plans for disaster response and recovery.

Implementation Measures

Implementation Measure L. Require that plans and permits for installation of major lifeline components such as highways, utilities, and petroleum or chemical pipelines to incorporate

design features to accommodate potential fault movement in areas of active faults without prolonged disruption of essential service or threat to health and safety.

4.9. Hazardous Materials

Policies

Policy 2. Innovative technologies to manage hazardous waste streams generated in Kern County will be encouraged.

Implementation Measures

Implementation Measure A. Facilities used to manufacture, store, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measure B. The proposed siting or expansion of hazardous waste facilities will be in conformance with the adopted Kern County and Incorporated Cities Hazardous Waste Management Plan.

4.10. Abandoned open Shafts and Wells

Policies

Policy 2. The County should protect residents from the hazards associated with development in areas where wells have been drilled and abandoned for exploration and/or production of oil and natural gas.

Implementation Measures

Implementation Measure B. Support the construction site review program of the Department of Oil, Gas, and Geothermal Resources that assures wells are precisely located, properly plugged and abandoned, and tested for leakage prior to development of the area.

Chapter 5. Energy Element

5.2. Importance of Energy to Kern County

Goals

General Goal: To assert Kern County's position as California's leading energy producer, to encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decisions and actions of other agencies as they affect energy development in Kern County.

Policies

Policy 3. The County shall continue to streamline energy permitting regulations.

Policy 5. The County shall work with other agencies to define regulatory responsibility concerning energy-related issues, and shall seek to eliminate, insofar as possible, duplicative regulations.

Policy 7. The processing of all discretionary energy project proposals shall comply with California Environmental Quality Act (CEQA) Guidelines directing that the environmental effects of a project must be taken into account as part of project consideration.

Policy 8. The County should work closely with local, state, and federal agencies to assure that energy projects (both discretionary and ministerial) avoid or minimize direct impacts to fish, wildlife, and botanical resources, wherever practical.

Policy 9. The County should develop and implement measures which result in long-term compensation for wildlife habitat, which is unavoidably damaged by energy exploration and development activities.

Policy 10. The County should require acoustical analysis for energy project proposals that might impact sensitive and highly-sensitive uses in accordance with the Noise Element of the General Plan.

5.3. Petroleum Resources and Development

5.3.1. Urban/Residential Development in Petroleum Resource Areas

Goals

Goal. To protect oil resource areas from unnecessary urban/suburban encroachment, and in instances of urban/suburban development in oil resource areas, to provide for the development of petroleum resources in a manner compatible with the surrounding environment to minimize adverse impacts and protect health and safety.

Policies

Policy 1. The County shall continue to assure adequate minimum setbacks between wells and from any existing structure, as permitted by the Kern County Zoning Ordinance.

Policy 2. The County shall assure adequate minimum setbacks between the construction of any structure and existing wells as permitted by the Kern County Fire Department and the State Division of Oil, Gas, and Geothermal Resources (DOGGR).

Policy 3. The County shall continue to provide the opportunity for establishing drilling islands prior to final maps subdivision approval of any proposal in a petroleum resource area or a waiver of surface entry rights by the applicable mineral rights holder.

Policy 4. All oilfield development shall take place in accordance with regulations administered by DOGGR.

Policy 5. New access roads to serve oilfield development should be sited to avoid traffic impacts.

Policy 6. In areas where petroleum production occurs close to urban development, oil companies shall be encouraged to site equipment so as to avoid unnecessary disturbance to urban uses.

Policy 7. The County should work in cooperation with incorporated cities of Kern County to establish compatible standards for oil development within urban areas.

Policy 8. Reduce the public's exposure to fires, explosions, blowouts, and other hazards associated with the accidental release of crude oil, natural gas, or hydrogen sulfide gas by ensuring that discretionary development projects have adequate separation from oil and natural gas production land uses.

Implementation Measures

Implementation Measure A. The Drilling Island District of the Kern County Zoning Ordinance shall establish and maintain development standards to permit petroleum exploration and development on single lots and in small areas.

Implementation Measure B. The Petroleum Extraction Combining District of the Kern County Zoning Ordinance shall establish and maintain specific standards for ensuring compatibility with urban and petroleum development for the Estate (E), Commercial Office (CO), Neighborhood Commercial (C-1), General Commercial (C-2), and Highway Commercial (CH) zoning designations.

Oil and gas production shall be subject to provisions set forth in Chapter 19.98 of the Kern County Zoning Ordinance.

Implementation Measure C. The County shall monitor its regulations pertaining to petroleum exploration, production, and update such regulations as necessary.

5.3.2. Kern County's Economic Dependence on the Oil Marketplace

Goals

Goal. To reduce the County's susceptibility to fluctuations in the petroleum production levels, and to encourage diversification of the economy.

Policies

Policy 3. The County shall encourage the conversion of existing petroleum-related facilities to other productive uses when they are no longer needed or productive.

Policy 4. The County should encourage the development of renewable energy industries to diversify the energy economy in Kern County.

5.3.3. Waste Disposal in Petroleum Development

Goals

Goal. To encourage the safe recycling, transportation, and disposal of wastes associated with petroleum production and processing, and to provide for the siting of disposal facilities in locations with proper access, while minimizing adverse impacts on the environment and on public health and safety.

Policies

Policy 1. The County shall continue to acknowledge the necessity to site nonhazardous oilfield waste disposal sites near petroleum development to minimize transportation hazards and expenses, consistent with the provisions of the Kern County and Incorporated Cities Integrated Waste Management Plan.

Policy 2. The County shall encourage recycling and new treatment methods for hazardous and nonhazardous oilfield wastes.

Policy 3. The County shall work cooperatively with appropriate state and regional agencies to provide for the proper siting of oilfield waste disposal facilities.

Implementation Measures

Implementation Measure A. The County shall work with the California Department of Oil, Gas, and Geothermal Resources to maintain an inventory of onsite and offsite disposal facilities in order to identify the scope of oilfield waste disposal facilities in Kern County.

Implementation Measure B. The County shall address oilfield hazardous waste issues through the Kern County and Incorporated Cities Hazardous Waste Management Plan.

Implementation Measure C. The County shall continue to maintain provisions in the Zoning Ordinance to provide for oilfield waste disposal facilities.

Implementation Measure D. The County shall continue to maintain provisions in the Zoning Ordinance for the development of oilfield waste recycling and treatment facilities.

5.3.4. Petroleum Technology and Advancement

Goals

Goal. To encourage the continuing advancement of energy technology and to respond to the needs it creates on the work force.

Policies

Policy 1. The County should actively encourage research and demonstration projects which would be positive for Kern County and not in conflict with adopted plans and programs.

Policy 2. The County should encourage the energy resource industry to invest and research the practical advancement of technology, and allow for periodic updates or training sessions for industry workers.

Implementation Measures

Implementation Measure A. The County should promote a continuing dialogue with petroleum industry representatives to monitor trends in technology and anticipate needed changes to development standards.

Implementation Measure B. The County shall review and revise, as necessary, the Zoning Ordinance to make provisions for experimental technologies.

5.3.5. Reuse of Nonproductive Petroleum Resource Areas

Goals

Goal. To ensure the proper abandonment of petroleum production operations, in accordance with DOGGR requirements, when petroleum resource areas are depleted or are no longer productive, to provide for conversion of these areas to other land uses.

Policies

Policy 1. The County shall promote safe well abandonment in accordance with DOGGR regulations through discretionary applications.

Policy 2. The County shall work with the DOGGR to ensure the removal of all surface equipment from abandoned petroleum development sites.

Policy 3. The County shall promote and encourage the safe reuse of former petroleum production lands by developments compatible with surrounding land use designations. The guidelines for site reestablishment include the following:

a. Removal of oil-laden soil
b. Shaping of disturbed lands back to natural grade and the elimination of pad areas, settling ponds, and similar disturbances.
c. Stabilization of sites by seedlings and plantings as appropriate.
d. Other measures as may be stipulated by the State Division of Oil, Gas and Geothermal Resources.
e. Proper identification and abandonment of all oil and natural gas wells.

Implementation Measures

Implementation Measure A. Upon cessation of drilling and/or producing operations in drilling islands, the County will consider initiating zone changes for such drilling islands to zoning districts compatible with surrounding land uses, provided the owner/operator demonstrates proper

abandonment and cleanup in accordance with State Division of Oil, Gas and Geothermal Resources regulations.

5.3.6. Environmental Impacts of Petroleum Development

Goals

Goal. To clearly identify and mitigate any adverse impacts on the environment from new or continued petroleum development by establishing clear and workable methods for industry compliance.

Policies

Policy 1. The County should pursue programs to address oil production as it relates to state and federal threatened and endangered species protection laws.

Policy 2. The County shall work with affected state and federal agencies and special interest groups to establish consistent policies for environmental protection activities related to petroleum production and oilfield waste disposal.

Policy 3. The County should attempt to ensure that the petroleum industry does not bear a burden of environmental regulation in excess of its contribution to the problems.

Policy 4. The County should encourage the use of clean-burning technologies in petroleum production.

Policy 5. The County should encourage air pollution control policies which apply the burden equally to local and upwind sources and to all classes of air polluters.

Policy 6. The County should work closely with state and federal agencies to avoid or minimize direct impacts to threatened and endangered species.

Implementation Measures

Implementation Measure B. The County will continue to participate in programs, such as the proposed Kern County Valley Floor Habitat Conservation Plan program, which are intended to mitigate impacts of development on threatened or endangered species, including seeking state and federal funding for endangered species protection programs.

Implementation Measure D. Energy resource industries should participate in the Kern County Valley Floor Habitat Conservation Plan to mitigate impacts to threatened and endangered species.

5.3.7. Processing and Transportation of Petroleum Products

Goals

Goal. To ensure the siting of refining facilities and pipelines in locations to provide maximum health, safety, and environmental protection; and to encourage the necessary processing and transportation facilities for Kern County's petroleum production.

Policies

Policy 1. New refineries shall be sited in accordance with provisions of the Kern County Zoning Ordinance.

Policy 2. The County shall review proposed pipelines and their alignments for their conformity with the Land Use, Open Space, and Conservation Element of this General Plan.

Policy 3. The County shall encourage the development of new pipelines with alignments that provide for environmental and the public's health and safety protection.

Implementation Measures

Implementation Measure A. The County shall review and revise, as necessary, the Zoning Ordinance to provide for suitable sites for refinery construction and expansion.

Implementation Measure B. The County shall review and revise, as necessary, the Emergency Response Plan, to provide consistent and proper procedures to address refinery accidents and pipeline ruptures.

5.4. Electricity Resources and Generation

5.4.1. Cogeneration

Goals

Goal. To encourage the safe and orderly development of cogeneration facilities and increased utilization of cogeneration in oil production and other industries as a cleaner and more efficient means of generating both steam and electricity.

Policies

Policy 1. The County shall allow the continued development of cogeneration facilities in primary oil resource areas and industrial areas.

Policy 3. The County should encourage the construction of (an) interstate natural gas pipeline(s) to provide supplies of natural gas for cogeneration and thermally enhanced oil recovery in Kern County, provided that proposals are consistent with the goals and policies of the Land Use, Conservation, and Open Space Element of the Kern County General Plan.

Implementation Measures

Implementation Measure A. The County shall continue to maintain provisions in the Zoning Ordinance to provide for the proper siting of cogeneration facilities in suitable areas.

5.4.7. Transmission Lines

Goals

Goal. To encourage the safe and orderly development of transmission lines to access Kern County's electrical resources along routes, which minimize potential adverse environmental effects.

Policies

Policy 1. The County should encourage the development and upgrading of transmission lines and associated facilities (e.g., substations) as needed to serve Kern County's residents and access the County's generating resources, insofar as transmission lines do not create significant environmental or public health and safety hazards.

Policy 2. The County shall review all proposed transmission lines and their alignments for conformity with the Land Use, Conservation, and Open Space Element of this General Plan.

Policy 3. In reviewing proposals for new transmission lines and/or capacity, the County should assert a preference for upgrade of existing lines and use of existing corridors where feasible.

Policy 4. The County should work with other agencies in establishing routes for proposed transmission lines.

Policy 5. The County should discourage the siting of above-ground transmission lines in visually sensitive areas.

Policy 6. The County should encourage new transmission lines to be sited/configured to avoid or minimize collision and electrocution hazards to raptors.

Implementation Measures

Implementation Measure B. The County shall continue to maintain provisions in the Zoning Ordinance and update as necessary to provide for transmission line development.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands

within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to land use and planning.

Chapter 2. Land Use Element

Goals

Goal 1. Accommodate new development which captures the economic demands generated by the marketplace and establishes Bakersfield's role as the capital of the southern San Joaquin Valley.

Goal 2. Accommodate new development which provides a full mix of uses to support its population.

Goal 3. Accommodate new development which is compatible with and complements existing land uses.

Goal 4. Accommodate new development which channels land uses in a phased, orderly manner and is coordinated with the provision of infrastructure and public improvements.

Policies

Policy 31. Allow for a variety of industrial uses, including land-extensive mineral extraction and processing, heavy manufacturing, light manufacturing, warehousing and distribution, transportation-related, and research and development uses (I-1).

Policy 32. Protect existing industrial designations from incompatible land use intrusions (I-1, I-6, I-8).

Policy 33. Encourage the efficient use of existing industrial land uses through consolidation of building and storage facilities (I-1, I-6, I-8).

Policy 34. Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors (I-1).

Policy 35. Encourage upgrading of visual character of heavy manufacturing industrial areas through the use of landscaping or screening-of visually unattractive buildings and storage areas (I-1, I-6, I-8).

Policy 36. Require that industrial uses provide design features, such as screen walls, landscaping and height, setback and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound and vibration (I-1, I-6, I-8).

Policy 37. Street frontages along all new industrial development shall be landscaped (I-1, I-6, I-8).

Policy 38. Minimize impacts of industrial traffic on adjacent residential parcels through the use of site plan review and improvement standards (I-1, I-6).

Policy 76. Provide for a mix of land uses which meets the diverse needs of residents; offers a variety of employment opportunities; capitalizes, enhances, and expands upon existing physical and economic assets; and allows for the capture of regional growth (I-1).

Policy 77. Allow for the continuance of agricultural uses in areas designated for future urban growth (I-1).

Policy 82. Preserve existing significant sound residential neighborhoods, commercial districts, and industrial areas (I-1, I-6, I-8).

Chapter III. Circulation Element

A. Streets

Goals

Goal 3. Minimize the impact of truck traffic on circulation, and on noise sensitive land uses.

Policies

Policy 6. Design and locate site access driveways to minimize traffic disruption where possible considering items such as topography, past parcelization and other factors (I-7).

Policy 7. Minimize direct and uncontrolled property access from arterials (I-8).

Policy 14. Provide continuous truck routes within incorporated areas that provide access to designated industrial areas (I-13).

Policy 15. Prohibit trucks from non-truck routes within incorporated areas except as necessary for direct property access for pick-up and delivery (I-13).

Policy 16. Require that truck access to commercial and industrial properties be designed to minimize impacts on adjacent residential parcels (I-14).

Policy 36. Prevent streets and intersections from degrading below Level of Service "C" where possible due to physical constraints (as defined in a Level of Service Standard) or when the existing Level of Service is below "C" prevent where possible further degradation due to new development or expansion of existing development with a three part mitigation program: adjacent right-of-way dedication, access improvements and/or an area wide impact fee. The area-wide impact fee would be used where the physical changes for mitigation are not possible due to existing development and/or the mitigation measure is part of a larger project, such as freeways, which will be built at a later date (I-28, I-29).

Policy 37. Require new development and expansion of existing development to pay for necessary access improvements, such as street extensions, widenings, turn lanes, signals, etc., as identified in the transportation impact report as may be required for a project (I-30, I-31, I-32).

Implementation Measures

Implementation Measure 7. Review all site plans for compliance with adopted drive approach design standards.

Implementation Measure 8. Review site plans, rezonings, and subdivision requests, with respect to access from arterials. Consider conditions of approval to minimize uncontrolled property access.

Implementation Measure 14. Amend the city and county Zoning Ordinances as needed to regulate truck access on properties adjacent to residential areas.

Implementation Measure 25. Maintain records of existing traffic volume and cumulative projections of traffic from new development to schedule projects for the Capital Improvement Program.

Implementation Measure 26. Establish guidelines for project design review based on traffic engineering standards (e.g., driveway design, onsite circulation) and the Level of Service Ordinance.

Implementation Measure 28. Periodic review and if needed, revision of adopted ordinances that includes a Level of Service standard for the city and county to include a definition of Level of Service "C", procedures for how it is measured, and mitigation measures to keep from exceeding the standard.

Implementation Measure 29. Periodic review and, if needed, revision of adopted guidelines for preparation of transportation impact reports, definition of undesirable impacts, and identification of mitigation procedures.

Implementation Measure 33. Periodic review and, if needed, revision of adopted Transportation Impact Fee Ordinance for the city and county, which specifies the area wide impact fee schedule and how the fees will be used.

D. Parking

Goals

Goal 2. Satisfy parking requirements in all new developments (residential, commercial, industrial, etc.) through off-street facilities.

Policies

Policy 3. Ensure that adequate onsite parking supply and parking lot circulation is provided on all site plans in accordance with the adopted parking standards (1-3).

Policy 4. Discourage the intrusion of non-neighborhood parking in residential areas (1-4).

Implementation Measures

Implementation Measure 3. Review all site plans for conformance with adopted parking standards.

Chapter V. Conservation Element

A. Biological Resources

Goals

Goal 1. Conserve and enhance Bakersfield's biological resources in a manner which facilitates orderly development and reflects the sensitivities and constraints of these resources.

Goal 2. To conserve and enhance habitat areas for designated "sensitive" animal and plant species.

Policies

Policy 1. Direct development away from "sensitive biological resource" areas, unless effective mitigation measures can be implemented (1·1, f-3, 1-4).

Policy 2. Preserve areas of riparian vegetation and wildlife habitat within floodways along rivers and streams, in accordance with the Kern River Plan Element and channel maintenance programs designed to maintain flood flow discharge capacity (1-4).

Policy 3. Discourage, where appropriate, the use of off-road vehicles to protect designated sensitive biological and natural resources (l-2).

Policy 4. Determine the feasibility of enhancing sensitive biological habitat and establishing additional wildlife habitat in the Project Area with state and/or federal assistance (1-3).

Policy 5. Determine the locations and extent of suitable habitat areas required for the effective conservation management of designated "sensitive" plant and animal species (1-3).

Implementation Measures

Implementation Measure 3. Preserve habitat and avoid "take" of protected species as required in the Metropolitan Bakersfield Habitat Conservation Plan.

B. Mineral Resources

Goals

Goal 1. Protect areas of significant resource potential for future use.

Goal 2. Document areas of current mineral and energy resource extraction, as a basis for land use and conservation policies and programs.

Goal 3. Avoid conflicts between the productive use of mineral and energy resource lands and urban growth.

Goal 4. Protect land, water, air quality and visual resources from environmental damage resulting from mineral and energy resource development.

Policies

Policy 4. Land use decisions shall recognize the importance of identified mineral resources and need for conservation of resources identified by the State Mining and Geology Board (I-2).

Policy 7. Promote development of compatible uses adjacent to mineral extraction areas (I-2).

Policy 10. Implement, as appropriate, the California Environmental Quality Act to minimize land use conflicts and reduce environmental impacts of all proposed resource extraction operations (I-2).

Policy 11. Prohibit incompatible development in areas which have a significant potential for harm to public health, safety and welfare due to mineral and petroleum extraction and processing (I-2).

Policy 12. Design resource extraction operations subject to discretionary permits to maintain the integrity of areas of "high environmental quality" and unique scenic value (I-2).

Policy 14. Review all discretionary mineral or petroleum development including renewal of existing authorizations, under the policies and procedures of the California Environmental Quality Act (I-4).

Policy 15. Require petroleum production sites in urban areas which are subject to discretionary permits, to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways (I-4).

Policy 16. Require all mineral development to be predicated on appropriate reclamation plans that meet the standards of the State Surface Mining and Reclamation Act and the implementing guidelines of the State Mines and Geology Board, and (or) the standards of the State Division of Oil and Gas. Reclamation/restoration of the sites shall be done as each phase of development or extraction is completed (I-4, I-5).

Implementation Measures

Implementation Measure 3. Periodically review and update local Zoning Ordinances that have been amended to accommodate mineral extraction uses outside of mineral resource zones.

C. Soils and Agriculture

Goals

Goal 1. Provide for the planned management, conservation, and wise utilization of agricultural land in the Planning Area.

Goal 2. Promote soil conservation and minimize development of prime agricultural land as defined by the following criteria:

- capability Class I and/or II irrigated soils
- 80-100 Storie Index rating
- gross crop return of $200 or more per acre per year
- annual carrying capacity of 1 animal unit per acre per year

Goal 3. Establish urban development patterns and practices that promote soil conservation and that protect areas of agricultural production of food and fiber crops, and nursery products.

Policies

Policy 1. Determine the extent and location of all prime agricultural land within the study area (I-1).

Policy 2. Review projects that propose subdividing or urbanizing prime agricultural land to ascertain how continued commercial agricultural production in the project vicinity will be-affected (I-2).

Policy 4. Monitor the amount of prime agricultural land taken out of production for urban uses or added within the plan area (I-3).

Policy 7. Land use patterns, grading, and landscaping practices shall be designed to prevent soil erosion while retaining natural watercourses when possible (I-4).

Policy 12. Prohibit premature removal of ground cover in advance of development and require measures to prevent soil erosion during and immediately after construction (I-4).

Implementation Measures

Implementation Measure 2. Evaluate discretionary projects for their impact on agricultural resources.

Implementation Measure 3. Document urban expansion and changes in the amount of agricultural land for purposes of determining cumulative impacts to prime agricultural land.

D. Water Resources

Goals

Goal 1. Conserve and augment the available water resources of the Planning Area.

Goal 2. Assure that adequate groundwater resources remain available to the Planning Area.

Goal 3. Assure that adequate surface water supplies remain available to the Planning Area.

Goal 4. Continue cooperative planning for and implementation of programs and projects which will resolve water resource deficiencies and water quality problems.

Goal 5. Achieve a continuing balance between competing demands for water resource usage.

Goal 6. Maintain effective cooperative planning programs for water resource conservation and utilization in the Planning Area by involving all responsible water agencies in the planning process.

Policies

Policy 6. Protect Planning Area groundwater resources from further quality degradation (I-7).

Policy 8. Consider each proposal for water resource usage within the context of total Planning Area needs and priorities-major incremental water transport, groundwater recharge, flood control, recreational needs, riparian habitat preservation and conservation (I-9).

Policy 9. Encourage and implement water conservation measures and programs (I-11).

Implementation Measures

Implementation Measure 6. Support the provision of adequate wastewater collection systems and treatment reclamation and disposal facilities which will prevent groundwater degradation by onsite wastewater systems.

Implementation Measure 7. Maintain industrial waste discharge regulation and monitoring programs which protect the Planning Area groundwater from contaminants.

Implementation Measure 10. Support additional water conservation measures and programs of benefit to the Planning Area.

E. Air Quality

Goals

Goal 1. Promote air quality that is compatible with health, wellbeing, and enjoyment of life by controlling point sources and minimizing vehicular trips to reduce air pollutants.

Goal 2. Continue working toward attainment of federal, state and local standards as enforced by the San Joaquin Valley Unified Air Pollution Control District.

Goal 3. Reduce the amount of vehicular emissions in the Planning Area.

Policies

Policy 1. Comply with and promote San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) control measures regarding Reactive Organic Gases (ROG). Such measures are focused on: (a) steam driven well vents, (b) Pseudo-cyclic wells, (c) natural gas processing plant fugitives, (d) heavy oil test stations, (e) light oil production fugitives, (f) refinery pumps and compressors, and (g) vehicle inspection and maintenance (I-1).

Policy 2. Encourage land uses and land use practices which do not contribute significantly to air quality degradation (I-1).

Policy 3. Require dust abatement measures during significant grading and construction operations (I-1).

Policy 5. Consider the location of sensitive receptors such as schools, hospitals, and housing developments when locating industrial uses to minimize the impact of industrial sources of air pollution (I-1).

Chapter VI. Open Space Element

Goals

Goal 3. Locate and site development to minimize the disruption of open space areas.

Policies

Policy 1. Promote the establishment, maintenance and protection of the Planning Area's open space resources, including the following:

a. Conservation of natural resources (refer to Chapter II-Land Use, Chapter V-Conservation, and Chapter XII Kern River Plan Element).
    - Kern River corridor
    - Management of hillsides
b. Managed production of resources

- Agriculture (refer to Chapter V-Conservation/Soils and Agriculture)
- Oil production (refer to Chapter V-Conservation/Mineral Resources)

c. Outdoor recreation

- Parks (refer to Chapter XI-Parks)
- Kern River corridor (refer to Chapter II-Land Use, Chapter V Conservation, and Chapter XII-Kern River Plan Element)

d. Public health and safety

- Hazard avoidance (refer to Chapter VIII-Safety)

Policy 5. Development location and siting should be sensitive to its relationship to the Kern River (I-3).

Policy 9. Encourage depleted resource extraction sites to be restored as alternative open space or developed with uses compatible with those adjacent (I-5).

Chapter VII. Noise Element

Goals

Goal 1. Ensure that residents of the Bakersfield Metropolitan Area are protected from excessive noise and existing moderate levels of noise are maintained.

Goal 2. Protect the citizens of the Planning Area from the harmful effects of exposure to excessive noise, and protect the economic base of the area by preventing the encroachment of incompatible land uses near known noise-producing roadways, industries, railroads, airports and other sources.

Policies

Policy 1. Identify noise-impact areas exposed to existing or projected noise levels exceeding 65 dB CNEL (exterior) or the performance standards described in Table VII-2. The noise exposure contour maps on file at the City of Bakersfield and County of Kern indicate areas where existing and projected noise exposures exceed 65 dB CNEL (exterior) for the major noise sources identified (I-1).

Policy 2. Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into project design to reduce noise to acceptable levels. (I-2, I-3, I-6, I-7).

Policy 3. Review discretionary industrial, commercial or other noise-generating land use projects for compatibility with nearby noise-sensitive land uses. Additionally, the development of new noise-generating land uses which are not preempted from local noise regulation will be reviewed

if resulting noise levels will exceed the performance standards contained within Table VII-2 in areas containing residential or other noise-sensitive land uses (I-3, I-6, I-7).

Policy 5. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise (I-7).

Implementation Measures

Implementation Measure 2. Review discretionary development plans, programs and proposals, including those initiated by both the public and private sectors, to ascertain and ensure their conformance to the policy framework outlined in this element.

Implementation Measure 4. Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65 dB CNEL and interior noise levels in excess of 45 dB CNEL and so that impacts on noise sensitive uses shall not exceed the performance standards in Table VII-2.

At time of any discretionary approval, such as a request for zone change or subdivision, the developer may be required to submit an acoustical report indicating the means by which the developer proposes to comply with the noise standards. The acoustical report shall:

a. Be the responsibility of the applicant.

b. Be prepared by a qualified acoustical consultant experienced in the fields of environmental noise assessment and architectural acoustics.

c. Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.

d. Include estimated noise levels in terms of CNEL and the standards of Table VII-2 (if applicable) for existing and projected future (10-20 years hence) conditions, with a comparison made to the adopted policies of the Noise Element.

e. Include recommendations for appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element.

f. Include estimates of noise exposure after the prescribed mitigation measures have been implemented. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a rationale for acceptance of the project must be provided.

Implementation Measure 10. Standards for Project Noise Impacts for Mobile Sources. A significant increase of existing ambient noise levels affecting existing noise sensitive land uses (receptors), and requiring the adoption of practical and feasible mitigation measures, is deemed to occur where a project will cause:

- An increase of the existing ambient noise level by 5 dB or more, where the existing ambient level is less than 60 dB CNEL;

- An increase of the existing ambient noise level by 3 dB or more, where the existing ambient level is 60 to 65 dB CNEL;
- An increase of the existing ambient noise level by 1.5 dB or more, where the existing ambient level is greater than 65 dB CNEL.

Standards for Cumulative Noise Impacts for Mobile Sources. A project's contribution to noise increase would normally be considered cumulatively considerable and considered significant when ambient noise levels affect noise sensitive land uses (receptors) and when the following occurs.

- A project increases the ambient (cumulative without project) noise level by 1 dB or more; and
- The cumulative with project noise levels cause the following:
  - An increase of the existing ambient noise level by 5 dB or more, where the existing ambient level is less than 60 dB CNEL;
  - An increase of the existing ambient noise level by 3 dB or more, where the existing ambient level is 60 to 65 DB CNEL;
  - An increase on the existing ambient noise level by 1.5 dB or more, where the existing ambient level is greater than 65 dB CNEL.

Chapter VIII. Safety Element

A. Seismic Safety

Goals

Goal 1. Substantially reduce the level of death, injury, property damage, economic and social dislocation and disruption of vital services that would result from earthquake damage.

Goal 2. Ensure the availability and effective response of emergency services following an earthquake.

Goal 4. Prevent loss of life from the failure of critical facilities in an earthquake and ensure the continued functioning of essential facilities following a disaster.

Goal 5. Protect essential lifelines and prevent casualties and major social and economic disruption due to liquefaction in an earthquake.

Goal 7. Protect land uses from the risk of dam failure inundation including the assurances that: the functional capabilities of essential facilities are available in the event of a flood; hazardous materials are not released; effective measures for mitigation of dam failure inundation are incorporated into the design of critical facilities; and the rapid and orderly evacuation of populations in the inundation area will occur.

Critical Facilities Policies

Policies

Policy 4. Encourage critical facilities in dam inundation areas to develop and maintain plans for safe shut-down and efficient evacuation from their facilities, as appropriate to the degree of flood hazard for each facility (I-26, I-31).

Policy 5. Incorporate planning for incidents affecting critical facilities into contingency plans for disaster response and recovery (I-31).

Fault Rupture Policies

Policies

Policy 12. Design significant lifeline installations such as highways, utilities and petrochemical pipelines which cross an active fault, to accommodate potential fault movement without prolonged disruption of an essential service or creating threat to health and safety (I-16).

Liquefaction Policies

Policies

Policy 13. Determine the liquefaction potential at sites in areas of high groundwater prior to development and determine specific mitigation to be incorporated into the foundation design, as necessary to prevent or reduce damage from liquefaction in an earthquake (I-17 through I-19).

Policy 14. Route major lifeline installations around potential liquefaction areas or otherwise protect them against significant damage from liquefaction in an earthquake (I-20).

Dam Failure Inundation Risk Policies

Policies

Policy 18. Design discretionary critical facilities located within the potential inundation area for dam failure in order to: mitigate the effects of inundation on the facility; promote orderly shut-down and evacuation (as appropriate); and, prevent onsite hazards from affecting building occupants and the surrounding communities in the event of dam failure (I-26).

Policy 19. Design discretionary facilities in the potential dam inundation area used for the manufacture, storage or use of hazardous materials to prevent onsite hazards from affecting surrounding communities in the event of inundation (I-27).

Policy 20. Require emergency response plans for the Planning Area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area (I-28).

Implementation Measures

Implementation Measure 2. Require detailed site studies for ground shaking characteristics, liquefaction potential, dam failure inundation and flooding potential, and fault rupture potential, as background to the design process for critical facilities under city and county discretionary approval.

Implementation Measure 3. Require structures that are within the plan area and are subject to Building Department review to adhere to the most current seismic standards adopted as part of the Uniform Building Code.

Implementation Measure 4. Review existing critical facilities for any significant siting, design or construction problems that would make them vulnerable in an earthquake. The findings shall be incorporated into emergency operations plans as well as addressed in longer-term programs of facilities upgrading or relocation.

Implementation Measure 10. Develop appropriate criteria and procedures for third-party review of the seismic design of critical facilities.

Implementation Measure 16. Require plans and permits for installation of major lifeline components such as for highways, utilities and petroleum or chemical pipelines to incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure 17. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation designs to mitigate potential damage to buildings on sites with liquefaction potential.

Implementation Measure 20. Route major lifeline components such as for highways, utilities and petroleum or chemical pipelines around areas of high groundwater wherever possible. Where they must cross an area of high groundwater, plans and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.

Implementation Measure 26. Develop procedures for the discretionary review of critical facilities proposed in an area of potential dam inundation. Approvals shall include requirements that emergency shut-down and facility evacuation plans be developed, maintained and exercised for each facility, and the potential effects of inundation on essential facility functions and the safety of occupants and the community in general are addressed.

Implementation Measure 27. Facilities used for the manufacture, storage or use of hazardous materials shall comply with the uniform fire code, with requirements for siting or design to prevent onsite hazards from affecting surrounding communities in the event of inundation.

Implementation Measure 28. Incorporate specific plans for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans.

Implementation Measure 29. Maintain effective disaster response and earthquake response plans and update on a regular basis.

B. Flooding

Goals

Goal 1. Minimize hazards to Planning Area residents resulting from flooding.

Goal 2. Reduce the risk of flooding to land uses.

Policies

Policy 1. Develop specific standards which apply to development located in flood hazard areas, as defined by federal Flood Insurance maps and most recent information as adopted by the responsible agency (I-1, I-2).

Implementation Measures

Implementation Measure 2. Develop procedures for the review of proposed facilities which use, manufacture or store hazardous materials proposed in areas of identified flood hazard.

C. Pubic

Goals

Goal 1. Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.

Goal 4. Assure that fire, hazardous substance regulation and emergency medical service problems are continuously identified and addressed in a proactive way, in order to optimize safety and efficiency

Policies

Policy 1. Identify future site locations, projected facility expansions, projected site acquisition costs, construction costs and operational costs in a manner that would maximize the efficiency of new public safety services (I-1, I-2, I-3).

Policy 2. Require discretionary projects to assess impacts on police and fire services and facilities (I-3).

Policy 7. Enforce ordinances regulating the use/manufacture/sale, transport/disposal of hazardous substances, and require compliance with state and federal laws regulating such substances.

Policy 8. The Kern County and Incorporated Cities Hazardous Waste Management Plan and Final Environmental Impact Report serves as the policy document guiding all facets of hazardous waste.

Policy 12. Where recommended by appropriate local, state or federal agencies for discretionary projects, soils shall be tested for concentrations of agricultural chemicals prior to grading permit approval whenever feasible. Contaminated soils shall be excavated and disposed of at a certified hazardous waste disposal facility whenever necessary.

Policy 16. All new discretionary development projects shall be subject to environmental and design review on a site-specific, project-by-project basis, including but not limited to an assessment to determine whether hazardous materials present potential health effects to human health as required by the Department of Environmental Services.

Implementation Measures

Implementation Measure 2. Funding for Police and Fire equipment and facilities will be facilitated through bond issues and/or development fees and/or land dedications and/or assessment districts.

Chapter X. Public Services and Facilities Management Element

A. General Utility Services

Goal 4. Develop funding principles and programs which will assure that all new development will pay for the incremental costs of the public facilities and services--utilities bridges, parks, and public safety facilities--both onsite and offsite, to serve such development.

Policies

Policy 5. Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent (I-3).

Implementation Measures

Implementation Measure 4. Create benefit assessment districts or establish service fees for the distribution of costs to users for capital improvement replacement costs and maintenance, utilizing such districts for the financing of improvements which are essential to Planning Area development.

B. Water Distribution

Goals

Goal 1. Ensure the provision of adequate water service to all developed and developing portions of the Planning Area.

Policies

Policy 3. Require that all new development proposals have an adequate water supply available (I-3, I-4).

Implementation Measures

Implementation Measure 3. Review, and modify as required, existing fee structures and ordinances to assure desired system financing and policy implementation.

C. Sewer Service

Goals

Goal 1. Ensure the provision of adequate sewer service to serve the needs of existing and planned development in the Planning Area.

Implementation Measures

Implementation Measure 6. Exclusive of County Service Area No. 71, developers shall be required to install dry sewer lines in streets and connections thereto for parcels less than 1 acre (net) in size in areas where a centralized sewer system is planned and imminent and where onsite systems can be proven to be temporarily satisfactory.

Within County Service Area No. 71, a proposed development at a density greater than one dwelling unit per three gross acres, as well as all commercial and industrial developments, shall be required to be served by a regional sewage collection and treatment system subject to the following provisions:

1. All new development (commercial, industrial and residential at densities greater than one dwelling unit per three gross acres}, including both discretionary and ministerial projects, shall be required to connect to public sewer when said development is located 1 ,000 feet or closer to available public sewer.

   If public sewer is more than 1 ,000 feet from development, a dry sewer system in conjunction with approved individual septic systems may be utilized for lots having an area of 10,000 square feet or larger. Dry sewer systems are not required for lots of three gross acres or larger. Single residential lots that require a ministerial permit shall connect to public sewer when located 200 feet or closer to available public sewer. Single residential lots less than three gross acres that are greater than 200 feet from available public sewer are required to install dry sewer in accordance with the requirements of the Engineering and survey.

2. All new development (commercial, industrial and residential at densities greater than one dwelling unit per three gross acres), including both discretionary and ministerial projects, shall pay a sewer development fee where the Board of Supervisors has adopted a planned sewer area and install dry sewer within the project development when located in excess of 1 ,000 feet from public sewer or where sewer service is not available as determined by the Engineering and Survey Services Department. The fee amount shall be based on the property's pro rata share of all conveyance, facility and capacity costs. Single residential lots that are greater than 200 feet from available public sewer are required to install dry

sewer in accordance with the requirements of the Engineering and Survey Services Department.

3. In those cases where sewer service will not be available as determined by the Sewer Master Plan, an exemption may be granted by the Engineering and Survey Services Department.

4. All new development (commercial, industrial, and residential at densities greater than one dwelling unit per three gross acres) shall be required to annex to an existing County Service Area (CSA) or form a new CSA if none is already in place. In conjunction with formation of, or annexation to, a CSA, applicants shall be required to form a Zone of Benefit for the purpose of constructing and maintaining a sewer trunk line.

D. Storm Drainage

Goals

Goal 1. Ensure the provision of adequate storm drainage facilities to protect Planning Area residents from flooding resulting from storm water excess.

Kern River Plan Element

The Kern River Plan Element governs land use within the Kern River Planning Area. The Element was prepared as a joint effort by the City of Bakersfield and Kern County. The following Kern River Plan Element policies are applicable to the proposed Project for all unincorporated county lands within the Kern River Planning Area.

Chapter III. Issues, Goals, and Basic Plan Policies

3.2. Open Space Versus Development

Policies

Policy 11. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, areas designated as A.4 (Mineral and Petroleum) and electrical power lines to oil wells, water wells, and water control devises in areas designated as 8.5 (Resource Management) unless otherwise required by law, and at River crossings, or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

3.4. Floodplain Management

Policies

Policy 9. Oil and mineral exploration and production shall be allowed within the secondary floodway, provided that adverse effects on riparian vegetation and wildlife habitat are minimized. Appurtenant facilities, such as tank farms and steam generators, shall be located outside any floodway; except that they may be allowed within the 8.4/2.5 (Mineral and Petroleum/Secondary

Floodway) upon showing by the operator that no other location is reasonably available for then, the proposed location and extent of construction is necessary for the operation of wells in the immediate vicinity, and the intent of this plan for the secondary floodway is followed.

Policy 10. Resource extraction activities, such as sand and gravel removal, shall comply with the "California Surface Mining and Reclamation Act of 1975."

3.5. Private Property and Public Use

Policies

Policy 2. Open space qualities of the Kern River primary and secondary floodway shall be protected consistent with policies of this plan, regardless of whether the land is in public or private ownership.

3.6. Mineral and Petroleum

Goals

Goal. To provide for the continued production of petroleum resources and to ensure that future exploration activities can take place, while ensuring that other open space values in the River area are reasonably protected. Utilize sand and gravel resources of the River in such a way as to ensure that floodway, groundwater recharge, and wildlife habitat values are protected.

Policies

Policy 1. Sand and gravel removal shall be done in such a manner as not to degrade, or otherwise adversely affect, the natural and scenic qualities of the Kern River, riparian vegetation, or wildlife habitat except as is necessary or appropriate to maintain the required channel capacity for flood control in the primary floodway.

Policy 2. Petroleum or sand and gravel activities proposed within the primary floodway shall conform to the specific requirements of the State Reclamation Board and other state and local regulatory agencies.

Policy 3. Petroleum extraction zone overlays and drilling island delineation shall be established in areas designated for resource uses for the purpose of protecting natural vegetation and wildlife. Brush clearing, moving of vegetation, and similar activities shall be permitted only to the extent required for those activities and a reclamation plan prepared.

Policy 4. Noise abatement measures shall be required of all resource management activities which would adversely affect adjacent land uses or wildlife habitat.

Policy 5. Mineral and petroleum exploration and extraction activities are permitted in the primary and secondary floodways subject to regulations, to be adopted within a two-year period by the County and City to accomplish the goals and policies of this Element and to mitigate adverse impacts which may otherwise result from construction of facilities and access thereto. Such

regulations shall include, but need not be limited to, requirements limiting the impact of access and facilities construction upon adjacent areas, prohibiting activities creating obstructions to floodflow, establishing minimal standards for flood proofing all wells, pumps and associated equipment, specifying spill prevention control and counter-measure plans and emergency procedures, and specifying site and access restoration,.

Chapter IV. Map Provisions and Policies

The intent of this plan with regard to the Primary and Secondary Floodways of the Kern River is that:

- No development or physical improvements for uses in the Primary Floodway which would restrict flows, interfere with groundwater recharge or increase the rise in water surface during high flows of the Kern River, or displace the primary floodway will be permitted.
- Limited development, with an emphasis on preserving open space within the area of the Secondary Floodway, with recognition of the potential flood hazard that exists therein, may be permitted.

4.8. Industrial

Policies

Policy 5. Industrial areas should be separate from residential areas to protect both homes and factories.

Policy 6. Industrial areas adjacent to the Kern River primary or secondary floodway should be buffered by landscaping or vegetation to provide the least possible conflict with open space values of the River.

Chapter V. Implementation Policies

B. Open Space and Development

Implementation Policies

Implementation Policy 2. Any new non-open space development, including projects by public agencies, shall not occur without prior City or County approval of a "Development Plan." The "Development Plan" shall be reviewed for completeness and consistency with the following guidelines:

a. Elevation drawings of all proposed structures and signs.

b. Landscaping plan which provides for screening of obnoxious uses and respects existing views of the Kern River channel.

c. Grading and revegetation plan.

d. Plot plan or recent aerial photograph depicting existing uses and natural vegetation cover.

e. A biota survey and analysis of effects which development would impose on any significant identified biota.

f. A certified delineation of the primary and secondary floodways, if applicable to the site, depicting both predevelopment conditions and future development conditions.

g. Other standard zoning and subdivision ordinance requirements in force at the time of application.

Implementation Policy 4. All new development and accessory uses, excepting wells, shall maintain a minimum setback of 90 feet from the primary floodway line. If not feasible to do so because of lot size or configuration, new development, including accessory uses, shall maintain a setback from the primary floodway line of 60% or greater of the distance between the primary floodway line and the point of the lot farthest from the primary floodway.

Implementation Policy 5. In order to preserve views of the River, reasonable height limits will be imposed through the "Development Plan" review process on any new non-open space development within any floodway. Criteria for height limits shall be based on existing site factors, such as surrounding land use, vegetation, and distance to the Kern River course.

Implementation Policy 6. Grading and filling for any new non-open space development shall not commence until approval under a "Development Plan."

Implementation Policy 7. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, 8.4 areas (Mineral and Petroleum), and at River crossings or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

C. Riparian Vegetation

Implementation Measures

Implementation Policy 1. The City and County shall develop a master list of plant species for criteria to approve "Development Plans." This list shall be considered for incorporation into this plan by General Plan Amendment. Revegetation or landscaping with native or compatible shrubs and trees shall be required as part of all public and private projects. Areas of unique habitat value, such as the Mesquite-Saltbush Association in the vicinity of Enos lane, shall be preserved in accordance with the City's approved plan for use of the 2,800-acre recharge area and River channel maintenance.

Implementation Policy 2. Prior to any development within the Kern River Plan boundaries, including residential, commercial, industrial, recreational, water recharge, channel improvement, and resource recovery projects, a landscaping plan shall be submitted to the respective City or County Planning Department for review and approval.

Implementation Policy 3. For all new development in residentially, commercially, and industrially zoned properties within the plan boundaries, the River setback area shall be either landscaped or revegetated. Except as might be required by the City or County Fire Department, no clearing of shrubs or tree cutting will be allowed unless otherwise provided for by this plan.

F. Mineral and Petroleum Extraction

Implementation Measures

Implementation Policy 1. The City and County shall revise, within two years from adoption of this plan, mineral and petroleum extraction regulations and provisions of their respective floodplain Zoning Ordinances consistent with all plan policies and incorporate the following features:

a. Strict limits on residential development.

b. Restrictions on the removal of riparian vegetation.

c. Noise limits when adjacent to highly sensitive and sensitive land uses.

d. Requirements for aesthetic treatment (painting, landscaping, screening) of production facilities (i.e., oil pump units, tanks, gravel crushers, etc.) located within the plan boundaries.

e. Allowance for sand and gravel operations necessary to the Kern River floodway or floodplain.

f. Allowances for petroleum extraction to occur with and without public hearing requirements and subject to a set of standard requirements, as in "a" through "d" above.

Implementation Policy 2. Mineral and petroleum extraction shall be encouraged on those lands designated “Mineral and Petroleum” on the Kern River Plan Map. Such use may also occur in other areas designated for recreation, resource, or industrial uses as long as the primary designated use is not significantly impaired and as long as such use is consistent with other provisions of this plan and in compliance with existing local, state, and federal regulations.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Each Specific Plan area has one of the following General Plan Map Codes:

Map Code 4.1 (Accepted County Plan Areas) - A designation of areas for which Specific Plans or Rural Community Plan have been adopted and incorporated into the Kern County General Plan.

Map Code 4.2 (Interim Rural Community Plan) - A designation used to identify area in the County for which Interim Rural Community Plan Maps have been prepared and are in effect until formal Specific Plans can be adopted for each respective community. No formal text plans have been adopted and the goals and policies of the Kern County General Plan govern any development within these areas.

Map Code 4.3 (Specific Plan Required) - A designation applied to areas wherein large-scale projects have been previously proposed by the project landowner(s) for which a specific plan has not yet been adopted. Areas designated Map Code 4.3 shall be subject to development, consideration, and adoption of a specific plan in accordance with all applicable local and state requirements.

Of the 24 designated Specific Plan Areas within the Project Area, 13 are designated General Map Code 4.3, meaning that the area has been designated as a Specific Plan Area for future development, but a Specific Plan has not yet been prepared. These areas are:

- Bear Trap
- Buena Vista Hills
- Commanche
- Grapevine Commercial
- Hudson Ranch
- Neumarkel
- Rancheria Specific Plan
- Tejon Creek No. 1
- Tejon Creek No. 2
- Tejon Hills
- Tunis Creek
- Tunis Ridge
- White Wolf

In addition, five of the 24 designated Specific Plan areas, which are designated General Map Code 4.2 include a map only and do not include an official Rural Community Plan. These areas are:

- Fellows
- Mettler
- Mexican Colony – Cherokee Strip
- Pond
- Smith's Corner

Of the remaining Specific and Rural Community Plans (General Map Code 4.1 and 4.2), the following plans contain no relevant policies related to oil and gas development:

- Blackwells Corner
- Beech Avenue Industrial Park
- Buttonwillow
- Kern River (Westside) Freeway
- I-5 and 58 Rural
- Oglesby
- Tejon Industrial Complex East
- Tejon Mountain
- Woody Rural

Specific Plan Policies, Goals, and Implementation Measures

The following Specific and Rural Community Plans contain the relevant goals, policies, and implementation measures with respect to oil and gas development. Figure 4.10-3 depicts Specific and Rural Community Planning areas for which a Specific Plan or Rural Community Plan has been adopted.

Lost Hills Specific Plan - 1978

Open Space and Conservation Element

- Other lands contributing to open space are the natural resource lands in the southwest portion of the plan area. This oil and gas field should be maintained in open space to minimize activities that would restrict its production. As production of oil and gas decreases significantly (1990-2000), these lands should remain in open space as agriculture.

Dustin Acres Rural Community Plan - 1983

The Final Environmental Impact Report (FEIR) prepared for the Dustin Acres Rural Community Plan identifies the following mitigation measures with regard to noise attenuation:

D. Location of oil wells should be sited so as not to create excessive noise or nuisance to adjacent residents.

Section III, Plan Policies and Objectives

Subsection C, Open Space and Conservation Plan Policy

- To provide resource management and open space by directing development activities away from designated resource areas.

Objectives

2. In areas with a resource designation on the specific plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of mineral or petroleum resources wi11 be considered to be consistent with this plan.

Implementation

- Precisely zone intensive agriculture resource areas a minimum of twenty acres gross lot size. Mineral and Petroleum Resource areas shall be precisely zoned for a minimum of 5 acres gross lot size. Zoning for resource designated areas shall be consistent with the Land Use Consistency Matrix.

Valley Acres Rural Community Specific Plan - 1983

The Final Environmental Impact Report (FEIR) prepared for the Valley Acres Rural Community Specific Plan identifies the following mitigation measures with regard to noise attenuation:

D. Location of oil wells should be sited so as not to create excessive noise or nuisance to adjacent residents.

Section III, Plan Policies and Objectives

Subsection C, Open Space and Conservation Plan Policy

- To provide resource management and open space by directing development activities away from designated resource areas.

Objectives

2. In areas with a resource designation on the specific plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of mineral or petroleum resources wi11 be considered to be consistent with this plan.

Implementation

- Precisely zone intensive agriculture resource areas a minimum of twenty acres gross lot size. Mineral and Petroleum Resource areas shall be precisely zoned for a minimum of 5 acres gross lot size. Zoning for resource designated areas shall be consistent with the Land Use Consistency Matrix.

Derby Acres Rural Community Specific Plan - 1984

Section VIII. Resource

1. In areas with a resource designation, only industrial activities which directly and obviously relate to the exploration, production, and transportation of mineral and petroleum resources are consistent with this Plan. (Mineral and Petroleum [Map Code 8.4]).

B. Petroleum related Industrial activities are permitted in the 8.4 Map Code Area. Industrial uses, such as those permitted in Map Code 7.15, would be considered consistent if sited pursuant to Section 7188.3 (conditional use permit in the Natural Resource [NR] zone). Should actual and necessary industrial sites be proposed in the 8.4 Map code areas, provision for ample and safe access to State Highway 33 must be provided which does

not include the local residential street system of the community.

McKittrick Rural Community Plan - 1984

- Due to the large number of hazardous old wells in the Plan area, the California Division of Oil and Gas must be consulted prior to entering or modifying any well encountered during future construction.

Rural Community Plan Map

- Mineral and Petroleum (Map Code 8.4) Areas which contain producing or potentially productive petroleum fields and mineral deposits. Uses are limited to activities directly associated with the resource extraction. Minimum parcel size is five acres gross.

Section VIII. Resource

1. In areas with a resource designation, only industrial activities which directly and obviously relate to the exploration, production, and transportation of mineral and petroleum resources are consistent with this Plan.

Tupman Rural Community Specific Plan - 1984

Section III, Plan Policies and Objectives

Subsection 3, Open Space and Conservation

Objective

- To provide resource management and open space by directing development activities away from designated resource areas.

Policy

1. In areas with a resource designation on the Specific Plan Map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of mineral or petroleum resources will be considered to be consistent with this Plan.

Implementation

- Mineral and Petroleum Resource areas shall be precisely zoned for a minimum of 5 acres gross lot size. Zoning for resource designated areas shall be consistent with the Land Use Consistency Matrix.

Casa Loma Specific Plan - 1986

Section 13.2.22 notes that the plan policies related to private oil pipelines and related construction facilities

- Shall not be construed to apply to the construction, installation, operation, and maintenance of pipelines for the transmission of crude oil operated by private enterprises; provided, however, before any right-of-way for transmission lines is acquired for regional or interstate facilities, the proposed route shall be submitted for Director review and recommendation

Cal Centre Specific Plan - 1988

Land Use Element under Agriculture

3. Oil well exploration drilling is permitted by right in the A Zone, and Map Code 3.3 (Pg. 14; Pg. 42 of document). [The A zone signifies Exclusive Agricultural Zone and Map Code 3.3 is areas zoned for Sewers Public Facilities.]

Breckenridge Hills Specific Plan - 1989

Circulation Element

In the A (Exclusive Agriculture) District, unrestricted drilling of oil wells is subject only to permit review by the Division of Oil and Gas and oil well placement nearby or within a planned road alignment is a concern.

Land Use Element

Goals

2. To protect and conserve existing oilfields.
3. Protect Resource extraction activities and exploratory testing for oil and gas from premature urban encroachment and allow for land devoted to these uses to convert to other appropriate uses at such time as resource extraction is no longer feasible.

Conservation and Open Space Element - Watershed and Drainage Plans

Policies

3. Petroleum exploration and extraction activities shall be confined to those areas currently under such uses (identified by land use Map Code 8.4 or 8.2 and 8.1).
4. The extraction of petroleum resources and future exploration or drilling activities should be allowed to continue while protecting areas planned for community development from significant adverse impacts.
5. Premature urban zoning, which may inhibit oil and/or gas extraction and/or exploration activities or preclude continued oil extraction activities, should be avoided.
9. Geotechnical and/or hazardous waste surveys will be conducted for oil extraction areas prior to residential development.

15. Require clearance from DOGGR for discretionary residential development projects within a designated oilfield.

San Emidio Specific Plan – 1992

Chapter 7.0: San Emidio New Town Specific Plan Document

4.7.3a-8: All development projects within the San Emidio Specific Plan shall comply with the provisions of the Oil and Gas Production Zoning Ordinance (Chapter 19.98)

4.7.3-10: Appropriate screening techniques shall be used and setbacks maintained to ensure compatibility between oil and gas wells and new development.

Section 2.6, Resource Conservation

Policies

Existing oil production and sand and gravel resources in San Emidio shall be able to continue as interim uses until the time that development occurs.

Implementation Measures

3. All producing oil wells shall be screened from proposed development by landscaping, shall be enclosed in structures or, shall be placed in underground vaults.
7. The current zoning for the leased land comprising the existing Kern Rock Sand and Gravel operation and areas of expansion of the lease into the designated Mineral Resource Zone (MRZ)-2 shall remain as Natural Resource [NR] District comprising 20 acres and Agricultural-I (A-1) as an interim use under this adopted Specific Plan.

Kern River Specific Trails Plan - 1993

Chapter 7-Trails Management and Maintenance

- All trails will be at least 50 feet from any active or abandoned well and all associated oilfield equipment in consultation with the DOGGR. Other than the section of trail system stated above, active or abandoned oils wells and all associated oilfields within 100 feet of the trails shall have a chain link fence placed around them in consultation with the owner/lessee of the equipment. At no times will pedestrians or equestrians be allowed on active oilfield maintenance roads. All trail development plans in and around oilfields will consult the oil and gas production operator for advisement.

Cameron Point Specific Plan – 1994

4.2.4. Implementation Measures

6. Existing and abandoned water and/or oil wells shall be identified in the field and plotted on land division maps.

Negative Declaration

12. The mineral rights holder shall be consulted with each subsequent phase of the development to determine if a DI (Drilling Island) District or the PE (Petroleum Extraction Combining) District will be necessary for future resource exploration.

Implementation Measures

2. Being located in an area with ongoing oil production, a "drill site" (Drilling Island Zone) may be established as a compatible zone and/or land use within this Specific Plan area without further amendments.

Western Rosedale Specific Plan – 1994

Chapter 1- Land Use Element

Policies

15. Petroleum production sites may be included within a development if adequate measures are included to protect adjacent sensitive land uses.

Chapter II- Open Space and Conservation Element

Policies

3. Protect significant mineral and petroleum resource areas to assure their continued availability until their recovery is no longer feasible.

8. Ensure petroleum and mineral development projects provide processes and procedures for the capture, treatment, and disposal of all gases, fluids, wastes, and spoils in accordance with federal, state and local regulations.

9. Require petroleum production sites in urban areas to install perimeter landscaping to help reduce the noise, dust, and visual impacts to adjacent sensitive receptors and public ways.

Chapter II- Mineral and Resource Policy Implementation

Implementation Measures

3(a) All future zone changes to commercial districts shall contain the PE (Petroleum Extraction Combining) and PD (Precise Development Combining) Districts.

3(b) Future zone change applications to commercial and industrial Zone Districts shall be accompanied by a map which clearly depicts future drilling sites. All sites shall be located and distributed in a manner to allow for future exploration and production of hydrocarbons.

3(c) Future precise development plans in commercially and industrially zoned districts shall be subject to the following drill site measures:

(1) All precise development plans shall clearly show the drill sites agreed to during the zone change process.

(2) All drill sites shall contain a minimum of two acres.

(3) Access to all drill sites shall be clearly depicted on precise development plans.

(4) Drill sites may be relocated subsequent to approval of A precise development plan if, in the opinion of the Planning Director, a conflict exists between the proposed development and the drill site(s) location. However, the number of sites may not be reduced, and the general distribution pattern of the sites shall be followed to the greatest extent possible.

(5) If relocation of drill sites is proposed, the project developer shall provide the mineral rights holders with information related to the proposed relocation prior to the Planning Director taking any action. The mineral rights holders shall be provided a minimum of 15 business days for review of relocation proposal and shall submit related comments to the Planning Director. The Planning Director shall consider said comments when making a decision regarding drill site relocation proposals.

South Kern Industrial Center Specific Plan – 2002

Section VI, Environmental Resource Management Element

Implementation Measures

30. The potential for future hydrocarbon exploration shall be considered by the property owners for the mineral rights holders by the establishment of three drilling island easements.

31. Any applicants proposing future hydrocarbon exploration on parcel development plans shall be required to consult in advance with the DOGGR. Applicants proposing hydrocarbon exploration shall submit a copy of the response letter from the DOGGR to the Kern County Planning Department prior to the issuance of a building permit.

Greater Tehachapi Area Specific Plan and Community Plan - 2010

Goals

8. To protect mineral resources from unnecessary urban/suburban encroachments, and in instances of urban/suburban development in mineral or oil resources areas, to provide for the development of such resources in a manner compatible with the surrounding environment to minimize adverse impacts and protect public health and safety.

Policies

31. Prohibit non mineral-resource related development in areas of the Greater Tehachapi Area that have been identified by the California Geological Survey "Mineral Land Classification of Southeastern Kern County" as MRZ-2a and MRZ-2b.

32. Ensure adequate minimum setbacks between the construction of any structure and existing mines or wells, as specified by the Kern County Fire Department and DOGGR.
33. Require any oilfield-related development to take place in accordance with DOGGR regulations and all mining-related development to take place in accordance with the requirements of the Surface Mining and Reclamation Act (SMARA).

Implementation Measures

34. All proposals to amend this plan shall be reviewed to ensure that the proposal would not result in the potential for sensitive uses to occur within close proximity to an existing mining operation or oilfield-related development.
35. All development proposals which would place non-mineral resource development within one mile of a known mining operation shall be reviewed to ensure that the proposed use would not conflict with the existing mining operation. Should potential incompatibilities be identified, the County shall not support the project unless those potential impacts can be mitigated to a less than significant level.
36. The County shall discourage the rezoning of any state designated mineral resource areas to residential or commercial Zone Districts to protect them from loss to urban development.

Kern County Zoning Ordinance – Chapter 19.98, Oil and Gas Production

The Kern County Zoning Ordinance contains 21 Zone Districts that function as base districts and are used to identify land uses in the unincorporated portions of the County. A "Lot Size Combining" district is also included in the code that provides for various lot sizes in the Estate (E) and Natural Resource (NR) base districts. These Zone Districts are applied to unincorporated properties both public and private.

The 21 Zone Districts can be broadly divided into five major categories:

1. Agriculture - includes A and A-1.
2. Residential - includes R-1, R-2, R-3, MP, and E.
3. Commercial - includes CO, C-1, C-2, and CH.
4. Industrial - includes M-1, M-2, and M-3.
5. Special - includes RF, OS, NR, DI, FPP, SP, and PL, each of which has a special application dealing with special limitations on land.

Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance contains the procedures and standards that apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County. At present, Chapter 19.98's general development standards and conditions require the following:

19.98.020 Unrestricted Drilling

No review or permit shall be required for the drilling of any steam injection well, steam drive well, service well, or any well intended for the exploration for or development or production of oil, gas, and other hydrocarbon substances, or for any related accessory equipment, structure, or facility in the Exclusive Agriculture (A), Limited Agriculture (A-1), Medium Industrial (M-2), Heavy Industrial (M-3), or Natural Resource (NR) Districts, provided that:

A. All drilling installations and operations comply with the requirements of state law and with applicable fire and safety ordinances and regulations of the County of Kern.

B. Drilling shall not be commenced within 100 feet of any existing residence without the written consent of the owner thereof.

C. Signs shall be limited to directional, warning, and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations.

D. Disposal of nonhazardous oilfield liquid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oilfield liquid waste or production water is produced and disposed of within the same designated oilfield; or
2. The nonhazardous oilfield liquid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

19.98.030 Drilling by Ministerial Permit

A. No well for use as an injection well and no well for the exploration for or development or production of oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in the Light Industrial (M-1) or Recreation-Forestry (RF) District until an application for plot plan review has been submitted to and approved by the Planning Director as consistent with the standards set out in Section 19.98.050 of this chapter and in accordance with the procedures set out in Sections 19.102.040 through 19.102.060 of this title. In approving an application for plot plan review, the Planning Director may waive any standards set out in Section 19.98.050 of this chapter if he/she determines that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity.

B. Disposal of nonhazardous oilfield liquid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oilfield liquid waste or production water is produced and disposed of within the same designated oilfield; or

2. The nonhazardous oilfield liquid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

19.98.040 Drilling by Conditional Use Permit

A. No well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in any zoning district described in this title in which such uses are permitted as conditional uses until an application for a conditional use permit has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.050 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.104 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.050 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity.

B. Disposal of nonhazardous oilfield liquid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oilfield liquid waste or production water is produced and disposed of within the same designated oilfield; or

2. The nonhazardous oilfield liquid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

C. If a producing well or service well is not completed upon land subject to a conditional use permit issued pursuant to this chapter and Chapter 19.104 of this title within 12 months from the date of issuance of the permit, or within any extended period thereof, the conditional use permit shall expire and the premises shall be restored as nearly as practicable to their original condition. No permit shall expire while the permittee is continuously conducting drilling, redrilling, completing or abandoning operations, or related operations, in a well on the lands covered by such permit, which operations were commenced while said permit was otherwise in effect. Continuous operations are operations suspended not more than 30 consecutive days. If, at the expiration of the 12-month period, the permittee has not completed his drilling program on the lands covered by such permit, the Planning Commission may, upon a written request of the permittee, extend the permit for the additional time requested by permittee for the completion of such drilling program.

19.98.050 Development Standards and Conditions

All wells drilled, pursuant to Section 19.48.020 of this title and Sections 19.98.030 and 19.98.040 of this chapter, for the exploration for or development or production of oil, gas, and other

hydrocarbon substances and related facilities and activities shall comply with the following standards, unless otherwise provided in this chapter:

A. No oil or gas well shall be drilled within 100 feet of any public highway or building not necessary to the operation of the well, or within 150 feet of any dwelling, or within 300 feet of any building used as a place of public assembly, institution, or school, or within 50 feet of any building utilized for commercial purposes constructed prior to the commencement of such drilling, without the written consent of the owner of such structure.

B. All drilling and production activities shall conform to all applicable fire and safety regulations, and firefighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.

C. No signs, other than directional and warning signs and those required for identification of the well, shall be constructed, erected, maintained, or placed on the premises or any part thereof, except those required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.

D. Sanitary toilet and washing facilities, if required by the Kern County Health Department or other governmental agencies, shall be installed and maintained in a clean and sanitary condition during drilling operations, and at such other times as specified by these agencies.

E. Proven technological improvements generally accepted and used in drilling and production methods shall be employed as they may become available if they are capable of reducing nuisances or annoyances.

F. All derricks, boilers, and other drilling equipment employed pursuant to this section to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well shall be removed within 90 days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derricks, boilers, and drilling equipment are to be used within a reasonable time, as determined by the Planning Director, for the drilling of another well or wells on the premises.

G. Within 90 days after any well has been placed in production, or after its abandonment, earthen sumps used in drilling or production or both (unless such sumps are to be used within a reasonable time as determined by the Planning Director for the drilling of another well or wells) shall be filled and the drilling site restored as nearly as practicable to a uniform grade. Temporary earthen sumps may be used for cleanout or remedial work on an existing well or other production facility. However, these sumps shall be filled and the site restored as nearly as practicable to uniform grade within 90 days after the cleanout or other remedial work is completed. Such restoration work shall comply with all applicable regulations of the DOGGR.

H. Any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Planning Director may approve the use of a standard type of derrick.

I. Whenever oil or gas is produced into and shipped from tanks located on the premises, such tanks, whenever located within 500 feet of any dwelling or commercial building, shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping or shall be fenced in such a manner as to, insofar as practicable, screen such tanks from public view. Such fencing shall comply with the requirements of the DOGGR.

J. Whenever a well is located within 500 feet from an existing dwelling unit, except in case of an emergency, no materials, equipment, tools, or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 a.m. and 8:00 p.m., unless otherwise required by the DOGGR.

K. Pumping wells shall be operated by electric motors or muffled internal combustion engines.

L. The height of all pumping units shall not exceed 35 feet and shall be painted and kept in neat condition.

M. All vehicle parking and maneuvering areas shall be treated and maintained with oiled sand or a similar dust binding material.

N. After production begins and a pump is installed on the wellhead, a fence at least 6 feet in height shall be installed around the pump site or drilling island for public safety. This fence shall be constructed of chain link with wood or metal slats or other screening fence as may be approved by the Planning Director. This fencing and screening requirement shall apply only to those pump sites located within 500 feet of any dwelling. Such fencing shall comply with the requirements of the DOGGR.

O. All required federal, state, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:

1. DOGGR
2. Kern County Fire Department
3. Kern County Health Department
4. Regional Water Quality Control Board (RWQCB)
5. Air Pollution Control District (APCD)
6. Kern County Engineering and Survey Services Department

19.98.060 Plot Plan Review - Conditional Use Permit – Application Contents

An application for plot plan review pursuant to Section 19.98.030 of this chapter and an application for a conditional use permit pursuant to Section 19.98.040 of this chapter shall include the following:

A. Name and address of the applicant.

B. Name(s) and address(es) of the property owner(s).

C. Assessor's parcel number(s).

D. Legal description of the property.

E. A plot plan or site development plan (in the case of a conditional use permit) drawn at the scale specified by the Planning Director, which includes the following information:

1. Topography and proposed grading.
2. Location of all proposed well holes and related accessory equipment, structures, and facilities to be installed and any abandoned wells if such are known to exist.
3. Location of all existing dwellings and buildings used for other purposes, located within 300 feet of the proposed well holes, identification of the use of each structure, and distances between well holes and existing buildings.
4. North arrow.

F. Narrative description of the proposed development, including:

1. Acreage or square footage of the property.
2. Nature of hydrocarbon development activity.
3. Description of equipment to be used.
4. Distance to all existing buildings.
5. Phasing or development schedule.

19.98.070 Permit Revocation and Modification

Any permit issued pursuant to this chapter may be revoked or modified pursuant to Section 19.102.020 of this title.

Kern County Zoning Ordinance – Chapter 19.81, Dark Skies Ordinance (Outdoor Lighting)

This chapter of the Kern County Zoning Ordinance provides requirements for outdoor lighting within specified unincorporated areas of Kern County in order to accomplish the following objectives:

1. Encourage a safe, secure, and less light-oriented nighttime environment for residents, businesses, and visitors.
2. Promote a reduction in unnecessary light intensity and glare, and to reduce light spillover onto adjacent properties.
3. Protect the ability to view the night sky by restricting unnecessary upward projections of light.
4. Promote energy conservation and a reduction in the generation of GHG by reducing wasted electricity that can result from excessive or unwanted outdoor lighting.

In accordance with Chapter 19.81.050 f the Kern County Zoning Ordinance, outdoor lighting in association with oil and gas exploration and production operations and related facilities are exempt from this chapter and are regulated by the provisions of Chapter 19.98 described above.

Kern County Zoning Ordinance – Setback Requirements

The Kern County Zoning Ordinance includes a number of setback requirements for oil and gas wells per Table 4.10-4.

Table 4.10-4: Summary of Kern County Existing Setback Requirements for Oil and Gas Wells

Zone Districts		Required Setbacks (in feet)			
		Dwelling	Public Highway or Building	Buildings Used as Places of Assembly, Institution or School	Any Building Used for Commercial Purposes
A	Exclusive Agriculture	100	N/A	N/A	N/A
A-1	Limited Agriculture	100	N/A	N/A	N/A
M-2	Medium Industrial	100	N/A	N/A	N/A
M-3	Heavy Industrial	100	N/A	N/A	N/A
NR	Natural Resource	100	N/A	N/A	N/A
RF	Recreation Forestry	150	100	300	50 (1)
M-1	Light Industrial	150	100	300	50 (1)
PE	Petroleum Extraction	150	100	300	50 (1)
DI	Drilling Island	150	100	300	50 (1)
	Zone Districts where CUPs are required	150	100	300	50 (1)

Notes:
(1) For wells within 50 feet of a building used for commercial purposes, written consent must be obtained from the structure's owner prior to the commencement of drilling.
(2) Fencing and screening is required for pumps sites within 500 feet of any dwelling. (19.98.050.N Development Standards)

Habitat Conservation Plans and Natural Community Conservation Plans

Oil and gas exploration and production activities could take place in areas within the boundaries of an approved HCP or Natural Community Conservation Plan (NCCP). The following HCPs and NCCPs have been approved for portions of the Project Area and are summarized below. The locations of these HCPs are presented on Figure 4.4-12 (see Section 4.4, Biological Resources).

1. Freeport-McMoRan Oil and Gas HCP
2. CRC (formerly Occidental of Elk Hills, Inc.) Non-Unit HCP (formerly Nuevo/Torch HCP, 1999)
3. Aera Coles Levee HCP (previously Arco Western Energy)
4. Chevron Pipeline HCP
5. California Aqueduct - San Joaquin Field Division HCP
6. Kern County Waste Management Department HCP
7. Kern Water Bank HCP/NCCP
8. Pacific Gas and Electric (PG&E) San Joaquin Valley Operations and Maintenance Program HCP
9. Tehachapi Uplands Multiple Species HCP
10. Metropolitan Bakersfield HCP

Additional details on the activities and species covered under the HCPs is provided in Section 4.4, Biological Resources.

1. Freeport-McMoRan Oil and Gas HCP

Freeport-McMoRan Oil and Gas (formerly Nuevo Energy Company/Torch Operating Company then Plains Exploration and Production Company) HCP was adopted in 1999 and addresses ongoing oilfield exploration and production activities on oilfield properties located in western Kern County. The HCP a encompasses 21,900 acres, including an initial 839.9 acres of conservation area lands in the Lokern area that will be set aside incrementally to compensate for habitat disturbances from oilfield activities. The federal incidental take statement authorized up to 1,700 acres of incidental take on the plan area lands. When Plains Exploration and Production Company acquired the properties from Nuevo Energy Company/Torch Operating Company in 2005, an additional 4,905 acres of land and were added to the HCP (an additional 414 acres of conservation area lands). In 2009, 300 acres of the incidental take acreage and 15 acres of the conservation land acreage were transferred to CRC (formerly Occidental) of Elk Hills, Inc., and Freeport-McMoRan (then Plains Exploration and Production Company) retained 1,400 acres of take acreage.

2. CRC (formerly Occidental of Elk Hills, Inc.) Non-Unit HCP (formerly Nuevo/Torch HCP)

The CRC Non-Unit HCP is a conservation plan that covers 7,050 acres. The HCP was originally prepared for Nuevo Energy Company/Torch Operating Company in February 1999. Incidental take authorization and responsibilities under the HCP were transferred to Plains Exploration and Production Company (PXP) on May 9, 2005. PXP subsequently transferred 300 acres of authorized incidental take and 15 acres of conservation lands to CRC on August 3, 2009. PXP retained take authorization and responsibilities on the remaining 1,400 acres of the original 1,700 acres authorized for incidental take, and these interests were subsequently conveyed to Freeport-McMoRan. In December 2009, USFWS approved the inclusion of 3,504 acres of new properties located in the vicinity of McKittrick Valley and the Elk Hills oilfield into the CRC Non-Unit HCP. 1,134 acres of the 3,504 acres were designated for use as mitigation land. No increase in the initially authorized 1,700 acres of take was included in the 2009 approval.

3. Aera Coles Levee HCP (previously Arco Western Energy)

The Aera Coles Levee HCP was approved in 1996 and covers 120,320 acres (188 sections) of land used for oil and gas exploration and production and a 6,059-acre preserve area. Only Aera's activities would be covered under this HCP. Covered activities include routine oil production operations, such as oil well removal, oil well workovers, and new oil well construction. Covered activities also include road maintenance and construction, vehicle traffic, unintentional fires, oil spills, water discharge and spills, vehicle accidents, and other unforeseen circumstances.

4. Chevron Pipeline HCP

The Chevron Pipeline HCP includes 25.5 acres near Taft, California, and covers Chevron activities related to the construction and operation of the 4.25-mile 27G Pipeline Project. Oil and gas drilling activities and other activities described in Chapter 3, Project Description, are not covered under this HCP.

5. California Aqueduct - San Joaquin Field Division HCP

The proposed California Aqueduct San Joaquin Field Division HCP would cover 11,816 acres adjacent to 121 miles of the California Aqueduct from Kettleman City to the Edmonston Pumping Plant at the base of the Tehachapi Mountains. The HCP also includes 4 pumping plants, two Operations and Maintenance Centers, and the initial 14.8 miles of the Coastal Branch Phase 1, a smaller canal that branches off from the California Aqueduct. The California Aqueduct - San Joaquin Field Division HCP would allow for routine and non-routine maintenance activities, minor new construction, and emergency procedures for these facilities. Oil and gas operators cannot receive take coverage under this HCP, although oil and gas activities are allowable within the HCP area.

6. Kern County Waste Management Department HCP

The Kern County Waste Management Department is responsible for the construction and management of 14 sanitary solid waste facilities (landfills) in Kern County, including seven closed or inactive sites where transfer stations may be operated. The Kern County Waste Management Department HCP, adopted in 1997, covers landfill operations (routine waste acceptance and management, facility maintenance, transfer station operation, and eventual facility closure) and is in the process of being amended to cover expansion at the remaining active landfills and the closure of historic burn dumps. In October 2005, the USFWS published a Notice of Intent to prepare an EIS for an amendment of the take statement and the Kern County Waste Management Department HCP. Oil and gas activities are not prohibited in the HCP Permit Area; however, oil and gas operators cannot receive take coverage under this HCP. This HCP applies only to the covered landfill activities and expansions within the Permit Area.

7. Kern Water Bank HCP/NCCP

The Kern Water Bank HCP/NCCP is managed by the Kern Water Bank Authority and covers 19,900 acres. The HCP was approved in 1997 and covers water conservation by developing water recharge and recovery facilities, the conservation and restoration of upland, intermittent wetland/rangeland, and other sensitive habitat, and the San Joaquin kit fox (*Vulpes macrotis mutica*), Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), giant kangaroo rat (*Dipodomys ingens*), San Joaquin antelope squirrel (*Ammospermophilus nelsoni*), and Bakersfield cactus (*Opuntia basilaris* var.). The HCP also includes a conservation bank that allows for conservation credit sales to third parties under certain conditions and subject to USFWS and California Department of Fish and Wildlife (CDFW) approval. In 1997, 5,592 acres of the HCP/NCCP area were permanently preserved in the HCP area, and 3,267 acres were included in the conservation bank. Developers with projects within the Master Permit Credit Area can purchase mitigation credits from the Kern Water Bank Authority. USFWS and CDFW will authorize incidental take for developers that acquire conservation credits if they determine that such authorization is appropriate. Although there are oil and gas activities within the HCP/NCCP area, the HCP/NCCP was designed so that it does not interfere with those operations. Take authorization for oil and gas activities can only be obtained by holders of pre-existing mineral rights and would be authorized by the Master Permits/Authorizations. Take authorization for any other oil and gas activities cannot be obtained under this HCP/NCCP.

8. Pacific Gas and Electric (PG&E) San Joaquin Valley Operations and Maintenance Program HCP

The PG&E San Joaquin Valley region HCP was approved in early 2008 and covers routine operations and maintenance and minor new construction activities related to PG&E's electrical system in the San Joaquin Valley for 30 years. The HCP covers 23 wildlife and 42 plant species, including the San Joaquin kit fox, California red-legged frog (*Rana draytonii*), vernal pool fairy shrimp (*Branchinecta lynchi*), and Western burrowing owl (*Athene cunicularia hypugea*). PG&E facilities that are covered by the HCP occur throughout the Project Area, generally within

existing rights of way (ROWs) owned by the company. Oil and gas operators cannot receive take coverage under this HCP. This HCP applies only to PG&E operations and maintenance programs.

9. Tehachapi Uplands Multiple Species HCP

The Tehachapi Uplands Multiple Species HCP was approved in 2013 and includes 141,886 acres within Tejon Ranch and 25 species, including the California condor (*Gymnogyps californianus*). The HCP term is 50 years. The northern boundary of this HCP is largely defined by the 2,000-foot elevation level above the valley floor. Portions of the Project Area extends above 2,000 feet and include lands that are covered by the HCP. As discussed in greater detail in Section 4.4, Biological Resources, pre-construction surveys and avoidance mandates for Project activities above 2,000 feet have been modified to address the different species of concern at higher elevations. Oil and gas operators cannot receive take coverage under this HCP. This HCP applies only to commercial and residential development activities and ongoing ranch activities.

10. Metropolitan Bakersfield HCP

Implemented in 1994, the Metropolitan Bakersfield HCP covers both federal and state listed species in the 408-square-mile Metropolitan Bakersfield Planning Area, which includes both city land and unincorporated County land. The goal of the HCP is to allow urban development per the MBGP and offset habitat loss by acquiring, preserving, and enhancing habitat for sensitive species. Oil drilling activities are not prohibited in the HCP area, but oil and gas operators cannot receive take coverage under the HCP.

4.10.4 Impacts and Mitigation Measures

Methodology

For the purposes of this analysis, relevant documents (particularly the KCGP, MBGP, the Kern County Zoning Ordinance, and HCPs) were consulted and a visual survey of the Project Area was performed. A discussion of the Project's consistency with plans and policies for each environmental topic area is summarized below and is described in greater detail in each of the relevant environmental topic sections (Sections 4.1 through 4.17) of this Environmental Impact Report (EIR).

Thresholds of Significance

The Kern County California Environmental Quality Act (CEQA) Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Physically divide an established community;
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan,

local coastal program, or Zoning Ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or

- Conflict with any applicable habitat conservation plan or natural community conservation plan.

Based on these standards, the effects of the Project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Impacts and Mitigation Measures

Impact 4.10-1: Physically Divide an Established Community

Construction

Established residential communities are dispersed throughout the Project Area on unincorporated County land. However, the majority of wells in Kern County would be constructed in Tier 1 areas (90%), which, by definition, are areas in which oil and gas activity is currently the primary land use. In contrast, residences are predominantly located on Tier 4 land. Although residences may be located on Tier 2 land, such residences are dispersed over large agricultural parcels and do not represent established communities. Finally, Tiers 3 and 5, while they might include residences, do not presently include residential communities. Therefore, there are no established communities located within Tiers 1, 2, 3, or 5.

Tier 4 areas make up less than 35,000 acres of the Project Area. Of this total, 26,160 acres are zoned for residential uses (Residential, Estate, or Mobile Park), the majority of which are clustered near the Metropolitan Bakersfield Planning Area in the Central and Eastern Subareas. However, because communities comprise a variety of uses, including commercial and industrial uses, the total acreage of 34,450 has been used to calculate impacts, even though, in some cases, these lands represent Commercial Highway areas or Industrial uses located outside of established communities.

Using the total acreage of Tier 4 land, the Applicant conservatively proposes to drill up to 25 wells in Tier 4 areas on an annual basis, representing 47 acres, or 0.14% of Tier 4 lands, as depicted in Table 4.10-5.

Table 4.10-5: Tier 4 Maximum Disturbance/Year

Subarea	Total Acres	Projected Well Count	Disturbance Factor (Acres/Well)	Total Acres Disturbed	Disturbance/ Year
Western	5,423	10	2	20	0.37%
Central	10,413	5	3	15	0.14%
Eastern	18,614	10	1.2	12	0.06%
TOTAL	**34,450**	**25**		**47**	**0.14%**

Per County setback requirements, any well, regardless of Tier, would maintain a minimum 150-foot setback from residences and a 300-foot setback from buildings used as places of assembly, institutions, or schools. Many Tier 4 lands are also located in Specific Plan areas, which often contain provisions for Drilling Islands. Drilling Islands are intended to protect the rights of mineral rights holders within residential and urban areas, while protecting the surrounding community from incompatible uses. While drilling is not prohibited outside of areas zoned Drilling Island, in order to permit a well in Tier 4, the Applicant must apply for a CUP, which would necessitate an additional level of review and would further ensure that residential communities are protected.

Unlike a linear project, such as a proposed highway, which has the potential to create a physical barrier in the middle of an existing community, wells drilled in Tier 4 areas would be dispersed over 34,450 acres throughout the 3,700-square-mile Project Area. Drilling activities, such as those described in the Future Development Scenario, have historically existed in the Project Area and, in some cases, residential uses have been constructed near historic drilling operations, encroaching upon oil and gas operations. As a result, KCGP policies and zoning setbacks are intended to protect both residential uses as well as oil and gas drilling operations, as described in Table 4.10-7. Therefore, the disturbance of less than 1% of total Tier 4 land per year would not result in the physical division of an established community, and impacts under this criterion would be less than significant. In addition, mitigation measures would further ensure that impacts on adjacent land uses, including established communities, are reduced, and impacts during construction would remain less than significant.

Operation

Impacts during operation would be similar to construction; however, during operation, fewer pieces of equipment and fewer workers would be located onsite, which would result in fewer impacts to the community. In addition, wells are only viable so long as the reservoir remains viable in a particular location. Therefore, although it is estimated that 25 new wells would be constructed per year, a portion of the existing wells are likely to be decommissioned and abandoned each year throughout the life of the Project. Also, the acreage conversion conservatively assumes that all land disturbed during construction would be disturbed throughout the life of the well when, in reality, the permanent footprint of most wells would be less than what

is projected. Even so, assuming that a total of 47 acres of land were to be permanently converted each year, in 25 years, a total of 1,175 acres would be disturbed. This total represents less than 3.5% of Tier 4 land in the Project Area as it exists today. Similar to construction, this disturbance would be dispersed throughout the Project Area and would not result in the physical division of an established community. Therefore, impacts during operation would be less than significant.

Mitigation Measures

Implement specified mitigation measures, including those that are applicable from Section 4.1, Aesthetics and Visual Resources, Section 4.3, Air Quality, Section 4.4 Biological Resources, Section 4.12, Noise, Section 4.15, Recreation, and Section 4.17, Utilities and Service Systems.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.10-2: Conflict with any Applicable Land Use Plan, Policy, or Regulation of an Agency with Jurisdiction over the Project

The proposed Project would be consistent with plans, policies, and goals of both the KCGP and MBGP, as analyzed in Table 4.10-7 at the end of this section and as described below.

Tier 1: Tier 1 consists of areas where oil and gas development is the predominant land use. Although sensitive land uses such as residential houses are not prohibited in all Tier 1 areas (e.g., in areas zoned Exclusive Agriculture and other zoning) such uses are limited in size (e.g., to 2.5 acre minimum lot sizes for A-1 zoning), and are generally not sited due to their inherent conflict with the industrial nature of intensive oil and gas production. and ownership patterns. Ownership patterns in the area are predominately oil companies. Regardless of whether a sensitive land use exists within or adjacent to a Tier 1 area, mitigation measures intended to protect sensitive receptors, such as setbacks, traffic mitigation fees, and measures intended to reduce noise, would still apply. In addition, measures intended to protect environmental resources, such as sensitive species and water quality, would also apply, regardless of whether the species or hydrological feature is located within or outside of a Tier 1 area. In addition, although in many cases oil developers own both surface and subsurface rights within Tier 1 areas, there may be some cases where a split estate could cause land use conflicts. For example, land use conflicts between a surface owner, such as a property owner who has historically owned land in a Tier 1 area, and subsurface mineral rights owners, such as oil and gas developers, would result in a significant impact. Revisions to the Zoning Ordinance would reduce these impacts to less than significant.

Tier 2: Tier 2 consists of areas that are zoned for agricultural uses that are not within a Tier 1 area. Tier 2 includes differing intensities of agricultural uses depending upon various factors, such as the quality of soil and availability of water, but also includes dispersed residences and other uses. Although oil and gas activities occur within Tier 2 areas and, therefore, occur in proximity to sensitive receptors, such as residences, mitigation measures intended to protect sensitive receptors, such as setbacks, traffic mitigation fees, and measures intended to reduce noise, would still apply. In addition, measures intended to protect environmental resources, such

as sensitive species and hydrological features, would also apply, and impacts on protected farmland would require mitigation as described in Section 4.2, Agricultural and Forest Resources. However, land use conflicts between surface owners, such as agricultural producers, and subsurface mineral rights owners, such as oil and gas developers, would result in a significant impact. Revisions to the Zoning Ordinance would reduce these impacts to less than significant.

Tier 3: Tier 3 consists of areas where historic drilling activity has been approved as "Unrestricted" or "Ministerial," that are not categorized as Tiers 1 or 2. Tier 3 areas include industrial uses and uses that are not necessarily associated with oil and gas development but could be associated with other uses, such as mining or forestry. In addition, Tier 3 includes Drilling Islands, which are primarily adjacent to sensitive land uses such as residences or schools as they are used in the subdivision process to ensure access to minerals. Regardless of whether oil and gas activities are located within a Tier 3 area, if there are sensitive uses within Tier 3 or adjacent to Tier 3, the same mitigation measures would apply, such as measures to increase setbacks and reduce noise, hazards, traffic, and aesthetic impacts. In addition, any environmental resources, such as sensitive habitat or species, would be protected by mitigation measures intended to reduce impacts. However, land use conflicts between surface owners, such as industrial plant owners/operators, and subsurface mineral rights owners, such as oil and gas developers, would result in a significant impact. Revisions to the Zoning Ordinance would reduce these impacts to less than significant.

Tier 4: Tier 4 predominantly consists of residential, commercial, and other uses. Tier 4 lands are more likely than other Tiers to contain sensitive receptors, such as homes, schools, hospitals, and churches, and a CUP would be required to obtain a drilling permit. Any CUP processed in Tier 4 would be subject to review under CEQA and include the mitigation measures described in this EIR along with any additional mitigations identified under a separate CEQA review. Implementing additional mitigation measures above those required in the EIR would provide greater protection for sensitive receptors and environmental resources. However, due to potential land use conflicts between surface owners, such as residents, and subsurface mineral rights owners, such as oil and gas developers, even with a CUP, impacts would be significant. Revisions to the Zoning Ordinance would reduce these impacts to less than significant.

Tier 5: Tier 5 includes Specific Plans adopted with a Special Plan Zone District or which include specific provisions for oil and gas operations. Specific Plan areas would either rely on the permit process proposed for the Oil Conformity Review and incorporate all mitigation measures or establish, through the processing of a Specific Plan or Site plan for Special Plan Zoning, replacement or additional mitigation measures and environmental protections. Any adoption of a Specific Plan or Special Plan zoning is subject to an EIR under CEQA and consideration through a public process with an advisory recommendation from the Planning Department and final consideration by the Board of Supervisors. As the cumulative impacts would not be reduced by a Specific Plan or Special Plan or relocated from the Valley, the environmental impacts would be similar due to potential land use conflicts with adjacent properties and potential split estate conflicts. Revisions to the Zoning Ordinance would reduce these impacts to less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance r Mitigation

Impacts would be less than significant.

Impact 4.10-3: Conflict with any applicable Habitat Conservation Plan or Natural Community Conservation Plan

The proposed Project would not conflict with any existing approved HCP or NCCP in the Project Area. Project activities are not prohibited in any of the approved HCP or NCCP areas; however, several HCPs do not cover oil and gas production activities, or only cover the oil and gas production activities of the permittees specified in Section 4.10.3, Regulatory Setting, (see Table 4.10-6). In addition, only impacts on species covered under the specific HCP would be covered. Section 4.4, Biological Resources, describes the species covered under each HCP.

If a developer drills a well or conducts any of the activities described in the Future Development Scenario in Chapter 3, Project Description, within one of the HCP areas described above and depicted on Figure 4.4-12 (see Section 4.4, Biological Resources), the developer may obtain take coverage for the species covered under the HCP (described in Section 4.4, Biological Resources), provided that oil and gas activities are covered under the HCP and the developer is named as a permittee in the HCP program or the HCP provides a mechanism for oil and gas operators to obtain coverage (Table 4.10-6). As a result, the proposed Project would be consistent with existing approved HCPs and NCCPs in the Project Area. Therefore, impacts would be less than significant.

Consistency with proposed HCPs and NCCPs is also addressed in Section 4.4, Biological Resources.

Table 4.10-6: Project Consistency with Approved HCPs and NCCPs in the Project Area

Plan Name	Covered Entity(ies)	O/G Activities Allowed within the HCP Area?	O/G Activities Covered by HCP?
1. Freeport-McMoRan Oil and Gas HCP	Freeport-McMoRan	Yes	Yes
2. CRC Non-Unit HCP	CRC	Yes	Yes
3. Aera Coles Levee HCP	Aera	Yes	Yes
4. Chevron Pipeline HCP	Chevron	Yes	No[1]
5. California Aqueduct – San Joaquin Field Division HCP	Department of Water Resources	Yes	No

Table 4.10-6: Project Consistency with Approved HCPs and NCCPs in the Project Area

Plan Name	Covered Entity(ies)	O/G Activities Allowed within the HCP Area?	O/G Activities Covered by HCP?
6. Kern County Waste Management Department HCP	Kern County Waste Management Department	Yes	No
7. Kern Water Bank HCP/NCCP	Kern Water Bank and O/G operators with existing leases in the HCP/NCCP area	Yes	Yes[2]
8. PG&E San Joaquin Valley O&M Program HCP	PG&E	Yes	No
9. Tehachapi Uplands Multiple Species	Tejon Ranch Corporation	Yes	No
10. Metropolitan Bakersfield HCP	City of Bakersfield, individuals, and organizations	Yes	No

Notes:
[1] Only activities related to the 27G Pipeline Project construction, operation, and maintenance are covered. The HCP does not cover O/G well drilling or other activities described in Chapter 3, Project Description.
[2] Only O/G operators with existing leases and activities in the HCP/NCCP area can obtain coverage.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

4.10.5 Cumulative Setting, Impacts, and Mitigation Measures

The geographic scope for cumulative impacts to land use and planning includes the area within 6 miles of the external Project Area. While projects in a larger area may affect some of the same resources as the Project, by focusing on projects within the Project Area and 6 miles outside of the Project Area, the analysis of cumulative impacts includes those projects that would most comparably affect the same resources as the Project.

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7, Discretionary Actions/Entitlements/Necessary Approvals.

Impact 4.10-4: Contribute to Cumulative Land Use Impacts

Oil and gas development activities, as described in the Future Development Scenario in Chapter 3, Project Description, are ongoing throughout the Project Area on both jurisdictional and nonjurisdictional land, such as city land within the Metropolitan Bakersfield Planning Area, BLM land, and land within the jurisdiction of other incorporated cities. If the proposed Project is

approved, all oil and gas development activities in the Project Area would continue; however, on land within Kern County's jurisdiction, mitigation proposed throughout this EIR would be incorporated into the County Zoning Ordinance as development standards. These additional development standards would only apply to activities on unincorporated Kern County land, but the effects of the development standards would reduce impacts on adjacent land uses, regardless of whether those uses are located on County jurisdictional or nonjurisdictional land. For example, oil and gas developers would be required to adhere to residential setbacks and setbacks to other sensitive land uses regardless of whether a nearby residence or other sensitive use is located on County or City land. As a result, the proposed Project would be consistent with planning efforts within the Project Area, such as the 2013 Kern COG RTP/SCS, the KCGP, MBGP, and other planning efforts on nonjurisdictional land.

In addition, the proposed Project would be consistent with adjacent BLM activities. Although Kern County development standards would only be applicable on County land, some parcels under County jurisdiction in the Western Subarea have private surface ownership and BLM subsurface mineral rights ownership. In order to develop wells on these lands, anyone leasing from the BLM would be required to file a permit request with the County, which would reduce impacts associated with BLM leasing on County jurisdictional land. Therefore, the Project would not result in a cumulatively considerable contribution to cumulative impacts on land use and planning.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
KERN COUNTY GENERAL PLAN	
CHAPTER 1. LAND USE, OPEN SPACE, AND CONSERVATION ELEMENT	
1.2 NON JURISDICTIONAL LAND	
Goal 1. To promote harmonious and mutually beneficial uses of land among the various jurisdictions and land management entities present in Kern County.	CONSISTENT. The proposed Project promotes harmonious and mutually beneficial uses among various jurisdictions because the proposed Project proposes new development standards that would mitigate impacts, which would have a beneficial impact on neighboring jurisdictions as well as County land. Therefore, the proposed Project would be consistent with Goal 1.
Policy 3. The County retains the maximum discretion allowed by law over land use issues of local concern, which impact the development of private and public property in the County.	CONSISTENT. The proposed Project maintains the County's authority over land use issues. The County is exercising its discretion over resource extraction land use issues by implementing new development standards for permitting oil and gas drilling permits within their jurisdiction. Therefore, the project would be consistent with Policy 3.
Policy 4. The County will solicit comments and coordinate with local governments, the military, and other federal or State jurisdictions on projects which are proposed within a peripheral area established mutual agreement between the County and the jurisdiction.	CONSISTENT. With the publication of the NOP, the County notified all local governments and federal and state entities with jurisdictions within the Project Area in order to solicit input. In addition, the County held meetings and teleconferences with a number of stakeholder agencies. The County also solicited input from neighboring jurisdictions outside of the Project Area. Therefore, the proposed Project would be consistent with Policy 4.
Policy 5. The County land use regulations do not apply to property administered by the State or federal Government in the absence of Memorandums of Understanding indicating otherwise. However, County land use regulations may apply to other public entities subject to provisions of State law.	CONSISTENT. The proposed Project covers County land only and does not include State or Federal Government land in the absence of Memorandums of Understanding stating otherwise. Therefore the proposed Project would be consistent with Policy 5.
Policy 6. The County will solicit a city's comments on land use planning proposals within the city's adopted sphere of influence or within one mile of the city limits, whichever is greater.	CONSISTENT. With the publication of the NOP, the County notified all local governments within the Project Area to solicit comments. Therefore, the proposed Project would be consistent with Policy 6.
1.3 PHYSICAL AND ENVIRONMENTAL CONSTRAINTS	
Goal 1. To strive to prevent loss of life, reduce personal injuries, and property damage, minimize economic and social diseconomies resulting from natural disaster by directing development to areas which are not hazardous.	CONSISTENT. As described in the Future Development Scenario, the majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas and have historically been devoted to oil and gas

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	development. The implementation of new development standards would further reduce risks associated with loss of life, personal injury, property damage, and economic and social diseconomies resulting from natural disaster. Therefore, the proposed Project would be consistent with Goal 1.
Policy 1. Kern County will ensure that new developments will not be sited on land that is physically or environmentally constrained ((Map Code 2.1 (Seismic Hazard), Map Code 2.2 (Landslide), Map Code 2.3 (Shallow Groundwater), Map Code 2.5 (Flood Hazard), Map Codes from 2.6 – 2.9, Map Code 2.10 (Nearby Waste Facility), and Map Code 2.11 (Burn Dump Hazard)) to support such development unless appropriate studies establish that such development will not result in unmitigated significant impact.	CONSISTENT. The proposed Project would be consistent with underlying zoning and would be subject to the development standards of the amended Ordinance. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. In order to minimize risk to Kern County residents and their property, new development will not be permitted in hazard areas in the absence of implementing ordinances and programs. These ordinances will establish conditions, criteria, and standards for the approval of development in hazard areas.	CONSISTENT. In order to minimize risk in hazard areas, developers would comply with the Kern County Fire Code, Kern County Multi-Hazard Mitigation Plan, Kern County Hazardous Waste Management Plan, Lake Isabella Dam Failure Evacuation Plan, Kern County Airport Land Use Compatibility Plan (ALUCP), and Kern County Code of Ordinances Chapter 19.76 – Airport Approach Height (H) Combining District. Developers would also be required to implement mitigation measures outlined in Section 4.8, Hazards and Hazardous Materials. Compliance with existing policies and plans and new mitigation measures would reduce impacts due to oil and gas development in hazard areas. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Zoning and other land use controls will be used to regulate and, in some instances, to prohibit development in hazardous areas.	CONSISTENT. While residential, commercial, and other development are not expressly prohibited in Tier 1 areas, in general, only oil and gas uses would be constructed within these areas due to compatibility issues. The development standards proposed as part of this project would be required regardless of where a sensitive receptor is located and would reduce impacts both within wellfields and near adjacent land uses. Therefore, the proposed Project would be consistent with Policy 3.
Policy 6. Regardless of percentage of slope, development on hillsides will be sited in the least obtrusive fashion, thereby, minimizing the extent of topographic alteration required and reducing soil erosion while maintaining soil stability.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP would include an Erosion Control Plan, the implementation of which would reduce topographic alteration and soil erosion. In addition, per Section 4.9, Hydrology and Water Quality, the operator would also comply with mitigation measures related to

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	reducing hydrological and water quality impacts. Therefore, the proposed Project would be consistent with Policy 6.
Policy 7. Ensure effective slope stability, wastewater drainage, and sewage treatments in areas with steep slopes are adequate for development.	CONSISTENT. The proposed Project does not include the construction of wastewater drainage or sewage treatment facilities. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. The SWPPP would include an Erosion Control Plan, the implementation of which would reduce slope instability. In addition, operators would avoid siting new project components on steep slopes to the extent feasible and would follow California Building Code standards and Kern County Code of Building Regulations and adhere to the requirements of mitigation measures. In addition, per Section 4.9, Hydrology and Water Quality, the operator would also comply with hydrological and water quality related mitigation measures. Therefore, the proposed Project would be consistent with Policy 7.
Policy 8. Encourage the preservation of the floodplain's flow conveyance capacity, especially in floodways, to be open space/passive recreation areas throughout the County.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. Implementation of a SWPPP would reduce the potential to impact a floodplain's flow conveyance capacity. In addition, per Section 4.9, Hydrology and Water Quality, the operator would also comply with mitigation measures. Therefore, the proposed Project would be consistent with Policy 8.
Policy 9. Construction of structures that impede water flow in a primary floodplain will be discouraged.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. Implementation of a SWPPP would reduce the potential to impede water flow in a primary floodplain. In addition, per Section 4.9, Hydrology and Water Quality, the operator would also comply with mitigation measures. Therefore, the proposed Project would be consistent with Policy 9.
Policy 10. The County will allow lands which are within flood hazard areas, other than primary floodplains, to be developed in accordance with the General Plan and Floodplain Management Ordinance, if mitigation measures are incorporated so as to ensure that the proposed development will not be hazardous within the requirements of the Safety Element (Chapter 4) of this General Plan.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, the operator shall implement a SWPPP and comply with stormwater regulations per mitigation measures. The applicant would also construct project components according to California Building Code standards and Kern County Code of Building Regulations and adhere to the requirements of mitigation measures in Section 4.6, Geology and Soils. Therefore, the proposed Project includes measures that would ensure that the project would not cause hazardous conditions within a flood hazard area. The proposed Project would be consistent with Policy 10.
Policy 11. Protect and maintain watershed integrity within Kern County.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. In addition, as discussed in Section 4.9, Hydrology and

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	Water Quality, the operator shall comply with all applicable federal, state, regional, and local agency water quality protection laws and regulations, and commonly utilized industry standards, including obtaining all applicable stormwater construction permits from the Central Valley Regional Water Quality Control Board (CVRWQCB) per mitigation measures. The operator would also implement best management practices, such as those set forth in the Kern County Grading Ordinance. Finally, all drilling operations would use either a closed loop system to avoid discharges of drilling muds and fluids or would obtain coverage under the State Water Resources Control Board (SWRCB) low threat discharge General Order (WDR General Order 2003-0003-DWQ). Therefore, project runoff would not impact watershed integrity, and the proposed Project would be consistent with Policy 11.
Policy 13. Development, which is located adjacent to a burn dumpsite and requires a discretionary permit, shall be reviewed for land use compatibility and possible soil contamination.	CONSISTENT. Future activities located next to a burn dumpsite in Tier 4 areas would be subject to a CUP. All other wells proposed adjacent to a burn dumpsite would be subject to development standards. Therefore, the proposed Project would be consistent with Policy 13.
Implementation Measure B. A seismic analysis may be required for those areas in Kern County which are susceptible to landslides.	CONSISTENT. An analysis of seismic hazards is included in Section 4.6, Geology and Soils. Therefore, the proposed Project would be consistent with Implementation Measure B.
Implementation Measure E. Development proposed in areas with steep slopes (Map Code 2.4) will be reviewed for conformity to Chapter 19.88 Hillside Development Ordinance or Chapter 19.52 Special Planning (SP) District to ensure that appropriate soil stability, drainage, and sewage treatment will result.	CONSISTENT. The Hillside Development Ordinance does not apply to oil and gas development. In the future, a CUP would be required for oil and gas development in areas designated Tier 5. Therefore, the proposed Project would be consistent with Implementation Measure E.
Implementation Measure H. Development within areas subject to flooding, as defined by the appropriate agency, will require necessary flood evaluations and studies.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, the operator shall implement a SWPPP and comply with all stormwater requirements per mitigation measures. The operator would also construct project components according to California Building Code standards and Kern County Code of Building Regulations and adhere to the requirements of mitigation measures described in Section 4.6, Geology and Soils. Therefore, the proposed Project includes measures that would ensure that the project would not cause hazardous conditions within a flood hazard area. The proposed Project would be consistent with Implementation Measure H.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Implementation Measure I. Designated flood channels and water courses, such as creeks, gullies, and riverbeds, will be preserved as resource management areas or in the case of urban areas, as linear parks whenever practical.	CONSISTENT. Construction and operation of the proposed Project would not interfere with resource management area preservation. Components would be sited to reduce impacts on flood channels and would follow applicable building laws as described in 4.9, Hydrology and Water Quality. Linear parks in urban areas are generally located on Tier 4 land. Oil and gas development on Tier 4 land would require a CUP. Other oil and gas development in designated flood channels and water courses would be subject to development standards. Therefore, the proposed Project would be consistent with Implementation Measure I.
Implementation Measure J. Compliance with the Floodplain Management Ordinance prior to grading or improvement of land for development or the construction, expansion, conversion or substantial improvements of a structure is required.	CONSISTENT. Operators would be required to comply with all laws, regulations, and ordinances, including the Floodplain Management Ordinance. Therefore, the proposed Project would be consistent with Implementation Measure J.
Implementation Measure M. The State Water Resources Control Board and the Local Enforcement Agency (Environmental Health Services) shall be consulted when discretionary development has been proposed near a known burn dumpsite.	CONSISTENT. The County solicited input from both the SWRCB and the Kern County Public Health Services Department, Environmental Health Services Division. Both entities received the NOP and have been given the opportunity to provide input into the proposed Project throughout the EIR process. Therefore, the proposed Project would be consistent with Implementation Measure M.
Implementation Measure N. Applicants for new discretionary development should consult with the appropriate Resource Conservation District and the California Regional Water Quality Control Board regarding soil disturbances issues.	CONSISTENT. The County solicited input from local jurisdictions with publication of the NOP. All local agencies have been given the opportunity to provide input into the proposed Project throughout the EIR process. Therefore, the proposed Project would be consistent with Implementation Measure N.
1.4 PUBLIC FACILITIES AND SERVICES	
Goal 1. Kern County residents and businesses should receive adequate and cost effective public services and facilities. The County will compare new urban development proposals and land use changes to the required public services and facilities needed for the proposed project.	CONSISTENT. As described in Section 4.14, Public Services, and Section 4.13, Population and Housing, nominal population growth in the Project Area would not stress certain existing public services, such as schools, parks, and libraries; however, the anticipated new oil and gas activity may tax services, such as police and fire services in the vicinity of the new oil and gas wells. With implementation of mitigation measures in Section 4.14, these impacts would be reduced to less than significant. Therefore, the proposed Project would be consistent with Goal 1.
Goal 5. Ensure that adequate supplies of quality (appropriate for intended use) water are available to residential, industrial, and agricultural users within Kern County.	CONSISTENT. As described in Section 4.9, Hydrology and Water Quality, with the implementation of mitigation and the adherence to existing laws and regulations, the proposed Project would not impact surface and groundwater

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	quality that is currently available for other uses. In addition, operators that currently provide produced water to municipal water districts for agricultural uses would continue to do so, which would help ensure that water continues to be available for such uses. Therefore, the proposed Project would be consistent with Goal 5.
Goal 9. Serve the needs of industries and Kern County residents in a manner that does not degrade the water supply and the environment and protect the public health and safety by avoiding surface and subsurface nuisances resulting from the disposal of hazardous wastes, irrespective of the geographic origin of the waste.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. In addition, as discussed in Section 4.9, Hydrology and Water Quality, the operator shall comply with all applicable federal, state, regional, and local agency water quality protection laws and regulations, and commonly utilized industry standards, including obtaining all applicable stormwater construction permits from the Central Valley Regional Water Quality Control Board (CVRWQCB) per mitigation measures. The operator would also implement best management practices, such as those set forth in the Kern County Grading Ordinance. Finally, all drilling operations would use either a closed loop system to avoid discharges of drilling muds and fluids or would obtain coverage under the State Water Resources Control Board (SWRCB) low threat discharge General Order (WDR General Order 2003-0003-DWQ). Therefore, the proposed Project would be consistent with Goal 9.
Policy 1. New discretionary development will be required to pay its proportional share of the local costs of infrastructure improvements required to service such development.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per traffic mitigation measures. Therefore the project would be consistent with Policy 1.
Policy 3. Individual projects will provide availability of public utility service as per approved guidelines of the serving utility.	CONSISTENT. As described in Section 4.14, Public Services, developers would comply with mitigation measures. Therefore the project would be consistent with Policy 3.
Implementation Measure C. Project developers shall coordinate with the local utility service providers to supply adequate public utility services.	CONSISTENT. As described in Section 4.14, Public Services, developers would comply with mitigation measures. Therefore the project would be consistent with Implementation Measure C.
Implementation Measure L. Prior to the approval of development projects, the County shall determine the need for fire protection services. New development in the County shall not be approved unless adequate fire protection facilities and resources can be provided.	CONSISTENT. As described in Section 4.14, Public Services, developers would comply with mitigation measures. Therefore the project would be consistent with Implementation Measure L.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Implementation Measure N. Secure complete and accurate information on all hazardous wastes generated, handled, stored, treated, transported, and disposed of within or through Kern County.	CONSISTENT. Section 4.8, Hazards and Hazardous Materials, describes hazardous wastes generated, handled, stored, treated, transported, and disposed of with respect to oil and gas development in the Project Area. Therefore, the proposed Project would be consistent with Implementation Measure N.
Implementation Measure O. Reduce to the greatest degree possible the amount of waste to be disposed of by encouraging private industry to construct and manage a high quality system of transfer stations, recycling facilities, treatment plants, and incinerators located near the generators of hazardous waste.	CONSISTENT. As described in Section 4.17, Utilities, operators currently recycle produced water for reuse in enhanced oil recovery and treat some water for agricultural purposes. Such activities would continue under the Future Development Scenario. Therefore, the proposed Project would be consistent with Implementation Measure N.
Implementation Measure R. Roads and highways utilized for commercial shipping of hazardous waste destined for disposal will be designated as such pursuant to Vehicle Code Sections 31303 et seq. Permit applications shall identify commercial shipping routes they propose to utilize for particular waste streams.	CONSISTENT. Commercial truck routes used by oil and gas operators in the Project Area are described in Section 4.16, Transportation and Traffic. Therefore, the proposed Project would be consistent with Implementation Measure R.
1.8 INDUSTRIAL	
Goal 1. Ensure that an adequate and geographically balanced supply of land is designated for a range of industrial purposes.	CONSISTENT. The proposed Project ensures that an adequate and geographically balanced supply of land is designated for a range of industrial purposes. Land that has historically been available for oil and gas development would continue to be available, and adherence to setbacks and proposed development standards would ensure that land continues to be available for a range of industrial purposes. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Promote the future economic strength and wellbeing of Kern County and its residents without detriment to its environmental quality.	CONSISTENT. The proposed Project would enact new oil and gas development standards, which would both protect the economic strength of the oil and gas industry by streamlining the permitting process and provide greater protection for the environment than exists under current County standards. Therefore the proposed Project would be consistent with Goal 2.
Goal 3. Ensure compatibility with land use designations such as residential, commercial, or other land uses that may be affected by such activities.	CONSISTENT. The proposed Project would not alter currently established land use designations such as residential, commercial, or other land uses. The new development standards are intended to provide greater environmental protection with respect to oil and gas development in the Project Area. Additionally, oil and gas development in residential and commercial areas (Tier 4) would still require the acquisition of a CUP prior to drilling new wells. Therefore, the proposed Project would be consistent with Goal 3.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 1. Locations for new industrial activities shall be provided with adequate infrastructure (water, sewage disposal systems, roads, drainage, etc.) to minimize effects on County services.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. As described in Section 4.14, Public Services, developers would also comply with mitigation measures to reduce impacts on public services. As described in Section 4.17, Utilities, the applicant would comply with mitigation measures to reduce impacts on Utilities. Therefore, impacts on County services would be reduced, and the project would be consistent with Policy 1.
Policy 3. The land areas best suited for industrial activity by virtue of their location and other criteria will be protected from residential and other incompatible development.	CONSISTENT. Residential uses and other incompatible development are not likely to be constructed in Tier 1 areas, where oil and gas activity are currently the primary land use. Therefore the proposed Project would be consistent with Policy 3.
Policy 4. Protect existing industrial designations from incompatible land use intrusion.	CONSISTENT. Lands zoned for industrial uses that are not otherwise included in Tier 1 are included in Tier 3. Oil and gas development is considered a compatible use in industrial areas. The proposed Project does not alter the zoning code such that residential or commercial or other incompatible uses would be allowed in lands zoned for industrial uses without a CUP. Therefore the proposed Project would be consistent with Policy 4.
Policy 5. Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors.	CONSISTENT. The majority of wells developed under the Future Development Scenario (90%) would be constructed in Tier 1 areas. Tier 1 areas are defined as areas in which oil and gas activity is currently the primary land use. Therefore, future wells would be clustered in areas containing intensive oil field development. Therefore the proposed Project would be consistent with Policy 5.
Policy 7. Require that industrial uses provide design features such as screen walls, landscaping, increased height and/or setbacks, and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound, and vibration.	CONSISTENT. As described in Section 4.1, Aesthetics, new development standards would be adopted that would reduce aesthetic impacts according to mitigation measures contained within this EIR. Therefore, the proposed Project would be consistent with Policy 7.
Policy 9. Prior to approval, all new discretionary industrial projects located in the Airport Influence Areas will be reviewed for compatibility with the Airport Land Use Compatibility Plan.	CONSISTENT. Any structures taller than 200 feet would require FAA approval. Also, developers would be required to adhere to mitigation measures. Therefore, the proposed Project would be compatible with the ALUCP, and the proposed Project would be consistent with Policy 9.
Policy 12. All industrial development equal to or greater than 40 acres in a rural area will require the adoption of a Specific Plan prior to development approval.	CONSISTENT. As described in the Future Development Scenario, 90% of future oil and gas activity would be located in Tier 1 areas. Although wells could be

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	drilled outside of Tier 1 areas in rural Tier 2 areas, such development would be dispersed and therefore would not meet the intended definition of an "industrial development" under this policy. Any future proposals to construct industrial-type ancillary facilities, such as cogeneration facilities over 50 MW, that would be greater than 40 acres, are not covered under the proposed Project and would require a separate approval process. Therefore, the proposed Project would be consistent with Policy 12.
Policy 13. Where feasible, locate future industrial activities in close proximity to railroad facilities and inter- and intra-State transportation corridors to minimize extensive travel through urban areas and to promote alternative transportation of goods.	CONSISTENT. It is not feasible to require that new oil and gas wells be located in close proximity to railroad facilities and transportation corridors because wells are sited according to the location of subsurface resources. However, as described in Section 4.16, Transportation and Traffic, future well activity would predominantly use existing transportation corridors to transport workers and equipment to and from well locations. Therefore, the proposed Project would be consistent with Policy 13.
Implementation Measure F. All General Plan Amendments, zone changes, conditional use permits, discretionary industrial developments, and variations from height limits established by zoning for properties which are located in the Airport Influence areas or near a military airport shall be reviewed by the Planning Department for compatibility with the Kern County Airport Land Use Compatibility Plan.	CONSISTENT. Any structures taller than 200 feet would require FAA approval. Also, developers would be required to adhere to mitigation measures. Therefore, the proposed Project would be compatible with the ALUCP, and the proposed Project would be consistent with Implementation Measure F.
Implementation Measure G. Require a Specific Plan for industrial land projects (as defined in the Assumptions Section of the Special Treatment Areas) to identify site specific issues and implementation, such as infrastructure, circulation, compatibility, and public services and facilities.	CONSISTENT. The proposed Project does not meet the definition of an "industrial land project." Any future proposals to construct industrial-type ancillary facilities that would meet this definition are not covered under the proposed Project and would require a separate approval process. Therefore, the proposed Project would be consistent with Implementation Measure G.
Implementation Measure I. Discretionary projects located within an Extreme, High, or Moderate Fire Hazard Zone shall abide by building materials and construction requirements set forth by the Kern County Fire Department and Office of Emergency Services.	CONSISTENT. Operators would be required to comply with all laws, regulations, and ordinances, including existing building materials and construction requirements set forth by the Kern County Fire Department and Office of Emergency Services. Therefore, the proposed Project would be consistent with Implementation Measure I.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
1.9 RESOURCE	
Goal 1. To contain new development within an area large enough to meet generous protections of foreseeable need, but in locations that will not impair the economic strength derived from the petroleum, agriculture, rangeland, or mineral resources or diminish the other amenities that exist in the County.	CONSISTENT. The majority of wells developed under the Future Development Scenario (90%) would be constructed in Tier 1 areas, which are defined as areas in which oil and gas activity is currently the primary land use. However, oil and gas activities are also an allowable use in Tiers 2, 3, 4, and 5 with additional mitigation as described throughout the EIR. Therefore, the proposed Project, through seeking to balance the needs of different land uses and industries, would ensure that the economic strength derived from the petroleum, agriculture, rangeland, or mineral resources industries would not be impaired. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Protect areas of important mineral, petroleum, and agricultural resource potential for future use.	CONSISTENT. The majority of wells developed under the Future Development Scenario (90%) would be constructed in Tier 1 areas, which are defined as areas in which oil and gas activity is currently the primary land use. However, oil and gas activities are also an allowable use in Tiers 2 with additional mitigation as described in Section 4.2, Agriculture and Forestry. Therefore, future development standards would protect areas of important mineral, petroleum, and agricultural resources for future use and would be consistent with Goal 2.
Goal 3. Ensure the development of resource areas minimize effects on neighboring resource lands.	CONSISTENT. The purpose of the EIR is to analyze the impacts of future oil and gas development on all land within the County's jurisdiction within the Project Area as well as analyzing impacts on neighboring resource lands. Mitigation designed to reduce and avoid impacts on lands associated with resource area development would also have the indirect effect of reducing impacts on neighboring areas. Therefore, the proposed Project would be consistent with Resource Goal 3.
Goal 4. Encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decision and actions of other agencies as they affect energy development in Kern County.	CONSISTENT. The proposed Project is designed to encourage safe and orderly oil and gas development through the implementation of County-wide development standards and a new oil and gas permitting process. These new standards are intended to meet the needs of other agencies with jurisdiction over oil and gas development and resource protection, such as DOGGR. Therefore, by developing this EIR and implementing the proposed development standards, the County has been actively involved in the decisions and actions of other agencies with respect to oil and gas development. Therefore, the proposed Project would be consistent with Resource Goal 4.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Goal 5. Conserve prime agriculture lands from premature conversion.	CONSISTENT. The County considers oil and gas development to be consistent with agricultural operations. However, the proposed Project would nonetheless conserve prime agricultural lands through implementation of mitigation measures. Therefore, the proposed Project would be consistent with Resource Goal 5.
Goal 6. Encourage alternative sources of energy, such as solar and wind energy, while protecting the environment.	CONSISTENT. The proposed Project includes development standards and a new permitting process for oil and gas development activities within Kern County that provide a streamlined ministerial review process for oil and gas projects. This process does not preclude or discourage alternative sources of energy, such as wind or solar, and a number of unrelated wind and solar projects are under development or have been recently developed within Kern County. Therefore, this project would not conflict with Resource Goal 6.
Policy 1. Appropriate resource uses of all types will be encouraged as desirable and consistent interim uses in undeveloped portions of the County regardless of General Plan designation.	CONSISTENT. The majority of wells developed under the Future Development Scenario (90%) would be constructed in Tier 1 areas, which are defined as areas in which oil and gas activity is currently the primary land use. Although these areas do not contain Important Farmlands and have not historically supported agricultural activities, many parcels are located in rural areas and are designated for agricultural uses. In addition, while Tier 2 areas include areas that are designated for agricultural uses and contain Important Farmland, not all land within Tier 2 has historically been used for agriculture. Therefore, with the implementation of proposed development standards, drilling wells in rural Tier 1 and Tier 2 areas would be consistent with Policy 1, regardless of General Plan designations in these areas.
Policy 2. In areas with a resource designation on the General Plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of the particular resource will be considered to be consistent with this General Plan.	CONSISTENT. The proposed Project does not encourage activities that are unrelated to the exploration, production, and transportation of oil and gas resources in areas with a General Plan resource designation. Areas with a Resource designation are located in Tier 1. Therefore, the proposed Project would be consistent with Resource Policy 2.
Policy 5. Areas of low intensity agriculture use (Map Code 8.2 (Resource Reserve), Map Code 8.3 (Extensive Agriculture), and Map Code 8.5 (Resource Management)) should be of an economically viable size in order to participate in the State Williamson Act Program/Farmland Security Zone Contract.	CONSISTENT. As discussed in Section 4.2, Agricultural and Forestry Resources, the Kern County Agricultural Preserve Standard Rules identify oil and gas drilling and production activities as a compatible use on Williamson Act land. Therefore, the project would be consistent with Policy 5.
Policy 7. Areas designated for agricultural use, which include Class I and II and other enhanced agricultural soils with surface delivery water systems, should be	CONSISTENT. Lands designated as Tier 2 are zoned either A or A-1 and may contain Important Farmland with Class I and II soils. As discussed in Section 4.2,

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
protected from incompatible residential, commercial, and industrial subdivision and development activities.	Agricultural and Forestry Resources, the Kern County Zoning Ordinance identifies oil and gas drilling and production activities as a compatible use on A and A-1 lands. Therefore, the proposed Project would be consistent with Policy 7.
Policy 10. To encourage effective groundwater resource management for the long-term economic benefit of the County the following shall be considered: (a) Promote groundwater recharge activities in various zone districts. (b) Support for the development of Urban Water Management Plans and promote Department of Water Resources grant funding for all water providers. (c) Support the development of groundwater management plans. (d) Support the development of future sources of additional surface water and groundwater, including conjunctive use, recycled water, conservation, additional storage of surface water and groundwater and desalination.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a Storm Water Pollution Prevention Plan (SWPPP), which would reduce impacts on groundwater. In addition, the project would not hinder County efforts to develop Urban Water Management Plans, promote Department of Water Resources grant funding, develop groundwater management plans, or develop future sources of additional surface and groundwater. As described in Section 4.17, Utilities, oil and gas operators currently recycle produced water for reuse in enhanced oil recovery and sell some water to municipal providers for agricultural uses. These practices would continue in the future. Therefore, the proposed Project would be consistent with Policy 10.
Policy 11. Minimize the alteration of natural drainage areas. Require development plans to include necessary mitigation to stabilize runoff and silt deposition through utilization of grading and flood protection ordinances.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, and Section 4.9, Hydrology and Water Quality, the operator shall implement a SWPPP, which would include an Erosion Plan. The SWPPP and Erosion Plan, as well as the implementation of mitigation measures described in these sections, would minimize the alteration of natural drainage areas and stabilize runoff and silt deposition. Therefore, the proposed Project would be consistent with Policy 11.
Policy 12. Areas identified by the Natural Resource Conservation Service (formerly Soil Conservation Service) as having high range-site value should be conserved for Extensive Agriculture uses or as Resource Reserve, if located within a County water district.	CONSISTENT. Lands designated as Tier 2 contain land designated Exclusive Agriculture and Resource Reserve and may contain land designated by the Natural Resource Conservation Service as having high range-site value. As discussed in Section 4.2, Agricultural and Forestry Resources, the Kern County Zoning Ordinance identifies oil and gas drilling and production activities as a compatible use on lands zoned for agricultural purposes. In addition, mitigation measures would reduce impacts on agriculture. Therefore, the proposed Project would be consistent with Policy 12.
Policy 14. Emphasize conservation and development of identified mineral deposits.	CONSISTENT. The proposed Project would streamline the permitting process for oil and gas development on unincorporated County land and implement new development standards, which would reduce future impacts on the environment. Therefore, the implementation of the project would emphasize both conservation and development of mineral deposits and would be consistent with Policy 14.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 15. Agriculture and other resource uses will be considered a consistent use in areas designated for Mineral and Petroleum Resource uses on the General Plan.	CONSISTENT. Lands designated as Tier 2 have historically contained dispersed oil and gas development activities. Such activities are considered compatible with agricultural activities. Under the Future Development Scenario, agricultural and oil and gas activities are proposed to continue as a compatible use. Therefore, the proposed Project would be consistent with Policy 15.
Policy 17. Lands classified as MRZ-2, as designated by the State of California, should be protected from encroachment of incompatible land uses.	CONSISTENT. Lands classified as MRZ-2 by the State of California include lands within DOGGR well fields. Current County zoning standards allow unrestricted drilling in areas zoned Natural Resource, Medium Industrial, and Heavy Industrial. The County also considers drilling a compatible use on land zoned Agriculture. Tier 1 areas include lands designated by the State of California as MRZ-2 and zoned Natural Resource, Medium Industrial, Heavy Industrial, and Agriculture by the County. Tier 1 areas are defined as areas that include intensive oil field development. According to the Future Development Scenario, 90% of future drilling would occur within Tier 1 areas. These areas would continue to be used for oil and gas development in the future. Incompatible land uses, such as residential and commercial uses are unlikely to be constructed in these areas. Therefore, the proposed Project would be consistent with Policy 17.
Policy 21. The County shall encourage qualifying agricultural lands to participate in the Williamson Act program or Farmland Security Zone program.	CONSISTENT. As discussed in Section 4.2, Agricultural and Forestry Resources, the Kern County Agricultural Preserve Standard Rules identify oil and gas drilling and production activities as a compatible use on Williamson Act and Farmland Security Zone land. Therefore, the proposed Project does not discourage qualifying agricultural lands to participate in the Williamson Act or Farmland Security Zone program. The project would be consistent with Policy 21.
Policy 25. Discourage incompatible land use adjacent to Map Code 8.4 (Mineral and Petroleum) areas.	CONSISTENT. The proposed Project does not encourage incompatible land uses adjacent to lands designated Map Code 8.4. According to the Future Development Scenario, future oil and gas production would continue in a manner similar to current operations with the implementation of additional development standards intended to protect the community and environmental resources. Lands designated Map Code 8.4 are predominantly located in Tier 1 areas. Tier 1 areas are defined as areas that include intensive oil field development. These areas would continue to be used for oil and gas development in the future. Incompatible land uses, such as residential and commercial uses are unlikely to be constructed in these areas. Therefore, the proposed Project would be consistent with Policy 25.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Implementation Measure B. Areas designated as Resource Reserve (Map Code 8.2), Extensive Agriculture (Map Code 8.3), Resource Management (Map Code 8.5) that are under Williamson Act Contracts or Farmland Security Zone Contracts will have a minimum parcel size of 80 acres until such time as a contract is expired or is cancelled, at which time the minimum parcel size will become 20 acres.	CONSISTENT. As discussed in Section 4.2, Agricultural and Forestry Resources, the Kern County Agricultural Preserve Standard Rules identify oil and gas drilling and production activities as a compatible use on Williamson Act land. Therefore, the proposed Project would not reduce the size of a Williamson or Farmland Security Zone parcel. The project would be consistent with Implementation Measure B.
Implementation Measure C. The County Planning Department will seek review and comment from the County Engineering and Survey Services Department on the implementation of the National Pollution Discharge Elimination System for all discretionary projects.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, construction activities in the Project Area that could result in a discharge to waters of the U.S. are subject to the California NPDES General Construction Permit (General Construction Activity NPDES Storm Water Permit, 2009-0009-DWQ and 2010-0014-DWQ). Therefore, the proposed Project would be consistent with Implementation Measure C.
Implementation Measure F. Prime agricultural lands, according to the Kern County Interim- Important Farmland map produced by the Department of Conservation, which have Class I or II soils and a surface delivery water system shall be conserved through the use of agricultural zoning with minimum parcel size provisions.	CONSISTENT. Lands designated as Tier 2 are zoned either A or A-1. Some parcels contain Important Farmland with Class I and II soils and also contain surface delivery water systems. As discussed in Section 4.2, Agricultural and Forestry Resources, the Kern County Zoning Ordinance identifies oil and gas drilling and production activities as a compatible use on A and A-1 lands. Therefore, the proposed Project would be consistent with Implementation Measure F.
Implementation Measure G. Property placed under the Williamson Act/Farmland Security Zone Contract must be in a Resource designation.	CONSISTENT. The proposed Project does not alter the zoning or General Plan designation of any lands within the Project Area. Therefore, the proposed Project would be consistent with Implementation Measure G.
Implementation Measure H. Use the California Geological Survey's latest maps to locate mineral deposits until the regional and Statewide importance mineral deposits map has been completed, as required by the Surface Mining and Reclamation Act.	CONSISTENT. The locations of oil and gas deposits were identified using the best available GIS data from DOGGR. Therefore, the proposed Project would be consistent with Implementation Measure H.
Implementation Measure I. Periodically review the Zoning Ordinance to reflect new technology and energy sources, and encourage these types of uses for new development.	CONSISTENT. The proposed Project includes an update of the language of the County Zoning Ordinance. The project does not preclude the use new technology or energy sources. Therefore, the proposed Project would be consistent with Implementation Measure I.
Implementation Measure J. The County shall continue to monitor new legislation as it relates to energy production and periodically review the General Plan and Zoning Ordinance for any required updates.	CONSISTENT. The County monitored new legislation related to oil and gas production throughout the production of this EIR and the preparation of the new development standards. The proposed Project includes an update to the portions of

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	the County Zoning Ordinance related to oil and gas development. Therefore, the proposed Project would be consistent with Implementation Measure J.
Implementation Measure K. Protect oilfields and mineral extraction areas through the use of appropriate implementing zone districts: A (Exclusive Agriculture), DI (Drilling Island), NR (Natural Resource), or PE (Petroleum Extraction).	CONSISTENT. The proposed Project does not alter the zoning or General Plan designation of any lands within the Project Area. Therefore, the proposed Project would be consistent with Implementation Measure K.
1.10 GENERAL PROVISIONS	
Goal 1. Ensure that the County can accommodate anticipated future growth and development while maintaining a safe and healthful environment and a prosperous economy by preserving valuable natural resources, guiding development away from hazardous areas, and assuring the provision of adequate public services.	CONSISTENT. The proposed Project would enact new oil and gas development standards, which would both protect the economic strength of the oil and gas industry by streamlining the permitting process and provide greater protection for the environment than exists under current County standards, thus maintaining a safe and healthful environment and prosperous economy. In addition, in the future it is unlikely that development such as residential and commercial projects would be constructed in Tier 1 areas. Also, according to Section 4.14, Public Services, mitigation measures would ensure that new oil and gas development contribute its fair share to the provision of public services. Therefore, the proposed Project would be consistent with Goal 1.
Policy 6. The County shall ensure the fair treatment of people of all races, cultures, incomes and age groups with respect to the development, adoption, implementation and enforcement of land use and environmental programs.	CONSISTENT. The proposed Project would enact new oil and gas development standards, which would provide greater protection for the public than exists under current County standards. The new development standards would protect all people in the vicinity of new oil and gas development equally regardless of race, culture, income, or age group. Therefore, the proposed Project would be consistent with Policy 6.
Policy 8. The County shall ensure that new industrial uses and activities are sited to avoid or minimize significant hazards to human health and safety in a manner that avoids over concentrating such uses in proximity to schools and residents.	CONSISTENT. The Kern County Zoning Ordinance contains setback requirements with respect to oil and gas development near schools, residences, and other sensitive land uses. These setback requirements would continue to be enforced under the Future Development Scenario. In addition, the majority of new development (90%) would be constructed within Tier 1 areas, which are defined as areas where oil and gas development is the primary land use. Sensitive land uses, such as residential developments and schools, are unlikely to be constructed in these areas. Therefore, the proposed Project would be consistent with Policy 8.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
1.10.1 PUBLIC SERVICES AND FACILITIES	
Policy 9. New development should pay its pro rata share of the local cost of expansions in services, facilities, and infrastructure which it generates and upon which it is dependent.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, and Section 4.14, Public Services, developers would be required to comply with mitigation measures to reduce impacts on traffic and public services. Implementation of these mitigation measures would ensure that new oil and gas development contribute its fair share to the provision of public services. Therefore, the proposed Project would be consistent with Policy 9.
Policy 16. The developer shall assume full responsibility for costs incurred in service extensions or improvements that are required to serve the project. Cost sharing or other forms of recovery shall be available when the service extensions or improvements have a specific quantifiable regional significance.	CONSISTENT. Service extensions, such as new water or sewer pipelines, are not included in the proposed Project. Distribution lines are included in the proposed Project and would be paid for and constructed by developers, as necessary. As described in Section 4.16, Transportation and Traffic, Section 4.14, Public Services, and Section 4.17, Utilities, requires implementation of mitigation measures. Implementation of these mitigation measures would ensure that new oil and gas development contribute its fair share to the provision of public services and utilities. Therefore, the proposed Project would be consistent with Policy 16.
Implementation Measure E. All new discretionary development projects shall be subject to the Standards for Sewage, Water Supply and Preservation of Environmental Health Rules and Regulations administered by the Environmental Health Services Department. Those projects having percolation rates of less than five minutes per inch shall provide a preliminary soils study and site specific documentation that characterizes the quality of upper groundwater in the project vicinity and evaluation of the extent to which, if any, the proposed use of alternative septic systems will adversely impact groundwater quality. If the evaluation indicates that the uppermost groundwater at the proposed site already exceeds groundwater quality objectives of the Regional Water Quality Control Board or would if the alternative septic system is installed, the applicant shall be required to supply sewage collection, treatment and disposal facilities.	CONSISTENT. New sewer pipelines and septic systems, are not included in the proposed Project. In addition, Section 4.17, Utilities, requires implementation of mitigation measures. Therefore, the proposed Project would be consistent with Implementation Measure E.
1.10.2 AIR QUALITY	
Policy 19. In considering discretionary projects for which an Environmental Impact Report must be prepared pursuant to the California Environmental Quality Act, the appropriate decision making body, as part of its deliberations, will ensure that: (a) All feasible mitigation to reduce significant adverse air quality impacts have been adopted; and	CONSISTENT. As described in Section 4.3, Air Quality, the applicant would be subject to the terms of applicable air quality permits, which would be approved by the San Joaquin Valley Air Pollution Control District (APCD). In addition, the County has incorporated feasible mitigation to reduce impacts to the greatest extent feasible, but air quality impacts remain significant after mitigation. The

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
(b) The benefits of the proposed project outweigh any unavoidable significant adverse effects on air quality found to exist after inclusion of all feasible mitigation. This finding shall be made in a statement of overriding considerations and shall be supported by factual evidence to the extent that such a statement is required pursuant to the California Environmental Quality Act.	County will consider the benefits of the proposed Project and whether they outweigh the unavoidable significant adverse effects of the proposed Project and, depending upon their findings, may prepare a statement of overriding considerations. Therefore, the proposed Project would be consistent with Policy 19.
Policy 20. The County shall include fugitive dust control measures as a requirement for discretionary projects and as required by the adopted rules and regulations of the San Joaquin Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District on ministerial permits.	CONSISTENT. As described in Section 4.3, Air Quality, the proposed Project includes best management practices and mitigation measures intended to reduce impacts due to fugitive dust as required by the San Joaquin Valley APCD. Therefore, the proposed Project would be consistent with Policy 20.
Policy 21. The County shall support air districts' efforts to reduce PM10 and PM2.5 emissions.	CONSISTENT. As described in Section 4.3, Air Quality, the proposed Project includes mitigation measures intended to reduce impacts due to fugitive dust (i.e., PM10 and PM2.5) as required by the San Joaquin Valley APCD. Therefore, the proposed Project would be consistent with Policy 20.
Policy 22. Kern County shall continue to work with the San Joaquin Valley Unified Air Pollution Control District and the Kern County Air Pollution Control District toward air quality attainment with federal, State, and local standards.	CONSISTENT. The San Joaquin Valley Unified APCD received a copy of the NOP in 2013, and the County has had discussions with the district during the preparation of this EIR. The proposed Project is located outside of Kern County APCD jurisdiction. Therefore, the proposed Project would be consistent with Policy 22.
Policy 23. The County shall continue to implement the local government control measures in coordination with the Kern Council of Governments and the San Joaquin Valley Unified Air Pollution Control District.	CONSISTENT. The Kern Council of Governments and the San Joaquin Valley Unified APCD received a copy of the NOP in 2013 and were given the opportunity to provide input into the EIR. Therefore, the proposed Project would be consistent with Policy 23.
Implementation Measure F. All discretionary permits shall be referred to the appropriate air district for review and comment.	CONSISTENT. As described in Section 4.3, Air Quality, the applicant would be subject to the terms of applicable air quality permits, which would be prepared and approved by the San Joaquin Valley APCD after the completion of this EIR. In addition, implementation of mitigation measures detailed in Section 4.3 would reduce impacts on air quality to the extent feasible. Therefore, the proposed Project would be consistent with Implementation Measure F.
Implementation Measure G. Discretionary development projects involving the use of tractor trailer rigs shall incorporate diesel exhaust reduction strategies including, but not limited to: • Minimizing idling time.	CONSISTENT. described in Section 4.3, Air Quality, the applicant would be subject to the terms of applicable air quality permits, which would be prepared and approved by the San Joaquin Valley APCD after the completion of this EIR. In addition, implementation of mitigation measures detailed in Section 4.3 would

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
• Electrical overnight plug-ins.	reduce impacts on air quality to the extent feasible. Therefore, the proposed Project would be consistent with Implementation Measure G.
Implementation Measure H. Discretionary projects may use one or more of the following to reduce air quality effects: a. Pave dirt roads within the development. b. Pave outside storage areas. c. Provide additional low Volatile Organic Compounds (VOC) producing trees on landscape plans. d. Use of alternative fuel fleet vehicles or hybrid vehicles. e. Use of emission control devices on diesel equipment. f. Develop residential neighborhoods without fireplaces or with the use of Environmental Protection Agency certified, low emission natural gas fireplaces. g. Provide bicycle lockers and shower facilities on site. h. Increasing the amount of landscaping beyond what is required in the Zoning Ordinance (Chapter 19.86). i. The use and development of park and ride facilities in outlaying areas. j. Other strategies that may be recommended by the local Air Pollution Control Districts.	CONSISTENT. As described in Section 4.3, Air Quality, the applicant would be subject to the terms of applicable air quality permits, which would be prepared and approved by the San Joaquin Valley APCD after the completion of this EIR. In addition, implementation of mitigation measures detailed in Section 4.3 would reduce impacts on air quality to the extent feasible. Therefore, the proposed Project would be consistent with Implementation Measure F.
1.10.3 ARCHAEOLOGICAL, PALEONTOLOGICAL, CULTURAL, AND HISTORICAL PRESERVATION	
Policy 25. The County will promote the preservation of cultural and historic resources which provide ties with the past and constitute a heritage value to residents and visitors.	CONSISTENT. Mitigation measures described in Section 4.5, Cultural Resources, would reduce impacts on cultural and historic resources. Therefore, the proposed Project would be consistent with Policy 25.
Implementation Measure K. Coordinate with the California State University, Bakersfield's Archaeology Inventory Center.	CONSISTENT. Mitigation measures described in Section 4.5, Cultural Resources would reduce impacts on cultural and historic resources. These measures require coordination with the CSU Bakersfield among other measures. Therefore, the proposed Project would be consistent with Policy 25.
Implementation Measure L. The County shall address archaeological and historical resources for discretionary projects in accordance with the California Environmental Quality Act (CEQA).	CONSISTENT. Archaeological and historical resources are analyzed in Section 4.5, Cultural Resources, of this EIR. Therefore, the proposed Project would be consistent with Implementation Measure L.
Implementation Measure M. In areas of known paleontological resources, the County should address the preservation of these resources where feasible.	CONSISTENT. Impacts on paleontological resources would be preserved to the greatest extent feasible as described in Section 4.5, Cultural Resources. Implementation of mitigation measures would reduce impacts on paleontological

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	resources. Therefore, the proposed Project would be consistent with Implementation Measure M.
Implementation Measure N. The County shall develop a list of Native American organizations and individuals who desire to be notified of proposed discretionary projects. This notification will be accomplished through the established procedures for discretionary projects and CEQA documents.	CONSISTENT. Native American organizations and individuals were notified of the preparation of this EIR as outlined in Section 4.5, Cultural Resources. In addition, mitigation measures would ensure that the County would consult with the appropriate Native American individuals in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. Therefore, the proposed Project would be consistent with Implementation Measure N.
Implementation Measure O. On a project specific basis, the County Planning Department shall evaluate the necessity for the involvement of a qualified Native American monitor for grading or other construction activities on discretionary projects that are subject to a CEQA document.	CONSISTENT. Native American organizations and individuals were notified of the preparation of this EIR as outlined in Section 4.5, Cultural Resources. In addition, mitigation measures would ensure that the County would consult with the appropriate Native American individuals in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. Therefore, the proposed Project would be consistent with Implementation Measure O.
1.10.5 THREATENED AND ENDANGERED SPECIES	
Policy 27. Threatened or endangered plant and wildlife species should be protected in accordance with State and federal laws.	CONSISTENT. As described in Section 4.4, Biological Resources, the applicant would be required to comply with State and federal laws. Therefore, the proposed Project would be consistent with Policy 27.
Policy 28. County should work closely with State and federal agencies to assure that discretionary projects avoid or minimize impacts to fish, wildlife, and botanical resources.	CONSISTENT. The County solicited the feedback of and received input from both the USFWS and CDFW during the preparation of this EIR. Therefore, the proposed Project would be consistent with Policy 28.
Policy 29. The County will seek cooperative efforts with local, State, and federal agencies to protect listed threatened and endangered plant and wildlife species through the use of conservation plans and other methods promoting management and conservation of habitat lands.	CONSISTENT. The County solicited the feedback of and received input from both the USFWS and CDFW during the preparation of this EIR. Impacts of the proposed Project on all HCPs within the Project Area are analyzed in Section 4.10, Land Use and Planning, and Section 4.4, Biological Resources. Therefore, the proposed Project would be consistent with Policy 29.
Policy 31. Under the provisions of the California Environmental Quality Act (CEQA), the County, as lead agency, will solicit comments from the California Department of Fish and Game and the U.S. Fish and Wildlife Service when an environmental document (Negative Declaration, Mitigated Negative Declaration, or	CONSISTENT. The County solicited the feedback of and received input from both the USFWS and CDFW during the preparation of this EIR. Therefore, the proposed Project would be consistent with Policy 31.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Environmental Impact Report) is prepared.	
Policy 32. Riparian areas will be managed in accordance with United States Army Corps of Engineers, and the California Department of Fish and Game rules and regulations to enhance the drainage, flood control, biological, recreational, and other beneficial uses while acknowledging existing land use patterns.	CONSISTENT. Future developers are required to adhere to all rules and regulations, including those regarding riparian areas. In addition, Section 4.9, Hydrology and Water Quality, and Section 4.6, Geology and Soils, describe the implementation of a SWPPP, which would help protect riparian areas. In addition, mitigation measures would further reduce impacts on riparian areas. Therefore, the proposed Project would be consistent with Policy 32.
Implementation Measure Q. Discretionary projects shall consider effects to biological resources as required by the California Environmental Quality Act.	CONSISTENT. Effects to biological resources are analyzed in Section 4.4, Biological Resources, of this EIR. Therefore, the proposed Project would be consistent with Implementation Measure Q.
Implementation Measure R. Consult and consider the comments from responsible and trustee wildlife agencies when reviewing a discretionary project subject to the California Environmental Quality Act.	CONSISTENT. The County solicited the feedback of and received input from both responsible and trustee wildlife agencies during the preparation of this EIR. Therefore, the proposed Project would be consistent with Implementation Measure R.
Implementation Measure S. Pursue the development and implementation of conservation programs with State and federal wildlife agencies for property owners desiring streamlined endangered species mitigation programs.	CONSISTENT. The proposed Project would streamline the drilling permit process, which would consequently streamline endangered species mitigation programs within the County. All drilling permits within Kern County jurisdiction would be subject to biological species mitigation outlined in this EIR. Therefore, the proposed Project would be consistent with Implementation Measure S.
1.10.6 SURFACE WATER AND GROUNDWATER	
Policy 34. Ensure that water quality standards are met for existing users and future development.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. In addition, as discussed in Section 4.9, Hydrology and Water Quality, the operator shall comply with all applicable federal, state, regional, and local agency water quality protection laws and regulations, and commonly utilized industry standards, including obtaining all applicable stormwater construction permits from the CVRWQCB per mitigation measures. In addition, all drilling operations would use either a closed loop system to avoid discharges of drilling muds and fluids or would obtain coverage under the SWRCB low threat discharge General Order (WDR General Order 2003-0003-DWQ). Implementation of the aforementioned compliance with laws and regulations, as well as the implementation of mitigation measures, would ensure that water quality standards are met for existing users and future development. Therefore, the

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	proposed Project would be consistent with Policy 34.
Policy 35. Ensure that adequate water storage, treatment, and transmission facilities are constructed concurrently with planned growth.	CONSISTENT. The proposed Project does not include the construction of water storage, treatment, or transmission facilities with the exception of those required for oil and gas development. In addition, although the proposed Project may cause nominal population growth in the Project Area as described in Section 4.13, Population and Housing, the majority of workers would be drawn from the existing population. Thus, implementation of the proposed Project would not require that new water storage, treatment, and transmission facilities be constructed to support growth. Therefore, the proposed Project would be consistent with Policy 35.
Policy 36. Ensure that appropriate funding mechanisms for water are in place to fund the needed improvements resulting from growth and subsequent development.	CONSISTENT. Although the proposed Project may cause nominal population growth in the Project Area as described in Section 4.13, Population and Housing, the majority of workers would be drawn from the existing population. In addition, the applicant would use reclaimed water to the extent possible per mitigation measures. Use of reclaimed water would reduce the oil and gas industry's need for municipal water, which would reduce the need for funding mechanisms to provide water infrastructure improvements. Thus, implementation of the proposed Project would not require funding mechanisms for water infrastructure. Therefore, the proposed Project would be consistent with Policy 36.
Policy 38. Encourage utilization of wastewater treatment facilities which provide for the reuse of wastewater.	CONSISTENT. Produced water is currently reused to the greatest extent practicable in oil field operations and would continue to be reused in the future per mitigation measures. In addition, some produced water in the Eastern Subarea is treated and sold for use in agricultural operations. This, too, would continue in the future. Therefore, the proposed Project would be consistent with Policy 38.
Policy 39. Encourage the development of the County's groundwater supply to sustain and ensure water quality and quantity for existing users, planned growth, and maintenance of the natural environment.	CONSISTENT. The proposed Project does not impact the County's ability to develop its groundwater supply. According to the Future Development Scenario, the proposed Project would continue to reuse produced water in oil field operations and sell treated produced water for agricultural uses. Therefore, the proposed Project would be consistent with Policy 39.
Policy 41. Review development proposals to ensure adequate water is available to accommodate projected growth.	CONSISTENT. Although the proposed Project may cause nominal population growth in the Project Area as described in Section 4.13, Population and Housing, the majority of workers would be drawn from the existing population. In addition, implementation of public services and utilities mitigation measures would further

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	reduce dependency on municipal water supplies. Therefore, the proposed Project would be consistent with Policy 41.
Policy 43. Drainage shall conform to the Kern County Development Standards and the Grading Ordinance.	CONSISTENT. Developers would conform to all local laws and ordinances and would comply with the Kern County Grading Ordinance. The applicant would also comply with mitigation measures. Therefore, the proposed Project would be consistent with Policy 43.
Policy 44. Discretionary projects shall analyze watershed impacts and mitigate for construction-related and urban pollutants, as well as alterations of flow patterns and introduction of impervious surfaces as required by the California Environmental Quality Act (CEQA), to prevent the degradation of the watershed to the extent practical.	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator shall implement a SWPPP. In addition, as discussed in Section 4.9, Hydrology and Water Quality, the operator shall comply with all applicable federal, state, regional, and local agency water quality protection laws and regulations, and commonly utilized industry standards, including obtaining all applicable stormwater construction permits from the Central Valley Regional Water Quality Control Board (CVRWQCB) per mitigation measures. The operator would also comply with the Kern County Grading Ordinance. Finally, all drilling operations would use either a closed loop system to avoid discharges of drilling muds and fluids or would obtain coverage under the State Water Resources Control Board (SWRCB) low threat discharge General Order (WDR General Order 2003-0003-DWQ). Although areas would be graded during construction and soil may be compacted, impervious services would be minimal. Therefore, impacts on watershed integrity would be reduced, and the proposed Project would be consistent with Policy 11.
Policy 45. New high consumptive water uses, such as lakes and golf courses, should require evidence of additional verified sources of water other than local groundwater. Other sources may include recycled stormwater or wastewater.	CONSISTENT. Treated oil and gas process water is not used for lakes and golf course but for agricultural purposes and other oil field uses. However, oil and gas developers would be required to implement mitigation measures per Section 4.9, Hydrology and Water Quality, and Section 4.17, Utilities and Service Systems. Therefore, the proposed Project would be consistent with Policy 45.
Implementation Measure U. The Kern County Environmental Health Services Department will develop guidelines for the protection of groundwater quality which will include comprehensive well construction standards and the promotion of groundwater protection for identified degraded watersheds.	CONSISTENT. The proposed Project includes the development of comprehensive well construction standards, including standards that protect groundwater. In addition, all County departments have been given the opportunity to provide input into the EIR process and will be given the opportunity to provide comments on the EIR, including comments on mitigation measures. Therefore, the proposed Project would be consistent with Implementation Measure U.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Implementation Measure X. Encourage effective groundwater resource management for the long-term benefit of the County through the following: Promote groundwater recharge activities in various zone districts. Support the development of Groundwater Management Plans. Support the development of future sources of additional surface water and groundwater, including conjunctive use, recycled water, conservation, additional storage of surface water, and groundwater and desalination.	CONSISTENT. The applicant would be required to comply with mitigation measures that encourage groundwater resource management and use of recycled water. Therefore, the proposed Project would be consistent with Implementation Measure X.
Implementation Measure Y. Promote efficient water use by utilizing measures such as: Requiring water-conserving design and equipment in new construction. Encouraging water-conserving landscaping and irrigation methods.	CONSISTENT. The applicant would be required to comply with mitigation measures that encourage groundwater resource management and use of recycled water. Therefore, the proposed Project would be consistent with Implementation Measure Y.
1.10.7 LIGHT AND GLARE	
Policy 48. Encourage the use of low-glare lighting to minimize nighttime glare effects on neighboring properties.	CONSISTENT. Implementation of mitigation measures would reduce glare associated with nighttime lighting. Therefore, the proposed Project would be consistent with Policy 48.
Implementation Measure AA. The County shall utilize CEQA Guidelines and the provisions of the Zoning Ordinance to minimize the impacts of light and glare on adjacent properties and in rural undeveloped areas.	CONSISTENT. The development would be required to comply with all applicable laws and ordinances related to light and glare, including mitigation measures. Therefore, the proposed Project would be consistent with Implementation Measure AA.
1.10.9 ECONOMIC DEVELOPMENT	
Policy 58. Support and work toward the elimination of disincentives for business and industry to prosper in Kern County, and create special economic development programs to encourage commerce and industry to locate in Kern County.	CONSISTENT. The proposed Project is intended to streamline the permit review process for oil and gas developers as well as encourage the safe development of mineral resources within the County. Streamlining the permit review process would eliminate disincentives for the oil and gas industry to prosper in Kern County while simultaneously maintaining a balance between economic development and the environment. Therefore, the proposed Project would be consistent with Policy 58.
Policy 62. Periodically review and update procedures for granting development approvals and permits and facilitate the processing of land use entitlements.	CONSISTENT. The proposed Project includes a review of the development approval and permit process for oil and gas development within Kern County. If the proposed Project is approved, procedures for granting development approvals for oil and gas wells and associated infrastructure would be updated in order to

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	facilitate the processing of land use entitlements. In order to ensure that conflicts between surface and subsurface entitlements are reduced, developers would be required to conform with mitigation measures, which includes the new Oil and Gas Conformity Review Process. Therefore, the proposed Project would be consistent with Policy 62.
Implementation Measure DD. Utilize the County's Economic Strategy and the Economic Incentive Program to promote economic growth and to maintain a strong local economy.	CONSISTENT. The proposed Project is intended to streamline the permit review process for oil and gas developers as well as encourage the safe development of mineral resources within the County. Streamlining the permit review process would eliminate disincentives for the oil and gas industry to prosper in Kern County while simultaneously maintaining a balance between economic development and the environment. Therefore, the proposed Project would be consistent with Implementation Measure DD.
1.10.10 OAK TREE CONSERVATION	
Policy 65. Oak woodlands and large oak trees shall be protected where possible and incorporated into project developments.	CONSISTENT. Developers would be required to implement mitigation measures, which would reduce impacts on oak trees and oak woodlands. Therefore, the proposed Project would be consistent with Policy 65.
Policy 66. Promote the conservation of oak tree woodlands for their environmental value and scenic beauty	CONSISTENT. Developers would be required to implement mitigation measures, which would reduce impacts on oak trees and oak woodlands. Therefore, the proposed Project would be consistent with Policy 66.
Implementation Measure LL. The following applies to development of parcels having oak tree canopy cover of less than ten percent (10%), but containing individual oak trees equal to or greater than a 12-inch diameter trunk at 4.5 feet breast height. Such trees shall be identified on plot plans. Discretionary development shall avoid the area beneath and within the trees unaltered drip line unless approved by a licensed or certified arborist or botanist. Specified tree removal related to the discretionary action may be granted by the decision making body upon showing that a hardship exists based on substantial evidence in the record.	CONSISTENT. Developers would be required to implement mitigation measures, which would reduce impacts on oak trees and oak woodlands. Therefore, the proposed Project would be consistent with Implementation Measure LL.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
CHAPTER 2. CIRCULATION ELEMENT	
Objective 1. To make certain that transportation facilities needed to support development are available. To ensure that these facilities occur in a timely manner so as to avoid traffic degradation.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. Therefore, the proposed Project does not conflict with Circulation Element Objective 1.
Objective 5. Maintain a minimum Level Of Service (LOS) D for all roads throughout the County.	CONSISTENT. According to the Future Development Scenario, activity levels, and therefore traffic levels, would be generally consistent with historical norms. Regardless, as described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. Therefore, the proposed Project would be consistent with Objective 5.
2.3.3 HIGHWAY PLAN	
Goal 5. Maintain a minimum Level of Service (LOS) D.	CONSISTENT. According to the Future Development Scenario, activity levels, and therefore traffic levels, would be generally consistent with historical norms. Regardless, as described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. Therefore, the proposed Project would be consistent with Goal 5.
Implementation Measure B. Continuity and integrity of the arterial and collector system at the mountain/valley region and the mountain/desert region boundary must be reviewed and approved in conjunction with project adoption on an individual basis.	CONSISTENT. The proposed Project boundary includes most of the San Joaquin Valley Floor portion of Kern County up to an elevation of 2,000 feet. The mountain/valley region and mountain/desert region interface area is outside the boundary of the proposed Project. Therefore, the proposed Project does not conflict with Circulation Element Implementation Measure B.
Implementation Measure C. Conformance to alignment minimum design standards, where roadways that deviate from section and mid-section lines intersect those lines, must be reviewed and approved in conjunction with project adoption on an individual basis.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. Therefore, the proposed Project would be consistent with Goal 5.
2.3.4 FUTURE GROWTH	
Policy 2. The County should monitor development applications as they relate to traffic estimates developed for this plan. Mitigation is required if development causes affected roadways to fall below Level Of Service (LOS) D. Utilization of the CEQA process would help identify alternatives to or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation	CONSISTENT. The proposed Project includes development standards that would reduce the adverse impacts associated with resource extraction. The County is utilizing the CEQA process to identify the proposed Project's impacts on traffic within the Project Area and has concluded that mitigation measures are required to reduce traffic impacts. As described in Section 4.13, Population and Housing,

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Element to establish jobs/housing balance if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build off-site transportation facilities. These enhancements would reduce traffic congestion to an acceptable level.	workers are expected to be drawn from the existing workforce within Kern County. Therefore, the project would not result in a large influx of workers into the Project Area that would necessitate additional housing. Therefore, the proposed Project would be consistent with Future Growth Policy 2.
Policy 4. As a condition of private development approval, developers shall build roads needed to access the existing road network. Developers shall build these roads to County standards unless improvements along State routes are necessary then roads shall be built to Caltrans standards. Developers shall locate these roads (width to be determined by the Circulation Plan) along centerlines shown on the circulation diagram map unless otherwise authorized by an approved Specific Plan Line. Developers may build local roads along lines other than those on the circulation diagram map. Developers would negotiate necessary easements to allow this.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. Therefore, the proposed Project would be consistent with Policy 4.
Implementation Measure C. Project development shall comply with the requirements of the Kern County Zoning Ordinance, Land Division Ordinance, and Development Standards.	CONSISTENT. The proposed Project includes an amendment to the current Zoning Ordinance Chapter 19 and development standards to mitigate impacts associated with resource extraction. In addition, the proposed Project includes a new Oil and Gas Conformity Review Process per MM 4.10-1. Therefore, the proposed Project would be consistent with Implementation Measure C.
2.3.7 SETBACK DEVIATION STUDIES	
Implementation Measure A. A setback deviation request shall report proposed setback distance. The Kern County Zoning Ordinance gives setback distance for permanent structures located along surveyed section and mid-section lines. Setback deviations may be authorized where it is demonstrated that expressway, arterial or collector construction will not occur while the structure in question is usable, or valuable. An entity pursuing a setback deviation shall submit an application with necessary justification to support the request. The application shall include fees to defray costs to prepare staff reports and administering the application.	CONSISTENT. Oil and gas developers are required to comply with all setback requirements outlined in the Kern County Ordinance. Setback deviations would be reviewed by the Kern County Planning Department as part of the new Oil and Gas Conformity Review Process (MM 4.10-1). Therefore, the proposed Project would be consistent with Implementation Measure A.
2.3.8 SAFETY HAZARDS OF FOG AND DUST	
Goal 2. To relieve blowing dust influences on driving safety in Kern County.	CONSISTENT. Developers would be required to comply with mitigation measures, which would reduce dust. Therefore, the proposed Project would be consistent with Goal 2.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
2.4 PRIORITY FOCUS AREA TOPICS – HIGHWAYS	
2.4.7 TAFT AREA	
Goal 1. Upgrade road circulation in and around Taft.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. In addition, a Construction Traffic Control Plan would be required. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Reduce the speeds and amount of commuters and truck traffic through the centers of rural communities based on engineering and speed surveys.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures requires the preparation of a Construction Traffic Control Plan. Implementation of such a plan would reduce impacts associated with construction traffic in rural communities. Therefore, the proposed Project would be consistent with Goal 1.
Policy 3. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build off-site transportation facilities. These enhancements would reduce traffic congestion impacts.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. In addition, a Construction Traffic Control Plan would be required. As described in Section 4.13, Population and Housing, workers are expected to be drawn from the existing workforce within Kern County. Therefore, the project would not result in a large influx of workers into the Project Area that would necessitate additional housing. Therefore, the proposed Project would be consistent with Priority Focus Areas Topics Policy 3.
Policy 4. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.	CONSISTENT. Mitigation measures require the applicant to prepare a Fugitive Dust Control Plan if required by the San Joaquin APCD. Therefore, the proposed Project would be consistent with Policy 4.
2.4.8 DELANO – MCFARLAND AREA	
Policy 5. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caldrons roadways. Utilization of the CEQA process would help identify	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. In addition, a Construction Traffic Control Plan would be required. As described in Section 4.13, Population and Housing, workers are expected to be drawn from the existing workforce within Kern County. Therefore, the project

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.	would not result in a large influx of workers into the Project Area that would necessitate additional housing. Therefore, the proposed Project would be consistent with Priority Focus Areas Topics Policy 5.
Policy 6. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.	CONSISTENT. Mitigation measures require that the applicant prepare a Fugitive Dust Control Plan if required by the SJVAPCD. Therefore, the proposed Project would be consistent with Policy 6.
2.4.9 LERDO AREA	
Goal 3. Improve traffic safety relative to farm vehicles and equipment.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures require that developers prepare a Construction Traffic Control Plan. Implementation of this plan would improve safety relative to farm vehicles and equipment. Therefore, the proposed Project would be consistent with Goal 3.
Goal 4. Provide for improved traffic flow adjacent to existing communities.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. In addition, a Construction Traffic Control Plan would be required. Therefore, the proposed Project would be consistent with Goal 4.
Policy 6. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build off-site transportation facilities. These enhancements would reduce traffic congestion impacts.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. In addition, a Construction Traffic Control Plan would be required. As described in Section 4.13, Population and Housing, workers are expected to be drawn from the existing workforce within Kern County. Therefore, the project would not result in a large influx of workers into the Project Area that would necessitate additional housing. Therefore, the proposed Project would be consistent with Priority Focus Areas Topics Policy 6.
Policy 7. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.	CONSISTENT. Per mitigation measures, if required by the San Joaquin APCD, the applicant would prepare a Fugitive Dust Control Plan. Therefore, the proposed Project would be consistent with Policy 7.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
2.5 OTHER MODES	
2.5.1 TRUCKS AND HIGHWAYS	
Goal 1. Provide for Kern County's heavy truck transportation in the safest way possible.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures require that developers prepare a Construction Traffic Control Plan. Implementation of this plan would improve safety relative to heavy truck transportation. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Reduce potential overweight trucks.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures require that developers prepare a Construction Traffic Control Plan. Implementation of this plan would improve safety relative to potential overweight trucks. In addition, developers would be required to pay traffic impact mitigation fees per mitigation measures. Therefore, the proposed Project would be consistent with Goal 2.
2.5.2 AIRPORT LAND USE COMPATIBILITY PLAN (ALUCP)	
Policy 2. To the extent legally allowable, prevent encroachment on public airport and military base operations from incompatible, unmitigated land uses.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to pay traffic impact mitigation fees per mitigation measures. In addition, a Construction Traffic Control Plan would be required. Therefore, the proposed Project would be consistent with Policy 2.
Implementation Measure A. Review discretionary land use development applications within the airports influence area and the military base operating area as shown in the ALUCP for consistency.	CONSISTENT. Any structures taller than 200 feet would require FAA approval. In addition, developers would be required to comply with mitigation measures. Therefore, the proposed Project would be compatible with the ALUCP, and the proposed Project would be consistent with Implementation Measure A.
2.5.4 TRANSPORTATION OF HAZARDOUS MATERIALS	
Goal 1. Reduce risk to public health from transportation of hazardous materials.	CONSISTENT. Implementation of mitigation measures would require that the Applicant arrange for transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act. Therefore, the proposed Project would be consistent with Goal 1.
Policy 1. The commercial transportation of hazardous material, identification and designation of appropriate shipping routes will be in conformance with the adopted Kern County and Incorporated Cities Hazardous Waste Management Plan.	CONSISTENT. With implementation of mitigation measures, hazards resulting from the commercial transportation of hazardous materials would be reduced. In addition, the applicant would be required to comply with all laws, regulations, policies, and ordinances with respect to hazardous materials transport. Therefore,

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	the proposed Project would be consistent with Policy 1.
Policy 2. Kern County and affected cities should reduce use of County-maintained roads and city-maintained streets for transportation of hazardous materials.	CONSISTENT. Implementation of mitigation measures would require that the Applicant arrange for transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act. In addition, transport routes identified in this EIR are consistent with historic transport routes in the County for oil and gas development materials and wastes. The proposed Project does not result in an increase in the use of County-maintained roads or city-maintained streets above current levels. Therefore, the proposed Project does not conflict with Policy 2.
CHAPTER 3. NOISE ELEMENT	
3.2 NOISE SENSITIVE AREAS	
Goal 1. Ensure that residents of Kern County are protected from excessive noise and that moderate levels of noise are maintained.	CONSISTENT. Noise mitigation measures would ensure that residents of Kern County are protected from excessive noise and that moderate levels of noise are maintained. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Protect the economic base of Kern County by preventing the encroachment of incompatible land uses near known noise producing roadways, industries, railroads, airports, oil and gas extraction, and other sources.	CONSISTENT. The majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas. Additionally, as described in Section 4.12, Noise, the applicant shall implement mitigation measures to ensure that residents of the Project Area will be protected from the harmful effects of exposure to excessive noise caused by oil and gas drilling and production activities. Therefore, the proposed Project would be consistent with Goal 2.
Policy 2. Require noise level criteria applied to all categories of land uses to be consistent with the recommendations of the California Division of Occupational Safety and Health (DOSH).	CONSISTENT. Implementation of mitigation measures would ensure that noise levels near sensitive receptors do not exceed noise level criteria recommended by State and federal agencies. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise.	CONSISTENT. The proposed Project does not impact the County's ability to use vegetation and landscaping as sound buffers between noise sensitive land uses and roadways or other noise-generating sources. As described in Section 4.12, Noise, new oil and gas development standards set by the proposed Project would require the use of berms, sound attenuation walls, and/or other methods, as necessary, in order to increase the absorption of noise from future oil and gas development

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	projects, per mitigation measures. Therefore, the proposed Project would be consistent with Policy 3.
Policy 4. Utilize good land use planning principles to reduce conflicts related to noise emissions.	CONSISTENT. The majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas. Residential uses and other sensitive uses are unlikely to be constructed in these areas; however, mitigation measures related to sensitive land uses would apply regardless of whether such uses were located within Tier 1 areas or any other areas. As described in Section 4.12, Noise, the applicant would implement mitigation measures to reduce conflicts related to noise emissions caused by oil and gas drilling and production activities. Therefore, the proposed Project would be consistent with Policy 4.
Policy 5. Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into the project design. Such mitigation shall be designed to reduce noise to the following levels: a) 65 dB Ldn or less in outdoor activity areas; b) 45 dB Ldn or less within interior living spaces or other noise sensitive interior spaces.	CONSISTENT. The majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas. Residential uses and other sensitive uses are unlikely to be constructed in these areas; however, mitigation measures related to sensitive land uses would apply regardless of whether such uses were located within Tier 1 areas or any other areas. Additionally, as described in Section 4.12, Noise, the applicant would implement mitigation measures to reduce conflicts related to noise emissions caused by oil and gas drilling and production activities. Therefore, the proposed Project would be consistent with Policy 4.
Policy 6. Ensure that new development in the vicinity of airports will be compatible with existing and projected airport noise levels as set forth in the ALUCP.	CONSISTENT. The proposed Project will comply with all mitigation measures, including those intended to reduce noise impacts on sensitive receptors and mitigation related to ALUCP compliance. Therefore, the proposed Project is consistent with Policy 6.
Policy 7. Employ the best available methods of noise control.	CONSISTENT. Implementation of mitigation measures outlined in Section 4.12, Noise, would ensure that noise levels near sensitive receptors do not exceed noise level criteria recommended by State and federal agencies. Therefore, the proposed Project would be consistent with Policy 7.
Implementation Measure A. Utilize zoning regulations to assist in achieving noise-compatible land use patterns.	CONSISTENT. The proposed Project includes an amendment to the County's Zoning Ordinance and introduces new development standards to mitigate oil and gas development impacts on the environmental resources, including mitigation to assist in achieving noise-compatible land use patterns. Therefore, the proposed Project would be consistent with Implementation Measure A.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Implementation Measure F. Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65 dB Ldn and interior noise levels in excess of 45 dB Ldn.	CONSISTENT. The majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas. Residential uses and other sensitive uses are precluded in these areas. Additionally, as described in Section 4.12, Noise, the applicant shall implement mitigation measures to reduce conflicts related to noise emissions caused by oil and gas drilling and production activities. Therefore, the proposed Project would be consistent with Implementation Measure F.
Implementation Measure J. Develop implementation procedures to ensure that requirements imposed pursuant to the findings of an acoustical analysis are conducted as part of the project permitting process.	CONSISTENT. As described in Section 4.12, Noise, noise levels associated with oil and gas production activities were measured by the applicant's consultant in 2014. The EIR analysis includes recommendations based on the findings of the applicant's noise study. The applicant shall implement mitigation measures to reduce noise emissions caused by oil and gas drilling and production activities on sensitive receptors. Therefore, the proposed Project would be consistent with Implementation Measure J.
CHAPTER 4. SAFETY ELEMENT	
Goal 1. Minimize injuries and loss of life and reduce property damage.	CONSISTENT. The applicant would comply with all laws, regulations, and ordinances. In addition, the applicant would implement mitigation measures outlined in Section 4.8, Hazards and Hazardous Materials. With the implementation of these measures, the proposed Project would be consistent with Goal 1.
Goal 8. Reduce the public's exposure to fire, explosion, blowout, and other hazards associated with the accidental release of crude oil, natural gas, and hydrogen sulfide gas.	CONSISTENT. The Applicant would implement mitigation measures outlined in Section 4.8, Hazards and Hazardous Materials, which would reduce the public's exposure to fire, explosion, blowout, and other hazards associated with accidental release of crude oil, natural gas, and hydrogen sulfide gas. In addition, the Applicant would be required pay mitigation fees that would mitigate impacts on police and fire protection services in the Project Area as outlined in Section 4.14, Public Services. Therefore, the proposed Project would be consistent with Goal 8.
4.2 GENERAL POLICIES AND IMPLEMENTATION MEASURE, WHICH APPLY TO MORE THAN ONE SAFETY CONSTRAINT	
Policy 1. That the County's program of identification, mapping, and evaluating the geologic, fire, flood safety hazard areas, and significant concentrations of hydrogen sulfide in oilfield areas, presently under way by various County departments, be continued.	CONSISTENT. The proposed Project does not interfere with County-wide programs related to identification, mapping, and evaluation of geologic, fire, flood safety hazard areas, and hydrogen sulfide concentrations in oilfield areas. The programs would continue regardless of the approval of the proposed Project.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	Therefore, the proposed Project would be consistent with Policy 1.
Policy 4. The County shall encourage extra precautions be taken for the design of significant lifeline installations, such as highways, utilities, and petrochemical pipelines.	CONSISTENT. The proposed Project is not a significant lifeline installation; however, all pipelines and other project components would be constructed according to County development standards. Therefore, the proposed Project would be consistent with Policy 4.
Implementation Measure F. The adopted multi-jurisdictional Kern County, California Multi- Hazard Mitigation Plan, as approved by FEMA, shall be used as a source document for preparation of environmental documents pursuant to CEQA, evaluation of project proposals, formulation of potential mitigation, and identification of specific actions that could, if implemented, mitigate impacts from future disasters and other threats to public safety.	CONSISTENT. Section 4.8, Hazards and Hazardous Materials consults the 2012 multi-jurisdictional Kern County, California Multi-Hazard Mitigation Plan. This document was considered in the design of mitigation measures described in Section 4.8, Hazards and Hazardous Materials. Therefore, the proposed Project would be consistent with Implementation Measure F.
4.3 SEISMICALLY INDUCED SURFACE RUPTURE, GROUND SHAKING, AND GROUND FAILURE	
Implementation Measure B. Require geological and soils engineering investigations in identified significant geologic hazard areas in accordance with the Kern County Code of Building Regulations.	CONSISTENT. As described in Section 4.6, Geology and Soils, the applicant would be required to follow all laws, regulations, and ordinances, including those related to geological and soils engineering investigations outlined in the Kern County Code of Building Regulations. Therefore, the proposed Project would be consistent with Implementation Measure B.
Implementation Measure C. The fault zones designated in the Kern County Seismic Hazard Atlas should be considered significant geologic hazard areas. Proper precautions should be instituted to reduce seismic hazard, whenever possible in accordance with State and County regulations.	CONSISTENT. As described in Section 4.6, Geology and Soils, the Kern County Seismic Hazard Atlas was consulted during the preparation of this EIR. Implementation of mitigation measures would reduce impacts due to seismic hazards and other geologic hazards. Therefore, the proposed Project would be consistent with Implementation Measure C.
Implementation Measure G. Route major lifeline components such as highways, utilities, petroleum or chemical pipelines around areas of high groundwater whenever possible. Where they must cross an area of high groundwater, plans, and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.	CONSISTENT. The proposed Project is not a major lifeline installation; however, all pipelines and other project components would be constructed according to County development standards. Therefore, the proposed Project would be consistent with Implementation Measure G.
Implementation Measure H. Require that plans and permits for installation of major lifeline components such as highways, utilities, petroleum or chemical pipelines to incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of essential service or threat to health and safety.	CONSISTENT. The proposed Project is not a major lifeline installation; however, all pipelines and other project components would be constructed according to County development standards. Therefore, the proposed Project would be consistent with Implementation Measure H.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Implementation Measure I. Design significant lifeline installations, such as highways, utilities, and petrochemical pipelines which cross an active fault, to accommodate potential fault movement without prolonged disruption of essential service or creating threat to health and safety.	CONSISTENT. The proposed Project is not a major lifeline installation; however, all pipelines and other project components would be constructed according to County development standards. Therefore, the proposed Project would be consistent with Implementation Measure I.
4.4 DAM FAILURE, FLOODING, AND INUNDATION	
Policy 2. Design discretionary critical facilities in the potential dam inundation area used for the storage, or use of hazardous materials to prevent on-site hazards from affecting surrounding communities in the event of inundation.	CONSISTENT. The proposed Project does not include the design of discretionary critical facilities; however, all project components would be constructed according to County development standards, including measures that would reduce impacts associated with hazardous materials in dam inundation areas. The implementation of these measures would reduce the proposed Project's potential to affect surrounding communities in the event of inundation. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Require emergency response plans for the planning area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area.	CONSISTENT. The proposed Project would not interfere with the City's ability to incorporate specific procedures for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans. Therefore, the proposed Project would be consistent with Policy 3.
Implementation Measure A. Facilities used for the manufacture, storage, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent on-site hazards from affecting surrounding communities in the event of inundation.	CONSISTENT. As described in Section 4.14, Public Services, construction and operation of all future oil and gas exploration and production activities that would be authorized under the proposed Project would be subject to the provisions of the Uniform Fire Code and local amendments; Titles 19, 22, and 27 of the California Safety Code Regulations; the Kern County Ordinance Code; and the National Fire Protection Association Standards. In addition, the proposed Project would comply with applicable development standards. Therefore, the proposed Project would be consistent with Implementation Measure A.
Implementation Measure B. Discretionary critical facilities within potential inundation areas shall be designed to mitigate or prevent effects of inundation.	CONSISTENT. The proposed Project does not include the design of discretionary critical facilities; however, all project components would be constructed according to County development standards, including measures that would mitigate impacts for components constructed in dam inundation areas. Therefore, the proposed Project would be consistent with Implementation Measure B.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
4.5 LANDSLIDES, SUBSIDENCE, SEICHE, AND LIQUEFACTION	
Policy 1. Determine the liquefaction potential at sites in areas of shallow groundwater (Map Code 2.3) prior to discretionary development and determine specific mitigation to be incorporated into the foundation design, as necessary, to prevent or reduce damage from liquefaction in an earthquake.	CONSISTENT. Section 4.6, Geology and Soils, of this EIR identifies areas of high groundwater and determines the liquefaction potential of those areas. Implementation of mitigation measures would reduce the potential of the project to result in significant damage from liquefaction in an earthquake Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. Route major lifeline installations around potential areas of liquefaction or otherwise protect them against significant damage from liquefaction in an earthquake.	CONSISTENT. The proposed Project does not meet the definition of a major lifeline installation; however, implementation of mitigation measures would reduce the potential of the project to result in significant damage from liquefaction in an earthquake. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Reduce potential for exposure of residential, commercial, and industrial development to hazards of landslide, land subsidence, liquefaction, and erosion.	CONSISTENT. Implementation of mitigation measures would reduce the potential of the project to expose residential, commercial, and industrial development to hazards of landslide, land subsidence, liquefaction, and erosion. Therefore, the proposed Project would be consistent with Policy 3.
Implementation Measure B. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation design to mitigate potential damage to buildings on sites with liquefaction potential.	CONSISTENT. Section 4.6, Geology and Soils, of this EIR describes the potential for liquefaction on sites in the Project Area. As described in Section 4.6, Geology and Soils, the applicant would be required to design all project buildings in accordance with applicable California Building Code seismic design standards and the Kern County Building Code. Implementation of mitigation measures would also ensure that impacts are reduced. Therefore, the proposed Project would be consistent with Implementation Measure B.
Implementation Measure C. Develop and maintain maps, at an appropriate scale, showing the location of all geologic hazards, including active faults, Alquist-Priolo Earthquake Fault Zones, 100-year flood hazard boundary, the extent of projected dam failure inundation and time arcs, depth of inundation, land subsidence, slope failure and earthquake-induced landslides, high groundwater, and liquefaction potential.	CONSISTENT. The EIR and its appendices include maps showing the location of geologic hazards that are present in the Project Area. Therefore, the proposed Project would be consistent with Implementation Measure C.
Implementation Measure D. Discretionary actions will be required to address and mitigate impacts from inundation, land subsidence, landslides, high groundwater areas, liquefaction and seismic events through the CEQA process.	CONSISTENT. Section 4.9, Hydrology and Water Quality, addresses inundation, and Section 4.6, Geology and Soils, addresses land subsidence, landslides, liquefaction and seismic events. Therefore, the proposed Project would be consistent with Implementation Measure D.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
4.6 WILDLAND AND URBAN FIRE	
Policy 1. Require discretionary projects to assess impacts on emergency services and facilities.	CONSISTENT. As part of this EIR, impacts on police and fire services and facilities from the proposed Project were evaluated and mitigation was suggested, as appropriate (refer to Section 4.14, Public Services). As described in Section 4.14, Public Services, the applicant would be required to address the project's demand for additional police and fire protection services through the payment of mitigation fees. Therefore, with implementation of mitigation measures, impacts to police and fire protection services would be reduced, and the proposed Project would be consistent with Policy 1.
Policy 3. The County will encourage the promotion of fire prevention methods to reduce service protection costs and costs to taxpayers.	CONSISTENT. As part of this EIR, impacts on fire services and facilities from the proposed Project were evaluated and mitigation was suggested, as appropriate (refer to Section 4.14, Public Services). As described in Section 4.14, Public Services, the applicant would be required to address the project's demand for additional police and fire protection services through the payment of mitigation fees. Therefore, with implementation of these measures, impacts to police and fire protection services would be reduced, and the proposed Project would be consistent with Policy 3.
Policy 5. Require that all roads in wildland fire areas are well marked, and that homes have addresses prominently displayed.	CONSISTENT. As described in Section 4.8, Hazards and Hazardous Materials, the majority of the Project Area falls within a Local Responsibility Area and is not classified within the State's Fire Hazard Severity Zones. Also, the proposed Project does not include the construction of homes. Mitigation measures would require the applicant to pay impact mitigation fees, which would ensure that impacts related to fire are reduced. Therefore, the proposed Project would be consistent with Policy 5.
Policy 6. All discretionary projects shall comply with the adopted Fire Code and the requirements of the Fire Department.	CONSISTENT. The proposed Project would comply with all laws and regulations, including the Fire Code and requirements of the Fire Department. See Impact 4.14.5 in Section 4.14, Public Services. Therefore, the proposed Project would be consistent with Policy 6.
Implementation Measure A. Require that all development comply with the requirements of the Kern County Fire Department or other appropriate agency regarding access, fire flows, and fire protection facilities.	CONSISTENT. The proposed Project would comply with all laws and regulations, including the requirements of the Kern County Fire Department and other appropriate agencies. See Impact 4.14.5 in Section 4.14, Public Services. Therefore, the proposed Project would be consistent with Implementation Measure A.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
4.8 CRITICAL FACILITIES AND HAZARDOUS BUILDINGS	
Policy 5. Incorporate planning for incidents affecting critical facilities into contingency plans for disaster response and recovery.	CONSISTENT. Although the proposed Project does not include the development of contingency plans for incidents that would specifically affect critical facilities (e.g., unforeseen natural disasters that would affect police stations, fire stations, hospitals, etc.), Mitigation measures require the applicant to pay mitigation fees for fire and police protection services. Ensuring that funds are available to reduce public services impacts related to the proposed Project would ensure that adequate levels of police and fire protection services are available in the event of an emergency affecting critical facilities. In addition, the proposed Project does not interfere with the County's ability to prepare contingency plans for disaster response and recovery that would affect county-wide critical facilities. Therefore, the proposed Project would be consistent with Policy 5.
Implementation Measure L. Require that plans and permits for installation of major lifeline components such as highways, utilities, and petroleum or chemical pipelines to incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of essential service or threat to health and safety.	CONSISTENT. The proposed Project does not meet the definition of a major lifeline installation; however, all components of the proposed Project would be constructed according to County development standards. Therefore, the proposed Project would be consistent with Implementation Measure L.
4.9 HAZARDOUS MATERIALS	
Policy 2. Innovative technologies to manage hazardous waste streams generated in Kern County will be encouraged.	CONSISTENT. As described in Section 4.8, Hazards and Hazardous Materials, implementation of mitigation measures would reduce impacts associated with the management of hazardous waste streams. Therefore, the proposed Project would be consistent with Policy 2.
Implementation Measure A. Facilities used to manufacture, store, and use of hazardous materials shall comply with the Uniform Fire Code, with requirements for siting or design to prevent on-site hazards from affecting surrounding communities in the event of inundation.	CONSISTENT. As described in Section 4.8, Hazards and Hazardous Materials, the proposed Project would comply with the Uniform Fire Code and other requirements for siting and design that would prevent on-site hazards from affecting surrounding communities. Also, see Section 4.9, Hydrology and Water Quality, for impacts related to inundation. Therefore, the proposed Project would be consistent with Implementation Measure A.
Implementation Measure B. The proposed siting or expansion of hazardous waste facilities will be in conformance with the adopted Kern County and Incorporated Cities Hazardous Waste Management Plan.	CONSISTENT. The proposed Project does not include the siting or expansion of hazardous waste facilities. The disposal of hazardous waste is described in Section 4.8, Hazards and Hazardous Materials. The applicant would comply with all applicable laws regarding the disposal of wastes and with mitigation measures

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	related to hazardous materials and waste. Therefore, the proposed Project would be consistent with Implementation Measure B.
4.10 ABANDONED OPEN SHAFTS AND WELLS	
Policy 2. The County should protect residents from the hazards associated with development in areas where wells have been drilled and abandoned for exploration and/or production of oil and natural gas.	CONSISTENT. The applicant would comply with all DOGGR rules related to well abandonment. Therefore the proposed Project would be consistent with Policy 2.
Implementation Measure B. Support the construction site review program of the Department of Oil, Gas, and Geothermal Resources that assures wells are precisely located, properly plugged and abandoned, and tested for leakage prior to development of the area.	CONSISTENT. The proposed Project provides a project-level CEQA review for wells drilled within the Project Area. In addition, the applicant would comply with all DOGGR requirements. Therefore the proposed Project would be consistent with Implementation Measure B.
CHAPTER 5. ENERGY ELEMENT	
General Goal: To assert Kern County's position as California's leading energy producer, to encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decisions and actions of other agencies as they affect energy development in Kern County.	CONSISTENT. The proposed Project would establish a new Oil and Gas Conformity Review Process. This process would streamline the oil and gas permit process and encourage safe and orderly energy development in Kern County. The County has actively engaged with other agencies during the preparation of this EIR to solicit feedback. Therefore, the proposed Project would be consistent with this General Goal.
Policy 3. The County shall continue to streamline energy permitting regulations.	CONSISTENT. The proposed Project would establish a new Oil and Gas Conformity Review process. This process would streamline the oil and gas permit process and encourage safe and orderly energy development in Kern County. Therefore, the proposed Project would be consistent with Policy 3.
Policy 5. The County shall work with other agencies to define regulatory responsibility concerning energy-related issues, and shall seek to eliminate, insofar as possible, duplicative regulations.	CONSISTENT. The proposed Project would establish a new Oil and Gas Conformity Review process. This process would streamline the oil and gas permit process and encourage safe and orderly energy development in Kern County. The County has actively engaged with other agencies during the preparation of this EIR to solicit feedback. Therefore, the proposed Project would be consistent with Policy 5.
Policy 7. The processing of all discretionary energy project proposals shall comply with California Environmental Quality Act (CEQA) Guidelines directing that the environmental effects of a project must be taken into account as part of project consideration.	CONSISTENT. The proposed Project would establish a new Oil and Gas Conformity Review process. This process would streamline the oil and gas permit process and encourage safe and orderly energy development in Kern County. This project-level EIR analyzes the impacts associated with the Future Development

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	Scenario and proposes mitigation measures to reduce environmental impacts. Therefore, the proposed Project complies with the requirements of CEQA and would be consistent with Policy 7.
Policy 8. The County should work closely with local, State, and federal agencies to assure that energy projects (both discretionary and ministerial) avoid or minimize direct impacts to fish, wildlife, and botanical resources, wherever practical.	CONSISTENT. The proposed Project will continue Kern County's ongoing commitment to consult with and cooperate with Federal, State, regional, and local agencies. Section 4.4, Biological Resources, analyzes impacts on species and habitat in the Project Area and proposes mitigation measures to reduce impacts. Therefore the proposed Project would be consistent with Policy 8.
Policy 9. The County should develop and implement measures which result in long-term compensation for wildlife habitat, which is unavoidably damaged by energy exploration and development activities.	CONSISTENT. Implementation of biological mitigation measures would reduce impacts on wildlife and habitat. In addition, several HCPs provide take for oil and gas development activities in the Project Area, which would result in long-term compensation for wildlife habitat. Therefore, the proposed Project would be consistent with Policy 9.
Policy 10. The County should require acoustical analysis for energy project proposals that might impact sensitive and highly-sensitive uses in accordance with the Noise Element of the General Plan.	CONSISTENT. As described in Section 4.12, Noise, noise levels associated with oil and gas production activities were measured by the applicant's consultant in 2014. The EIR analysis includes recommendations based on the findings of the applicant's noise study. The applicant shall implement mitigation measures to reduce noise emissions caused by oil and gas drilling and production activities on sensitive receptors. Therefore, the proposed Project would be consistent with Implementation Measure J.
5.3 PETROLEUM RESOURCES AND DEVELOPMENT	
5.3.1 URBAN/RESIDENTIAL DEVELOPMENT IN PETROLEUM RESOURCE AREAS	
Goal. To protect oil resource areas from unnecessary urban/suburban encroachment, and in instances of urban/suburban development in oil resource areas, to provide for the development of petroleum resources in a manner compatible with the surrounding environment to minimize adverse impacts and protect health and safety.	CONSISTENT. Under the Future Development Scenario, 90% of new wells would be drilled in Tier 1 areas. Tier 1 areas are defined as areas where oil and gas development is the primary land use. Future residential and commercial development projects are unlikely to be constructed in Tier 1 areas. In addition, County setbacks from sensitive uses, such as residences and schools, would continue to be enforced, as modified by mitigation measures outlined in this EIR. Mitigation measures would ensure that petroleum resources are developed in a manner compatible with the surrounding environment and would minimize adverse impacts. Therefore, the proposed Project would be consistent with this Goal.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 1. The County shall continue to assure adequate minimum setbacks between wells and from any existing structure, as permitted by the Kern County Zoning Ordinance.	CONSISTENT. County setbacks would continue to be enforced under the proposed Project, as modified by mitigation measures. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. The County shall assure adequate minimum setbacks between the construction of any structure and existing wells as permitted by the Kern County Fire Department and the State Division of Oil, Gas, and Geothermal Resources (DOGGR).	CONSISTENT. County setbacks would continue to be enforced under the proposed Project, as modified by mitigation measures. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. The County shall continue to provide the opportunity for establishing drilling islands prior to final maps subdivision approval of any proposal in a petroleum resource area or a waiver of surface entry rights by the applicable mineral rights holder.	CONSISTENT. The proposed Project does not affect the establishment of drilling islands during the subdivision approval process. Therefore, the proposed Project would be consistent with Policy 3.
Policy 4. All oilfield development shall take place in accordance with regulations administered by DOGGR.	CONSISTENT. DOGGR field rules would continue to be applicable under the Future Development Scenario, and all DOGGR regulations would continue to apply to future wells drilled in the Project Area. Therefore the proposed Project would be consistent with Policy 4.
Policy 5. New access roads to serve oilfield development should be sited to avoid traffic impacts.	CONSISTENT. MM 4.16-1 and MM 4.16-2 would reduce traffic impacts associated with the proposed Project. Therefore, the proposed Project would be consistent with Policy 5.
Policy 6. In areas where petroleum production occurs close to urban development, oil companies shall be encouraged to site equipment so as to avoid unnecessary disturbance to urban uses.	CONSISTENT. County setbacks would continue to be enforced under the proposed Project, as modified by mitigation measures. Therefore, the proposed Project would be consistent with Policy 6.
Policy 7. The County should work in cooperation with incorporated cities of Kern County to establish compatible standards for oil development within urban areas.	CONSISTENT. With the publication of the NOP, the County notified all local governments within the Project Area in order to solicit input. The intent of the proposed Project is to streamline the oil and gas conformity review process and to develop mitigation measures to ensure the safe development of oil and gas resources within the Project Area. Therefore, the proposed Project would be consistent with Policy 7.
Policy 8. Reduce the public's exposure to fires, explosions, blowouts, and other hazards associated with the accidental release of crude oil, natural gas, or hydrogen sulfide gas by ensuring that discretionary development projects have adequate separation from oil and natural gas production land uses.	CONSISTENT. County setbacks would continue to be enforced under the proposed Project, as modified by mitigation measures. In addition, 90% of future oil and gas development would occur within Tier 1 areas. Incompatible uses, such as residential development, are unlikely to be constructed in Tier 1 areas. Mitigation measures proposed throughout this EIR would reduce the public's

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	exposure to hazards associated with oil and gas development. Therefore, the proposed Project would be consistent with Policy 8.
Implementation Measure A. The Drilling Island District of the Kern County Zoning Ordinance shall establish and maintain development standards to permit petroleum exploration and development on single lots and in small areas.	CONSISTENT. Under the proposed Project, Drilling Island Districts would be classified as Tier 3. Future drilling on Tier 3 land would be allowed via ministerial permit. Therefore, the proposed Project would be consistent with Implementation Measure A.
Implementation Measure B. The Petroleum Extraction Combining District of the Kern County Zoning Ordinance shall establish and maintain specific standards for ensuring compatibility with urban and petroleum development for the Estate (E), Commercial Office (CO), Neighborhood Commercial (C-1), General Commercial (C-2), and Highway Commercial (CH) zoning designations. Oil and gas production shall be subject to provisions set forth in Chapter 19.98 of the Kern County Zoning Ordinance.	CONSISTENT. The proposed Project includes a revision of the Kern County Zoning Ordinance to establish standards that would ensure the compatibility of future oil and gas development with various land uses in Kern County. The proposed Project would amend Chapter 19.98, and other sections of the Zoning Ordinance, to include new development standards for oil and gas development in order to streamline the permit process and mitigate the impacts of development on the environment. Therefore, the proposed Project would be consistent with Implementation Measure B.
Implementation Measure C. The County shall monitor its regulations pertaining to petroleum exploration, production, and update such regulations as necessary.	CONSISTENT. The County monitored new legislation related to oil and gas production throughout the production of this EIR and the preparation of the proposed development standards contained herein. The proposed Project includes an update to the County Zoning Ordinance with respect to oil and gas development. Therefore, the proposed Project would be consistent with Implementation Measure C.
5.3.2 KERN COUNTY'S ECONOMIC DEPENDENCE ON THE OIL MARKETPLACE	
Goal. To reduce the County's susceptibility to fluctuations in the petroleum production levels, and to encourage diversification of the economy.	CONSISTENT. The proposed Project would streamline the oil and gas conformity review process and does not discourage other types of economic development in the County. Therefore, the proposed Project would be consistent with this goal.
Policy 3. The County shall encourage the conversion of existing petroleum-related facilities to other productive uses when they are no longer needed or productive.	CONSISTENT. The proposed Project would streamline the oil and gas conformity review process and does not discourage the conversion of existing petroleum-related facilities to other productive uses when they are no longer needed or productive. Therefore, the proposed Project would be consistent with Policy 3.
Policy 4. The County should encourage the development of renewable energy industries to diversify the energy economy in Kern County.	CONSISTENT. Kern County has permitted a number of solar and wind projects in the past 5 years. The proposed Project does not discourage future renewable energy development within the County. Therefore, the proposed Project does not conflict with and would be consistent with Policy 4.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
5.3.3 WASTE DISPOSAL IN PETROLEUM DEVELOPMENT	
Goal. To encourage the safe recycling, transportation, and disposal of wastes associated with petroleum production and processing, and to provide for the siting of disposal facilities in locations with proper access, while minimizing adverse impacts on the environment and on public health and safety.	CONSISTENT. The proposed Project does not include the siting or expansion of hazardous waste facilities. The disposal of hazardous waste is described in Section 4.8, Hazards and Hazardous Materials. The applicant would comply with all applicable laws regarding the disposal of wastes and would comply with all mitigation measures related to hazardous materials and waste. With implementation of mitigation measures, impacts related to the safe transportation of petroleum wastes would be reduced. Therefore, the proposed Project would be consistent with this goal.
Policy 1. The County shall continue to acknowledge the necessity to site nonhazardous oil field waste disposal sites near petroleum development to minimize transportation hazards and expenses, consistent with the provisions of the Kern County and Incorporated Cities Integrated Waste Management Plan.	CONSISTENT. The disposal of hazardous waste is described in Section 4.8, Hazards and Hazardous Materials. The applicant would comply with all applicable laws regarding the disposal of wastes and would comply with all mitigation measures related to hazardous materials and waste. With implementation of mitigation measures, impacts related to the safe transportation of petroleum wastes would be reduced. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. The County shall encourage recycling and new treatment methods for hazardous and nonhazardous oil field wastes.	CONSISTENT. Produced water is currently reused to the greatest extent practicable in oil field operations and would continue to be reused in the future per mitigation measures outline in Section 4.17, Utilities and Service Systems. In addition, some produced water in the Eastern Subarea is treated and sold for use in agricultural operations. This, too, would continue in the future. Approval of the proposed Project would not preclude the introduction of new improved treatment methods that may be developed in the future. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. The County shall work cooperatively with appropriate State and regional agencies to provide for the proper siting of oilfield waste disposal facilities.	CONSISTENT. The disposal of hazardous waste is described in Section 4.8, Hazards and Hazardous Materials. The applicant would comply with all applicable laws regarding the disposal of wastes and would comply with all mitigation measures related to hazardous materials and waste disposal. Therefore, the proposed Project would be consistent with Policy 3.
Implementation Measure A. The County shall work with the California Department of Oil, Gas, and Geothermal Resources to maintain an inventory of on-site and off-site disposal facilities in order to identify the scope of oil field waste disposal facilities in Kern County.	CONSISTENT. The disposal of hazardous waste is described in Section 4.8, Hazards and Hazardous Materials. The applicant would comply with all applicable laws regarding the disposal of wastes and would comply with all mitigation measures related to hazardous materials and waste disposal. Therefore, the

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	proposed Project would be consistent with Implementation Measure A.
Implementation Measure B. The County shall address oilfield hazardous waste issues through the Kern County and Incorporated Cities Hazardous Waste Management Plan.	CONSISTENT. See Section 4.8, Hazards and Hazardous Materials, for a discussion of the Kern County and Incorporated Cities Hazardous Waste Management Plan. The proposed Project would be consistent with this plan. Therefore, the proposed Project would be consistent with Implementation Measure B.
Implementation Measure C. The County shall continue to maintain provisions in the Zoning Ordinance to provide for oilfield waste disposal facilities.	CONSISTENT. The disposal of hazardous waste is described in Section 4.8, Hazards and Hazardous Materials. The proposed Project does not include the construction of new hazardous waste facilities and does not alter existing provisions in the Zoning Ordinance that provide for oilfield waste disposal facilities. Therefore, the proposed Project would be consistent with Implementation Measure C.
Implementation Measure D. The County shall continue to maintain provisions in the Zoning Ordinance for the development of oilfield waste recycling and treatment facilities.	CONSISTENT. Produced water is currently reused to the greatest extent practicable in oil field operations and would continue to be reused in the future per mitigation measures outlined in Section 4.17, Utilities and Service Systems. In addition, some produced water in the Eastern Subarea is treated and sold for use in agricultural operations. This, too, would continue in the future. If the proposed Project is approved, these mitigation measures would be adopted into the Zoning Ordinance as new development standards. Therefore, the proposed Project would be consistent with Implementation Measure D.
5.3.4 PETROLEUM TECHNOLOGY AND ADVANCEMENT	
Goal. To encourage the continuing advancement of energy technology and to respond to the needs it creates on the work force.	CONSISTENT. The proposed Project includes a Zoning Ordinance amendment and the implementation of a new, streamlined permitting process for oil and gas development. Approval of the proposed Project would not preclude the continuing advancement of energy technology that could be developed in the future. Therefore, the proposed Project would be consistent with this goal.
Policy 1. The County should actively encourage research and demonstration projects which would be positive for Kern County and not in conflict with adopted plans and programs.	CONSISTENT. The proposed Project is designed to encourage safe and orderly oil and gas development through the implementation of County-wide development standards and a new oil and gas permitting process. The proposed Project does not discourage research and demonstration projects that would be positive for Kern County. Therefore, the proposed Project would be consistent with Policy 1.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 2. The County should encourage the energy resource industry to invest and research the practical advancement of technology, and allow for periodic updates or training sessions for industry workers.	CONSISTENT. The proposed Project includes a Zoning Ordinance amendment and the implementation of new development standards for the oil and gas industry in Kern County. These new standards do not discourage industry research or training sessions for industry workers. Therefore, the proposed Project does not conflict and is consistent with Policy 2.
Implementation Measure A. The County should promote a continuing dialogue with petroleum industry representatives to monitor trends in technology and anticipate needed changes to development standards.	CONSISTENT. The proposed Project includes the implementation of a new, streamlined permitting process for oil and gas development. The new process is designed to provide for economically feasible and environmentally responsible growth of the industry in Kern County and the development of industry-wide best practices. Throughout the Project the County has maintained dialogue with the petroleum industry and anticipated changing needs for the next 20 years. The Project was proposed due to needed changes to development standards. Therefore, the proposed Project would be consistent with Implementation Measure A.
Implementation Measure B. The County shall review and revise, as necessary, the Zoning Ordinance to make provisions for experimental technologies.	CONSISTENT. The proposed Project includes a Zoning Ordinance amendment and the implementation of new development standards for the oil and gas industry in Kern County. These new standards do not discourage the proliferation of future experimental technologies. It is possible that over the time horizon of the Future Development Scenario, future technological advances could further reduce environmental impacts. Therefore, the proposed Project does not conflict and would be consistent with Implementation Measure B.
5.3.5 REUSE OF NONPRODUCTIVE PETROLEUM RESOURCE AREAS	
Goal. To ensure the proper abandonment of petroleum production operations, in accordance with DOGGR requirements, when petroleum resource areas are depleted or are no longer productive, to provide for conversion of these areas to other land uses.	CONSISTENT. The proposed Project would streamline the oil and gas conformity review process and does not discourage the conversion of existing petroleum-related facilities to other productive uses when they are no longer needed or productive. Wells would be abandoned according to DOGGR requirements. Therefore, the project would be consistent with this Goal.
Policy 1. The County shall promote safe well abandonment in accordance with DOGGR regulations through discretionary applications.	CONSISTENT. The applicant would comply with DOGGR regulations related to well abandonment. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. The County shall work with the DOGGR to ensure the removal of all surface equipment from abandoned petroleum development sites.	CONSISTENT. The applicant would comply with DOGGR regulations related to the removal of surface equipment from abandoned petroleum development sites. Therefore, the proposed Project would be consistent with Policy 2.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 3. The County shall promote and encourage the safe reuse of former petroleum production lands by developments compatible with surrounding land use designations. The guidelines for site reestablishment include the following: a. Removal of oil-laden soil b. Shaping of disturbed lands back to natural grade and the elimination of pad areas, settling ponds, and similar disturbances. c. Stabilization of sites by seedlings and plantings as appropriate. d. Other measures as may be stipulated by the State Division of Oil, Gas and Geothermal Resources. e. Proper identification and abandonment of all oil and natural gas wells.	CONSISTENT. The applicant would comply with DOGGR regulations related to the abandonment of petroleum development sites. In addition, the applicant would implement mitigation measures, which would reduce impacts associated with contaminated soil. Therefore, the proposed Project would be consistent with Policy 3.
Implementation Measure A. Upon cessation of drilling and/or producing operations in drilling islands, the County will consider initiating zone changes for such drilling islands to zoning districts compatible with surrounding land uses, provided the owner/operator demonstrates proper abandonment and cleanup in accordance with State Division of Oil, Gas and Geothermal Resources regulations.	CONSISTENT. The proposed Project does not alter the zoning designation of any land in the Project Area. However, approval of the project would not prevent the County from initiating zoning changes for inactive drilling islands. Therefore, the proposed Project would be consistent with Implementation Measure A.
5.3.6 ENVIRONMENTAL IMPACTS OF PETROLEUM DEVELOPMENT	
Goal 1. To clearly identify and mitigate any adverse impacts on the environment from new or continued petroleum development by establishing clear and workable methods for industry compliance.	CONSISTENT. The proposed Project would streamline the review process for future oil and gas projects in Kern County, and would enact new oil and gas development standards to provide greater protection for the environment than exists under current County standards. Therefore, the proposed Project would be consistent with Goal 1.
Policy 1. The County should pursue programs to address oil production as it relates to State and federal threatened and endangered species protection laws.	CONSISTENT. As described in Section 4.4, Biological Resources, the applicant would be required to comply with State and federal threatened and endangered species protection laws during future oil production operations. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. The County shall work with affected State and federal agencies and special interest groups to establish consistent policies for environmental protection activities related to petroleum production and oilfield waste disposal.	CONSISTENT. The County solicited the feedback of and received input from State and federal agencies and special interest groups during the preparation of this EIR. Consistent with this policy, this EIR includes mitigation measures to reduce the impacts associated with future oil production operations and oilfield waste disposal. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. The County should attempt to ensure that the petroleum industry does not bear a burden of environmental regulation in excess of its contribution to the	CONSISTENT. The proposed Project contains development standards for oil and gas projects that would mitigate only what is impacted by the applicant as

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
problems.	described in the Future Development Scenario. Therefore, the proposed Project would be consistent with Policy 3.
Policy 4. The County should encourage the use of clean-burning technologies in petroleum production.	CONSISTENT. The proposed Project includes development standards that would reduce impacts of oil and gas production. Development standards do not discourage the use of clean-burning technologies in oil and gas production; therefore, the proposed Project would be consistent with Policy 4.
Policy 5. The County should encourage air pollution control policies which apply the burden equally to local and upwind sources and to all classes of air polluters.	CONSISTENT. The proposed Project includes development standards that would reduce the air quality impacts of oil and gas production. Refer to Section 4.3, Air Quality. Therefore, the proposed Project would be consistent with Policy 5.
Policy 6. The County should work closely with State and federal agencies to avoid or minimize direct impacts to threatened and endangered species.	CONSISTENT. The County solicited the feedback of and received input from both the USFWS and CDFW during the preparation of this EIR. All drilling permits within Kern County jurisdiction would be subject to biological species mitigation outlined in Section 4.4, Biological Resources, of this EIR. Therefore, the proposed Project would be consistent with Policy 6.
Implementation Measure B. The County will continue to participate in programs, such as the proposed Kern County Valley Floor Habitat Conservation Plan program, which are intended to mitigate impacts of development on threatened or endangered species, including seeking State and federal funding for endangered species protection programs.	CONSISTENT. The potential for the proposed Project to affect sensitive biological resources, including species protected by the Valley Floor HCP, is described in Section 4.4, Biological Resources of this EIR. The implementation of mitigation measures described in this section will minimize the impacts of future oil and gas development to sensitive biological resources in accordance with the Kern County Valley Floor HCP and other applicable HCPs. Additionally, the proposed Project would not hinder the County's ability to seek State and federal funding for endangered species protection programs. Therefore, the proposed Project would be consistent with Implementation Measure B.
Implementation Measure D. Energy resource industries should participate in the Kern County Valley Floor Habitat Conservation Plan to mitigate impacts to threatened and endangered species.	CONSISTENT. All oil and gas drilling permits within Kern County jurisdiction would be subject to biological species mitigation outlined in Section 4.4, Biological Resources, of this EIR. The implementation of mitigation measures described in this section will minimize the impacts of future oil and gas development to sensitive biological resources in accordance with the Kern County Valley Floor HCP and other applicable HCPs. Therefore, the proposed Project would be consistent with Implementation Measure D.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
5.3.7 PROCESSING AND TRANSPORTATION OF PETROLEUM PRODUCTS	
Goal. To ensure the siting of refining facilities and pipelines in locations to provide maximum health, safety, and environmental protection; and to encourage the necessary processing and transportation facilities for Kern County's petroleum production.	CONSISTENT. The proposed Project does not include the construction of new refining facilities, and would not discourage the building/modification of necessary processing and transportation facilities for Kern County's petroleum production. Additionally, development standards established by the proposed Project would maximize health, safety, and environmental protection during the installation of collection pipelines for future oil and gas production operations. Therefore, the proposed Project would be consistent with this goal.
Policy 1. New refineries shall be sited in accordance with provisions of the Kern County Zoning Ordinance.	CONSISTENT. The proposed Project does not include the construction of new refineries. Therefore, the project would be consistent with Policy 1.
Policy 2. The County shall review proposed pipelines and their alignments for their conformity with the Land Use, Open Space, and Conservation Element of this General Plan.	CONSISTENT. The proposed Project does not include the construction of new distribution pipelines, which are intended to pipe crude oil to offsite refineries. The Project includes onsite collection pipelines to transport oil, water, and steam. Such pipelines, as well as other components, would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. The County shall encourage the development of new pipelines with alignments that provide for environmental and the public's health and safety protection.	CONSISTENT. Collection pipelines for future oil and gas operations would be installed in accordance with the proposed Project's new development standards, which are designed to maximize public health and safety and environmental protection. Therefore, the proposed Project would be consistent with Policy 3.
Implementation Measure A. The County shall review and revise, as necessary, the Zoning Ordinance to provide for suitable sites for refinery construction and expansion.	CONSISTENT. The Project does not include the construction or expansion of refineries. The Project does not conflict with the County's ability to review and revise the Zoning Ordinance with respect to refinery construction and expansion. Therefore the proposed Project would be consistent with Implementation Measure A.
Implementation Measure B. The County shall review and revise, as necessary, the Emergency Response Plan, to provide consistent and proper procedures to address refinery accidents and pipeline ruptures.	CONSISTENT. The proposed Project would not inhibit the County's ability to review and revise the Emergency Response Plan, as necessary, to provide consistent and proper procedures to address refinery accidents and pipeline ruptures. Therefore, the proposed Project would be consistent with Implementation Measure B.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
5.4 ELECTRICITY RESOURCES AND GENERATION	
5.4.1 COGENERATION	
Goal. To encourage the safe and orderly development of cogeneration facilities and increased utilization of cogeneration in oil production and other industries as a cleaner and more efficient means of generating both steam and electricity.	CONSISTENT. The proposed Project does not include the construction of new cogeneration facilities. Cogeneration facilities that are currently used in oil extraction operations would continue to be used in the future. Therefore, the project would be consistent with this goal.
Policy 1. The County shall allow the continued development of cogeneration facilities in primary oil resource areas and industrial areas.	CONSISTENT. Although the construction of new cogeneration facilities are not included in the list of activities covered under this EIR, this Project does not prevent the development of cogeneration facilities under a separate EIR process. Therefore, the project does not conflict with Policy 1.
Policy 3. The County should encourage the construction of (an) interstate natural gas pipeline(s) to provide supplies of natural gas for cogeneration and thermally enhanced oil recovery in Kern County, provided that proposals are consistent with the goals and policies of the Land Use, Conservation, and Open Space Element of the Kern County General Plan.	CONSISTENT. Although the construction of new cogeneration facilities are not included in the list of activities covered under this EIR, this project does not prevent the development of cogeneration facilities under a separate EIR process and does not prevent the County from encouraging the construction of an interstate natural gas pipeline. Therefore, the project would be consistent with Policy 3.
Implementation Measure A. The County shall continue to maintain provisions in the Zoning Ordinance to provide for the proper siting of cogeneration facilities in suitable areas.	CONSISTENT. No changes to Zoning Ordinance requirements related to cogeneration facilities would occur under this Project. Therefore, the proposed Project would be consistent with Implementation Measure A.
5.4.7 TRANSMISSION LINES	
Goal. To encourage the safe and orderly development of transmission lines to access Kern County's electrical resources along routes, which minimize potential adverse environmental effects.	CONSISTENT. The proposed Project does not include the construction of high voltage transmission lines. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the Project would be consistent with this goal.
Policy 1. The County should encourage the development and upgrading of transmission lines and associated facilities (e.g., substations) as needed to serve Kern County's residents and access the County's generating resources, insofar as transmission lines do not create significant environmental or public health and safety hazards.	CONSISTENT. The proposed Project does not include the construction of high voltage transmission lines or substations. Transmission line development and upgrades to serve Kern County's residents is not discouraged or otherwise hindered by the proposed Project. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the Project would be consistent with the Policy 1.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 2. The County shall review all proposed transmission lines and their alignments for conformity with the Land Use, Conservation, and Open Space Element of this General Plan.	CONSISTENT. The proposed Project includes a zoning amendment that addresses oil and gas production in the County and establishes new development standards. Transmission lines, their alignment, and their process for review will remain unaffected by the implementation of this Project. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the proposed Project does not conflict with Policy 2.
Policy 3. In reviewing proposals for new transmission lines and/or capacity, the County should assert a preference for upgrade of existing lines and use of existing corridors where feasible.	CONSISTENT. The proposed development standards apply to activities described in the Future Development Scenario. Transmission lines, their alignment, and their process for review will remain unaffected by the implementation of this Project. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Section Policy 3.
Policy 4. The County should work with other agencies in establishing routes for proposed transmission lines.	CONSISTENT. The proposed development standards apply to activities described in the Future Development Scenario. Transmission lines, their alignment, and their process for review would remain unaffected by the implementation of this Project. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Policy 4.
Policy 5. The County should discourage the siting of above-ground transmission lines in visually sensitive areas.	CONSISTENT. The proposed development standards apply to activities described in the Future Development Scenario. Transmission lines, their alignment, and their process for review would remain unaffected by the implementation of this Project. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Policy 5.
Policy 6. The County should encourage new transmission lines to be sited/configured to avoid or minimize collision and electrocution hazards to raptors.	CONSISTENT. The proposed development standards apply to activities described the Future Development Scenario. Transmission lines, their alignment, and their process for review would remain unaffected by the implementation of this Project. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Policy 6.
Implementation Measure B. The County shall continue to maintain provisions in the Zoning Ordinance and update as necessary to provide for transmission line development.	CONSISTENT. The proposed Project contains an amendment to the County Zoning Ordinance. Proposed changes to the Zoning Ordinance would not affect provisions related to transmission line development. The current provisions for

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	transmission lines will remain. Distribution lines associated with the Project would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Implementation Measure B.
METROPOLITAN BAKERSFIELD GENERAL PLAN	
CHAPTER 2. LAND USE, OPEN SPACE, AND CONSERVATION ELEMENT	
1.3 PHYSICAL AND ENVIRONMENTAL CONSTRAINTS	
Goal 1. Accommodate new development which captures the economic demands generated by the marketplace and establishes Bakersfield's role as the capital of the southern San Joaquin Valley.	CONSISTENT. The proposed Zoning Ordinance amendment and related development standards would streamline the regulatory process for oil and gas production within the County. This new process would encourage economic development that creates high quality jobs and promotes capital investment in Kern County. Bakersfield's role as capital of the southern San Joaquin Valley is not precluded, discouraged, or jeopardized by the proposed Project; therefore, the Project would be consistent with Goal 1.
Goal 2. Accommodate new development which provides a full mix of uses to support its population.	CONSISTENT. The proposed Zoning Ordinance amendment and new development standards would not preclude or otherwise deter the development of other uses within the Metropolitan Bakersfield Area. Therefore, the proposed Project would be consistent with Goal 2.
Goal 3. Accommodate new development which is compatible with and complements existing land uses.	CONSISTENT. The proposed Project's new development standards would reduce adverse impacts associated with oil and gas production. 90% of new development would occur in Tier 1 areas, by definition, are areas in which oil and gas development is the primary land use. New development standards described throughout this EIR would ensure that oil and gas development in all Tiers is compatible with existing land uses. Therefore, the proposed Project would be consistent with Goal 3.
Goal 4. Accommodate new development which channels land uses in a phased, orderly manner and is coordinated with the provision of infrastructure and public improvements.	CONSISTENT. Currently, drilling in Kern County in concentrated in Tier 1 areas while more spread out, less industrial-scale drilling takes place throughout the County on Tiers 2, 3, 4, and 5 land. The historic patterns of oil and gas development would continue under the proposed Project; however, the proposed Project would implement a more streamlined permitting process to ensure that oil and gas development occurs in an orderly and coordinated manner. Therefore, the proposed Project would be consistent with Goal 4.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 31. Allow for a variety of industrial uses, including land-extensive mineral extraction and processing, heavy manufacturing, light manufacturing, warehousing and distribution, transportation-related, and research and development uses (I-1).	CONSISTENT. The proposed Project would not change existing zoning designations that allow for oil and gas development. Zones where land-extensive mineral extraction and processing occurs would continue in the future (Tier 1 areas). In addition, oil and gas development would continue in Tiers 2, 3, 4, and 5, and development in all Tiers would be required to conform to proposed development standards. Therefore, the proposed Project would be consistent with Goal 31.
Policy 32. Protect existing industrial designations from incompatible land use intrusions (I-1, I-6, I-8).	CONSISTENT. Changes to existing industrial designations are not included in the proposed Project. 90% of future oil and gas development is projected to occur in Tier 1 areas. Tier 1 areas are areas in which oil and gas development is the dominant land use. Incompatible uses, such as residential development, are unlikely to be constructed in these areas. Therefore, the proposed Project would be consistent with Policy 32.
Policy 33. Encourage the efficient use of existing industrial land uses through consolidation of building and storage facilities (I-1, I-6, I-8).	CONSISTENT. As described in the Future Development Scenario, central storage facilities serve multiple wells, particularly in Tier 1 areas where large storage facilities serve densely developed well fields. Consolidated central storage facilities would continue to be used under the Future Development Scenario. Expansions to such facilities would be constructed according to proposed development standards. Therefore, the proposed Project would be consistent with Policy 33.
Policy 34. Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors (I-1).	CONSISTENT. It is not feasible to require that new oil and gas wells be clustered along transportation corridors because wells are sited according to the location of subsurface resources. However, drilling in Kern County is generally concentrated in Tier 1 areas. The historic patterns of oil and gas development would continue under the proposed Project, and 90% of future oil and gas development is projected to occur in Tier 1 areas. Therefore, future oil and gas development would be largely clustered near existing development. Therefore, the proposed Project would be consistent with Policy 34.
Policy 35. Encourage upgrading of visual character of heavy manufacturing industrial areas through the use of landscaping or screening-of visually unattractive buildings and storage areas (I-1, I-6, I-8).	CONSISTENT. Per Section 4.1, Aesthetics, mitigation measures would reduce impacts of visually unattractive components near sensitive receptors. Therefore, the proposed Project would be consistent with Policy 35.
Policy 36. Require that industrial uses provide design features, such as screen walls, landscaping and height, setback and lighting restrictions between the boundaries of	CONSISTENT. Per Section 4.1, Aesthetics, mitigation measures would reduce impacts of visually unattractive components near sensitive receptors. In addition,

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound and vibration (I-1, I-6, I-8).	per Section 4.12, Noise, mitigation measures would reduce impacts of sound and vibration. Therefore, the proposed Project would be consistent with Policy 36.
Policy 37. Street frontages along all new industrial development shall be landscaped (I-1, I-6, I-8).	CONSISTENT. Per Section 4.1, Aesthetics, mitigation measures would reduce impacts of visually unattractive components near sensitive receptors. Therefore, the proposed Project would be consistent with Policy 37.
Policy 38. Minimize impacts of industrial traffic on adjacent residential parcels through the use of site plan review and improvement standards (I-1, I-6).	CONSISTENT. Per Section 4.16, Transportation and Traffic, mitigation measures would reduce impacts of project-related traffic in the Project Area. Therefore, the proposed Project would be consistent with Policy 38.
Policy 76. Provide for a mix of land uses which meets the diverse needs of residents; offers a variety of employment opportunities; capitalizes, enhances, and expands upon existing physical and economic assets; and allows for the capture of regional growth (I-1).	CONSISTENT. The proposed Zoning Ordinance amendment and new development standards would not preclude or otherwise deter the development of a variety of employment opportunities in the Project Area. The proposed amendment would streamline the permitting process for oil and gas development, thus capitalizing on the County's mineral resources while ensuring that new development standards reduce the industry's environmental impact. Therefore, the proposed Project would be consistent with Policy 76.
Policy 77. Allow for the continuance of agricultural uses in areas designated for future urban growth (I-1).	CONSISTENT. As described in Section 4.13, Population and Housing, the proposed Project would result in nominal population growth in the Project Area; however, such growth would not prevent the continuance of agricultural uses. Impacts of oil and gas development on Tier 2 land would be mitigated by implementation of mitigation measures. Therefore, the proposed Project would be consistent with Policy 77.
Policy 82. Preserve existing significant sound residential neighborhoods, commercial districts, and industrial areas (I-1, I-6, I-8).	CONSISTENT. The proposed Project would not alter currently established land use designations such as residential, commercial, or other land uses. The new development standards are intended to provide greater environmental protection with respect to oil and gas development in the Project Area. Additionally, oil and gas development in residential and commercial areas (Tier 4) would still require the acquisition of a CUP prior to drilling new wells. In addition, the Kern County Zoning Ordinance contains setback requirements with respect to oil and gas development near schools, residences, and other sensitive land uses. These setback requirements would continue to be enforced under the Future Development Scenario as amended by proposed development standards. The majority of new development (90%) would be constructed within Tier 1 areas, which are defined as areas where oil and gas development is the primary land use. Therefore, the

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	proposed Project would be consistent with Policy 82.
CHAPTER 3. CIRCULATION ELEMENT	
STREETS	
Goal 3. Minimize the impact of truck traffic on circulation, and on noise sensitive land uses.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, under MM 4.16-1, developers would be required to prepare a Construction Traffic Control Plan. Implementation of this plan would reduce impacts of project-related truck traffic on circulation and noise sensitive land uses. Therefore, the proposed Project would be consistent with Goal 3.
Policy 6. Design and locate site access driveways to minimize traffic disruption where possible considering items such as topography, past parcelization and other factors (I-7).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. For example, mitigation measures would require a Construction Traffic Control Plan which would detail how the applicant would maintain access to adjacent properties and outline any temporary lane closures during development, among other requirements. Therefore, the proposed Project would be consistent with Policy 6.
Policy 7. Minimize direct and uncontrolled property access from arterials (I-8).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to prepare a Construction Traffic Control Plan. Implementation of this plan would minimize direct and uncontrolled property access from arterials. Therefore, the proposed Project would be consistent with Policy 7.
Policy 14. Provide continuous truck routes within incorporated areas that provide access to designated industrial areas (I-13).	CONSISTENT. See Section 4.16, Transportation and Traffic, regarding truck routes in the Project Area. Mitigation measures would reduce project-related traffic impacts in the Project Area. Therefore, the proposed Project would be consistent with Policy 14.
Policy 15. Prohibit trucks from non-truck routes within incorporated areas except as necessary for direct property access for pick-up and delivery (I-13).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. For example, developers would be required to prepare a Construction Traffic Control Plan. Therefore, the proposed Project would be consistent with Policy 15.
Policy 16. Require that truck access to commercial and industrial properties be designed to minimize impacts on adjacent residential parcels (I-14).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. For example, developers would be required to prepare a Construction Traffic Control Plan and pay traffic mitigation fees. These measures would minimize impacts on adjacent

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	residential parcels. Therefore, the proposed Project would be consistent with Policy 16.
Policy 36. Prevent streets and intersections from degrading below Level of Service "C" where possible due to physical constraints (as defined in a Level of Service Standard) or when the existing Level of Service is below "C" prevent where possible further degradation due to new development or expansion of existing development with a three part mitigation program: adjacent right-of-way dedication, access improvements and/or an area wide impact fee. The area-wide impact fee would be used where the physical changes for mitigation are not possible due to existing development and/or the mitigation measure is part of a larger project, such as freeways, which will be built at a later date (I-28, I-29).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. For example, developers would be required to prepare a Construction Traffic Control Plan and pay traffic mitigation fees. These measures would reduce impacts on Level of Service and road degradation. Therefore, the proposed Project would be consistent with Policy 36.
Policy 37. Require new development and expansion of existing development to pay for necessary access improvements, such as street extensions, widenings, turn lanes, signals, etc., as identified in the transportation impact report as may be required for a project (I-30, I-31, I-32).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would require that the applicant pay traffic mitigation fees. Therefore, the proposed Project would be consistent with Policy 37.
Implementation Measure 7. Review all site plans for compliance with adopted drive approach design standards.	CONSISTENT. MM 4.10-1 details the County's new Oil and Gas Conformity Review Process, which would ensure that all well permit applications are reviewed for compliance with applicable standards. Therefore, the proposed Project would be consistent with Implementation Measure 7.
Implementation Measure 8. Review site plans, rezonings, and subdivision requests, with respect to access from arterials. Consider conditions of approval to minimize uncontrolled property access.	CONSISTENT. The proposed Project does not include rezonings or subdivision requests. MM 4.10-1 details the County's new Oil and Gas Conformity Review Process, which would ensure that all well permit applications are reviewed for compliance with applicable standards. Therefore, the proposed Project would be consistent with Implementation Measure 8.
Implementation Measure 14. Amend the city and county zoning ordinances as needed to regulate truck access on properties adjacent to residential areas.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. If the proposed Project is approved, mitigation measures described herein would be adopted into the County Zoning Ordinance. Therefore, the proposed Project would be consistent with Implementation Measure 14.
Implementation Measure 25. Maintain records of existing traffic volume and cumulative projections of traffic from new development to schedule projects for the Capital Improvement Program.	CONSISTENT. Existing traffic volume and cumulative traffic projections are detailed in Section 4.16, Transportation and Traffic. Per mitigation measures, developers would be required to pay traffic mitigation fees. Therefore, the

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	proposed Project would be consistent with Implementation Measure 25.
Implementation Measure 26. Establish guidelines for project design review based on traffic engineering standards (e.g., driveway design, on-site circulation) and the Level of Service Ordinance.	CONSISTENT. MM 4.10-1 details the County's new Oil and Gas Conformity Review Process, which would ensure that all well permit applications are reviewed for compliance with applicable standards. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. If the proposed Project is approved, mitigation measures described herein would be adopted into the County Zoning Ordinance. Therefore, the proposed Project would be consistent with Implementation Measure 26.
Implementation Measure 28. Periodic review and if needed, revision of adopted ordinances that includes a Level of Service standard for the city and county to include a definition of Level of Service "C", procedures for how it is measured, and mitigation measures to keep from exceeding the standard.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. If the proposed Project is approved, mitigation measures described herein would be adopted into the County Zoning Ordinance. Therefore, the proposed Project would be consistent with Implementation Measure 14.
Implementation Measure 29. Periodic review and, if needed, revision of adopted guidelines for preparation of transportation impact reports, definition of undesirable impacts, and identification of mitigation procedures.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. If the proposed Project is approved, mitigation measures described herein would be adopted into the County Zoning Ordinance. Therefore, the proposed Project would be consistent with Implementation Measure 29.
Implementation Measure 33. Periodic review and, if needed, revision of adopted Transportation Impact Fee Ordinance for the city and county, which specifies the area wide impact fee schedule and how the fees will be used.	CONSISTENT. As described in Section 4.16, Transportation and Traffic, per mitigation measures, the applicant pay traffic mitigation fees. Therefore, the proposed Project would be consistent with Implementation Measure 33.
CHAPTER 3. CIRCULATION ELEMENT	
PARKING	
Goal 2. Satisfy parking requirements in all new developments (residential, commercial, industrial, etc.) through off-street facilities.	CONSISTENT. No new standards related to parking are being developed as part of this EIR. Project components requiring parking would conform to existing parking standards outlined in the County Zoning Ordinance. Therefore, the proposed Project is consistent with Goal 2.
Policy 3. Ensure that adequate on-site parking supply and parking lot circulation is provided on all site plans in accordance with the adopted parking standards (1-3).	CONSISTENT. No new standards related to parking are being developed as part of this EIR. Project components requiring parking would conform to existing parking standards outlined in the County Zoning Ordinance. Therefore, the proposed Project is consistent with Policy 3.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 4. Discourage the intrusion of non-neighborhood parking in residential areas (1-4).	CONSISTENT. As described in Section 4.16, Transportation and Traffic, developers would be required to prepare a Construction Traffic Control Plan. Implementation of this plan would minimize the intrusion of non-neighborhood parking in residential areas. Therefore, the proposed Project would be consistent with Policy 4.
Implementation Measure 3. Review all site plans for conformance with adopted parking standards.	CONSISTENT. MM 4.10-1 details the County's new Oil and Gas Conformity Review Process, which would ensure that all well permit applications are reviewed for compliance with applicable standards. As described in Section 4.16, Transportation and Traffic, mitigation measures would reduce traffic impacts in the Project Area. If the proposed Project is approved, mitigation measures described herein would be adopted into the County Zoning Ordinance. Therefore, the proposed Project would be consistent with Implementation Measure 3.
CHAPTER 5. CONSERVATION ELEMENT	
A. BIOLOGICAL RESOURCES	
Goal 1. Conserve and enhance Bakersfield's biological resources in a manner which facilitates orderly development and reflects the sensitivities and constraints of these resources.	CONSISTENT. This EIR serves to comply with this goal. For reasons described in Section 4.4, Biological Resources, the proposed Project would aid in the conservation and enhancement of Bakersfield's sensitive biological resources. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. To conserve and enhance habitat areas for designated "sensitive" animal and plant species.	CONSISTENT. As described in Section 4.4, Biological Resources, the proposed Project would enhance or restore existing habitat or establish a new conservation easement in the Project Area per mitigation measures. These measures are designed to reduce or offset impacts related to oil and gas exploration and extraction operations. Therefore, the proposed Project would be consistent with Goal 2.
Policy 1. Direct development away from "sensitive biological resource" areas, unless effective mitigation measures can be implemented (1·1, f-3, 1-4).	CONSISTENT. The proposed Project would enact new oil and gas development standards, which would provide greater protection for sensitive biological resource areas than exists under current County standards. Upon approval of the proposed Project, sensitive biological resources would be avoided or impacts would be reduced through the use of mitigation, as described in Section 4.4, Biological Resources Therefore, the proposed Project would be consistent with Policy 1.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 2. Preserve areas of riparian vegetation and wildlife habitat within floodways along rivers and streams, in accordance with the Kern River Plan Element and channel maintenance programs designed to maintain flood flow discharge capacity (1-4).	CONSISTENT. As described in Section 4.4, Biological Resources, the Applicant would implement mitigation measures, which would require pre-disturbance surveys to identify and map sensitive natural communities and riparian habitat that could occur within the Project Area. In addition, the Applicant would be required to avoid sensitive natural areas or obtain the necessary state or federal permits/approvals for disturbance in these areas. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Discourage, where appropriate, the use of off-road vehicles to protect designated sensitive biological and natural resources (l-2).	CONSISTENT. As described in Section 4.4, Biological Resources, off-road traffic would be prohibited outside of designated access routes. Therefore, the proposed Project would be consistent with Policy 3.
Policy 4. Determine the feasibility of enhancing sensitive biological habitat and establishing additional wildlife habitat in the Project Boundary with State and/or Federal assistance (1-3).	CONSISTENT. The proposed development standards would provide greater protection for sensitive biological habitat than exists under current County standards. Additionally, Section 4.4, Biological Resources, describes mitigation strategies that would enhance or restore habitat or establish a new conservation easement for the purpose of wildlife habitat preservation. Therefore, the proposed Project would be consistent with Policy 4.
Policy 5. Determine the locations and extent of suitable habitat areas required for the effective conservation management of designated "sensitive" plant and animal species (1-3).	CONSISTENT. As described in Section 4.4, Biological Resources, preconstruction surveys would be conducted to determine the locations and extent of suitable habitat areas required for effective conservation management of designated sensitive plant and animal species in the Project Area. Therefore, the proposed Project would be consistent with Policy 5.
Implementation Measure 3. Preserve habitat and avoid "take" of protected species as required in the Metropolitan Bakersfield Habitat Conservation Plan.	CONSISTENT. The potential for the proposed Project to affect sensitive biological resources, including species protected by the Metropolitan Bakersfield HCP, is described in Section 4.4, Biological Resources. The implementation of mitigation measures described in Section 4.4 would minimize the impacts of future oil and gas development to sensitive biological resources in accordance with the Metropolitan Bakersfield HCP and other HCPs. Therefore, the proposed Project would be consistent Implementation Measure 3.
B. MINERAL RESOURCES	
Goal 1. Protect areas of significant resource potential for future use.	CONSISTENT. Proposed development standards would protect areas with significant resource potential for future use. Therefore, the proposed Project would be consistent with Goal 1.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Goal 2. Document areas of current mineral and energy resource extraction, as a basis for land use and conservation policies and programs.	CONSISTENT. Chapter 3 of this EIR documents areas of highly concentrated resource extraction activity (Tier 1), areas where resource extraction occurs in tandem with agricultural activities (Tier 2), as well as areas where resource extraction occurs on a lesser scale (Tiers 3, 4, and 5). Therefore, the proposed Project would be consistent with Goal 2.
Goal 3. Avoid conflicts between the productive use of mineral and energy resource lands and urban growth.	CONSISTENT. Adherence to proposed development standards would reduce conflicts between the productive use of mineral and energy resource lands and urban growth. Therefore, the proposed Project would be consistent with Goal 3.
Goal 4. Protect land, water, air quality and visual resources from environmental damage resulting from mineral and energy resource development.	CONSISTENT. The proposed Project would enact new oil and gas development standards, which would streamline the permitting process and provide greater protection for environmental resources (land, water, air quality, and visual resources) than exists under current County standards. Therefore, the proposed Project would be consistent with Goal 4.
Policy 4. Land use decisions shall recognize the importance of identified mineral resources and need for conservation of resources identified by the State Mining and Geology Board (I-2).	CONSISTENT. The development standards proposed as part of this Project are intended to both streamline the permit review process for oil and gas development while at the same time providing a higher level of environmental protection than exists under the existing Zoning Ordinance. Therefore, the proposed Project would be consistent with Policy 4.
Policy 7. Promote development of compatible uses adjacent to mineral extraction areas (I-2).	CONSISTENT. The proposed Project promotes development of compatible uses adjacent to mineral extraction areas through the implementation of new development standards. Implementation of the proposed standards would reduce the impacts of oil and gas development on surrounding land uses. Therefore, the proposed Project would be consistent with Policy 7.
Policy 10. Implement, as appropriate, the California Environmental Quality Act to minimize land use conflicts and reduce environmental impacts of all proposed resource extraction operations (I-2).	CONSISTENT. Proposed development standards are intended to minimize land use conflicts and reduce environmental impacts of future oil and gas exploration and production activities. MM 4.10-1 would implement a new Oil and Gas Conformity Review Process, which includes a system of surface owner sign off and notification in order to reduce land use conflicts. Therefore, the proposed Project would be consistent with Policy 10.
Policy 11. Prohibit incompatible development in areas which have a significant potential for harm to public health, safety and welfare due to mineral and petroleum extraction and processing (I-2).	CONSISTENT. Implementation of proposed development standards would reduce environmental impacts by ensuring that current County regulations reflect the County's interest in protecting the health, safety, and general welfare of residents

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	and visitors. Therefore, the proposed Project would be consistent with Policy 11.
Policy 12. Design resource extraction operations subject to discretionary permits to maintain the integrity of areas of "high environmental quality" and unique scenic value (I-2).	CONSISTENT. Implementation of proposed development standards would provide greater protection for the environment than exists under current County standards. Therefore, the proposed Project would encourage the maintenance and protection of areas of "high environmental quality" and unique scenic value during future oil and gas development in the Project Area. Therefore, the proposed Project would be consistent with Policy 12.
Policy 14. Review all discretionary mineral or petroleum development including renewal of existing authorizations, under the policies and procedures of the California Environmental Quality Act (I-4).	CONSISTENT. This EIR analysis has been prepared to identify and evaluate the potential environmental impacts associated with future oil and gas exploration, development, and production activities that are expected to occur in the Project Area, within the next 25 years, pursuant to the project's Amended Zoning Ordinance. In accordance with CEQA, Kern County will consider information contained in this EIR in their decision to approve, conditionally approve, or deny approval of the proposed Project. Therefore, the proposed Project would be consistent with Chapter 5, Section B, Policy 14.
Policy 15. Require petroleum production sites in urban areas which are subject to discretionary permits, to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways (I-4).	CONSISTENT. As described in Section 4.1, Aesthetics, mitigation measures would require that the visual impacts of oil and gas development be reduced near sensitive receptors. Therefore, the proposed Project would be consistent with Policy 15. Similar mitigation measures would be used to reduce the noise and dust impacts on adjacent receptors where new wells would be located outside Tier 1 areas. Therefore, the proposed Project is consistent with Policy 15.
Policy 16. Require all mineral development to be predicated on appropriate reclamation plans that meet the standards of the State Surface Mining and Reclamation Act and the implementing guidelines of the State Mines and Geology Board, and (or) the standards of the State Division of Oil and Gas. Reclamation/restoration of the sites shall be done as each phase of development or extraction is completed (I-4, I-5).	CONSISTENT. All future oil and gas development is required to meet DOGGR standards. Therefore, the proposed Project would be consistent with Policy 16.
Implementation Measure 3. Periodically review and update local zoning ordinances that have been amended to accommodate mineral extraction uses outside of mineral resource zones.	CONSISTENT. The proposed Project includes an update to the Kern County Zoning Ordinance related to oil and gas development. The proposed development standards would apply to future oil and gas extraction activities that may occur on unincorporated County land. Therefore, the proposed Project would be consistent with Implementation Measure 3.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
C. SOILS AND AGRICULTURE	
Goal 1. Provide for the planned management, conservation, and wise utilization of agricultural land in the planning area.	CONSISTENT. As discussed in Section 4.2, Agricultural and Forestry Resources, oil and gas drilling and production activities are an allowable use in Tier 2 areas, where agricultural lands (Important Farmland with Class I and II soils) exist. Proposed development standards would provide greater protection for agricultural lands than currently exists and would require compensation for loss of Important Farmland. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Promote soil conservation and minimize development of prime agricultural land as defined by the following criteria: • capability Class I and/or II irrigated soils • 80-100 Storie Index rating • gross crop return of $200 or more per acre per year • annual carrying capacity of 1 animal unit per acre per year	CONSISTENT. As discussed in Section 4.2, Agricultural and Forestry Resources, oil and gas drilling and production activities are an allowable use in Tier 2 areas, where agricultural lands (Important Farmland with Class I and II soils) exist. Proposed development standards would provide greater protection for agricultural lands than currently exists and would require compensation for loss of Important Farmland. Therefore, the proposed Project would be consistent with Goal 2.
Goal 3. Establish urban development patterns and practices that promote soil conservation and that protect areas of agricultural production of food and fiber crops, and nursery products.	CONSISTENT. As discussed in Section 4.2, Agricultural and Forestry Resources, oil and gas drilling and production activities are an allowable use in Tier 2 areas, where agricultural lands (Important Farmland with Class I and II soils) exist. Proposed development standards would provide greater protection for agricultural lands than currently exists and would require compensation for loss of Important Farmland. Therefore, the proposed Project would be consistent with Goal 3.
Policy 1. Determine the extent and location of all prime agricultural land within the study area (I-1).	CONSISTENT. To support the EIR analysis, all prime agricultural land within the Project Area was identified. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. Review projects that propose subdividing or urbanizing prime agricultural land to ascertain how continued commercial agricultural production in the project vicinity will be-affected (I-2).	CONSISTENT. Refer to Section 4.2, Agricultural Resources, for a discussion of Project impacts to prime agricultural land. The proposed Project would be consistent with Policy 2.
Policy 4. Monitor the amount of prime agricultural land taken out of production for urban uses or added within the plan area (I-3).	CONSISTENT. An evaluation of the potential effects on prime agricultural land is presented in Section 4.2, Agricultural Resources. Therefore, the proposed Project would be consistent with Policy 4.
Policy 7. Land use patterns, grading, and landscaping practices shall be designed to prevent soil erosion while retaining natural watercourses when possible (I-4).	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator would implement a SWPPP which would include an Erosion Control Plan. Implementation of a SWPPP would reduce the potential for soil erosion while

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	retaining natural watercourses. Therefore, the proposed Project would be consistent with Policy 7.
Policy 12. Prohibit premature removal of ground cover in advance of development and require measures to prevent soil erosion during and immediately after construction (I-4).	CONSISTENT. As discussed in Section 4.6, Geology and Soils, the operator would implement a SWPPP which would include an Erosion Control Plan. Measures included in the SWPPP would reduce the potential for soil erosion associated with project construction activities. Therefore, the proposed Project would be consistent with Policy 12.
Implementation Measure 2. Evaluate discretionary projects for their impact on agricultural resources.	CONSISTENT. An evaluation of the potential effects on prime agricultural land is presented in Section 4.2, Agricultural Resources. Therefore, the proposed Project would be consistent with Implementation Measure 2.
Implementation Measure 3. Document urban expansion and changes in the amount of agricultural land for purposes of determining cumulative impacts to prime agricultural land.	CONSISTENT. An evaluation of the potential cumulative effects on prime agricultural land is presented in Section 4.2, Agricultural Resources. Therefore, the proposed Project would be consistent with Implementation Measure 3.
D. WATER RESOURCES	
Goal 1. Conserve and augment the available water resources of the planning area.	CONSISTENT. As described in Section 4.17, Utilities and Service Systems, oil and gas operators currently recycle produced water for reuse in enhanced oil recovery and sell some water to municipal providers for local agricultural operations. These practices would continue in the future. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Assure that adequate groundwater resources remain available to the planning area.	CONSISTENT. Impacts on groundwater are discussed in Section 4.9, Hydrology and Water Quality. With the implementation of mitigation measures, impacts on groundwater resources would be reduced. Therefore, the proposed Project would be consistent with Goal 2.
Goal 3. Assure that adequate surface water supplies remain available to the planning area.	CONSISTENT. Impacts on surface water are discussed in Section 4.9, Hydrology and Water Quality. With the implementation of mitigation measures, impacts on surface water resources would be reduced. Therefore, the proposed Project would be consistent with Goal 3.
Goal 4. Continue cooperative planning for and implementation of programs and projects which will resolve water resource deficiencies and water quality problems.	CONSISTENT. The County coordinates with numerous responsible and trustee agencies through the CEQA process. Federal, State and local agencies with jurisdiction in the Project Area received the NOP for the EIR, and a number of agencies have been given the opportunity to provide input throughout the CEQA

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	process. Section 4.9, Hydrology and Water Quality, addresses project-related water quality issues that were identified by various agencies during the EIR scoping process. Therefore, the proposed Project would be consistent with Goal 4.
Goal 5. Achieve a continuing balance between competing demands for water resource usage.	CONSISTENT. The proposed Project analyzes project-related water supply impacts in Section 4.17, Utilities and Service Systems. With the implementation of mitigation measures, impacts related to water use would be reduced, which would help achieve a better balance between competing demands for water resource usage. Therefore, the proposed Project would be consistent with Goal 5.
Goal 6. Maintain effective cooperative planning programs for water resource conservation and utilization in the planning area by involving all responsible water agencies in the planning process.	CONSISTENT. With the publication of the NOP, the County notified water resource agencies including SWRCB, CCRWQCB, and CVRWQCB. In addition, some agencies were given the opportunity to provide input throughout the CEQA process. Therefore, the proposed Project would be consistent with Goal 6.
Policy 6. Protect planning area groundwater resources from further quality degradation (I-7).	CONSISTENT. Section 4.9, Hydrology and Water Quality, describes the potential for the proposed Project to affect groundwater resources and presents mitigation measures to minimize potential impacts and protect groundwater resources from further quality degradation. Therefore, the proposed Project would be consistent with Policy 6.
Policy 8. Consider each proposal for water resource usage within the context of total planning area needs and priorities-major incremental water transport, groundwater recharge, flood control, recreational needs, riparian habitat preservation and conservation (I-9).	CONSISTENT. The proposed Project analyzes project-related water supply impacts in Section 4.17, Utilities and Service Systems. With the implementation of mitigation measures, impacts related to water use would be reduced. Section 4.9, Hydrology and Water Quality, includes an analysis of impacts related to surface and groundwater and Section 4.4, Biological Resources, includes an analysis of impacts related to riparian habitat. Therefore, the proposed Project would be consistent with Goal 5.
Policy 9. Encourage and implement water conservation measures and programs (I-11).	CONSISTENT. As described in Section 4.17, Utilities and Service Systems, the proposed Project would support water conservation efforts currently practiced in the Project Area, such as the recycling of produced water for reuse in enhanced oil recovery and the sale of recycled water to municipal providers for local agricultural purposes. Therefore, the proposed Project would be consistent with Policy 9.
Implementation Measure 6. Support the provision of adequate wastewater collection systems and treatment reclamation and disposal facilities which will	CONSISTENT. As discussed in Section 4.17, Utilities and Services, prior to the issuance of a permit, the operator shall implement mitigation measures to ensure

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
prevent groundwater degradation by on-site wastewater systems.	that the method of sewage disposal for the Project shall be as required and approved by the Kern County Public Health Services Department. Additionally, Section 4.9, Hydrology and Water Quality, describes the potential for the proposed Project to affect groundwater resources and presents mitigation measures to protect groundwater resources from further quality degradation. Therefore, the proposed Project would be consistent with Implementation Measure 6.
Implementation Measure 7. Maintain industrial waste discharge regulation and monitoring programs which protect the planning area groundwater from contaminants.	CONSISTENT. As discussed in Section 4.6, Geology and Soils and Section 4.9, Hydrology and Water Quality, the operator would implement a SWPPP and would comply with all applicable federal, state, regional, and local agency water quality protection laws and regulations, and commonly utilized industry standards, including obtaining all applicable stormwater construction permits from the CVRWQCB. The operator would also comply with the Kern County Grading Ordinance. Additionally, all drilling operations would use either a closed loop system to avoid discharges of drilling muds and fluids or would obtain coverage under the SWRCB low threat discharge General Order (WDR General Order 2003-0003-DWQ). Implementation of these measures, laws, and regulations would protect the planning area groundwater from contaminants. Therefore, the proposed Project would be consistent with Implementation Measure 7.
Implementation Measure 10. Support additional water conservation measures and programs of benefit to the planning area.	CONSISTENT. As described in Section 4.17, Utilities and Service Systems, oil and gas operators currently recycle produced water for reuse in enhanced oil recovery and sell some water to municipal providers for agricultural operations. These water conservation practices would continue in the future. Therefore, the proposed Project would be consistent with Implementation Measure 10.
E. AIR QUALITY	
Goal 1. Promote air quality that is compatible with health, wellbeing, and enjoyment of life by controlling point sources and minimizing vehicular trips to reduce air pollutants	CONSISTENT. As described in Section 4.3, Air Quality, the applicant would be subject to the terms of an air quality permit, which, if required, would be approved by the San Joaquin Valley Unified Air Pollution Control District. In addition, the County has incorporated feasible mitigation to reduce the project's emissions impacts to the greatest extent feasible. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Continue working toward attainment of Federal, State and Local standards as enforced by the San Joaquin Valley Unified Air Pollution Control District.	CONSISTENT. As described in Section 4.3, Air Quality, the applicant would be subject to the terms of the project's air quality permit, which would be approved by the San Joaquin Valley Unified Air Pollution Control District. Therefore, the

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	proposed Project would be consistent with Goal 2.
Goal 3. Reduce the amount of vehicular emissions in the planning area.	CONSISTENT. Section 4.3, Air Quality, analyzes vehicular emissions and proposes mitigation measures to reduce impacts. Therefore, the proposed Project would be consistent with Goal 2.
Policy 1. Comply with and promote San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) control measures regarding Reactive Organic Gases (ROG). Such measures are focused on: (a) steam driven well vents, (b) Pseudo-cyclic wells, (c) natural gas processing plant fugitives, (d) heavy oil test stations, (e) light oil production fugitives, (f) refinery pumps and compressors, and (g) vehicle inspection and maintenance (I-1).	CONSISTENT. Section 4.3, Air Quality, describes the ROG control measures relevant to future oil and gas exploration and production activities that would be authorized under the proposed Project and conducted between 2015 and 2035. Section 4.3 also describes how the proposed Project will comply with the SJVUAPCD control measures regarding ROG. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. Encourage land uses and land use practices which do not contribute significantly to air quality degradation (I-1).	CONSISTENT. Section 4.3, Air Quality, analyzes vehicular emissions and proposes mitigation measures to reduce impacts. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Require dust abatement measures during significant grading and construction operations (I-1).	CONSISTENT. Developers would be required to comply with dust suppression measures during construction as described in Section 4.3, Air Quality. Therefore, the proposed Project would be consistent with Policy 3.
Policy 5. Consider the location of sensitive receptors such as schools, hospitals, and housing developments when locating industrial uses to minimize the impact of industrial sources of air pollution (I-1).	CONSISTENT. Section 4.3, Air Quality, identifies the location of sensitive receptors and describes mitigation measures to minimize air pollution impacts on schools, hospitals, and residential areas. Therefore, the proposed Project would be consistent with Policy 5.
CHAPTER 6. OPEN SPACE ELEMENT	
Goal 3. Locate and site development to minimize the disruption of open space areas.	CONSISTENT. As described in Chapter 3.0, Project Description, the majority of new wells would be drilled in existing well fields in Tier 1 areas, where oil and gas activity are the primary land use. Additionally, oil or gas exploration or production is prohibited in the Open Space District (OS) zoning districts of Kern County. Therefore, the proposed Project would be consistent with Goal 3.
Policy 1. Promote the establishment, maintenance and protection of the planning area's open space resources, including the following: a. Conservation of natural resources (refer to Chapter II-Land Use, Chapter V-Conservation, and Chapter XII Kern River Plan Element). • Kern River corridor	CONSISTENT. The proposed Project would enact new oil and gas development standards which would streamline the permitting process and provide greater protection for the environment than exists under current County standards. Therefore, the proposed Project would encourage the maintenance and protection of the planning area's open space resources during future oil and gas development

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
• Management of hillsides b. Managed production of resources • Agriculture (refer to Chapter V-Conservation/Soils and Agriculture) • Oil production (refer to Chapter V-Conservation/Mineral Resources) c. Outdoor recreation • Parks (refer to Chapter XI-Parks) • Kern River corridor (refer to Chapter II-Land Use, Chapter V Conservation, and Chapter XII-Kern River Plan Element) d. Public health and safety • Hazard avoidance (refer to Chapter VIII-Safety)	in the Project Area, and the proposed Project would be consistent with Policy 1.
Policy 5. Development location and siting should be sensitive to its relationship to the Kern River (I-3).	CONSISTENT. Oil and gas development near the Kern River would be required to adhere to mitigation measures proposed throughout this EIR. In particular, refer to Sections 4.2, Biological Resources, and 4.9, Hydrology and Water Quality. Therefore, the proposed Project would be consistent with Policy 5.
Policy 9. Encourage depleted resource extraction sites to be restored as alternative open space or developed with uses compatible with those adjacent (I-5).	CONSISTENT. The majority of new wells would be drilled in existing well fields in Tier 1 areas, which have historically been used for oil and gas development. Former well fields would be abandoned in compliance with DOGGR standards and mitigation measures. Therefore, the proposed Project would be consistent with Policy 9.
CHAPTER 7. NOISE ELEMENT	
Goal 1. Ensure that residents of the Bakersfield Metropolitan Area are protected from excessive noise and existing moderate levels of noise are maintained.	CONSISTENT. Residents of the Bakersfield Metropolitan Area will be protected from excessive noise caused by oil and gas production through the implementation of mitigation measures as described in Section 4.12, Noise. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Protect the citizens of the planning area from the harmful effects of exposure to excessive noise, and protect the economic base of the area by preventing the encroachment of incompatible land uses near known noise-producing roadways, industries, railroads, airports and other sources.	CONSISTENT. The majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas. Additionally, as described in Section 4.12, Noise, the applicant shall implement mitigation measures to ensure that residents of the Project Area will be protected from the harmful effects of exposure to excessive noise caused by oil and gas drilling and production activities. Therefore, the proposed Project would be consistent with Goal 2.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 1. Identify noise-impact areas exposed to existing or projected noise levels exceeding 65 dB CNEL (exterior) or the performance standards described in Table VII-2. The noise exposure contour maps on file at the City of Bakersfield and County of Kern indicate areas where existing and projected noise exposures exceed 65 dB CNEL (exterior) for the major noise sources identified (I-1).	CONSISTENT. As described in Section 4.12, Noise, mitigation measures would reduce impacts related to noise. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into project design to reduce noise to acceptable levels. (I-2, I-3, I-6, I-7).	CONSISTENT. The proposed Project is not a noise-sensitive land use. All future oil and gas development would be required to comply with development standards, which would reduce impacts of development on noise sensitive land uses. Therefore, the proposed Project would be consistent with Policy 2.
Policy 3. Review discretionary industrial, commercial or other noise-generating land use projects for compatibility with nearby noise-sensitive land uses. Additionally, the development of new noise-generating land uses which are not preempted from local noise regulation will be reviewed if resulting noise levels will exceed the performance standards contained within Table VII-2 in areas containing residential or other noise-sensitive land uses (I-3, I-6, I-7).	CONSISTENT. As described in Section 4.12, Noise, the applicant would implement mitigation measures to ensure project compatibility with nearby noise-sensitive land uses. Therefore, the proposed Project would be consistent with Policy 2.
Policy 5. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise (I-7).	CONSISTENT. The proposed Project does not impact the County's ability to use vegetation and landscaping as sound buffers between noise sensitive land uses and roadways or other noise-generating sources. As described in Section 4.12, Noise, oil and gas developers would be required to comply with mitigation measures that reduce noise impacts. Therefore, the proposed Project would be consistent with Policy 5.
Implementation Measure 2. Review discretionary development plans, programs and proposals, including those initiated by both the public and private sectors, to ascertain and ensure their conformance to the policy framework outlined in this element.	CONSISTENT. As described in Section 4.12, Noise, the applicant would implement mitigation measures to ensure project compatibility with nearby noise-sensitive land uses. In addition, Kern County would review each Site Plan Application for oil and gas development on a site-specific basis per MM 4.10-1 to ensure its conformance to development standards. Therefore, the proposed Project would be consistent with Implementation Measure 2.
Implementation Measure 4. Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65 dB CNEL and interior noise levels in excess of 45 dB CNEL and so that impacts on noise sensitive uses shall not exceed the performance standards in Table VII-2.	CONSISTENT. As described in Section 4.12, Noise, very few new oil and gas exploration and production wells anticipated to be constructed annually within the Project Area are expected be located in Tier 4, which, with a predominance of urban uses, is where most sensitive receptors would be expected to occur. Implementation of mitigation measures would ensure that the proposed Project will not subject residential or other noise sensitive land uses to exterior noise levels

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
At time of any discretionary approval, such as a request for zone change or subdivision, the developer may be required to submit an acoustical report indicating the means by which the developer proposes to comply with the noise standards. The acoustical report shall: a) Be the responsibility of the applicant. b) Be prepared by a qualified acoustical consultant experienced in the fields of environmental noise assessment and architectural acoustics. c) Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions. d) Include estimated noise levels in terms of CNEL and the standards of Table VII-2 (if applicable) for existing and projected future (10-20 years hence) conditions, with a comparison made to the adopted policies of the Noise Element. e) Include recommendations for appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element. f) Include estimates of noise exposure after the prescribed mitigation measures have been implemented. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a rationale for acceptance of the project must be provided.	in excess of 65 dB CNEL. Therefore, the proposed Project would be consistent with Implementation Measure 4.
Implementation Measure 10. Standards for Project Noise Impacts for Mobile Sources. A significant increase of existing ambient noise levels affecting existing noise sensitive land uses (receptors), and requiring the adoption of practical and feasible mitigation measures, is deemed to occur where a project will cause: • An increase of the existing ambient noise level by 5 dB or more, where the existing ambient level is less than 60 dB CNEL; • An increase of the existing ambient noise level by 3 dB or more, where the existing ambient level is 60 to 65 dB CNEL; • An increase of the existing ambient noise level by 1.5 dB or more, where the existing ambient level is greater than 65 dB CNEL. Standards for Cumulative Noise Impacts for Mobile Sources. A project's contribution to noise increase would normally be considered cumulatively considerable and considered significant when ambient noise levels affect noise sensitive land uses (receptors) and when the following occurs. • A project increases the ambient (cumulative without project) noise level by 1 dB or more; and • The cumulative with project noise levels cause the following:	CONSISTENT. A complete discussion of the Project's noise impacts is included in Section 4.12, Noise. With implementation of mitigation measures, impacts to noise-sensitive land uses (receptors) would be reduced to less than significant. Therefore, the proposed Project would be consistent with Implementation Measure 10.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
○ An increase of the existing ambient noise level by 5 dB or more, where the existing ambient level is less than 60 dB CNEL; ○ An increase of the existing ambient noise level by 3 dB or more, where the existing ambient level is 60 to 65 DB CNEL; An increase on the existing ambient noise level by 1.5 dB or more, where the existing ambient level is greater than 65 dB CNEL.	
CHAPTER 8. SAFETY ELEMENT	
A. SEISMIC SAFETY	
Goal 1. Substantially reduce the level of death, injury, property damage, economic and social dislocation and disruption of vital services that would result from earthquake damage.	CONSISTENT. As described in the Future Development Scenario, the majority of new wells would be drilled in existing well fields in Tier 1 areas, which are located outside of populated areas and have historically been devoted to oil and gas development. The implementation of new development standards for the proposed Project would further reduce risks associated with loss of life, personal injury, property damage, and economic and social dislocation and disruption of vital services that would result from earthquake damage in and around oil and gas development areas. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Ensure the availability and effective response of emergency services following an earthquake.	CONSISTENT. As described in Section 4.14, Public Services, the applicant shall pay mitigation fees to ensure the availability and effectiveness of firefighters, police and rescue responders in the event of an emergency in or around the oil and gas well fields. Therefore, the proposed Project would be consistent with Goal 2.
Goal 4. Prevent loss of life from the failure of critical facilities in an earthquake and ensure the continued functioning of essential facilities following a disaster.	CONSISTENT. Consistent with this goal, developers would be required to comply with adopted safety regulations, such as the Fire Code, and would comply with mitigation measures related to hazards and safety. Developers would also be required to adhere to applicable building code regulations. Therefore, the proposed Project would be consistent with Goal 4.
Goal 5. Protect essential lifelines and prevent casualties and major social and economic disruption due to liquefaction in an earthquake.	CONSISTENT. The implementation of new development standards for the proposed Project would minimize risks associated with loss of life and major social and economic disruption that could occur due to liquefaction in and around oil and gas development areas. Therefore, the proposed Project would be consistent with Goal 5.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Goal 7. Protect land uses from the risk of dam failure inundation including the assurances that: the functional capabilities of essential facilities are available in the event of a flood; hazardous materials* are not released; effective measures for mitigation of dam failure inundation are incorporated into the design of critical facilities; and the rapid and orderly evacuation of populations in the inundation area will occur.	CONSISTENT. As described in Section 4.9, Hydrology, project facilities in the potential dam inundation area would be required to comply with the Uniform Fire Code's siting or design requirements to prevent on-site hazards from affecting surrounding communities in the event of inundation from a catastrophic failure of the Lake Isabella dam. Compliance with applicable standards and mitigation measures would reduce the risk that components would damage essential facilities in the event of dam failure inundation. Therefore, the proposed Project would be consistent with Goal 7.
CRITICAL FACILITIES POLICIES	
Policy 4. Encourage critical facilities in dam inundation areas to develop and maintain plans for safe shut-down and efficient evacuation from their facilities, as appropriate to the degree of flood hazard for each facility (I-26, I-31).	CONSISTENT. The proposed Project components do not meet the definition of a critical facility. Further, the proposed Project would not impair the City's ability to develop or maintain plans for the safe shut-down and efficient evacuation from critical facilities in the Project Area. Therefore, the proposed Project would not conflict with and would be consistent with Policy 4.
Policy 5. Incorporate planning for incidents affecting critical facilities into contingency plans for disaster response and recovery (I-31).	CONSISTENT. The proposed Project would not impair the City's ability to incorporate planning for incidents affecting critical facilities into contingency plans for disaster response and recovery. Therefore, the proposed Project would not conflict with and would be consistent with Policy 5.
FAULT RUPTURE POLICIES	
Policy 12. Design significant lifeline installations such as highways, utilities and petrochemical pipelines which cross an active fault, to accommodate potential fault movement without prolonged disruption of an essential service or creating threat to health and safety (I-16).	CONSISTENT. The proposed Project does not include the design of significant lifeline installations, such as large petrochemical pipelines. However, gathering lines and other project components would be required to comply with proposed development standards, which would reduce impacts in case of an earthquake. Therefore, the proposed Project would be consistent with Policy 12.
LIQUEFACTION POLICIES	
Policy 13. Determine the liquefaction potential at sites in areas of high groundwater prior to development and determine specific mitigation to be incorporated into the foundation design, as necessary to prevent or reduce damage from liquefaction in an earthquake (I-17 through I-19).	CONSISTENT. Section 4.6, Geology and Soils, identifies areas of high groundwater, determines the liquefaction potential of those areas, and proposes mitigation as necessary to prevent or reduce damage from liquefaction in an earthquake. Compliance with mitigation measures would reduce the potential for the project to result in damage due to liquefaction in an earthquake. Therefore, the

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	proposed Project would be consistent with Goal 2.
Policy 14. Route major lifeline installations around potential liquefaction areas or otherwise protect them against significant damage from liquefaction in an earthquake (I-20).	CONSISTENT. The proposed Project does not meet the definition of a major lifeline installation; however, implementation of mitigation measures would reduce the potential of the proposed Project to result in significant damage from liquefaction in an earthquake. Therefore, the proposed Project would be consistent with Policy 14.
DAM FAILURE INUNDATION RISK POLICIES	
Policy 18. Design discretionary critical facilities located within the potential inundation area for dam failure in order to: mitigate the effects of inundation on the facility; promote orderly shut-down and evacuation (as appropriate); and, prevent on-site hazards from affecting building occupants and the surrounding communities in the event of dam failure (I-26).	CONSISTENT. The proposed Project does not meet the definition of a major lifeline installation; however, implementation of mitigation measures would reduce the potential of the Project to impact critical facilities. Therefore, the proposed Project would be consistent with Policy 18.
Policy 19. Design discretionary facilities in the potential dam inundation area used for the manufacture, storage or use of hazardous materials to prevent on-site hazards from affecting surrounding communities in the event of inundation (I-27).	CONSISTENT. As described in Section 4.9, Hydrology, project facilities in the potential dam inundation area used for the manufacture, storage, and use of hazardous materials would be required to comply with the Uniform Fire Code's siting or design requirements to prevent on-site hazards from affecting surrounding communities in the event of inundation from a catastrophic failure of the Lake Isabella dam. Therefore, the proposed Project would be consistent with Policy 19.
Policy 20. Require emergency response plans for the planning area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area (I-28).	CONSISTENT. The proposed Project would not interfere with the City's ability to incorporate specific procedures for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans. Therefore, the proposed Project would be consistent with Policy 20.
Implementation Measure 2. Require detailed site studies for ground shaking characteristics, liquefaction potential, dam failure inundation and flooding potential, and fault rupture potential, as background to the design process for critical facilities under city and county discretionary approval.	CONSISTENT. The proposed Project does not include the development of new critical facilities; therefore, there is no need to provide the detailed siting background that goes into the design of such facilities, as recommended in this implementation measure. However, oil and gas developers would be required to comply with development standards, which would reduce impacts on critical facilities. Therefore, the proposed Project is consistent with Implementation Measure 2.
Implementation Measure 3. Require structures that are within the plan area and are subject to Building Department review to adhere to the most current seismic standards adopted as part of the Uniform Building Code.	CONSISTENT. As described in Section 4.6, Geology and Soils, the Project Area is within Seismic Zone 4; accordingly, any structures erected would be required to comply with the Uniform Building Code's design standards applicable to Seismic

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	Zone 4. Therefore, the proposed Project would be consistent with Implementation Measure 3.
Implementation Measure 4. Review existing critical facilities for any significant siting, design or construction problems that would make them vulnerable in an earthquake. The findings shall be incorporated into emergency operations plans as well as addressed in longer-term programs of facilities upgrading or relocation.	CONSISTENT. The proposed Project does not meet the definition of a critical facility; however, implementation of mitigation measures would reduce the potential of the Project to impact critical facilities in an earthquake. Therefore, the proposed Project would be consistent with Implementation Measure 4.
Implementation **Measure 10.** Develop appropriate criteria and procedures for third-party review of the seismic design of critical facilities.	CONSISTENT. The proposed Project does not meet the definition of a critical facility; however, implementation of mitigation measures would reduce the potential of the Project to impact critical facilities in an earthquake. Therefore, the proposed Project would be consistent with Implementation Measure 10.
Implementation Measure 16. Require plans and permits for installation of major lifeline components such as for highways, utilities and petroleum or chemical pipelines to incorporate design features to accommodate potential fault movement in areas of active faults without prolonged disruption of an essential service or threat to health and safety.	CONSISTENT. The proposed Project does not meet the definition of a major lifeline component; however, implementation of mitigation measures would reduce the potential of the Project to impact public health and safety during an earthquake. Therefore, the proposed Project would be consistent with Implementation Measure 16.
Implementation Measure 17. Require liquefaction investigations in all areas of high groundwater potential and appropriate foundation designs to mitigate potential damage to buildings on sites with liquefaction potential.	CONSISTENT. Section 4.6, Geology and Soils, describes the potential for liquefaction in the Project Area. The applicant would be required to design all buildings in accordance with applicable California Building Code standards and the Kern County Building Code. Prior to ground disturbing activities, the applicant would also be required to prepare a Site Plan Conformity Review application, in which they would confirm project compliance with applicable DOGGR regulations and the Alquist-Priolo Earthquake Fault Zoning Act. Therefore, the proposed Project would be consistent with Implementation Measure 17.
Implementation Measure 20. Route major lifeline components such as for highways, utilities and petroleum or chemical pipelines around areas of high groundwater wherever possible. Where they must cross an area of high groundwater, plans and permits shall require design features to accommodate extensive ground rupture without prolonged disruption of an essential service or threat to health and safety.	CONSISTENT. The proposed Project does not meet the definition of a major lifeline installation; however, implementation of mitigation measures would reduce the potential of the project to impact areas of high groundwater or cause threats to health and safety. Therefore, the proposed Project would be consistent with Implementation Measure 20.
Implementation Measure 26. Develop procedures for the discretionary review of critical facilities proposed in an area of potential dam inundation. Approvals shall include requirements that emergency shut-down and facility evacuation plans be	CONSISTENT. The proposed Project does not meet the definition of a critical facility; however, implementation of mitigation measures would reduce the potential of the project to impact critical facilities. Therefore, the proposed Project

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
developed, maintained and exercised for each facility, and the potential effects of inundation on essential facility functions and the safety of occupants and the community in general are addressed.	would be consistent with Implementation Measure 26.
Implementation Measure 27. Facilities used for the manufacture, storage or use of hazardous materials shall comply with the uniform fire code, with requirements for siting or design to prevent on-site hazards from affecting surrounding communities in the event of inundation.	CONSISTENT. As described in Section 4.14, Public Services, construction and operation of all future oil and gas exploration and production activities that would be authorized under the proposed Project would be subject to the provisions of the Uniform Fire Code and local amendments; Titles 19, 22, and 27 of the California Safety Code Regulations; the Kern County Ordinance Code; and the National Fire Protection Association Standards, among other regulations and development standards. Therefore, the proposed Project would be consistent with Implementation Measure 27.
Implementation Measure 28. Incorporate specific plans for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans.	CONSISTENT. The proposed Project would not interfere with the City's ability to incorporate specific plans for the sequential and orderly evacuation of the potential dam inundation area into emergency response plans. Therefore, the proposed Project would be consistent with Implementation Measure 28.
Implementation Measure 29. Maintain effective disaster response and earthquake response plans and update on a regular basis.	CONSISTENT. The proposed Project would not interfere with the City's ability to maintain or update effective disaster response and earthquake response plans. Therefore, the proposed Project would be consistent with Implementation Measure 29.
B. FLOODING	
Goal 1. Minimize hazards to planning area residents resulting from flooding.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, mitigation measures would be implemented to minimize flood hazards to planning area residents. With implementation of these measures, the Project would not expose people to a significant risk of injury or death involving flooding. Therefore, the proposed Project would be consistent with Goal 1.
Goal 2. Reduce the risk of flooding to land uses.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, mitigation measures would be implemented to reduce the risk to land uses and structures within a flood hazard area. Therefore, the proposed Project would be consistent with Goal 2.
Policy 1. Develop specific standards which apply to development located in flood hazard areas, as defined by Federal Flood Insurance maps and most recent information as adopted by the responsible agency (I-1, I-2).	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, some existing oil and gas administrative fields within the Project Area are within a 100-year flood hazard area identified by FEMA on applicable Flood Insurance Rate

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
	Maps. The project would implement mitigation measures to minimize flood hazards related to development located in the flood hazard areas. Therefore, the proposed Project would be consistent with Policy 1.
Implementation Measure 2. Develop procedures for the review of proposed facilities which use, manufacture or store hazardous materials proposed in areas of identified flood hazard.	CONSISTENT. The proposed Project would not prevent the County and City from developing procedures for the review of proposed facilities which use, manufacture or store hazardous materials proposed in areas of identified flood hazard. In addition, the proposed Project would comply with development standards and regulations regarding hazardous materials. Therefore, the proposed Project would be consistent with Implementation Measure 2.
C. PUBLIC SAFETY	
Goal 1. Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.	CONSISTENT. The proposed Project includes a zoning amendment that would streamline the permitting process for oil and gas development activities within Kern County, while providing greater protection for the environment and residents than exists under current County standards. The proposed development standards would improve public safety for the Metropolitan Bakersfield Area. Therefore, the proposed Project would be consistent with Goal 1.
Goal 4. Assure that fire, hazardous substance regulation and emergency medical service problems are continuously identified and addressed in a proactive way, in order to optimize safety and efficiency	CONSISTENT. Section 4.14, Public Services, addresses impacts on police, fire and emergency medical services and facilities from the proposed Project. Section 4.8, Hazards and Hazardous Materials, addresses impacts related to hazardous wastes generated, handled, stored, treated, transported, and disposed of with respect to oil and gas development in the Project Area. Therefore, the proposed Project would be consistent with Goal 4.
Policy 1. Identify future site locations, projected facility expansions, projected site acquisition costs, construction costs and operational costs in a manner that would maximize the efficiency of new public safety services (I-1, I-2, I-3).	CONSISTENT. The proposed Project would be required to comply with new development standards, which would reduce impacts on the environment and public safety. Developers would also be required to pay impact mitigation fees related to fire, police, and traffic impacts. Therefore, the proposed Project would be consistent with Policy 1.
Policy 2. Require discretionary projects to assess impacts on police and fire services and facilities (I-3).	CONSISTENT. Impacts and mitigation measures related to police and fire services are outlined in Section 4.14, Public Services. The applicant would be required to address the project's demand for additional police and fire protection services through the payment of mitigation fees. Therefore, the proposed Project would be consistent with Policy 2.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 7. Enforce ordinances regulating the use/manufacture/sale, transport/disposal of hazardous substances, and require compliance with state and federal laws regulating such substances.	CONSISTENT. As described in Section 4.8, Hazards and Hazardous Materials, oil and gas developers would comply with state and federal laws regulating the use/manufacture/sale, transport/disposal of hazardous substances. Specifically, all hazardous substances generated by the proposed Project would be handled and shipped in accordance with USDOT and waste regulatory requirements. Therefore, the proposed Project would be consistent with Policy 7.
Policy 8. The Kern County and Incorporated Cities Hazardous Waste Management Plan and Final Environmental Impact Report serves as the policy document guiding all facets of hazardous waste.	CONSISTENT. Operators would be required to comply with all applicable laws, regulations, ordinances and policy documents related to the use, transport, and disposal of hazardous waste, including the Kern County and Incorporated Cities Hazardous Waste Management Plan. Therefore, the proposed Project would be consistent with Policy 8.
Policy 12. Where recommended by appropriate local, state or federal agencies for discretionary projects, soils shall be tested for concentrations of agricultural chemicals prior to grading permit approval whenever feasible. Contaminated soils shall be excavated and disposed of at a certified hazardous waste disposal facility whenever necessary.	CONSISTENT. Section 4.8, Hazards and Hazardous Materials, describes the use, transport and disposal of hazardous substances with respect to oil and gas development in the Project Area. Consistent with this policy, contaminated soils shall be excavated and disposed of at a certified hazardous waste disposal facility whenever necessary. Therefore, the proposed Project would be consistent with Policy 12.
Policy 16. All new discretionary development projects shall be subject to environmental and design review on a site-specific, project-by-project basis, including but not limited to an assessment to determine whether hazardous materials present potential health effects to human health as required by the Department of Environmental Services.	CONSISTENT. Pursuant to CEQA, and consistent with this policy, this EIR analysis outlines the potential environmental impacts of the proposed Project, including an assessment of the potential human health effects, as described in Section 4.8, Hazards and Hazardous Materials. Therefore, the proposed Project would be consistent with Policy 16.
Implementation Measure 2. Funding for Police and Fire equipment and facilities will be facilitated through bond issues and/or development fees and/or land dedications and/or assessment districts.	CONSISTENT. As described in Section 4.14, Public Services, mitigation fees would be required to reduce impacts on police and fire protection in the Project Area. Therefore, the proposed Project would be consistent with Implementation Measure 2.
CHAPTER 10. PUBLIC SERVICES AND FACILITIES ELEMENT	
A. GENERAL UTILITY SERVICES	
Goal 4. Develop funding principles and programs which will assure that all new development will pay for the incremental costs of the public facilities and services--utilities bridges, parks, and public safety facilities--both on-site and offsite, to serve	CONSISTENT. As described in Section 4.14, Public Services, and Section 4.13, Population and Housing, nominal population growth in the Project Area would not stress certain existing public services, such as utilities bridges, parks, schools, and

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
such development.	libraries; however, the anticipated new oil and gas activity may tax for police and fire protection services in the vicinity of the new oil and gas wells. With implementation of mitigation measures impacts would be reduced. Therefore, the proposed Project would be consistent with Goal 4.
Policy 5. Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent (I-3).	CONSISTENT. The proposed Project will not require modifications to existing public service facilities or infrastructure, such as parks, schools, and libraries. As described in Section 4.14, Public Services, the applicant would be required to address the Project's demand for additional police and fire protection services from new oil and gas exploration and production activities through the payment of mitigation fees. Therefore, the proposed Project would be consistent with Policy 5.
Implementation Measure 4. Create benefit assessment districts or establish service fees for the distribution of costs to users for capital improvement replacement costs and maintenance, utilizing such districts for the financing of improvements which are essential to planning area development.	CONSISTENT. The proposed Project would not impair the City's ability to create benefit assessment districts or establish service fees for the distribution of costs to users for capital improvement replacement costs and maintenance. Therefore, the proposed Project would be consistent with Implementation Measure 4.
B. WATER DISTRIBUTION	
Goal 1. Ensure the provision of adequate water service to all developed and developing portions of the planning area.	As described in Section 4.9, Hydrology and Water Quality, with the implementation of mitigation and the adherence to existing laws and regulations, the proposed Project would not impact surface and groundwater quality that is currently available for other uses. In addition, as described in Section 4.17, Utilities and Services, operators that currently provide produced water to municipal water districts for agricultural uses would continue to do so, which would help ensure that water continues to be available for such uses. Therefore, the proposed Project would be consistent with Goal 1.
Policy 3. Require that all new development proposals have an adequate water supply available (I-3, I-4).	CONSISTENT. The applicant would use reclaimed water to the extent possible per mitigation measures. Use of reclaimed water would reduce the Project's impact on the local water supply. Therefore, the proposed Project would be consistent with Policy 36.
Implementation Measure 3. Review, and modify as required, existing fee structures and ordinances to assure desired system financing and policy implementation.	CONSISTENT. Developers would be required to pay mitigation fees related to traffic, police, and fire protection in the Project Area. Therefore, the proposed Project would be consistent with Implementation Measure 3.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
C. SEWER SERVICE	
Goal 1. Ensure the provision of adequate sewer service to serve the needs of existing and planned development in the planning area.	CONSISTENT. The Project would not connect to the public sewer system. As discussed in Section 4.17, Utilities and Services, the project's sanitary waste disposal needs would be met by new or expanded septic systems and the operator shall implement mitigation to ensure that the method of sewage disposal for the project shall be as required and approved by the Kern County Public Health Services Department. Therefore, the proposed Project would be consistent with Goal 1.
Implementation Measure 6. Exclusive of County Service Area No. 71, developers shall be required to install dry sewer lines in streets and connections thereto for parcels less than 1 acre (net) in size in areas where a centralized sewer system is planned and imminent and where on-site systems can be proven to be temporarily satisfactory. Within County Service Area No. 71, an proposed development at a density greater than one dwelling unit per three gross acres, as well as all commercial and industrial developments, shall be required to be served by a regional sewage collection and treatment system subject to the following provisions: 1. All new development (commercial, industrial and residential at densities greater than one dwelling unit per three gross acres}, including both discretionary and ministerial projects, shall be required to connect to public sewer when said development is located 1,000 feet or closer to available public sewer. If public sewer is more than 1 ,000 feet from development, a dry sewer system in conjunction with approved individual septic systems may be utilized for lots having an area of 10,000 square feet or larger. Dry sewer systems are not required for lots of three gross acres or larger. Single residential lots that require a ministerial permit shall connect to public sewer when located 200 feet or closer to available public sewer. Single residential lots less than three gross acres that are greater than 200 feet from available public sewer are required to install dry sewer in accordance with the requirements of the Engineering and survey. 2. All new development (commercial, industrial and residential at densities greater than one dwelling unit per three gross acres), including both discretionary and ministerial projects, shall pay a sewer development fee where the Board of	CONSISTENT. The project would not connect to the public sewer system and new sewer pipelines would not be required to serve the proposed Project. The project's sanitary waste disposal needs would be addressed by new or expanded septic systems, as approved by the Kern County Public Health Services Department. Therefore, the proposed Project would be consistent with Implementation Measure 6.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Supervisors has adopted a planned sewer area and install dry sewer within the project development when located in excess of 1,000 feet from public sewer or where sewer service is not available as determined by the Engineering and Survey Services Department. The fee amount shall be based on the property's pro rata share of all conveyance, facility and capacity costs. Single residential lots that are greater than 200 feet from available public sewer are required to install dry sewer in accordance with the requirements of the Engineering and Survey Services Department. 3. In those cases where sewer service will not be available as determined by the Sewer Master Plan, an exemption may be granted by the Engineering and Survey Services Department. All new development (commercial, industrial, and residential at densities greater than one dwelling unit per three gross acres) shall be required to annex to an existing County Service Area (CSA) or form a new CSA if none is already in place. In conjunction with formation of, or annexation to, a CSA, applicants shall be required to form a Zone of Benefit for the purpose of constructing and maintaining a sewer trunk line.	
D. STORM DRAINAGE	
Goal 1. Ensure the provision of adequate storm drainage facilities to protect planning area residents from flooding resulting from storm water excess.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, developers would implement mitigation measures to ensure that the Project would not create or contribute runoff water that would exceed the capacity of local storm water drainage systems. Therefore, storm water runoff would not impact planning area residents and the proposed Project would be consistent with Goal 1.
CHAPTER 12. KERN RIVER PLAN ELEMENT	
3.2 OPEN SPACE VERSUS DEVELOPMENT	
Policy 11. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, areas designated as A.4 (Mineral and Petroleum) and electrical power lines to oil wells, water wells, and water control devises in areas designated as 8.5 (Resource Management) unless otherwise required by law, and at River crossings, or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.	CONSISTENT. As described in Chapter 3.0, Project Description, the Project's electrical distribution lines, which are intended to supply lower voltages of power to individual wells, would be sited above-ground. Such lines would be constructed according to the proposed development standards. Therefore, the proposed Project would be consistent with Policy 11.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
3.4 FLOODPLAIN MANAGEMENT	
Policy 9. Oil and mineral exploration and production shall be allowed within the secondary floodway, provided that adverse effects on riparian vegetation and wildlife habitat are minimized. Appurtenant facilities, such as tank farms and steam generators, shall be located outside any floodway; except that they may be allowed within the 8.4/2.5 (Mineral and Petroleum/Secondary Floodway) upon showing by the operator that no other location is reasonably available for then, the proposed location and extent of construction is necessary for the operation of wells in the immediate vicinity, and the intent of this plan for the secondary floodway is followed.	CONSISTENT. An evaluation of the potential effects on riparian vegetation and wildlife habitat is addressed in Section 4.2, Biological Resources. The implementation of mitigation measures will minimize the impact of the proposed Project on sensitive biological resource areas. In addition, operators would be required to comply with all applicable laws, regulations, and ordinances with respect to oil and gas exploration and development in the Project Area. Therefore, the proposed Project would be consistent with Policy 9.
Policy 10. Resource extraction activities, such as sand and gravel removal, shall comply with the "California Surface Mining and Reclamation Act of 1975."	CONSISTENT. The operator shall comply with standards of the California Surface Mining and Reclamation Act of 1975 during resource extraction activities in an effort to protect other mineral resources in the Project Area from impacts related to oil and gas development. Therefore, the proposed Project would be consistent with Policy 10.
3.5 PRIVATE PROPERTY AND PUBLIC USE	
Policy 2. Open space qualities of the Kern River primary and secondary floodway shall be protected consistent with policies of this plan, regardless of whether the land is in public or private ownership.	CONSISTENT. Mitigation measures described in Section 4.4, Biological Resources, would be implemented to protect the open space qualities of the Kern River floodway areas. Therefore, the proposed Project would be consistent with Policy 2.
3.6 MINERAL AND PETROLEUM	
Goal. To provide for the continued production of petroleum resources and to ensure that future exploration activities can take place, while ensuring that other open space values in the River area are reasonably protected. Utilize sand and gravel resources of the River in such a way as to ensure that floodway, groundwater recharge, and wildlife habitat values are protected	CONSISTENT. As described in sections 4.4, Biological Resources and 4.9, Hydrology and Water Quality, mitigation measures would be implemented to ensure that the Kern River floodway, groundwater recharge, and wildlife habitat values are protected. Therefore, the proposed Project would be consistent with this goal.
Policy 1. Sand and gravel removal shall be done in such a manner as not to degrade, or otherwise adversely affect, the natural and scenic qualities of the Kern River, riparian vegetation, or wildlife habitat except as is necessary or appropriate to maintain the required channel capacity for flood control in the primary floodway.	CONSISTENT. As described in Sections 4.1, Aesthetics, 4.4, Biological Resources, and 4.9, Hydrology and Water Quality, mitigation measures would be implemented to protect the natural and scenic qualities of the Kern River, riparian vegetation and wildlife habitat. Therefore, the proposed Project would be consistent with Policy 1.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
Policy 2. Petroleum or sand and gravel activities proposed within the primary floodway shall conform to the specific requirements of the State Reclamation Board and other State and local regulatory agencies.	CONSISTENT. The proposed Project is designed to encourage environmentally-conscience oil and gas development through the implementation of County-wide development standards and a new oil and gas permitting process. The proposed standards are intended to meet the requirements of agencies with jurisdiction over resource protection, such as the State Reclamation Board and other State and local regulatory agencies. Therefore, by developing this EIR and implementing the proposed development standards, the County has considered the decisions and actions of other agencies with respect to oil and gas development and any activities proposed within the primary floodway shall conform to the specific requirements of these regulatory agencies. The proposed Project would be consistent with Policy 2.
Policy 3. Petroleum extraction zone overlays and drilling island delineation shall be established in areas designated for resource uses for the purpose of protecting natural vegetation and wildlife. Brush clearing, moving of vegetation, and similar activities shall be permitted only to the extent required for those activities and a reclamation plan prepared.	CONSISTENT. 90% of the wells developed under the Future Development Scenario would be constructed in Tier 1 areas, where oil and gas drilling and production activities are the predominant land uses. Additionally, mitigation measures described in Section 4.4, Biological Resources, would be implemented to protect natural vegetation and wildlife in the Project Area during future oil and gas development activities. Therefore, proposed Project would be consistent with Policy 3.
Policy 4. Noise abatement measures shall be required of all resource management activities which would adversely affect adjacent land uses or wildlife habitat.	CONSISTENT. Refer to Section 4.12, Noise, for a complete discussion of potential noise impacts resulting from the proposed Project and proposed noise abatement measures to reduce impacts. With the implementation of proposed development standards, the proposed Project would be consistent with Policy 4.
Policy 5. Mineral and petroleum exploration and extraction activities are permitted in the primary and secondary floodways subject to regulations, to be adopted within a two-year period by the County and City to accomplish the goals and policies of this Element and to mitigate adverse impacts which may otherwise result from construction of facilities and access thereto. Such regulations shall include, but need not be limited to, requirements limiting the impact of access and facilities construction upon adjacent areas, prohibiting activities creating obstructions to floodflow, estab1ishing minimal standards for flood proofing all wells, pumps and associated equipment, specifying spill prevention control and counter-measure plans and emergency procedures, and specifying site and access restoration.	CONSISTENT. As discussed in Section 4.9, Hydrology and Water Quality, all applicants would be required to comply with applicable laws, regulations and standards, including well drilling management, construction, monitoring, blowout prevention, fluid and mud containment and emergency response measures. Additionally, DOGGR regulations would require the preparation of spill contingency plans (in addition to federal requirements, if applicable, to develop spill prevention, control and countermeasure (SPCC) plans), secondary containment for stored materials on site, and fluid and chemical storage and handling equipment inspections and maintenance during oil and gas operations. Therefore, the proposed Project would be consistent with Policy 5.

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
CHAPTER 4. MAP PROVISIONS AND POLICIES	
The intent of this plan with regard to the Primary and Secondary Floodways of the Kern River is that: • No development or physical improvements for uses in the Primary Floodway which would restrict flows, interfere with groundwater recharge or increase the rise in water surface during high flows of the Kern River, or displace the primary floodway will be permitted. • Limited development, with an emphasis on preserving open space within the area of the Secondary Floodway, with recognition of the potential flood hazard that exists therein, may be permitted.	CONSISTENT. The proposed Project would not restrict flows, interfere with groundwater recharge or increase the rise in water surface during high flows of the Kern River, or displace the primary floodway for the Kern River. Therefore, the proposed Project would be consistent with Chapter 4 of this plan.
4.8 INDUSTRIAL	
Policy 5. Industrial areas should be separate from residential areas to protect both homes and factories.	CONSISTENT. As described in the Future Development Scenario, 90% of future oil and gas activity would be located in Tier 1 areas, near existing oil and gas facilities and outside of residential areas. Although wells could be drilled outside of Tier 1 areas, such development would be dispersed and therefore would not meet the intended definition of an "industrial area" under this policy. Any future proposals to construct industrial-type ancillary facilities that are not described in the Future Development Scenario, such as cogeneration facilities, are not covered under the proposed Project and would require a separate approval process. Therefore, the proposed Project would be consistent with Policy 5.
Policy 6. Industrial areas adjacent to the Kern River primary or secondary floodway should be buffered by landscaping or vegetation to provide the least possible conflict with open space values of the River.	CONSISTENT. Mitigation measures described in Section 4.4, Biological Resources, would be implemented to protect the Kern River floodway areas. Therefore, the proposed Project would be consistent with Policy 6.
CHAPTER 5. IMPLEMENTATION POLICIES	
B. OPEN SPACE AND DEVELOPMENT	
Implementation Policy 2. Any new non-open space development, including projects by public agencies, shall not occur without prior City or County approval of a "Development Plan." The "Development Plan" shall be reviewed for completeness and consistency with the following guidelines: a. Elevation drawings of all proposed structures and signs. b. Landscaping plan which provides for screening of obnoxious uses and respects	CONSISTENT. Prior to the issuance of a drilling permit, Kern County would review the applicant's oil and gas drilling permit application for completeness and consistency with the Metropolitan Bakersfield General Plan, including the guidelines outlined in this implementation policy. The drilling permit form would identify the location of the proposed well(s) and appropriate mitigation measures required for the drilling area. Therefore, the proposed Project would not conflict

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
existing views of the Kern River channel. c. Grading and revegetation plan. d. Plot plan or recent aerial photograph depicting existing uses and natural vegetation cover. e. A biota survey and analysis of effects which development would impose on any significant identified biota. f. A certified delineation of the primary and secondary floodways, if applicable to the site, depicting both predevelopment conditions and future development conditions. g. Other standard zoning and subdivision ordinance requirements in force at the time of application.	with and would be consistent with Implementation Policy 2.
Implementation Policy 4. All new development and accessory uses, excepting wells, shall maintain a minimum setback of 90 feet from the primary floodway line. If not feasible to do so because of lot size or configuration, new development, including accessory uses, shall maintain a setback from the primary floodway line of 60 percent or greater of the distance between the primary floodway line and the point of the lot farthest from the primary floodway.	CONSISTENT. As described in Section 4.9, Hydrology and Water Quality, the applicant would be required to comply with all applicable federal, state, regional and local agency laws and regulations, and commonly utilized industry standards, including the Kern County Floodplain Management Ordinance and General Plan and Zoning Code provisions related to floodplain risks. All development under the proposed Project would maintain the minimum setback standards in accordance with the Zoning Ordinance, as amended. Therefore, the proposed Project would be consistent with Implementation Policy 4.
Implementation Policy 5. In order to preserve views of the River, reasonable height limits will be imposed through the "Development Plan" review process on any new non-open space development within any floodway. Criteria for height limits shall be based on existing site factors, such as surrounding land use, vegetation, and distance to the Kern River course.	CONSISTENT. The proposed Project would enact new oil and gas development standards, which provide greater protection for visual resources in the Project Area than exists under current County standards. Section 4.1, Aesthetics, describes the impacts on visual resources that would result from future oil and gas development activities pursuant to the Project and mitigation measures that would reduce these impacts. Therefore, the proposed Project would be consistent with Implementation Policy 5.
Implementation Policy 6. Grading and filling for any new non-open space development shall not commence until approval under a "Development Plan."	CONSISTENT. Kern County would review and approve the applicant's drilling permit application prior to the issuance of a permit for drilling and associated construction activities. Therefore, the proposed Project would be consistent with Implementation Policy 6.
Implementation Policy 7. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, 8.4 areas (Mineral and Petroleum), and at River crossings or where it can be shown that the specific	CONSISTENT. As described in the Chapter 3.0, Project Description, the majority of new wells would be drilled in existing well fields in Tier 1 areas where oil and gas activity are the primary land use, and would include above-ground electrical

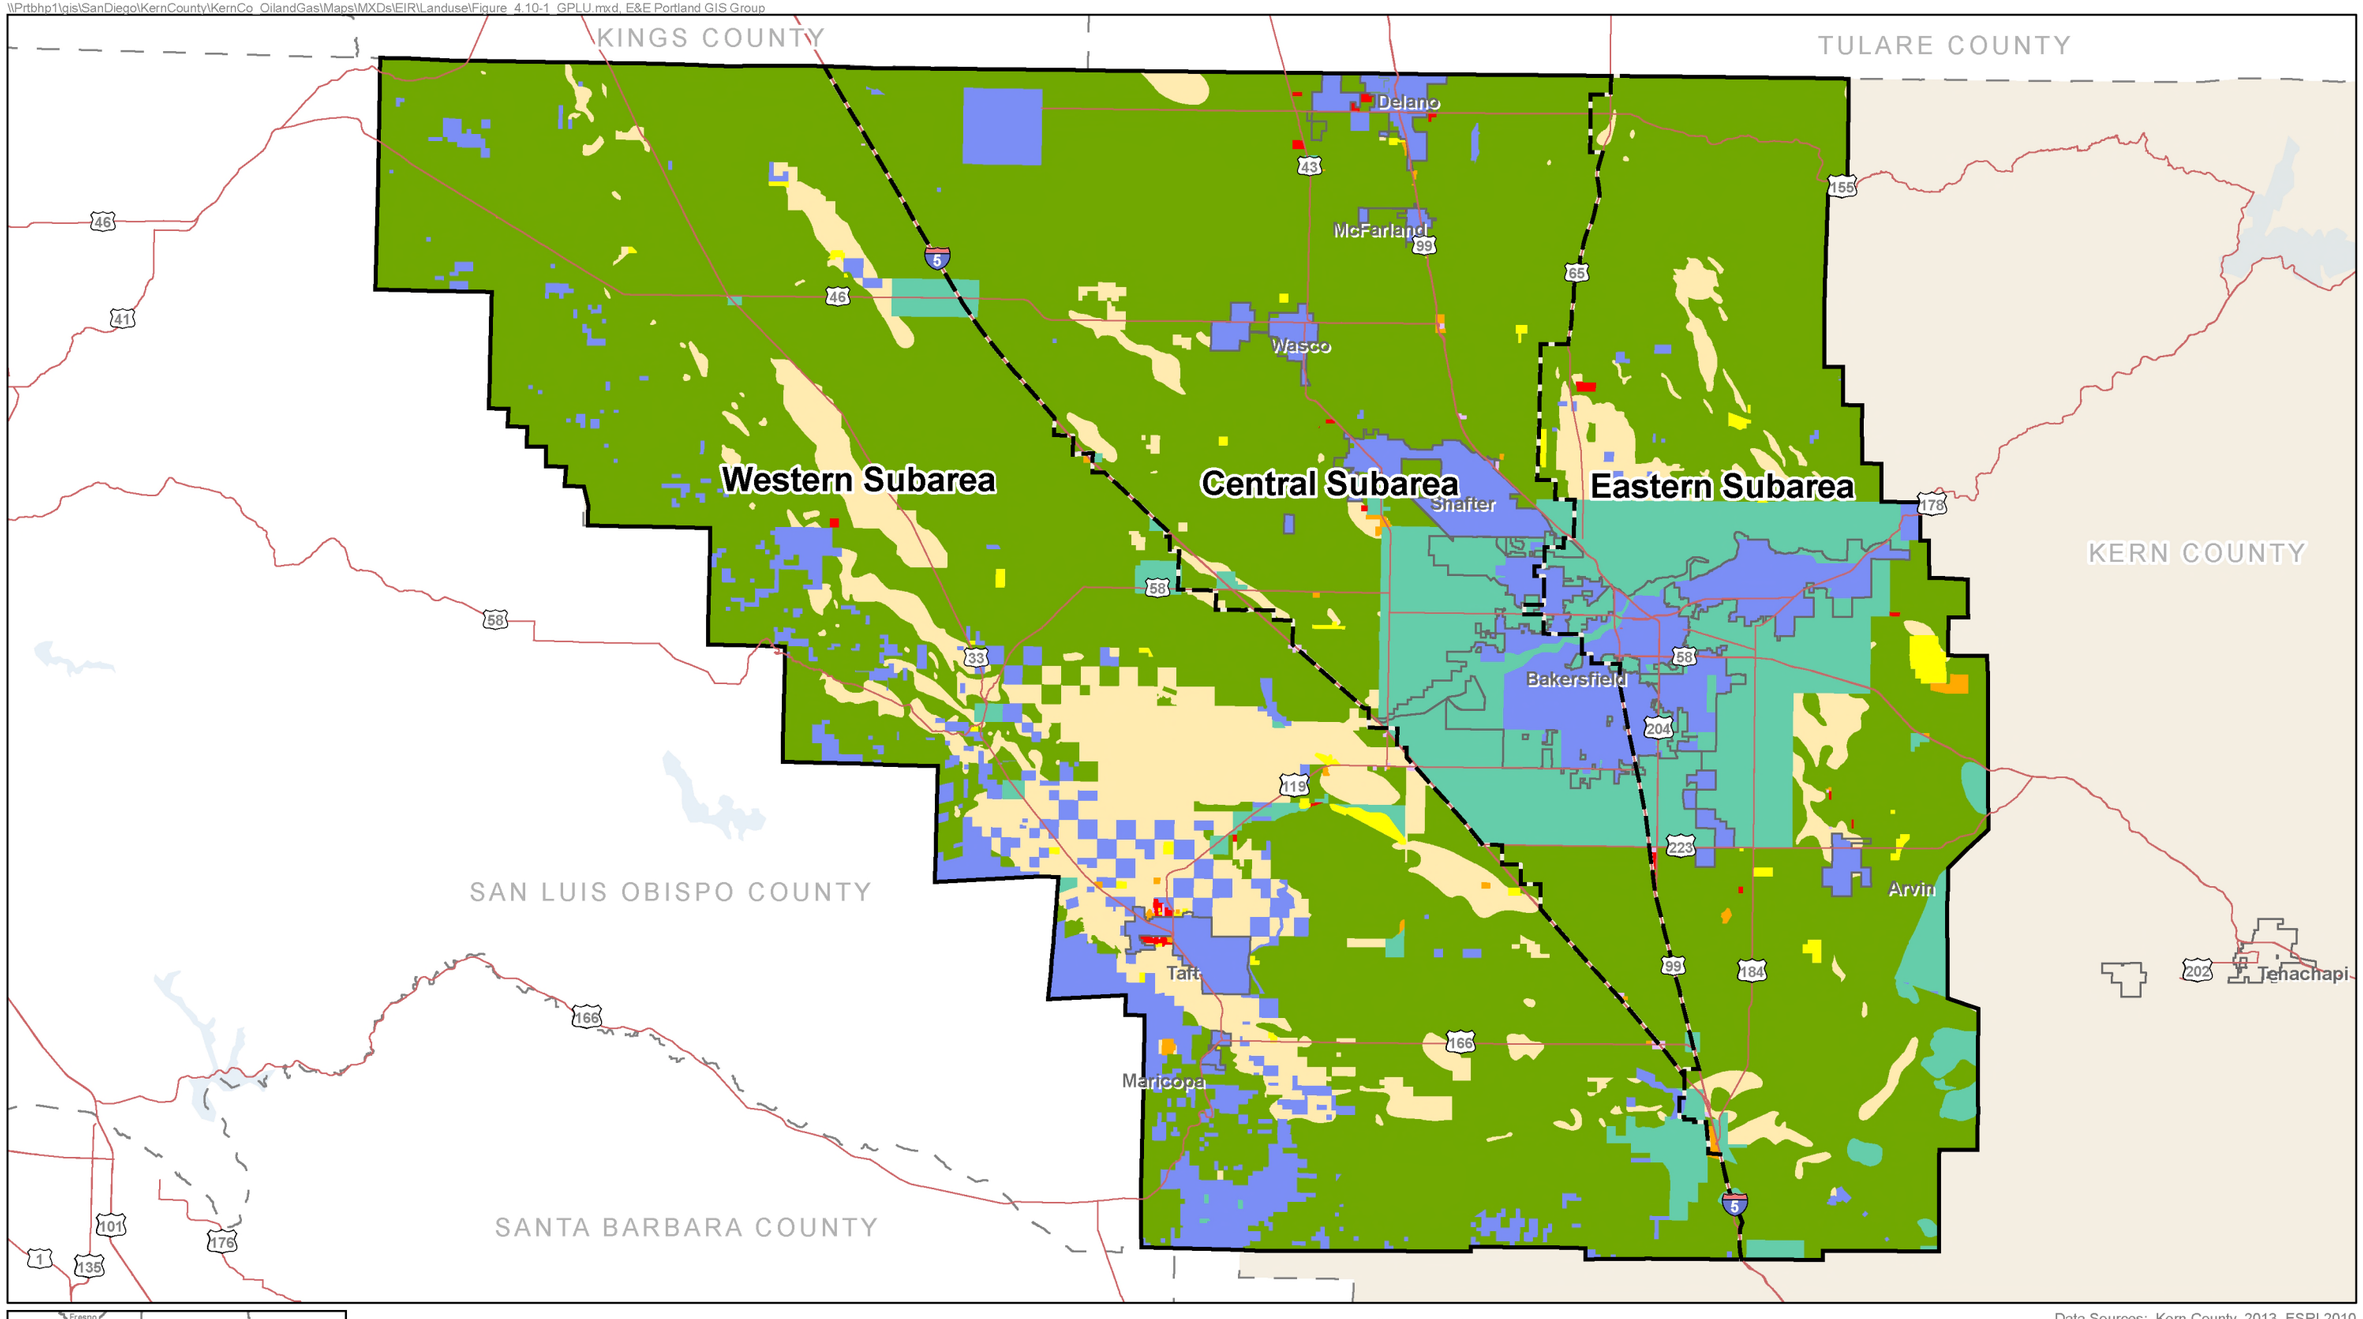

Table 4-10-7: Project Consistency with Local Planning Documents

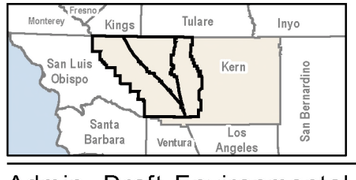

Goals and Policies	Proposed Project Consistency
nature of the facility is such that it is entirely infeasible to do so.	distribution lines, which are intended to supply lower voltages of power to individual wells. Therefore, the proposed Project would be consistent with Implementation Policy 7.
C. RIPARIAN VEGETATION	
Implementation Policy 1. The City and County shall develop a master list of plant species for criteria to approve "Development Plans." This list shall be considered for incorporation into this plan by General Plan Amendment. Revegetation or landscaping with native or compatible shrubs and trees shall be required as part of all public and private projects. Areas of unique habitat value, such as the Mesquite-Saltbush Association in the vicinity of Enos lane, shall be preserved in accordance with the City's approved plan for use of the 2,800-acre recharge area and River channel maintenance.	CONSISTENT. As described in Chapter 3.0, Project Description, of this EIR re-vegetation of abandoned or disturbed oil and gas areas shall be in accordance with native vegetation in the immediate area. Therefore, the proposed Project would be consistent with Implementation Policy 1.
Implementation Policy 2. Prior to any development within the Kern River Plan boundaries, including residential, commercial, industrial, recreational, water recharge, channel improvement, and resource recovery projects, a landscaping plan shall be submitted to the respective City or County Planning Department for review and approval.	CONSISTENT. Visual screening would be required for oil and gas activities near sensitive receptors. In addition, future oil and gas activities on Tier 4 lands would require a CUP in accordance with Section 19.104 of the Kern County Zoning Ordinance, and as a condition of the CUP a landscaping plan shall be submitted to the County Planning Department for review and approval, consistent with this policy. Therefore, the proposed Project would be consistent with Implementation Policy 2.
Implementation Policy 3. For all new development in residentially, commercially, and industrially zoned properties within the plan boundaries, the River setback area shall be either landscaped or revegetated. Except as might be required by the City or County Fire Department, no clearing of shrubs or tree cutting will be allowed unless otherwise provided for by this plan.	CONSISTENT. Section 4.4, Biological Resources, of this EIR discusses potential impacts and mitigation measures related to the Kern River corridor. Therefore, the proposed Project would be consistent with Implementation Policy 3.
F. MINERAL AND PETROLEUM EXTRACTION	
Implementation Policy 1. The City and County shall revise, within two years from adoption of this plan, mineral and petroleum extraction regulations and provisions of their respective floodplain zoning ordinances consistent with all plan policies and incorporate the following features: a. Strict limits on residential development. b. Restrictions on the removal of riparian vegetation. c. Noise limits when adjacent to highly sensitive and sensitive land uses.	CONSISTENT. The proposed Project includes an amendment to the Kern County Zoning Ordinance. New development standards that would be adopted under the proposed Project are intended to provide greater environmental protection with respect to oil and gas development in Kern County. As described in this EIR, the proposed Project would be consistent with all applicable policies in the Metropolitan Bakersfield General Plan, and mitigation measures would incorporate the features outlined in this implementation policy. See Section 4.1, Aesthetics,

Table 4-10-7: Project Consistency with Local Planning Documents

Goals and Policies	Proposed Project Consistency
d. Requirements for aesthetic treatment (painting, landscaping, screening) of production facilities (i.e., oil pump units, tanks, gravel crushers, etc.) located within the plan boundaries. e. Allowance for sand and gravel operations necessary to the Kern River floodway or floodplain. Allowances for petroleum extraction to occur with and without public hearing requirements and subject to a set of standard requirements, as in "a" through "d" above.	Section 4.4, Biological Resources, Section 4.9, Hydrology and Water Quality, and Section 4.12, Noise, for more information about specific measures. Therefore, the proposes Project would be consistent with Implementation Policy 1.
Implementation Policy 2. Mineral and petroleum extraction shall be encouraged on those lands designated "Mineral and Petroleum" on the Kern River Plan Map. Such use may also occur in other areas designated for recreation, resource, or industrial uses as long as the primary designated use is not significantly impaired and as long as such use would be consistent with other provisions of this plan and in compliance with existing local, State, and federal regulations.	CONSISTENT. The proposed Project includes an amendment to the Zoning Ordinance and includes development standards that would streamline the permitting process for oil and gas production, including development on lands designated "Mineral and Petroleum" and on other land designations where such development is allowed. Mitigation measures and compliance with existing local, state, and federal regulations would reduce adverse impacts to the environment Therefore, the proposed Project would be consistent with Implementation Policy 2.

Section 4.11

Mineral Resources

Section 4.11

Mineral Resources

4.11.1 Introduction

This section describes the affected environment and regulatory setting for mineral resources. It also describes the impacts on mineral resources that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

State law defines "minerals" as "[a]ny naturally occurring chemical element or compound, or groups of elements and compounds, formed from inorganic processes and organic substances, including, but not limited to, coal, peat, and bituminous rock, but excluding geothermal resources, natural gas, and petroleum" (14 CCR § 3501). For purposes of this Environmental Impact Report (EIR), "minerals" are defined as also including oil and gas resources.

4.11.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north; Santa Barbara and San Luis Obispo counties to the west; the Tehachapi Mountains and the Sierra Nevadas to east; and the northern boundary of the Los Padres National Forest to the south.

Kern County is located within District 4 of the State Division of Oil, Gas and Geothermal Resources (DOGGR) and is one of the richest oil-producing counties in the United States. The valley floor area of the County and the lower elevations of the surrounding mountain ranges contain numerous deposits of oil and gas resources, a major economic resource for the County. All oil and gas resources produced in District 4 as listed in State publications are from Kern County, except for about 1% that come from Tulare, Kings and San Luis Obispo counties.

Other mineral resources in Kern County include numerous mining operations that extract a variety of materials, including petroleum, natural gas, aggregate materials (sand and gravel), stone, gold, dimensional stone, limestone, clay, shale, gypsum, pumice, decorative rock, silica, and specialty sand.

Oil and Gas Resources

Kern County leads the state in oil and natural gas production. Kern County produced 77% of California's in-state oil in 2012 and about 64% of the state's total natural gas. Kern County's Elk Hills oilfield is the state's top natural gas producer. Two other fields, South Belridge and

Lost Hills, rank in the state's top five for gas production. The state's top five oil producing fields—Midway-Sunset, South Belridge, Kern River, Cymric, and Elk Hills—are located within the Project Area in Kern County. Three of these fields—Midway-Sunset, South Belridge, and Kern River—are ranked in the top 10 producing oilfields in the nation. Specifically, Kern County produced 141.69 million barrels of oil and 143.16 million cubic feet of natural gas in 2012 (DOGGR 2013). The historic production of oil and natural gas in Kern County, from 2002 to 2012, is provided in Chapter 3, Project Description (Table 3-3). As of 2014, of the 100 administrative wellfields located within Kern County, 76 are active fields that continue to produce oil and natural gas.

Mineral and petroleum resources are a fundamental element of Kern County's employment base and overall economy. As new recovery technologies come into use, petroleum extraction should continue its economic importance. Even as California ramps up state laws to promote renewable energy resources and alternative transportation fuels, experts continue to recognize that oil and gas production will continue to be critical, and domestic oil and gas production remains a vital national interest.

Aggregate Materials Resources (Sand and Gravel)

The State Geologist has classified 2,971 square miles of land in Kern County as Mineral Resource Zones (MRZs) of varying significance. The designated mineral resource zones in the Project Area are for aggregate resources, consisting of stone, sand, and gravel, generally suitable for use in building and road construction (CGS 2009), and are defined as follows:

- **MRZ-1**: Areas where available geologic information indicates that little likelihood exists for the presence of significant mineral resources.
- **MRZ-2**: Areas where adequate information indicates that significant mineral deposits are present, or where it is judged that a high likelihood for their presence exists. This zone shall be applied to known mineral deposits or where well-developed lines of reasoning, based upon economic-geologic principles and adequate data, demonstrate that the likelihood for occurrence of significant mineral deposits is high.
- **MRZ-3:** Areas containing known or inferred mineral occurrences of undetermined mineral resource significance (CGS 2009).

The locations of MRZ-1 and MRZ-2 zones are presented on Figure 4.11-1. The remainder of the Project Area either has not been studied for the presence of aggregate material resources or is designated as MRZ-3 where inferred occurrences of resources are of undetermined significance (CGS 2009).

Two areas within the Project Area are designated as MRZ-1, where there is little likelihood for the presence of aggregate material resources. One MRZ-1 zone is located within the Central Subarea just south of State Highway 46; the other zone crosses the Western, Central, and Eastern Subareas in the southern portion of the Project Area (Figure 4.11-1). Both MRZ-1 zones

are located in agricultural areas identified by the Project Description as "Tier 2" areas (Figure 4.11-2). The MRZ-1 zones partially overlap Core Areas (Figure 4.11-1).

Eleven aggregate material deposits are designated as MRZ-2 within the Project Area. As shown on Figure 4.11-1, two MRZ-2 zones are located wholly within the Western Subarea and six are wholly located within the Eastern Subarea. One of the MRZ-2 zones bisects the Western and Eastern Subareas in the southern portion of the Project Area, along Interstate 5. Two MRZ-2 zones bisect the Central and Eastern Subareas, along State Highways 99 and 65. Most of the MRZ-2 zones are located in agricultural areas identified by the Project Description as "Tier 2" areas. In addition, some MRZ-2 zones are located within areas identified as "Tier 3" and "Tier 4" (Figure 4.11-2). All of the MRZ-2 zones overlap Core Areas partially or wholly.

A number of smaller areas in the vicinity of known deposits are designated as MRZ-1 where the resource has been mined out. The remainder of the Project Area either has not been studied for the presence of aggregate material resources or is designated as MRZ-3, where inferred occurrences of resources are of undetermined significance (CGS 2009).

Aggregate Mines

Based on a database search of active mines listed in the California Department of Conservation, Office of Mine Reclamation (OMR) database, there are 21 active or newly permitted (and presumed to be active in the near future) aggregate materials mines in the Project Area. Figure 4.11-3 shows mines and mineral resources in the Project Area and the Core Area boundaries as defined in the Project Description. Multiple data sources were used to develop this figure. For this reason mines and/or mineral deposits may appear as more than one map symbol. For example, active mines in deposits known before 1962 will appear on Figure 4.11-3 as an active mine symbol based on data from (OMR 2015) and a separate symbol to indicate the presence of a deposit, based on data from Mineral Resources of Kern County, County Report 1 (CDMG 1962). Deposits known before 1962 (from CDMG 1962) are described as potential deposits because they may have since been mined out or may still represent a recoverable resource.

As shown on Figure 4.11-3, a total of five of the active and newly permitted aggregate mines are located within the administrative boundaries of active oilfields. Three active and newly permitted aggregate mines are located in the Western Subarea, two of which are located within the administrative boundaries of active oilfields. Three active aggregate materials mines are located in Core Areas of the Western Subarea. No active or newly permitted aggregate materials mines are located in the Central Subarea. In the Central Subarea, no active aggregate materials mines are located in Core Areas. Eight active or and newly permitted aggregate materials mines are located in the Eastern Subarea, three of which are located within the administrative boundaries of active oilfields. Seven aggregate mines are located in the Eastern Subarea, four of which are located within the administrative boundaries of active oilfields. In the Eastern Subarea, a total of four active aggregate materials mines are located in Core Areas.

Other Mineral Resources

Based on a search of the California Department of Conservation, Office of Mine Reclamation, database, there are seven active mines in the Project Area producing either shale, diatomite, clay, or gypsum. The OMR list does not specify the product being produced for two mines. There are 21 additional active mines producing aggregate materials (sand and gravel), as discussed above (OMR 2015).

As shown on Figure 4.11-3 deposits or historic mines for clay, copper, gems and minerals, lode gold, gypsum, specialty sand, sulfur, and uranium occur within the Project Area. There are five clay deposits in the Project Area, three of which are located within the administrative boundary of an active oilfield. There is one copper deposit in the Project Area, which is located outside the administrative boundaries of any oilfield. There are two gem and mineral localities in the Project Area, which are located outside the administrative boundaries of any oilfield. There are two lode gold and one placer gold deposits in the Project Area, which are located outside the administrative boundaries of any oilfield. There are 28 gypsum deposits in the Project Area, nine of which are located within the administrative boundaries of an active oilfield. There is one specialty sand deposit in the Project Area, which is located outside the administrative boundaries of any oilfield. There are three sulfur deposits in the Project Area, one of which is located within the administrative boundaries of an active oilfield. There are ten uranium deposits in the Project Area, five of which are located within the administrative boundaries of an active oilfield. (CDMG 1962)

In the Western Subarea, there are eight uranium, two clay, six potential aggregate materials, two sulfur, and 23 gypsum deposits mapped in Core Areas. In the Central Subarea, there is one aggregate materials deposit mapped in Core Areas. In the Eastern Subarea, there are one clay, potential aggregate materials, and two gypsum deposits mapped in Core Areas. Please note that the aggregate material deposits discussed here are not currently active mines in contrast to the active mines discussed above.

4.11.3 Regulatory Setting

Federal

Surface Mining and Reclamation Act of 1975

The Surface Mining and Reclamation Act of 1975 (SMARA) was mandated in order to identify and protect mineral resources of statewide or regional significance and ensure that those resources are available when needed. SMARA requires the State Geologist to classify land into MRZs according to its known or inferred mineral potential. The primary goal of mineral land classification is to ensure that the mineral potential of land is recognized by local government decision makers and considered before land use decisions are made that could preclude mining.

State

Division of Oil, Gas, and Geothermal Resources

DOGGR regulates the production of oil and gas, as well as geothermal resources, within the State of California. DOGGR regulations, which are contained in CCR, Title 14, Division 2, Chapter 4, include well design and construction standards, surface production equipment and pipeline requirements, and well abandonment procedures and guidelines. DOGGR regulates well abandonment procedures to ensure effectiveness in preventing migration of oil and gas from a producing zone to shallower zones, including potable groundwater zones. DOGGR oversees well operations.

DOGGR also has regulatory authority over Class II injection wells for enhanced recovery and disposal. In California, the operation of all Class II injection wells are regulated by DOGGR, under provisions of CCR Section 1724.6, and the federal Safe Drinking Water Act. When an operator ceases well operation or production, state law requires the well to be abandoned within a reasonable time period.

Effective January 1 2014, California adopted several new and amended provisions of the Public Resources Code and Water Code to regulate any oil or gas well stimulation activity designed to enhance oil or gas production or recovery by increasing the permeability of the geologic formation that contains hydrocarbon deposits. Well stimulation activities covered by the new legislation include hydraulic fracturing and acid well stimulation treatments. The legislation, commonly referred to as Senate Bill 4 (SB 4), amended Sections 3213, 3215, 3236.5, and 3401 of the Public Resources Code, added Article 3 to Chapter 1 of Division 3 of the Public Resources Code, and added Section 10783 to the Water Code. SB 4, as amended, requires that DOGGR: (1) promulgate emergency interim regulations by January 2014 and adopt permanent regulations regulating well stimulation treatments by July 2015; (2) complete a statewide Environmental Impact Report on well stimulation treatments by July 2015; (3) complete an independent scientific study of well stimulation by January, 2015; and (4) consult and reach formal agreements with other regulatory agencies to provide regulatory accountability for, and public transparency to, well stimulation treatments by January, 2015.

DOGGR adopted interim well stimulation regulations in January 2014, and readopted the interim regulations in July 2014. Proposed permanent regulations were circulated for public review and comment in October 2014, adopted on December 30, 2014, and are scheduled to go into effect by July 1, 2015.

State Mining and Geology Board

Pursuant to SMARA, mineral lands are mapped with the California Mineral Land Classification System according to jurisdictional boundaries. All mineral commodities in the area, including aggregates, common clay, and dimensional stone, are mapped at one time. Priority is given to areas where future mineral resource extraction could be precluded by incompatible land uses or mineral resources are likely to be mined during the 50-year period following their classification.

Detailed mineral land classification and designation reports provided by the State Mining and Geology Board (SMGB) are on file with the City of Bakersfield and Kern County. SMGB also has adopted regulations (14 Cal. Code Regs. 3500 et seq.) establishing state policy for reclamation of mined lands and conduct of surface mining operations.

The SMGB established MRZs to designate lands that contain mineral deposits. Accordingly, the MRZ classification system is used to evaluate an area's mineral resources pursuant to SMARA. A "resource" is a concentration of naturally occurring solid, liquid, or gaseous material in such form and amount that economic extraction of the commodity from the concentration is currently potentially feasible. A "reserve" is that part of the resource base that could be economically extracted or produced within the foreseeable future. For any given mineral resource, an area may be classified as MRZ-1, MRZ-2, MRZ-3, or MRZ-4, as follows:

- **MRZ-1**: Areas where the available geologic information indicates that no significant mineral deposits are present or where it is judged that no significant likelihood exists for their presence;
- **MRZ-2a**: Areas where the available geologic information indicates that significant mineral deposits are present;
- **MRZ-2b**: Areas where the available geologic information indicates that there is likelihood for the presence of significant mineral deposits;
- **MRZ-3a**: Areas where the available geologic information indicates that mineral deposits exist, but the significance of the deposits cannot be determined from available data;
- **MRZ-3b**: Areas where the available geologic information indicates that mineral deposits are likely to exist, but the significance of the deposits cannot be determined from available data; and
- **MRZ-4**: Areas where the available geologic information is inadequate for assignment into any other MRZ or where there is not enough information available to determine the presence or absence of mineral deposits.

As described in Section 4.11.2, Environmental Setting, the Project Area contains mineral resource areas classified as MRZ-1, MRZ-2, and MRZ-3.

According to the SMGB, "Designation" is the process by which the SMGB determines that a particular classified mineral deposit is of regional, multi-community, or statewide economic significance. This process is facilitated through analyses by the State Geologist and the California Division of Mines and Geology (also known as the California Geological Survey, or CGS), and information gathered from local communities, the mining industry, and other governmental agencies, such as the Governor's Office of Planning and Research. The purpose of Designation is to identify those areas that are of prime importance in meeting future needs of the study region and that remain available from a land use perspective.

Designation is an effort to conserve mineral resources in regions of expected rapid urbanization or other land uses that might prevent surface mining activities, and therefore result in a loss of the mineral resource to the community. To avoid dictating to local communities where future aggregate mines should be located, mineral designated areas generally contain resources (un-permitted deposits) that are far in excess of the region's 50-year demand. This approach attempts to provide maximum flexibility to local governments in making land use decisions, while still conserving an adequate amount of construction aggregate for the future.

The objectives of these processes are to provide local agency decision makers with information on the location, need, and importance of mineral resources within their jurisdiction, and to require that this information be considered in local land use planning decisions. These objectives are met through the adoption of local Mineral Resource Management Policies that provide for the conservation and prudent development of these mineral deposits.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element and the Energy Element of the KCGP include goals, policies, and implementation measures related to mineral resources that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.9. Resource

Goals

Goal 1. To contain new development within an area large enough to meet generous protections of foreseeable need, but in locations that will not impair the economic strength derived from the petroleum, agriculture, rangeland, or mineral resources or diminish the other amenities that exist in the County.

Goal 2. Protect areas of important mineral, petroleum, and agricultural resource potential for future use.

Goal 3. Ensure the development of resource areas to minimize effects on neighboring resource lands.

Goal 4. Encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decision and actions of other agencies as they affect energy development in Kern County.

Policies

Policy 1. Appropriate resource uses of all types will be encouraged as desirable and consistent interim uses in undeveloped portions of the County regardless of General Plan designation.

Policy 2. In areas with a resource designation on the General Plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of the particular resource will be considered to be consistent with this General Plan.

Policy 14. Emphasize conservation and development of identified mineral deposits.

Policy 17. Lands classified as MRZ-2, as designated by the State of California, should be protected from encroachment of incompatible land uses.

Policy 25. Discourage incompatible land use adjacent to Map Code 8.4 (Mineral and Petroleum) areas.

Implementation Measures

Implementation Measure H. Use the California Geological Survey's latest maps to locate mineral deposits until the regional and Statewide importance mineral deposits map has been completed, as required by the Surface Mining and Reclamation Act.

Implementation Measure I. Periodically review the Zoning Ordinance to reflect new technology and energy sources, and encourage these types of uses for new development.

Implementation Measure K. Protect oilfields and mineral extraction areas through the use of appropriate implementing Zone Districts: A (Exclusive Agriculture), DI (Drilling Island), NR (Natural Resource), or PE (Petroleum Extraction).

Chapter 5. Energy Element

5.2. Importance of Energy to Kern County

General Goal

To assert Kern County's position as California's leading energy provider, to encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decisions and actions of other agencies as they affect energy development in Kern County.

Policies

Policy 5. The County shall work with other agencies to define regulatory responsibility concerning energy-related issues, and shall seek to eliminate, insofar as possible, duplicative regulations.

5.3. Petroleum Resources and Development

Policies

Policy 4. All oilfield development shall take place in accordance with regulations administered by DOGGR.

Implementation Measures

Measure C. The County shall monitor its regulations pertaining to petroleum exploration production and update such regulations as necessary.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to mineral resources.

Chapter II. Land Use Element

Policies

Policy 31. Allow for a variety of industrial uses, including land-extensive mineral extraction and processing, heavy manufacturing, light manufacturing, warehousing and distribution, transportation-related, and research and development uses (I-1).

Chapter V. Conservation Element

B. Mineral Resources

Goals

Goal 1. Protect areas of significant resource potential for future use.

Goal 2. Document areas of current mineral and energy resource extraction, as a basis for land use and conservation policies and programs.

Goal 3. Avoid conflicts between the productive use of mineral and energy resource lands and urban growth.

Goal 4. Protect land, water, air quality and visual resources from environmental damage resulting from mineral and energy resource development.

Policies

Policy 4. Land use decisions shall recognize the importance of identified mineral resources and need for conservation of resources identified by the State Mining and Geology Board (I-2).

Policy 7. Promote development of compatible uses adjacent to mineral extraction areas (I-2).

Policy 10. Implement, as appropriate, the California Environmental Quality Act to minimize land use conflicts and reduce environmental impacts of all proposed resource extraction operations (I-2).

Policy 11. Prohibit incompatible development in areas which have a significant potential for harm to public health, safety and welfare due to mineral and petroleum extraction and processing (I-2).

Policy 12. Design resource extraction operations subject to discretionary permits to maintain the integrity of areas of "high environmental quality" and unique scenic value (I-2).

Policy 14. Review all discretionary mineral or petroleum development including renewal of existing authorizations, under the policies and procedures of the California Environmental Quality Act (I-4).

Policy 15. Require petroleum production sites in urban areas which are subject to discretionary permits, to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways (I-4).

Policy 16. Require all mineral development to be predicated on appropriate reclamation plans that meet the standards of the State Surface Mining and Reclamation Act and the implementing guidelines of the State Mines and Geology Board, and (or) the standards of the State Division of Oil and Gas. Reclamation/restoration of the sites shall be done as each phase of development or extraction is completed (I-4, I-5).

Implementation Measures

Implementation Measure 3. Periodically review and update local Zoning Ordinances that have been amended to accommodate mineral extraction uses outside of mineral resource zones.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

4.11.4 Impacts and Mitigation Measures

Methodology

The following documents were analyzed and compared to identify potential conflicts of the Project's presence and operations with mineral resource extraction:

- Mines and Mineral Resources of Kern County, California, County Report 1. California Division of Mines and Geology (CDMG 1962).
- Update of Mineral Land Classification: Aggregate Materials in the Bakersfield Production-Consumption Region, Kern County, California. California Geological Survey (CGS 2009).
- 2012 Preliminary Report of California Oil and Gas Production Statistics, Publication PR03. California Division of Oil, Gas, and Geothermal Resources (DOGGR 2013).
- Mines in Kern County, California, from the Mineral Resource Data System, from the United States Geological Survey (MRDS 2011).
- Mines within the Project Area, California Department of Conservation, Office of Mine Reclamation (OMR 2015).
- Surface Mining and Reclamation Ordinances – Current Status: January 29, 2014. California Department of Conservation, State Mining Geology Board (SMGB 2014).

A list of the specific cited references is provided at the end of this resource section.

Thresholds of Significance

The Kern County California Environmental Quality Act (CEQA) Implementation Document and Kern County Environmental Checklist state that a project would have a significant impact on mineral resources if it would:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; or
- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

Project Impacts

The Project will protect and preserve the availability of known oil and gas resources, and the ongoing and future extraction of such resources, while imposing additional environmental mitigation measures, and substantive and procedural ordinance mandates, to avoid and minimize the significant impacts associated with such activities. Development of oil and gas resources through the Oil and Gas Conformity Review process under the Amended Zoning Ordinance is considered a beneficial mineral resource impact of the Project. Increasing oil and gas exploration

and production in Kern County and encouraging ongoing economic development by the oil and gas industry are among the Project Objectives.

The types of potential impacts related to mineral resources other than oil and gas are generally the same for both construction and operation of future oil and gas exploration and production activities, and therefore the analysis provided below applies to both temporary construction impacts and operational impacts.

Impact 4.11-1: Result in the Loss of Availability of a Known Mineral Resource that would be of Value to the Region and the Residents of the State

Future oil and gas exploration and production activities could result in the temporary or permanent loss of availability of another type of mineral resource if development of oil and gas resources overlaps with areas that contain other mineral resources and those resources could not be extracted, or if oil and gas exploration and production activities prevented access to mineral resources.

There are two mapped clay deposits, 13 potential aggregate materials deposits, and nine gypsum, one sulfur, and five uranium deposits located within the current administrative boundaries of the oil and gas fields in the Project Area. There are three clay, 25 gypsum, eight uranium, and 20 potential aggregate materials deposits mapped within the Core Areas (Figure 4.11-3).

- In the Western Subarea, there are one clay, nine gypsum, one sulfur, five uranium, and six aggregate materials deposits within the administrative boundaries of oil and gas field. There are eight uranium, 23 gypsum, six aggregate materials, two sulfur, and two clay deposits mapped in Core Areas in the Western Subarea.

- In the Central Subarea, there is one potential aggregate materials deposit within the administrative boundary of an oil and gas field and in a Core Area.

- In the Eastern Subarea, there are six potential aggregate materials deposits and one clay deposit within the administrative boundaries of oil and gas fields. There are two gypsum, 13 aggregate materials, and one clay deposits mapped in Core Areas in the Eastern Subarea.

Mineral resource mines are active within the Project Area, including within the Core Areas of the oil and gas fields in the Project Area (Figure 4.11-3). Currently, eight mines are active within the administrative boundaries of oil and gas fields in the Project Area. These include five aggregate materials mines, one shale mine, one diatomite mine, and one gypsum mine.

- In the Western Subarea, there are one shale, one gypsum, one diatomite, and two aggregate materials mines currently active within the administrative boundaries of oil and gas fields. There are one gypsum, two diatomite, three aggregate materials, and two shale mines active in Core Areas of the Western Subarea.

- In the Central Subarea, there are no active mines within the administrative boundary of an oil and gas field or within a Core Area.

- In the Eastern Subarea, there are three aggregate materials mines currently active within the administrative boundaries of oil and gas fields. There are four aggregate materials mines active in Core Areas of the Eastern Subarea.

The presence of these mines within existing oil and gas fields demonstrates that concurrent development of both types of mineral resources is possible, and that the presence of oil and gas exploration and production facilities does not preclude the development of other mineral resources. With the use of directional drilling, oil and gas resources—which are typically located below other recoverable mineral deposits—can be developed from the perimeter of those deposits. Conversely, oil and gas development activities can be conducted concurrently with or after mining of another resource. For example, oil wells can be drilled on a reclaimed mine or in portions of active mines, such as mined out areas or areas that will not be mined for a number of years. Therefore, future development of oil and gas facilities from the implementation of the proposed Project would not result in the loss of availability of other known mineral resources and the Project would result in a less than significant impact.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Impact 4.11-2: Result in the Loss of Availability of a Locally Important Mineral Resource Recovery Site Delineated on a Local General Plan, Specific Plan, or Other Land Use Plan

The Kern County General Plan does not separately delineate any locally important mineral resource recovery site. However, General Plan Resource Policy 17 provides that "Lands classified as MRZ-2, as designated by the State of California, should be protected from encroachment of incompatible land uses." Future oil and gas exploration and production activities could result in the loss of availability of local important mineral resource if oil and gas activities prevented access to those resources. Based on a review of California Geological Survey publications, the locally important mineral resource recovery sites in the Project Area are aggregate materials resources. As shown on Figure 4.11-1, designated mineral resources zones for aggregate materials overlap the current administrative boundaries of oil and gas fields. Future development of petroleum resources could overlap areas that contain aggregate materials resources.

As described above, mineral resource mines are currently active within the administrative boundaries and Core Areas of oil and gas fields in the Project Area. For example, two aggregate materials mines are within the boundaries of MRZ-2, where significant aggregate materials

deposits are present. This demonstrates that oil and gas activities and mineral extraction can and do occur in close proximity to each other. With the use of directional drilling, oil and gas resources can be developed below mineral deposits. Mineral resources can also be developed after oil and gas operations end. Conversely, oil and gas development activities can be conducted concurrent with or after mining of aggregate materials resources. For example oil wells can be drilled on a reclaimed mine or in portions of active mines such as mined out areas or areas that will not be mined for a number of years. Therefore, future development of oil and gas facilities from the implementation of the proposed Project would not result in the loss of availability of other important mineral resources, and the Project would result in a less than significant impact.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

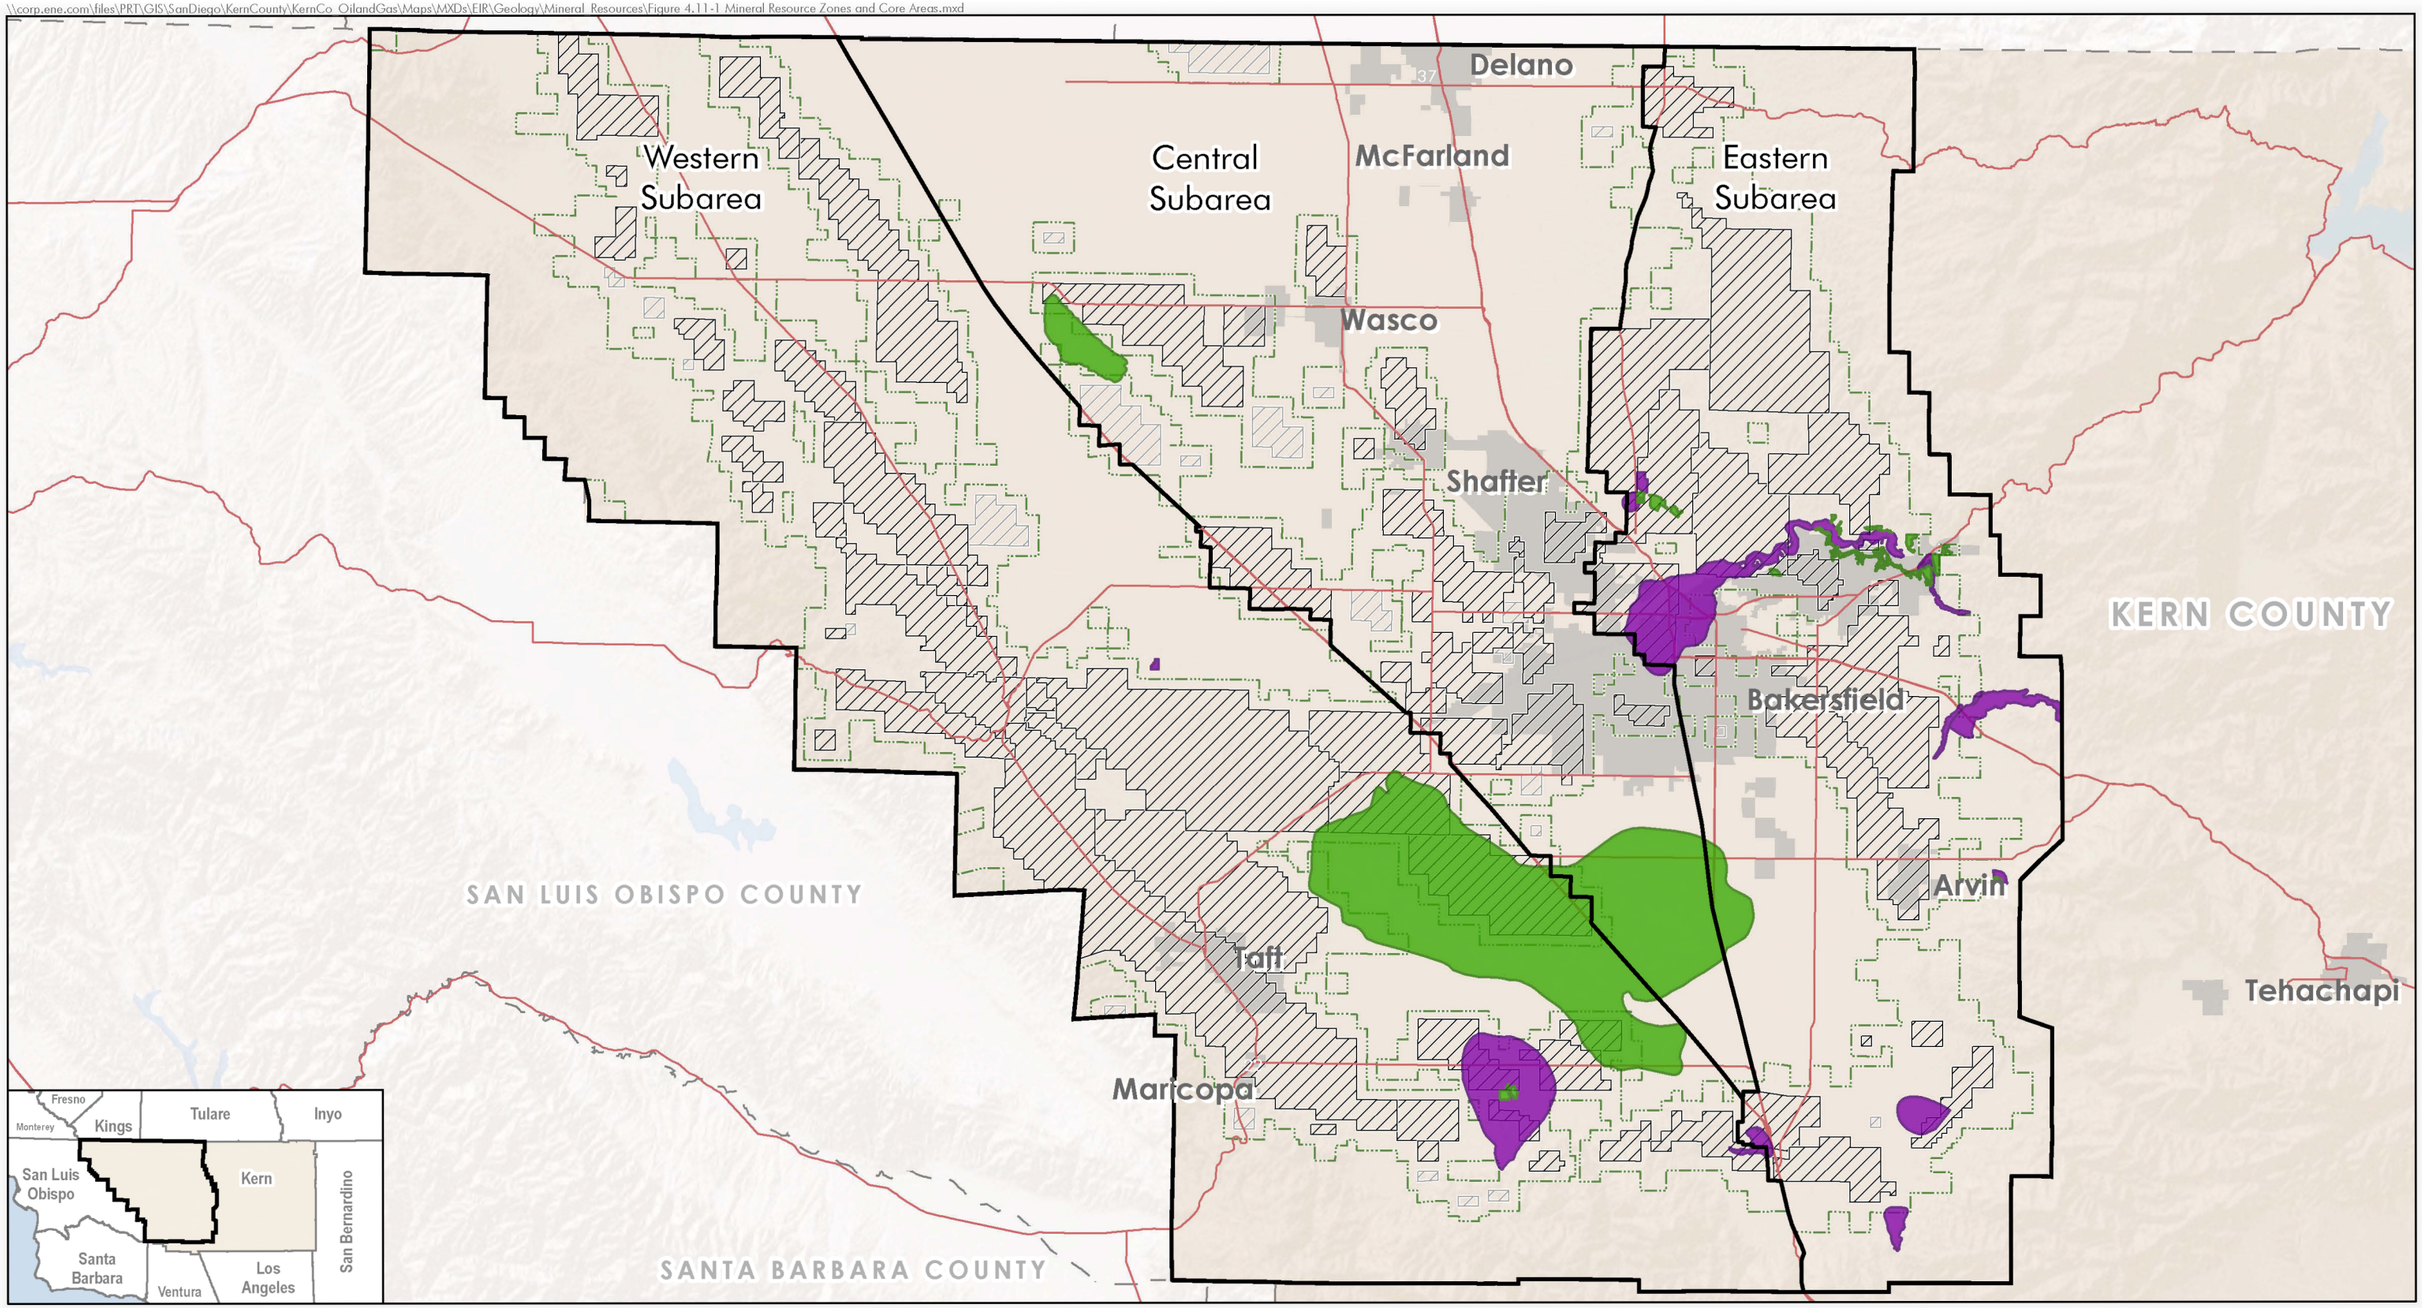
4.11.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to mineral resources includes the area within 6 miles of the Project Area boundary, and areas (e.g., incorporated cities) within the Project Area that are not subject to County jurisdiction. While projects in a larger area may affect some of the same mineral resources as the Project, by focusing on projects within the Project Area and 6 miles outside of the Project Area, the analysis of cumulative impacts includes those projects that would most comparably affect the same resources as the Project.

Impact 4.11-3: Contribute to Cumulative Mineral Resources Impacts

As described above, with techniques such as directional drilling and opportunities to develop oil and gas resources and other mineral resources concurrently or sequentially, the Project would not interfere with the recovery of other mineral resources within the Project Area or cause any potentially significant adverse impacts to mineral resource recovery outside the Project Area. As a result, the Project will not result in a cumulatively considerable contribution to cumulative impacts to mineral resources and the impact would be less than significant.



Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Section 4.12

Noise

Section 4.12

Noise

4.12.1 Introduction

This section describes the affected environment and regulatory setting for noise quality. It also describes the impacts on noise receptors that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

This section is based on an independent evaluation of noise conditions in the Project Area, Project activities that cause noise, and the effectiveness of noise-related mitigation and avoidance measures. The section is also informed by the Environmental Noise Assessment Noise Study Technical Report prepared by Brown-Buntin Associates, Inc. (Brown-Buntin 2015), entitled "Environmental Noise Assessment, Oil and Gas Development EIR Kern County, California," which is presented in Appendix V.

Terminology

Noise

The assessment of noise impacts uses specific terminology and fundamental descriptors not commonly used in everyday conversation. Therefore, in order to assist in a thorough understanding of the subsequent analysis, these terms are discussed in this subsection.

Acoustics is the study of sound, and noise is defined as unwanted sound.

Airborne sound is a rapid fluctuation or oscillation of air pressure above and below atmospheric pressure creating a sound wave.

The **pitch** or loudness of sound determines whether a sound is of a pleasant or objectionable nature. Pitch, which is the height or depth of a tone or sound, is louder to humans when it is high-pitched versus low-pitched. The loudness of a sound is determined by a combination of the intensity of the sound waves with the reception characteristics of the ear.

Measurement scales are used to describe sounds. A **decibel (dB)** is a unit used to describe the amplitude of sound, and sound levels are calculated on a logarithmic, not linear, basis. The lowest sound level that an unimpaired human ear can hear is described as zero on the decibel scale. Due to the logarithmic nature of measuring sound levels on the decibel scale, a 10-dB increase represents a tenfold increase in acoustic energy, whereas a 20-dB increase represents a hundredfold increase in acoustic energy. Because a relationship exists between acoustic energy and intensity, each 10-dB increase in sound level can have an approximate doubling effect on loudness as perceived by the human ear.

The most common metric is the overall **A-weighted sound level measurement (dBA)** that has been adopted by regulatory bodies worldwide. The A-weighting network measures sound in a fashion similar to the way a person perceives or hears sound, thus achieving very good correlation in terms of evaluating acceptable and unacceptable sound levels.

The relative A-weighted noise levels of common sounds measured in the environment and industry for various qualitative sound levels are provided in Table 4.12-1.

Table 4.12-1: Typical Sound Levels Measured in the Environment and Industry

Noise Source at a Given Distance	A-Weighted Sound Level (in decibels)	Qualitative Description
Carrier deck jet operation Jet takeoff (200 feet)	140 130 120	Pain threshold
Auto horn (3 feet) Jet takeoff (1,000 feet) Shout (0.5 feet)	110 100	Maximum vocal effort
Heavy truck (50 feet)	90	Very annoying; hearing damage (8-hr, continuous exposure)
Pneumatic drill (50 feet) Freight train (50 feet) Freeway traffic (50 feet)	80 70 to 80 70	Annoying Intrusive (telephone use difficult)
Air conditioning unit (20 feet) Light auto traffic (50 feet) Living room/Bedroom	60 50 40	Quiet
Library/Soft whisper (5 feet) Broadcasting/Recording studio	30 20 10	Very quiet Just audible

Source: Adapted from Table E (NYSDEC 2001).

A-weighted sound levels can be measured or presented as **equivalent sound pressure level (L_{eq})**. This is defined as the average noise level, on an equal-energy basis for a stated period of time, and is commonly used to measure steady-state sound or noise that is usually dominant. Statistical measurements are typically denoted by L_n, where 'n' represents the percentile of time the sound level is exceeded. The measurement of L_{90} represents the noise level that is exceeded during 90% of the measurement period. Similarly, the L_{10} represents the noise level exceeded for 10% of the measurement period. The maximum noise level (L_{max}) is the maximum instantaneous noise level during a specific period of time.

Of particular interest in this analysis are other descriptors of noise that are commonly used to help determine noise/land use compatibility and predict an average community reaction to adverse effects of environmental noise, including traffic-generated, construction, and industrial noise. One of the most universal descriptors is the average day-night level (DNL or L_{dn}). As a result of

recommendation by the California Health Department and state planning law, this descriptor is used by many planning agencies, including Kern County's Planning and Community Development Department. The L_{dn} noise metric represents a 24-hour period and applies a time-weighted factor designed to penalize noise events that occur during nighttime hours when relaxation and sleep disturbance are of more concern for average residents. Noise occurring during the daytime hours—between 7:00 AM and 10:00 PM—is measured in decibels. Noise occurring between 10:00 PM and 7:00 AM, however, is effectively "penalized" by adding 10 dB to the measured level. In California, the use of the community noise equivalent level (CNEL) descriptor is also permitted. CNEL is identical to the day-night average sound level metric, except that CNEL adds a 5 dB penalty for noise occurring during evening hours between 7:00 PM and 10:00 PM (Harris 1991) as well as the 10 dB penalty added between 10:00 PM and 7:00 AM.

Vibration

Vibration is defined as the mechanical motion of the ground, or buildings or other type of structures, that is induced by the operation of mechanical devices or equipment. Vibration generally results in an "oscillatory" motion, in terms of the displacement, velocity, or acceleration of the ground (or structure), that causes a person to be aware of the vibration by means such as, but not limited to, sensation by touch or visual observation of moving objects.

The effects of groundborne vibration include movements of building floors, rattling of windows, and shaking of items on shelves or hangings on the walls. In extreme cases, vibration can cause damage to buildings. The noise radiated from the motion of the room surfaces is called groundborne noise. Table 4.12-2 presents typical levels of groundborne vibration, vibration sources, and responses.

Table 4.12-2: Typical Levels of Groundborne Vibration

Response	Velocity Level (1)	Typical Sources (At 50 feet)
Minor cosmetic damage of fragile buildings	100	Blasting from construction projects
Difficulty with tasks such as reading a video display terminal (VDT) screen	90	Bulldozers and other heavy tracked construction equipment
Residential annoyance, infrequent events	80	Rapid transit, upper range
Residential annoyance, frequent events	70	High speed rail, typical
Approximate threshold for human perception	60	Bus or truck, typical
None	50	Typical background vibration

Source: Adapted from Figure 7-3 (FHWA 2006)

Note: (1) = Root mean square (RMS) Vibration Velocity Level in VdB relative to 10^{-6} inches/second.

Similar to noise, vibration varies based on the nature of the structure affected (i.e., the weight of the building), soil conditions, layering of the soils, the depth of groundwater table, etc.

4.12.2 Environmental Setting

Noise-Sensitive Land Uses

Noise sensitive land uses, as defined by the Noise Elements of the Kern County General Plan (KCGP), the Metropolitan Bakersfield General Plan (MBGP), and adopted Specific Plans in the Project Area include residential areas, schools, convalescent and acute care hospitals, retirement homes, long-term medical or mental facilities, parks and recreation areas, and churches.

Existing Environment

Noise

Major noise sources in the Project Area include Interstate 5, state highways, railroads, airports and existing commercial/industrial operations (including existing oil and gas exploration/ production activities and related facilities). Existing ambient noise levels within the Project Area vary considerably depending upon distance from major noise sources and the noise generation characteristics of contributing noise sources at any given location. The noise environment in the Project Area has been characterized by conducting ambient noise level measurements at various locations within the Project Area and quantifying typical noise levels from the major sources that affect the Project Area.

Ambient noise monitoring was conducted between January 7, 2015 and January 21, 2015, at 18 locations within the Project Area. Noise monitoring sites were selected to represent typical acoustic settings within the Project Area where oil and gas exploration and production activities either already occur or could occur in the future, and included six locations in the Western Subarea, six locations in the Central Subarea, and six locations in the Eastern Subarea. Noise monitoring was conducted using unattended automated equipment that measured ambient noise levels continuously for a minimum period of 24 hours at each site. Figure 4.12-1 depicts the locations where ambient noise measurements were collected.

Noise monitoring equipment consisted of Larson-Davis Laboratories Model LDL 820 sound level analyzers equipped with Bruel & Kjaer (B&K) Type 4176 half inch diameter microphones. Microphones were located on tripods at approximately 5 feet aboveground and were equipped with random incidence correctors so that noise levels from sources in all directions could be accurately measured. The monitors were calibrated with a B&K Type 4230 acoustical calibrator to ensure the accuracy of the measurements. The equipment complies with applicable specifications of the American National Standards Institute (ANSI) for Type 1 sound measurement systems.

Table 4.12-3 summarizes ambient noise monitoring results. Noise measurement data are described in terms of the equivalent energy (L_{eq}), maximum (L_{max}) and L_{90} noise level descriptors.

The L_{eq} and L_{max} describe energy average and maximum noise levels measured during each hour of the sample periods, respectively. The L_{90} describes the noise level exceeded 90% of the time during each hour, which is generally considered to represent the residual (or background) noise level. Reported maximum noise levels in the absence of identifiable single noise events were typically caused by intermittent noise events such as a nearby passing vehicle, an occasional aircraft over-flight, and other localized noise sources close to the measuring device (e.g., car doors opening and closing, a barking dog, a conversation of people standing near the device, etc.). The measured DNL for each of the 18 ambient noise monitoring sites is also included in Table 4.12-3.

Table 4.12-3: Ambient Noise Levels

Location	Range of Hourly Noise Levels			DNL/CNEL (dBA)
	L_{eq} (dBA)	L_{max} (dBA)	L_{90} (dBA)	
Western Subarea				
Site 1	42.9 – 58.4	54.8 – 76.5	34.2 – 39.4	58.5
Site 2	45.5 – 63.6	66.7 – 83.1	32.6 – 56.1	63.9
Site 3	52.9 – 66.5	71.4 – 89.9	44.4 – 59.6	67.8
Site 4	38.0 – 55.7	55.8 – 76.0	31.3 – 49.1	56.7

Central Subarea				
Site 7	40.1 – 57.0	55.8 – 86.8	34.5 – 51.4	56.6
Site 8	32.4 – 51.4	45.3 – 68.2	27.9 – 47.8	47.6
Site 9	42.2 – 56.0	47.3 – 74.4	39.9 – 50.3	55.1
Site 10	44.6 – 66.0	59.8 – 87.1	35.9 – 45.6	64.4
Site 11	38.7 – 53.4	47.9 – 72.3	35.7 – 46.1	51.8
Site 12	28.8 – 45.6	39.2 – 65.3	26.5 – 39.9	44.8
Eastern Subarea				
Site 13	29.7 – 55.6	43.6 – 72.6	25.1 – 51.0	50.7
Site 14	36.0 – 49.4	50.6 – 64.7	29.6 – 44.8	50.4
Site 15	43.0 – 56.9	54.8 – 80.1	33.1 – 47.7	55.4
Site 16	38.3 – 46.8	42.8 – 65.2	35.9 – 43.0	48.3
Site 17	34.0 – 50.8	48.5 – 72.4	30.8 – 44.6	50.7
Site 18	34.8 – 45.9	43.2 – 66.8	31.2 – 41.5	46.9
			Average DNL/CNEL, dB	**54.7**

Source: Brown-Buntin Associates, Inc. 2015

Hourly L_{eq} values represent average noise levels, and these average measurements can be significantly affected by occasional noise events in the vicinity of the monitoring site. Measured DNL values ranged from 44.8 to 67.8 decibels at the ambient noise monitoring sites, with an average of 54.7 dBA. Generally, the highest ambient noise levels occurred at sites that were located relatively close to major transportation sources or commercial/industrial activities unrelated to oil and gas exploration and production activities (Site 3, Site 10, and Site 15).

A detailed description of the noise monitoring sites, aerial photographs showing the site locations, noise sources affecting the site, and measured noise levels can be found in the Environmental Noise Assessment, presented in Appendix V.

Vibration

The vibration environment would be affected by traffic from nearby roadways or train tracks. Heavy trucks can generate vibrations that vary depending on vehicle type, weight, and pavement conditions. For trains, factors such as speed, suspensions on the vehicle, rail and wheel conditions, and soil and subsurface conditions will affect the level of groundborne vibration. In the areas where oil and gas activities are likely to occur, existing vibration levels would be expected to be low.

4.12.3 Regulatory Setting

The Project Area does not include incorporated cities within Kern County. The Project includes land that is under the jurisdiction of Kern County. Noise standards for the County and federal noise guidelines are addressed here.

Federal

Federal highway and aircraft guidelines and regulations have been established by Federal Highway Administration (FHWA) (23 Code of Federal Regulations [CFR] 772) and Federal Aviation Administration (FAA) regulations (18 CFR 150). Federal guidelines and regulations are summarized in Table 4.12-4. These federal regulations do not apply to Project activities, but are applicable to some existing activities in the Project Area (e.g., aircraft, roadway construction) and also represent useful benchmarks for noise standards used by other agencies.

Table 4.12-4: Federal Guidelines and Regulations for Exterior Noise (dBA)

Agency	L_{eq}	DNL
Federal Energy Regulatory Commission	[49]	55
U.S. Department of Transportation (construction noise level at residential land use during daytime)[a]	90	---
Federal Highway Administration	67	[67]
Federal Aviation Administration	[59]	65
U.S. Department of Housing and Urban Development[b]	[59]	65

Sources:
[a] FTA 2006
[b] 24 CFR 51B; HUD 1991
Note: Brackets around numbers (e.g., [59]) indicate a calculated equivalent standard. Because FHWA regulates peak noise level, the DNL is assumed equivalent to the peak noise hour.

Occupational Safety and Health Act of 1970

Onsite noise levels are regulated by the Occupational Safety and Health Administration (OSHA). This regulation protects workers from the effects of occupational noise exposure. The noise exposure level of workers is regulated at 90 dBA over an 8-hour work shift to protect hearing (29 CFR 1910.95). Employee exposure to levels exceeding 85 dBA requires that employers develop a hearing conservation program. Such programs include adequate warning, the provision of hearing protection devices, and periodic employee testing for hearing loss.

State

The Division of Occupational Safety and Health (CalOSHA) implements and enforces the noise exposure limits established by the federal OSHA, as described above, for the state of California.

No state regulations apply to noise specifically from oil and gas operations; however, there are general state guidelines provided by the California Department of Health Services that define acceptable noise levels based on a land use compatibility matrix designed to protect residents and other sensitive land uses from excessive noise levels. These guidelines help to define a threshold for acceptable noise levels for residential areas in the Project Area. The California Department of Health Services has identified DNL or CNEL values of 60 dBA or less as normally acceptable outdoor levels for residential areas.

Kern County does not have regulations that define acceptable levels of vibration. One of the most recent references suggesting vibration guidelines is the California Department of Transportation (Caltrans) Transportation and Construction Vibration Guidance Manual (Caltrans 2013). The Manual provides guidance for determining annoyance potential criteria and damage potential threshold criteria. These criteria are provided below in Table 4.12-5 and Table 4.12-6, and are presented in terms of peak particle velocity (PPV) in inches per second (in/sec).

Table 4.12-5: Guideline Vibration Annoyance Potential Criteria

Human Response	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Barely Perceptible	0.04	0.01
Distinctly Perceptible	0.25	0.04
Strongly Perceptible	0.9	0.1
Severe	2.0	0.4

Source: Caltrans 2013

Table 4.12-6: Guideline Vibration Damage Potential Threshold Criteria

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile, historic buildings, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan area and, therefore, would be subject to applicable policies and measures of the KCGP. The Noise Element of the KCGP include goals, policies, and implementation measures related to noise that apply to the Project, as described below.

The KCGP Noise Element identifies residential areas, schools, convalescences and acute care hospitals, parks and recreation areas, and churches as noise sensitive land uses. In noise sensitive areas, exterior noise levels generated by new projects are to be mitigated to 65 dBA L_{dn} or less in outdoor activity areas and to 45 dBA L_{dn} or less within interior living spaces or other noise sensitive interior spaces.

Chapter 3. Noise Element

Goals

Goal 1. Ensure that residents of Kern County are protected from excessive noise and that moderate levels of noise are maintained.

Goal 2. Protect the economic base of Kern County by preventing the encroachment of incompatible land uses near known noise producing roadways, industries, railroads, airports, oil and gas extraction, and other sources.

Policies

Policy 2. Require noise level criteria applied to all categories of land uses to be consistent with the recommendations of DOSH.

Policy 3. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise.

Policy 4. Utilize good land use planning principles to reduce conflicts related to noise emissions.

Policy 5. Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into the project design. Such mitigation shall be designed to reduce noise to the following levels:

(a) 65 dBA L_{dn} or less in outdoor activity areas; and

(b) 45 dBA L_{dn} or less within interior living spaces or other noise sensitive interior spaces.

Policy 6. Ensure that new development in the vicinity of airports will be compatible with existing and projected airport noise levels as set forth in the Airport Land Use Compatibility Plan (ALUCP).

Policy 7. Employ the best available methods of noise control.

Implementation Measures

Implementation Measure A. Utilize zoning regulations to assist in achieving noise-compatible land use patterns.

Implementation Measure F. Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65A dB L_{dn} and interior noise levels in excess of 45 dBA L_{dn}.

Implementation Measure H. Encourage cooperation between the County and the incorporated cities within the County to control noise.

Implementation Measure I. Noise analyses shall include recommended mitigation measure, if required, and shall:

(a) Include representative noise level measurements with sufficient sampling periods and location to adequately describe local conditions.

(b) Include estimated noise levels, in terms of CNEL, for existing and projected future (10-20 years hence) conditions, with a comparison made to the adopted policies of the Noise Element.

(c) Include recommendations for appropriate mitigation to achieve compliance with the adopted polices and standards of the Noise Element.

(d) Include estimates of noise exposure after the prescribed mitigation measures have been implemented. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a rationale for acceptance of this project must be provided.

Implementation Measure J. Develop implementation procedures to ensure that requirements imposed pursuant to the findings of an acoustical analysis are conducted as part of the project permitting process.

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to noise.

Chapter III. Circulation Element

A. Streets

Goals

Goal 3. Minimize the impact of truck traffic on circulation, and on noise sensitive land uses.

Chapter V. Conservation Element

B. Mineral Resources

Policies

Policy 15. Require petroleum production sites in urban areas which are subject to discretionary permits, to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways (I-4).

Chapter VII. Noise Element

Goals

Goal 1. Ensure that residents of the Bakersfield metropolitan area are protected from excessive noise and existing moderate levels of noise are maintained.

Goal 2. Protect the citizens of the planning area from the harmful effects of exposure to excessive noise, and protect the economic base of the area by preventing the encroachment of incompatible land uses near known noise-producing roadways, industries, railroads, airports and other sources.

Policies

Policy 1. Identify noise-impact areas exposed to existing or projected noise levels exceeding 65 dB CNEL (exterior) or the performance standards described in Table VII-2. The noise exposure contour maps on file at the City of Bakersfield and County of Kern indicate areas where existing and projected noise exposures exceed 65 dB CNEL (exterior) for the major noise sources identified (I-1).

Policy 2. Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into project design to reduce noise to acceptable levels. (I-2, I-3, I-6, I-7).

Policy 3. Review discretionary industrial, commercial or other noise-generating land use projects for compatibility with nearby noise-sensitive land uses. Additionally, the development of new noise-generating land uses which are not preempted from local noise regulation will be reviewed if resulting noise levels will exceed the performance standards contained within Table VII-2 in areas containing residential or other noise-sensitive land uses (I-3, I-6, I-7).

Policy 5. Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise (I-7).

Implementation Measures

Implementation Measure 2. Review discretionary development plans, programs and proposals, including those initiated by both the public and private sectors, to ascertain and ensure their conformance to the policy framework outlined in this element.

Implementation Measure 4. Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65 dB CNEL and interior noise levels in excess of 45 dB CNEL and so that impacts on noise sensitive uses shall not exceed the performance standards in Table VII-2.

At time of any discretionary approval, such as a request for zone change or subdivision, the developer may be required to submit an acoustical report indicating the means by which the developer proposes to comply with the noise standards. The acoustical report shall:

(a) Be the responsibility of the applicant.

(b) Be prepared by a qualified acoustical consultant experienced in the fields of environmental noise assessment and architectural acoustics.

(c) Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.

(d) Include estimated noise levels in terms of CNEL and the standards of Table VII-2 (if applicable) for existing and projected future (10-20 years hence) conditions, with a comparison made to the adopted policies of the Noise Element.

(e) Include recommendations for appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element.

(f) Include estimates of noise exposure after the prescribed mitigation measures have been implemented. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a rationale for acceptance of the project must be provided.

Implementation Measure 5: Develop implementation procedures to ensure that requirements imposed pursuant to the findings of an acoustical analysis are conducted as part of the project permitting process.

Implementation Measure 6: Enforce the Noise Insulation Standards (California Administrative Code, Title 24) and Chapter 35 of the Uniform Building Code concerning the construction of new multiple-occupancy dwellings such as hotels, apartments, and condominiums.

Implementation Measure 10. Standards for Project Noise Impacts for Mobile Sources. A significant increase of existing ambient noise levels affecting existing noise sensitive land uses (receptors), and requiring the adoption of practical and feasible mitigation measures, is deemed to occur where a project will cause:

- An increase of the existing ambient noise level by 5 dB or more, where the existing ambient level is less than 60 dB CNEL;

- An increase of the existing ambient noise level by 3 dB or more, where the existing ambient level is 60 to 65 dB CNEL;
- An increase of the existing ambient noise level by 1.5 dB or more, where the existing ambient level is greater than 65 dB CNEL.

Standards for Project Noise Impacts from Mobile Sources

A significant increase in existing ambient noise levels affecting existing noise-sensitive land use (receptors) and requiring the adoption of practical and feasible mitigation measures is deemed to occur where a project would cause:

- An increase in the existing ambient noise level by 4 dB or more, where the existing ambient level is less than 60 dB CNEL;
- An increase in the existing noise level by 3 dB or more, where the existing ambient level is 60 to 65 dB CNEL; or
- An increase in the existing ambient noise level by 4.5 dB or more, where the existing ambient level is greater than 65 dB CNEL.

Standards for Cumulative Noise Impacts for Mobile Sources

A project's contribution to noise increase would normally be considered cumulatively considerable and considered significant when ambient noise levels affect noise sensitive land uses (receptors) and when the following occurs:

- A project increases the ambient (cumulative without project) noise level by 1 dB or more; or
- The cumulative with project noise levels cause the following:
    - An increase of the existing ambient noise level by 5 dB or more, where the existing ambient level is less than 60 dB CNEL;
    - An increase of the existing ambient noise level by 3 dB or more, where the existing ambient level is 60 to 65 DB CNEL; or
    - An increase on the existing ambient noise level by 1.5 dB or more, where the existing ambient level is greater than 65 dB CNEL.

3.6. Mineral and Petroleum

Policies

Policy 4. Noise abatement measures shall be required of all resource management activities which would adversely affect adjacent land uses or wildlife habitat.

F. Mineral and Petroleum Extraction

Implementation Measures

Implementation Policy 1. The city and County shall revise, within two years from adoption of this plan, mineral and petroleum extraction regulations and provisions of their respective floodplain Zoning Ordinances consistent with all plan policies and incorporate the following features:

a) Noise limits when adjacent to highly sensitive and sensitive land uses.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County Zoning Ordinance

Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance contains the procedures and standards that apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County. At present, Chapter 19.98's general development standards and conditions relevant to noise require the following:

- **Specific well setback distances from various structures** (19.98050.A). No oil or gas well shall be drilled within 100 feet of any public highway or building not necessary to the operation of the well, or within 150 feet of any dwelling, or within 300 feet of any building used as a place of public assembly, institution, or school, or within 50 feet of any building utilized for commercial purposes constructed prior to the commencement of such drilling, without the written consent of the owner of such structure.

  Required setbacks from buildings and public highways for new oil and gas wells in various Zone Districts are presented on Table 3-1 of this EIR;

- **Material delivery restrictions** (19.98.050.J). Whenever a well is located within 500 feet from an existing dwelling unit, except in case of an emergency, no materials, equipment, tools, or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 AM and 8:00 PM, unless otherwise required by the California Division of Oil and Gas.

- **Electric motors/Muffled engines** (19.98.050.K). Pumping wells shall be operated by electric motors or muffled internal combustion engines.

Kern County Ordinance Code – Health and Safety – Title 8

Chapter 8.36, Noise Control (Section 8.36.020, Prohibited Sounds) of the Ordinance Code of Kern County prohibits the creation of construction noise between the hours of 9:00 PM and 6:00 AM on weekdays and between the hours of 9:00 PM and 8:00 AM on weekends, which is audible to a person with average hearing faculties or capacity at a distance of 150 feet from the construction site, if the construction site is within 1,000 feet of an occupied residential dwelling except for emergency work or when the Development Services Director or his designated representative provides an exemption for a limited time.

4.12.4 Impacts and Mitigation Measures

Methodology

The California Environmental Quality Act (CEQA) requires determination of the significance of noise impacts associated with proposed projects. The process of assessing the significance of noise impacts associated with the Project involves establishing thresholds at which significant impacts on noise-sensitive uses may occur. Noise levels associated with construction and operational activities related to the Project were predicted and compared to these significance thresholds.

Methodology and assumptions from the Environmental Noise Assessment (Appendix V) are summarized in Table 4.12-7.

Table 4.12-7: Methods and Assumptions for Noise

Methods/Assumptions	Analytical Framework for Measuring Noise
Equipment and methods to assess noise generation during construction and operation of future oil and gas wells and related facilities.	– Larson Davis Model 824 and Model LDL 820 sound level meters – SoundPLAN acoustic modeling software used for modeling construction and operational noise – Calculations based on FHWA Highway Construction Noise Handbook
Modeling assumptions	– Flat topography – Ground absorption factor 0.5 – 40 degrees Fahrenheit – 50% relative humidity – 5-foot receiver height – 10-foot noise source height

Noise levels associated with oil and gas production activities were measured by Brown-Buntin Associates, Inc., at 18 locations throughout Kern County in December 2014 and January 2015 (Brown-Buntin 2015). For each activity, noise level measurements were taken in a minimum of

four different directions from the activity to document the loudest direction of noise. The activities measured included construction phase activities such as production well drilling (during both well advancement and pulling out of the borehole), exploratory well drilling, well stimulation and well workover activities, and operational-phase activities, such as active production wells (both electric and diesel powered), including use of ancillary facilities and equipment (e.g., pipelines, tanks, etc.). Well plugging, abandonment, and decommissioning activities were not specifically measured because these would be similar to, and therefore have been determined to produce noise levels, that are equivalent to or less than construction phase activities.

Noise measurements were conducted using a Larson Davis Model 824 Sound Level Meter to document the spectral (frequency) components of each source. The meter was calibrated prior to use with a Larson Davis CA250 calibrator to ensure the accuracy of the measurements. A windscreen was used over the microphone to avoid interference resulting from wind sources during outdoor measurements.

Project-related noise levels were calculated by Brown-Buntin Associates, Inc., using the SoundPLAN acoustic model. SoundPLAN utilizes measured spectral sound power levels to determine noise exposure from a noise source. Inputs to the model include noise source spectral sound power levels, topography, atmospheric conditions, ground absorption factors, shielding from existing walls or buildings, noise source height, and receiver height. The modeling included the conservative assumption that the topography was flat. Using the SoundPLAN noise model, which is based on ISO 9613, is overly conservative on sites with a flat topography or steady downward slope from turbine to receiver. It is also important to recognize that, in scenarios where the topography is relatively flat or there is a steady slope away from a sound source located on a hill, these methods can over-predict noise by up to 6 dBA, even where line-of-sight from the receiver location to the turbine hub is not broken. The model included the loudest observed noise measurement for each source as a basis for modeling potential Project-related noise exposure. The model included no shielding as a result of buildings or other structures that may be in the sound propagation path. These assumptions represent a worst-case assessment in regards to noise propagation from individual sources.

For the noise modeling effort, construction activities included well pad site preparation activities, such as geophysical surveys, land clearing and grading for well pads, access road construction or improvement, construction of temporary drilling sumps, installation, completion, and initial operation (testing) of new wells and ancillary equipment, installation of temporary equipment and facilities such as storage tanks or drilling sumps, and spill prevention activities. Construction activities result in temporary elevated noise levels.

Ground-level activities, such as land clearing, site preparation, and access road construction, require equipment including bulldozers, excavators, loaders, and dump trucks. The local increase in general vehicle traffic could be a source of noise impact, depending upon the number of trips to and from a specific area.

Although construction activities for a particular well, group of wells, or storage tank area may be temporary and somewhat brief (i.e., on the order of a several weeks to several months), staggered development of multiple wells or other oil and gas facilities within a particular area could occur over the course of several years.

Construction activities included well workovers and re-working. Well workover involves repair or maintenance of an existing production well for the purpose of restoring, prolonging or enhancing the production of the well, while re-working involves well changes including the removal and replacement or alteration of the well casing. Typically, the loudest source of noise associated with a drill rig is the power generation equipment, which is typically a diesel-powered internal combustion engine.

Well stimulation processes primarily consist of hydraulic fracturing treatments and acid well stimulation treatments (i.e., acid fracturing and acid matrix). Equipment used for these treatments is similar to that used for well construction. Stimulation may also involve more vehicles and equipment at a particular well site than during construction. Equipment used for well stimulation treatment may include mobile water tanks, truck-mounted blending units, sand storage trailers, truck-mounted pumps, generators, control vans, and other vehicles. Up to 20 truck-mounted pumps may be present at a well site for a large operation. Acid well stimulation treatments may require a similar amount of equipment and numbers of vehicles, although the types of equipment and vehicles may vary.

Well decommissioning and abandonment entails plugging and abandoning wells once they are no longer productive. Well decommissioning and abandonment involves removal, disassembly, and salvage or disposal of pumping units, well cellars, pipelines, and associated infrastructure, plugging the well with concrete and steel plates, and restoration of the well pad. Equipment used for decommissioning and abandonment varies somewhat from that used for construction, but would be expected to generate similar or lesser noise levels. Typical equipment used onsite for decommissioning and abandonment may include bulldozers, motor graders, front end loaders, cement and dump trucks, and well workover rigs.

Noise levels resulting from construction equipment are dependent on several factors, including the number and type of equipment operating, the level of operation, and the distance between sources and receptors. The loudest equipment during construction would contribute to a composite average or equivalent site noise level.

To evaluate the modelling data with respect to existing standards, some assumptions needed to be used. The Noise Element of the KCGP establishes a land use compatibility criterion of 65 dB DNL for exterior noise levels in outdoor activity areas of residential uses. The construction noise contour of 60 dBA is equivalent to CNEL of 63.2 dBA assuming the average of the high noise level measurements derived from Table 4.12-3. This level approaches the 65 dBA CNEL and for construction activity that extends beyond daytime hours, this level may exceed 65 dBA CNEL. Therefore, the noise contour at 60 dBA (see Tables 4.12-8 and 4.12-10) is assumed to be equivalent to 65 dBA CNEL.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would result in:

- Exposure of persons to, or generate, noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies;
- Exposure of persons to, or generate, excessive groundborne vibration or groundborne noise levels;
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;
- For a project located within the Kern County Airport Land Use Compatibility Plan, expose people residing or working in the project area to excessive noise levels; or
- For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.

Based on these standards, the effects of the Project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

Impact 4.12-1: Exposure of Persons to, or Generate, Noise Levels in Excess of Standards Established in the Local General Plan or Noise Ordinance or Applicable Standards of Other Agencies

Potential noise impacts may vary for each location of future oil and gas construction and operational activities; however, the analysis provided below covers the potential Project activities that may occur at a given location.

Construction Impacts

Short-term construction noise impacts could result from land clearing and grading for well pads and work areas, construction/maintenance of access roads, construction of accessory facilities (including pipelines, electrical transmission lines, drilling sumps or temporary storage tanks), transporting the drilling rig, associated equipment, workers and materials to the well pad site, well drilling, and construction equipment operations. Due to the complexity of drilling and the hazards associated with leaving a well unattended during the drilling process, drilling operations are typically conducted 24 hours a day. Depending upon the depth of the formation, some wells

may take less than 24 hours to drill, while some wells may take up to 60 days in deeper formations.

While new oil and gas exploration and production wells and related facilities could be located within any Zone Districts within the Project Area, historically 95% of such development has occurred within Core Areas. Of this total, 90% has occurred in Tier 1 areas, where the oil and gas activity is the primary land use and well and activity densities preclude almost all other uses. Of the 2,697 new oil and gas exploration and production wells anticipated to be constructed annually within the Project Area, 2,430 (90%) would be located within Tier 1 areas, while 25 new oil and gas exploration and production wells (less than 1%) would be located in Tier 4, which, with a predominance of urban uses, is where most sensitive receptors would be expected to occur. Construction noise is usually made up of intermittent peaks and continuous lower levels of noise from equipment cycling through use. During construction, noise from construction activities could impact noise-sensitive land uses if such uses are located in the immediate area. Using the noise levels associated with oil and gas well construction and development and the above-described methodology, distances from individual Project-related noise sources to the 50 dB, 55 dB and 60 dB contours were calculated using SoundPLAN. The results of the calculations are provided in Table 4.12-8.

Table 4.12-8: Construction Noise Exposure Levels

	Distance (feet) to Contour		
Activity	**50 dB**	**55 dB**	**60 dB**
Well Pad Preparation	2,500	1400	800
Drilling (Well Advancement)	3,550	2,270	1,420
Drilling (Pull Out Of Well/Borehole)	2,130	1,300	750
Large-Scale Exploratory Drilling[1]	7,250	4,750	3,000
Well Workover (Maintenance)	2,150	1,350	850
Well Stimulation	2,700	1,650	1,000

Source: Brown-Buntin 2015
Note: (1) = Kenai Drill Rig #7

It should be noted that at increased distances from a modeled noise source (distances greater than 1,000 feet), the modeled results should be considered with tolerance limitations of +/- 5 dB. At such distances from the noise source, variables such as atmospheric conditions (including wind speeds and direction), topography and ground absorption could cause modeled results to vary, thereby warranting use of the tolerance limitation adjustment of +/- 5 dB.

The Kenai Rig included in Table 4.12-8 is one of the largest operating drill rigs in the United States, and is used for exploratory drilling at depths up to 25,000 feet below surface elevation. Noise levels produced by such drill rigs are substantially higher than those produced by more typical rigs commonly utilized in the Project Area. It is not expected that a rig of this size would be commonly used within the Project Area because average well depths in the Western Subarea

average 2,305 feet, 10,414 feet in the Central Subarea average, and 2,220 feet in the Eastern Subarea. Nonetheless, the noise levels and contour for the Kenai Rig was included as part of the conservative modeling and assessment methodology appropriate for a project-level EIR.

Noise from construction of other ancillary activities, such as pipelines, extensions of electric services to well sites, construction or maintenance of access roads, drilling of injection wells, etc., was determined to result in noise levels that were similar to or less than the measured construction noise scenarios listed in Table 4.12-8.

Although construction noise that occurs between 6:00 AM and 9:00 PM on weekdays, and between 8:00 AM and 9:00 PM on weekends is exempt from restrictions, after that time construction noise cannot be audible within 150 feet of the construction site and 1,000 feet of an occupied residential building. If construction were to be conducted 24 hours per day, all activities described in Table 4.2-8 would be audible at 150 feet. In accordance with the Kern County Zoning Ordinance, setbacks for oil and gas wells currently are 150 feet from residential dwellings and hospitals and 300 feet from places of assembly, including schools and churches. These land uses are considered sensitive noise receptors. If oil and gas activities were to occur within 150 feet of a residence or 300 feet of a place of assembly, construction noise levels could exceed audible levels if construction were to occur outside of the 6:00 AM to 9:00 PM framework. In addition, construction noise could exceed the County's 65 dBA CNEL threshold at residences and places of assembly, even if the current setbacks were observed. Therefore, even with the current setback requirements, construction noise impacts could be significant if construction were to occur between 9:00 PM and 6:00 AM.

Operations Impacts

Using the noise levels associated with oil and gas production wells and related accessory activities included in the Project, the above-described methodology, distances from individual Project-related noise sources to the 50 dB, 55 dB, and 60 dB contours were calculated using SoundPLAN. The results of the calculations are provided in Table 4.12-9. As with construction noise, at increased distances from a modeled noise source (distances greater than 1,000 feet), the modeled results include tolerance limitations of +/- 5 dB to take into account noise source variables such as atmospheric conditions (including wind speeds and direction), topography, and ground absorption that could cause modeled results to vary from modeled results.

Table 4.12-9: Operational Noise Exposure Kern County Oil and Gas Production

	Distance (feet) to Contour		
Activity	**50 dB**	**55 dB**	**60 dB**
Well Production (Electric Power)	180	110	70
Well Production (Diesel Power)	580	330	190

Source: Brown-Buntin 2015

Noise levels from the operation of industrial-scale ancillary activities, such as cogeneration plants and water treatment facilities, were not separately evaluated since these facilities currently exist in locations that are not proximate to any sensitive noise receptor (e.g., Tier 1 areas). As with well drilling, typically the loudest source of noise associated with well operation is the power generation equipment. Noise levels from tank batteries, subsurface pipelines, and related smaller-scale industrial activities would be expected to be at or below the noise levels measured for well production activities based on power generation equipment noise as noted in Table 4.12-9.

Larger ancillary facilities are outside the scope of this Project (i.e., no new cogeneration facilities or landfills are included within the scope of the Project), and mitigation measures for such excluded facilities are not proposed.

According to Implementation Measure 4 of the KCGP Noise Element, commercial and industrial uses or operations need to be designed or arranged so that they will not subject residential or other noise sensitive land uses to exterior noise levels in excess of 65 dBA CNEL. Table 4.12-9 demonstrates that noise from electric power generation attenuates to less than the 65 dB standard by a distance of 70 feet from the source. Accordingly, based on the current setback requirements for oil and gas activities in Kern County for residential dwellings and hospitals (150 feet), and places of assembly, including schools and churches (300 feet), well operations using electrical power would comply with the established noise level requirement. However, Table 4.12-9 shows that noise from diesel power generation attenuates to less than the 65 dB standard by a distance of 190 feet from the source, indicating that well operations using diesel power may not comply with the standard near residences and hospitals with a 150 foot setback. Therefore, impacts due to operational noise could be significant.

Traffic Noise

A Traffic Impact Study and Roadway Assessment for the Project was prepared by Ruettgers & Schuler (March 2015) to analyze potential impacts of the Project and is included as Appendix W of this EIR. Potential Project impacts to existing traffic levels and roadways were determined for both construction and operation of the Project, using the most recently published roadway traffic volumes and Project-related vehicle trip calculations.

The Project would be expected to generate the equivalent of 19,300 trips per day by 2035, which includes worker trips, as well as equipment and material delivery truck trips (Appendix W). These trips would be disbursed to more than 500 roadways within the Project Area, based on historic wellfield production rates.

A doubling of traffic volumes on a roadway would be expected to result in a 3 dBA increase in noise generated by traffic, which is equivalent to the human threshold for perceiving a change in the ambient noise level. Based on the Project trip generation calculations and distribution as shown in Section 4.16, Transportation and Traffic, of this EIR, the Project would not double the traffic volumes on any affected roadways. Therefore, no significant increase in noise levels would occur along area roadways as a result of the Project.

Mitigation Measures

MM 4.12-1 The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines). This Figure need not be prepared for Tier 1 areas unless a sensitive receptor is located within 3,000 feet of a construction site inside the Tier 1 area.

a. If there are no sensitive noise receptors within this potential impact area, then no construction mitigation measures shall be required.

b. If there are sensitive human noise receptors within the potential impact area, then additional information must be provided showing the type of equipment being used and the noise contours with levels not exceeding 65 dBA at the nearest exterior wall of the sensitive receptor or more than 1 dBA higher than the ambient noise levels, if in excess of 65 dBA. If noise levels are shown to exceed 65 dBA or more than 1 dBA higher than the ambient noise levels in excess of 65 dBA, then one or more of the following mitigation measures shall be taken:

1. Placement of a temporary sound attenuation wall(s) shall be placed at the optimal distance to the sensitive receptor, as determined by an acoustical expert.
2. Construction of a temporary berm shall be placed at the optimal distance to the sensitive receptor, as determined by an acoustical expert.
3. Modification of equipment to reduce noise impacts.
4. Implementation of a quiet mode drilling plan or other sound reduction technology or practices as documented in a report submitted to the County.
5. Arranging for the voluntary, temporary relocation of the occupants of the sensitive receptor during the construction period.
6. Use the following setback distances for the activities specified:

Construction Noise Setbacks

Activity	Setback Distance (feet)
Well Pad Preparation	800
Drilling (Well Advancement)	1,420
Drilling (Pull Out Of Well/Borehole)	750
Large-Scale Exploratory Drilling[1]	3,000
Well Workover	850

Source: Brown-Buntin 2015
Note:
[1]Kenai Drill Rig #7

Information submitted with the Site Plan Application must detail the combination and methods used to determine the level of reduction and shall not exceed 65 dBA or any ambient levels in excess of 65 dBA or more than 1 dBA higher than the ambient noise levels, if in excess of 65 dBA.

MM 4.12-2 New oil and gas wells shall be a minimum 190 feet from the closest sensitive receptor.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.12-2: Exposure of Persons to, or Generate, Excessive Groundborne Vibration or Groundborne Noise Levels

Groundborne vibration from construction activities could be detected if there are activities, buildings, or businesses that are sensitive to vibration that are located near a construction site. Business such as recording studios and historic buildings are vulnerable to vibration.

Typical vibration levels at a distance of 100 feet from construction equipment used in oil and gas development activities are summarized by Table 4.12-10. As shown in Table 4.12-5, vibration is barely perceptible at level of 0.04 PPV from a transient source and at a level of 0.01 PPV from a continuous source. Vibration would be considered strongly perceptible at a level of 0.9 PPV from a transient source and at a level of 0.1 from a continuous source. Vibration levels that could cause damage to extremely fragile historic buildings are 0.12 PPV from a transient sources and 0.08 PPV from a continuous source (see Table 4.12-6).

In addition, vibration from transient sources is generated by geophysical surveys during oil and gas exploration. The vibroseis method generates vibrations utilizing truck-mounted units to vibrate the ground. The shothole method generates vibrations by detonation of underground charges. Vibroseis is used in for most survey work, but the shothole method is required where

vibroseis equipment cannot operate, e.g., areas of steep terrain, where vibroseis would disturb crops, plowed fields or orchards, or where shot hole drilling will be less disruptive to environmentally sensitive areas. Geophysical surveys are generally conducted in remote field areas well away from human habitation. They typically operate in a location for only a few minutes before moving on. Geophysical surveys are designed to create vibrational or impulsive energy for the purpose of obtaining reflections from deep rock layers to generate a 3D image of the subsurface. Accordingly, for both the vibroseis and the shothole methods, the sources are designed specifically to direct energy downward rather than up and out, and so result in relatively low PPV levels even at reasonably close surface proximity. Vibration associated with geophysical surveys is based on conservative scenarios of vibroseis equipment and varying charge sizes at a 50 foot depth.

For the shothole method, survey practices and existing regulatory guidance ensure that there would be no exceedence of the significance threshold when detonating charges. Operators generally follow the Blasting Guidance Manual of the U.S. Department of Interior Office of Surface Mining Reclamation and Enforcement in determining the charges to be used in proximity to different receptors and structures. According to the Blasting Guidance Manual, velocities as low as 0.50 PPV may damage brittle materials such as lath and plaster that may be found in older structures, while damage may occur to newer construction materials such as drywall starting at velocities of 0.75 PPV (Rosenthal and Morlock 1987). To avoid exceeding these values, operators generally set charges at least 300 feet from water wells and engineered structures unassociated with oil and gas development. For the shothole method, Table 4.12-10 shows the vibration levels for various charge sizes at the minimum 300 feet stand-off distance.

Table 4.12-10: Typical Vibration Levels During Construction

Equipment	PPV (in/sec)	
	@ 100'	@ 300'
Bulldozer (Large)	0.011	--
Bulldozer (Small)	0.0004	--
Loaded Truck	0.01	--
Caisson Drilling	0.01	--
Vibroseis (4 units @ 70% drive)	0.40	--
5.5 lb shothole charge (dBX) @ 30 ft depth	>1.10	≤0.20
11 lb shothole charge (dBX) @ 50 ft depth	>1.95	≤0.30
13.2 lb shothole charge (dBX) @ 50 ft depth	>2.25	>0.40

Sources: Caltrans 2013; Weingarten et al. 2015

As shown in Table 4.12-10, typical oil and gas development equipment operates at vibration levels that would be below both thresholds of annoyance or damage. Therefore, vibration impacts due to construction activities would be less than significant under this criterion.

Oil and gas well operations equipment that includes electric- or diesel-powered pumps. Other operational equipment includes tank batteries, subsurface pipelines, and related smaller-scale industrial activities. Use of this type of equipment typically would result in groundborne vibration in the immediate vicinity of the well at lower levels than the construction sources of vibration identified in Table 4.12-10. Because there are setback requirements for oil and gas activities, potentially vulnerable buildings or business would not be in the immediate vicinity of a well; therefore, impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Impact 4.12-3: A Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project

A substantial permanent increase in ambient noise levels would occur if noise levels increase in excess of 65 dBA CNEL. This analysis examined operational noise levels because they would be long-term in nature.

At a distance of 70 feet from a well, noise from electric-powered oil and gas wells would attenuate to a level of 60 dBA, which is less than 65 dBA CNEL. However, noise from diesel powered oil and gas wells would not attenuate to a level of 60 dBA CNEL until 190 feet from a well (see Table 4.12-9). A house or hospital could be located within 150 feet of a well; therefore, there is the potential for a substantial permanent increase in ambient noise levels in excess of the 65 dBA standard in the vicinity of sensitive noise receptors and therefore impacts could be significant.

Mitigation Measures

Implement MM 4.12-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.12-4: A Substantial Temporary or Periodic Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project

Oil and gas well development would result in temporary increases in ambient noise levels in the vicinity. Noise levels would fluctuate depending on the phase of construction, equipment type and duration of use, and distance between the noise source and receptor. This analysis focuses on construction-related noise because it would be temporary or periodic.

Well Pad Preparation

Prior to the installation of a well, a well pad site must be cleared and graded to make room for the placement of the necessary equipment and materials to be used during the drilling and developing of the well. Site preparation would generate noise from bulldozers, backhoes, and other types of construction equipment. The A-weighted sound pressure levels for the construction equipment that typically would be used during well pad preparation are presented in Table 4.12-11 along with the estimated sound pressure levels at various distances from the site.

Table 4.12-11: Estimated Construction Noise Levels at Various Distances for Well Pad Preparation

Construction Equipment	Qty.	Usage Factor %	L_{max} SPL @ 50 feet (dBA)	Distance in Feet/SPL (dBA)					
				50 (adj.)	250	500	1,000	1,500	2,000
Excavator	1	40	81	77	63	57	51	47	45

Draw Works	1	74	10	60	46	40	34	30	28
Triple Shaker	1	85	15	75	61	55	49	45	43
Composite Noise Level				**76**	**62**	**56**	**50**	**47**	**44**

Notes:
[1] SPL = sound pressure level.
[2] sound power level.
Key:
Adj. = adjusted to quantity

Hydraulic Fracturing

Table 4.12-13 presents the estimated noise levels that may be experienced at various distances from a hydraulic fracturing operation, based on 20 pumper trucks operating at a sound power level of 110 dBA and 20 pumper trucks operating at a sound power level of 115 dBA.

Table 4.12-13: Estimated Construction Noise Levels at Various Distances for Hydraulic Fracturing

Construction Equipment	Qty.	SPL[2] (dBA)	Distance (feet)	Qty Adjusted Sound Level	Distance in Feet/SPL[1] (dBA)					
					50	250	500	1,000	1,500	2,000
Pumper Truck	20	110	3	123	99	85	79	73	69	67
Pumper Truck	20	115	3	128	104	90	84	78	74	72

Source: Confidential Industry Source
Notes:
[1] SPL = sound pressure level.
[2] sound power level.

Although construction noise conducted between 6:00 AM and 9:00 PM on weekdays and 8:00 AM and 9:00 PM on weekends is exempt from restrictions, after that time it is prohibited from being audible within 150 feet of the construction site and 1,000 feet of an occupied residential building. Based on the data presented in the above tables, well pad preparation, drilling, and hydraulic fracturing would be audible within 150 feet of the equipment. Hydraulic fracturing would be audible at 1,000 feet from the pump trucks and well pad preparation and drilling could be audible at 1,000 feet. Based on the fact that sensitive noise receptors could hear construction noise and these noise levels would be in excess 65 dBA CNEL, particularly if drilling occurs all

night, construction noise is considered a significant adverse impact if located near one or more sensitive noise receptors (e.g., a home, hospital, school, church, or other public assembly facility).

Oil well operation for extraction purposes typically would not result in substantial temporary or permanent increases in ambient noise levels (see Table 4.2-9).

Mitigation Measures

Implement MM 4.12-1, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.12-5: For a Project Located within the Kern County Airport Land Use Compatibility Plan, Expose People Residing or Working in the Project Area to Excessive Noise Levels

Public use airports addressed by the Kern County ALUCP that are within the Project Area include Meadows Field, Bakersfield Municipal, Delano Municipal, Elk Hills-Buttonwillow, Poso Kern County, Taft Kern County, Shafter-Minter Field, Wasco Kern County, and Lost Hills airports. Currently, ten oilfields are located within 2 miles of a public use airport (see Figure 4.8-2). Future oil and gas-related development activities could occur in the vicinity of any of the public use airports identified in the Kern County ALUCP.

Aircraft operations at airports within the Project Area, with the exception of Meadows Field in Bakersfield, consist of relatively infrequent flights by small general aviation propeller aircraft. Occasional corporate jet aircraft operations occur at the Bakersfield Municipal, Delano Municipal, and Shafter-Minter Field airports. Meadows Field is an air carrier airport with scheduled turboprop and jet aircraft service and relatively frequent operations by general aviation propeller and jet aircraft.

The 65 dB CNEL contours for airports within the Project Area, as identified in the ALUCP, are confined to the airport property, with the exception of Bakersfield Municipal Airport and Meadows Field where the 65 dB CNEL contours extend slightly to the northwest of airport property.

As discussed previously, noise levels generated during construction or operations of oil and gas facilities at specified distances exceed 65 dB CNEL. Oil and gas activities could only occur at the appropriate setback distance, but could be as close as 50 feet from an industrial facility. If oil and gas facilities were built or operated within the 65 decibel CNEL contours of Meadows Field or the Bakersfield Municipal Airport, then the combined noise levels of aircraft take-offs and landings and oil and gas activities have the potential to exceed County acceptable noise levels for workers and/or residents that are in proximity to both the public airport and potential oil and gas activities, depending on the location of the well and the residence or facility. Therefore, there could be significant impacts.

Mitigation Measures

Implement MM 4.12-1 and MM 4.12-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

Impact 4.12-6: For a Project Located within the Vicinity of a Private Airstrip, Expose People Residing or Working in the Project Area to Excessive Noise Levels

Many private airports are located within the Project Area, such as Paradise Lakes Airport, Tejon Ag Airport, Creekside Airport, Di Giorgio Ranch Landing Strip, Majors Airport, Cashen Strip Airport, Belridge Strip Airport, and Paramount Farms Airport. In addition, two United States military airbases outside the Project Area utilize military operation airspace within a small portion of the Project Area for military aircraft operations. A complete list of the public and private airports is included in Section 4.8, Hazards and Hazardous Materials/Public Health Risks.

Oil and gas activities are currently occurring near private airstrips, including Belridge Strip and Di Giorgio Ranch Landing Strip. Future oil and gas development authorized under the Project could occur throughout the Project Area. Private airports in the area house mostly single-engine planes. The short duration of noise events generated by planes taking off and landing at private airstrips would temporarily increase noises levels in the immediate vicinity of the airport. Oil and gas development activities authorized under the Project could occur in proximity to a private airstrip. Given that oil and gas activities authorized under the Project would, at a minimum, have to comply with current setback requirements, an industrial facility could be within 50 feet or a residence could be with 150 feet. Noise levels at these distances under some circumstances could exceed acceptable noise levels. The combined noise levels of aircraft take-offs and landings and oil and gas activities have the potential to exceed acceptable noise levels for workers and/or residents that are in proximity to both a private airport and potential oil and gas activities, depending on the location of the well and the residence or facility and therefore impacts could be significant.

Mitigation Measures

Implement MM 4.12-1 and MM 4.12-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.12.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to noise receptors is the Project Area. Because noise can only be heard within a specific distance of a specific source, the cumulative impact analysis considers the combined noise impacts of the Project with nearby related projects.

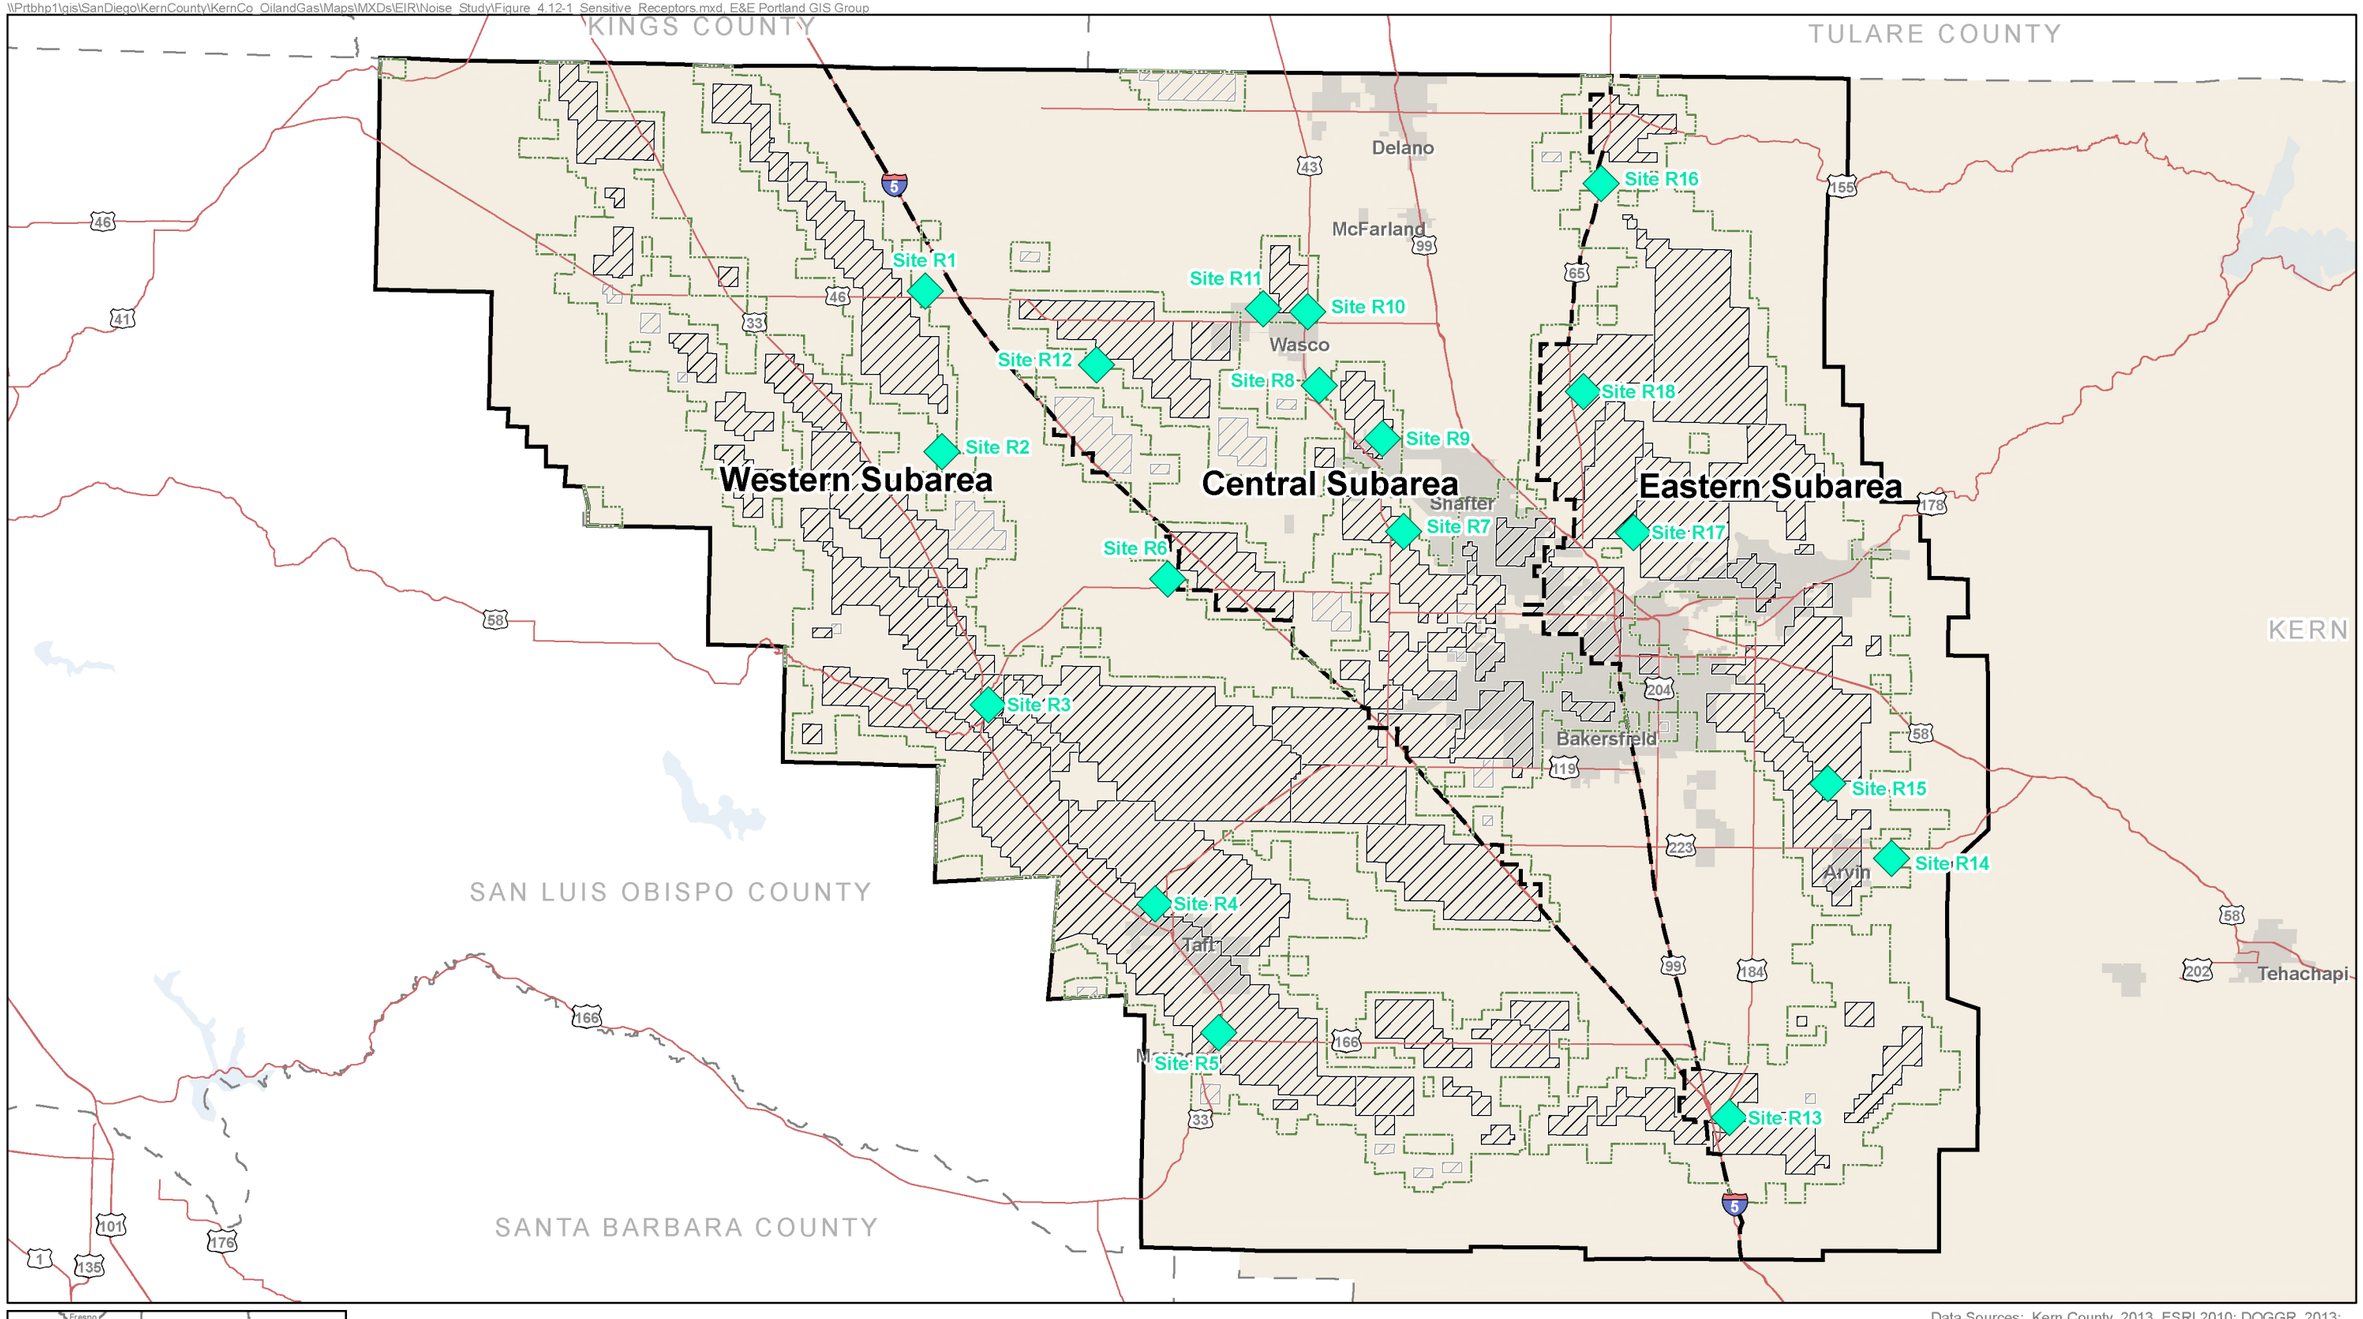
The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7 of Chapter 3, Project Description. Implementation of these plans and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions within which each related project is located. This includes appropriate environmental review, in compliance with the requirements of CEQA and/or the National Environmental Policy Act. Should potential noise impacts be identified, appropriate mitigation would be prescribed.

Impact 4.15-7: Cumulative Impact on Noise Receptors

Since oil and gas activities could occur anywhere in the Project Area, the combined noise levels from the Project and existing or reasonably foreseeable projects depend on the proximity of oil and gas activities to other noise sources at a specific location. Noise generated from construction of certain types of wells authorized under the Project, conservatively assuming use of the largest exploratory deep drilling rig (Kenai Rig), could be in excess of 65 dBA CNEL up to 3,000 feet from a construction site and up to 190 feet from a diesel-powered operating well. Therefore, significant noise impacts would occur if there are sensitive noise receptors within 3,000 feet of the construction of a well and 190 feet of an operating diesel-powered well. Other projects with construction or operations occurring concurrently with construction or operations of a well would also contribute to noise levels experienced by nearby sensitive noise receptors.

Projects associated with the aforementioned plans would have to comply with the Kern County Noise Ordinance and/or the Noise Element of the KCGP and, therefore, would have to ensure noise levels did not exceed standards. For example, the Kern Council of Governments (COG) 2014 Regional Transportation Plan for Kern County Final Program EIR provides numerous measures to address transportation-related noise.

Oil and gas activities subject to project authorization would have to implement MM 4.12-1 if there are sensitive human noise receptors within 3,000 feet of a well to ensure that the noise levels do not exceed 65 dBA at the nearest exterior wall of the nearest sensitive receptor or more than 1 dBA higher than the ambient noise levels, if in excess of 65 dBA. Cumulatively significant noise impacts could occur even if noise levels associated oil and gas activities are under 65 dBA, depending on the location of another nearby project, its noise levels, and the distance to a sensitive noise receptor.



Mitigation Measures

Implement MM 4.12-1 and MM 4.12-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant.

Section 4.13

Population and Housing

Section 4.13

Population and Housing

4.13.1 Introduction

This section of the EIR describes the affected environmental and regulatory settings for population and housing. It also describes the impacts on population and housing that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance (Project) and, for those impacts that are deemed significant, mitigation measures that would reduce these impacts.

The information in this section is based on data from, but not limited to, the Kern Council of Government (COG) and Kern COG 2014 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and accompanying Environmental Impact Report (EIR), which is hereby incorporated by reference into this EIR, as well as the Kern County General Plan (KCGP) Housing Element (2008–2013), and demographic information from the California Department of Finance (DOF) and the U.S. Census Bureau.

4.13.2 Environmental Setting

Population

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north, Santa Barbara and San Luis Obispo counties to the west, the Tehachapi Mountains and the Sierra Nevada's to the east, and the northern boundary of the Los Padres National Forest to the south.

County population growth has been significant over the last several decades, particularly in the Bakersfield area. The DOF estimated that the total County population between 2010 and 2014 increased 4%, while population in the unincorporated areas increased by an estimated 1% (DOF 2014).

According to the U.S. Census Bureau, in 2010, the population of Kern County was 839,631, with 30.3% of Kern County residents under the age of 18, and 9.0% over the age of 65 (U.S. Census Bureau 2010). The DOF estimates that, while the total County population has increased, more growth is occurring in the incorporated cities than in the unincorporated County areas. Table 4.13-1 depicts the changes in population within Kern County from 2010 to 2014.

Table 4.13-1: Kern County Population Trends (in thousands), 2010 to 2014

Kern County	2010	2011	2012	2013	2014	Change 2010-2014	
						Numeric	Percent
Incorporated Areas	541.7	543.9	546.2	553.4	562.9	21.2	3%
Unincorporated Areas	297.9	300.6	303.8	307.7	310.2	12.3	1%
TOTAL	**839.6**	**844.5**	**850.0**	**861.1**	**873.1**	**33.5**	**4%**

Source: DOF 2014

Kern County has also experienced significant immigration growth in the last decade, and the natural increase in the existing, non-immigrant population has also remained fairly constant. On average, legal immigration in Kern County increases by approximately 2,176 per year (DOF 2013a).

The DOF projects Kern County's population will exceed one million by 2025 and reach 1,604,371 by July 1, 2050 (DOF 2013b). Additionally, the Kern COG Draft Regional Housing Data Report projects a net population increase of approximately 143,265 to the unincorporated areas of Kern County by 2023, an approximate 47% increase.

Regional and Local Housing Trends

Unlike much of California, Kern County has experienced an increase in homeownership. In 2000, Kern County had a total of 231,564 housing units; in 2010, there were 284,367 units (DOF 2013c). Nearly 90% of the 284,367 units were occupied (owner occupied: 254,610; renter occupied: 101,782), and 29,757 (or 10.5%) of the units were vacant in 2010. As of May 10, 2013, Kern County had a total of 288,624 housing units, 10.4% of which were vacant. (DOF 2013d). Housing units and occupancy/vacancy rate trends for 2000 through 2013 are reflected in Table 4.13-2. Additionally, the Kern COG projects a net gain of approximately 83,176 housing units within the County by 2023, an increase of about 29% (Kern COG 2014).

Table 4.13-2: Kern County Housing Trends

Area	Unit Count			Occupancy/Vacancy Rate		
	2000	2013	Percent Change	Occupied 2000	Occupied 2013	Percent Change

Regional and Local Employment Trends

According to the California Employment Development Department (CEDD), Kern County consistently ranks among the top five most-productive agricultural counties in the United States and is the nation's third largest petroleum-producing counties. Additionally, because of its unique geographic location, Kern has also become the distribution center for some of the world's largest companies, with freight cargo going to and from the Ports of Los Angeles and Long Beach. The County is also host to major freeways, providing north-south access within and beyond California's borders, as well as access to California's central coast and eastward to adjacent states and beyond.

Between 2000 and 2010, Kern County's civilian labor force grew by 38%, and the compound growth rate of the labor force during this period was 3.2% per year. The employed labor force grew by 34% between 2000 and 2010, and the compound growth rate was 2.9% per year. Similarly, the number of jobs in healthcare grew by 31%. The energy and natural resources industry and transportation, logistics, and advanced manufacturing industry both increased by 16%. Value-added agriculture and construction industries increased by 6% and 4%, respectively. In the private sector, the total number of jobs grew by 12%, and the total number of establishments grew by 24% (Kern Economic Development Corporation 2012). Table 4.13-5 describes the workforce distribution for major industries in Kern County.

Table 4.13-5: Private Sector Industries in Kern County

Industry	Percent of Workforce
Agriculture Production and Food Manufacturing	24
Energy, Natural Resources, and Utilities (including Oil and Gas)	6.0
Construction	7.0
Transportation, Logistics, and Manufacturing	7.0
Wholesale and Retail Trade	16

Table 4.13-5: Private Sector Industries in Kern County

Industry	Percent of Workforce
Professional, Scientific, and Technical Services	5.0
Finance, Business & Administrative Support Services	11
Health Care Services	10
Leisure, Hospitality, and Other Services	14

Source: KEDC 2012

During 2011, the annual average number of individuals participating in the Kern County labor force was 382,000. Of these, 325,000 were employed during 2011, leaving 57,000 actively looking for work (KEDC 2012). Based on Kern Economic Development Corporation's (KEDC's) 2012 Labor Market Study, Kern County's labor force grew dramatically between 2005 and 2010, at nearly 19.6%. As a result, the unemployment rate in Kern County remains high. As of 2014 (annual data), the labor force stands at 394,400, with 353,200 employed and 41,200 unemployed, for an unemployment rate of 10.4% (CEDD 2015a). Unemployment is down from 13.2%, as reported in the KEDC 2012 Report. According to CEDD, employment from 2002 to 2012 in the oil and gas sector in Kern County almost doubled, starting at 6,900 and rising to 12,300. Since 2012, employment in the oil and gas sector has remained around 12,000 (CEDD 2015b).

Based on job growth patterns, national trends, and high occupational location quotients, the following are key industries for Kern County:

- Value-added agriculture;
- Energy and natural resources;
- Transportation, logistics, and advanced manufacturing;
- Aerospace and defense technology;
- Construction; and
- Healthcare services

According to the Kern COG Report, there were 1.10 jobs per housing unit for incorporated areas of Kern County in 2010, and that ratio increased to 1.18 in 2013 but is projected to decrease to 1.03 by 2023. Similarly, the ratio of jobs to housing units in unincorporated areas of Kern County is expected to decrease from 1.13 (2013) to 0.83 (2023) (Kern COG 2013).

4.13.3 Regulatory Setting

State

California Housing Element Law

California state law requires each city and county to adopt a general plan for future growth containing at least seven mandatory elements, including Housing Element. Unlike other general plan elements, the Housing Element is required to be updated every five to six years, and is subject to detailed statutory requirements and mandatory review by a state agency, the California Department of Housing and Community Development (HCD 2007). This plan must include a Housing Element that identifies housing needs for all economic segments and provides opportunities for housing development to meet their existing and projected housing needs including their share of the regional housing need. At the state level, the HCD estimates the relative share of California's projected population growth that could occur in each county in the state based on DOF population projections and historic growth trends. Where there is a regional COG, as in Kern County, the HCD provides the regional housing need to the COG. The council then assigns a share of the regional housing need to each of its cities and counties. The process of assigning shares provides cities and counties the opportunity to comment on the proposed allocations. The HCD oversees the process to ensure that the COGs distribute their share of the state's projected housing need.

Before adopting an update to its Housing Element, the city or county must submit a draft to the HCD for review. The HCD advises the local jurisdiction as to whether its Housing Element complies with the provisions of California housing element law.

The COGs are required to assign regional housing shares to the cities and counties within their regions on a similar five-year schedule. At the beginning of each cycle, the HCD provides population projections to the councils of governments, which then allocate shares to their cities and counties. The shares of the regional need are allocated before the end of the cycle so that the cities and counties can amend their housing elements by the deadline.

Regional

2014 Regional Transportation Plan/Sustainable Communities Strategy

In June 2014, the Kern COG adopted a SCS for the Kern Region that implements Senate Bill 375, California's Sustainable Communities and Climate Protection Act. The SCS integrates transportation planning, greenhouse gas reductions from passenger vehicles and light-duty trucks, and regional housing needs with a forecasted development pattern that acknowledges Kern County's and the incorporated cities' General Plan programs.

The SCS acknowledges the importance of energy resources, including oil and gas production, as an important resource and industry to Kern County's economy and future growth.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element and the Energy Element of the KCGP include goals, policies, and implementation measures related to population and housing that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.6. Residential

Goals

Goal 2. Ensure the provision of safe and amenable living environments and the promotion of efficient and economical use of land.

Goal 6. Promote the conservation of water quantity and quality in Kern County.

Goal 7. Minimize land use conflicts between residential and resource, commercial, or industrial land uses.

1.8. Industrial

Goals

Goal 1. Ensure that an adequate and geographically balanced supply of land is designated for a range of industrial purposes.

Goal 2. Promote the future economic strength and well-being of Kern County and its residents without detriment to its environmental quality.

Goal 3. Ensure compatibility with land use designations such as residential, commercial, or other land uses that may be affected by such activities.

Policy 4. Protect existing industrial designations from incompatible land use intrusion.

1.10. General Provisions

Goals

Goal 1. Ensure that the County can accommodate anticipated future growth and development while maintaining a safe and healthful environment and a prosperous economy by preserving valuable natural resources, guiding development away from hazardous areas, and assuring the provision of adequate public services.

Policies

Policy 6. The County shall ensure the fair treatment of people of all races, cultures, incomes and age groups with respect to the development, adoption, implementation and enforcement of land use and environmental programs.

1.10.9. Economic Development

Policies

Policy 58. Support and work toward the elimination of disincentives for business and industry to prosper in Kern County, and create special economic development programs to encourage commerce and industry to locate in Kern County.

Policy 62. Periodically review and update procedures for granting development approvals and permits and facilitate the processing of land use entitlements.

Implementation Measures

Implementation Measure DD. Utilize the County's Economic Strategy and the Economic Incentive Program to promote economic growth and to maintain a strong local economy.

Chapter 5. Energy Element

5.3.2. Kern County's Economic Dependence on the Oil Marketplace

Goals

Goal. To reduce the County's susceptibility to fluctuations in the petroleum production levels, and to encourage diversification of the economy.

Policies

Policy 3. The County shall encourage the conversion of existing petroleum-related facilities to other productive uses when they are no longer needed or productive.

Policy 4. The County should encourage the development of renewable energy industries to diversify the energy economy in Kern County.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). There are no policies, goals, or implementation measures in the MBGP that are applicable to population and housing.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County General Plan, Housing Element 2008–2013, Adopted 2008

The Housing Element is a separate element of the KCGP. Each city and county is required by California housing law to develop a Housing Element, one of the seven general plan elements, in order to qualify for allocation of state regional housing funding. To receive regional housing funds, each city and county must update its general plan Housing Element on a regular basis (generally, every five years). The housing element must incorporate policies and identify potential sites that would accommodate the city or county's share of the regional housing needs. Kern County adopted the current Housing Element in December 2008. Because the Project would not include new housing, the goals and policies of the Housing Element largely do not apply to the Project.

4.13.4 Impact and Mitigation Measures

Methodology

No population or employment growth is anticipated as part of the Project beyond the continued gradual population growth attributed to the region as a whole (and not attributable to any particular industry sector) by the Kern COG RTP/SCS EIR projections. While hydraulic fracturing and other well stimulation techniques have resulted in very substantial increases in oil and gas production activities in other states, the Monterey Shale geologic formation in Kern County is fundamentally different and estimates of both the quantity and rate of petroleum production from the Monterey Shale using existing technologies have been substantially reduced (See, e.g., http://www.postcarbon.org/publications/drilling-california/). In the absence of any dramatic technical advances, substantial increases in oil and gas production in the County—and substantial increases in the population and housing activity associated with oil and gas production—are not anticipated to increase appreciably above the baseline 2012 level. The dramatic drop in the global price of oil in 2014, for example, resulted in production curtailments and well construction activity levels in 2014 that were well under 2012 levels.

Thresholds of Significance

The Kern County California Environmental Quality Act (CEQA) Implementation Document and Kern County Environmental Checklist state that a project would have a significant impact on population and housing if it would:

- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere; or
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

Based on these standards, the effects of the Project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

The types of potential impacts related to population and housing is generally the same for construction and operational activities, each of which requires a workforce of experienced employees. Accordingly, the impacts assessment applies to both Project construction and operation.

Impact 4.13-1: Induce Substantial Population Growth in an Area, Either Directly (for example, by proposing new homes and businesses) or Indirectly (for example, through extension of roads or other infrastructure)

Based on information from the Bureau of Labor, it is estimated that 16,752 workers in Kern County were employed in the oil and gas extraction industry in 2012. Of this total, 14,067 were estimated to be "oilfield" employees. It should be noted that the Project's Traffic Impact Study and Roadway Assessment, (included as Appendix W of this EIR) conservatively assumed Kern County had 14,500 oilfield employees (Appendix W). The state's employment office estimated employment in the Kern County oil and gas sector differently, but shows a steady increase from 2002 to 2012 at which time the growth stabilized around 12,000 (CEDD 2015b).

Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance are anticipated to result in up to 2,697 new production wells being drilled annually, while 2,231 wells are anticipated to be plugged and abandoned. Additionally, it is anticipated that up to 1,200 wells would receive some type of well stimulation treatment annually (see Table

3-5, Annual Well Forecast – Project Subareas). These estimates are higher than historic averages, and much higher than occur during petroleum market contraction periods, such as 2014. Given the long history of oil and gas development within Kern County, including periods of relatively high and relatively low production, the oil and gas sector is expected to continue to sustain a substantial share of employment for Kern County residents. The pool of experienced oil and gas workers residing in Kern County is sufficient to provide the industry workforce over the lifetime of the Project, and any nominal increase in the oil and gas workforce in the future would likely continue to be comprised of local Kern County residents, consistent with the Kern COG's population and household growth projections for the County as a whole. In addition, unemployment in Kern County is approximately 10.4%; therefore, there would be an available labor pool to fill the anticipated nominal growth in employment. As such, the Project would not lead to substantial population growth and this impact is less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Impact 4.13-2: Displace Substantial Numbers of Existing Housing, Necessitating the Construction of Replacement Housing Elsewhere

Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance would not require the displacement of housing, nor necessitate the construction of replacement housing. No physical displacement of housing units are anticipated or authorized under the Project or this EIR.

Additionally, the vast majority of oil and gas production occurs in Tier 1, 2 and 3 areas that have no or few residences, and the Project's Noise and Air Quality Mitigation Measures require minimum setback distances from residences to avoid any incompatible land uses on an operational basis, and includes either mandatory setback distances during construction phase activities or the voluntary, temporary relocation of residents during such temporary construction work (typically lasting approximately 3 weeks). Additionally, the Conditional Use Permit and Specific Plan requirements applicable to oil and gas activities in Tiers 4 and 5 likewise provide for appropriate setback distances or other procedural and substantive requirements to assure land use compatibility between and oil and gas production activity and nearby residences. Accordingly, the Project would not indirectly result in displacement of housing and would therefore have no impact on housing.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Impact 4.13-3: Displace Substantial Numbers of People, Necessitating the Construction of Replacement Housing Elsewhere

As with Impact 4.13-2, above, the Project would not displace people or necessitate the construction of replacement housing in other locations. Therefore, there would be no impact.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

4.13.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to recreation resources includes the area within 6 miles of the external Project Area. While projects in a larger area may affect some of the same recreation resources as the Project, by focusing on projects within the Project Area and 6 miles outside of the Project Area, the analysis of cumulative impacts includes those projects that would most comparably affect the same resources as the Project.

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7, of Chapter 3, Project Description.

Impact 4.13-4: Cumulative Impact on Population and Housing

Kern County is expected to continue to grow, with or without the Project, consistent with the growth projections included in the 2014 Kern COG RTP/SCS and accompanying EIR.

As described above, the ongoing production of oil and gas in Kern County, with the additional mitigation measures and other substantive and procedural requirements included in the proposed revisions to the County's oil and gas ordinances included in the Project, would not be expected to result in any substantial increase in population or in housing demand, or require the displacement of substantial residences or people and construction of relocated housing, in Kern County. Further, growth in the Kern County area has been accounted for in various local and regional plans and projections. Accordingly, displacement of and demand for housing and changes in the local labor market and population would not be significant for Project-level or cumulative impact purposes for the Project. As a result, the Project will not result in a cumulatively considerable contribution to cumulative impacts for population and housing and the impact would be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Section 4.14

Public Services

Section 4.14

Public Services

4.14.1 Introduction

This section describes the affected environment and regulatory setting for public services, which includes fire protection, law enforcement services, schools, emergency medical services, and other public facilities. This section also describes the impacts on public services that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance (Project) and related ordinance amendments, and mitigation measures that would reduce these impacts, if necessary. For impacts to parks and other recreational facilities, please refer to Section 4.15, Recreation.

4.14.2 Environmental Setting

Kern County is California's third largest county in California, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north, Santa Barbara and San Luis Obispo counties to the west, the Tehachapi Mountains and the Sierra Nevadas to the east, and the northern boundary of the Los Padres National Forest to the south.

Fire Protection

Wildland fire protection in Kern County is a cooperative effort. The Kern County Fire Department (KCFD) provides firefighting services to many cities throughout the County. In addition, operating agreements with the U.S. Forest Service (USFS), U.S. Department of the Interior, Bureau of Land Management (BLM), U.S. Fish and Wildlife Service (USFWS), and the California Department of Forestry and Fire Protection (CAL FIRE), also provide wildland fire protection.

According to the 2011 KCFD Unit Strategic Fire Plan, the Project Area falls within the Western Kern, Northern Kern Valley, Valley/Foothill, and Mt. Pinos Communities Fuel Management Areas. The following table lists the Fire Management Areas in the Project Area, the relevant battalion, and the authorities responsible for fire-fighting in these Fire Management Areas.

Most of the Project Area falls within either the fire protection authority of either the Kern County Fire Department or the City of Bakersfield Fire Department. These jurisdictions are discussed in further detail below. As shown in Table 4.14-1, the BLM, USFS and U.S. Department of Defense (DOD) also have responsibility for fire protection services in the Project Area.

Table 4.14-1: Fire Protection Services

Fire Management Area	Battalion	Responsibility for Wildland Fires
Western Kern	2	State, Federal (BLM, DOD, USFWS), Local
Northern Kern Valley	3	State, Federal (USFS), Local
Mt. Pinos Communities	5	State, Federal (BLM, USFS), Local
Valley/Foothill	4 and 6	State, Federal (BLM, USFS), Local

KCFD provides fire protection services for the 8,000 square miles of unincorporated areas of Kern County and the cities of Arvin, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi, and Wasco. KCFD has 45 full-time fire stations and one seasonal station. KCFD is broken into seven battalions for operational management; each battalion covers a large geographical area and includes seven to nine fire stations. In total, KCFD serves nine cities and 41 communities. As of 2010, over 546 uniformed firefighters were serving in the seven battalions, 46 fire stations, 55 engines, four ladder trucks, 41 patrols, 25 command vehicles, three hand crews, two helicopters, one fixed-wing aircraft, two hazardous materials response teams, one technical rescue team, one hotshot crew, and three light/air vans. KCFD has 14 Mutual Aid Agreements with neighboring fire suppression organizations to further strengthen the emergency services available to residents.

In 2012, KCFD responded to over 11,000 fires. In the oilfields in Western Kern County, over 1,100 fires have occurred from 2006 to January 2015.

The Bakersfield Fire Department (BFD), headquartered at 2101 H Street in Bakersfield, serves the City of Bakersfield. BFD has a response area of 130 square miles and currently serves a population of 333,719. The average response time for BFD is 4 minutes, with a dispatch time of 1 minute and 2 minutes for crew turnout (City of Bakersfield 2014a; Hartley 2014). BFD responded to an average of 1,742 fires, ruptures, and explosions, annually, over a five-year period (Hartley 2014).

BFD's inventory includes 14 engines, three ladder trucks, four Type III engines, two four wheel drive Type IV patrols, one "Light & Air" unit, one hazardous materials unit, one urban search and rescue unit, one heavy utility tender, one technical rescue trailer, one decontamination unit, four battalion command vehicles, three safety officer command vehicles, and other support units (City of Bakersfield 2014b). The equipment is distributed across BFD's 14 stations.

The City of Bakersfield has an annual oil well safety inspection program. These inspections focus on fire and safety issues as well as environmental and noise issues (City of Bakersfield 2014c).

The Emergency Communications Center (ECC) for KCFD and BFD is located in the Whiting Communications Center in Northeast Bakersfield (City of Bakersfield 2014d). The ECC is responsible for dispatching resources over an area of more than 8,000 square miles that includes 65 fire stations. ECC's approximate call volume was 85,000 calls in 2012.

Forty-one fire stations located within the Project Area are under the jurisdiction of KCFC or BFD, as listed in Table 4.14-2.

Sources: City of Bakersfield 2014e; Hartley 2014

Within the Project Area, the majority of the fire stations are located in Non-Jurisdictional Areas; however, several are located within or near Tier 1 areas (see Figure 4.14-1).

Police Protection

California Highway Patrol

The California Highway Patrol (CHP) provides traffic regulation enforcement, oversees response to emergency incidents on California's highways or assists other public agencies responding to emergency incidents, and promotes the safe and efficient movement of people and goods on California highways to minimize loss of life, injuries, and property damage. CHP officers patrol State highways and implement the CHP's other law enforcement activities (e.g., drug interception, vehicle theft investigation and prevention, vehicle inspections, accident investigations, and public awareness campaigns), with the support of the non-uniformed personnel assigned to area and division offices.

The CHP has eight divisions that provide services throughout California. Kern County is located in both the Central and Inland Division service areas (CHP 2015). The CHP has three offices in the Project Area, including one in Bakersfield, one in Buttonwillow, and one in Lebec (see Table 4.14-4), which are part of the CHP's Central Division. The Central Division includes Kern, Fresno, Tulare, Merced, Madera, Kings, Stanislaus, and Tuolumne counties and has 15 area offices, six residential posts, two commercial inspection facilities, three communications/dispatch centers, 667 uniformed officers, and 226 non-uniformed personnel (CHP 2015).

Table 4.14-4: California Highway Patrol Area Offices in the Project Area

(420) Bakersfield 4040 Buck Owens Boulevard	(426) Buttonwillow 29949 Stockdale Highway
(430) Fort Tejon 1033 Lebec Road	

Kern County Sheriff's Office

The Kern County Sherriff provides police protection services to the unincorporated portions of the County. The Kern County Sheriff is the County's chief law enforcement officer. The Sheriff's Office has 1,202 sworn and civilian employees. There are 567 authorized deputy sheriff positions deployed in patrol, substation, detective, courts services, and special investigations units. The Kern County Sheriff's Office provides protection for the unincorporated areas of Kern County and has a contract arrangement with some incorporated areas. The Kern County Sherriff's headquarters is located in Bakersfield and consists of 15 substations that provide patrol services to remote areas of Kern County, such as the desert and mountainous regions as well as other areas that need law enforcement services. Six of these substations are located within the Project Area: Buttonwillow, Delano, Lamont, Rosedale, Taft, and Wasco (see Table 4.14-5 and Figure 4.14-2). These substations are located in either non-jurisdictional areas or agricultural areas (Tier 2).

The average response times for the Kern County Sheriff's Office are 7 minutes 24 seconds for emergency in-progress calls (e.g., a crime that is under way and/or a life-or-death situation), 14 minutes 25 seconds for non-emergency in-progress calls (e.g., a crime that has already occurred and/or an incident that is not life-threatening), and 28 minutes 23 seconds for report calls (reporting a crime that is not in progress) (Pruitt 2014).

The Metro Patrol Division of the Kern County Sheriff's Office has eight sergeants, 67 deputies, seven senior deputies, and eight civilian support staff. The Kern County Sheriff's Office Metro Patrol Division covers four zones within the city of Bakersfield. The four zones cover 600 square miles, but this area does not include the outlying areas where the substations provide services.

The Rural Crimes Investigation Unit addresses property crimes in the agricultural, ranch, and oilfield portions of the County. Crime has increased in their jurisdiction in the period from 2009 to 2012; specifically, there has been a significant increase in metal thefts, which increased from 46 in 2009 to 455 in 2012 (Winn 2014).

Bakersfield Police Department

The Bakersfield Police Department (BPD) has jurisdiction over 150 square miles of City of Bakersfield. In 2014, the BPD had 346 sworn officers and has the authorized capacity of 389 (Table 4.14-5) (International Association of Chiefs of Police 2014; Grubbs 2014).

Schools

Kern County public school system is operated by the Kern County Superintendent of Schools (KCSOS). The KCSOS serves 47 K-12 school districts in the County (Table 4.14-6).The Project Area is within the boundaries of 40 of these school districts. According to 2012-2013 data, the total K-12 enrollment for Kern County was 178,671 students (Table 4.14-6).

Parks

Please see information regarding park and recreation facilities in Section 4.15, Recreation.

Other Public Facilities

There are over 60 community health centers, health clinics, ambulatory surgical centers, and hospitals within the Project Area. The following are hospitals in the Project Area that have emergency rooms:

- Bakersfield Heart Hospital, Sillect Avenue, Bakersfield;
- Bakersfield Memorial Hospital, 34th Street, Bakersfield;
- Delano Regional Medical Center, Delano;
- Kern Medical Center, Bakersfield;
- Mercy Hospital, Bakersfield;
- Mercy Southwest Hospital, Bakersfield;
- Ridgecrest Regional Hospital, Ridgecrest; and
- San Joaquin Community Hospital, Bakersfield.

The Kern Medical Center also has a trauma center.

The Kern County Emergency Medical Services Department (EMS) is the lead agency for the EMS system in Kern County. EMS is responsible for coordinating all system participants, which include the public, emergency service providers, and hospitals throughout the County. The department provides training programs for EMS such as certification and recertification for local EMS personnel. It includes communications services, including EMS dispatch. Transportation services include ambulance service monitoring and system compliance, service areas and performance standards, and status of EMS transportation systems. The County has been divided into 10 geographic regions. Each region, or Exclusive Operating Area (EOA), has been assigned to one ambulance provider.

A Community Health Needs Assessment (CHNA) was prepared for Kern County in 2013 (Healthy Community Institute and Strategy Solutions 2013) through a collaborative effort of the Kern County Community Benefit Collaborative, and is comprised of Delano Regional Medical Center, Dignity Health (Mercy and Memorial Hospitals), Kaiser Permanente, and San Joaquin Community Hospital. The CHNA was conducted to identify primary health issues, status, and needs, and enable providers to establish priorities, development interventions, and to direct resources to improve the health of Kern County residents.

The CHNA identified that nearly 200 existing health care facilities and resources (out-patient care, home health, hospices, skilled nursing facilities, etc.) are available in the County. The results of the study did not reveal a lack of health care or hospital services availability to the community but, instead, identified the need to increase wellness and health education throughout the County.

Other public services include over 25 federal post offices and city and County libraries. Kern County Library Main Branch (Beale Memorial Library) is located at 701 Truxtun Avenue in Bakersfield. The County library system is divided into two districts: Greater Bakersfield Area and Outside Bakersfield Area. Greater Bakersfield Area has seven branch libraries, plus a bookmobile and the Olive Drive Fire Research Center; Outside Bakersfield Area has 13 branches, plus a bookmobile. Of these 20 library branches, 13 are located within the Project Area.

4.14.3 Regulatory Setting

Federal

No federal regulations, plans, or public service standards applicable to the Project have been identified.

State

Fire Protection

CAL FIRE

Under Title 14 of the Natural Resources of the California Code of Regulations (CCR), CAL FIRE has the primary responsibility for implementing fire wildlife planning and protection for State Responsibility Area (SRA) lands. CAL FIRE develops fire safe regulations and issues fire safe clearances for land within a fire district of SRA. More than 31 million acres of California's privately-owned wildlands are under the jurisdiction of CAL FIRE through the CAL FIRE Resource Management Program. CAL FIRE provides emergency services in 36 of the state's 58 counties via contracts with local governments (CAL FIRE 2012).

In addition to wildland fires, CAL FIRE's planning efforts involve responding to other types of emergencies that may occur on a daily basis, including residential or commercial structure fires, automobile accidents, heart attacks, drowning victims, lost hikers, hazardous material spills on highways, train wrecks, floods, and earthquakes.

Under Title 24, Regulations Development, the Office of the State Fire Marshal (OSFM) is responsible for promulgating regulations that promote fire and life safety for inclusion into the State Building Codes, including the California Building Code, California Fire Code, California Electrical Code, California Mechanical Code, California Plumbing Code, and California Historical Building Code. These documents are also referred to as California Code of Regulations, Title 24. The process incorporates a great deal of public participation and is guided by the State Building Standards Law.

California Occupational Safety and Health Administration

In accordance with CCR, Title 8, Sections 1270, Fire Prevention, and 6773, Fire Protection and Fire Equipment, the California Occupational Safety and Health Administration (Cal/OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hosing sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of firefighting and emergency medical equipment.

Schools

California State Assembly Bill 2926 – School Facilities Act of 1986

In 1986, Assembly Bill (AB) 2926 was enacted by the State of California authorizing entities to levy statutory fees on commercial/industrial and residential development in order to pay for school facilities. AB 2926, entitled the School Facilities Act of 1986, was expanded and revised in 1987 through the passage of AB 1600, which added Section 66000 et seq. of the California Government Code.

Proposition 1A/Senate Bill 50

Proposition 1A/Senate Bill (SB) 50 (Chapter 407, Statutes of 1998) created the School Facility Program where eligible school districts may obtain state bond funds. State funding requires matching local funds that generally come from developer fees. SB 50 authorizes school districts to assess fees directly to offset the costs associated with increasing school capacity as a result of new development. The old "Stirling" fees were incorporated into SB 50 and are referred to as Level 1 fees. These fees are currently capped at $0.47 per square foot for commercial and industrial (nonresidential) development and age-restricted senior housing. Districts meeting certain criteria may collect Level 2 fees as an alternative to Level 1 fees. Level 2 fees are calculated under a formula in SB 50. Level 3 fees are approximately double Level 2 fees and are implemented only when the State Allocation Board is not apportioning state bond funds. The passage of Proposition 1D on November 7, 2006, precludes the implementation of Level 3 fees for the foreseeable future. SB 50 states that payment of developer fees are "deemed to be complete and full mitigation" of the impacts of new development.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element and the Safety Element of the KCGP include goals, policies, and implementation measures related to public safety that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.4. Public Facilities and Services

Goals

Goal 1. Kern County residents and businesses should receive adequate and cost effective public services and facilities. The County will compare new urban development proposals and land use changes to the required public services and facilities needed for the proposed project.

1.4.1. Public Facilities and Services

Policies

Policy 1. New discretionary development will be required to pay its proportional share of the local costs of infrastructure improvements required to service such development.

Policy 6. The County will ensure adequate fire protection to all Kern County residents.

Policy 7. The County will ensure adequate police protection to all Kern County residents.

Implementation Measures

Implementation Measure L. Prior to the approval of development projects, the County shall determine the need for fire protection services. New development in the County shall not be approved unless adequate fire protection facilities and resources can be provided.

1.10. General Provisions

Goals

Goal 1. Ensure that the County can accommodate anticipated future growth and development while maintaining a safe and healthful environment and a prosperous economy by preserving valuable natural resources, guiding development away from hazardous areas, and assuring the provision of adequate public services.

1.10.1. Public Services and Facilities

Policies

Policy 9. New development should pay its pro rata share of the local cost of expansions in services, facilities, and infrastructure which it generates and upon which it is dependent.

Policy 15. Prior to approval of any discretionary permit, the County shall make the finding, based on information provided by the California Environmental Quality Act (CEQA) documents, staff analysis, and the applicant, that adequate public or private services and resources are available to serve the proposed development.

Policy 16. The developer shall assume full responsibility for costs incurred in service extensions or improvements that are required to serve the Project. Cost sharing or other forms of recovery shall be available when the service extensions or improvements have a specific quantifiable regional significance

Chapter 4. Safety Element

4.6. Wildland and Urban Fire

Policies

Policy 1. Require discretionary projects to assess impacts on emergency services and facilities.

Policy 3. The County will encourage the promotion of fire prevention methods to reduce service protection costs and costs to taxpayers.

Policy 4. Ensure that new development of properties have sufficient access for emergency vehicles and for the evacuation of residents.

Policy 5. Require that all roads in wildland fire areas are well marked, and that homes have addresses prominently displayed.

Policy 6. All discretionary projects shall comply with the adopted Fire Code and the requirements of the Fire Department.

Implementation Measures

Implementation Measure A. Require that all development comply with the requirements of the Kern County Fire Department or other appropriate agency regarding access, fire flows, and fire protection facilities.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to public services.

Chapter VIII. Safety Element

The MBGP Safety Element includes the following goals and policies:

C. Public Safety

Goals

Goal 1. Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.

Goal 2. Ensure that adequate police and fire services and facilities are available to meet the needs of current and future metropolitan residents through the coordination of planning and development of metropolitan police and fire facilities and services.

Goal 3. Provide for the coordinated planning and development of service areas for police and fire protection to ensure an equitable burden of responsibility between County and City in metropolitan Bakersfield.

Goal 4. Ensure that fire, hazardous substance regulation, and emergency medical service problems are continuously identified and addressed in a proactive way, to optimize safety and efficiency.

Policies

Policy 1. Identify future site locations, projected facility expansions, projected site acquisition costs, construction costs and operational costs in a manner that would maximize the efficiency of new public safety services (I-1, I-2, I-3).

Policy 2. Require discretionary projects to assess impacts on police and fire services and facilities (I-3).

Policy 11. Expand emergency medical services by the City and County Fire Departments and encourage the integration of ground and air and public and private resources to achieve efficiency and effectiveness of emergency medical services.

Implementation Measures

Implementation Measure 2. Funding for Police and Fire equipment and facilities will be facilitated through bond issues and/or development fees and/or land dedications and/or assessment districts.

Chapter X. Public Services and Facilities Element

A. General Utility Services

Goals

Goal 4. Develop funding principles and programs which will assure that all new development will pay for the incremental costs of the public facilities and services—utilities bridges, parks, and public safety facilities—both onsite and offsite, to serve such development.

Policies

Policy 5. Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent (I-3).

Implementation Measures

Implementation Measure 4. Create benefit assessment districts or establish service fees for the distribution of costs to users for capital improvement replacement costs and maintenance, utilizing such districts for the financing of improvements which are essential to planning area development.

Chapter XI. Parks Element

None of the goals, policies, or implementation measures related to parks are applicable to the proposed Project.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County Unit Strategic Fire Plan

The Kern County Fire Department's 2012 Unit Strategic Fire Plan was developed collaboratively between federal, state, city, and County agencies to identify and prioritize fire management strategies. The plan is designed to be an assessment and planning tool. The plan documents the wildland fire situation throughout the State Responsibility Areas (SRA) within the County. The SRA is the area where the State of California is financially responsible for the prevention and suppression of wildfires. The goal of this plan is to reduce costs and losses from wildfire by protecting assets at risk through focused pre-fire management prescriptions and increasing initial attack success.

Kern County Multi-Hazard Mitigation Plan

The purpose of the multi-hazard mitigation plan is to reduce or eliminate the long-term risk to people and property from natural hazards and their effects in the County. The plan was updated in 2012 to help Kern County become less vulnerable to losses from future disasters. The multi-jurisdictional plan includes the County and the incorporated municipalities of Arvin, Bakersfield, California City, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi, and Wasco. This plan also covers 53 special districts that include school, recreation and park, water,

community service, and other districts. Among the items assessed, the plan evaluated the risks associated with seismic events, dam failure, severe weather, and wildfire on oil and gas facilities.

Kern County Wildland Fire Management Plan

The Kern County Wildland Fire Management Plan documents the assessment of wildland fire situations throughout the SRAs within the County. The Kern County Fire Department Wildland Fire Management Plan provides for systematically assessing the existing levels of wildland protection services and identifying high-risk and high-value areas that are potential locations for costly and damaging wildfires. The goal of the plan is to reduce costs and losses from wildfire by protecting assets at risk through focused pre-fire management prescriptions and increasing initial attack success. Based on this assessment, preventive measures are implemented, including the creation of wildfire protection zones.

Capital Improvement Plan and Public Facilities Mitigation Program

The changing fiscal landscape in California during the past 30 years has steadily undercut the financial capacity of local governments to fund infrastructure. Faced with these trends, the County has adopted a policy of "growth pays its own way" through use of a public facilities mitigation program. The primary policy objective of this program is to ensure that new development pays the capital costs associated with growth.

In 2008, the County adopted a Capital Improvement Plan (CIP) that identifies the best current understanding of the public facilities that will be needed to accommodate new development anticipated through 2030. The CIP further identified appropriate existing facility demand standards to be used as a basis for estimating future facility needs and level of service. The adopted CIP includes a summary of proposed service levels for the included facilities and a conceptual list of planned projects, upon which the CIP was based. The scope of services includes: parks, libraries, sheriff (public protection and investigation), fire, animal control, public health, landfill/transfer stations, and general government. Roads and sewer costs and impacts are not part of the program.

Continued growth within the County and the associated impacts resulting from that growth have increased the demands to Countywide public services and have made it difficult to not only implement and fund many of those facilities identified within the CIP, but maintain existing public service demand standards as growth occurs. In short, despite the increase in property taxes generated as a result of the proposed Project and other similar projects within the County, public facility impacts are still underfunded and unable to maintain existing and adopted facility standards.

The purpose of the Public Facilities Mitigation Program is to identify impacts on public services and identify the monetary CEQA mitigation necessary to meet the facilities associated with that growth. The following categories have been identified to help determine which specific public needs are impacted by a typical development project.

- Countywide Public Protection Facilities;

- Sheriff Patrol and Investigation Facilities;
- Library Facilities;
- Animal Control Facilities;
- Park Facilities;
- Fire Facilities;
- Waste Management Facilities;
- Public Health Facilities; and
- General Government Facilities.

4.14.4 Impacts and Mitigation Measures

This section presents a discussion of the potential public services impacts associated with development of the proposed Project.

Methodology

The potential impacts associated with the Project were evaluated on a quantitative and qualitative basis and reflect consultations with public service providers in the Project Area. Public service systems were evaluated by reviewing the most current data available from State and Kern County department websites, the KCGP, the Kern County Multi-Hazard Mitigation Plan, and the Kern Count Wildland Fire Management Plan.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant public services impact if it would:

- Result in substantial adverse physical impacts associated with the need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or to other performance objectives for any of the following public services:
  - Fire protection,
  - Police protection,
  - Schools,
  - Parks, and
  - Other public facilities.

Project Impacts

Impact 4.14-1: Result in Substantial Adverse Physical Impacts Associated with the Need for New or Physically Altered Governmental Facilities, the Construction of which Would Cause Significant Environmental Impacts, in Order to Maintain Acceptable Service Ratios, Response Times, or Other Performance Objectives for Any of the Following Public Services: Fire Protection, Police Protection, Schools, Parks, and Other Public Facilities

The following analysis addresses potential impacts on fire, police, and other public services from construction of new or physically altered facilities and the impacts on these services that would be generated by implementation of the Project.

Population and industrial growth in a given area increases the use of public services, such as fire, police, and schools. Increased use of these services can strain their capacity, which affects their performance and/or their ability to provide their services adequately. Future oil and gas exploration and production activities that would be authorized under the Project are not anticipated to result in a substantial population increase (see Section 4.13, Population and Housing). In addition, future oil and gas exploration and production activities would not include provisions of new or physically altered government facilities.

Given the history of oil and gas development within Kern County, and as explained further in Section 4.13, Population and Housing, any nominal increase in the oil and gas workforce in the future would likely be comprised of local Kern County residents. As such, the nominal population growth would not stress certain existing public services, such as schools and libraries; however, the anticipated new oil and gas activity may strain services, such as police and fire services, in the vicinity of the new oil and gas wells.

Fire Protection

Activities during any stage of oil and gas exploration and production activities could produce sparks or ignition sources that could ignite products being used or produced or nearby vegetation. A total of 598 fires have occurred in the western Kern County oilfields or oilfield extraction areas from 2000 to 2014. Figure 4.14-1 illustrates the locations of fire stations, the current oil and gas administrative wellfield areas, and CAL FIRE fire zones. Most active oil and gas fields are located in areas with moderate fire risks.

Construction and operation of all future oil and gas exploration and production activities that would be authorized under the proposed Project would be subject to the provisions of the Uniform Fire Code and local amendments (Titles 19, 22, and 27 of the California Safety Code Regulations; the Kern County Ordinance Code; and the National Fire Protection Association Standards). Oil and gas activities also would have to comply with all applicable wildland fire management plans and policies established by CAL FIRE and KCFD.

A community's requirements for fire protection facilities are based on the number of residents and workers in the primary service area. Service demand is primarily tied to the size of the population being served, not land use activity, because emergency medical calls typically make up the majority of responses provided by a fire department. As the population within a service area increases, so does the number of emergency medical calls. The need for fire protection and emergency response facilities also increases. However, future oil and gas exploration and production activities that would be authorized under the proposed Project are not anticipated to result in a substantial population increase. Given the long history of oil and gas development within Kern County, and as explained further in Section 4.13, Population and Housing, any nominal increase in the oil and gas workforce in the future would likely be comprised of local Kern County residents.

In general, oil and gas exploration and production facilities do not have their own onsite firefighting teams. While fire extinguishers are retained onsite to suppress small fires and precautions are taken to prevent fires, most facilities rely on the firefighting capabilities of the local jurisdiction to address most fires. Like other businesses that use hazardous materials, oil and gas exploration and production facilities are required to file hazardous materials business plans with the Kern County Environmental Health through the California Environmental Reporting System (CERS) program. This is, in part, so that the fire department would be prepared to respond to all types of emergencies that could occur at such facilities.

There are five classes of fires:

Class A: Class A fires are fires in ordinary combustibles, such as wood, paper, cloth, trash, and plastics.

Class B: Class B fires are fires in flammable liquids, such as gasoline, petroleum oil, and paint. Class B fires also include flammable gases, such as propane and butane. Class B fires do not include fires involving cooking oils and grease.

Class C: Class C fires are fires involving energized electrical equipment, such as motors, transformers, and appliances. Remove the power, and the Class C fire becomes one of the other classes of fire.

Class D: Class D fires are fires in combustible metals, such as potassium, sodium, aluminum, and magnesium.

Class K: Class K fires are fires in cooking oils and greases, such as animals fats and vegetable fats (Fire Equipment Manufacturers Association 2015)

Other than Class K, which are fires associated with commercial kitchens, any of these types of fires could occur at oil and gas facilities because of the hazardous materials that could be located on oil and gas facilities. Both Kern County and City of Bakersfield have hazardous materials teams. However, with the projected increase in the number of oil and gas facilities where many different types of chemicals and/or large quantities of oil or gas are present, significant impacts could occur if the hazardous material response teams do not have sufficient firefighting

materials or equipment to extinguish the type of fires that could be associated with the types of materials that could be at an oil and gas facility.

Police Protection

The Kern County Sheriff's Office serves a population base of over 500,000 in metropolitan and rural areas. The staffing ratio for Metropolitan Bakersfield is currently one officer per 1,000 people, but their target goal is 1.3 per 1,000 people (City of Bakersfield 2014f). Implementation of the proposed Project would not lead to a substantial increase in the population within the County; therefore, the per capita staffing ratio would not be affected. However, there would be an increase in industrial development, potentially in rural areas of the County.

As shown on Figure 4.14-2 and Table 4.14-5, several Sheriff's stations have very large response areas, such as 1,500 square miles for the Buttonwillow substation and 850 square miles for the Lamont substation and 787 square miles for the Taft substation. The Buttonwillow and Taft substations cover most of the Western Subarea. The Delano, Wasco, and Rosedale Sheriff substations and the Bakersfield Police Department cover the Central Subarea, while the Delano and Lamont Sheriff substations and the Bakersfield Police Department cover the Eastern Subarea.

As described in Section 4.14.2, the Rural Crimes Investigation Unit, which addresses property crimes in the agricultural, ranch, and oil and gas field portions of Kern County, has experienced a 10-fold increase in incidences, specifically in metal theft, between 2009 and 2012 (Winn 2014). This rise in crime is not attributed to oil and gas activity. However, increased oil and gas development would mean that there would be equipment, vehicles, and other metal objects at existing and future construction and operations sites.

The Rural Crimes Investigation Unit (RCIU) is currently staffed with one sergeant (supervisor), two senior deputies (investigators), three deputies, one support technician (clerical). In addition, there is one unpaid reserve deputy. The total cost of the RCIU is $1,097,000, which includes salaries and benefits, overtime, surveillance equipment, supplies, training, fuel, and air support flight hours. The Sherriff's office receives approximately $366,000 in state funding from the Central Valley Rural Crimes Prevention Fund to help offset these costs; giving a net general fund cost of approximately $731,000.

The Rural Crimes Unit investigates all crimes that affect farming, ranching, and the oil industry in Kern County. Metal theft is the largest problem that affects farms, ranches, and the oil industry in Kern County. The addition of three deputies to the Rural Crimes Unit has allowed the Sheriff's Department to develop and implement effective strategies, which have reduced the dollar amount and number of rural crime incidences.

Although service demands would not increase from the implementation of the proposed Project , new oil and gas exploration and production activities could increase the level of demand for police protection services from the Sheriff's Office, specifically in rural areas, because new oil and gas activity could attract vandals or create security risks requiring police response. Since the

majority of new oil and gas activities would likely be in rural areas, there could be some increase in demands on the Rural Crimes Unit of the Kern County Sheriff's Department. This impact could be significant.

Schools

Population growth is anticipated to be nominal as result of implementation of the proposed Project during the construction, operation, maintenance, and decommissioning phases of future oil and gas exploration and production activities (see Section 4.13, Population and Housing). As a result, the Project would not substantially affect enrollment in local schools, and school impacts are considered less than significant.

Parks

Please see information regarding park and recreation facilities in Section 4.15, Recreation.

Other Public Facilities

As discussed above, emergency medical calls typically make up the majority of responses provided by a fire department. As the number of residents and workers increases, the need for emergency response services increases. Since population growth is anticipated to be nominal as a result of the implementation of the proposed Project, the Project would not have a significant impact on emergency services or to other public facilities, such as or postal services or libraries. Therefore, impacts on other public facilities are considered to be less than significant.

Mitigation Measures

The Facilities Mitigation Program is designed to augment, where appropriate, funding of services when projected tax revenues from projects are expected to result in a funding shortfall for project-related service demands. Applicants collectively contribute approximately 30% of the property tax revenues collected by the County, and accordingly pay their fair share for most local services with the exception of demand for fire-fighting and rural sheriff services, for which additional funding is included as mitigations (MM 4.14-1 and MM 4.14-2) in this Environmental Impact Report (EIR).

MM 4.14-1 Applicant shall contribute to funding the acquisition of a Combination Walk-in/Non-Walk-in Industrial Firefighting vehicle capable of responding with a minimum of five firefighters with the tools and equipment necessary for industrial firefighting and rescue. Each Applicant shall pay $150 per well on each Oil and Gas Conformity Review permit until the total cost of the vehicle purchase is reached, not to exceed $850,000, to be paid through mitigation fees on Oil and Gas Conformity Review permits. Subsequent Applicants shall not be subject to this mitigation measure.

MM 4.14-2 Applicant shall provide funding in the amount of $425 per Oil and Gas Conformity Review permit issued for the Sheriff's Rural Crime Unit. Funding shall be used for one Sergeant, two Senior Deputies (investigators), three

Deputies, One Support Technician (clerical), and helicopter usage, based on the amount of funding provided by this permit mitigation fee. The Sheriff's department shall annually report on the expenditure of funds for the Rural Crimes Unit, including incident reports and response times. If other sources of funding for the Rural Crimes Unit are secured, then the mitigation fee amount shall be adjusted to pay only the gap between actual costs and funding provided from other sources.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.14.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

Cumulative impacts to public services are usually associated with population in-migration and growth in an area, which increase the demand for particular services, leading to the need for expanded services or new facilities. Public services are provided by local jurisdictions or districts. Service providers serving the Project are located in Kern County. Therefore, the geographic scope for cumulative impacts to public services is limited to the County.

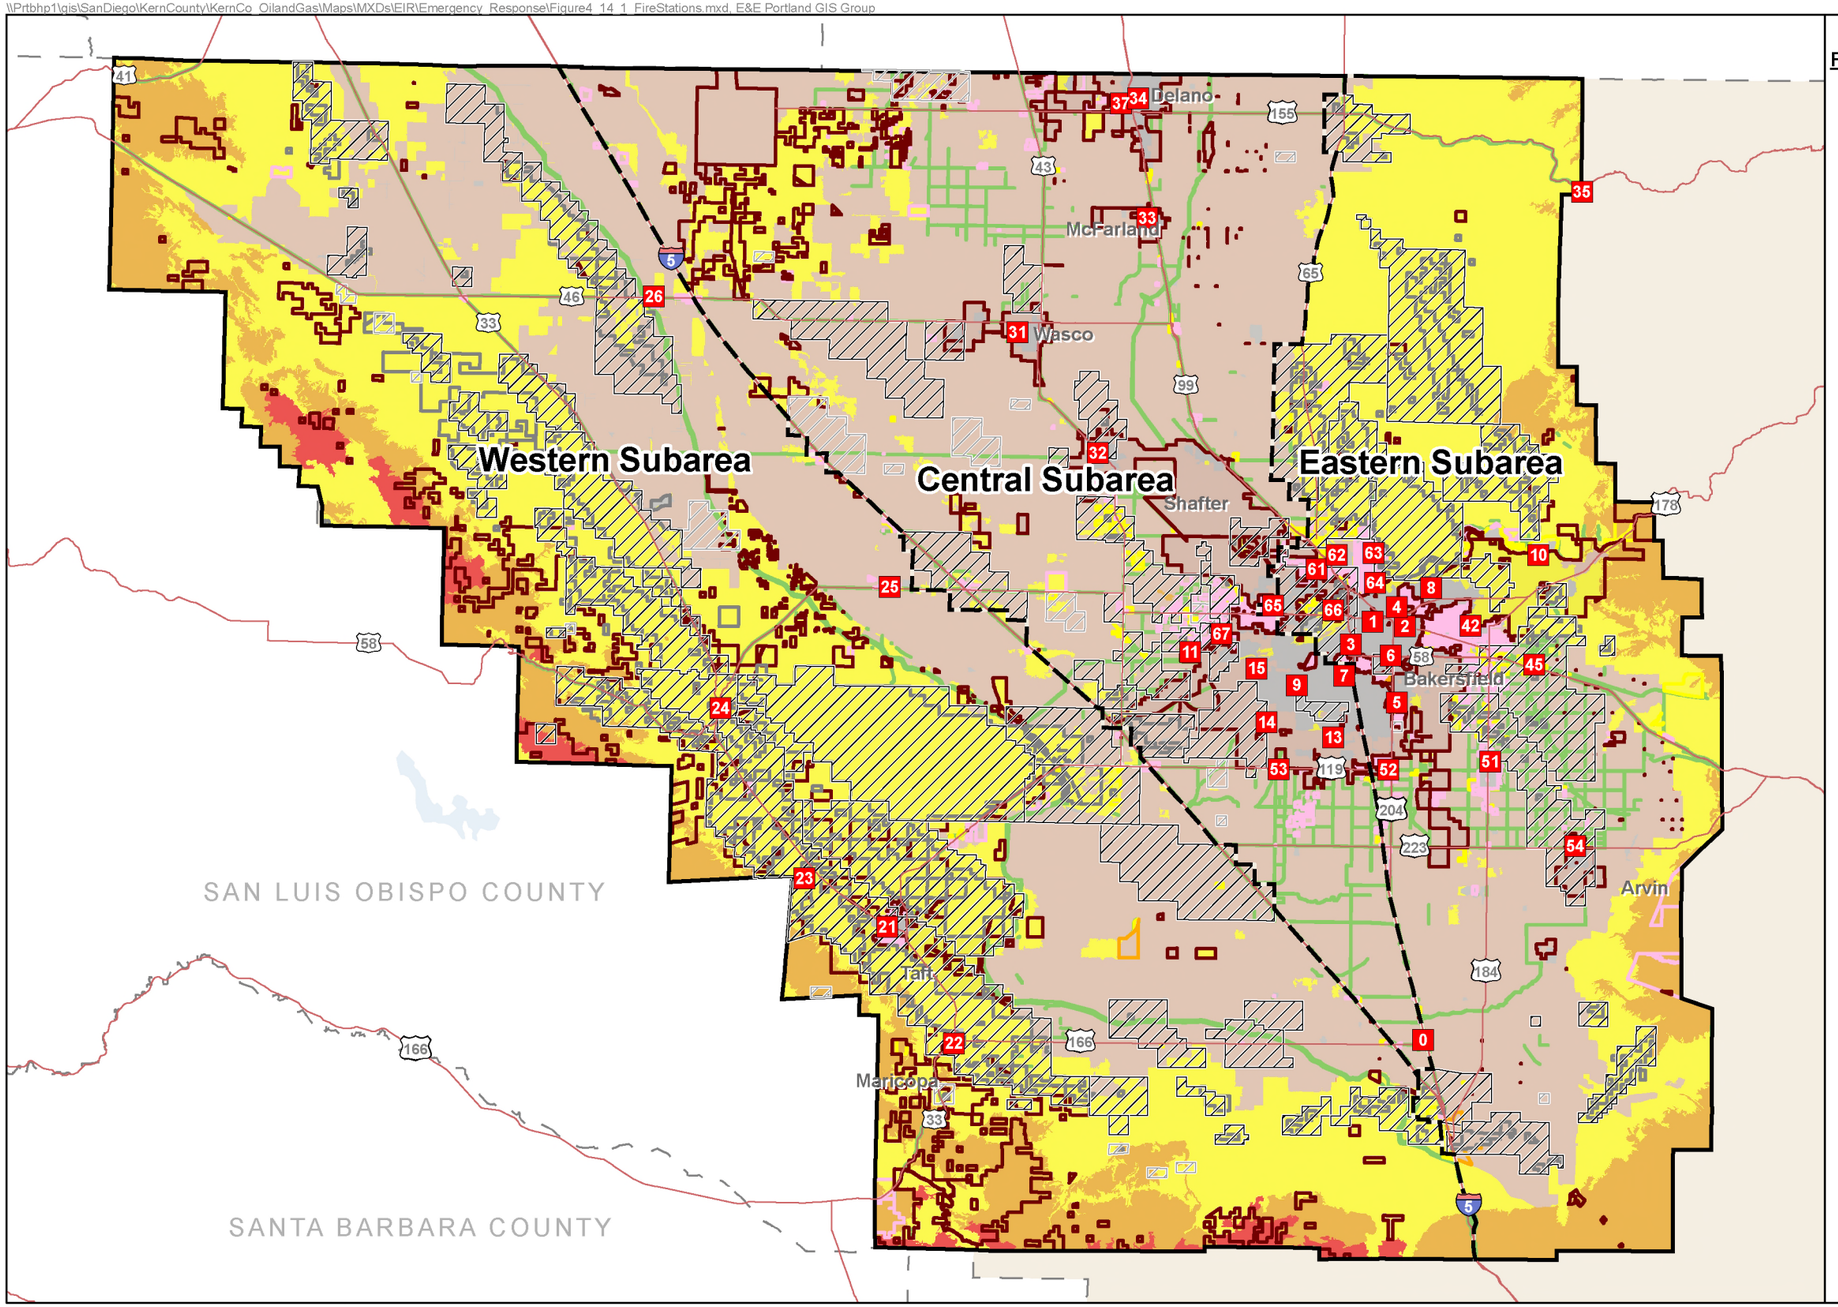
Impact 4.14-2: Contribute to Cumulative Public Service Impacts

The plans evaluated in this cumulative analysis are described in Section 3.8, Cumulative Projects. Implementation of these plans and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions within with each related project is located. This includes the possibility of being required to undergo environmental review, in compliance with the requirements of CEQA and/or the National Environmental Policy Act (NEPA). Should potential impacts to public services be identified, appropriate mitigation would be prescribed.

Significant impacts to fire and police protection services would occur as a result of the future oil and gas exploration and production activities that would be authorized under the proposed Project (Impact 4.14-1). However, mitigation measures MM 4.14-1 and MM 4.14-2 would be incorporated to ensure that impacts are less than significant.

Overall, the proposed Project would cumulatively contribute to an increased demand for fire, police, schools, and other public facilities and, therefore, could be significant impacts. While the proposed Project's contribution to growth in the region would be nominal, cumulative projects that would occur under the regional plans would add to the cumulative demand for such services through the introduction of new residents and users of the proposed facilities. However, this growth has been considered and accounted for in the KCGP, the MBGP, and the Kern Council of Government (COG) Regional Transportation Plan (RTP)/Sustainable Communities Strategy

(SCS). Additionally, in accordance with the KCGP, Public Services and Facilities, Policies 9 and 16 (see Section 4.14.3, Regulatory Setting), new developments would be required to pay a pro rata share of the local cost for the expansion of services under the Public Facilities Mitigation Program. Developers would be required to assume full responsibility for costs incurred in service extensions or improvements that are required to serve their project(s). Therefore, new projects would have to pay for the extension or improvement of fire, police, or other services to serve a specific development, if those services are not available and to ensure service objectives are met.



Additionally, the Project Area is located in an area that is served by all public service providers and the proposed Project's incremental impacts can be sufficiently mitigated (MM 4.14-1 and MM 4.14-2); therefore, the Project's incremental effect on public services is not cumulatively considerable and would be considered less than significant.

Mitigation Measures

Implement MM 4.14-1 and MM 4.14-2, as described above.

Level of Significance After Mitigation

Cumulative impacts would be less than significant with mitigation.

Fire Stations

0. Station Tejon Ranch
5441 Dennis McCarthy Rd Metter, CA 93243
Response Area (sq. mi.): 308

Section 4.15

Recreation

Section 4.15

Recreation

4.15.1 Introduction

This section describes the affected environment and regulatory setting for parks and recreation facilities. It also describes the impacts on parks and recreation facilities that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance (Project), and mitigation measures that would reduce these impacts, if necessary.

4.15.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north; Santa Barbara and San Luis Obispo counties to the west; the Tehachapi Mountains and the Sierra Nevadas to east; and the northern boundary of the Los Padres National Forest to the south.

The Project Area is located in the western half of Kern County, an area that includes, or is adjacent to, many recreational opportunities, including camping, hiking, horseback riding, boating and water skiing, bird watching, picnicking, scenic viewing, golf, baseball and softball, and soccer. The following sections provide a summary of federal, state, and local recreational facilities located in the region.

Local

The Kern County Parks and Recreation Department operates and maintains 40 neighborhood parks throughout the County, as well as several public buildings that also are used for recreational purposes. There are several local parks located within and adjacent to the Project Area that are owned, operated, and maintained by local jurisdictions and private entities. The Lost Hills RV Park is a privately-owned recreational vehicle (RV) park and campground at State Route 46 and Interstate 5 in Lost Hills, California, that also has a swimming pool, playground, store, and other facilities (Lost Hills RV Park 2013). Lost Hills Paramount Park is also located in Lost Hills. Parks in the city of Arvin include the Smothermon and Kovacevich parks, Di Giorgio County Park and the Arvin Little League Field. Lamont Park and Buttonwillow Recreation Park are located in the towns of Lamont and Buttonwillow, respectively. Parks in the City of Shafter include Richland Park, Rodriguez Park, Kirchenmann Park, James Park, and Mannel Park. Westside Park, Barker Park, Wasco Recreation Ballpark, and Cormack Park are located in Wasco. Browning Road Park, Ritchey Park, Arturo J. Munoz Park, Villa Del Caribe Park, and McFarland Park are located in the City of McFarland. Eleven parks—Albany, Cecil Avenue, Cesar Chavez, Delano Skate Park, Jefferson, Kalibo, Morningside, Martin Luther King, Jr. (Valle

Vista), Veneto, Heritage, and Memorial—are located in the city of Delano. One stadium, Frederick Field Memorial Stadium, and the Delano Public Golf Course are also located in Delano. A Street Park, Taft City Park, Ford City Park, and Civic Center Park are located near the cities of Taft and Ford on the west side of the County. Capitola Park is located south of Maricopa along State Route 166.

Regional Setting

Numerous park and recreational facilities are located in the vicinity of the Project Area, including national parks, national forests, state parks, and other recreational opportunities (Figure 4.15-1). In addition, the Pacific Crest Trail (PCT) is located east of the Project Area, with the closest segment 9.75 miles away.

The Kern County Parks and Recreation Department manages an extensive system of regional parks designed to serve the Countywide population and small neighborhood and community parks primarily intended to meet the recreational needs of nearby residents in unincorporated communities. These facilities include seven regional parks, 41 neighborhood parks, 25 public buildings, and three golf courses. The Department also provides landscaping services for 76 county buildings. Including incorporated areas, Kern County contains 4,726 acres of park land with 4,282 acres of regional parks and 389 acres of local neighborhood parks, both leased and owned by the County (Kern County Parks and Recreation Department 2010). The Kern River County Park, the largest regional recreation facility in the County, provides a variety of structured and non-structured recreational facilities, including Hart Memorial Park, Camp Okihi, the Kern County Soccer Park, Lake Ming, the Kern River Golf Course, and picnic areas. Non-structured recreational uses occur along the length of Kern River County Park and include rafting, hiking, bicycle trails, off-road vehicle uses. A list of regional parks and community parks within Kern County is provided as Table 4.15-1.

Notes:
(*) Not an official part of the Kern County park system. Kern County Parks and Recreation Dept. provides recreation services inside the park area.
(a) Ed Oakley Memorial Building located within a small park that includes recreational facilities.
(b) A new park.
(c) Owned by Kern County but operated as a Westside Recreation and Park District facility (not Kern County Parks) under a long-term lease.
(d) Leased, not owned, by the Parks Department.
(e) Currently listed as a Kern County park site.
(f) Park site has been transferred to the Wasco Park District.
(g) Leased, not owned, by the Parks Department.
(h) Leased, not owned, by the Parks Department.
(i) Ownership transferred to Rosamond Community Service District.

Special Recreation and Park Districts

There are nine special recreation and park districts that provide recreational facilities within Kern County. Eight are independent park districts, and one is a community services district (Rosamond). Together these park districts provide over 40 parks or recreation facilities, along with local recreation programming. The extent and variety of parks and programs varies between districts depending on the level of local financial support and the primary mission of the organization. Recreational facilities provided by these districts are listed in Table 4.15-2.

Table 4.15-2: Special Recreation and Park Districts

District	Recreational Facilities
Tehachapi Valley Recreation and Park District	– Brite Lake Aquatic Rec. Center – Dye Natatorium Pool – Philip Marx Central Park – Meadowbrook Dog Park – Meadowbrook Park – West Park Activity Center – Skate Park – West Park

Table 4.15-2: Special Recreation and Park Districts

District	Recreational Facilities	
Buttonwillow Recreation and Park District	– Buttonwillow Park	– Buttonwillow Recreation Building
Shafter Recreation and Park District	– Mannel Park – Kirschenmann Park – Stringham Park	– Rodriguez Park – Town Square – Veterans Park
Bear Mountain Recreation and Park District	– Bear Mountain Park – Weedpatch Park	– Arvin and Lamont Pools
Wasco Recreation and Park District	– Barker Park – Westside Park	– Cormack Park
McFarland Recreation and Park District	– Browning Road Park	– McFarland Park
North of the River Recreation Department	– Almondale Park – Beardsley Park, North – Emerald Cove Park – Fruitvale-Norris Park – Greenacres Park – Highland Park – Liberty Park – Madison Grove Park – McCray Park – Mondavi Park, North – North Meadows Park – North Rosedale Park	– Olive Park East and Olive Park West – Polo Community Park – The Rasmussen Center – River Lakes Ranch Park – Riverview Park – San Lauren Park – Sears Park – Silver Oak Park – Standard Park – Westdale Park
West Side Recreation and Park District	– "A" Street Park – Community Center Park (Skate Park) – Fitness Center – Franklin Field Complex – Mil Potrero Park	– Taft Community Center – Skate Escape – Walter Glenn Natatorium Swimming Pool – Westside Mountain Park
Rosamond Community Service District	– Jim Williford Community Park	– Rosamond Community Pool

National Forests, Parks, and Monuments

Los Padres National Forest

The Los Padres National Forest is located immediately south of the Project Area. The forest extends 220 miles from Monterey County to the western edge of Los Angeles County and encompasses nearly 2 million acres. The forest is divided into five administrative districts, including the Monterey, Santa Lucia, Santa Barbara, Ojai, and Mount Pinos Ranger Districts. The Mount Pinos Ranger District includes the portion of the Los Padres National Forest that is closest to the Project Area. Recreational activities within the forest include fishing, hunting, off-roading, camping, hiking, horseback riding, and trail use (Oh Ranger.com. 2013).

Sequoia National Forest

The Sequoia National Forest (SNF) is located within Kern County in the southern Sierra Nevada Mountains of California. The SNF is named for the giant sequoia trees that are located within 38 groves within the boundaries of the forest. The Giant Sequoia National Monument, 328,000 acres in size, is located within the forest, and was established by presidential proclamation on April 15, 2000. The SNF covers 1,865 square miles and ranges in elevation from 1,000 feet in the foothills of the Sierra Nevadas to over 12,000 feet. The SNF's Sequoia groves are part of its 196,000 acres of forests, which also consists of Jeffrey pine, red fir, coast Douglas-fir, ponderosa pine, white fir, and lodgepole pine. The SNF contains over 2,500 miles of roads and 850 miles of trails, and a number of camping and recreational facilities.

Carrizo Plain National Monument

The Carrizo Plain National Monument (CPNM) is located in California's southern Coast Range, 90 miles west of the city of Bakersfield and 60 miles east of the city of San Luis Obispo. Most of the area is in the eastern portion of San Luis Obispo County; however, 5% of the CPMN (13,540 acres) is located within western Kern County within the Project Area. The CPNM is managed by the Bureau of Land Management (BLM), the Nature Conservancy, and the California Department of Fish and Wildlife. The 250,000-acre facility was established by presidential proclamation in 2001 to preserve unique San Joaquin Valley saline and fault zone habitats and related biological and geological resources.

Most CPNM recreational use is concentrated around the Goodwin Education Center, Soda Lake, Painted Rock, Selby, the Caliente Mountains, the Elkhorn Plain, and the KCL campground, a semi-private facility. The most current information available indicates that visitor use increased from 24,620 in fiscal year (FY) 2001 to 87,040 in FY 2007 (BLM 2010).

Kern National Wildlife Refuge

The Kern National Wildlife Refuge (KNWR) is 11,250 acres in size and is located in the northern portion of the Project Area. It is primarily managed for hunting waterfowl, with a hunting season from October to late January. The KNWR has 17 hunting blinds spaced across 730 acres, with three of the blinds being wheelchair accessible or ADA compliant, and also provides up to 1,867 acres of free roam hunting area (USFWS 2013). The refuge also includes a 6-mile auto tour route and provides opportunities for hiking, bird watching, and photography.

State Parks

The California Department of Parks and Recreation owns, maintains, and operates one state park (Red Rock Canyon) two state historic parks (Fort Tejon and Tomo-Kahni), one state reserve (Tule Elk), and one recreation area (Hungry Valley State Vehicular Recreation Area [SVRA]) available to the public for activities including off-road vehicle use and camping within Kern County.

Red Rock Canyon State Park

Red Rock Canyon State Park is a 27,000-acre park within the Mojave Sector of the Tehachapi District of the California State Park System. The park is located along State Route 14 in Kern County, 25 miles northeast of Mojave, 80 miles east of Bakersfield, and 39 miles east of the Project Area. The park includes two natural preserves and opportunities for camping, sightseeing, equestrian activities, hiking, and off-highway vehicle use (California Department of Parks and Recreation 2013d).

Fort Tejon State Historic Park

Fort Tejon State Historic Park is located near the apex of the Grapevine Canyon, which includes a portion of Interstate 5 and the main vehicular travel corridor between the Central Valley and Southern California. The park is operated and maintained by the California Department of Parks and Recreation and includes the site of a U.S. Army fort established in 1854 and abandoned in 1864. Restored adobes, several 400-year-old valley oak trees, and interactive exhibits, including period recreations with live actors, occur within the park. Facilities include a visitor's center and museum, picnic areas, and group campsites. The park generally is not a destination location and not heavily used except for one day each month from May through September when Civil War-period reenactments occur. The park's only campground, a group facility that can accommodate approximately 100 people, is rarely reserved. A portion of the Fort Tejon State Historical Park is located 1.3 miles south of the Project Area. This area of Fort Tejon State Historical Park contains historical markers for Rose Stage Station, Sebastian Indian Reservation, and the Fages-Zalvidea Trails (State Historic Landmarks 300, 133, and 291, respectively) which are points of interest for travelers along Interstate 5 (CDPR 2013a and The Historical Marker Database 2009a-c).

Tomo-Kahni State Historic Park

Tomo-Kahni State Historic Park, located 21 miles east of the Project Area, was created as a unit of California State Parks in 1993 to protect and preserve the integrity of the site of Tomo-Kahni, or "Winter Village," a Kuwaitis (Nuwa) Native American community located atop a ridge in the Tehachapi Mountains, overlooking Sand Canyon to the east and the Tehachapi valley to the west. Tomo-Kahni is available to the public only by guided tours on weekends during the spring and fall months (California Department of Parks and Recreation 2013b). Recreational opportunities include hiking trails, historical/cultural sites, guided tours, vista points, and nature and wildlife viewing.

Tule Elk State Natural Reserve

The 987-acre Tule Elk State Natural Reserve protects a small herd of tule elk, once in danger of extinction, and provides opportunities to observe native birds of the San Joaquin Valley (California Department of Parks and Recreation 2013c). Located southeast of Buttonwillow and within the Project Area, recreational facilities within the reserve include a picnic area and interpretive exhibits.

Hungry Valley State Vehicular Recreation Area (SVRA)

SVRA is located south of the Tejon Pass, 6 miles south of the Project Area. The 19,000-acre SVRA is operated by the Off Highway Motor Vehicle Recreation Division of California State Parks and includes more than 130 miles of trails for motorcycle, dune buggy, all-terrain, and 4x4 vehicle use and fee campsites (California Department of Parks and Recreation 2013e).

Private Parks

Wind Wolves Preserve

The Wildlands Conservancy owns and manages the 93,000-acre Wind Wolves Preserve, a portion of which is within the Project Area. This private ecological preserve is south of State Route 166 and west of Interstate 5 in the foothills of the San Emigdio Mountain Range. Hiking, mountain biking, nature viewing, picnicking, and outdoor education activities are provided for public use.

4.15.3 Regulatory Setting

Federal

National Trails System Act of 1968

The National Trails System Act (Public Law 90-543) was passed by Congress in 1968 to create a series of trails "to promote the preservation of, public access to, travel within, and enjoyment and appreciation of the open-air, outdoor areas and historic resources of the Nation." The Act authorized a national system of trails and defined four categories of national trails, including National Scenic Trails, National Historic Trails, National Recreation Trails and Connecting or Side Trails. National Scenic Trails are established to provide access to spectacular natural beauty and to allow the pursuit of healthy outdoor recreation and "extended trails so located as to provide for maximum outdoor recreation potential and for the conservation and enjoyment of the nationally significant scenic, historic, natural, or cultural qualities of the areas through which such trails may pass" (16 U.S.C. 1242(a)(2)). In addition, the 1968 Act also authorized creation of the PCT as a National Scenic Trail. As Congressionally established long-distance trails, each trail in the National Trails System is administered by a federal agency, such as by the U.S. Department of Agriculture (USDA) Forest Service for the PCT.

Pacific Crest Trail Planning Criteria

The Pacific Crest National Scenic Trail Comprehensive Plan (USDA Forest Service 1982) and previous Forest Service documents provide guidelines and criteria for design and location of the PCT. Specifically, these guidelines state that the most desirable location will avoid unattractive roads, mining areas, power and telephone lines, commercial and industrial development, fences, and other features incompatible with the natural condition of the trail and with its use for outdoor recreation. Where the trail encounters such development, it should be located so as not to adversely affect, or conflict with, the purpose of the development, natural vegetation, topography,

or natural plantings shall be used, where possible, to screen objectionable features from the view of trail users.

State

There are no state recreation regulations applicable to this Project.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element of the KCGP includes goals, policies, and implementation measures related to recreation that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.4. Public Facilities and Services

Goals

Goal 8. Provide recreation opportunities for all citizens of Kern County while avoiding duplication between jurisdictions.

Goal 12. Provide a balanced system of parks and recreational facilities to meet Kern County's diverse needs and clearly define responsibility for the provision of these facilities.

Goal 13. Provide a variety of park and recreation programs that offer safe, equitable, and balanced recreational opportunities for all residents and visitors.

Policies

Policy 4. The provision of parks and recreational facilities of varying size, function, and location to serve County residents will be encouraged. Special attention will be directed to providing linear parks along creeks, rivers, and streambeds in urban areas.

Policy 5. Seek to provide recreational facilities where deficiencies have been identified.

Implementation Measures

Implementation Measure E. Continue to establish coordinated efforts between government entities and private enterprise to identify and preserve unique scenic qualities of existing natural resources and to enhance the image of the County as a whole.

Implementation Measure F. Continue to use the accepted California and National Design Standards for both passive and active park development to accommodate programmed and

spontaneous activities. Some usable area should be held as open turf for free play and community festivals.

Implementation Measure G. Continue to encourage coordination between appropriate jurisdictions in the acquisition (including cooperative agreements), developments, and use of parks to avoid duplication of facilities and provide economic use of public funds.

Implementation Measure H. Continue to pursue federal, state, and private grant funding for the rehabilitation and acquisition of parks and recreation facilities.

Implementation Measure GG. Implement a level of service standard of 2.5 acres of park area per 1,000 residents.

Implementation Measure HH. The County shall periodically investigate the level of service standards for parks and recreation services to ensure that adequate recreation facilities are provided for County residents.

Implementation Measure II. The Kern County Parks and Recreation Department will evaluate the possibility of alternative funding sources for the development, rehabilitation, and operation of park and recreational facilities. These funding sources shall include the possible implementation of development fees and/or special assessment districts such as used for lighting and landscaping, under a County Service Area (CSA).

Metropolitan Bakersfield General Plan

The MBGP, a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to recreation.

Chapter VI. Open Space Element

Goals

Goal 1. Conserve and enhance the unique aspects of open space within the planning area.

Goal 2. Create an integrated system of open space amenities in the planning area.

Goal 3. Locate and site development to minimize the disruption of open space areas.

Goal 6. Create a greenbelt corridor along the Kern River with increased recreational opportunities.

Policies

Policy 1. Promote the establishment, maintenance and protection of the planning area's open space resources, including the following:

c) Outdoor recreation

- Parks (refer to Chapter XI-Parks)
- Kern River corridor (refer to Chapter II-Land Use, Chapter V Conservation, and Chapter XII-Kern River Plan Element).

Policy 5. Development location and siting should be sensitive to its relationship to the Kern River (I-3).

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern River Plan Element (Chapter XII of the Kern County General Plan)

The Kern River Plan Element, which is included in both the KCGP and the MBGP, includes implementation measures related to recreational facilities and parks. Recreational facilities within the area covered by the Kern River Plan Element are described in Section 4.15.2, Regional Setting. The Kern River Plan Element implementation policies that apply to petroleum extraction within areas designated for recreational use are outlined below.

Chapter V. Implementation Policies

5.3. (F) Implementation Standards and Specific Policies: Mineral and Petroleum Extraction

Implementation Policy 2. Mineral and petroleum extraction shall be encouraged on those lands designated "Mineral and Petroleum" on the Kern River Plan Map. Such use may also occur in other areas designated for recreation, resource, or industrial uses as long as the primary designated use is not significantly impaired and as long as such use is consistent with other provisions of this plan and in compliance with existing local, state, and federal regulations.

Kern County Parks and Recreation Master Plan

In 2010, the County of Kern County Parks and Recreation Master Plan (Master Plan), which evaluated the County's park and recreation resources, assessed the needs for the future, and

developed a roadmap to meeting those needs, was adopted. This Master Plan presents a long-term vision and goals for the Department and for the community to the year 2030; describes current and future needs, interests and community preferences for parks, recreation and facilities, and outlines the policies and goals that create a management framework for the parks and recreation system. It also describes the recommended actions for carrying out polices and achieving the goals.

Chapter IV. Policies Goals and Actions

Policy Recommendations

Policy I. Provide a quality park and open space system that supports opportunities for active and passive recreation to meet the wide ranging recreational and social needs of the diverse, varied communities of Kern County.

Policy II. Maximize resources and expand opportunities for the County-wide parks and recreation system by reforming the financial support structure for the park system, enhancing organizational capabilities, and pro-actively engaging other organizations and the community at large through partnerships and other cooperative arrangements.

Goal 1. Rehabilitate, renovate and modernize existing parks and recreational facilities in the Kern County park system.

Goal 2. Provide a minimum standard of 5 acres of park land per 1,000 residents. This standard would apply to regional parks serving the entire County, as well as local parks in unincorporated areas of the County not served by a local park district.

Goal 3. Provide access to various types of indoor and outdoor recreation facilities with the capacity to support increased recreation programming and provide year-round recreation opportunities for all County residents.

Goal 4. Expand trail connections and pathways throughout Kern County.

Goal 5. Ensure that all Kern County parks and recreation facilities maintain a high level of safety and security for visitors and employees.

Goal 6. Incorporate natural areas and unique ecological and archeological features into the park and open space system to protect threatened species, conserve significant natural and cultural resources and retain critical habitat areas that are unique to Kern County.

Goal 7. Achieve sustainable long-term financial viability for the Kern County park system to satisfy operational needs, capital requirements and desired recreation services.

Goal 8. Re-define the organizational structure of the Kern County park system to improve coordination with other park agencies, park and recreation districts and private providers to ensure that the parks and recreation needs of all Kern County residents are being met.

Goal 9. Continue to support the development and delivery of recreation programs and services provided by other park agencies, non-profit groups, and community organizations in Kern County.

Goal 10. Engage Kern County residents in the planning, stewardship, and programming of park and recreation resources, and provide effective community outreach and marketing to increase public awareness and support of recreation services.

Goal 11. Design and manage County parks and recreation facilities to support families, provide youth with healthy and safe recreational activities, and to encourage community-building.

Goal 12. Develop, train, and support a professional parks department staff who effectively serve the community in the realization of the goals and objectives of this Plan.

To ensure that an adequate amount of recreation facilities are available for all County residents in the future, the Master Plan recommended an overall level of service standard of 5.0 acres of parkland per 1,000 residents.

4.15.4 Impacts and Mitigation Measures

Methodology

The evaluation of possible impacts to recreational resources included a review of the Kern County Parks Master Plan, KCGP Land Use, Open Space, and Conservation Element and the Kern River Plan Element, the MBGP, the Kern County Parks and Recreation Master Plan, and online U.S. Geological Survey (USGS) topographic maps using geographic information system (GIS) software to identify the location and/or description of parks and recreation areas in Kern County. To determine potential impacts, the impact significance thresholds described below were applied to all phases of future oil and gas exploration and production activities.

Table 4.15-3: Methods and Assumptions for Recreation

Methods/Assumptions	Analytical Framework for Recreation
Population Increase	As explained in Section 4.13, Population and Housing, implementation of the Project would not result in a substantial increase in employment or employment-related population.

Thresholds of Significance

The Kern County California on Environmental Quality (CEQA) Implementation Document and Kern County Environmental Checklist state that a project would have a significant impact on recreation if it would:

- Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; or

- Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment.

Project Impacts

The types of potential impacts related to recreational facilities are generally the same for each phase of the future oil and gas exploration and production activities (well construction, operation and maintenance, well stimulation, well abandonment and decommissioning); therefore, the analysis provided below applies to all Project phases.

Impact 4.15-1: Increase the Use of Existing Neighborhood and Regional Parks or Other Recreational Facilities such that Substantial Physical Deterioration of the Facility Would Occur or be Accelerated

Population growth in a given area increases the use of recreational facilities, which can cause accelerated deterioration of neighborhood and regional parks or other recreational facilities. Future oil and gas exploration and production activities that would be authorized under the proposed Project are not anticipated to result in a substantial population increase.

Given the long history of oil and gas development within Kern County, and as further explained in Section 4.13, Population and Housing, any nominal increase in the oil and gas workforce in the future would likely be comprised of local Kern County residents. As such, the Project would not lead to an increase in use of any recreational facilities that would cause or accelerate substantial deterioration of such facilities. Therefore, no impacts from increased use of recreational facilities would occur from implementation of the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance during the construction, operation and maintenance, or abandonment and decommissioning phases of future oil and gas exploration and production activities. A less than significant impact is identified for this issue.

Potential impacts related to future oil and gas exploration and production activities located adjacent to or near parks and recreational activities are addressed in each topical section of this Environmental Impact Report (EIR) (e.g., aesthetics/visual resources, air quality, land use, noise, etc.), since parks are considered a sensitive land use.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Impact 4.15-2: Include Recreational Facilities or Require Construction or Expansion of Recreational Facilities that Might Have an Adverse Physical Effect on the Environment

Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance do not include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. As explained above, future oil and gas exploration and production activities that would be authorized under the proposed Project are not anticipated to result in a substantial population increase or substantial increase in demand for recreational facilities. No adverse physical effects related to recreational facilities would occur to the environment as a result of the Project. Therefore, impacts are anticipated to be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

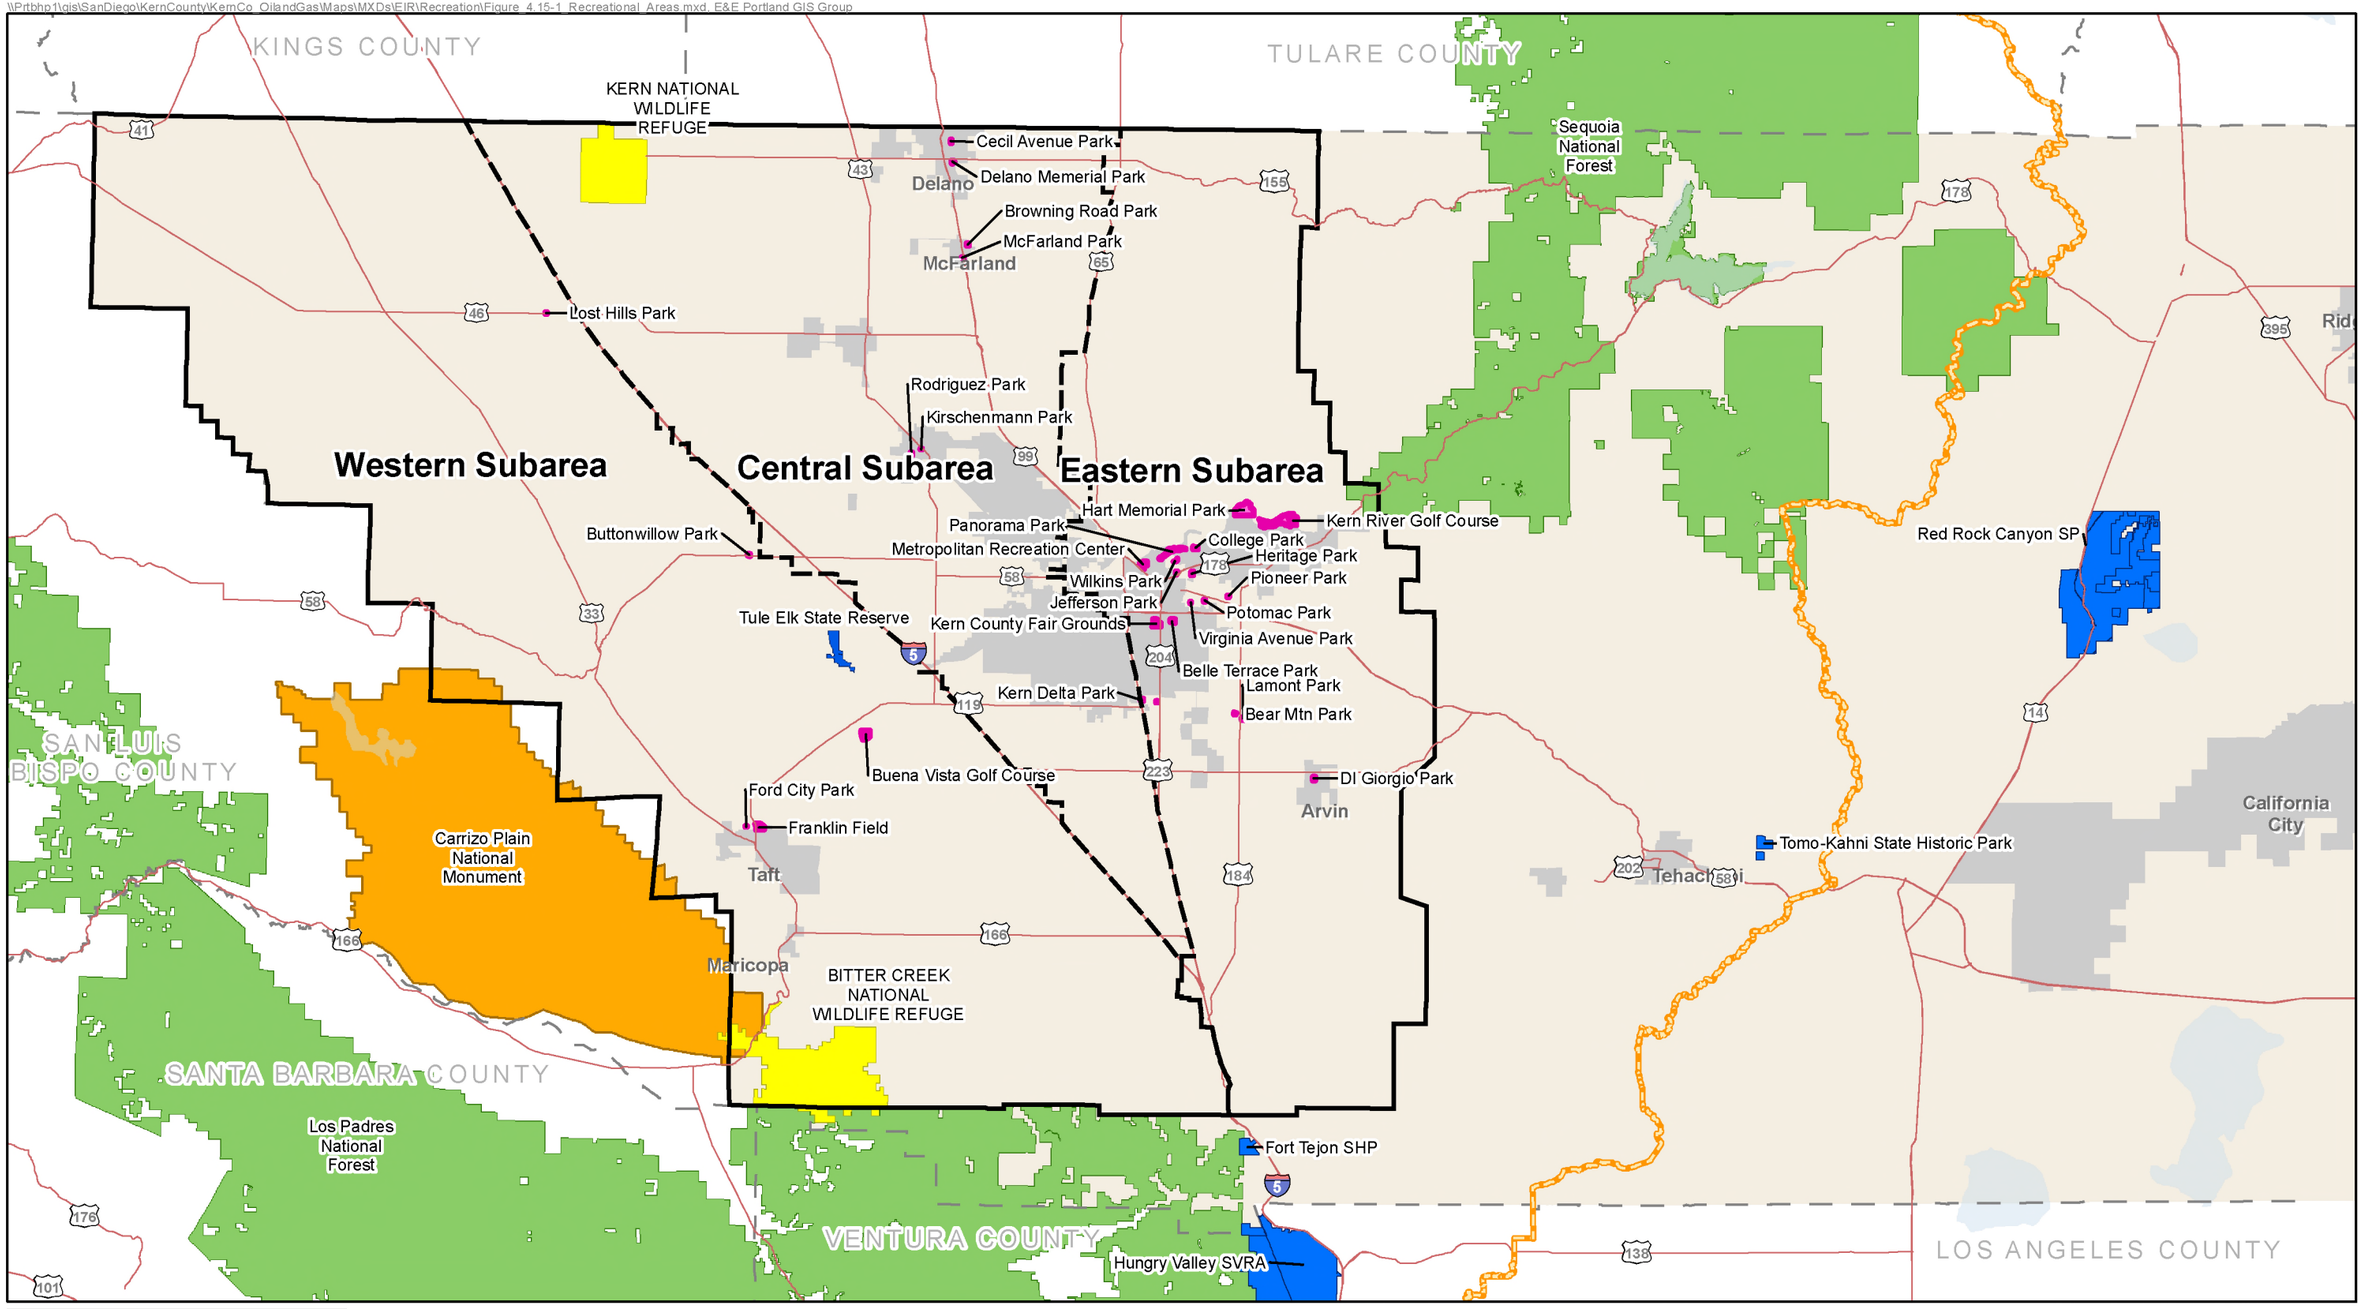
4.15.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for cumulative impacts to recreation resources includes the area within 6 miles of the external Project Area. While projects in a larger area may affect some of the same recreation resources as the Project, by focusing on projects within the Project Area and 6 miles outside of the Project Area, the analysis of cumulative impacts includes those projects that would most comparably affect the same resources as the Project.

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7, of Chapter 3, Project Description.

Impact 4.15-3: Cumulative Impact on Recreational Facilities



With regard to cumulative effects of the Project, together with other projects resulting in increased use of parks (Impact 4.15-1), the Project's impact would be minimal because any nominal increase in the oil and gas workforce in the future would likely be comprised of local Kern County residents. The Project's contribution to any cumulative recreation impact would not be cumulatively considerable. With regard to Impact 4.15-2, the Project's impacts was determined to also be minimal for similar reasons and, therefore, would not contribute to cumulative impacts together with other projects and therefore less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance

Impacts would be less than significant.

Section 4.16

Transportation and Traffic

Section 4.16

Transportation and Traffic

4.16.1 Introduction

This section describes the affected environment and regulatory setting for transportation and traffic. It also describes the impacts on transportation and traffic that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance (Project), including impacts from future oil and gas development pursuant to the Amended Ordinance, and mitigation measures that would reduce these impacts, if necessary.

Information contained within this section was primarily provided by the Traffic Impact Study and Roadway Assessment Kern County Oil and Gas Well Activity (Traffic Study), dated March 2015, which was prepared by Ruettgers and Schuler and included as Appendix W of this Environmental Impact Report (EIR). This Traffic Study provides an analysis of existing and 2035 traffic conditions. Potential traffic impacts to intersections and roadways were determined for both development/construction and operation of the Project using the most recently published roadway traffic volumes and project-related vehicle trip calculations. Discussion and evaluation of transportation facilities, including pavement conditions, are based on site surveys with applicable thresholds and impacts identified. Additional impacts to the airport system are also discussed.

4.16.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north, Santa Barbara and San Luis Obispo counties to the west, the Tehachapi Mountains and the Sierra Nevada Mountains to east, and the northern boundary of the Los Padres National Forest to the south.

Transportation in the Project Area is dominated by automobile traffic. This section discusses the existing conditions related to transportation and traffic in the Project Area. The circulation system in the Project Area is made up of a combination of state, county and city jurisdiction facilities. Major components of the system are discussed below.

Regional and Local Roadway Facilities

Regional access to oilfields and ancillary facilities in the Project Area could be obtained via the numerous highways and two lane roads that traverse the Project Area. These facilities are described below and are presented on Figure 4.16-1.

Regional Roads

Interstate 5 is a major, four-lane, divided freeway that extends north from the Mexican border to the Canadian border and provides access for goods movement, shipping, and travel. This highway crosses the western portion of Kern County and is designated as an arterial/major highway by the Circulation Element of the Kern County General Plan (KCGP).

State Route 33 (Westside Highway) connects U.S. 101 at Ventura with Interstate 5 near Vernalis and Tracy. The highway begins in Ventura as a freeway, but changes to a rural character as it ascends the San Rafael Mountains near Ojai. State Route 33 descends into the great Central Valley, and it quickly becomes a parallel route to Interstate 5, serving the communities of Maricopa, Taft, Avenal, Coalinga, Mendota, Los Banos, and Patterson. State Route 33 ends its lengthy journey at its junction with Interstate 5 just south and east of Tracy.

State Route 43 (Central Valley Highway) extends north from State Route 119 in Kern County to State Route 99 in Kings County. State Route 43 operates as a four-lane highway between the cities of Shafter and Wasco and as a two-lane highway elsewhere within the Project Area.

State Route 46 (Famoso Highway) begins at State Route 99, goes west through Wasco, and continues west into San Luis Obispo County. This route ends at U.S. Highway 1 on the Pacific Coast. The road is a two-lane highway in Kern County.

State Route 58 (Rosedale Highway/Mojave Freeway) begins in San Luis Obispo County, enters Kern County near McKittrick, and runs east through Bakersfield and Mojave to the County boundary past Boron to end in San Bernardino County. This route is a divided highway that runs generally east-west across Kern County, connecting Bakersfield, Tehachapi, and Mojave to Lenwood and Barstow to the east. The right-of-way varies between two and four lanes.

State Route 65 is a two-lane highway that starts at State Route 99 in unincorporated Oildale, north of Bakersfield, and continues into Tulare County.

State Route 99 (Golden State Highway) is a major north-south route through the central valley of California. State Route 99 begins south of Bakersfield branching off Interstate 5 and continuing north to Sacramento. State Route 99 provides a vital regional north-south link to the cities and communities in the San Joaquin Valley. Most of State Route 99 is a six-lane freeway in Kern County. Sections through Bakersfield have eight lanes. Sections north of McFarland and south of White Lane, in Bakersfield, have four lanes.

State Route 166 (Maricopa Highway) begins at Interstate 5 in Mettler Station. State Route 166 continues west through Maricopa into Santa Barbara County where it eventually reaches US 101.

State Route 184 (Weedpatch Highway) extends north from State Route 223 to Kern Canyon Road along the northerly extension of the Wheeler Ridge Road alignment. State Route 184 then turns onto the Kern Canyon Road alignment and continues northeasterly to State Route 178. State Route 184 operates as a two-lane roadway within the Project Area.

Local Roads

County roads that are expected to provide access to the oilfields and ancillary facilities in the Project Area and also serve as links for regional traffic include Lerdo Highway, Seventh Standard Road, Stockdale Highway and Copus Road/David Road. These roadways all operate with two lanes within the Project Area, with the exception of Lerdo Highway from State Route 43 to State Route 99, and Seventh Standard Road from Santa Fe Way to State Route 99. Both of these segments operate as four-lane roadways.

Other county roads expected to provide east-west access to the oilfields include Garces Highway, Pond Road, Sherwood Avenue, Whisler Road, Kimberlina Road, Merced Avenue, and Stockdale Highway (Figure 4.16-1). These roads all operate as two-lane roadways in the vicinity of the oilfields.

Performance Criteria

Intersection and Roadway Levels of Service

For California Environmental Quality Act (CEQA) purposes, defined performance criteria are utilized to determine if a project causes a significant impact. To describe the quality of service of the study intersections and roadways, the Traffic Study (Appendix W) used Level of Service (LOS) ratings, which range from LOS A (free-flow conditions) to LOS F (severely congested conditions), as indicated in Tables 4.16-1, 4.16-2 and 4.16-3.

Table 4.16-1: Level of Service Criteria for Unsignalized Intersections

Average Control Delay (seconds per vehicle)	Level of Service	Expected Delay to Minor Street Traffic
≤ 10	A	Little or no delay
> 10 and 15	B	Short traffic delays
> 15 and 25	C	Average traffic delays
> 25 and 35	D	Long traffic delays
> 35and 50	E	Very long traffic delays
> 50	F	Extreme delay

Source: Appendix W

Table 4.16-2: Level of Service Criteria for Signalized Intersections

Volume/ Capacity	Control Delay (seconds per vehicle)	Level of Service
< 0.60	≤ 10	A
0.61 - 0.70	> 10 and ≤ 20	B
0.71 - 0.80	> 20 and ≤ 35	C

Table 4.16-2: Level of Service Criteria for Signalized Intersections

Volume/ Capacity	Control Delay (seconds per vehicle)	Level of Service
0.81 - 0.90	> 35 and ≤ 55	D
0.91 - 1.00	> 55 and ≤ 80	E
> 1.0	> 80	F

Source: Appendix W

Table 4.16-3: Level of Service Characteristics for Roadways

LOS	Characteristics
A	Free-flow operation exists.
B	Reasonably free-flow operation exists; the ability to maneuver within the traffic stream is only slightly restricted.
C	Travel speeds are still at or near free-flow, but the ability to maneuver within the traffic stream is noticeably restricted.
D	Travel speeds begin to decline with increasing flows; the ability to maneuver is more noticeably limited; and minor incidents can be expected to create queuing.
E	Operation is at or near capacity and is therefore volatile because virtually no useable gaps in the traffic stream appear; maneuverability is extremely limited; and any disruption to the traffic stream, such as vehicles entering from ramps or changing lanes, can cause disruptions.
F	Breakdown in vehicular flow occurs, with queues forming behind major breakdown points, such as traffic incidents or recurring points of congestion.

Existing Traffic Conditions

The Traffic Study (Appendix W) provides information regarding the existing traffic operations for 65 unsignalized intersections, 36 signalized intersections, and 462 roadway segments in the Project Area. The existing traffic volumes are comprised of the combination of published annual average daily traffic volumes (AADT), and AM and PM peak hour turning movements that were counted in 2014. These traffic volumes represent a combination of traffic generated by non-oil and gas (NOG) activities (traffic completely unrelated to oil and gas operations), as well as traffic generated by existing oil and gas operations. The hours from 5:30 a.m. to 7:30 a.m. and 3:30 p.m. to 5:30 p.m. account for the morning and evening peak travel times. Traffic worksheets are provided in Appendix A of the Traffic Study (Appendix W).

The majority of the study intersections currently operate at an acceptable LOS (LOS D or better for intersections located within the non-metropolitan region of Kern County, and LOS C or better for intersections located within the Bakersfield and Kern County metropolitan areas and for

California Department of Transportation [Caltrans] facilities) during the AM and PM peak hours, as summarized in Tables 4.16-4 and 4.16-5. However, 19 intersections are calculated to operate at an unacceptable LOS during the AM Peak and/or PM Peak hours under existing conditions (Appendix W).

The existing AADT volumes and roadway capacities and the calculated volume to capacity (V/C) ratios are shown in Table 4.16-6. Of the 463 roadway segments evaluated, the majority operate at an acceptable LOS (LOS D or better for roadways located within the non-metropolitan region of Kern County and LOS C or better for roadways located within the Bakersfield and Kern County metropolitan areas and for Caltrans facilities). However, 30 segments are calculated to operate at an unacceptable LOS under existing conditions (Appendix W).

Table 4.16-6: Roadway Segment Operations, 2015

Street Segment	Existing ADT	Existing Capacity	V/C Ratio

Source: Appendix W
Notes:
(1) Published ADT data.
(2) Where existing data was not available, existing volumes are projected from latest previous year data
Key:
SR = State Route
V/C/ = Volume to Capacity

Other Transportation Facilities

Public Transit Service

The County of Kern operates Kern Regional Transit (KRT), which operates daily bus routes within the unincorporated communities of Buttonwillow, Lamont, Kern River Valley, Frazier Park, Rosamond, and Mojave. In western Kern County, bus routes connect Bakersfield to various cities including Delano, Wasco, Taft, Lebec, and Frazier Park (KRT 2014). KRT also provides intercity service between Delano/McFarland/Wasco/Shafter/ Bakersfield, Lamont/Bakersfield, Lake Isabella/Bakersfield, Frazier Park/Bakersfield, California City/Mojave/Rosamond/ Lancaster/Palmdale, Lost Hills/Bakersfield, and Taft/Bakersfield. GetBus operates daily bus routes within the city of Bakersfield and surrounding areas (GetBus 2014). Greyhound provides bus service from Bakersfield north to Fresno and from Bakersfield south to Los Angeles (Greyhound 2010).

Railways

Amtrak provides passenger rail service from Bakersfield to the north through Fresno. Rail service from Bakersfield to Los Angeles is provided via San Francisco. A direct connection to the south through Los Angeles is not currently provided, but high-speed rail service between San Francisco and Los Angeles via Bakersfield may be available by 2029 (Amtrak 2014; California High-Speed Rail Authority 2014).

Freight service is provided by the San Joaquin Valley Railroad, which operates throughout the San Joaquin Valley and interchanges with the Union Pacific Railroad and the Burlington Northern Santa Fe Railroad in Bakersfield. Commodities transported by the San Joaquin Valley Railroad include petroleum and agricultural products.

Aircraft and Military Aviation

Public Airports

Commercial air travel in western Kern County is provided by Meadows Field Airport in northern Bakersfield. Direct flights are available to Los Angeles, San Francisco, Phoenix, Houston, and other U.S. cities. Bakersfield Municipal Airport is located in the south-central Bakersfield area.

Other public airports include Delano Municipal Airport, Wasco-Kern County Airport, and Shafter Airport-Minter Field in northern Kern County, and Taft-Kern County Airport in southwestern Kern County. Smaller public airports (averaging less than 100 aircraft operations per month) are also located in western Kern County, including Lost Hills-Kern County Airport, Elk Hills-Buttonwillow Airport, and Poso-Kern County Airport (AirNav 2014).

Private Airports

A number of private airstrips are located throughout western Kern County, including Tejon Ag and Paradise Lakes airfields south of Bakersfield, Majors Airfield north of Bakersfield, Joe Gottlieb Field Airport west of Bakersfield, and Cashen Airport northwest of Wasco (AirNav 2014).

Military Aviation

Kern County has three military aviation installations: the China Lake Naval Air Weapons Station and Edwards Air Force Base (AFB), both of which are located in the eastern part of the County, and the Lemoore Naval Air Station, located in the central San Joaquin Valley. Each installation has unique flying operations and their primary mission is to test military aircraft and weapon systems. Due to the military bases' required flying mission, aircraft fly beyond the boundaries of the installations at supersonic speeds and sometimes as low as 200 feet above the ground. In order to minimize flight hazards to non-military aircraft, the military aircraft from these installations fly within restricted airspace known as the Joint Service Restricted R-2508 Complex. This complex is considered an extension of the airspace for these military aviation installations and their flying missions. The facilities coordinated with local governments and airports in the Joint Land Use Study completed in 2008. Mojave Air and Space Port and Inyo Kern Airport both provide civilian flight-testing and drone testing capabilities. Mojave Air and Space Port is also the first FAA licensed civilian space flight testing facility in the United States.

Bicycle and Pedestrian Facilities

Many cities within Kern County have adopted bicycle and pedestrian plans as a subsection of their General Plans' Circulation Element. In western Kern County, Bakersfield has a number of existing and planned bicycle lanes and paths, and the cities of Delano, Wasco, Shafter, and Taft have a number of planned bicycle lanes and paths, as well. A large bicycle and pedestrian path is planned between Bakersfield and Taft that would follow the California Aqueduct and primarily traverse through existing oilfields. This path would be an extension of the Kern River Bike Path that follows the Kern River through Bakersfield. The Kern River Bike Path is the most popular bicycle path in the County (Kern COG 2012).

Existing Pavement Conditions

Analysis of the potential impacts of future oil and gas development on the pavement condition of roadways within the Project Area involved estimating remaining pavement service life and assessing the need and timing for maintenance and rehabilitation improvements. The analysis was

conducted for each of the study years (2015 through 2035) and included 400 centerline miles of county roads and 350 centerline miles of state routes.

Two primary data sources were used for the pavement condition analysis: truck load and pavement condition.

Truck Load

Heavy truck traffic is the primary factor affecting pavement condition. Pavement is designed using a Traffic Index (TI), which is a measure of the cumulative number of heavy trucks expected to load a pavement over its service life. As per Caltrans methodology, TI's are estimated by converting mixed truck loads to 18,000-pound Equivalent Single-Axle Loads (ESALs). A TI for a 20-year design life (standard for new roadway construction) was assigned to each roadway. Caltrans truck count data for the year 2012 were used to develop TI estimates for state routes per Caltrans methodology. When available, design TIs obtained from record drawings were used for County roadways. For each of the remaining County roadways, TI's were estimated based on a review of Kern COG traffic count data and roadway classifications. The range of 20-year TIs used for this study, along with corresponding maximum ESAL values, are presented in Table 4.16-7.

Table 4-16-7: Traffic Index and Maximum Equivalent Single-Axle Loads

Roadway Type	20-Year Traffic Index (TI)	Maximum Equivalent Single-Axle Load (ESAL) (1)
Freeway State	10.0 - 15.5	3,020,000 - 112,000,000
Highway State	8.0 - 12.0	487,000 - 13,500,000
Arterial County	9.0 - 10.0	1,270,000 - 3,020,000
Collector County	7.0 - 8.5	164,000 - 798,000

Source: Appendix W
Note:
(1) Caltrans 2006

Pavement Condition Data

Caltrans assesses the condition of the California State Highway System (SHS) through its Pavement Condition Survey (PCS). The PCS data collection process involves conducting pavement surface condition inspections and measuring ride quality. PCS data are grouped into one of three pavement "condition states," as described in Table 4.16-8.

Table 4.16-8: State Pavement Condition Survey Conditions

Pavement Condition	Condition State	Visible Distress
Good	1	Pavement in good/excellent condition No or few potholes or cracks
Fair	2	Pavement in fair condition Minor surface distress (cracking, raveling and potholes)
Poor	3	Pavement in poor condition with extensive/significant cracks or poor ride only

Source: Appendix W

Kern County assesses pavement condition using the Pavement Surface and Evaluation Rating system (PASER). PASER ratings are assigned to County roadways based on visual surface condition inspections, and range from "1" (failed pavement in need of reconstruction) to "10" (new pavement or pavement with no visible signs of distress). For the purposes of this analysis, PASER ratings were grouped, as shown in Table 4.16-9, to generally correspond with Caltrans' pavement condition states.

Table 4.16-9: County Pavement Surface and Evaluation Rating System Ratings

Pavement Condition	PASER Rating	Visible Distress
Good	10	None (new construction)
	9	None (recent overlay)
	8	Sealed or light linear cracks
Fair	7	Moderate linear cracks, no or light surface wear, no or few patches in excellent condition
	6	Severe linear cracks, early block cracking, light surface wear, patches in good condition
	5	Secondary linear cracks, block cracking, moderate surface wear, patches in good condition
Poor	4	Multiple linear cracks, block cracking, severe surface wear, patches in fair condition, ruts
	3	Multiple linear cracks, severe block cracking, some alligator cracking, patches, ruts, potholes
	2	Alligator cracking, severe ruts, extensive patches in poor condition, potholes
	1	Extensive amounts of severe distress

Source: Appendix W

PCS and PASER data for the year 2013 were used for this study. Corresponding pavement conditions (Good, Fair, and Poor) for roadway segments within the Project Area are shown on Figure 4.16-2. The Kern County Roads Department has a general policy goal of maintaining at least 50% of its roadways at or above a PASER rating of 5 (Good or Fair condition). A review of the pavement condition data revealed that County roadways within the Project Area met this goal in 2013. Similarly, it was also found that at least 50% of study area state routes in the Project Area were in Good or Fair condition in 2013. These 2013 condition levels were used as the baseline conditions for the pavement condition analysis in Section 4.16.4.

4.16.3 Regulatory Setting

Federal Aviation Administration

The Federal Aviation Administration (FAA) regulates aviation at regional, public, private, and military airports. The FAA regulates objects affecting navigable airspace and structures taller than 200 feet according to Federal Aviation Regulation 14 Code of Federal Regulations (CFR) Part 77. For structures of this size, both the U.S Department of Transportation (USDOT) and Caltrans require the proponent to submit FAA Form 7460-1, Notice of Proposed Construction or Alteration.

As described in 14 CFR 77.9 (Construction or Alteration Requiring Notice), each sponsor who proposes any of the following construction or alteration scenarios shall notify the FAA in the form and manner as follows:

If requested by the FAA, or if you propose any of the following types of construction or alteration, you must file notice with the FAA of:

(a) Any construction or alteration that is more than 200 feet above ground level (AGL) at its site.

(b) Any construction or alteration that exceeds an imaginary surface extending outward and upward at any of the following slopes:

(1) 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway more than 3,200 feet in actual length, excluding heliports.

(2) 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway no more than 3,200 feet in actual length, excluding heliports.

(3) 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport described in paragraph (d) of this section.

(c) Any highway, railroad, or other traverse way for mobile objects, of a height which, if adjusted upward 17 feet for an Interstate Highway that is part of the National System of Military and Interstate Highways where overcrossings are designed for a minimum of 17

feet vertical distance, 15 feet for any other public roadway, 10 feet or the height of the highest mobile object that would normally traverse the road, whichever is greater, for a private road, 23 feet for a railroad, and for a waterway or any other traverse way not previously mentioned, an amount equal to the height of the highest mobile object that would normally traverse it, would exceed a standard of paragraph (a) or (b) of this section.

(d) Any construction or alteration on any of the following airports and heliports:

(1) A public use airport listed in the Airport/Facility Directory, Alaska Supplement, or Pacific Chart Supplement of the U.S. Government Flight Information Publications;

(2) A military airport under construction, or an airport under construction that will be available for public use;

(3) An airport operated by a Federal agency or the U.S. Department of Defense (DOD).

(4) An airport or heliport with at least one FAA-approved instrument approach procedure.

(e) You do not need to file a notice for construction or alteration is not needed for the following:

(1) Any object that will be shielded by existing structures of a permanent and substantial nature or by natural terrain or topographic features of equal or greater height, and will be located in the congested area of a city, town, or settlement where the shielded structure will not adversely affect safety in air navigation;

(2) Any air navigation facility, airport visual approach or landing aid, aircraft arresting device, or meteorological device meeting FAA-approved siting criteria or an appropriate military service siting criteria on military airports, the location and height of which are fixed by its functional purpose;

(3) Any construction or alteration for which notice is required by any other FAA regulation.

(4) Any antenna structure of 20 feet or less in height, except one that would increase the height of another antenna structure.

Per 14 CFR 77.7, notification requirements include sending one executed form set of FAA Form 7460-1, Notice of Proposed Construction or Alteration, to the Manager, Air Traffic Division, FAA Regional Office having jurisdiction over the area within which the construction or alteration will be located. The notice required must be submitted at least 45 days before the earlier of the following dates: (1) the date the proposed construction or alteration is to begin; or (2) the date an application for a construction permit is to be filed.

State

California Department of Transportation (Encroachment Permits and Transportation Permits (Oversized Permits)

Caltrans has jurisdiction over state highways within California and sets maximum load limits for trucks and safety requirements for oversized vehicles that operate on highways. The following Caltrans regulations apply to potential transportation and traffic impacts of the proposed Project:

California Vehicle Code (CVC), Division 15, Chapters 1 through 5 (Size, Weight, and Load). Includes regulation pertaining to licensing, size, width, and load of vehicles operated on highways.

Caltrans has the discretionary authority to issue special permits for the movement of vehicles/vehicle loads that exceed statutory limitations for size or weight on state roadways as specified in Division 15 of the CVC. Completion of a Transportation Permit application is required for Caltrans to issue a special permit (Caltrans 2014).

Public Resources Code Section 3237, Emergency Access

The California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR), State Oil and Gas Supervisor District Deputy may order the plugging and abandonment of a well that has been deserted. For purposes of this regulation, credible evidence of desertion includes, but is not limited to, an operator's failure to maintain the access road to a well site passable to oilfield and emergency vehicles (DOGGR 2014).

Public Resources Code Section 3600, Setback from Public Roadways

Public Resources Code (PRC) Section 3600 establishes that oil and gas wells located within 100 feet of a public street, road, or highway dedicated prior to the commencement of drilling of the well are a public nuisance.

California Street and Highway Code Section 660, 670-695 and 1450 et seq.

This code requires permits from Caltrans for any roadway encroachment during truck transportation and delivery, includes regulations for the care and protection of state and County highways, provides for the issuance of written permits, and requires permits for any load that exceeds Caltrans weight, length, or width standards for public roads.

Senate Bill 743

Senate Bill (SB) 743 (Stats. 2013, Ch. 386) authorizes the Governor's Office of Planning and Research to adopt CEQA Guidelines for establishing alternative metrics to analyze traffic impacts aside from LOS. Once the new CEQA Guidelines go into effect, vehicle LOS and similar measures related to delay shall not be used as the sole basis for determining the significance of transportation impacts.

Local

Kern Council of Governments 2014 Regional Transportation Plan/Sustainable Communities Strategy

The Kern Council of Governments (COG), as a regional transportation agency, prepares the Regional Transportation Plan (RTP) to examine long-range transportation issues, opportunities, and needs for Kern County. The 2014 RTP is a 26-year blueprint that establishes a set of regional transportation goals, policies, and actions intended to guide development of the planned multi-modal transportation systems in Kern County (Kern COG 2014). The 2014 RTP includes a policy element that is shaped by goals, policies, and performance indicators, a description of planning assumptions for regional growth and future needs for travel and goods movement, a Sustainable Communities Strategy (SCS) that identifies planning strategies and illustrative development patterns that would reduce greenhouse gas (GHG) emissions, and a plan of action for the region to pursue to meet identified transportation needs. The RTP was developed through a continuing, comprehensive, and cooperative planning process, and provides for effective coordination between local, regional, state, and federal agencies.

The RTP promotes a more efficient transportation system that calls for fully funding alternative transportation modes, while emphasizing transportation demand and transportation system management approaches for new highway capacity. The Constrained Program of Projects (included in the 2014 RTP, Chapter 5, Strategic Investments, Table 5-1), includes projects that move the region toward a financially constrained and balanced system. Constrained projects have undergone air quality conformity analyses to ensure that they contribute to the region's compliance with state and federal air quality rules.

Kern COG also prepares the Regional Transportation Improvement Program and the Federal Transportation Improvement Program, which are funding documents for the implementation of projects referenced and identified in the RTP. The Kern COG is the designated Congestion Management Agency for Kern County. The RTP/SCS includes a Congestion Management Program (CMP), which is designed to ensure that a balanced transportation system is developed, relating population and traffic growth, land use decisions, performance standards, and air quality improvements, as specified under SB 375.

The Kern COG CMP includes six elements: Land Use Impact Analysis, Multimodal Performance Standards, Regional Traffic Model, Transportation Demand Management, Capital Improvement Program (CIP), and Deficiency Plan. The Kern COG CMP network (also referred to as congestion management corridors), which includes a system of roadways that will be monitored in relation to established LOS standards and includes the several highways and principal arterials, is presented in Table 4.16-10.

Table 4.16-10: Kern COG Congestion Management Corridors

Highways	
Interstate 5	SR 155
SR 14	SR 166
SR 33	SR 178
SR 43	SR 184
SR 46	SR 202
SR 58*	SR 204
SR 65	SR 223
SR 99	U.S. 395
SR 119	
Principal Arterials	
China Lake Boulevard – SR 178 to Route 395	
Rosamond Boulevard – Tehachapi-Willow Springs Road to SR 14	
Seventh Standard Road – SR 99 to Interstate 5	
Tehachapi-Willow Springs Road – SR 58 to Rosamond Boulevard	
Wheeler Ridge Road – Interstate 5 to SR 223	

Source: Kern COG 2014
Note:
*The new Westside Parkway and Stockdale Highway will be added to the CMP system when the designation of SR 58 switches over to those routes, possibly by 2015.

LOS E has been established as the minimum system-wide LOS traffic standard in the CMP. Those roads currently experiencing even greater traffic congestion have been accepted at their existing traffic level of LOS F. By so doing, cities and the County will not be penalized through loss of gas tax funds for not meeting the new CMP LOS E standard. Existing LOS F locations, are listed below.

- Seventh Standard Road – SR 99 to Coffee Road;
- Portions of SR 119 at SR 99;
- Portions of SR 178/24th Street – Oak Street to N Street;
- Portions of SR 58 – SR 99 to Cottonwood Road; and
- Portions of SR 58/Rosedale Highway – SR 99 to Fruitvale Avenue.

According to the Final 2014 RTP/SCS, this list was updated based on the most recent travel demand model validation base year.

Kern County General Plan

The Project Area is located within the KCGP area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element, the Circulation Element, and the Safety Element of the KCGP include goals, policies, and implementation measures related to transportation and traffic that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.8. Industrial

Goals

Policy 1. Locations for new industrial activities shall be provided with adequate infrastructure (water, sewage disposal systems, roads, drainage, etc.) to minimize effects on County services.

Policy 5. Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors.

Policy 13. Where feasible, locate future industrial activities in close proximity to railroad facilities and inter- and intra-State transportation corridors to minimize extensive travel through urban areas and to promote alternative transportation of goods.

Implementation Measures

Implementation Measure G. Require a Specific Plan for industrial land projects (as defined in the Assumptions Section of the Special Treatment Areas) to identify site specific issues and implementation, such as infrastructure, circulation, compatibility, and public services and facilities.

1.9. Resource

Policy 2. In areas with a resource designation on the General Plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of the particular resource will be considered to be consistent with this General Plan.

Chapter 2. Circulation Element

Objectives

Objective 1. To make certain that transportation facilities needed to support development are available. To ensure that these facilities occur in a timely manner so as to avoid traffic degradation.

Objective 5. Maintain a minimum Level of Service (LOS) D for all roads throughout the County.

2.3.3. Highway Plan

Goals

Goal 5. Maintain a minimum Level of Service (LOS) D.

Implementation Measures

Implementation Measure B. Continuity and integrity of the arterial and collector system at the mountain/valley region and the mountain/desert region boundary must be reviewed and approved in conjunction with project adoption on an individual basis.

Implementation Measure C. Conformance to alignment minimum design standards, where roadways that deviate from section and mid-section lines intersect those lines, must be reviewed and approved in conjunction with project adoption on an individual basis.

2.3.4. Future Growth

Goals

Goal 1. To provide ample flexibility in this plan to allow for growth beyond the 20 year planning horizon.

Policies

Policy 2. The County should monitor development applications as they relate to traffic estimates developed for this plan. Mitigation is required if development causes affected roadways to fall below Level of Service (LOS) D. Utilization of the CEQA process would help identify alternatives to or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs/housing balance if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion to an acceptable level.

Policy 4. As a condition of private development approval, developers shall build roads needed to access the existing road network. Developers shall build these roads to County standards unless improvements along State routes are necessary then roads shall be built to Caltrans standards. Developers shall locate these roads (width to be determined by the Circulation Plan) along centerlines shown on the circulation diagram map unless otherwise authorized by an approved Specific Plan Line. Developers may build local roads along lines other than those on the circulation diagram map. Developers would negotiate necessary easements to allow this.

Implementation Measures

Implementation Measure C. Project development shall comply with the requirements of the Kern County Zoning Ordinance, Land Division Ordinance, and Development Standards.

2.3.7. Setback Deviation Studies

Implementation Measures

Implementation Measure A. A setback deviation request shall report proposed setback distance. The Kern County Zoning Ordinance gives setback distance for permanent structures located along surveyed section and mid-section lines. Setback deviations may be authorized where it is demonstrated that expressway, arterial or collector construction will not occur while the structure in question is usable, or valuable. An entity pursuing a setback deviation shall submit an application with necessary justification to support the request. The application shall include fees to defray costs to prepare staff reports and administering the application.

2.4. Priority Focus Area Topics - Highways

2.4.7. Taft Area

Goals

Goal 1. Upgrade road circulation in and around Taft.

Goal 2. Reduce the speeds and amount of commuters and truck traffic through the centers of rural communities based on engineering and speed surveys.

Policies

Policy 3. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.

Policy 4. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.

2.4.8. Delano – McFarland Area

Policies

Policy 5. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could

involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.

Policy 6. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.

2.4.9. Lerdo Area

Goals

Goal 3. Improve traffic safety relative to farm vehicles and equipment.

Goal 4. Provide for improved traffic flow adjacent to existing communities.

Policies

Policy 6. The County should monitor development applications as they relate to traffic generation developed for this plan. If traffic resulting from projects such as General Plan amendment(s) would exceed current volume to capacity projections, mitigation is required if development causes roadways to fall below LOS D and LOS C for Caltrans roadways. Utilization of the CEQA process would help identify alternatives to, or mitigation for such developments. Mitigation could involve amending the Land Use, Open Space and Conservation Element to establish jobs - housing balance. This is triggered if projected trips in any traffic zone exceed trips identified for this Circulation Element. Mitigation could involve exactions to build offsite transportation facilities. These enhancements would reduce traffic congestion impacts.

Policy 7. Kern County should not allow new roads that serve low-density parcels to have unpaved surfaces. Any road capable of or now serving fifty average daily traffic trips or more should be paved.

2.5. Other Modes

2.5.1 Trucks and Highways

Goals

Goal 1. Provide for Kern County's heavy truck transportation in the safest way possible.

Goal 2. Reduce potential overweight trucks.

2.5.4. Transportation of Hazardous Materials

Goals

Goal 1. Reduce risk to public health from transportation of hazardous materials.

Policy 1. The commercial transportation of hazardous material, identification and designation of appropriate shipping routes will be in conformance with the adopted Kern County and Incorporated Cities Hazardous Waste Management Plan.

Policy 2. Kern County and affected cities should reduce use of County-maintained roads and city-maintained streets for transportation of hazardous materials.

Chapter 5. Safety Element

5.3.3. Waste Disposal in Petroleum Development

Goals

Goal. To encourage the safe recycling, transportation, and disposal of wastes associated with petroleum production and processing, and to provide for the siting of disposal facilities in locations with proper access, while minimizing adverse impacts on the environment and on public health and safety.

Policies

Policy 1. The County shall continue to acknowledge the necessity to site nonhazardous oilfield waste disposal sites near petroleum development to minimize transportation hazards and expenses, consistent with the provisions of the Kern County and Incorporated Cities Integrated Waste Management Plan.

5.3.7. Processing and Transportation of Petroleum Products

Goals

Goal. To ensure the siting of refining facilities and pipelines in locations to provide maximum health, safety, and environmental protection; and to encourage the necessary processing and transportation facilities for Kern County's petroleum production.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to transportation and traffic.

Chapter II. Land Use Element

Policies

Policy 34. Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors (I-1).

Policy 38. Minimize impacts of industrial traffic on adjacent residential parcels through the use of site plan review and improvement standards (I-1, I-6).

Chapter III. Circulation Element

A. Streets

Goals

Goal 3. Minimize the impact of truck traffic on circulation, and on noise sensitive land uses.

Goal 5. Provide a system of freeways which maintains adequate travel times in and around the metropolitan area.

Goal 7. Develop and maintain a circulation system that supports the land use plan shown in the general plan.

Policies

Policy 6. Design and locate site access driveways to minimize traffic disruption where possible considering items such as topography, past parcelization and other factors (I-7).

Policy 7. Minimize direct and uncontrolled property access from arterials (I-8).

Policy 14. Maintain the integrity of the circulation system (I-12).

Policy 14. Provide continuous truck routes within incorporated areas that provide access to designated industrial areas (I-13).

Policy 15. Prohibit trucks from non-truck routes within incorporated areas except as necessary for direct property access for pick-up and delivery (I-13).

Policy 16. Require that truck access to commercial and industrial properties be designed to minimize impacts on adjacent residential parcels (I-14).

Policy 36. Prevent streets and intersections from degrading below Level of Service "C" where possible due to physical constraints (as defined in a Level of Service Standard) or when the existing Level of Service is below "C" prevent where possible further degradation due to new development or expansion of existing development with a three part mitigation program: adjacent right-of-way dedication, access improvements and/or an area-wide impact fee. The area-wide impact fee would be used where the physical changes for mitigation are not possible due to

existing development and/or the mitigation measure is part of a larger project, such as freeways, which will be built at a later date (I-28, I-29).

Policy 37. Require new development and expansion of existing development to pay for necessary access improvements, such as street extensions, widenings, turn lanes, signals, etc., as identified in the transportation impact report as may be required for a project (I-30, I-31, I-32).

Policy 39. Require new development and expansion of existing development to pay or participate in its pro rata share of the costs of expansions in area-wide transportation facilities and services which it necessitates (I-32, I-33).

Implementation Measures

Implementation Measure 7. Review all site plans for compliance with adopted drive approach design standards.

Implementation Measure 8. Review site plans, rezonings, and subdivision requests, with respect to access from arterials. Consider conditions of approval to minimize uncontrolled property access.

Implementation Measure 14. Amend the city and county Zoning Ordinances as needed to regulate truck access on properties adjacent to residential areas.

Implementation Measure 25. Maintain records of existing traffic volume and cumulative projections of traffic from new development to schedule projects for the Capital Improvement Program.

Implementation Measure 26. Establish guidelines for project design review based on traffic engineering standards (e.g., driveway design, onsite circulation) and the Level of Service Ordinance.

Implementation Measure 28. Periodic review and if needed, revision of adopted ordinances that includes a Level of Service standard for the city and county to include a definition of Level of Service "C", procedures for how it is measured, and mitigation measures to keep from exceeding the standard.

Implementation Measure 29. Periodic review and, if needed, revision of adopted guidelines for preparation of transportation impact reports, definition of undesirable impacts, and identification of mitigation procedures.

Implementation Measure 33. Periodic review and, if needed, revision of adopted Transportation Impact Fee Ordinance for the city and county, which specifies the area wide impact fee schedule and how the fees will be used.

B. Parking

Goals

Goal 2. Satisfy parking requirements in all new developments (residential, commercial, industrial, etc.) through off-street facilities.

Policies

Policy 3. Ensure that adequate onsite parking supply and parking lot circulation is provided on all site plans in accordance with the adopted parking standards (I-3).

Policy 4. Discourage the intrusion of non-neighborhood parking in residential areas (I-4).

Implementation Measures

Implementation Measure 3. Review all site plans for conformance with adopted parking standards.

Chapter X. Public Services and Facilities Element

A. General Utilities

Policies

Policy 5. Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent (I-3).

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be located within the boundary of an adopted Specific Plan would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern County Airport Land Use Compatibility Plan

The Kern County Airport Land Use Compatibility Plan (ALUCP) establishes procedures and criteria by which Kern County can address compatibility issues when making planning decisions regarding airports and the land uses around them. Land Use Compatibility Maps for all airports in Kern County depict each airport's area of influence. Oil and gas exploration and production activities authorized under the proposed Project that would be located within an airport influence area would be subject to ALUCP policies.

Chapter 3

3.2. Safety

3.2.1. Objective

The intent of land use safety compatibility criteria is to minimize the risks associated with an off-airport aircraft accident or emergency landing.

a. Risks both to people and property in the vicinity of an airport and to people on board the aircraft shall be considered.

b. More stringent land use controls shall be applied to the areas with greater potential risk.

3.2.4. Other Risks

Storage of fuel or other hazardous materials shall be prohibited in Compatibility Zone A and subject to restrictions in the B zones as identified in Table 3A of the ALUCP.

3.3. Airspace Protection

3.3.1. Height Limits

The criteria for limiting the height of structures, trees, and other objects in the vicinity of an airport shall be set in accordance with Part 77, Subpart C, of the Federal Aviation Regulations and with the United States Standard for Terminal Instrument Procedures.

3.3.4. FAA Notifications

Proponents of a project which may exceed a Part 77 surface must notify the Federal Aviation Administration as required by FAR Part 77, Subpart B, and by the California State Public Utilities Code Sections 21658 and 21659.

3.3.5. Other Flight Hazards

Land use characteristics which may produce hazards to aircraft in flight shall not be permitted within any airport's influence area. Specific characteristics to be avoided include:

a. Glare, distracting lights, or light patterns which could be mistaken for airport lights;

b. Sources of dust, steam, or smoke which may impair pilot visibility;

c. Sources of electrical interference with aircraft communications or navigation;

d. Any use, especially landfills and certain agricultural uses, which may attract large flocks of birds; and

e. Any light or series of lights which may cause visual discomfort or loss of orientation during critical phases of flight.

Chapter 4

4.17. Military Aviation

4.17.2.3. Military Aviation Encroachment

Towers – Obstructions such as cellular towers, radio towers, television towers and wind turbines that penetrate into airspace become a hazard to flight safety. Concentrated numbers of such structures can result in the loss of a route as useable for testing and training operations.

Engineering, Surveying, and Permit Services Department

The Engineering, Surveying, and Permit Services Department enforce Kern County development standards for streets and other infrastructure. The standards are applicable to all developments within Kern County that are outside of incorporated cities. Division 9 of the County's development standards specifies requirements for traffic studies. Division 1, Section 105-4, of the standards requires that all construction to connect driveway approaches to County roads must first be authorized by an Encroachment Permit. The Engineering, Surveying, and Permit Services Department's Transportation and Encroachments Permits Division issues Transportation Permits for vehicles on County roadways that carry oversized loads, as specified in the California Vehicle Code.

4.16.4 Impacts and Mitigation Measures

Methodology

The evaluation of the potential impacts of vehicular traffic associated with oil and gas exploration and production activity was broken into the following main areas:

- Intersection LOS;
- Roadway LOS;
- Pavement conditions; and
- Safety considerations.

The traffic operations analysis included LOS analysis of intersections during the AM and PM peak hour periods, and a V/C analysis of average daily traffic on roadway segments for both the existing and future (Year 2035) conditions. Roadway physical conditions were evaluated based on County and Caltrans roadway conditions reports and rating systems. Potential safety considerations were evaluated through review of County and Caltrans traffic data and interviews with County Roads Department staff regarding recent history of accidents, primarily within oilfield areas.

It is important to note that the Traffic Study (Appendix W) for this EIR differs from a typical traffic analysis for a residential development or industrial facility. A typical traffic study contains

a quantitative analysis of traffic generated by residents of housing or employees at operating facilities, but does not include quantitative analysis of short-term traffic generated during construction of the housing or facilities. By contrast, the quantitative analysis in the Traffic Study for this EIR includes traffic generated both by construction activities during the well development phase, and by operational activities during the production phase. The Traffic Study assumed that well development included all activities needed to bring an oil or gas well into production, including:

- Exploration and land preparation;
- Well drilling, completion, and stimulation; and
- Construction/installation of support infrastructure (e.g., collection and distribution pipelines, electric systems, etc.) and ancillary facilities (e.g., separators, storage tanks, etc.).

The Traffic Study assumed the development phase for a single oil or gas well would generally occur over a period of 30 to 90 days.

The Traffic Study assumed that well production would include routine daily operations and inspections, regular well maintenance and reworks, and plugging and abandonment when a well no longer fulfills its intended purpose.

Trip Generation

Traffic engineers and planners typically use trip generation rates, equations, and data contained in the Institute of Transportation Engineers (ITE) Trip Generation Manual to estimate traffic volumes generated by conventional land uses (e.g., commercial, residential, industrial, recreational, etc.). However, the ITE Manual does not contain similar trip generation information for oil and gas development and production. Therefore, for the purposes of this study, a multi-tiered approach was used to estimate daily volumes of oil and gas traffic within the Project Area. This approach involved the use of three data sources: (1) oilfield vehicle counts; (2) oil and gas employment figures; and (3) AADT volumes, which are detailed in Appendix W.

The Traffic Study (Appendix W) found that each new well would generate 30 trips/day over a period of 30 to 90 days during the well development phase.

During the production phase, which (includes daily operation, well reworks/maintenance, and plug/abandonment) each well would generate 0.17 trips/day, based on oil/gas records, field observations, and other studies.

Future oil and gas traffic volumes were estimated by applying the development and production rates detailed above to the annual well count projections provided by the Applicant (Appendix W). The Project's annual future oil and gas trip generation for the years 2015 through 2035 are summarized in Table 4.16-11.

Table 4.16-11: Projected Future Well Trip Generation

Year	Development Trips (30 trips/well/day; 60 days)	Production Trips (0.17 trips/well/day; 365 days)	Total Trips
2015	26,072	9,438	35,510
2016	26,110	9,686	35,796
2017	26,149	9,934	36,083
2018	26,188	10,182	36,370
2019	26,227	10,431	36,658
2020	26,265	10,680	36,945
2021	26,304	10,930	37,234
2022	26,343	11,179	37,522
2023	26,382	11,430	37,812
2024	26,421	11,681	38,101
2025	26,459	11,932	38,391
2026	26,498	12,183	38,681
2027	26,537	12,435	38,972
2028	26,576	12,687	39,263
2029	26,614	12,940	39,555
2030	26,653	13,193	39,847
2031	26,692	13,447	40,139
2032	26,731	13,701	40,432
2033	26,769	13,955	40,725
2034	26,808	14,210	41,018
2035	26,847	14,465	41,312

Trip Distribution

For the purposes of this analysis, trip distribution represents the movement of oil and gas traffic between the oilfields and the central metropolitan Bakersfield area. The Traffic Study (Appendix W) assumed that all oil and gas trips originate and terminate within the Project Area. Oil and gas trips were assigned to roadways based on oilfield production rates, published AADT volumes, and input from Kern County Roads Department staff regarding known oilfield access routes.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project would normally be considered to have a significant impact if it would:

- Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit;
- Conflict with an applicable congestion management program, including, but not limited to LOS standards and travel demand measures, or other standards established by the County congestion management agency for designated roads or highways as follows:
  - Metropolitan Bakersfield General Plan LOS C,
  - Kern County General Plan LOS D, and
  - Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D;
- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks;
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- Result in inadequate emergency access; or
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

Based on these standards, the effects of the Project have been categorized as either a "less than significant impact" or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less than significant level through the application of mitigation, it is categorized as a "significant unavoidable impact."

Project Impacts

Impact 4.16-1: Conflict with an Applicable Plan, Ordinance, or Policy Establishing Measures of Effectiveness for the Performance of the Circulation System, Including, but not Limited to, Intersections, Streets, Highways and Freeways, Pedestrian and Bicycle Paths, and Mass Transit

The minimum LOS goal for roadways within the Bakersfield and Kern County metropolitan areas is LOS C. The minimum LOS goal for roadways within the non-metropolitan region of Kern County is LOS D, and for Caltrans facilities, the minimum LOS goal is between LOS C and LOS D. A significant impact is found where project traffic reduces the LOS to below the minimum LOS goal, or where the pre-existing condition of the roadway is below the minimum LOS, and the LOS degrades below the pre-existing LOS with the addition of the project.

Year 2015 Intersection Operations

The addition of Project-related traffic to Year 2015 conditions would contribute to 19 of the 101 intersections evaluated as operating below acceptable LOS (at LOS E or worse for intersections located within the non-metropolitan region of Kern County and LOS D or worse for intersections located within the Bakersfield and Kern County metropolitan areas and for Caltrans facilities Appendix W). These impacts would be significant.

Table 4.16-12 summarizes the impacted intersections, as identified in the Traffic Study, and the improvements necessary to maintain or improve the operational LOS of the roadway system in the Project Area and, thereby, mitigate Project impacts. Also identified on Table 4.16-12 is the Project's percent share of the cost for implementation, as identified in the Traffic Study, of the intersection improvements, calculated by dividing the oil and gas (Project-related) traffic at the intersection by the total traffic. Implementation of MM 4.16-1 would require application to pay a roadway maintenance fee to address wear and tear of roads due to oil and gas industry traffic. Implementation of this mitigation measures, described below, would reduce impacts to below a level of significance.

Table 4.16-12: Intersection Impacts and Mitigation 2015

No.	Intersections [1]	Level of Service Impacts		Improvements Needed by 2015	Project % Share

SR = State Route

Year 2015 Roadway Operations

The addition of Project-related traffic to Year 2015 conditions would contribute to 30 of the 462 roadway segments evaluated as operating below acceptable LOS (at LOS E or worse for roadways located within the non-metropolitan region of Kern County, and LOS D or worse for roadways located within the Bakersfield and Kern County metropolitan areas and for Caltrans facilities (Appendix W). These impacts would be significant.

Table 4.16-13 summarizes the impacted roadway segments and the improvements necessary to maintain or improve the operational LOS of the roadway system in the Project Area and, thereby, mitigate Project impacts. Also identified on Table 4.16-13 is the Project's percent share of the cost for implementation of the roadway segment improvements, calculated by dividing the oil and gas (Project-related) traffic at the intersection by the total traffic. Implementation of a road maintenance fee, described in MM 4.16-1 and a Traffic Control Plan as described in MM 4.16-2 would reduce impacts to below a level of significance (Appendix W).

In addition, transportation of heavy equipment and materials associated with construction activities may result in temporary conflicts with other traffic on Caltrans routes, arterials or collectors. MM 4.16-1 provides for a Construction Traffic Control Plan incorporating standard elements, such as timing of deliveries and work hours, signage, lighting, and traffic control devices, and maintaining access. Implementation of mitigation measures MM 4.16-1, described below, would reduce such impacts to below a level of significance:

Table 4.16-13: Roadway Impacts and Mitigation 2015

Pavement Conditions

The pavement condition analysis consisted of assessing the need and timing for maintenance and rehabilitation improvements per roadway segment per study year based on estimates of remaining pavement service life. Both remaining life and improvement needs were estimated based on a pavement life cycle curve developed for this study. The pavement life cycle curve, illustrated below, closely approximates a "typical" pavement life cycle curve and correlates PASER ratings to pavement condition.

Pavement Lifecycle Curve

The pavement life cycle curve and 2013 pavement condition data were used to estimate a baseline remaining service life for each publicly maintained roadway in the Project Area. As shown below, the baseline percentage of remaining life per roadway segment was then applied to the maximum ESAL corresponding to the roadway's 20-year TI in order to establish the baseline ESAL total for the roadway segment.

baseline ESAL total = (baseline % remaining service life) x (maximum ESAL)

For each of the subsequent years, remaining service life per roadway segment was estimated by deducting the annual ESAL from the ESAL total for the preceding year. Annual ESAL's were calculated for each study roadway using Caltrans' methodology based on future traffic volume projections (discussed previously) and estimates of total truck and axle group percentages (developed based on Caltrans and Kern COG traffic count data).

For the purposes of this study, the need for a pavement condition improvement per study roadway per study year was identified when one of the remaining service life threshold conditions shown in Table 4.16-14a was met. The scheduling of needed improvements, as shown in Table 4.16-14b, was prioritized based on pavement condition and traffic volume, as shown in Table 4.16-15, in order to maintain the baseline pavement conditions for County roads and state routes. In general, roadways were scheduled for needed maintenance or rehabilitation in priority order (1 through 9) for each study year until these baseline conditions were met. All unscheduled improvements were deferred, except for overlays that, if not done in the present year, would lead to reconstruction in

the following year. The remaining life resets in Table 4.16-14a were applied in the year the corresponding pavement condition improvement was scheduled.

Table 4.16-14a: Pavement Condition Improvement Thresholds and Resets

A breakdown of roadway improvements needed over the study period (2015 through 2035) is shown in Table 4.16-16. These improvements are based on estimates of existing and future pavement conditions and include impacts attributable to future oil and gas exploration and production activities within the Project Area.

Table 4.16-16: Roadway Maintenance and Rehabilitation Summary, Years: 2015-2035

Project Area Roadways	Preventive Maintenance (lane miles)	Corrective Maintenance (lane miles)	Major Rehabilitation (lane miles)	Roadway Reconstruct (lane miles)
All Study Roadways	2,355	992	877	288

Source: Appendix W

It is noted that preventive and corrective maintenance measures are designed to maintain pavement with little to moderate levels of distress in good condition and generally have an expected service life of less than ten years. It is for this reason that roadways in this analysis were scheduled for preventive and corrective maintenance multiple times over the 20-year study period. In contrast, rehabilitation measures are designed to provide structural enhancement to severely distressed pavements and have an expected service life ranging from ten years for a structural overlay to 20 or more years for complete reconstruction. Consequently, Project Area roadways would receive major rehabilitation once or twice over the 20-year study period.

Oil and gas exploration and production activities that would be authorized under the proposed Project would add additional vehicle and truck trips to the roadway system. Pavement conditions for 750 centerline miles of state routes and county roads were evaluated for potential pavement

condition impacts resulting from oil and gas truck traffic. Of this total, 400 centerline miles were considered to be primary and secondary routes for oil and gas traffic. Specific volumes of oil and gas traffic were assigned to these primary and secondary routes and a nominal volume of Project-related traffic was assigned to non-primary and non-secondary routes The Traffic Study found that this additional traffic could contribute to the degradation of pavement conditions and the service life for roadways in the Project Area, which could be a significant impact. Table 4.16-17 identifies the specific pavement condition improvements needed, by year, to maintain area roadways, along with the Project's fair-share contribution. Implementation of a road maintenance fee as described in MM 4.16-1 would reduce impacts to below a level of significance.

Source: Appendix W
Key:
SR = State Route

As described, Project-related impacts could conflict with applicable plans and ordinance relations to the performance of the circulation system. As a result, there could be significant impacts. Implementation of MM 4.16-1 would require application to pay a roadway maintenance fee to address wear and tear of roads due to oil and gas industry traffic. Implementation of this mitigation measures, described below, would reduce impacts to below a level of significance. Implementation of a Traffic Control Plan as described in MM 4.16-2 would ensure that the level of congestion would be reduced so that the impact would be below a level of significance

Mitigation Measures

MM 4.16-1 The Applicant shall pay a road maintenance mitigation fee of $1,500 per permit for new wells to pay for roadway maintenance and related improvements to address wear and tear on roads caused by oil and gas industry traffic. The Roads department shall annually report on the expenditure of funds from the Oil and Gas Roadway Maintenance Fee. Expenditures from the fund shall be as determined by the Roads Commissioner, using as a reference the list of roadways identified in the Environmental Impact Report as being used for traffic by the oil and gas industry. If Kern County secures funding from a sales tax dedicated to transportation funding, then the amount of the traffic mitigation fee shall be re-evaluated at the time the County becomes a self-help county.

MM 4.16-2 Applicants who are using an arterial or collector, or Caltrans route, for access to a construction site, shall consult with the Kern County Public Works Department – Roads Division to determine if a Construction Traffic Control Plan is required based on the timing and volume of larger vehicle rigs and the volume of traffic to address public safety and congestion management. If a Plan is required, the Applicant shall prepare and submit a Construction Traffic Control Plan to the Kern County Roads Department and to the California Department of Transportation (District 9 office) for approval. The Construction Traffic Control Plan must be prepared in accordance with both the California Department of Transportation Manual on Uniform Traffic Control Devices and Work Area Traffic Control Handbook and shall include, but not be limited to, the following issues:

a. Timing of deliveries of heavy equipment and building materials.

b. Placing temporary signing, lighting, and traffic control devices as necessary to indicate the presence of heavy vehicles and construction traffic.

c. Determining the need for construction work hours and arrival/departure times outside peak traffic periods.

d. Ensuring access for emergency vehicles to the Project site.

e. Any temporary closure of travel lanes or disruptions to street segments and intersections during well development.

f. Maintaining access to adjacent property.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.16-2: Conflict with an Applicable Congestion Management Program, Including, but not limited to LOS Standards and Travel Demand Measures, or Other Standards Established by the County Congestion Management Agency for Designated Roads or Highways, as Follows: Metropolitan Bakersfield General Plan LOS C; Kern County General Plan LOS D; and Caltrans Endeavors to Maintain a Target LOS at the Transition between LOS C and LOS D.

The Circulation Element of the KCGP states that the design LOS for Kern County is LOS C. The minimum LOS for conformance with the KCGP is LOS D. The Kern COG CMP has established LOS E as the minimum system-wide LOS traffic standard for CMP corridors (Table 4.16-10). With the addition of Project-related construction traffic, under the future condition (Year 2035 NOG + Project), a number of CMP corridors would operate at LOS E or below. However, these roadways would also operate below acceptable LOS even without Project-related traffic (Year 2035 NOG). Therefore, operation of these corridors below acceptable LOS is not considered an impact of the Project; however because the LOS of these corridors is impaired, implementation of MM 4.16-2 would reduce Project impacts to existing levels that would represent a less than significant impact.

Mitigation Measures

Implement MM 4.16-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.16-3: Result in a Change in Air Traffic Patterns, Including Either an Increase in Traffic Levels or a Change in Location that Results in Substantial Safety Risks

Because the Project is not expected to include structures exceeding 500 feet in height, it would comply with Kern County Zoning Ordinance 19.08.160 and Section 3.3.1 of the Kern County ALUCP. If an applicant would require a vertical structure more than 200 feet in height (e.g., transmission line poles, vertical pump jack), the applicant would be required to comply with FAA Advisory Circular 70/7460-1, Obstruction Lighting/Marking requirements. The applicant would file Form 7460-1, Notification of Proposed Construction or Alteration, with the FAA for each structure. Airport-related mitigation measures, described in Section 4.8, Hazards and Hazardous Materials, require an applicant to submit FAA Form 7460-1 requesting that the FAA issue a Determination of No Hazard to Air Navigation, when required. If the FAA determines that the structure would result in a potential obstruction unless reduced to a specified height, the applicant would be required to work with the FAA to resolve any adverse effects on aeronautical operations.

Numerous public, military, and private airports are located within the Project Area. Section 4.8, Hazards and Hazardous Materials includes mitigation measures, which require applicants to comply with the applicable airport land use compatibility plan if their operations would be located within an airport area of influence.

Implementation of these mitigation measures would ensure that the Project is consistent with Section 3.3.4 of the Kern County ALUCP. The mitigation measures would also ensure that the Project would not impact operations of aircraft using Kern County airspace, and that all required Project components shall have lighting and markings required by the FAA so as not to create a hazard to air navigation

Mitigation Measures

Implement airport-related mitigation measures as described in Section 4.8, Hazards and Hazardous Materials.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.16-4: Substantially Increase Hazards due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses (e.g., Farm Equipment)

Well development (which includes well stimulation activities), would continue to require the delivery of heavy construction equipment using area roadways. The use of oversized vehicles during construction can create a hazard to the public by limiting motorist views on roadways and by the obstruction of space and, therefore, could have a significant impact. A description of the need for California Highway Patrol escorts, as well as the number needed, and the timing of

transport, is required to be detailed in respective oversized load permits. The Traffic Study (Appendix W) prepared for this project assumed that 10% of all oil and gas-related traffic would be heavy trucks. Of this total, 35% would be two-axle trucks, 10% would be three-axle trucks, 25% would be four-axle trucks, and, 30% would be five-or-more-axle trucks.

The Traffic Study reviewed roadway accident history data obtained from the County and state. Potential areas of concern regarding accidents were also discussed with Kern County Roads Department staff. In general, there were no specific findings indicating increased accident rates on Project Area roadways related to oil and gas activity. Historically, the County has addressed various safety and operational issues that have arisen periodically over the years due to changes in roadway activity along oil and gas routes.

The introduction of construction-related traffic would have the potential to increase accident rates and could result in significant impacts; however, with the implementation of MM 4.16-1, , as listed above, would also require this information be provided in the Construction Traffic Control Plan for Kern County approval and would reduce potential impacts to less than significant

Mitigation Measures

Implement MM 4.16-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.16-5: Result in Inadequate Emergency Access

As described above, increased Project-related traffic could cause a significant increase in congestion or affect the existing and future LOS on roads, which could indirectly affect emergency access. While the Project is not expected to require closures of public roads, which could inhibit access by emergency vehicles, during well development, heavy construction-related traffic could interfere with emergency response or emergency evacuation procedures in the event of an emergency, such as a wildfire or a chemical spill. Heavy construction-related traffic could also interfere with emergency response to other NOG-related uses in the vicinity and, therefore, could represent a significant impact

To ensure emergency access during construction, MM 4.16-2 requires the preparation of a Construction Traffic Control Plan and includes assurance of access for emergency vehicles.

Mitigation Measures

Implement MM 4.16-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.16-6: Conflict with Adopted Policies, Plans, or Programs Regarding Public Transit, Bicycle, or Pedestrian Facilities, or Otherwise Decrease the Performance or Safety of Such Facilities

Kern County operates KRT, which operates daily bus routes within the unincorporated communities of Buttonwillow, Lamont, Kern River Valley, Frazier Park, Rosamond, and Mojave. In western Kern County, bus routes connect Bakersfield to various cities including Delano, Wasco, Taft, Lebec, and Frazier Park (KRT 2014). KRT also provides inter-city service between Delano/McFarland/Wasco/Shafter/ Bakersfield, Lamont/Bakersfield, Lake Isabella/Bakersfield, Frazier Park/Bakersfield, California City/Mojave/Rosamond/Lancaster/Palmdale, Lost Hills/Bakersfield, and Taft/Bakersfield.

To ensure Project-related traffic would not impact roadways utilized by the KRT, MM 4.16-2 requires that a Construction Traffic Control Plan be prepared, These mitigation measures would ensure that Project-related traffic does not impact KRT operations.

Mitigation Measures

Implement MM 4.16-2, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.16.5 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

The geographic scope for transportation and traffic cumulative impacts is Kern County as a whole. This geographic scope of analysis is appropriate for transportation and traffic due to the regional nature of transportation and traffic impacts that could occur within the entire Kern County transportation network.

This cumulative impact analysis utilizes the projection method due to the mostly rural nature of the Project Area, the large regional nature of the Project Area, and the uncertain timing of future projects. Based on information from the Traffic Study, Year 2035 volumes were developed utilizing growth rates obtained from the Kern COG traffic model. The Kern COG traffic model is a comprehensive analytic model used by the County to forecast traffic impacts as development occurs. The Kern COG model is based upon the General Plans of the County and cities within the County. When approval is given to projects that involve amendments to the General Plans, those General Plan amendments and projects are added to the Kern COG traffic model in order to ensure that the model accurately reflects land use changes. In this manner, the KCOG model is constantly updated to ensure that the baseline data contained accurately reflect the traffic volumes associated with growth trends in the region.

To assess traffic impacts in the Future Year 2035, two scenarios were evaluated that include the 2035 Growth Only (2035 NOG) and the 2035 NOG + O&G Projection.

2035 Growth Only (2035 NOG)

This scenario utilized existing traffic counts projected out to the Year 2035 at a growth rate included in the Kern COG traffic model. This scenario utilized a methodology that is typically used in traffic impact studies and, thus, provided typical future traffic volumes. However, because oil and gas activities may not necessarily grow at the same rate as NOG activities; the 2035 NOG + O&G Projection was also analyzed for comparison purposes (Appendix W).

2035 NOG + O&G Projection

This scenario utilized existing NOG traffic volumes projected out to the Year 2035, plus the addition of projected oil and gas traffic. The growth rates for projected oil and gas traffic were based on input provided by the Applicant and Kern County staff. Under this scenario, oil and gas and NOG traffic volumes were projected to grow at different rates, which provided an additional data set from which potential traffic impacts associated with the increase in oil and gas exploration and production activity were identified (Appendix W).

If an intersection or segment was forecasted to operate below the established LOS in Year 2035, a significant cumulative impact was identified.

Project Impacts

Impact 4.16.7: Cumulative Impacts on Transportation and Traffic

Year 2035 Intersection Operations

The addition of Project-related traffic contributes to 34 of the 101 intersections that operate below acceptable LOS (LOS E or below for intersections located within the non-metropolitan region of Kern County and LOS D or below for intersections located within the Bakersfield and Kern County metropolitan areas and for Caltrans facilities, as stated in the Traffic Study) under Year 2035 conditions (Table 4.16-18). This impact would be significant. It should be noted, however, that, based on information provided in the Traffic Study, 31 of these intersections would also operate below acceptable LOS in the Year 2035 condition without the addition of Project-related traffic (Appendix W). Based on the conclusions of the Traffic Study, implementation of mitigation measure MM 4.16-2 would reduce the impact to below a level of significance.

Table 4.16-18: Cumulative Intersection Impacts and Mitigation

No.	Intersections [1]	Level of Service Impacts		Improvements Needed by 2035	Project % Share

Year 2035 Roadway Operations

The addition of Project-related traffic contributes to 99 of the 462 roadway segments that operate below acceptable LOS (LOS E or below for roadways located within the non-metropolitan region of Kern County and LOS D or below for roadways located within the Bakersfield and Kern County metropolitan areas and for Caltrans facilities) under Year 2035 conditions (see Table 4.16-19) (Appendix W). This impact would be significant. However, based on information provided in the Traffic Study, all 99 of these roadway segments would also operate below acceptable LOS in the Year 2035 condition without the addition of Project-related traffic. This

significant impact would be reduced to below a level of significance with implementation of MM.4.16-1 and MM 4.16-2.

Table 4.16-19: Cumulative Roadway Impacts and Mitigation

Roadway Segment [1]	No. of Lanes	Level of Service Impacts		Roadway Improvement Required by 2035 [3]	Roadway Improvement Project % Share

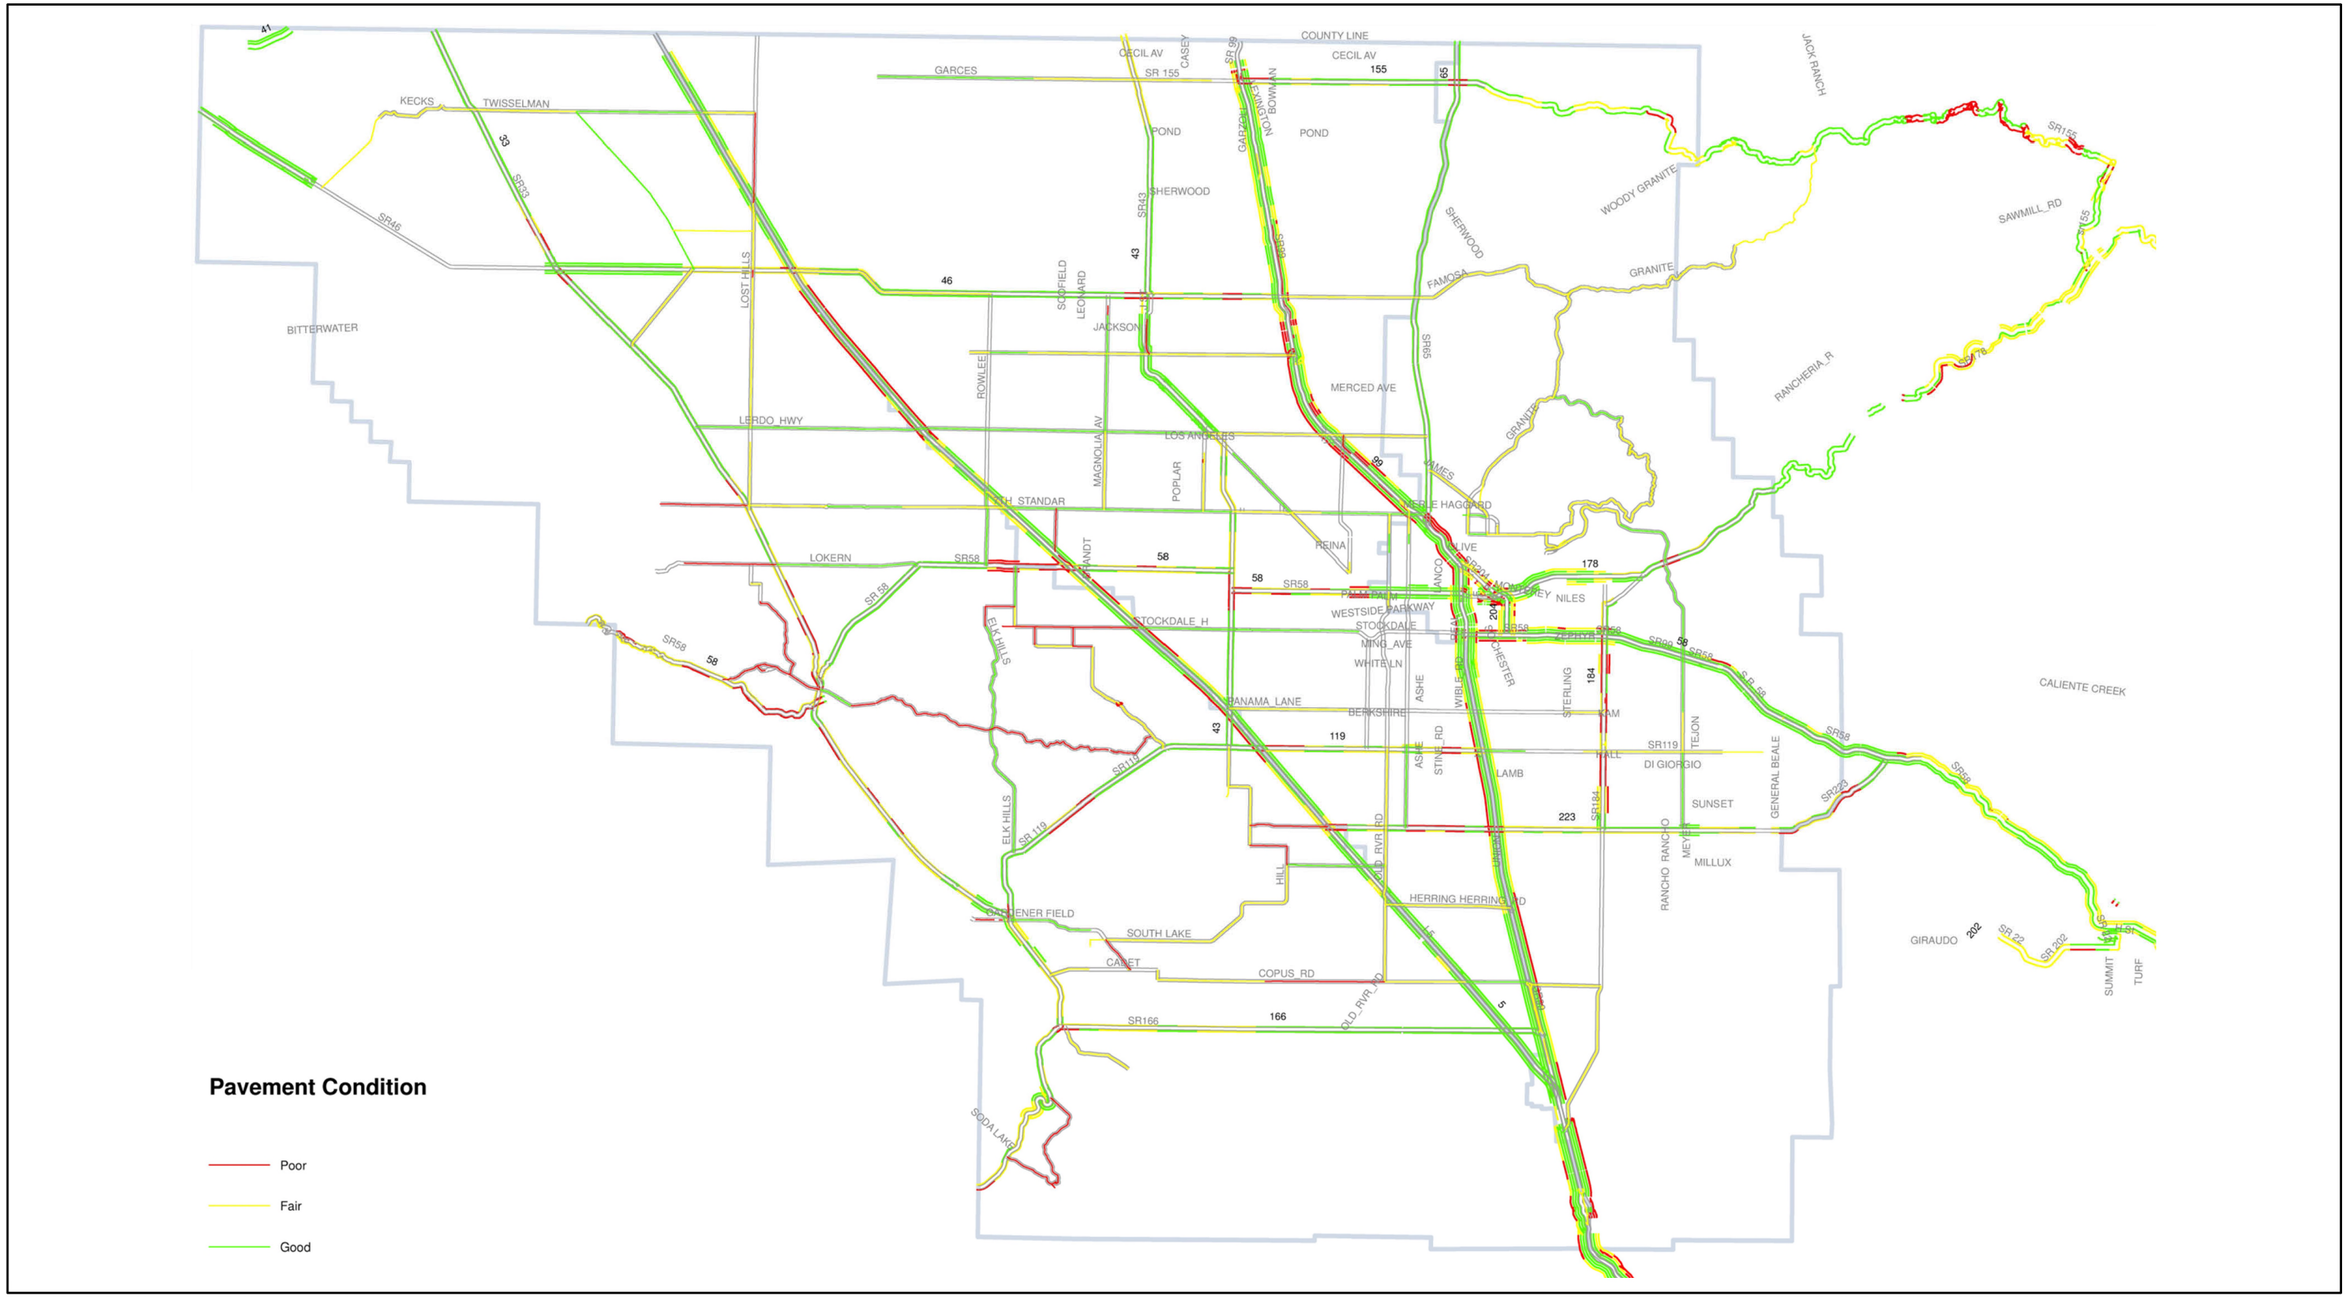
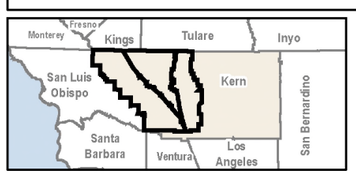
Notes:
(1) Includes intersections operating below LOS C. X denotes scenario during which substandard operations would occur.
(2) Roadway cannot be expanded further.
(3) Assumes no mitigation implemented in 2015.
(4) NOG = Non-oil and gas-related traffic; Project – oil and gas-related traffic
Key:
SR = State Route

Mitigation Measures

Implement MM 4.16-1 and MM 4.16-2, as described above.



Level of Significance After Mitigation



Based on information provided in the Traffic Study (Appendix W), impacts would be less than significant with mitigation.

Section 4.17

Utilities and Service Systems

Section 4.17

Utilities and Service Systems

4.17.1 Introduction

This section describes the affected environment and regulatory setting for public utilities and service systems: water, solid waste, and wastewater and stormwater drainage. It also describes the impacts on utility infrastructure systems that would result from implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance (Project), including impacts from future oil and gas development pursuant to the Amended Ordinance, and mitigation measures that would reduce these impacts, if necessary.

4.17.2 Environmental Setting

Kern County is California's third largest county, encompassing 8,202 square miles at the southern end of the Central Valley. The 3,700-square-mile Project Area is predominantly located in the western portion of the County in the San Joaquin Valley bounded by Kings and Tulare counties to the north, Santa Barbara and San Luis Obispo counties to the west, the Tehachapi Mountains and the Sierra Nevada Mountains to the east, and the northern boundary of the Los Padres National Forest to the south.

Kern County is located within District 4 of the State Division of Oil, Gas and Geothermal Resources (DOGGR) and is a large producer of natural gas. The valley floor area of the County and the lower elevations of the surrounding mountain ranges contain numerous deposits of oil and gas resources, a major economic resource for the County. Five of the state's most productive natural gas fields are located in Kern County.

Water Supply and Demand

An analysis of the Project Area's water supply and demand, including for oil and gas exploration and production activities, was prepared by the Applicant's consultant, Kennedy/Jenks Consultants and independently reviewed by the County. The analysis is attached as Appendix T to this Environmental Impact Report (EIR) and utilizes the Water Supply Assessment (WSA) criteria in California Water Code Sections 10910 et seq., including an analysis of Project Area water supply and demand under current and projected future conditions in normal or average single dry and multiple dry years and information in the Tulare Lake Basin Portion of Kern County Integrated Regional Water Management Plan (IRWMP), Final Update, prepared by Kennedy/Jenks Consultants and approved by the Kern County Water Agency in 2011. The IRWMP provides a cooperative regional framework, implementation plan, and context for managing water resources, and was developed with the participation of a wide range of water agencies, town councils, regulatory, environmental, agricultural, tribal, and land use planning entities in the Kern County region, including the Project Area (KCWA 2011).

Project Area Water Supplies

Water supplies in the Project Area are obtained from: (1) imported surface water from the State Water Project (SWP) and federal Central Valley Project (CVP); (2) local surface water, primarily in the Kern River and regulated flows from the Lake Isabella dam and reservoir; (3) secondary and tertiary-treated recycled water from 14 wastewater treatment plants (WWTPs) in the San Joaquin Valley portion of Kern County; (4) produced water that is reused, primarily for oil and gas exploration and production activities and agriculture (excluding produced water disposed to the surface or by injection); and (5) groundwater.

Based on historical records for the San Joaquin Valley portion of the Kern County, on average groundwater accounts for about 37% of the total Project Area water supply. However, during dry years, groundwater can account for more than 60% of total supply. During dry years in 2007 and 2008, groundwater pumping made up approximately 69% of total supply compared with less than 10% during 2011, a recent wet year (Appendix T). During the current drought, which began in 2012, portions of the Project Area have not received any imported water and are totally dependent on groundwater. This reliance on groundwater has negatively impacted groundwater levels in the Project Area.

The following sections summarize each of the primary water supplies in the Project Area.

Imported Surface Water

Imported surface water is used for agricultural and municipal and industrial (M&I) purposes and is the most important source of groundwater recharge in the Project Area. Imported water avoids the use of groundwater when available, and is percolated into groundwater in several water banking facilities in wetter years for storage and use in drier periods. Figure 4.9-6 shows the locations of the primary water banking districts located in the Project Area. During the current drought, surface water supplies have been significantly curtailed for several successive years, significant banking and recharge using imported water has not been possible to achieve, and groundwater levels throughout the state, including the Project Area, have been depleted.

State Water Project

The Project Area receives imported surface water from the SWP and CVP. The SWP is the largest state-built, multi-purpose water project in the United States and includes 33 storage facilities, 21 reservoirs and lakes, 24 pumping and generating plants, four hydroelectric power plants, and 660 miles of aqueducts. SWP facilities and deliveries are maintained and operated by the California Department of Water Resources (DWR). The SWP system conveys water to the Project Area that is primarily released from Oroville Dam on the Feather River and flows south to pumping facilities located on the southern edge of the Sacramento Delta.

SWP water supplies are allocated to 29 system contractors under the terms of water supply contracts with the DWR. The maximum amount of water per year that an SWP contactor may request is listed in Table A of each contract with the DWR and is referred to as the contractor's "Table A amount." As discussed below, actual deliveries vary with hydrologic conditions and

may be significantly lower than the listed Table A amount in drier years and higher in wetter years. The Kern County Water Agency (KCWA) is the SWP contractor for the Project Area. Under current conditions, the maximum amount available for all 29 SWP contractors is 4.17 million acre-feet per year (AFY). KCWA has a Table A amount of 982,730 AFY. KCWA allocates SWP water under contracts with 13 Project Area water districts (WDs), or "member units," and to an improvement district that is operated by KCWA for agricultural and municipal and industrial (M&I) uses. Table 4.17-1 lists the KCWA member units and the maximum annual amount of SWP agricultural and M&I water each district could receive under its contract with the KCWA.

Table 4.17-1: Kern County Water Agency Member Unit SWP Contract Amounts

District/Agency	Agricultural Contract Amount (AF)	M&I Contract Amount (AF)	Total (AF)
Belridge WSD	121,508		121,508
Berrenda Mesa WD	92,600		92,600
Buena Vista WSD	21,300		21,300

TOTAL	**863,730**	**119,000**	**982,730**

Source: Appendix T, Table 5

Due to annual rainfall and snowpack variability, system storage levels, Sacramento Delta water quality and flow requirements for state and federally protected species, contractor demands, and other factors, the amount of water delivered to SWP contractors varies each year. According to KCWA, the agency received about 35% of the listed Table A amount in 2013, about 5% in 2014, a critically dry year, and, in March 2015, the DWR announced that SWP deliveries would be 20% of contractor requests in 2015 (KCWA 2014, 2015).

Table 4.17-2 shows the deliveries of SWP water supplied by KCWA to member units from 2003-2012.

Table 4.17-2: SWP Deliveries to KCWA, 2003-2012

Year	SWP Deliveries (AF)
2003	919,424
2004	771,898
2005	1,377,899
2006	1,242,631
2007	716,612
2008	279,334
2009	380,337
2010	469,319
2011	1,083,667
2012	584,589

Source: Appendix T, Table 6

The DWR biannually analyzes the wet, normal, dry and multiple dry year reliability of SWP system deliveries in draft and final SWP delivery reliability reports (DRRs). The most recent DRR is the Final Delivery Reliability Report 2013, issued in December 2014 (DWR 2014). The report considers regulatory and judicial decisions affecting pumping levels from the Delta, the potential effects of climate change, the hydrologic record in 1922-2003, and other factors to identify current and future delivery reliability, expressed as percentage of Table A contract amounts for SWP contractors, including KCWA. Table 4.17-3 summarizes the projected deliveries of SWP water to KCWA based on the current DRR and future reliability estimated by the DWR for 2020 to 2035. Table 4.17-3 shows the SWP could deliver 58 to 62% of the Table A amounts for each contractor on a long-term average basis. The DWR further estimates that SWP deliveries during multiple-dry year periods would average about 31% of the Table A amounts and 11% during single dry years. The most recent version of the SWP delivery reliability report does not take account of SWP deliveries during the most recent years of the current drought.

Source: Appendix T, Table 8
Note:
(a) A large portion of the Tejon Castac WD is located outside of the Project Area; thus, its contract amount of 5,278 AF was excluded from future projections. A small portion of Tehachapi-Cummings County WD (about 5%) is within the Project Area and 5% of the WD's contract amount (equivalent to 1,035 AFY) was included for future projections.

SWP contractors are periodically able to access other water supplies, including "Article 21" water (water that is excess to the current needs of SWP contractors and that is available under Article 21 of the DWR contracts), turnback pool water (unused Table A water that is "turned back" to the DWR and available to other contractors), and DWR dry year purchases. These potential water sources are discussed in more detail below. The availability of these potential deliveries is uncertain and dependent on hydrological conditions and regulatory constraints. To provide a conservative assessment, none of these potential water sources is included in the Project Area supply analysis.

Article 21 water may be supplied when Delta outflow requirements for environmental purposes have been met, SWP storage south of the Delta is full, and there is available aqueduct conveyance capacity. However, recent regulatory and judicial decisions affecting Delta flow requirements to protect certain fish species are anticipated to reduce the availability of Article 21 water under future conditions.

The turnback pool program allows contractors to sell ("turn back") excess Table A supplies to other contractors. In general, as urban contractor demands have increased, the amount of water turned back and available for purchase under this program has diminished over time.

The DWR has the authority to implement dry year water purchase programs in critically dry years. Water is purchased by DWR, where available, and resold to contractors that may desire additional supplies. The amount, availability, and cost of water delivered under a dry year water purchase program is subject to multiple uncertainties and cannot be reliably predicted in any given year.

Central Valley Project

The CVP is a set of federal facilities that extend from north of Redding to areas near Bakersfield and to the South Bay Area. The CVP encompasses two of California's largest river systems: the Sacramento River, which flows south toward the Delta, and the San Joaquin River, which flows north to the Delta. The Friant Dam stores San Joaquin River flows in Millerton Lake northeast of Fresno. These supplies are routed south to the Project Area through the 151.8-mile-long Friant-Kern Canal, which terminates near the Kern River in southwest Bakersfield. The Friant-Kern Canal has a maximum capacity of 5,000 cubic feet per second (cfs), which decreases to 2,000 cfs at its terminus in the Project Area.

The CVP is operated by the U.S. Bureau of Reclamation (USBR). CVP supplies are generally allocated to long-term contractors on the basis of Class 1 ("firm") and Class 2 ("non-firm, hydrology dependent") amounts. Surplus supplies may be provided to other contractors on an irregular basis under Section 215 of the Reclamation Reform Act of 1982 ("Section 215" water). According to the KCWA, during 1950 to 2007, an average of 318,877 AFY of CVP water was delivered through the Friant-Kern Canal to the Project Area for agricultural and M&I uses (IRWMP 2011).

The CVP long-term contractors in the Project Area include Arvin-Edison Water Storage District (WSD), Delano-Earlimart Irrigation District (ID), Kern-Tulare WD, Shafter-Wasco ID, and Southern San Joaquin WSD. Water districts that are not contractors with the USBR in the Project Area occasionally exchange other supplies for CVP water, including KCWA, Kern Delta WD, North Kern WSD, Rosedale-Rio Bravo WSD, and Semitropic WSD. Since 2003, deliveries of CVP water to the contractors and exchange districts within the Project Area have ranged from 260,000 AF (2007) to 800,000 AF (2005). Table 4.17-5 provides a summary of the CVP deliveries to the Project Area during 2003 to 2012, including to long-term contractors and by exchanges to non-contractors.

Notes:
(a) CVP contractors.
(b) Combined deliveries from Friant-Kern Canal and Cross Valley Canal.
(c) Non-CVP contractors receiving CVP water by exchange with contractors.

The reliability of future CVP deliveries to the Project Area is affected by hydrological variability and a 2006 settlement of an 18-year lawsuit involving the U.S. Department of the Interior and Commerce Department, the Natural Resources Defense Council, and the Friant Water Users Authority (now Friant Water Authority) regarding fish habitat in the San Joaquin River below Friant Dam. The settlement and related federal legislation in 2009 require that significant amounts of water previously available to CVP Friant contractors, including Kern County, must, instead, be discharged to the river channel in an effort to create salmon and other fish habitats. A series of interim flows to the river were initiated in 2009, and more permanent "restoration" flows began in 2014. Restoration flow releases will range from approximately 71,000 AF in a critical dry year to approximately 556,000 AF in wetter years and will have a priority over existing contracts. In certain emergency drought conditions, restoration flows may be reduced for other purposes.

The level of CVP delivery reductions to the Project Area related to the 2006 settlement also depends on hydrological and other factors. Current estimates indicate that average annual deliveries from Friant Dam will be reduced by 13% to 15% from prior levels. The potential availability of Section 215 water supplied in the Project Area will also likely fall by as much as 30,000 to 40,000 AFY (see Appendix T).

To provide a conservative assessment, future CVP delivery levels in the Project Area assume that only Class 1 (firm) contract supplies would be delivered under future conditions. This approach is conservative because Class 2, Section 215, or other exchange water may be available under certain conditions, but uncertain future hydrological and regulatory conditions are expected to reduce the probability that the CVP system will have surplus supplies. Hydrologic modeling of CVP operations for 1922 to 1994 was conducted during the 2006 settlement to estimate the water supply expected to be available under various hydrologic conditions (Appendix T). The post-settlement operational model results were used to project the amount of CVP-Friant supplies of Class 1 water that would be delivered to the Project Area.

As shown in Table 4.17-6, the projections indicate that the Project Area would, on average, receive 305,600 AFY from the CVP system under future conditions, or 91% of the Class 1 water contract amounts. CVP deliveries would fall to 23% of Class 1 amounts during a single dry year (analogous to 1977 conditions), and to 68% during multiple dry year periods (based on the historically most severe four-year drought in 1931 to 1934).

Table 4.17-6: CVP Project Area Delivery Reliability in Average, Dry and Multiple Dry Years (AF)

CVP Water Supply Reliability	Delano – Earlimart ID	Shafter-Wasco ID	Southern San Joaquin MUD	Arvin-Edison WSD	Kern-Tulare WD	Total
Long-Term Average

Source: Appendix T, Table 11

As shown in Table 4.17-7 most of the CVP water would be delivered to the Central Subarea, which would also experience the largest delivery reductions. The Central Subarea would receive 262,500 AFY (86%) of the CVP deliveries, and the Eastern Subarea would receive 13.5% in an average year. About 0.3% would be delivered to the Western Subarea. Dry and multiple dry year CVP deliveries would be reduced by 23% and 68%, respectively, in each Subarea.

Table 4.17-7: CVP Project Area Delivery Reliability in Average, Dry and Multiple Dry Years by Subarea (AF)

Includes Class 1 allocations from the following agencies: a portion of Arvin-Edison WSD (93%) and a portion of Kern-Tulare WD (23%).

Local Surface Water

Local surface water in the Project Area is primarily obtained from Kern River flows, which are regulated by the Lake Isabella dam operated by the U.S. Army Corps of Engineers (USACE) and the Kern River Watermaster. Smaller streams, most of which are ephemeral, flow during periods of rain or for brief periods in the spring if they are fed by snowmelt and generally percolate into valley floor aquifers or, in limited instances, are used for agricultural irrigation. The Lake Isabella reservoir was designed to store approximately 570,000 AF of water. The facility's water storage has been limited to approximately 361,250 AF for safety purposes until the USACE upgrades the dam in accordance with an approved safety modernization program scheduled for completion in 2022 (USACE 2015).

The Kern River Watermaster coordinates reservoir releases with the USACE to provide water for downstream users, primarily for irrigation and groundwater recharge. Table 4.17-8 summarizes the annual unregulated and regulated flow volumes in the Kern River from 1980 to 2011. In 1989 the State Water Resources Control Board (SWRCB) declared that Kern River was fully appropriated and that no new diversions would be considered for approval. The status of the river flows remains subject to an ongoing administrative appeal and related legal process that may alter the existing patterns of Kern River water use.

Table 4.17-8: Historic Kern River Flows (AF)

Year	Natural (AF)	Regulated (AF)	Year	Natural (AF)	Regulated (AF)
1980	1,639,957	1,560,652	1996	1,038,261	968,036

1995	1,385,160	1,197,100	2011	1,374,894	1,404,645

Sources: Appendix T, Table 13

Flows from minor streams also occur in the Project Area, particularly in the Central and Eastern Subareas. The mean flow of Project Area streams, other than Kern River, is 98,900 AF (KCWA 2011). To provide a conservative assessment, local surface water supplies in the Project Area were assumed to be solely derived from the Kern River. Average year Kern River supplies were 764,400 AFY (Appendix T) during 1970 to 2011. In 1977, the driest year for which data is available, Kern River diversions were 197,000 AF, and during the 1987-1991 drought, average diversions were 335,500 AF (Appendix T). Table 4.17-9 summarizes the availability of Kern River water supplies in the Project Area during average, single dry and multiple-dry years based on 1970-2011 diversion records. The river water is assumed to be diverted and used in the Eastern Subarea, although some flows may reach the Central or Western Subareas in very wet years.

Table 4.17-9: Project Area Kern River Supplies in Average, Single Dry and Multiple Dry Years by Subarea

Water Year Type	Project Area (AF)	Western Subarea (AF)	Central Subarea (AF)	Eastern Subarea (AF)
Average Water Year (based on average diversions 1970 to 2011)	764,400	--	--	764,400
Single-Dry Water Year (based on diversions 1977)	197,000	--	--	197,000
Multiple Dry Year (based on average diversions 1987 to 1991)	335,500	--	--	335,500

Source: Appendix T, Table 15

Recycled Water

In 2011, 54,000 AF of secondary and tertiary-treated recycled water was produced for use in the Project Area by 14 WWTPs in the San Joaquin Valley portion of Kern County. About 49,000 AF of the recycled water supply was used for agricultural irrigation (Appendix T). Many farming operations have also installed facilities that intercept water that would normally run off fields during irrigation ("tailwater") for reuse in the same or adjacent fields (from the foot of one field to the head of another). Based on regional planning estimates prepared by the KCWA and other water districts, the amount of secondary and tertiary-treated recycled water from Project Area WTTPs and recycled tailwater from farming operations in the Project Area is about 77,000 AFY (Appendix T). This level of recycled water supply is conservative because several Project Area water suppliers and users are considering measures to increase recycled water production and use.

Produced Water from Oil and Gas Activities

As discussed in Section 4.9, Hydrology and Water Quality, oil and gas exploration and production activities in the Project Area also generate "produced water" (i.e., residual water from the separation of oil and gas after extraction). About 234,959 AF of produced water was generated during 2012 in the Project Area. The oil and gas industry reused 38% (88,812 AF) of this amount for enhanced oil recovery (EOR) injection or other oilfield activities, and 14% (32,771 AF) was supplied to the Cawelo WD for agricultural irrigation. About 84,571 AF (36%) of the produced water was disposed into injection wells, and 30,223 AF (13%) was disposed in surface ponds.

For analysis purposes, the supply of produced water in the Project Area available for treatment and reuse in the future is assumed to be sufficient to meet the anticipated demand for reuse, including oilfield operations and agricultural irrigation. This is a reasonable assumption, given that approximately half of produced water is currently disposed of rather than reused. As shown in Table 19 and Table 39 of Appendix T, the Project Applicant has estimated that, in 2015, about 93,106 AF of produced water will be reused for EOR and other oil and gas purposes. By 2035, oil and gas activities will utilize about 121,412 AF of produced water. The projections further assume that produced water use for agriculture will be 32,771 AFY under existing and future

conditions. As a result, the total Project Area produced water supply, excluding produced water disposal by injection or to surface ponds, is projected to increase from about 125,877 AFY in 2015 to 154,183 AFY in 2035.

Groundwater

As discussed in Section 4.9, Hydrology and Water Quality, the Project Area primarily overlies the Tulare Lake Basin/Kern County Subbasin of the San Joaquin Valley Groundwater Basin (DWR Groundwater Basin 5-22.14). Historically, California law has not required that water well operators in the state, including the Project Area, report the amount of groundwater extracted for agricultural, M&I, or other uses, except when aquifers are subject to a court-imposed adjudication. Project Area groundwater is not managed under an adjudication. The IRWMP developed estimates of groundwater extraction in the Project Area based on land uses and other water supplies. Table 4.17-10 summarizes the estimated amount of groundwater extracted in the Project Area from 1980 to 2011.

Table 4.17-10: Estimated Annual Project Area Groundwater Extraction, 1980-2011

Year	Extractions (AF)	Year	Extractions (AF)
1980	977,000	1996	1,609,600
1981	1,161,000	1997	1,091,400
1982	802,200	1998	1,290,200
1983	762,700	1999	1,471,500
1984	1,252,200	2000	1,360,100
1985	1,293,800	2001	1,953,900
1986	947,600	2002	1,575,000
1987	1,208,700	2003	1,203,900
1988	1,540,000	2004	1,842,300
1989	1,588,500	2005	579,900
1990	1,796,000	2006	716,500
1991	2,002,400	2007	2,212,300
1992	1,673,600	2008	2,306,500
1993	987,700	2009	1,212,400
1994	1,897,700	2010	230,400
1995	1,242,800	2011	419,000
		Mean [a]	**1,319,000**

Sources: Appendix T, Table 16
Note:
(a) Mean of the historical records is rounded off to the nearest hundred.

Project Area groundwater use tends to increase during drier periods when surface supplies decrease. As discussed in Section 4.9, Hydrology and Water Quality, groundwater withdrawals have been particularly significant in response to the current drought and have reduced aquifer storage and groundwater elevations to historically low levels in many locations. Prior to the drought, the IRWMP identified groundwater overdraft as "one of the longest-standing issues in the Kern Region," and also indicated that the region including the Project Area may experience a net loss to storage due to groundwater pumping of approximately 325,000 AFY (KCWA 2011). In November 2014, the DWR published a public update on drought conditions in California indicating that groundwater in the Tulare Lake Basin, which includes the Project Area, experienced notable declines since 2011, including reductions in the range of 25 to 50 feet to historically low levels (DWR 2014).

For analysis purposes in this EIR, the mean volume of estimated groundwater extractions during 1980 to 2011, 1.319 million AF, is assumed to represent average year demand for groundwater in the Project Area. The amount of groundwater extracted in a single dry year groundwater extraction was assumed to be the average groundwater use during dry and critically dry years, as defined by the DWR during 1980 to 2011. The amount of groundwater extracted during multiple dry years is assumed to be the average level of extraction estimated to have occurred during the 1987-1992 drought. Project Area and Subarea groundwater use in average, dry, and multiple dry years is summarized in Table 4.17-11.

Table 4.17-11: Project Area Average, Dry and Multiple Dry Year Groundwater Supplies by Subarea

	Project Area (AF)	Western Subarea (AF)	Central Subarea (AF)	Eastern Subarea (AF)
Average Water Year (based on average extractions 1980-2011)	1,319,000	659,500	237,400	422,100
Single-Dry Water Year (based on average of dry and critical years of extractions 1980-2011)	1,673,000	836,500	301,100	535,400
Multiple Dry Year (based on average extractions 1987-1992)	1,635,000	817,450	294,300	523,200

Source: Appendix T, Table 17

Groundwater extractions by Subarea were estimated based on the assumption that groundwater extractions would be proportional to the estimated agricultural demand within each Subarea. Groundwater supplies may not be available for all uses in each Subarea.

As discussed in Section 4.9.3, Regulatory Setting, in 2014, California enacted the Groundwater Sustainability Management Act. The Act requires, for the first time, the implementation of Groundwater Sustainability Plans (GSPs) for high- and medium-priority aquifers, based on groundwater data compiled by the California Statewide Groundwater Elevation Monitoring (CASGEM) program. Project Area groundwater basins are subject to a "high" priority ranking, and one or more GSPs must be adopted for the regional aquifers by 2020. A GSP must ensure

that, over a period of 20 years, "sustainable groundwater management" is achieved, including the avoidance of "chronic lowering of groundwater levels" and "significant and unreasonable" reductions in groundwater storage, land subsidence, and "adverse impacts on beneficial uses." The DWR is required to adopt regulations for the preparation of a GSP by January 2016. To date, draft regulations have not been circulated for public review and comment. It is possible that groundwater use in the Project Area may be modified or reduced from the assumed levels in Table 4.17-11 if necessary to achieve the sustainable groundwater management requirements mandated by the new state legislation.

Project Area Supply Summary

Table 4.17-12 summarizes the Project Area water supplies that are currently available for the Project Area, including SWP and CVP imported water, Kern River water, recycled water, oilfield-produced water, and groundwater, and that are estimated to be available in 2035.

Table 4.17-12: Summary of Project Area Average, Single Dry, and Multiple Dry Year Water Supplies, 2015 and 2035 (AF)

	Average (AF)	Single-Dry Year (AF)	Multiple Dry Year (AF)
2015			
SWP Imported Water	565,900	105,500	293,700
CVP Imported Water	305,600	77,200	228,400
Groundwater	1,319,000	1,673,000	1,635,000
Kern River	764,400	197,000	335,500
Recycled Water	77,000	77,000	77,000
Oilfield-Produced Water [(a)]	125,981	125,981	125,981
TOTAL	**3,157,881**	**2,255,681**	**2,695,581**
2035			
SWP Imported Water	565,900	105,500	293,700
CVP Imported Water	305,600	77,200	228,400
Groundwater	1,319,000	1,673,000	1,635,000
Kern River	764,400	197,000	335,500
Recycled Water	77,000	77,000	77,000
Oilfield-Produced Water	155,004	155,004	155,004
TOTAL	**3,186,904**	**2,284,704**	**2,724,604**

Source: Appendix T, Table 20
Note:
(a) Oilfield produced water supply includes 32,771 AFY provided for agricultural reuse in the Eastern Subarea to the Cawelo Water District and produced water supply amounts are slightly higher (104 AF higher for 2015 and 810 AF higher for 2035) than projected produced water demand in Tables 19 and 39 of the WSA due to the use of a different supply estimation methodology.

Project Area Water Demand

The primary sources of water demand in the Project Area are agriculture, urban use, including residential commercial, industrial, public service (e.g., schools, parks, recreation) and other urban M&I demand, and oil and gas exploration and production. The following sections summarize the water demands for each of these uses in the Project Area.

Agricultural Water Demand

Agricultural water demand was estimated by using the per-acre water application rate for the major crops grown multiplied by the acreage of each crop in the Project Area. As shown in Table 4.17-13, based on 2006 land use data prepared by the DWR, about 886,000 acres are used for irrigated agriculture in the Project Area. The average consumption per irrigated acre ranges from less than 2 AFY per acre to more than 4 AFY per acre, depending on the type of crop under cultivation.

Table 4.17-13: Project Area Agricultural Acreage, Crop Application Rates and Water Demand (AFY)

Crop Type	Irrigated Acreage	Consumptive Water Use (AF/acre)	Agricultural Water Demand (AFY)
Alfalfa and alfalfa mixtures	90,129	4.10	369,529
Almonds	171,273	3.28	561,776
Apples, Pears, Plums	3,958	3.45	13,655
Apricots, Nectarines, Peaches	4,890	3.35	16,383
Beans (dry and green)	3,811	2.11	8,041
Carrots	24,684	2.55	62,944
Citrus(grapes, lemons, oranges)	60,566	3.37	204,108
Corn, Grain Sorghum	26,659	2.95	78,644
Cotton	103,302	2.71	279,949
Grapes(Vineyards)	103,371	2.81	290,471
Grain and Grain Hay	110,184	2.07	228,080
Melons, Squash, Cucumbers	4,375	1.46	6,388
Misc. Deciduous Trees	15,996	3.34	53,427
Misc. Field Crops	47,972	2.09	100,261
Misc. Subtropical Trees	669	3.38	2,263
Misc. Vegetables	6,785	1.62	10,991
Nursery	5,145	3.28	16,875
Onions, Garlic	10,875	1.70	18,487
Pasture, Turf, Misc. Grasses	9,530	4.13	39,360
Pistachios	63,351	4.11	260,372

Table 4.17-13: Project Area Agricultural Acreage, Crop Application Rates and Water Demand (AFY)

Crop Type	Irrigated Acreage	Consumptive Water Use (AF/acre)	Agricultural Water Demand (AFY)
Potatoes	4,379	1.98	8,671
Safflower	1,304	2.23	2,909
Sugar Beets	574	3.29	1,888
Tomatoes	9,854	2.51	24,734
Walnuts	2,153	3.89	8,375

Source: Appendix T, Table 37

Table 4.17-14 summarizes the irrigated acreage and agricultural water demand by Subarea. The Central Subarea accounts for about 50%, the Western Subarea accounts for about 32%, and the Eastern Subarea accounts for 18% of total Project Area agricultural demand. Agriculture utilizes about 2.669 million AFY in the Project Area.

Table 4.17-14: Irrigated Agricultural Acreage and Water Demand by Subarea

Subarea	Irrigated Acreage	Agricultural Water Demand (AFY)
Western	289,404	867,309
Central	428,561	1,327,759
Eastern	167,863	473,619
TOTAL	**885,828**	**2,668,687**

Source: Appendix T, Table 38

As discussed in Appendix T, for analysis purposes in this EIR, existing agricultural water demand is conservatively assumed to remain constant, although urban development and other factors are likely to reduce irrigated acreage and water use in the Project Area over time.

Urban Water Demand

Urban demand projections were evaluated in normal, single dry, and multiple dry years in five-year increments from 2010 to 2035, based on publicly available data, including urban water management plans (UWMPs) adopted by water agencies in the Project Area, the IRWMP, and the Poso Creek Integrated Regional Water Management Plan (see Appendix T). Urban water demands include residential, commercial, industrial, institutional, landscape, and other public services, such as fire department, recreational, and school uses. Table 4.17-15 summarizes the existing and projected future average year urban water demand in the Project Area from 2010 to

2035. Urban water use in the Project Area is expected to increase from 237,028 AFY in 2015 to 301,736 AFY in 2035.

Table 4.17.15: Project Area Average (Average) Hydrologic Year Urban Water Demand 2010-2035 (AFY)

Source: Appendix T, Table 31
Note: The urban estimates exclude a small amount of urban demand in Casa Loma WC and Mettler CWD in the Central Subarea due to lack of available data. City of MacFarland demand is included in the MacFarland MWC totals.

Based on the data sources summarized above and in Appendix T, Project Area urban water demands in single dry and multiple dry years were also estimated under existing and future conditions. As shown in Table 4.17-16, urban water demands are estimated to be slightly lower in a single dry year and slightly higher during multiple dry years compared with normal or average year projections.

Table 4.17-16: Project Area Average, Single Dry and Multiple Dry Year Urban Water Demand 2015-2035 (AFY)

	2015	2020	2025	2030	2035
Average (Average) Year	237,028	237,257	257,014	278,795	301,736
Single Dry Year	234,938	236,461	255,928	277,418	299,970
Multiple Dry Year	239,853	241,170	261,009	282,901	305,885

Source: Appendix T, Tables 34-36

Table 4.17-17 shows existing and projected future Project Area urban water demand by Subarea for 2015-2035. Most of the urban water use in the Project Area occurs in the Eastern Subarea (49%) and Central Subarea (41%). The Western Subarea has a lower resident population and accounts for about 9% of Project Area urban water demand in an average year.

Oil and Gas Exploration and Production Demand

As discussed in Appendix T and in Section 4.9, Hydrology and Water Quality, oil and gas exploration and production activities require the use of produced water, mainly for EOR steam and water injection purposes, and M&I supplies for well drilling and maintenance, well stimulation treatment, supplemental steam generation, and other operations that require higher quality water.

Produced Water Demand

Produced water is generated during the oil and gas extraction process from water that is located in oil-bearing formations. Oil and gas production wells bring a mixture of hydrocarbons and water to the surface. The extracted hydrocarbon and water mixture is routed to tanks and other facilities to separate the lighter oil and gas contents from heavier produced water. As shown in Figure 4.9-7 (see Section 4.9, Hydrology and Water Quality), the ratio of produced water to oil recovered in the Project Area has increased from under 6 units (e.g., gallons, barrels, or AF) of produced water for each unit of oil recovered in 2002 to nearly 13 units of produced water for each unit of oil recovered in 2012 and 2013. About 231,260 AF of produced water was generated along with the extraction of about 18,300 AF (141.6 million barrels) of oil in the Project Area in 2013.

As summarized in Section 4.9, Water Quality and Hydrology, Project Area produced water generally has relatively high levels of total dissolved solids (TDS), contains naturally-occurring residual oil, grease and other hydrocarbon-related constituents, and may contain elevated levels of boron, chloride or other constituents that tend to occur in hydrocarbon-bearing formations. About 38% of the total volume of produced water in 2012, or 88,812 AF, was reused for EOR water and steam injections, pressure maintenance, well pulling, coil tubing activities, dust control, and surface facility construction. As shown in Table 4.17-18, produced water demand for oil and gas reuse is expected to be about 93,106 AF in 2015 and to increase to 121,412 AF by 2035.

Table 4.17-18: Oil and Gas Exploration and Production Demand for Produced Water 2012-2035 (AFY)

2012	2015	2020	2025	2030	2035
88,812	93,106	100,182	107,258	114,334	121,412

Source: Appendix T, Table 19 and Table 39

As discussed in Section 4.9, Hydrology and Water Quality, about 32,771 AFY of relatively high quality produced water from oilfields located along the base of Sierra Nevadas in the Eastern Subarea is provided to CWD for agricultural reuse. Produced water reuse for irrigation requires additional filtration and treatment to meet applicable water quality standards, including waste discharge requirements (WDRs) issued by the Central Valley Regional Water Quality Board (CVRWQCB). The Applicant has projected that 32,771 AF of produced water will continue to be supplied to CWD in the Eastern Subarea through 2035. As discussed below, additional produced water reuse has been proposed or considered, but none has been approved or implemented in other Project Area locations.

M&I Water Demand

As discussed in Appendix T, oil and gas exploration and production demand for M&I water is projected in this EIR based on the ratio of water use for applicable activities per production well in the Project Area during 2012. M&I water is used for oil and gas operations that require higher water quality than can typically be obtained from produced water to protect equipment, avoid potential chemical reactions, and to avoid potential water quality impacts during well drilling when muds and drilling fluids could come into contact with water-bearing formations before well casings and cement seals have been installed. M&I water is used by oil and gas operators for: (a) drilling muds; (b) well stimulation treatments; (c) mud service, cementing, acidizing, and coil tubing maintenance; (d) well pulling; (e) domestic water use in oilfields and related structures; (f) well abandonment; and (g) steam production. As shown in Table 4.17-19, oil and gas M&I water demand in the Project Area was about 8,778 AF in 2012.

Table 4.17-19: Oil and Gas Exploration and Production Demand for M&I Water 2012 (AF)

New Well Construction (Drill Mud + Well Stimulation)	589
Maintenance (Mud Services + Cementing)	61
Maintenance (Acidizing + Coil Tubing)	52
Maintenance (Well Pulling + Domestic Water)	594
Well Abandonment	202
Steam Production	7,279
TOTAL	8,778

Source: Appendix T, Table 28

As discussed in Chapter 3, Project Description, the Project Applicant has estimated that up to 2,697 new production wells could be subject to Oil and Gas Conformity Review under the proposed Zoning Ordinance amendment each year, 64% of which would be located in the Western Subarea, 5% in the Central Subarea, and 31% in the Eastern Subarea. As shown in Table 4.17-20, oil and gas M&I demand could increase to 11,760 AFY (or to 12,936 AFY, including a 10% contingency factor) by 2035 under these assumptions.

Table 4.17-20: Oil and Gas Exploration and Production Demand for M&I Water 2015-2035 (AFY)

	2015	2020	2025	2030	2035
Projected M&I Use	9,660	10,185	10,710	11,235	11,760
Projected M&I demand with 10% contingency	10,626	11,204	11,781	12,359	12,936

Source: Appendix T, Table 30

Oil and gas operators obtain M&I water from a variety of sources, including groundwater wells, deliveries from Project Area water purveyors, spot market purchases, or in truck-mounted tanks that are filled at industrial locations served by M&I suppliers. As discussed in Appendix T, 52 water purveyors were surveyed to determine if each had adopted an UWMP or an agricultural water management plan (AWMP) that identified oil and gas supply as a component of total service demand. The analysis identified 21 purveyors with adopted UWMPs or AWMPs that did not discuss oil and gas demand, 25 purveyors for which UWMPs or AWMPs were not available, and six purveyors with UWMPs or AWMPs that addressed oil and gas demand. The six purveyors include the Vaughn Water Company, West Kern Water District, Oildale Mutual Water Company, Rag Gulch Water District 2008 AWMP (currently incorporated into the Kern-Tulare Water District AWMP, which does not address oil and gas demand), Belridge Water Storage District , and the Lost Hills Water District.

As shown in Table 4.17-21, the Belridge Water Storage District (1,600 AFY) and the Lost Hills Water District (708 AFY) were the only purveyors that quantified the amount of water expected to be provided to oil and gas operators over time. These two districts estimate that about 2,308 AFY of water will be supplied to oil and gas operators. A review of approved online well stimulation treatment notices posted by DOGGR between December 3, 2013, and March 6, 2014, identified the Belridge Water Storage District, the West Kern Water District, other "canal" and "Tulare" water, and groundwater as M&I water supply sources for oil and gas well stimulation activities (Appendix S).

Table 4.17-21: Oil and Gas Exploration and Production Demand Identified in Project Area UWMPs and AWMPs (AFY)

	2010	2015	2020	2025	2030	2035
Belridge 2012 AWMP	1,600	1,600	1,600	1,600	1,600	1,600
Lost Hills Water District 2012 AWMP	708	708	708	708	708	708
TOTAL	**2,308**	**2,308**	**2,308**	**2,308**	**2,308**	**2,308**

Source: Appendix T, Table 3

As discussed in Appendix T, and in Impact 4.17-4, the analysis of supply and demand indicates that surplus water is not available in the Project Area. Any new use reduces the availability of water to another Project Area user, or increases the existing and severe regional groundwater overdraft if supply shortfalls are addressed by increased groundwater extraction. Due to the variability of oil and gas M&I supply sources from year to year, the current drought that has severely restricted the availability of imported and local surface supplies, and for conservative analysis purposes, this EIR assumes that all oil and gas demand for M&I-quality water are met by using M&I-quality groundwater.

Project Area Demand Summary

Table 4.17-22 summarizes the Project Area agricultural, urban, and oil and gas water demands in average, single dry, and multiple dry years for 2015 and 2035.

Table 4.17-22: Summary of Project Area Average, Single Dry and Multiple Dry Year Water Demand, 2015 and 2035 (AF)

	Average Year	Single Dry Year	Multiple Dry Year
2015			
Urban Demand (M&I)	237,029	234,938	239,854
Agricultural Demand (Excluding Produced Water)	2,635,916	2,635,916	2,635,916
Agricultural Demand (Produced Water Reuse)	32,771	32,771	32,771
Oil and Gas M&I Demand	9,660	9,660	9,660
Oil and Gas Produced Water Demand	93,106	93,106	93,106
TOTAL	**3,008,482**	**3,006,391**	**3,011,307**
2035			
Urban Demand (M&I)	301,736	299,971	305,886
Agricultural Demand (Excluding Produced Water)	2,635,916	2,635,916	2,635,916
Agricultural Demand (Produced Water Reuse)	32,771	32,771	32,771
Oil and Gas M&I Demand	11,761	11,761	11,761
Oil and Gas Produced Water Demand	121,412	121,412	121,412
TOTAL	**3,103,596**	**3,101,831**	**3,107,746**

Source: Appendix T, Table 39

California is currently experiencing a major period of drought, including below normal rainfall and mountain snowpack levels that have persisted since 2012. On January 17, 2014, Governor Brown proclaimed a drought state of emergency and directed state officials to take all necessary actions to prepare for these drought conditions (State of California 2014). California obtains about one-third of its water supply from the snowmelt in the Sierra Nevadas. Snowmelt is the primary source for water, which is delivered to the Project Area through state and federal canal projects. As of March 12, 2015, the Sierra Nevadas snowpack was only 17% of the historical average for the time of year.

On April 1, 2015, Governor Brown issued an executive order directing the SWRCB to impose a 25% reduction on the state's 400 local water supply agencies. The agencies will be responsible for implementing restrictions to cut back on water use and for monitoring compliance. The order would impose varying degrees of cutbacks on water use affecting homeowners, farms, and other businesses, as well as the maintenance of cemeteries and golf courses. The order included additional water conservation and planning measures, and the potential installation of salinity barriers in the Sacramento Delta in response to historically low snowpack levels in the state (State of California 2015). The executive order also requires that groundwater elevation monitoring be implemented throughout the state, including the Project Area, by the end of 2015. On May 22,

2015, the SWRCB approved a program under which riparian water right holders in the Sacramento-San Joaquin River Delta would voluntarily cut back water use by 25% from 2013 levels in exchange for assurances that the rights holders will not face further riparian curtailment during the June-September growing season (SWRCB 2015). In April 2015, the state Department of Water Resources determined that the drought is continuing into a fourth year (DWR 2014, 2015).

Electricity and Natural Gas

Pacific Gas and Electric Company (PG&E), Southern California Edison (SCE), and Southern California Gas Company (SoCalGas) provide electricity and natural gas to Kern County customers, with PG&E generally servicing the westerly portion of the County. SoCalGas also provides gas to customers in the western County. PG&E's service territory, referred to as its "Kern Division," covers a large area of the County and includes Arvin, Bakersfield, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Wasco, and unincorporated portions of the County. Within this area, PG&E serves gas and/or electricity to 154,000+ residential customers and about 23,000 commercial and industrial customers. SCE serves electricity only to most of the remaining parts of the County, including the mountain, foothill, and southern desert communities of the County. This includes Delano, Lake Isabella, and Tehachapi, Mojave, Rosamond, and other unincorporated areas. SoCalGas provides gas-only service to various regions of Kern County.

Table 4.17-23 provides an estimate of the electricity and natural gas use in 1997, 2008, and 2012 for oil and gas production. The data indicate that there is an increased use of electricity over the time period, but a decreased used natural gas.

Table 4.17-23: Estimated Project Area (DOGGR District 4) Electricity and Natural Gas Use 1997, 2008 and 2012 for Oil and Gas Production

Electricity			
Year	**Crude Oil production (kbbl)**	**Electrical use factor, Kkwh/kbbl**	**Annual use (Gwh)**
1997	213,053	12.98	2,765
2008	162,286	20.70	3,359
2012	141,694	25.18	3,568
Natural Gas			
Year	**Crude Oil production (kbbl)**	**Natural gas use factor, MBTU/kbbl**	**Annual use (TBtu)**
1997	213,053	1,147	244
2008	162,286	1,335	217
2012	141,694	1,444	205

1997 and 2008 calculated from statewide energy intensity factors (CEC 2013; see Table 2) and reported District 4 production (DOGGR 1998, 2009); 2012 estimated from 1997-2008 statewide energy intensity factors (CEC 2013; see Table 2) pro-rated by reported statewide crude oil production decline during 1997-2008 reported in the 2013 CALEB update (CEC 2013) and reported District 4 production (DOGGR 2013).

Oil and gas extraction energy use in the Project Area is a function of the location and amount of crude oil production, neither of which can be predicted with reasonable certainty under future conditions. If recent trends persist, oil production in the Project Area would require additional energy per barrel produced, but total energy use would continue to decline. Therefore, no new power generation plants or new major gas infrastructure would be needed to support the anticipated energy needs for the Project.

Wastewater Disposal

Kern County Waste Management Department

The Kern County Waste Management Department (WMD) operates two County Sanitation Districts: Kern Sanitation Authority (KSA) and Ford City-Taft Heights Sanitation District, two wastewater plants (the KSA Treatment Plant and Taft Treatment Plant owned by the County of Kern (and two County Service Area [CSA]) wastewater collection systems. The Board of Supervisors serves as the members of the Board of Directors for the two districts.

Wastewater treatment services within Kern County are provided by a number of local agencies, and the current flow and capacity of these facilities are presented in Table 4.17-24.

Table 4.17-24: Wastewater Flows and Capacity of Treatment Facilities in the Kern

Produced Water/Wastewater Disposal

Groundwater that exists naturally in oil and gas reservoirs is brought to the surface when oil and gas are extracted from these reservoirs. This water is known as "produced water." Produced water that is not reused for oilfield operations, or that is not treated and supplied to other users for agricultural irrigation, is disposed by oilfield operators in surface impoundments (ponds) in accordance with WDRs issued by the CVRWQCB or is injected into Class II injection wells (discussed in more detail in Section 4.9, Hydrology and Water Quality) permitted by DOGGR. During 2012, oilfield operators disposed of about 30,000 AF of produced water into surface ponds, and 84,500 AF of produced water was disposed by injection into Class II wells in the Project Area. The generation, reuse, and disposal of produced water, potential impacts associated with produced water activities, and mitigation measures required to reduce potentially significant impacts to less than significant levels are discussed in Section 4.9, Hydrology and Water Quality.

Stormwater Drainage

The Kern County Engineering and Survey Services Department manages storm drain systems in Kern County. Development sites are required to provide for their own onsite retention or show that existing facilities have sufficient capacity to carry the additional runoff. These onsite retention basins are usually maintained by a County service area if they are for a residential project or privately maintained by the developer through a special district or other entity if they are for a commercial development. The County declines to assume liability for commercial or

industrial drainage sumps, due to the issues of increased nonpoint-source contamination, particularly from industrial uses.

As discussed in Section 4.9, Hydrology and Water Quality, Impact 4.9-5, about 97.4% of the Project Area consists of Tier 1 and Tier 2 lands. Tier 1 lands, in which oil and gas activities are the predominant land use, represent 10.1% of the Project Area, while Tier 2 lands, where agriculture is the predominant use, represent 87.3% of the Project Area. In addition, 97% of the projected annual disturbance of up to 4,856 acres would occur in Tier 1 (4,400 acres) or Tier 2 (298 acres) areas. Urban-scale constructed stormwater drainage systems occur, to a limited extent, in Tier 1 and Tier 2 areas. Most drainage is managed on a site-specific basis in Project Area oilfields and agricultural locations. Potential project-related development would affect, at most, 0.3% of the acreage in Tiers 3, 4, and 5 that could generate runoff to existing or planned regional or constructed stormwater drainage systems.

Solid Waste

Kern County Waste Management Department

The Kern County WMD provides environmentally safe management of solid waste and is responsible for operating seven landfills, five transfer stations, and three bin sites throughout the County. WMD landfills are located in Bakersfield (Bena Landfill), Boron, Mojave-Rosamond, Ridgecrest, Shafter-Wasco, Taft, and Tehachapi.

WMD also operates two special waste facilities and provides information to the residents of Kern County regarding recycling and ways to reduce waste. In addition, the WMD oversees the operation of several wastewater treatment facilities.

Solid waste is a mixture of items discarded as useless or unwanted arising from residential, commercial, industrial, institutional, agricultural, and mining activities. These wastes include construction and demolition (C&D) -generated waste as well as inert wastes. In most cases, solid waste is hauled directly to Class III landfills, with the remainder being taken to transfer stations, resource recovery centers, or refuse-to-energy facilities. Class III landfills typically handle the disposal of non-hazardous waste. The general waste classifications utilized by the Kern County WMD are:

- Non-hazardous solid waste, which consists mostly of household garbage, commercial wastes, agricultural waste, and litter.
- Special waste, which is any waste that requires special handling, including infectious waste, pesticide containers, sewage sludge, oilfield waste, household hazardous waste, and asbestos waste.
- Designated waste, which is a waste that consists of or contains pollutants that could be released at concentrations in excess of applicable water quality objectives and standards

or hazardous waste that has been granted a variance from hazardous waste management requirements.

- Hazardous waste, which is a waste that, because of its quantity, concentration, physical, chemical, or infectious characteristics, may either: (a) cause or significantly contribute to an increase in mortality or an increase in serious irreversible or incapacitating reversible illness; or (b) pose a substantial present or potential hazard to human health or the environment when improperly managed.

- Industrial wastes, which are hazardous and non-hazardous by-products produced by oil and gas extraction, pesticide, paper, petrochemical, rubber, plastics, electronics, and other industries.

Not all of the above-defined wastes may be disposed of at a landfill. State law regulates the disposal of wastes at landfills.

Kern County is responsible for compliance with the California Integrated Wastewater Management Act of 1989, Assembly Bill (AB) 939. AB 939 requires that cities and counties reduce the amount of solid waste being sent to landfills by 50% by January 1, 2000, and requires cities and counties to prepare AB 939 solid waste planning documents. These documents include the Source Reduction and Recycling Element (SRRE), the Household Hazardous Waste Element (HHWE), and the Non-Disposal Facility Element (NDFE). All three of these documents have been approved for Kern County, as well as an Integrated Waste Management Plan approved February 1998 by the California Integrated Waste Management Board (California Integrated Waste Management). The Kern County Integrated Waste Management Plan is the long-range planning document for landfill facilities.

C&D waste is heavy, inert material. This material creates significant problems when disposed of in landfills. Since C&D waste is heavier than paper and plastic, it is more difficult for counties and cities to reduce the tonnage of disposed waste. For this reason, C&D waste has been specifically targeted by the State of California for diversion from the waste stream. Projects that will generate C&D waste should emphasize deconstruction and diversion planning, rather than demolition. Deconstruction is the planned and organized dismantling of a prior construction project, which allows maximum use of the deconstructed materials for recycling in other construction projects and sends a minimum of the deconstruction material to landfills.

The Kern County Waste Management Department administers or sponsors the following recycling programs that contribute to meeting the State-mandated solid waste diversion goals:

- Recycling programs at landfills to recycle or divert a wide variety of products, such as wood waste, cathode ray tubes, tires, inert materials, appliances, etc.
- Kern County and the City of Bakersfield operate drop-off recycling centers for household recyclables located within the unincorporated metropolitan area and within the city. County and City drop-off recycling centers may be used by both County and City residents.

- Financial assistance for the operation of the City of Bakersfield Green Waste Facility.
- Kern County Special Waste Facility provides disposal of household hazardous waste services to all County residents.
- Cosponsors semi-annual Bulky Waste Collection Events, which are held in the Bakersfield area and are available to both County and city residents.
- Participates jointly with the City of Bakersfield on a Christmas tree recycling campaign.
- Cosponsors jointly with the Community Clean Sweep, a telephone book recycling program.
- Sponsors the Community Clean Sweep to conduct summer workshops called "Trash to Treasure," which educates children on recycling and other Kern County Waste Management Department programs.
- Operates, in collaboration with the Community Clean Sweep, an innovative elementary school education program called "Clean Kids Hit the Road Puppet Show."
- Provides recycling trailers to churches, schools, and non-profit organization.

Landfills

Table 4.17-25 identifies the landfill class, maximum cubic yards, maximum tons per day, cubic yards per year, closure date, and remaining capacity date of the landfills in Kern County.

Table 4.17-25: Landfills in Kern County

Landfill Name and Location	Landfill Class	Permitted Capacity		Remaining Cubic Yards	Closure Date Under Current Permits	Remaining Capacity Date
		Max Cubic Yards Per Year	Max Tons Per Day			
Public Landfills						
Bakersfield Metropolitan (Bena) Sanitary Landfill 2951 Neumarkel Road, Caliente, CA 93220	Class III	53,000,000	4,500	32,808,260	April 1, 2046	July 01, 2013
Boron Sanitary Landfill 11400 Boron Avenue, Boron, CA 93516	Class III	1,057,000	200	94,851	January 1, 2037	January 19, 2011
Clean Harbors Buttonwillow LLC 2500 West Lokern Road Buttonwillow, CA 93206	Class I	14,293,760	4,000	183,960,000	January 1, 2040	May 29, 2014
McKittrick Waste Treatment Site 56533 Highway 58, McKittrick, CA 93251	Class II	2,091,800	1,180	662,221	December 31. 2029	May 1, 2014
Mojave-Rosamond Sanitary Landfill 400 Silver Queen Road, Mojave, CA 93501	Class III	2,262,243	470	606,848	December 31. 2019	March 11, 2010
Ridgecrest Recycling & Sanitary Landfill 3301 Bowman Road Ridgecrest, CA 93555	Class III	10,500,000	701	5,037,428	December 31, 2045	September 16, 2010
Shafter-Wasco Recycling & Sanitary Landfill 17621 Scofield Ave., Shafter, CA 93263	Class III	21,895,179	1,500	14,534,860	December 31, 2027	May 23, 2014
Taft Recycling & Sanitary Landfill 13351 Elk Hills Road, Taft, CA 93268	Class III	11,000,000	800	7,380,708	December 31, 2078	February 01, 2011

Table 4.17-25: Landfills in Kern County

Landfill Name and Location	Landfill Class	Permitted Capacity		Remaining Cubic Yards	Closure Date Under Current Permits	Remaining Capacity Date
		Max Cubic Yards Per Year	Max Tons Per Day			
Tehachapi Sanitary Landfill 12001 Tehachapi Blvd., Tehachapi, CA 93561	Class III	3,388,723	1,000	329,171	January 1, 2016	May 23, 2014
Private Use Landfills						
Edwards Air Force Base (AFB) Main Base Sanitary Landfill, (1) (a) 220 Landfill Road, Edwards Air Force Base, CA 93524	Class III	2,250,000	120	1,078,875	December 31, 2028	Not Available
H.M. Holloway Landfill 13850 Holloway Road, Lost Hills, CA 93249	Class II, Class III	12,600,000	2,000	7,522,934	January 31, 2019	December 31, 2013
U.S. Borax Inc.-Gangue/ (2) (b) Refuse Waste Pile 14486 Borax Road, Boron, CA 93516	Class III	8,500,000	443	908,496	January 1, 2023	May 29, 2014

Notes:
(1) Not a public landfill; only accepts waste generated at Edwards AFB.
(2) Not a public landfill; only accepts waste derived solely from US Borax Boron Operations.
Operators are only required to update information every five years.

4.17.3 Regulatory Setting

Federal

Clean Water Act (33 U.S.C. §1251 et seq.)

The 1972 Federal Water Pollution Control Act and its 1977 amendments, collectively known as the Clean Water Act (CWA), established national water quality goals and the basic structure for regulating discharges of pollutants into the waters of the United States. Section 402 of the CWA establishes the National Pollutant Discharge Elimination System (NPDES) to regulate the discharge of pollutants into waters of the United States. Section 404 of the CWA regulates the discharge of fill or dredged materials to waters of the U.S. (see Section 4.4, Biological Resources). Permits issued under the CWA limit the composition and, in some cases, the volume of a discharge and the concentrations of individual pollutants. Discharge requirements are based on available technology (technology-based effluent limits) and on the quality of the receiving waters (water quality-based effluent limits).

The CWA allows for the delegation of implementation authority to the states. Under the federal or delegated program, all the information required for permit application and monitoring for permit compliance are considered public, with the exception of certain confidential business information that may be considered "trade secret." In addition, the program requires delegated states to establish water quality standards for specific water bodies and to designate the types of pollutants to be regulated, including total suspended solids and oil and grease. In California, NPDES permitting authority is delegated to the SWRCB and nine Regional Water Quality Control Boards (RWQCBs). The Project Area is within the jurisdiction of the CVRWQCB.

Under the NPDES program, all point sources that discharge directly into waters of the United States are required to obtain a permit regulating their discharge. Each NPDES permit specifies effluent limitations for particular pollutants as well as monitoring and reporting requirements for the proposed discharge. Construction activities in the Project Area that could result in a discharge to waters of the United States are subject to the California NPDES General Permit for Stormwater Associated with Construction Activities (Construction Activity NPDES Storm Water General Permit, 2009-0009-DWQ and 2010-0014-DWQ). Other stormwater discharges could be subject to the Industrial General Permit issued under the NPDES program, to a municipal separate storm sewer system NPDES permit issued for municipal locations, or to individual NPDES permits issued to specific landowners or land use operators.

Discharges of treated wastewater to surface waters of the United States require a NPDES permit. In California, the RWQCBs administer the issuance of these federal permits. Obtaining a NPDES permit requires preparation of detailed information, including characterization of wastewater sources, treatment processes, and effluent quality. The conditions of a permit are subject to many factors, such as basin plan water quality objectives, impaired water body status of the receiving water, historical flow rates of the receiving water, effluent quality and flow, the California Toxics Rule (CTR), the SWRCB's State Implementation Plan (SIP) implementing the

CTR, and established Total Maximum Daily Loads (TMDLs) for various pollutants. More information about NPDES permits that apply to oil and gas operations is provided in the discussion of state permitting below.

Section 401 of the CWA requires that an applicant requesting a federal permit for an activity that may result in a discharge into waters of the United States obtain state certification that the proposed activity will not violate state and federal water quality standards. State water quality standards are discussed below. The CVRWQCB implements Section 401 of the CWA in the Project Area.

Total Maximum Daily Loads

Under Section 303(d) of the CWA, states, territories, and authorized tribes are required to develop lists of impaired waters. These are waters that exceed applicable water quality standards. The law requires that these jurisdictions establish priority rankings for waters on the lists and develop TMDLs for these waters. A TMDL is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards.

There are no impaired waters listed within the Project Area, and no TMDLs have been established for surface waters in the Project Area.

Safe Drinking Water Act

The Safe Drinking Water Act of 1974 (SDWA) gave the U.S. Environmental Protection Agency (EPA) the authority to set standards for contaminants in drinking water supplies. The EPA was required to establish primary regulations for the control of contaminants that affected public health and secondary regulations for compounds that affect the taste, odor, and aesthetics of drinking water. Under the provisions of SDWA, the California Department of Health Services (DHS) has primary enforcement responsibility. Title 22 of the California Administrative Code establishes DHS authority and stipulates state drinking water quality and monitoring standards.

Federal Energy Regulatory Commission

The Federal Energy Regulatory Commission (FERC) regulates and oversees the energy industries in the interest of the American public. The Energy Policy Act of 2005 gave FERC additional responsibilities, including interstate commerce, licenses and inspections, energy markets, and penalizing energy organizers and individuals who violate FERC rules in the energy markets.

State

California Energy Commission

The California Energy Commission (CEC) regulates the provision of natural gas and electricity within the state. The CEC is the state's primary energy policy and planning agency. Created in 1974, the CEC has five major responsibilities: forecasting future energy needs and keeping

historical energy data, licensing thermal power plants 50 megawatts (MW) or larger, promoting energy efficiency through appliance and building standards, developing energy technologies and supporting renewable energy, and planning for and directing the State of California's response to energy emergencies.

Water Code Sections 10910 et seq.

Water Code Section 10910 et seq. were amended by Senate Bill (SB) 610 in 2001 to require that a WSA be prepared by a public water system for certain projects subject to the California Environmental Quality Act (CEQA), including: a proposed residential development of more than 500 dwelling units; a proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space; a proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space; a proposed hotel or motel, or both, having more than 500 rooms; a proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area; a mixed-use project that includes one or more of the projects specified in this subdivision; or a project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500–dwelling-unit project. Water Code Section 10910(b) further provides that the CEQA lead agency may prepare the WSA if a public water system that may supply water for the project cannot be identified. As discussed above, no public water system would provide more than a small portion of the water required for oil and gas activities in the Project Area.

The Applicant's consultant, Kennedy/Jenks Consultants, completed a draft water supply and demand analysis that includes the required elements of a WSA. The draft WSA was independently reviewed by the County and helped inform the water supply and demand analysis in this EIR. A copy of the draft WSA is included in Appendix T of this EIR.

Senate Bill 1281, Disclosure of Oil and Gas Water Use and Disposal

SB 1281, effective January 2015, amended Sections 3226.3 and 3227 of the Public Resources Code (PRC) to require that: (1) DOGGR provide the SWRCB with an annual "inventory of all unlined oil and gas field sumps;" and (2) well operators provide DOGGR with quarterly information regarding the source and disposition of water produced by or used in oil and gas production in addition to existing obligations to report gas and oil production and produced water information on a monthly basis. The new quarterly reporting requirements include information regarding: (a) the source and volume of any water, including produced water (also subject to monthly reporting), including the water used to generate or make up the composition of any injected fluid or gas, identified by water source if more than one water source is used; (b) the volume of untreated water suitable for domestic or irrigation purposes used in oil and gas operations; (c) the treatment of water and the use of treated or recycled water in oil and gas field activities including, but not limited to, exploration, development, and production; and (d) the specific disposition of all water used in or generated by oil and gas field activities, including

water produced from each well as reported in an operator's monthly reports, and separated by volume of disposition if more than one disposition method is used.

The amendments retain certain previous monthly reporting requirements in Section 3227, including: (1) the amount and gravity of oil, gas and water, and the number of days fluid was produced from each well; (2) the number of drilling, producing, injecting, or idle wells owned or operated by a person subject to reporting requirements; (3) the disposition of gas produced from each field; (4) the disposition of produced water each field and the amount of fluid or gas injected into each well used for enhanced recovery, underground storage of hydrocarbons, or wastewater disposal.

DOGGR has collected and reported the monthly data described in Section 3227 for several years. The first quarterly reports pursuant to SB 1281 amendments were due to be filed by well operators by June 1, 2015 (DOGGR 2015).

DOGGR has indicated that the new information required by SB 1281 would be published after the close of each quarterly reporting period.

Sustainable Groundwater Management Act

In 2014, California enacted the Sustainable Groundwater Management Act (Water Code Section 10720 et seq.). The Act, and related amendments to California law, require that all groundwater basins designated as high- or medium-priority in the DWR CASGEM program and that are subject to critical overdraft conditions must be managed under a new GSP, or a coordinated set of GSPs, by January 31, 2020. High- and medium-priority basins that are not subject to critical overdraft conditions must be managed under a GSP by January 31, 2022. Where GSPs are required, one or more local groundwater sustainability agencies (GSAs) must be formed to cover the basin and prepare and implement applicable GSPs. The Act does not apply to basins that are managed under a court-approved adjudication, or to low-or very–low-priority basins.

A GSA has the authority to require registration of groundwater wells, measure and manage extractions, require reports and assess fees, and to request revisions of basin boundaries, including establishing new subbasins. The preparation of a GSP by a GSA is exempt from CEQA. Each GSP must include a physical description of the covered basin, such as groundwater levels, groundwater quality, subsidence, information on groundwater-surface water interaction, data on historical and projected water demands and supplies, monitoring and management provisions, and a description of how the plan will affect other plans, including city and county general plans.

The Act defines groundwater as "water beneath the surface of the earth within the zone below the water table in which the soil is completely saturated with water, but does not include water that flows in known and definite channels." A groundwater extraction facility is defined as "a device or method for extracting groundwater from within a basin" Water Code Section 10721(g-h). GSPs are reviewed by the DWR to ensure that, over a period of 20 years, "sustainable groundwater management" is achieved. As defined by the Act, sustainable groundwater

management means that groundwater use within basins managed by a GSP will not cause any of the following "undesirable results":

- Chronic lowering of groundwater levels (not including overdraft during a drought, if a basin is otherwise managed);
- Significant and unreasonable reductions in groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degradation of water quality;
- Significant and unreasonable land subsidence; and
- Surface water depletions that have significant and unreasonable adverse impacts on beneficial uses (Water Code Section 10721(w)).

The DWR must adopt regulations for the preparation of a GSP by January 2016, and GSAs must be formed for high- and medium-priority basins by June 2017. The current CASGEM maps identify virtually all of the valley floor groundwater basins in the Project Area as "high-priority" basins (DWR, n.d.). Unless subsequently revised, GSPs must be implemented for these basins by January 2020 where critical overdraft conditions have been identified, or by 2022. At present, no GSA has been formed and no GSP has been adopted for any portion of the Project Area. In April 2015, Governor Brown issued an executive order requiring that the CASGEM groundwater level monitoring requirements identified in Water Code Section 10933 be implemented by local agencies by the end of 2015 (State of California 2015).

Senate Bill 4 (Well Stimulation Water Use Disclosure)

Effective January 1, 2014, California adopted several new and amended provisions of the PRC and Water Code to regulate any oil or gas well stimulation activity designed to enhance oil or gas production or recovery by increasing the permeability of the geologic formation that contains hydrocarbon deposits. Well stimulation activities covered by the new legislation include hydraulic fracturing and acid well stimulation treatments. The legislation, commonly referred to as "SB 4," amended Sections 3213, 3215, 3236.5, and 3401 of, and added Article 3 to, Chapter 1 of Division 3 of the PRC, and added Section 10783 to the Water Code. SB 4 requires that DOGGR: (1) promulgate emergency interim and adopt permanent regulations regulating well stimulation treatments by January 2015 to take effect no later than July 1, 2015; (2) complete a statewide EIR on well stimulation treatments by July 2015; (3) complete an independent scientific study of well stimulation by January 2015; and (4) consult and reach formal agreements with other regulatory agencies to provide regulatory accountability for, and public transparency to, well stimulation treatments by January 2015. SB 4 also requires that the SWRCB develop model criteria for oil and gas-related groundwater monitoring by July 2015. The regulations, studies, and interagency agreements required by SB 4 are intended to regulate water quality and potential geological hazards that could be associated with well stimulation, such as earthquakes or ground instability resulting from bedrock fracturing or acidization.

The well stimulation regulations require that each well operator disclose, within 60 days after a well stimulation treatment is completed, information regarding the source, volume, composition, and disposition of well stimulation fluids, including, but not limited to, water sources, hydraulic fracturing fluids, acid well stimulation fluids, and flowback fluids (CCR §1788). The disclosures are provided to DOGGR and must be available online in a format that allows for searching and aggregating the information. A well stimulation treatment report must also be filed with DOGGR, including any information concerning stimulation treatments that differ from what was anticipated in the well stimulation treatment design submitted to DOGGR under Section 1784(b) and whether the actual location of the well stimulation treatment differs from what was indicated in the well stimulation permit application.

Porter-Cologne Water Quality Control Act

The Porter–Cologne Water Quality Control Act (Porter-Cologne Act) authorizes regulation of California water rights and water quality by the SWRCB. The Porter–Cologne Act also established nine RWQCBs to ensure that water quality on local/regional levels is maintained. The Project Area is under the jurisdiction of the CVRWQCB.

Wastewater

General Waste Discharge Requirements for Sanitary Sewer Systems

The General WDRs for Sanitary Sewer Systems were adopted by the SWRCB in May 2006. These WDRs require local jurisdictions to develop a sewer system management plan (SSMP) that addresses the necessary operation and emergency response plans to reduce sanitary sewer overflows. The WDRs require that the local jurisdiction approve the SSMP.

Solid Waste

California Department of Resources Recycling and Recovery (formerly California Integrated Waste Management Board)

California Department of Resources Recycling and Recovery (CalRecycle) is the State agency designated to oversee, manage, and track California's 76 million tons of waste generated each year. It is one of the six agencies under the umbrella of the California Environmental Protection Agency (Cal/EPA). CalRecycle develops regulations to control and manage waste, for which enforcement authority is typically delegated to the local government. CalRecycle works jointly with local governments to implement regulations and fund programs.

California Integrated Waste Management Act (AB 939)

California adopted its first statewide, general recycling program in 1989.[1] The Integrated Waste Management Act of 1989 (PRC 40050 et seq. or AB 939, codified in PRC 40000), administered by CalRecycle, requires all local and county governments to adopt a Source Reduction and Recycling Element to identify means of reducing the amount of solid waste sent to landfills. This law set reduction targets at 25% by the year 1995 and 50% by the year 2000.

Assembly Bill 341

AB 341 (Chesbro, Chapter 476, Statutes of 2011), approved by Governor Brown on October 5, 2011, established a new statewide goal of 75% recycling composting and source reduction by 2020. In contrast to earlier diversion mandates, disposal-related activities, including alternative daily cover, alternative intermediate cover, transformation, waste tire-derived fuel, and beneficial reuse at solid waste landfills, do not count toward the statewide recycling goal.

In order to achieve the 75% recycling goal, CalRecycle has identified six primary focus areas: (1) moving organics out of the landfill; (2) continuing reform of the Beverage Container Recycling Program; (3) expanding the recycling/manufacturing infrastructure; (4) exploring new models for state and local funding of materials management programs; (5) promoting state procurement of post-consumer recycled content products; and (6) promoting extended producer responsibility.

Oil and Gas-Related Wastewater Disposal

Federal, state, and local laws, regulations, and policies pertaining to the disposal of oil and gas-related produced water and other wastewater in the Project Area are discussed in detail in Section 4.9.3, Regulatory Setting.

Energy

California Energy Commission

The CEC is the state's primary energy policy and planning agency. Created by the legislature in 1974, the CEC has five major responsibilities: (1) forecasting future energy needs and keeping historical energy data; (2) licensing thermal power plants 50 MW or larger; (3) promoting energy efficiency through appliance and building standards; (4) developing energy technologies and supporting renewable energy; and (5) planning for and directing state response to energy emergencies. With the signing of the Electric Industry Deregulation Law in 1998 (AB 1890), the CEC's role includes overseeing funding programs that support public interest energy research, advancing energy science and technology through research, development, and demonstration, and providing market support to existing, new, and emerging renewable technologies.

California Public Utilities Commission

The California Public Utilities Commission (CPUC) regulates privately owned electric, telecommunications, natural gas, water, and transportation companies, in addition to household goods movers and rail safety. The CPUC is responsible for ensuring that customers have safe and reliable utility service at reasonable rates, protecting against fraud and promoting the health of California's economy.

California's Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24 Building Standards)

The CEC administers Title 24 Building Standards, which were established in 1978 in response to a legislative mandate to reduce California's energy consumption. Standards are periodically updated to allow consideration and possible incorporation of new energy efficiency technologies and methods. California's building efficiency standards are updated on an approximately three-year cycle. The 2013 Building Standards will continue to improve upon the current 2008 Standards for new construction of, and additions and alterations to, residential and non-residential buildings. The 2013 Building Standards will go into effect on January 1, 2014, following approval of the California Building Standards Commission.

Local

Kern County General Plan

The Project Area is located within the Kern County General Plan (KCGP) area and, therefore, would be subject to applicable policies and measures of the KCGP. The Land Use, Conservation, and Open Space Element and the Energy Element of the KCGP includes goals, policies, and implementation measures related to utilities and service systems that apply to the Project, as described below.

Chapter 1. Land Use, Conservation, and Open Space Element

1.4. Public Facilities and Services

Goals

Goal 1. Kern County residents and businesses should receive adequate and cost effective public services and facilities. The County will compare new urban development proposals and land use changes to the required public services and facilities needed for the proposed project.

Goal 5. Ensure that adequate supplies of quality (appropriate for intended use) water are available to residential, industrial, and agricultural users within Kern County.

Goal 9. Serve the needs of industries and Kern County residents in a manner that does not degrade the water supply and the environment and protect the public health and safety by avoiding surface and subsurface nuisances resulting from the disposal of hazardous wastes, irrespective of the geographic origin of the waste.

Policy 1. New discretionary development will be required to pay its proportional share of the local costs of infrastructure improvements required to service such development.

Policy 3. Individual projects will provide availability of public utility service as per approved guidelines of the serving utility.

Implementation Measures

Implementation Measure C. Project developers shall coordinate with the local utility service providers to supply adequate public utility services.

Implementation Measure L. Prior to the approval of development projects, the County shall determine the need for fire protection services. New development in the County shall not be approved unless adequate fire protection facilities and resources can be provided.

Implementation Measure N. Secure complete and accurate information on all hazardous wastes generated, handled, stored, treated, transported, and disposed of within or through Kern County.

Implementation Measure O. Reduce to the greatest degree possible the amount of waste to be disposed of by encouraging private industry to construct and manage a high quality system of transfer stations, recycling facilities, treatment plants, and incinerators located near the generators of hazardous waste.

Implementation Measure R. Roads and highways utilized for commercial shipping of hazardous waste destined for disposal will be designated as such pursuant to Vehicle Code Sections 31303 et seq. Permit applications shall identify commercial shipping routes they propose to utilize for particular waste streams.

1.8 Industrial

Policies

Policy 1. Locations for new industrial activities shall be provided with adequate infrastructure (water, sewage disposal systems, roads, drainage, etc.) to minimize effects on County services.

5. Energy Element

5.3.3. Waste Disposal in Petroleum Development

Goals

Goal, To encourage the safe recycling, transportation, and disposal of wastes associated with petroleum production and processing and to provide for the siting of disposal facilities in locations with proper access, while minimizing adverse impacts on the environment and on public health and safety.

Policies

Policy 1, The County shall continue to acknowledge the necessity to site nonhazardous oilfield waste disposal sites near petroleum development to minimize transportation hazards and expenses, consistent with the provisions of the Kern County and Incorporated Cities Integrated Waste Management Plan.

Policy 2, The County shall encourage recycling and new treatment methods for hazardous and nonhazardous oilfield wastes.

Policy 3, The County shall work cooperatively with appropriate State and regional agencies to provide for the proper siting of oilfield waste disposal facilities.

Policy 4, The County shall address hazardous oilfield waste disposal issues in the Kern County and Incorporated Cities Hazardous Waste Management Plan policies and implementation measures.

Implementation Measures

Implementation Measure B, The County shall address oilfield hazardous waste issues through the Kern County and Incorporated Cities Hazardous Waste Management Plan.

Implementation Measure C, The County shall continue to maintain provisions in the Zoning Ordinance to provide for oilfield waste disposal facilities.

Implementation Measure D, The County shall continue to maintain provisions in the Zoning Ordinance for the development of oilfield waste recycling and treatment facilities.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan (MBGP), a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division, was last adopted on December 11, 2007. The MBGP includes both city and unincorporated County lands. The MBGP describes the community's physical development as well as its economic, social and environmental goals and is currently undergoing an update. The Project Area includes a total of 152,040 acres of unincorporated County lands that are covered under the MBGP (7.41%). Project-related development on unincorporated lands within the MBGP Planning Area would be subject to the following applicable policies and implementation measures of the MBGP, with respect to utilities and service systems.

Chapter II. Land Use Element

Policies

Policy 54, The developer shall be responsible for all onsite costs incurred as a result of the proposed project, in addition to a proportional share of offsite costs incurred in service extension or improvements. The availability of public or private services or resources shall be evaluated during discretionary project consideration. Availability may affect project approval or result in a reduction in size, density, or intensity otherwise indicated in the general plan's map provisions.

Chapter X. Public Services and Facilities Element

A. General Utilities

Goals

Goal 4. Develop funding principles and programs which will assure that all new development will pay for the incremental costs of the public facilities and services--utilities bridges, parks, and public safety facilities--both onsite and offsite, to serve such development.

Policies

Policy 5. Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent (I-3).

Implementation Measures

Implementation Measure 4. Create benefit assessment districts or establish service fees for the distribution of costs to users for capital improvement replacement costs and maintenance, utilizing such districts for the financing of improvements which are essential to planning area development.

B. Water Distribution

Goals

Goal 1. Ensure the provision of adequate water service to all developed and developing portions of the planning area.

Policies

Policy 3. Require that all new development proposals have an adequate water supply available (I-3, I-4).

Implementation Measures

Implementation Measure 3. Review, and modify as required, existing fee structures and ordinances to assure desired system financing and policy implementation.

C. Sewer Service

Goals

Goal 1. Ensure the provision of adequate sewer service to serve the needs of existing and planned development in the planning area.

Implementation Measures

Implementation Measure 6. Exclusive of County Service Area No. 71, developers shall be required to install dry sewer lines in streets and connections thereto for parcels less than 1 acre (net) in size in areas where a centralized sewer system is planned and imminent and where onsite systems can be proven to be temporarily satisfactory.

Within County Service Area No. 71, a proposed development at a density greater than one dwelling unit per three gross acres, as well as all commercial and industrial developments, shall be required to be served by a regional sewage collection and treatment system subject to the following provisions:

1. All new development (commercial, industrial and residential at densities greater than one dwelling unit per three gross acres}, including both discretionary and ministerial projects, shall be required to connect to public sewer when said development is located 1,000 feet or closer to available public sewer.

   If public sewer is more than 1,000 feet from development, a dry sewer system in conjunction with approved individual septic systems may be utilized for lots having an area of 10,000 square feet or larger. Dry sewer systems are not required for lots of three gross acres or larger. Single residential lots that require a ministerial permit shall connect to public sewer when located 200 feet or closer to available public sewer. Single residential lots less than three gross acres that are greater than 200 feet from available public sewer are required to install dry sewer in accordance with the requirements of the Engineering and survey.

2. All new development (commercial, industrial and residential at densities greater than one dwelling unit per three gross acres), including both discretionary and ministerial projects, shall pay a sewer development fee where the Board of Supervisors has adopted a planned sewer area and install dry sewer within the project development when located in excess of 1 ,000 feet from public sewer or where sewer service is not available as determined by the Engineering and Survey Services Department. The fee amount shall be based on the property's pro rata share of all conveyance, facility and capacity costs. Single residential lots that are greater than 200 feet from available public sewer are required to install dry sewer in accordance with the requirements of the Engineering and Survey Services Department.

3. In those cases where sewer service will not be available as determined by the Sewer Master Plan, an exemption may be granted by the Engineering and Survey Services Department.

4. All new development (commercial, industrial, and residential at densities greater than one dwelling unit per three gross acres) shall be required to annex to an existing County Service Area (CSA) or form a new CSA if none is already in place. In conjunction with formation of, or annexation to, a CSA, applicants shall be required to form a Zone of Benefit for the purpose of constructing and maintaining a sewer trunk line.

D. Storm Drainage

Goals

Goal 1. Ensure the provision of adequate storm drainage facilities to protect planning area residents from flooding resulting from storm water excess.

Kern County Specific Plans

Kern County has adopted 24 Specific Plans for properties within the Project Area. These Specific Plans are intended to be an amplification of the goals and policies of the KCGP and are, therefore, consistent therewith. As depicted in Figure 4.10-3, less than 8% of the Project Area is located wholly or partially within adopted Specific Plan areas. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance that would be regulated according to County zoning, with the exception of the Specific Plans identified as Tier 5.

Kern River Plan

3.2. Open Space Versus Development

Policies

Policy 11. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, areas designated as A.4 (Mineral and Petroleum) and electrical power lines to oil wells, water wells, and water control devises in areas designated as 8.5 (Resource Management) unless otherwise required by law, and at River crossings, or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

5.3. Implementation Standards and Specific Policies

B. Open Space and Development

Implementation Policies

Implementation Policy 7. New or relocated utility lines shall be placed underground, except in areas subject to intensive agricultural uses, 8.4 areas (Mineral and Petroleum), and at River crossings or where it can be shown that the specific nature of the facility is such that it is entirely infeasible to do so.

Kern County and Incorporated Cities Hazardous Waste Management Plan

In 1991, Kern County and the incorporated cities adopted the Kern County and Incorporated Cities Hazardous Waste Management Plan, which was developed to comply with State Law (California Health and Safety Code Section 25135 et seq.). The Hazardous Waste Management Plan includes goals, policies, and implementation measures directed at the safe and responsible management of hazardous waste including waste stream management, source reduction, siting of

new facilities, and other provisions. The safe management of hazardous waste is to be accomplished in accordance with federal, state and local laws.

4.17.4 Impacts and Mitigation Measures

Methodology

The potential impacts associated with the Project were evaluated on a quantitative and qualitative basis and reflect consultations with public service providers in the Project Area. Public service systems were evaluated by reviewing the most current data available from State and Kern County department websites, the KCGP, the Kern County Multi-Hazard Mitigation Plan, water management plans adopted by Project Area water providers, an analysis of Project Area water supplies completed by Kennedy/Jenks Consultants (Appendix T) and the Kern County Fire Department Wildfire Management Plan. The potential impacts associated with the proposed Project are evaluated on a quantitative and qualitative basis through coordination with the service agencies described above. The discussion below lists specific impacts and measures that would be incorporated to mitigate and reduce potential impacts, to the extent feasible.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that the proposed project would have significant impacts on utilities and service systems depending on whether the project would:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board;
- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects;
- Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects;
- Not have sufficient water supplies available to serve the project from existing entitlements and resources, or new or expanded entitlements would be needed;
- Result in a determination by the wastewater treatment provider that serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments;
- Be served by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs; or
- Fail to comply with federal, state, and local statutes and regulations related to solid waste.

Project Impacts

Impact 4.17-1: Exceed Wastewater Treatment Requirements of the Applicable Regional Water Quality Control Board

As discussed above and in Section 4.9, Hydrology and Water Quality, about 97.4% of the Project Area consists of Tier 1 lands, in which oil and gas activities are the predominant land use, or Tier 2 lands, where agriculture is the predominant use. Of the 97.4% of the Project Area in Tier 1 and Tier 2 lands, 10.1% of the Project Area is located in Tier 1, and 87.3% is located in Tier 2. The remaining 2.6% is found in Tier 3, 4, and 5 lands. In addition, 97% of the projected annual disturbance of up to 4,856 acres would occur in Tier 1 (4,400 acres) or Tier 2 (298 acres) areas. Urban-scale constructed wastewater treatment facilities that are subject to CVRWQCB wastewater treatment requirements would not be significantly affected by Project activity because the majority of activity would not occur where these types of facilities are present.

The majority of wastewater produced by oil and gas activities associated with the implementation of the Project is produced water and well stimulation flowback water, which would likely be either disposed of via Class II Underground Injection Control (UIC) injection wells, percolation and evaporation ponds (aka wastewater disposal ponds), and sumps. Wastewater would not be delivered directly to a municipal wastewater treatment facility. Therefore, these disposal methods would not impact municipal wastewater treatment facilities.

Potential impacts could occur associated with wastewater treatment requirements that may be adopted by the CVRWQCB for other oil and gas-related activities are discussed in Section 4.9, Hydrology and Water Quality, including Impact 4.9-1 (Violate any water quality standards or waste discharge requirements) Potential impacts related to CVRWQCB wastewater treatment requirements analyzed in Section 4.9 include: stormwater and runoff impacts; surface or subsurface discharges during well construction and operation; produced water reuse and disposal (including enhanced oil recovery activities, agricultural irrigation, disposal in evaporation and percolation ponds, and disposal in injection wells); and well stimulation activities. These could result in significant impacts, but would be mitigated through the implementation of the stormwater mitigation measures in Section 4.9, Hydrology and Water Quality, which require compliance with all applicable water quality protection laws and regulations, including stormwater management laws and regulations.

In addition, as discussed in the Section 4.13, Population and Housing, no population or employment growth is anticipated as part of the of the Project beyond the continued gradual growth attributed to the region as a whole (and not attributable to any particular industry sector) by the Kern County of Governments (COG) Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) EIR projections. Therefore, Project-related employment would not lead to sanitary wastewater generation that would exceed wastewater treatment requirements, and impacts would be less than significant

Mitigation Measures

Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.

Level of Significance After Mitigation

Impacts would be less than significant after mitigation.

Impact 4.17-2: Require or Result in the Construction of New Water or Wastewater Treatment Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects

As discussed above and in Section 4.9, Hydrology and Water Quality, about 97.4% of the Project Area consists of Tier 1 and Tier 2 lands. Tier 1 lands, in which oil and gas activities are the predominant land use, represent 10.1% of the Project Area, while Tier 2 lands, where agriculture is the predominant land use, represent 87.3% of the Project Area. In addition, 97% of the projected annual disturbance of up to 4,856 acres would occur in Tier 1 (4,400 acres) or Tier 2 (298 acres) areas. Almost all oil and gas activities in the Project Area would occur in locations that are not served by, or planned to be served by, constructed, municipal, or regional water or wastewater treatment facilities. Potential impacts related to the construction or expansion of existing or new regional water or wastewater treatment facilities would be less than significant. Potential impacts related to the use of municipal and industrial water supplies are discussed in Impact 4.17-4 below.

Future oil and gas exploration and production activities and related Project facilities could, depending on their location relative to existing oil and gas infrastructure, require construction/expansion of a septic system and leach line. While sanitary wastewater generation is not anticipated to be significant, new and/or expanded non-municipal wastewater treatment facilities could be required.

While all applicable local, state, and federal requirements and Best Management Practices (BMPs) would be incorporated into construction of all Project-related facilities, a new or expanded septic system and leach line could result in significant impacts to the environment (with respect to surface water, groundwater, and vegetation).

Mitigation Measures

MM 4.17-1 Prior to the issuance of building permits for an operations and maintenance building, the method of sewage disposal shall be as required and approved by the Kern County Public Health Services Department. Compliance with this requirement will necessitate that the Project proponent obtain the necessary approvals for the design of the septic system from the Kern County Engineering, Surveying and Permit Services Department. The septic system disposal field shall be located a minimum of 100 feet from a classified stream or 25 feet from a

non-classified stream and shall not be located where it would impact State wetlands or special-status plant species.

Level of Significance After Mitigation

Impacts would be less than significant after mitigation.

Impact 4.17-3: Require or Result in the Construction of New Stormwater Drainage Facilities or Expansion of Existing Facilities, the Construction of which Could Cause Significant Environmental Effects

As discussed for Impacts 4.9-4 and 4.9-5 in Section 4.9, Hydrology and Water Quality, about 97.4% of the Project Area consists of Tier 1 and Tier 2 lands. Tier 1 lands, in which oil and gas activities are the predominant land use, represent 10.1% of the Project Area, while Tier 2 lands, where agriculture is the predominant use, represent 87.3% of the Project Area. In addition, 97% of the projected annual disturbance of up to 4,856 acres would occur in Tier 1 (4,400 acres) or Tier 2 (298 acres) areas. Urban-scale constructed stormwater drainage systems occur, to a limited extent, in Tier 1 and Tier 2 areas. Potential project-related development in Tiers 3, 4, and 5 could produce runoff to existing or planned regional or constructed stormwater drainage systems, The extent of the potential new development would affect, at most, 0.3% of the acreage in Tiers 3, 4, and 5, per year, and would not generate new sources of runoff that could significantly impact existing or planned wastewater treatment systems in these locations (see Impact 4.9-5, as described in Section 4.9, Hydrology and Water Quality).

As discussed in Section 4.9, Hydrology and Water Quality, stormwater drainage would be managed by site-specific stormwater and runoff management measures. Oil and gas operations that are located in close proximity with or on sites that are hydrologically connected to waters of the United States are generally subject to the requirements of the Construction General Permit and Industrial General Permit adopted by the SWRCB unless otherwise subject to exemption or waiver. These permits require strict compliance with water quality standards through the implementation of BMPs and other measures. The American Petroleum Institute (API) and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for stormwater and runoff management. Stormwater mitigation measures in Section 4.9, Hydrology and Water Quality, require compliance with all applicable federal, state, regional, and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) obtaining coverage under the stormwater construction general permit and industrial general permit issued by the SWRCB and complying with industry stormwater management standards for construction and operational activities. In addition, they require that any oil and gas applicant not subject to state or federal stormwater management laws, regulations or general permits, must implement a drainage plan as specified in the Kern County Grading. These measures ensure that all sites subject to the Chapter 19.98 conformity review process will implement stormwater drainage control measures that meet applicable water quality and other legal requirements. As discussed in Appendix F the conservative disturbance factors used in this EIR account for all activities, including stormwater management measure implementation, related to oil and gas activities subject to the proposed oil

and gas Chapter 19.98 conformity review process. Therefore, with the implementation of the stormwater mitigation measures in Section 4.9, Hydrology and Water Quality, would further ensure that impact would be less than significant.

Potential environmental effects that may be associated with site-specific stormwater drainage facilities in the Project Area are evaluated in the other substantive sections of this EIR, including Section 4.4, Biological Resources, and Section 4.9, Hydrology and Water Quality.

Mitigation Measures

Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.

Level of Significance After Mitigation

Impacts would be less than significant after mitigation.

Impact 4.17-4: Not Have Sufficient Water Supplies Available to Serve the Project from Existing Entitlements and Resources, or New or Expanded Entitlements would be Needed

As discussed above and in Appendix T, based on the potential development of up to 2,697 new production wells per year, oil and gas exploration and production demand for produced water and M&I water would increase from existing levels. As shown in Table 4.17-26, oil and gas demand for produced water is projected to increase by 32,600 AFY, and M&I demand is projected to increase by about 2,982 AFY from 2012 levels by 2035. Produced water demand for agricultural reuse is projected to be 32,771 AFY.

Table 4.17-26: Produced Water and Oil and Gas M&I Water Demand 2012, 2015 and 2035 (AF)

	2012	2015	2035	Net Increase 2012-2035	Percent Increase
Produced Water (oil and gas uses)	88,812	93,106	121,412	32,600	37%
Produced Water (agricultural reuse)	32,771	32,771	32,771	--	0%
Subtotal: Produced Water Demand	121,583	125,877	154,183	32,600	27%
Projected M&I Water Demand	8,778	9,660	11,760	2,982	34%

Source: Appendix T, Table 19, Table 30, and Table 39

As discussed in Section 4.9, Hydrology and Water Quality, oil and gas exploration and production activities currently generate sufficient produced water to meet existing and future demands. About 234,959 AF of produced water was generated in 2012, and about 321,894 AF would be generated in 2035 if produced water volume increases at the same rate as projected oil and gas industry demand (37% increase during 2012-2035). About 49% of produced water was

disposed by injection or to surface ponds in 2012. As shown in Section 4.9, the percentage of surplus produced water subject to disposal in 2035 could range from 48% to 52%, depending on the potential reuse of these supplies for other purposes.

The amount of produced water generated in the Project Area in 2012 would exceed anticipated demand in 2035 for oil and gas and agricultural reuse by more than 80,000 AF. As shown in Section 4.9, the volume of produced water, and the ratio of produced water to recovered hydrocarbons, has increased in the Project Area over time. As Project Area oilfields mature, it is likely that the volume of produced water, and the ratio of produced water to recovered hydrocarbons, would be comparable to or greater than in 2012. Consequently, Project Area produced water supplies can be expected to continue to exceed demand by a significant margin under future conditions, and produced water resources are sufficient to meet current and projected future produced water demand in the Project Area.

Oil and gas demand for M&I water is also projected to increase by about 2,982 AFY from 2012 levels by 2035 (see Table 4.17-26). This EIR assumes that all oil and gas M&I demands are met by using M&I-quality groundwater. This is a conservative assumption because oil and gas M&I supply sources vary from year to year and may include surface supplies in wetter periods. Current drought conditions have severely restricted the availability of imported and local surface supplies throughout California, including the Project Area, and groundwater is being used more heavily to meet Project Area demand, including for oil and gas activities. As discussed above and in Appendix T, the draft WSA prepared by the Project Applicant concludes that surplus M&I-quality water is not available in the Project Area. Any new use reduces the availability of M&I-quality water to another Project Area user, or increases the regional groundwater overdraft if supply shortfalls are addressed by increased groundwater extraction. Consequently, existing entitlements and resources are insufficient to meet current and projected future M&I water demand in the Project Area. Increasing M&I water demand under overdraft conditions is considered to be a significant impact.

Tables 4.17-27 to 4.17-29 summarize Project Area urban, agricultural, and oil and gas supply and demand in the Project Area and for each Subarea, over 2015-2035 under average, single dry year, and multiple dry year conditions. The estimated supply and demand in each projection incorporate the assumptions discussed in Section 4.17.2, Environmental Setting.

Table 4.17-27 shows that, under average year conditions, water supply in the Project Area is approximately the same as total demand. Due to significant agricultural activity and related irrigation demand, the Central Subarea has a supply deficit in average years ranging from -681,596 AF in 2015 to -717,682 AF in 2035. Surpluses in the Eastern Subarea, generally associated with the availability of diverted water from the Kern River, and smaller average year surpluses in the Western Subarea slightly exceed the supply deficits in the Central Subarea.

Table 4.17-27: Project Area and Subarea Average Year Water Demand and Supply 2015-2035

	2015	2020	2025	2030	2035

Source: Appendix T

Table 4.17-28 shows that, under single dry year conditions, when surface supplies from the SWP, CVP and Kern River systems would be substantially reduced, significant supply deficits would occur in the Project Area, the Central Subarea, and the Western Subarea. Project Area supply deficits in single dry years would range from -750,710 AF in 2015 to -817,127 AF in 2035. Supply deficits in the Central Subarea would exceed -950,000 AFY, and range from -12,989 to -14,320 AFY in the Western Subarea. Surpluses in the Eastern Subarea would be unable to offset the deficits projected in the Central and Western Subareas.

Source: Appendix T

Table 4.17-29 shows that, under multiple dry year conditions, when surface supplies would be reduced below average year levels, significant supply deficits would occur in the Project Area and the Central Subarea. Project Area supply deficits in multiple dry years would range from -315,626 AF in 2015 to -383,042 AF in 2035. Central Subarea supply deficits would range from -772,009 AF in 2015 to -808,789 AF in 2035. Surpluses in the Eastern Subarea and Western Subarea would be unable to offset the deficits projected in the Central Subarea.

Source: Appendix T

Under current conditions, water supply deficits in the Project Area are largely addressed by increased groundwater extractions. The November 2014 drought impact update published by the DWR indicates that subsidence is occurring in many groundwater basins in the state, especially in the Tulare Lake hydrologic region that includes the Project Area, and that the southern San Joaquin Valley has a higher potential for future subsidence due to groundwater withdrawals. The DWR also concluded that, since spring 2008 groundwater levels have fallen to at all-time lows in the southern San Joaquin Valley hydrologic region and are more than 50 feet below previous historically low levels experienced prior to 2000 (DWR 2014). Satellite data since 2003 indicates that excessive groundwater pumping rates in the San Joaquin Valley, including the Project Area, have caused aquifer losses approximately equal to the storage capacity of Lake Mead, America's largest reservoir (NASA 2009).

Oil and gas exploration and production water use in the Project Area accounts for a relatively small portion of overall demand and higher-quality M&I water consumption in the Project Area. Oil and gas total water use, including produced water demand, is expected to be about 3.4% of total Project Area water demand in 2015. Oil and gas water demand would account for 4.3% of total Project Area water use in 2035 (see Table 4.17-30).

Table 4.17-30: Total Project Area and Oil and Gas in Average, Single Dry, and Multiple Dry Years, 2015 and 2035 (AF)

	Average Year	Single Dry Year	Multiple Dry Year
2015			
Project Area Demand	3,008,482	3,006,391	3,011,307
Oil and Gas M&I Demand	9,660	9,660	9,660

Table 4.17-30: Total Project Area and Oil and Gas in Average, Single Dry, and Multiple Dry Years, 2015 and 2035 (AF)

	Average Year	Single Dry Year	Multiple Dry Year
Oil and Gas Produced Water Demand	93,106	93,106	93,106

Oil and Gas Produced Water Demand	121,412	121,412	121,412
Subtotal: Oil and Gas Water Demand	133,173	133,173	133,173
Oil and gas share of total Project Area demand	4.3%	4.3%	4.3%

Sources: See Tables 4.17-20 and 4.17-27 to 4.17-29

Most of the oil gas demand in the Project Area is met by using produced water. As shown in Table 4.17-31, excluding produced water supply and demand, oil and gas water use accounts for about 0.34% of total Project Area M&I and agricultural water demand in 2015. In 2035, oil and gas M&I demand would account for 0.40% of total Project Area M&I and agricultural water demand. As shown in Table 4.17-20, the projected oil and gas M&I demand with a 10% contingency would be 10,626 AFY in 2015 and 12,936 AFY in 2035. Based on oil and gas M&I demand estimates with a 10% contingency, oil and gas M&I demand could be 0.37% of total Project Area M&I and agricultural water demand in 2015 and 0.44% of total Project Area M&I and agricultural water demand in 2035.

Table 4.17-31: Total Project Area and Oil and Gas M&I and Agricultural Water Demand (Excluding Produced Water Supplies and Demand) Average, Single Dry, and Multiple Dry Years, 2015 and 2035 (AF)

	Average Year	Single Dry Year	Multiple Dry Year
2015			
Project Area Demand	2,872,945	2,870,854	2,875,770

	Average Year	Single Dry Year	Multiple Dry Year
Oil and gas share of total urban and agricultural demand	0.40%	0.40%	0.40%

Sources: See Tables 4.17-20 and 4.17-27 to 4.17-29

Excluding the use of produced water, current and projected oil and gas M&I water demand is about 4% of total urban M&I water use in the Project Area. As shown in Table 4.17-32, oil and gas M&I water use accounts for about 4.03% to 4.11% of total Project Area urban demand in 2015. In 2035, oil and gas M&I demand would account for 3.84% to 3.92% of total Project Area urban water demand depending on hydrologic conditions. As shown in Table 4.17-20, the projected oil and gas M&I demand with a 10% contingency would be 10,626 AFY in 2015 and 12,936 AFY in 2035. Based on oil and gas M&I demand estimates with a 10% contingency, oil and gas M&I demand could range from 4.23% to 4.31% of total Project Area urban M&I demand in 2035, depending on hydrologic conditions.

Table 4.17-32: Total Project Area and Oil and Gas M&I and Urban Water Demand in Average, Single Dry, and Multiple Dry Years, 2015 and 2035 (AF)

	Average Year	Single Dry Year	Multiple Dry Year
2015			
Project Area Urban Demand	237,029	234,938	239,854
Oil and Gas M&I Demand	9,660	9,660	9,660
Oil and Gas % of Total Urban Demand	4.08%	4.11%	4.03%
2035			
Project Area Urban Demand	301,736	299,971	305,886
Oil and Gas M&I Demand	11,761	11,761	11,761
Oil and Gas % of Total Urban Demand	3.90%	3.92%	3.84%

Sources: See Tables 4.17-20 and 4.17-27 to 4.17-29

Oil and gas M&I demand is expected to increase by 2,100 AF per year from 2015 to 2035, while urban demand is projected to increase from 64,707 to 66,032 AF from 2015 levels, depending on hydrologic conditions. As shown in Table 4.17-33, oil and gas M&I demand would amount to 3.18% to 3.25% of the net increase in urban M&I demand in the Project Area during 2015 to 2035. Projected oil and gas M&I demand would increase by about 2,310 AFY during 2015 to 2035, including a 10% contingency (see Table 4.17-20), and would amount to 3.5% to 3.57% of the net increase in urban M&I demand in the Project Area during 2015 to 2035.

Table 4.17-33: Project Area Urban and Oil and Gas M&I Water Net Demand Increase, 2015 to 2035 Average, Single Dry, and Multiple Dry Years

	Average Year	Single Dry Year	Multiple Dry Year
Project Area Urban Demand Increase	64,707	65,033	66,032
Oil and Gas M&I Demand Increase	2,100	2,100	2,100
Oil and Gas/Urban Demand Increase	3.25%	3.23%	3.18%

Sources: See Tables 4.17-20 and 4.17-27 to 4.17-29

As discussed above, for conservative analysis purposes, all oil and gas M&I water demand is assumed to be supplied from Project Area M&I-quality groundwater aquifers. As discussed in Appendix T, prior levels of Project Area groundwater extraction by all users are assumed to be maintained in future years, although the implementation of a GSP for the Project Area could change the volume of groundwater that can be used to meet new state sustainability requirements. As shown in Table 4.17-34, under these assumptions, oil and gas M&I water demand in 2015 would account for about 0.58% to 0.73% of total Project Area groundwater extraction, depending on hydrologic conditions. In 2035, oil and gas M&I water demand would account for about 0.70% to 0.89% of total Project Area groundwater use. As shown in Table 4.17-20, the projected oil and gas M&I demand with a 10% contingency would be 10,626 AFY in 2015 and 12,936 AFY in 2035. Based on oil and gas M&I demand estimates with a 10% contingency, and assuming that all such demand was met by using groundwater, oil and gas M&I demand would amount to 0.61% to 0.81% of Project Area groundwater use in 2015, and 0.77% to 0.98% of Project Area groundwater use in 2035, depending on hydrologic conditions.

Table 4.17-34: Project Area Total Groundwater Extraction and Oil and Gas M&I Water Demand in Average, Single Dry, and Multiple Dry Years, 2015 and 2035

	Average Year	Single Dry Year	Multiple Dry Year
2015			
Project Area Groundwater Extraction	1,319,000	1,673,000	1,635,000
Oil and Gas M&I Demand	9,660	9,660	9,660
Oil and Gas Share of Groundwater Use	0.73%	0.58%	0.59%
2035			
Project Area Groundwater Extraction	1,319,000	1,673,000	1,635,000
Oil and Gas M&I Demand	11,761	11,761	11,761
Oil and Gas Share of Groundwater Use	0.89%	0.70%	0.72%

Source: Appendix T

Oil and gas M&I water demand represents a relatively small share of total Project Area agricultural and urban water use, excluding produced water supply and demand (see Table 4.17-30) and total Project Area groundwater extractions (see Table 4.17-34). However, oil and gas annual M&I water demand during 2015 to 2035 would account for about 4% of total urban demand and more than 3% of the net increase in urban demand anticipated over the same period (see Tables 4.17-33 and Table 4.17-34). The projected growth in oil and gas M&I water demand would require the development of new or expanded M&I-quality entitlements in a region for which existing and projected future supplies are projected to be inadequate to meet demand under dry and multiple dry year conditions, even assuming the maintenance of historical groundwater extraction levels. As discussed above, groundwater use prior to the current drought was estimated to result in a net withdrawal of over 300,000 AFY from southern San Joaquin valley aquifers (KCWA 2011), and more recently has caused unprecedented reductions in groundwater levels, subsidence, and storage in the Project Area (DWR 2014). Under these conditions, oil and gas M&I water use would compete with other M&I demands for supplies that are not expected to be readily available in the Project Area. A commensurate increase in groundwater extraction would be required to meet M&I demand if other supply sources are constrained. The impacts to M&I water supplies in the Project Area would be significant at a Project level, and oil and gas water demand would also contribute to significant cumulative impacts to groundwater and regional water resources in the Project Area.

Impacts related to oil and gas exploration and production demand for M&I water could be reduced or avoided by the increased reuse of produced water otherwise subject to disposal. As discussed in Section 4.9, Hydrology and Water Quality, the additional reuse of about 7% of the total produced water that is projected to be disposed by injection or into surface ponds (e.g., 11,761 AF of a projected disposal volume of about 163,711 AF in 2035; see Section 4.9) would completely offset oil and gas M&I water demand by 2035. As discussed in Appendix T, there is no surplus water available in the Project Area to meet demand, particularly for higher-quality M&I water, and any such use reduces potential supplies for other purposes.

Produced water is generated from hydrocarbon-bearing formations that are not currently used and are unlikely to be used for M&I purposes due to typically high levels of TDS, hydrocarbon-related constituents, boron, chloride, and other potential constituents of concern. As discussed above, produced water has been treated, blended with other water supplies, and successfully reused for agricultural irrigation in the Eastern Subarea. Agricultural irrigation generally uses surface and groundwater supplies that have substantially higher water quality than produced water and that can be more easily and cost-effectively treated for M&I use. Additional produced water treatment and reuse for agriculture, or additional produced water use in lieu of M&I supplies by oil and gas operators, would effectively increase the supply of higher quality surface and groundwater in the supply-limited Project Area.

The extent to which additional produced water could be reused to offset oil and gas M&I water use in the Project Area depends on several factors, including produced water quality, treatment costs and requirements, the availability of conveyance capacity to route produced water to and from treatment facilities, and the availability of institutional mechanisms for managing produced

water treatment and distribution. As discussed in Section 4.9, Hydrology and Water Quality, the CVRWQCB has determined that, in certain instances, even relatively high-quality produced water available from certain oilfields in the Eastern Subarea has, on occasion, not met applicable arsenic or oil and grease water quality standards. Additional management measures, including percolation into water banking facilities, have been required to address these water quality concerns (see CVRWQCB Order R5-2011-0900 and CVRWQCB Order R5-2012-0058). The reuse of additional produced water, particularly supplies with lower quality than available in the Eastern Subarea, could require more intensive, technically demanding, and more costly forms of treatment. It is possible that treatment requirements could have other environmental effects related to increased energy use and air quality and greenhouse gas (GHG) emissions, or post-treatment waste stream disposal.

Additional produced water reuse in the Project Area could occur from agreements between individual oilfield operators and potential water users. The Kern-Tulare Water District has proposed to use 8,000 AFY of treated produced water in the Western Subarea. A CEQA notice of preparation for an EIR that will address potential environmental impacts related to the proposed produced water use was published in 2015 (SCH Number: 2015021024). The EIR will be prepared by the district. Additional use of treated produced water has been considered, but has not yet been formally proposed, in other Project Area locations. The extent to which additional produced water reuse may occur from agreements between individual oilfield operators and potential water users in the Project Area is uncertain. To date, no such agreements, other than with the CWD, have been approved and implemented in the Project Area.

Oil and gas operators may be able to substitute additional produced water for M&I supplies to conduct certain oilfield activities, including EOR and steam production. EOR activities currently account for the largest share of oil and gas M&I water use. Certain EOR operations, such as steam generation, may require higher-quality water supplies than can be typically obtained from treated produced water to avoid equipment corrosion or damage and potential chemical interactions. The use of produced water for other oilfield activities, such as discharge for dust suppression, would require additional permitting and approvals to avoid impacts to biological, water, and other resources. The extent to which oilfield operators can feasibly increase produced water reuse and decrease M&I demand is uncertain.

It is also possible that the development of significant additional produced water reuse could occur under the sponsorship of a regional program that would apportion treatment and infrastructure costs, identify and utilize the highest quality produced water to minimize treatment and waste requirements, and distribute available supplies. There is no existing administrative mechanism for accomplishing these objectives. As discussed in Section 4.17.3, Regulatory Setting, recently enacted state law requires that a new groundwater management agency (GMA) or set of agencies be established to develop and implement one or more GSPs for Project Area aquifers. The GSPs must ensure that Project Area groundwater use avoid certain "undesirable results" as defined under state law.

The potential reuse of additional amounts of produced water could be consistent with GSP groundwater sustainability requirements. In addition, the regional scope of the GSP process could

facilitate the implementation of conveyance, treatment, and cost allocation measures that would most efficiently increase produced water reuse throughout the Project Area. One or more GMAs for the Project Area must be created by 2017, and one or more GSPs for Project Area aquifers must be adopted by 2020 to achieve applicable legislative sustainability objectives by 2040. The GSP process has never before been implemented in California, and regulations have yet to be promulgated by the DWR for the development of groundwater sustainability plans. Consequently, the extent to which the GSP process could be used to enhance produced water reuse in the Project Area is uncertain.

Based on existing water constraints in the Project Area, the Project would continue to create existing, as well as projected future, increases in water demand, and there are no feasible mitigation measures available to reduce such impacts to a less than significant level. Implementation of MM 4.17-2 to MM 4.17-4 could reduce water supply impacts, but the allocation of water supplies and water demands, the complex laws affecting water rights, the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the varied technical feasibility of treating produced water, and the produced water reuse opportunities all present complex variables that fall outside the scope of the County's jurisdiction or control under CEQA. The County concludes that other agencies can and should cooperate in water management planning and implementation actions under the Sustainable Groundwater Management Act and other applicable laws to improve the quantity and reliability of water supplies in the Project Area. Project impacts to water supplies would be significant and unavoidable.

Mitigation Measures

MM 4.17-2 Applicant shall increase the re-use of produced water, and reduce its use of municipal and industrial-quality ground or surface water use to the extent feasible. By the end of 2016, the Applicants shall review water use data submitted to Division of Oil Gas and Geothermal Resources under Senate Bill 1281 and identify the five biggest oil industry users of municipal and industrial water by volume. The five biggest oil industry users of municipal and industrial water shall work together to develop and implement a plan identifying new measures to reduce municipal and industrial water use by 2020. The plan shall address the following activities, as appropriate: steam generation; drilling and completions (including hydraulic fracturing); dust control; compaction activities related to construction; and landscaping. Through the KernFLOWS initiative or other efforts (e.g., Groundwater Sustainability Agency), the five biggest oil industry users of municipal-and-industrial water shall also work with local agricultural producers and water districts to identify new opportunities to increase the use of produced water for agricultural irrigation and other activities, as appropriate. Any produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for such agricultural irrigation or other uses.

MM 4.17-3 In the County's required participation for the formulation of a Groundwater Sustainability Agency, the Applicant shall work with the County to integrate into the Groundwater Sustainability Plan for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the re-use of produced water from oil and gas activities, and (with appropriate treatment) to produce new water supplies for other uses such as agricultural irrigation and groundwater recharge. The produced water re-use goal is 30,000 acre-feet per year, which would offset more than the current use of imported water and groundwater from non-oil bearing zones by the oil and gas industry.

MM 4.17-4 The Applicant shall work with the County on the Groundwater Sustainability Plan to increase Applicant use of reclaimed water and reduce the Applicant's use of municipal-and-industrial quality imported surface water or groundwater.

Level of Significance After Mitigation

Significant and unavoidable.

Impact 4.17-5: Result in a Determination by the Wastewater Treatment Provider that Serves or may Serve the Project that it has Inadequate Capacity to Serve the Project's Projected Demand in Addition to the Provider's Existing Commitments

As discussed in Impact 4.17-2, almost all oil and gas activities in the Project Area would occur in locations that are not served by, or planned to be served by, constructed, municipal, or regional wastewater treatment facilities. Potential impacts related to the capacity of a wastewater treatment provider to meet Project-related demands would be less than significant. Potential impacts related to produced water and other wastewater treatment and disposal are discussed in Section 4.9, Hydrology and Water Quality, and Impact 4.17-1 and Impact 4.17-2, and will be less than significant with mitigation. Potential impacts related to onsite domestic wastewater treatment will be mitigated by MM 4.17-1 to less than significant levels by requiring the installation of septic systems where applicable in compliance with Kern County standards.

As discussed in the Section 4.13, Population and Housing, no population or employment growth is anticipated as part of the of the Project beyond the continued gradual growth attributed to the region as a whole (and not attributable to any particular industry sector) in the Kern COG 2014 RTP/ SCS and accompanying Environmental Impact Report. Therefore, Project-related sanitary wastewater generation would not exceed the capacity of wastewater treatment providers, and impacts would be less than significant.

Mitigation Measures

Implement MM 4.17-1, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.17-6: Be Served by a Landfill with Insufficient Permitted Capacity to Accommodate the Project's Solid Waste Disposal Needs

The Project would generate solid waste during construction and operations. Drilling and production wastes are non-hazardous. Most drilling and production wastes would be managed using one of the following methods (all of which require compliance with applicable laws and regulations):

- Underground injection, such as in disposal wells;
- Onsite burial, such as in pits, and landfills of non-hazardous drilling muds;
- Land treatment, such as by land spreading, land farming, and road spreading of non-hazardous oily dirt;
- Evaporation; and
- Discharge to evaporation and percolation ponds.

Other types of waste generated in oilfield operations include wood, metal equipment parts, damaged tools, construction debris, excess soil and vegetation generated from cutting and grading, concrete residue, pallets, cardboard boxes, papers, plastics, banding materials, scrap steel, scrap aluminum, scrap wire, and general trash. These wastes are collected at specially permitted in-field solid waste transfer stations or disposed of in onsite permitted facilities, or transported to offsite landfills or recycling facilities, as appropriate, on a regular basis. Transfer stations consist of containers where waste is collected for transfer to Kern County landfills or other approved sites. It is estimated that 11 cubic feet of road mix would be generated per well. Excess soil and vegetation (mulched) found to be nonhazardous could be used as ground cover.

The California Solid Waste Reuse and Recycling Access Act of 1991, as amended, requires expanded or new development projects to incorporate storage areas for recycling bins into the project design. Reuse and recycling of construction debris would reduce operating expenses and save valuable landfill space.

Several landfills within the County have the availability capacity to accommodate the solid waste anticipated to be generated by the Project through and beyond 2035, and as discussed above much of the solid waste that would be generated by oil and gas activities would be managed onsite. Therefore, the Project would not be expected to significantly impact Kern County landfills. Nevertheless, MM 4.17-5 is required to ensure compliance with policies to reduce waste sent to landfills.

Mitigation Measures

Implement MM 4.17-2 and MM 4.17-3, as described above, and the following:

MM 4.17-5 During construction activities for Project facilities, the Applicant shall not store construction waste onsite for longer than the duration of the construction activity, or transport any waste to any unpermitted facilities. The Applicant shall also reduce construction waste transported to landfills by recycling solid waste construction materials, such as taking materials to recycling and reuse locations listed in the brochure on recycling construction and demolition materials available on the Kern County Waste Management Department website.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

Impact 4.17-7: Fail to comply with Federal, State, and Local Solid Waste Statutes and Regulations

As discussed above, the Project would generate solid waste during construction and operations. The 1989 California Integrated Waste Management Act (AB 939) requires Kern County to attain specific waste diversion goals. In addition, the California Solid Waste Reuse and Recycling Access Act of 1991, as amended, requires expanded or new development projects to incorporate storage areas for recycling bins into the project design. AB 341 requires additional solid waste recycling by 2020. Implementation of MM 4.17-5 will ensure compliance with policies to reduce waste sent to landfills.

Mitigation Measures

Implement MM 4.17-5, as described above.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

4.17.5 Cumulative Setting, Impacts, and Mitigation Measures

The geographic scope for cumulative impacts to utilities and service systems includes the area within 6 miles of the external Project Area. While projects in a larger area may affect some of the same resources as the Project, by focusing on projects within the Project Area and 6 miles outside of the Project Area, the analysis of cumulative impacts includes those projects that would most comparably affect the same resources as the Project.

The regional plans and projections evaluated in this cumulative analysis are described in Section 3.7, of Chapter 3, Project Description.

Impact 4.17-8: Cumulative Impacts on Utilities and Service Systems

Kern County has grown, and is expected to continue to grow, with or without the Project, consistent with the growth projections included in the 2013 Kern COG RTP/SCS and accompanying EIR.

As described above, the ongoing production of oil and gas in Kern County, with the additional mitigation measures and other substantive and procedural requirements included in the proposed revisions to the County's oil and gas ordinances included in the Project, would not be expected to result in any substantial increase in population.

Significant cumulative impacts to public services would occur if the cumulative projects would overburden the public service agencies and if utility providers were unable to provide adequate services. The cumulative projects would substantially increase the demand for public service providers and utility servers. As discussed above, the Project would not increase the demand for municipal wastewater treatment, stormwater management, or landfills. Incorporation of the mitigation measures 4.17-1 and 4.17-5 described above would further reduce impacts from the proposed Project, in conjunction with other projects in the area, to a less than significant cumulative level for public utilities use except water supply

As shown in Table 4.17-27 to 4.17-29, future growth will increase water demand in the Project Area by 2035 in average, dry, and multiple dry year conditions, even assuming groundwater extractions remain at historic levels and are not limited to comply with the state's new GSP requirements. Table 4.17-27 shows that the Central Subarea has a supply deficit in average years ranging from -681,596 AF in 2015 to -717,682 in 2035. Surpluses in the Eastern Subarea, generally associated with the availability of diverted water from the Kern River, and smaller average year surpluses in the Western Subarea slightly exceed the supply deficits in the Central Subarea. Table 4.17-28 shows that, under single dry year conditions, Project Area supply deficits in single dry years would range from -750,710 AF in 2015 to -817,127 AF in 2035. Table 4.17-29 shows that, under multiple dry year conditions, Project Area supply deficits in multiple dry years would range from -315,626 AF in 2015 to -383,042 AF in 2035.

Oil and gas demand for M&I water is also projected to increase by about 2,982 AFY from 2012 levels by 2035. As discussed above and in Appendix T, surplus M&I-quality water is not available in the Project Area. Any new use reduces the availability of M&I-quality water to another Project Area user, or increases the regional groundwater overdraft if supply shortfalls are addressed by increased groundwater extraction. Consequently, existing entitlements and resources are insufficient to meet the current and projected future M&I water demand in the Project Area, and increasing M&I water demand under overdraft conditions would contribute to a significant cumulative water supply impact in the Project Area.

Implementation of MM 4.17-2 to 4.17-4 could reduce cumulative water supply impacts, but the allocation of water supplies and water demands, the complex laws affecting water rights, the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the varied technical feasibility of treating produced water, and the produced water reuse

opportunities, all present complex variables that fall outside the scope of the County's jurisdiction or control under CEQA. The County concludes that other agencies can and should cooperate in water management planning and implementation actions under the Sustainable Groundwater Management Act and other applicable laws to improve the quantity and reliability of water supplies in the Project Area. Because of significant ongoing regional uncertainties regarding water supplies, and the need for agencies other than Kern County to take action to improve management of regional water supplies to meet existing and reasonable foreseeable demand, cumulative impacts to water supplies would remain significant and unavoidable.

Mitigation Measures

Implement MM 4.17-1 through MM 4.17-5, as described above.

Level of Significance After Mitigation

Significant and unavoidable with respect water supply. Less than significant with respect to other public utilities, including municipal wastewater treatment, stormwater management, or landfills with mitigation.

Chapter 5

Consequences of Project Implementation

Chapter 5

Consequences of Project Implementation

5.1 Environmental Effects Found To Be Less Than Significant

According to Section 15128 of the California Environmental Quality Act (CEQA) Guidelines, an Environmental Impact Report (EIR) must "contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR."

Kern County has engaged the public in the scoping of the EIR. The contents of this EIR were established based on an Initial Study/Notice of Preparation (NOP) prepared in accordance with the CEQA Guidelines and on public and agency comments received during the public scoping period. Issues that were identified to have no impact or less-than-significant impacts during preparation of the Initial Study/NOP do not need to be addressed further in this EIR. However, based on the findings of the NOP and the results of scoping, Kern County has determined that the EIR must include a detailed analysis of all environmental issues identified in Appendix G of the CEQA Guidelines.

After further study and environmental review in this EIR, direct and indirect impacts of the oil and gas development and operational activities associated with the implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance Project (not including cumulative impacts) would be less than significant or could be reduced to less-than-significant levels with mitigation measures for the following issue areas:

- Geology and Soils;
- Hazards and Hazardous Materials;
- Land Use and Planning;
- Mineral Resources;
- Noise;
- Population and Housing;
- Recreation;
- Utilities and Services; and
- Transportation and Traffic.

5.2 Significant Environmental Effects That Cannot Be Avoided

Section 15126.2(b) of the CEQA Guidelines requires that the EIR describe any significant impacts, including those that can be mitigated but not reduced to less-than-significant levels. Potential environmental effects of the proposed Project and proposed mitigation measures are discussed in detail in Chapter 4 of this EIR. The following environmental impacts were determined to be significant and unavoidable (Table 5-1).

Table 5-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
Aesthetics and Visual Resources	Although implementation of mitigation measures would reduce the adverse visual changes experienced at individual key observation point locations, there are no mitigation measures that would preserve the existing character and quality of the Project Area and its surroundings. Project-related oil and gas activities would continue to produce visible changes to the existing environment and the resultant visual impact is considered **significant and unavoidable**. The Project has the potential to create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. After implementation of MM 4.1-6, this impact would remain **significant and unavoidable.**	The oil and gas industry has a visible presence on the landscape of the San Joaquin Valley Floor and, the Project in combination with the implementation of other reasonably foreseeable oil and gas projects will continue to result in adverse visible changes within Kern County. Therefore, the Project's cumulative contribution after implementation of the recommended mitigation measures would remain cumulatively **significant and unavoidable** as a result of these changes in visual character and quality.
Air Quality	The Project would continue to generate odors. With implementation of MM 4.3-7, impacts would still be **significant and unavoidable**.	The construction and operational activities of oil and gas activities that would be authorized under the Project would result in an increase of criteria pollutants (oxides of nitrogen [NOx], volatile organic compounds [VOC], carbon monoxide [CO], particulate matter less than 10 microns and less than 2.5 microns in diameter [PM_{10} and $PM_{2.5}$, respectively]) in excess of the recommended criteria pollutant significance threshold adopted by the SJVAPCD Board. Emission sources in Kern County contribute between 11% and 21% of criteria pollutant emissions in the San

Table 5-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
		Joaquin Valley Air Basin. The Project would contribute between 2% and 14% of these pollutants in the San Joaquin Valley Air Basin or between 19% and 97% of Kern County's contribution. This analysis indicates that most sulfur dioxide (SO_2) emissions in Kern County would originate from oil and gas activities and the majority of NO_X emissions. Therefore, the proposed Project would have a **cumulatively considerable** contribution of criteria pollutant (NO_X, PM_{10}, $PM_{2.5}$, CO and SO_2) emissions to the Kern County portion of the SJVAB.
Agricultural Resources	None.	The geographic scope for cumulative impacts to agricultural and forest resources encompasses the whole of Kern County. The oil and gas exploration and production activities that would be authorized through implementation of the proposed Project along with projected population growth could result in **significant and unavoidable** cumulative impacts on farmland conversion.
Biological Resources	None.	Future oil and gas exploration and production activities related to the proposed Zoning Ordinance amendment could contribute to a significant cumulative impact on Project Area biological resources because future use and development of federal, state, and incorporated urban lands are not within the County's jurisdiction or control. Future land uses and development could affect biological resources in each of these jurisdictions and would be undertaken as independent actions with associated impacts, avoidance and minimization requirements, and mitigation, if required, under applicable federal, state, regional and local agency law. Impacts would remain **significant and unavoidable** with mitigation.

Table 5-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
Cultural Resources	None.	The geographic scope for cumulative impacts to cultural and paleontological resources includes the area within a one-mile radius from the Project Area. Cumulative impacts could result when paleontological, historical, and archaeological resources or human remains cannot be avoided by future projects. For paleontological and archaeological resources, it is important to recover a scientifically significant sample so the information can be preserved. For historic buildings and structures, detailed recordings, including measured drawings and photographs, can preserve the information. For human remains, reburial in a location not slated for future development can protect those remains from future disturbance. There could be **significant cumulative impacts** to paleontological, historical, and archaeological resources or human remains as a result of the oil and gas exploration and production activities that would be authorized under the Project. Implementation of best professional practices would reduce many impacts to a less than significant level. However, buried archaeological and paleontological resources could be damaged or destroyed. Direct mitigation using the measures above would reduce most of these impacts to a **less than significant level**.
Greenhouse Gases	The Project has the potential to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. With the implementation of MM 4.7-5, the impact would remain **significant and unavoidable.**	The geographic scope for cumulative impacts for GHGs includes the area within 6 miles of the external Project Area boundary, and areas (e.g., incorporated cities) within the Project Area. Climate change impacts are inherently global and cumulative, and not Project specific. While implementation of MM 4.7-1 through MM 4.7-3 and the 2014

Table 5-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
		Regional Transportation Plan mitigation measures would encourage reduction in GHG emissions at a regional level, they do not provide a mechanism that guarantees GHG emission reductions on a cumulative basis. The Project's cumulative contribution after implementation of the recommended mitigation measures would remain **cumulatively significant and unavoidable** as a result of the GHG emissions associated with the Project.
Hydrology and Water Quality	As discussed in Section 4.17, Utilities and Service Systems, while MM 4.17-2 through MM 4.17-4 would encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease M&I demand is uncertain. As a result, potential impacts to groundwater levels and aquifer volumes would be **significant and unavoidable with mitigation**.	Project impacts could result in cumulatively considerable impacts that would be considered significant. Implementation of MM 4.9-1 through MM 4.9-6 would reduce potential cumulative impacts to water quality, erosion risks, flooding and other hydrologic resources to less than significant with mitigation. As discussed in Section 4.17, Utilities and Service Systems, although MM 4.17-2 through MM 4.17-4 encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease municipal and industrial (M&I) demand is uncertain. As a result, cumulative impacts to groundwater would be significant and unavoidable. The County lacks jurisdiction and control over land conversions, and actions or approvals by other agencies that may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly, this impact remains **significant and unavoidable**.
Utilities and Services	Implementation of MM 4.17-2 to MM 4.17-4 could reduce water supply impacts, but the allocation of water supplies and water demands, the complex laws affecting water	The geographic scope for cumulative impacts to utilities and service systems includes the area within 6 miles of the external Project Area.

Table 5-1: Summary of Unavoidable Significant Adverse Impacts of the Project

Resources	Project Impacts	Cumulative Impacts
	rights, the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the varied technical feasibility of treating produced water, and the produced water reuse opportunities all present complex variables that fall outside the scope of the County's jurisdiction or control under CEQA. Although mitigation measures would reduce water use impacts, water quality impacts would be **significant and unavoidable**.	Cumulative impacts would be **significant and unavoidable with respect to water supply**. For other public utilities, including municipal wastewater treatment, stormwater management, or landfills with mitigation, impacts would be **less than significant** with mitigation measures.

5.3 Irreversible Impacts

Section 15126.2(c) of the CEQA Guidelines defines an irreversible impact as an impact that uses nonrenewable resources during the initial and continued phases of the Project. Irreversible impacts can also result from damage caused by environmental accidents associated with the Project. Irretrievable commitments of resources should be evaluated to ensure that such consumption is justified. Oil and gas development and operational activities associated with the implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) and related ordinance amendments to the Kern County Zoning Ordinance would commit nonrenewable resources during construction and operation activities. During these activities, oil, gas, and other nonrenewable resources would be consumed. Therefore, an irreversible commitment of nonrenewable resources would occur as a result of the Zoning Ordinance. However, assuming that those commitments occur in accordance with the adopted goals, policies, and implementation measures of the Kern County General Plan (KCGP), as a matter of public policy, those commitments have been determined to be acceptable. The KCGP ensures that any irreversible environmental changes associated with those commitments will be minimized.

5.4 Significant Cumulative Impacts

According to Section 15355 of the CEQA Guidelines, the term cumulative impacts "refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." Individual effects that may contribute to a cumulative impact may be from a single project or a number of separate projects. Individually, the impacts of a project may be relatively minor, but when considered along with impacts of other closely

related or nearby projects, including newly proposed projects, the effects could be cumulatively considerable.

This EIR has considered the potential cumulative effects of the proposed Project. Impacts for the following issue areas have been found to be cumulatively considerable:

- Aesthetics;
- Agriculture and Forest Resources;
- Air Quality;
- Biological Resources;
- Cultural Resources;
- Greenhouse Gases (GHGs);
- Hydrology and Water Quality; and
- Utilities and Services (Water Supply).

Each of these significant cumulative impacts is discussed in the applicable section of Chapter 4, Environmental Setting, Impacts, and Mitigation Measures, of this EIR.

5.5 Growth Inducement

The KCGP recognizes that certain forms of growth are beneficial, both economically and socially. Section 15126.2(d) of the CEQA Guidelines provides the following guidance on growth-inducing impacts: a project is identified as growth inducing if it "could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment."

Growth inducement can be a result of new development that requires an increase in employment, removes barriers to development, or provides resources that lead to secondary growth. With respect to employment, 16,752 workers in Kern County were employed in the oil and gas extraction industry in 2012. Of this total, 14,067 were estimated to be "oilfield" employees. Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance would result in 2,697 new production wells being drilled annually, while 2,231 wells would be plugged and abandoned. Additionally, it is anticipated that 1,200 wells would receive some type of well stimulation treatment during this same timeframe. Given the long history of oil and gas development within Kern County, implementation of the Project would not result in a large increase in employment that would significantly induce growth.

With respect to removing barriers to development, such as through providing access to previously undeveloped areas, the oil and gas development activities would involve constructing temporary and permanent access roads. Some roads may be removed and restored after initial construction;

some may be reduced in size; and others may be maintained at their construction size for the life of the associated oil and gas operation. In general, these roads would provide for access to oil and gas construction and operation areas and would not provide access into other areas thereby promoting growth-inducing development. No other development would be anticipated as a result of these roads, and oil and gas development would tend to preclude other development from occurring.

While the Project would contribute to energy supply, which supports growth, the development of additional oil and gas resources is a response to increased market demand and is not a factor that induces new growth. Kern County planning documents already permit and anticipate a certain level of growth in the area of the Project and in the state as a whole, along with attendant growth in energy demand. It is this anticipated growth that drives energy-production projects and development, not vice versa. The Project would supply oil and gas to accommodate and support existing demand and projected growth, but it would not foster any new growth. Therefore, any link between the Project and growth in Kern County would be speculative.

In Kerncrest Audubon Society v. Los Angeles Department of Water and Power, the analysis of growth-inducing effects contained in the EIR for the Pine Tree Wind Development Project was challenged. Plaintiffs argued that the discussion was too cursory to provide adequate information about how additional electricity generated by the Project would sustain further growth in the Los Angeles area. The court held that the additional electricity that the Project would produce was intended to meet the current forecast of growth in the Los Angeles area. As such, the wind development project would not cause growth, and so it was not reasonable to require a detailed analysis of growth-inducing impacts. In addition, EIRs for similar energy projects have contained similarly detailed analyses of growth-inducing impacts. Their conclusions that increasing the energy supply would not create growth has been upheld, because: (1) the additional energy would be used to ease the burdens of meeting existing energy demands within and beyond the area of the Project; (2) the energy would be used to support already-projected growth; or (3) the factors affecting growth are so multifarious that any potential connection between additional energy production and growth would necessarily be too speculative and tenuous to merit extensive analysis. Thus, as has been upheld in the courts, this level of analysis is sufficient to inform the public and decision makers of the growth-inducing impacts of the Project.

5.6 Energy Conservation

In order to assure that energy implications are considered in Project decisions, CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy (see Public Resources Code section 21100(b)(3)). According to Appendix F of the CEQA Guidelines, the goal of conserving energy implies the wise and efficient use of energy including: (1) decreasing overall per capita energy consumption; (2) decreasing reliance on natural gas and oil; and (3) increasing reliance on renewable energy sources.

There are no reported data specifically identifying oil and gas production and exploration energy use in the Project Area. The California Energy Commission (CEC) and the Lawrence Berkeley National Laboratory (LBNL) have been developing California energy balance (CALEB) estimates for the state that include data for the "oil and gas extraction" industry. The most recent CALEB update was published by the CEC in 2013 and includes energy supply and demand estimates, including oil and gas extraction energy use, for the period 1997-2008 (CEC 2013).

The LBNL has published a 2012 flowchart for California energy use that summarizes total state energy use and energy sources for that year (LBNL 2015).

This section primarily uses the data provided in the 2013 CALEB update (CEC 2013), the 2012 LBNL state energy flow chart (LBNL 2015) annual crude oil production statistics for California, and the Project Area (DOGGR District 4) published by DOGGR for 1997, 2008, and 2012 (DOGGR 1998, 2009, and 2013), and energy data compiled in the state of California and available online in the state energy consumption data management system (ECDMS 2015).

Energy use is measured in different ways depending on the source (e.g., natural gas, petroleum products, or electricity) and end use (e.g., industry, residential or transportation). The CALEB data and LBNL flow charts generally convert energy use and supply from all sources to British thermal units (Btus), which is a measure of the heat content in a specific volume of gas or petroleum fuel or in a specific amount of electrical power. Natural gas use is also measured by volume, including a standard cubic foot (SCF) or cubic foot (CF). According to the U.S. Energy Information Administration (EIA), in 2014 the average heat content of a CF of natural gas in the United States was about 1,028 Btus (EIA 2015). Electrical energy use is usually measured in watt-hours, which represents the amount of electricity used over time to power a specific use. For example, the operation of piece of equipment that requires 1,000 watts to operate (i.e., equipment with a power requirement of one kilowatt or "kw") for two days would consume 48 kilowatt hours (Kwh) of energy. Larger amounts of electrical energy use, such as statewide totals, are often measured in millions of Kwh, or gigawatt hours (Gwh).

According to the LBNL, in 2012 California used about 2,500 trillion Btus (TBtu) of natural gas (LBNL 2015). The California Energy Almanac indicates that the state used about 282,140 Gwh of electrical energy in 2012 (ECDMS 2015). The LBNL estimates that total state energy use, converted to Btus from all sources, was about 7,100 TBtu in 2012 (LBNL 2012). The CALEB database indicates that the state used 8,016 TBtu of total energy in 2008 (CEC 2013). These estimates indicate that, despite continued population increases, California reduced total energy consumption by about 11% from 2008 to 2012.

Based on data from EIA, California is the U.S. state that imports the greatest amount of energy from other states and countries. Consumption of overall energy in California outweighs in-state production by about three-to-one (DOGGR 2015). The most recent CALEB data published by the CEC indicates that California imported 6,046 TBtu (75%) of the 8,016 TBtu of energy used in that year (CEC 2013). As shown in Table 5-2, in 2013 California relied on imports to meet 32% of in-state electrical demand, 90% of instate natural gas demand (including natural gas used to produce in-state electricity), and about 63% of the crude oil delivered to in-state refineries,

including about 12% from Alaska, and 51% from foreign producers in locations such as Saudi Arabia, Ecuador, Iraq, and Colombia (ECDMS 2015; DOGGR 2015).

Table 5-2: California Energy Demand and In-State and Imported Supplies (2013)

	Total Demand	Instate Supply	Imported Supply	Percent Imported
Electricity (gigawatt hours per year)	296,628	199,783	96,845	33%
Natural gas (million standard cubic feet per day)	6,061	618	5,443	90%
Crude oil delivered to instate refineries (million barrels per year-42 gallon per barrel)	624	230	393	63%

Source: ECDMS 2015

According to the LBNL, in 2012 petroleum accounted for 3,300 TBtu (46.5%) and natural gas 2,500 TBtu (35.2%) of California's total energy use of 7,100 TBtu (LBNL 2015). As shown in Table 5-2, the state is heavily reliant on imports from other locations for natural gas energy supplies. California is also increasingly reliant on imports to meet petroleum-related energy needs. In-state crude oil deliveries to California refineries, which produce petroleum products used mainly for in-state purposes, fell from 49.6% of total refinery deliveries in 2000 to 37% in 2013 (ECDMS 2015). As discussed below, the declining share of in-state crude oil supplies for in-state refiners requires that California import crude oil delivered primarily by ship from overseas locations, including South America and the Middle East, and by pipeline, rail or truck from Alaska or, to a lesser extent, other U.S. sources. The production and conveyance of imported crude oil to meet in-state petroleum energy demand requires additional energy, increases the risk of transportation-related hazards, such as ocean crude oil discharges or rail accidents, and utilizes crude oil produced in locations that are generally much less regulated than in California and have not implemented policies similar in scope to the state's landmark energy efficiency and GHG reduction requirements (see Section 4.7, Greenhouse Gas Emissions and Global Climate Change).

The most recent CALEB data published by the CEC indicates that oil and gas extraction used about 342 TBtu in 2008. About 94% of this energy use was generated from natural gas used to operate remote pumping facilities, steam generation, and other heating and treatment purposes (CEC 2013). Based on these estimates, the CALEB data indicates that oil and gas extraction accounted for about 4% of the state's total 8,016 Btu of energy use in 2008 (CEC 2013).

The most recent CALEB data published by the CEC also includes estimates of electrical and natural gas use per volume of extracted oil in California for the period 1997-2008 (Table 5-3). These estimates indicate that oil and gas electricity use ranged from 12.3 Kwh per 1,000 barrels (kbbl) to 20.7 Kwh/kbbl of crude oil produced in the state during 1998-2007. Natural gas use was estimated to range from 1,085 million Btu (MBtu)/kbbl to 1,375 MBtu/kbbl of crude oil produced over the same period (CEC 2013). One barrel of oil equals 42 gallons.

Table 5-3: California CALEB Estimates of Crude Oil Extraction Energy Use, 1997 and 2008

	Unit	1997	2008
Electricity use	Gwh/year	4,418	5,170
Fuel use	TBtu/year	390	334
Production of crude oil in California	Kbbl	340,362	249,993*
Electricity use per kbbl of crude oil	Kkwh/kbbl	12.98	20.68
Natural gas use per kbbl of crude oil	MBTU/kbbl	1,147	1,335

Source: CEC 2013
*Crude oil production includes onshore and state and federal offshore totals. DOGGR reported data for 2008 indicates total production from onshore and state and federal offshore sources was about 238,600 kbbl

As noted in the most recent CALEB data published by the CEC, the energy intensity required to produce a barrel of crude oil in California increased over 1997–2008 while total production decreased. The reason for the increasing energy intensity of crude oil production in the state appears to be related to the declining productivity of many oilfields, which requires the use of steam, water, and other enhanced oil recovery (EOR) techniques to recover increasingly viscous and more difficult to extract crude oil in existing oilfields (CEC 2013). As discussed in Section 3, Project Description and Section 4.9, Hydrology and Water Quality, EOR requires energy, mainly in the form of natural gas, to treat, heat, and inject steam or water to mobilize oil in underground formations for pumping to the surface. Although the amount of natural gas required to extract a barrel of crude oil increased from 1997–2008, the overall decline in California production by 90,369,443 barrels during this period resulted in a decrease in natural gas use from 390 TBtu to 334 TBtu (Table 5-4).

The most recent CALEB data published by the CEC energy intensity estimates can be used to approximate Project Area electricity use in 1997 and 2008 based on Project Area crude oil production. Project Area oil and gas extraction energy use in 2012 can also be estimated by calculating the increase in energy use per production decline during 1997-2008 from the CALEB data. Based on the data in Table 5-4, as California production declined by 90,369,443 barrels, electricity use increased by 0.000085 Kkwh/kbbl and natural gas increased by 0.0021 MBtu/kbbl during 1997–2008. These increases are consistent with the conclusions in the most recent CALEB data published by the CEC that additional energy per barrel is required as oilfield deposits become more difficult to extract. According to DOGGR, California crude oil production from all sources was 197,510,422 barrels in 2012, a decline of 52,482,578 barrels from the production levels reported in the most recent CALEB data published by the CEC (Table 5-3). If energy use increased at the same rate in relation to production declines over 2008-2012 as during 1997-2008, crude oil extraction would have used about 25.2 Kkwh/kbbl and 1,444 MBtu/kbbl in 2012. Table 5-4 summarizes oil and gas production energy use in the Project Area in 1997, 2008, and 2012 based on the statewide electricity and natural gas factors produced in the 2013 CALEB update, 2012 factors calculated from the most recent CALEB data published by the CEC, and Project Area (DOGGR District 4) crude oil production for 1997, 2008, and 2012.

Table 5-4: Estimated Project Area (DOGGR District 4) Electricity and Natural Gas Use 1997, 2008, and 2012

Electricity			
Year	**Crude Oil production (kbbl)**	**Electrical use factor, Kkwh/kbbl**	**Annual use (Gwh)**
1997	213,053	12.98	2,765
2008	162,286	20.70	3,359
2012	141,694	25.18	3,568
Natural Gas			
Year	**Crude Oil production (kbbl)**	**Natural gas use factor, MBTU/kbbl**	**Annual use (TBtu)**
1997	213,053	1,147	244
2008	162,286	1,335	217
2012	141,694	1,444	205

Notes: 1997 and 2008 calculated from statewide energy intensity factors (CEC 2103; see Table 5-3) and reported District 4 production (DOGGR 1997, 2008); 2012 estimated from 1997-2008 statewide energy intensity factors (CEC 2103; see Table 5-3) pro-rated by reported statewide crude oil production decline during 1997-2008 reported in the 2013 CALEB update (CEC 2013) and reported District 4 production (DOGGR 2012).

Based on the statewide energy intensity factors developed in the most recent CALEB data published by the CEC (CEC 2013), Project Area oil and gas production energy use is consistent with reported statewide trends for 1997-2008. As oil deposits became more difficult to extract, more electricity and natural gas were used per barrel of crude oil produced in the Project Area over this period (Table 5-4). Total electrical energy use rose from 2,765 Gwh to 3,359 Gwh and total natural gas use declined from 244 TBtu to 217 TBtu as crude oil production declined by 50,766,000 barrels from 1997 to 2008. Table 5-4 indicates that similar trends would have occurred during 2008-2012 if the energy intensity increase per unit of production decline over 1997-2008 was the same during 2008 to 2012. Under these assumptions, total Project Area electrical energy use would have increased from 3,359 Gwh to 3,568 Gwh and total natural gas use would have declined from 217 TBtu to 205 TBtu as crude oil production declined by 20,592,000 barrels from 2008 to 2012 (see Table 5-4).

The energy use estimates in Table 5-4 and Table 5-5 indicate that since 1997, as crude oil production declined, total Project Area energy use also declined. Although oil extraction sector statewide and Project Area electrical energy use increased from 1997, as discussed above, well over 90% of all such energy use is produced from natural gas when measure in terms of heat content (Btu) (CEC 2013). Total natural gas use tends to fall as total crude oil production volumes decline. The most recent CALEB data published by the CEC estimated that total energy use for oil and gas extraction in California measured in total Btus fell by 13% from 1997-2008 even though energy use per barrel extracted rose over this period (CEC 2013).

Similar trends appear to characterize energy use in the Project Area. Table 5-5 summarizes Project Area energy use for 1997, 2008, and 2012 based on Table 5-4 and by converting electrical energy use to equivalent heat content levels (in Btu).

Table 5-5: Project Area Oil and Gas Extraction Energy Use - 1997, 2008, and 2012

	1997	2008	2012
Electricity (TBtu)	9.44	11.46	12.18
Natural gas (TBtu)	244.37	216.65	204.63
Total (TBtu)	253.81	228.11	216.81

Note: Calculated from Table 5-4 converting electrical use to Btus at rate of 3,412 Btu per Kwh

Table 5-5 shows that, consistent with the conclusions in the most recent CALEB data published by the CEC, natural gas provides substantially more than 90% of oil and gas extraction energy use in the Project Area (CEC 2013). Between 1997 and 2008, Project Area energy use for oil and gas extraction declined because overall production declined. If 1997-2008 energy intensity trends continued after 2008, Project Area total energy use also would have declined due to reduced crude oil production during 2008 through 2012.

Oil and gas extraction energy use in the Project Area is a function of the location and amount of crude oil production, neither of which can be predicted with reasonable certainty under future conditions. If recent trends persist, oil production in the Project Area would require additional energy per barrel produced, but total energy use would continue to decline. The state supply of electricity and natural gas, including electrical power and gas that is produced and used by oil and gas operators in cogeneration and similar facilities, has been sufficient to meet Project Area demand. Supplies would likely remain sufficient to meet demand assuming oil and gas production electricity and natural gas demand in the Project Area remains consistent with historical levels. The extent to which new sources of crude oil may exist in recoverable quantities in the Project Area remains uncertain. In 2014, for example, the EIA's estimates of the recoverable oil in the 1,750-square-mile Monterey Shale formation in California, portions of which underlie the Project Area, were reportedly reduced from 13.6 billion to 600 million barrels (Los Angeles Times 2014). Due to the wide variation in these estimates, it is not possible to estimate potential energy use in the Project Area that could be associated with Monterey Shale or other nonconventional oil recoveries.

Oil and gas production is inherently energy intensive and results in the production of hydrocarbon materials that are refined into fossil fuels. As discussed above, due to California's continued dependence on petroleum products to meet state energy needs, and declining in-state crude oil production, all in-state production is supplied to California refineries. In-state production reduces the amount of crude oil that the state must import from Alaska, South America, and the Middle East, and reduces the transportation energy use, health and safety hazards, and potential environmental consequences associated with crude oil production in less regulated locations outside of the state.

Project Area oil and gas extraction energy efficiency is also affected by public regulatory and market factors. As discussed in Section 4.7, Greenhouse Gas Emissions and Global Climate Change, California has enacted landmark legislation to reduce the use of fossil fuels, reduce GHG emissions, and increase the efficiency of fossil fuel use for home and industrial heating and transportation. Oil and gas production in California is regulated under the state's GHG cap and trade program. These measures impose building construction and operational standards that increase incentives to reduce energy use in all state sectors, including oil and gas production.

Market factors include competition from other global crude oil suppliers to California refineries, many of which are subject to significantly less regulation and oversight than Project Area producers. Major oil producers, such as Saudi Arabia, have also indicated a willingness to reduce crude oil prices to maintain market share and reduce competition from higher-cost crude oil sources (Forbes 2015). As discussed above, crude oil production in California has been characterized by increasing energy intensity per barrel produced; a factor that increases production costs and reduces the competitiveness of in-state oil supplies. Project Area production has been decreasing in part due to the energy costs associated with extracting remaining supplies relative to competing crude oil prices. California's regulatory policies discouraging fossil fuel use, including natural gas combustion that supplies over 90% of Project Area oil and gas extraction energy requirements, also increase energy costs for instate producers. Under these conditions, Project Area oil and gas production operators have significant incentives to use energy as efficiently and wisely as possible to compete with global producers.

Chapter 6

Alternatives

Chapter 6
Alternatives

6.1 Introduction

The California Environmental Quality Act (CEQA) requires that an Environmental Impact Report (EIR) describe a range of reasonable alternatives to the project or to the location of the project site that could feasibly avoid or lessen any significant environmental impacts of the project while attaining most of the project's basic objectives. An EIR also must compare and evaluate the environmental effects and comparative merits of the alternatives. This chapter describes alternatives considered but eliminated from further consideration, including the reasons for elimination, and compares the environmental impacts of several alternatives retained with those of the Project.

The following are key provisions of the CEQA Guidelines (Section 15126.6):

- The discussion of alternatives shall focus on alternatives to the Project or its location that are capable of avoiding or substantially lessening any significant effects of the Project, even if these alternatives would impede to some degree the attainment of the Project objectives, or would be more costly.

- The No Project Alternative shall be evaluated, along with its impacts. The no Project analysis shall discuss the existing conditions at the time the notice of preparation was published, as well as what would be reasonably expected to occur in the foreseeable future if the Project were not approved, based on current plans and consistent with available infrastructure and community services.

- The range of alternatives required in an EIR is governed by a "rule of reason;" therefore, the EIR must evaluate only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the Project.

- For alternative locations, only locations that would avoid or substantially lessen any of the significant effects of the Project need be considered for inclusion in the EIR.

- An EIR need not consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative.

The range of feasible alternatives is selected and discussed in a manner to foster meaningful public participation and informed decision making. Among the factors that may be taken into account when addressing the feasibility of alternatives, as described in Section 15126.6(f)(1) of the CEQA Guidelines, are environmental impacts, site suitability, economic viability, availability

of infrastructure, general plan consistency, regulatory limitations, jurisdictional boundaries, and whether the Project proponent could reasonably acquire, control, or otherwise have access to an alternative site. An EIR need not consider an alternative whose effects could not be reasonably identified, whose implementation is remote or speculative, and that would not achieve the basic Project objectives.

Per the CEQA Guidelines, this section discusses alternatives that are capable of avoiding or substantially lessening the Project's potentially significant environmental effects. Section 6.2, Summary of Project Impacts Relevant to Evaluation of Alternatives, summarizes the potentially significant Project impacts relevant to this EIR's evaluation of Project alternatives. Following this summary, Section 6.3, Project Objectives, restates the Project proponent's Project objectives. Section 6.4, Process Used to Develop/Screen Alternatives, describes the process used to develop and screen the alternatives evaluated in this EIR. Section 6.5, Alternatives Eliminated from Further Consideration, presents alternatives to the Project that were considered but eliminated for further analysis. Section 6.6, Alternatives to the Project, presents alternatives fully analyzed in this EIR, and provides a comparison of each alternative's environmental effects to those of the Project. Section 6.7, Comparative Impacts of Project to All Alternatives, sets forth a table that summarizes the relative impacts of all of the alternatives as compared to the Project. Section 6.8, Environmentally Superior Alternative, makes a determination about the environmentally superior alternative analyzed in this EIR.

6.2 Summary of Project Impacts Relevant to Evaluation of Alternatives

Potential significant adverse environmental impacts that would result from the Project have been evaluated in Chapter 4, Environmental Setting, Impacts, and Mitigation Measures, of this EIR. The mitigation measures and impact conclusions are summarized in Chapter 1, Executive Summary, which includes a summary chart of impact conclusions for all topic areas. This EIR concludes that the Project has the potential to cause significant and unavoidable environmental impacts in the following categories: Aesthetics and Visual Resources; Agricultural and Forest Resources; Air Quality; Biological Resources; Cultural and Paleontological Resources; Greenhouse Gas Emissions and Global Climate Change; Hydrology and Water Quality; Utilities and Service Systems. Each impact category evaluated in this EIR is summarized below.

6.2.1 Aesthetics and Visual Resources

As explained in Section 4.1, Aesthetics and Visual Resources, the Project would have less than significant impacts, without mitigation, with respect to its effects on scenic vistas and scenic resources. However, the Project would substantially degrade the existing visual character or quality of the Project site and its surroundings, even with mitigation, and thus this impact would be significant and unavoidable. Even with mitigation, the Project would create some new sources of light or glare that could adversely affect day or nighttime views in some portions of the Project

Area and such impacts would be significant and unavoidable. Finally, the Project's incremental aesthetic effects, combined with the aesthetic effects of other projects, would be cumulatively considerable, a significant impact for which there is no mitigation. Thus, the Project cumulative aesthetic impact would also be significant and unavoidable.

6.2.2 Agricultural and Forest Resources

As explained in Section 4.2, Agricultural and Forest Resources, with mitigation, the Project would have a less than significant impact with respect to its potential to convert prime farmland, unique farm, or farmland of statewide importance to non-agricultural use. Even without mitigation, however, the Project would have a less than significant impact with respect to its potential to conflict with existing agricultural zoning, forestry zoning, timberland zoning, and Williamson Act contracts. Likewise, since there is no forest land in the Project Area, the Project would have no impact on forest land resources. Moreover, the Project would not result in the cancellation of an open space contract or farmland security zone contract for any parcel of 100 or more acres. The Project would have a potential significant impact with respect to its potential to involve other changes in the environment which, because of their location or nature, could result in the conversion of farmland to non-agricultural use (or the conversion of forest land to non-forest use), but such impacts would be mitigated to less than significant levels. Finally, the Project's incremental effects on agricultural resources would be cumulatively considerable and, even with mitigation, this potentially significant cumulative impact would not be mitigated to a less than significant level.

6.2.3 Air Quality

As explained in Section 4.3, Air Quality, with mitigation, the Project would not conflict with or obstruct implementation of the applicable air quality plan, or violate any applicable air quality standard. However, even with mitigation, scientific uncertainty regarding the use of NO_X and PM_{10} offsets for ROG emissions other factors makes Project-related emission of these criteria pollutants significant and unavoidable. With mitigation, the Project would not expose sensitive receptors to substantial pollutant concentrations, and would not create objectionable odors affecting a substantial number of people; however, ambient conditions remain which could cause Project odor-related impacts to remain significant and unavoidable. Finally, cumulative air emissions would be significant and unavoidable, even with mitigation.

6.2.4 Biological Resources

As explained in Section 4.4, Biological Resources, with mitigation, the Project's potential to have a direct or indirect adverse effect on any species identified as candidate, sensitive, or special status species in local or regional plans, policies, or regulations or by wildlife agencies would be less than significant. Also, with mitigation, the Project's potential to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by wildlife agencies would be less than significant. The Project's

potential to have a substantial adverse effect on federally protected wetlands through direct removal, filing, or hydrological interruption, or other means would be less than significant with mitigation. Likewise, with mitigation, the Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites. With mitigation, the Project would not conflict with any local policies or ordinances protecting biological resources, such as tree preservation policies or ordinances. Moreover, any adverse impacts related to the Project's potential to conflict with the provisions of a habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan would be mitigated to a less than significant level. However, the Project would make a cumulatively considerable contribution to cumulative biological resource impacts, even with mitigation.

6.2.5 Cultural and Paleontological Resources

As explained in Section 4.5, Cultural and Paleontological Resources, with mitigation, the Project would have a less than significant impact with respect to its potential to cause a substantial adverse change in the significance of an historic resource. Similarly, with implementation of mitigation measures described in Section 4.5, the Project would have a less than significant impact with respect to its potential to cause a substantial adverse chance in the significance of an archaeological resource. Moreover, with mitigation, the Project would have a less than significant impact with respect to its potential to directly or indirectly destroy a unique paleontological resource, site, or feature. With mitigation, the Project would also have a less than significant impact with respect to its potential to disturb any human remains. However, even with mitigation, the Project would make a cumulatively considerable contribution to impacts regarding historic, archaeological, or paleontological resources or human remains and such impact is significant and unavoidable.

6.2.6 Geology and Soils

As explained in Section 4.6, Geology and Soils, with mitigation, the Project would not cause a significant impact with respect to its potential to expose people or structures to risk of loss, injury or death involving the rupture of a known earthquake fault. The Project, as mitigated, would not expose people or structures to substantial adverse effects including the risk of loss, injury or death involving strong seismic ground shaking. Moreover, with mitigation, the Project would not expose people or structures to substantial adverse effects including risk of loss, injury or death involving seismic-related ground failure, including liquefaction. Likewise, with mitigation, the Project would not expose people or structures to substantial adverse effects including risk of loss, injury or death involving landslides. The Project, as mitigated, would not result in substantial soil erosion or the loss of topsoil. The Project's potential impacts related to onsite or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse would also be mitigated to a less than significant level. The Project's potential significant impacts related to expansive soils, or soils incapable of adequately supporting the use of septic tanks or alternate wastewater disposal

systems where sewers are not available would be less than significant with mitigation. Finally, with mitigation, the Project would not make a cumulatively considerable contribution related to geologic and soil resource impacts.

6.2.7 Greenhouse Gas Emissions and Global Climate Change

As explained in Section 4.7, Greenhouse Gas Emissions and Global Climate Change, the Project's potential adverse effects related to direct and indirect greenhouse gas emissions would be mitigated to less than significant levels. However, the Project would conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing emissions of greenhouse gases, thus causing a significant and unavoidable impact, even with mitigation. Finally, the Project would make a cumulatively considerable contribution to a cumulative greenhouse gas emission impact, even with mitigation, and this impact is therefore significant and unavoidable.

6.2.8 Hazards and Hazardous Materials/Public Health Risks

As explained in Section 4.8, Hazards and Hazardous Materials/Public Health Risks, with mitigation, the Project would have a less than significant environmental impact with respect to its potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Likewise, with mitigation, the Project would have a less than significant environmental impact with respect to its potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The Project's potential to handle hazardous or acutely hazardous materials, substance, or wastes within one-quarter mile of an existing or proposed school would also be mitigated to a less than significant level, as would the Project's potential to create a hazard to the public or the environment as a result of being a site that is included on a list of hazardous materials sites complied pursuant to Government Code Section 65962.5. With mitigation, the Project would have a less than significant impact with respect to its potential to result in a safety hazard for people residing or working within an area covered by an adopted Airport Land Use Compatibility Plan. Even without mitigation, the Project would have a less than significant impact with respect to its potential to result in a safety hazard for people residing or working within the vicinity of an airstrip, and with respect to the Project's potential to impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan. The Project's potential to expose people or structures to a significant risk of loss, injury, or death involving wildland fires would be mitigated to a less than significant level, as would the Project's potential to generate vectors or have a component that includes agricultural waste exceeding adopted qualitative thresholds. Moreover, with mitigation, the Project would not make a cumulatively considerable contribution to cumulative hazards and hazardous materials impacts.

6.2.9 Hydrology and Water Quality

As explained in Section 4.9, Hydrology and Water Quality, the Project's construction period impacts, including stormwater and runoff impacts, and impacts related to surface or subsurface discharges during well construction, well reworking, and plugging and abandonment, would not violate water quality standards or waste discharge requirements and would be less than significant with mitigation. Likewise, the Project's operational period impacts, including stormwater and runoff impacts, and impacts related to oil, produced water, maintenance and production (including "enhanced oil recovery" (EOR) and well stimulation), municipal and industrial (M&I) water, and constituent leaks and surface spills or equipment leaks at the surface from ruptured or leaking tanks, pipes, values, hoses, and other process equipment, would not violate water quality standards or waste discharge requirements and would be less than significant with mitigation. Moreover, the Projects operational period impacts related to surface or subsurface discharges during well construction, well reworking, and plugging and abandonment, and surface or subsurface discharges related to produced water or well stimulation, will be less than significant with mitigation and would not violate any water quality standards or waste discharge requirements.

As further explained in Section 4.9, Hydrology and Water Quality, the Project's potential impacts to groundwater supply and recharge from produced water generation, injection, and well stimulation will be less than significant with mitigation. However, as discussed in both Section 4.9 and Section 4.17, Utilities and Service Systems, although mitigation measures encourage the additional reuse of produced water, the extent to which oilfield operators can increase produced water reuse and decrease M&I demand is uncertain. As a result, potential Project impacts to groundwater levels and aquifer volumes will be significant and unavoidable with mitigation. However, with mitigation, the Project will have a less than significant impact with respect to its potential to substantially alter the existing drainage pattern of the Project Area in a manner that would result in substantially erosion or siltation onsite or offsite. Moreover, with mitigation, the Project would not substantially alter the existing drainage pattern of the Project Area, or substantially increase the rate of surface runoff, in a manner that would result in onsite or offsite flooding.

With mitigation, the Project would not create or contribute to runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Likewise, the proposed Project would not place housing within a mapped 100-year flood hazard area, even without mitigation. Moreover, with mitigation, the Project would not place structures that would impede or redirect flood flows within a 100-year flood hazard. Similarly, Project impacts related to its potential to expose people or structures to a significant risk of loss, injury, or death involving flooding would be mitigated to less than significant levels. Even without mitigation, the Project would not contribute to inundation by seiche, tsunami, or mudflow.

The Project's potential impacts related to conflicts with the Water Quality Control Plan for the Tulare Lake Basin (Basin Plan) would be less than significant with mitigation if groundwater not

shown as exempted in the Basin Plan is not considered suitable or potentially suitable for municipal (MUN) uses by the Regional Water Quality Control Board. However, this impact would be significant and unavoidable if Project Area groundwater not shown as exempted in the Basin Plan is considered suitable or potentially suitable for MUN uses.

Even with mitigation, the Project would cause a significant and unavoidable impact with respect to its potential to make a cumulatively considerable contribution to cumulative impacts to groundwater elevations and aquifer volumes, unless M&I water use for oil and gas exploration and production is offset by additional reuse of produced water under future conditions, in which case such impact would be mitigated to a less than significant level. However, potential cumulative impacts to water quality, erosion risks, flooding and other hydrologic resources would be mitigated to a less than significant level.

6.2.10 Land Use and Planning

As explained in Section 4.10, Land Use and Planning, with mitigation, the Project would have a less than significant impact with respect to its potential to physically divide an established community. Likewise, with mitigation, the Project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project. Even without mitigation, the Project would not conflict with any applicable habitat conservation plan or natural community conservation plan. Finally, the Project would not make a cumulatively considerable contribution to any cumulative land use or planning impacts, even without mitigation.

6.2.11 Mineral Resources

As explained in Section 4.11, Mineral Resources, the Project would have a less than significant impact with respect to its potential to result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state, even without mitigation. Moreover, the Project would have a less than significant impact, without mitigation, with respect to is potential to result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, Specific Plan, or other land use plan. Finally, the Project would not make a cumulatively considerable contribution to mineral resource impacts, even without mitigation.

6.2.12 Noise

As explained in Section 4.12, Noise, the Project would have the potential to expose persons to, or generate, noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies, but such potentially significant impacts would be mitigated to a less than significant levels. The Project's potential to expose persons to, or to generate, excessive groundborne vibration or groundborne noise levels would be less than significant and does not require mitigation. Although the Project has the potential to result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing

without the Project, this potentially significant impact would be mitigated to a less than significant level. Likewise, the Project's potential to result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project would be mitigated to a less than significant level. Moreover, mitigation would reduce the Project's potential to expose people residing or working in the Project to excessive noise levels caused by those Project activities occurring within the Kern County Airport Land Use Compatibility Plan to less than significant levels. Those Project activities located within the vicinity of a private airstrip have the potential to expose people residing or working in the Project Area to excessive noise levels, but such impacts would be reduced to less than significant through mitigation. Finally, the Project's potential to make a cumulatively considerable contribution to noise impacts on noise receptors would be mitigated to less than significant levels.

6.2.13 Population and Housing

As explained in Section 4.13, Population and Housing, the Project would not induce substantial population growth in the area, either directly or indirectly, even without mitigation. Moreover, the Project would not displace substantial numbers of people or existing housing, necessitating the construction of replacement housing elsewhere, even without mitigation. Nor would the Project make a cumulatively considerable contribution to population and housing impacts, even without mitigation.

6.2.14 Public Services

As explained in Section 4.14, Public Services, with mitigation, the Project would not result in substantial adverse physical impacts associated with the provision of, or need for, new or physically altered governmental facilities, the construction of which could cause significant environmental effects, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services, including fire protection, police protection, schools, parks and other public facilities. Moreover, with mitigation, the Project would not cause a cumulatively considerable contribution to any cumulative public service impacts.

6.2.15 Recreation

As explained in Section 4.15, Recreation, the Project would have a less than significant impact, without mitigation, with respect to its potential to result in the increased use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration would occur or be accelerated. Nor would the Project include recreational facilities or require construction or expansion of recreational facilities that might have an adverse physical effect on the environment, even without mitigation. Finally, the Project would not make a cumulatively considerable contribution to impacts on recreation facilities, even without mitigation.

6.2.16 Transportation and Traffic

As explained in Section 4.16, Transportation and Traffic, with mitigation, the Project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, and would not conflict with an applicable congestion management program. With mitigation, the Project would not result in a change in air traffic patterns that results in substantial safety risks, nor would it substantially increase transportation-related hazards due to a design feature or incompatible use. The Project as mitigated would have a less than significant impact with respect to its potential to result in inadequate emergency access, and would not conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. Finally, with mitigation, the Project would not make a cumulatively considerable contribution to cumulative transportation or cumulative traffic impacts.

6.2.17 Utilities and Service Systems

As explained in Section 4.17, Utilities and Service Systems, with mitigation, the Project would not exceed applicable wastewater treatment requirements. Further, with mitigation, the Project would not require or result in the construction or expansion of new or existing water or wastewater treatment facilities or stormwater drainage facilities in a manner that would cause significant environmental effects. With mitigation, the Project would have a less than significant impact with respect to adequate wastewater treatment and landfill capacities. Moreover, with mitigation, the Project's potential to violate federal, state, and local solid waste statutes would be less than significant. However, the Project would result in a significant and unavoidable Project-level and cumulative impact with respect to having sufficient water supplies available to serve the Project from existing entitlements and resources, even with mitigation. The Project would not, however, cause a cumulatively considerable contribution to any other cumulative impacts related to utilities and service systems.

6.3 Project Objectives

6.3.1 County Objectives

The County has defined the following objectives for the Project:

- Update the County's Zoning Ordinance to include additional procedures and compliance standards that address changes in laws and regulations by other agencies, and technological advancements within the oil and gas industry, for the purpose of reducing or eliminating potential significant adverse environmental impacts, to the extent feasible, of future oil and gas activities, and thereby ensure that current County ordinances reflect the County's interest in protecting the health, safety and general welfare of residents and visitors.

- Encourage ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County which enables the County to invest in capital improvement projects and social programs, which benefit County residents, retail businesses, and capital industries which ensures the County's fiscal stability.

- Continue Kern County's ongoing commitment to consult and cooperate with federal, state, regional and local agencies by periodically reviewing adopted regulations to ensure the long-term viability of Kern County's resources.

- Continue to improve and streamline current energy regulations and increase County monitoring and involvement in state and federal energy legislation.

- Protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting sustainability and encouraging best management practices, which are mutually beneficial, through strategic short and long range planning.

- Ensure the protection of environmental resources by emphasizing the conservation of productive agricultural lands, the encouragement of planned urban growth, the promotion of clean air strategies to address existing air quality issues, and the promotion of long-term water conservation strategies which will ensure the quality and adequacy of surface and groundwater supplies for future growth of all of Kern County's industries.

- Contain new development within an area large enough to meet generous projections of foreseeable need but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County.

6.3.2 Applicant Objectives

The Project proponents have defined the following objectives for the Project:

- Create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County of Kern, as well as the California Division of Oil, Gas and Geothermal Resources and other responsible agencies.

- Achieve an efficient and streamlined environmental review and permitting process for all oil and gas operations covered by the proposed Project.

- Provide for economically feasible and environmentally responsible growth of the Kern County oil and gas industry.

- Develop industry-wide best practices, performance standards and mitigation measures that ensure adequate protection of public health and safety and the environment.

- Increase oil and gas exploration and production in Kern County as a means of reducing California's dependence upon foreign sources of energy.

- Increase oil and gas exploration and production in Kern County as a means of increasing employment opportunities and economic prosperity to Kern County's residents, businesses, and local government.

6.4 Process Used to Develop/Screen Alternatives

The alternatives to the Project analyzed in this EIR were selected through a two-step process. First, the County identified potential alternatives based on the comments it received during the EIR scoping process and though internal deliberations that took into consideration the overall Project objectives, and then the County screened out those alternatives that it determined would not meet most of the Project objectives, were infeasible, would not substantially reduce any of the Project's significant environmental effects, or were not reasonable or realistic. Second, the County identified those alternatives that passed the screening criteria and which represent a range of available options to carry forward for analysis in this chapter.

6.5 Alternatives Eliminated from Further Consideration

Kern County considered several alternatives to reduce the Project's significant and unavoidable impacts. Per CEQA, the lead agency may make an initial determination as to which alternatives are feasible and warrant further consideration and which are infeasible. The following alternatives were initially considered but were eliminated from further consideration in this EIR because they do not meet Project objectives and/or were infeasible.

6.5.1 Drilling Ban on Agriculturally Productive Land Alternative

The Drilling Ban on Agriculturally Productive Land Alternative is identical to the Project, except that it would amend Chapter 19.98 of the Kern County Zoning Ordinance to prohibit all new oil and gas exploration, development and production activities on lands zoned either Exclusive Agricultural (A) or Limited Agricultural (A-1) if such land is being used for agricultural production at the time of drilling permit application. If this alternative were implemented, the Project's agricultural mitigation program, as set forth in Mitigation Measure 4.2-1 would not apply. As a result, under this alternative, there would be less agricultural land conserved in perpetuity in the County, and there would be less restoration of agricultural land to productive use through the removal of legacy oil and gas production equipment, than would occur under the Project. Moreover, under this alternative, it is more likely that otherwise prohibited oil and gas

activities on agricultural lands would be displaced to non-agricultural lands with greater habitat and wildlife resource values than are typically found on previously disturbed and actively farmed irrigated agricultural land, potentially causing greater overall environmental harm. Moreover, this alternative could result in more horizontal and directional subsurface drilling activities needed to recover subsurface oil and gas resources located outside of agricultural zoning districts. This additional horizontal and directional subsurface drilling activity would generate greater air quality, greenhouse gas, and toxic air contaminant emissions than would the proposed Project. Horizontal and directional drilling activities generally require more time to complete than does the vertical drilling activity typically associated with Kern County oil and gas well development and longer drilling periods require the additional combustion of fossil fuels that cause polluting emissions. In addition, since the vast majority of the Project Area would be off-limits to oil and gas activities under this alternative, Alternative 3 is legally infeasible due to legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability. For these reasons, the Drilling Ban on Agriculturally Productive Land Alternative is rejected for analysis in this EIR.

6.5.2 Drilling Ban on All Lands Alternative

The Drilling Ban On All Lands Alternative would amend Chapter 19.98 the Kern County Zoning Ordinance to prohibit all new oil and gas exploration, development and production activities within the Project Area. Under this alternative, existing oil and gas wells that are in production on or before the Zoning Ordinance amendment would be authorized to continue, but all existing oil and gas exploration and well development activities would be required to cease and all affected land would be required to be restored to its pre-exploration condition. This alternative assumes that Chapter 19.98 of the Kern County Zoning Ordinance would not be amended to establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging and abandonment. Moreover, this alternative assumes that Chapter 19.98 of the Kern County Zoning Ordinance would not be amended to establish a new "Oil and Gas Conformity Review" ministerial permit procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. Finally, this alternative would not be updated to incorporate the Project's relevant proposed development standards into the County's Dark Skies Ordinance or the Zoning Ordinance provisions governing the Floodplain Primary District, the Petroleum Extraction (PE) Combining District, and Hillside Development.

The Drilling Ban On All Lands Alternative was screened from consideration because it would not achieve most Project objectives. Specifically, this alternative would not achieve any of the Applicant's Project objectives, and it would not achieve four of the seven of the County's Project objectives. In addition to failing to meet most of the Project objectives, an alternative that completely bans all new oil and gas exploration, development and production activities is infeasible due to existing legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability. Since the Drilling Ban On All Lands Alternative is

legally infeasible and would not achieve most of the Project's basic objectives it is rejected for analysis in this EIR.

6.5.3 Larger Project Area Alternative

The Larger Project Area Alternative is identical to the Project, except it would enlarge the Project Area described in Chapter 3, Project Description, to include additional acreage in the Project Area's Eastern Subarea. This alternative is feasible, and it would achieve most of the County's and Applicant's Project objectives. This alternative would not, however, reduce of any of the Project's potentially significant adverse environmental effects. By expanding the Project Area to include more acreage available for oil and gas exploration, development and production activities, the Larger Project Area Alternative would likely have more adverse environmental effects to air quality, biology, cultural resources, and agricultural resources than would the Project. Since this alternative would not reduce any of the Project's significant adverse effects, it is rejected for analysis in this EIR.

6.5.4 More Wells within Project Footprint Alternative

The More Wells Within the Project Footprint Alternative is identical to the Project, except it would also amend Zoning Ordinance Chapter 19.98 to cap the number of oil and gas drilling permits issued by the County at 3,500 per calendar year. As discussed in Chapter 3, Project Description, this EIR assumes that, under Project conditions, 2,697 new producing wells would be drilled in the Project Area on an annual basis over the next 20 years. Under the Permit Cap Alternative, the County would authorize more growth than is assumed by this EIR, but would cap the maximum number of new well permits available to applicants within the Project Area at 3,500 per calendar year. This alternative is screened from consideration in this EIR because a larger number of wells than is contemplated by the Project would not reduce, but may exacerbate, the Project's significant environmental effects.

6.5.5 Fewer Wells within the Project Footprint Alternative

The Fewer Wells Within the Project Footprint Alternative is identical to the Project, except it would also amend Zoning Ordinance Chapter 19.98 to cap the number of oil and gas drilling permits issued by the County at 1,500 per calendar year, an amount significantly less than the Project's 2,697 new producing wells assumed by this EIR to be drilled on an annual basis over the next 20 years. This alternative is screened from consideration in this EIR because it would not achieve the basic Project objectives of the Applicant (i.e., to provide for growth of the Kern County oil and gas industry through creation of streamlined environmental review and permitting process for all Kern County oil and gas operations), and because a permit cap is legally infeasible due to legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability.

6.5.6 Offsite Alternative

The Offsite Alternative would carry out the Project in a different area of the County outside of the Project Area described Chapter 3, Project Description. The Project Area, however, was selected because of its proximity to the location of oil and gas resources within the County. As explained in Chapter 3, Project Description, the Project Area was selected because it encompasses the portion of the County in which oil and gas development has historically occurred and is reasonably foreseeable to occur in the coming decades. DOGGR requires oil and gas production wells to be reported, and each is included in an "Administrative Boundary" area for DOGGR's regulatory oversight purposes. If a new well is drilled outside the Administrative Boundary, the boundary is adjusted by DOGGR once the new well reaches a sustained production output for a year. Historically, more than 95% of oil and gas production occurs within DOGGR's Administrative Area boundaries. Since the Project Area boundary was drawn to encompass the DOGGR Administrative Area boundaries, and land outside of such Administrative Areas where it is probable that oil and gas development will expand, the proposed Project Area best represents the location of probable future oil and gas development in Kern County. Since the fundamental purpose of the Project is to update the County's zoning regulations applicable to future oil and gas development in the County, and since the proposed Project Area represents the area wherein 95% of future oil and gas development is likely to occur, no other sites would be suitable for the Project as proposed. Moreover, it would be technologically infeasible to construct and operate oil and gas drilling facilities that are located outside of the Project Area but also have access to the County's oil and gas resources, which are primarily located inside the proposed Project Area. For these reasons, the Offsite Alternative was dismissed from analysis in this EIR.

It should also be noted that, while CEQA requires an EIR to identify project alternatives, it does not require the EIR to identify alternative project locations. Per the CEQA Guidelines, an EIR must include a reasonable range of "alternatives to the project, *or* to the location of the project." (14 Cal. Code of Regs. Section 15126.6(a)(emphasis added)). Applicable case law recognizes that CEQA grants lead agencies flexibility to elect to analyze either onsite or offsite alternatives, or both. (Mira Mar Mobile Community v. City of Oceanside (2004) 119 Cal.App.4th 447, 491). There is no requirement under CEQA that an EIR always explore an offsite alternative. (California Native Plant Society v. City of Santa Cruz (2009) 177 Cal.App.4th 957, 933). Thus, CEQA does not require this EIR to analyze the Offsite Alternative.

6.5.7 Renewable Energy Alternatives

This chapter considers multiple alternatives designed to offset some of the Project-related air emissions associated with energy consumption, including greenhouse gas emissions, by considering a version of the proposed Project that would amend Chapter 19.98 of the Kern County Zoning Ordinance to require all new oil and gas well drilling operations to be powered by renewable electric generation sources, such as wind and solar technologies, rather than being powered by fossil fuel-powered electric generation sources. In all other respects, the alternatives discussed in this section would be identical to the Project.

Wind Energy Alternative

The Wind Energy Alternative assumes that each new well site permitted in the Project Area would be developed in the same manner as would occur under Project conditions, but also that each new well site would be developed with wind turbines and related facilities in an amount sufficient to provide the electric capacity needed to power well operations at such site.

Wind energy, or electricity generated from wind-power turbines, is a proven and available technology. Like solar energy, however, wind energy is high variable. Both wind and solar energy are "non-firm" forms of renewable energy and thus are interruptible and not available on a continuous schedule. Moreover, according to the California Energy Commission, wind resource potential for the Project Area is low, with average wind speeds generally below 10.1 miles per hour, making wind energy less desirable than solar energy for oil and gas well drilling and production needs.

According to the American Wind Energy Association, as a general rule of thumb, it requires 60 acres to produce 1 megawatt (MW) of power capacity for land-based wind farms. To match the electricity capacity required to power oil and gas development and production activities associated with a new oil well, wind turbines would need to be constructed at each well site to supply electricity to that well, thus expanding each well site footprint, as compared to the Project. The wind turbine development assumed by this alternative would result in additional ground disturbance and construction at each well site, thus exacerbating the environmental effects associated with well site development under Project conditions (e.g., for each well site, this alternative would entail greater impacts to aesthetic, agricultural, cultural, and biological resources that would the Project). In addition, wind turbine operation at each well site could cause noise impacts associated with subsonic noise generation, as well as avian mortality impacts associated with wind turbine operations that would otherwise be avoided by the Project. Since the wind energy development required by this alternative would cause greater environmental impacts at each well site than would the Project, further analysis of the Wind Energy Alternative is rejected for analysis by this EIR on the basis that it would not offer significant environmental advantages over the Project, even if it would reduce overall Project emissions by reducing each well site's reliance on polluting fossil fuel combustion to power well operations. Moreover, the energy storage technology necessary to make this alternative technically feasible is not presently commercially available.

Solar Energy Alternative

The Solar Energy Alternative assumes that each new well site permitted in the Project Area would be developed in the same manner as would occur under Project conditions, but also that each new well site would be developed with solar photovoltaic (PV) panels and related facilities in an amount sufficient to provide the electric capacity needed to power well operations at such site.

Solar PV electric generation is commercially available in the Project Area. Like wind power generation, however, solar PV power generation is variable with the potential for sudden changes

during daily and seasonal cycles. Moreover, solar PV technology only generates power during daylight hours, whereas the drilling and operation of the new oil and gas wells contemplated by this alternative would be conducted on 24-hour basis, as discussed in Chapter 3, Project Description. Because of variations in insolation (i.e., incoming solar radiation), a solar PV system designed to meet each well site's energy demand would need to store energy during peak insolation hours for use during non-peak times. Solar PV systems typically would provide power at design capacity for 5-6 hours per day. Thus, to store sufficient power to provide continuous, uninterrupted power for 24-hours per day consistent with this alternative's electricity demand, the solar PV facility would have to have a capacity four to five times larger than this alternative's electricity demand.

Solar PV technology typically requires approximately 8 acres of solar PV cells to generate 1 MW of capacity, though some recent design improvements have reduced this to 6 acres per MW. Using the 6-acre-per-MW scale, this alternative would require far more acres of land to produce the amount of electric power needed to supply sufficient electricity to each well site, thus expanding each well site footprint, as compared to the Project. The Solar PV development assumed by alternative would result in additional ground disturbance and construction at each well site, thus exacerbating the environmental effects associated with well site development under Project conditions (e.g., for each well site, this alternative would entail greater impacts to aesthetic, agricultural, cultural, and biological resources that would the Project). Thus, further analysis of the Solar Energy Alternative in this EIR is rejected on the basis that it would not offer significant environmental advantages over the Project, even if it might reduce the Project emissions overall by reducing reliance on polluting fossil fuel combustion to power well site operations. Moreover, the energy storage technology necessary to make this alternative technically feasible is not presently commercially available. For these reasons, the Solar Energy Alternative is not further considered in this EIR.

Zero Net Gain Alternative

The Zero Net Gain Alternative is identical to the Project, except that it would amend Chapter 19.98 of the Kern County Zoning Ordinance to also provide that no new oil or gas well drilling permits will be issued by the County, except to the extent that an equal number of existing oil or gas wells have first stopped production and have been abandoned in accordance with state law. Thus, under this alternative, there would be zero net gain in the total number of oil and gas wells operating in the County as compared to baseline conditions. The Zero Net Gain alternative is rejected for consideration in this EIR because it would not achieve most of the Applicant's Project objectives, including its objectives to (i) achieve an efficient and streamlined environmental review and permitting process for all oil and gas operations covered by the Project, (ii) provide for economically feasible and environmentally responsible growth of the Kern County oil and gas industry; (iii) increase oil and gas exploration and production in Kern County as a means of reducing California's dependence upon foreign sources of energy, or (iv) increase oil and gas exploration and production in Kern County as a means of increasing employment opportunities and economic prosperity to Kern County's residents, businesses, and local government. Moreover, this alternative would also not achieve the County's objective of

encouraging ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County that enables the County to invest in capital improvement projects and social programs.

6.6 Alternatives to the Project

Alternatives that would avoid or substantially lessen any of the significant effects of the Project and that would feasibly attain most of the basic Project objectives are evaluated in Sections 6.6.1 through 6.6.6, below. Each alternative is discussed with respect to its relationship to the Project's objectives. Kern County has considered the following alternatives, which are also identified in Table 6-1, Comparison of Alternatives, and discussed individually below:

- Alternative 1 – "No Project" Alternative
- Alternative 2 – CUP Alternative
- Alternative 3 – Reduced Ground Disturbance Alternative
- Alternative 4 – No Hydraulic Fracturing Alternative
- Alternative 5 – Low-Emission EOR Technology Alternative
- Alternative 6 – Recycled Water Alternative

6.6.1 Alternative 1 – "No Project" Alternative

As required by CEQA Guideline §15126.6, this chapter describes and analyzes a "no project" alternative for the purpose of comparing the impacts of approving the Project with the impacts of not approving the Project. Alternative 1, the "No Project" Alternative, thus assumes that the Project's proposed amendment to Title 19 of the Kern County Zoning Ordinance will not be approved. Accordingly, Alternative 1 assumes that Chapter 19.98 of the Kern County Zoning Ordinance will not be amended to establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging and abandonment. Moreover, Alternative 1 assumes that Chapter 19.98 of the Kern County Zoning Ordinance will not be amended to establish a new "Oil and Gas Conformity Review" ministerial permit procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. Moreover, under Alternative 1, the Zoning Ordinance would not be updated to incorporate the Project's relevant proposed development standards into the County's Dark Skies Ordinance or the Zoning Ordinance provisions governing the Floodplain Primary District, the Petroleum Extraction (PE) Combining District, and Hillside Development.

Alternative 1 assumes that oil and gas development and production activities will continue in the Project Area in accordance with the existing Kern County Zoning Ordinance. As discussed in Chapter 3, Project Description, Section 19.98.020 of the existing Zoning Ordinance currently authorizes "unrestricted drilling," with no County permit required, in County lands zoned for Exclusive Agriculture (A), Limited Agriculture (A-1), Medium Industrial (M-2), Heavy Industrial (M-3) and Natural Resource (NR), subject to compliance with specified conditions and standards which augment those of DOGGR, the SJVAPCD, and applicable fire and safety ordinances and regulations of the County of Kern. Thus, in these zoning districts, no review or permit would be required under the "No Project" Alternative for the drilling of any well intended for the exploration for, or development or production of, oil, gas, and other hydrocarbon substances, or for any related accessory equipment, structure, or facility used as part of the oil and gas production process. However, per the existing Zoning Ordinance, under Alternative 1, drilling would continue to be prohibited within, at minimum, one hundred (100) feet of any existing residence without the written consent of the owner thereof.

Under Alternative 1, oil or gas exploration or production would continue to be allowed within the Floodplain Primary District (FPP), subject to the Special Review Procedures and Development Standards set forth in Zoning Ordinance Section 19.50.130. Moreover, oil or gas exploration or production would continue to be permitted within a Special Planning District (SP), provided it is consistent with the County General Plan land use designation applicable to the subject property and does not create a conflict with the public health, safety, and welfare.

In addition, under Alternative 1, drilling by "ministerial permit" will continue in several zoning districts pursuant to Zoning Ordinance Section 19.98.030. A "ministerial" permit requires an application and review process, but the County does not impose site-specific conditions in such permits and the Applicant is entitled to receive the permit once it demonstrates that relevant standards are met. Under Alternative 1, ministerial permits will continue to be required in the Light Industrial (M-1) and Recreation-Forestry (RF) Districts, subject to specified development standards, which will also continue to apply in Drilling Island (DI) Zone Districts and Petroleum Extraction (PE) Combining District.

Under Alternative 1, a Conditional Use Permit (CUP) will continue to be required for oil or gas exploration or production in all residential districts, including the Estate District (E), as well as in the Low, Medium, and High-Density Residential Districts (R-1, R-2, and R-3, respectively). A CUP will also continue to be required in commercial districts, including the Commercial Office District (CO), Neighborhood Commercial District (C-1), General Commercial District (C-2) and the Highway Commercial District (CH) as well as in the Platted Lands District (PL). Finally, under Alternative 1, oil and gas exploration or production will continue to be prohibited in Mobile Home Park District (MP) (Section 19.26.040) and in the Open Space District (OS) zoning districts (Section 19.44.040).

Comparative Impacts of Alternative 1

Alternative 1 is environmentally inferior to the proposed Project. As explained in Chapter 3, Project Description, the proposed Project would substantially amend sections of the Kern County

Zoning Ordinance related to oil and gas exploration and production, including Chapter 19.98, Oil and Gas Production. In doing so, the Project would update and extend to all oil and gas exploration and production facilities development standards and conditions designed to avoid or minimize environmental impacts associated with pre-drilling exploration, well drilling, and the operation of well and other oil and gas production-related equipment and facilities. As discussed in Chapter 3, Project Description, the updated development standards and conditions include several new requirements that would avoid or minimize the impacts of oil and gas exploration and production related to land use, agricultural resources, biological resources, soils and geological resources, water resources, flooding, fire safety, odor management, noise, air quality, cultural resources, lighting, spill prevention and remediation measures, among other categories. The Project would also establish a new "Oil and Gas Conformity Review" procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions, and to provide for ongoing tracking and compliance monitoring. If Alternative 1 were adopted, none of the Project's proposed development standards or conditions would be implemented in the County on a consistent basis for all new oil and gas wells in the future and, therefore, Alternative 1 would not achieve the same environmental benefits of the Project. Without implementation of the Project's proposed development standards and conditions, Alternative 1 would have greater environmental impacts than the Project in most impact categories, particularly with respect to impacts related to biological resources, hydrological resources, cultural resources, and noise.

Alternative 1's Relationship to the Project Objectives

If implemented, Alternative 1 would not achieve most of the Project objectives. Alternative 1 would not update the County's Zoning Ordinance to include additional procedures and compliance standards. Alternative 1 would not streamline the County's current energy regulations, nor would it promote sustainability and best management practices to the same extent as the Project. Compared to the Project, Alternative 1 would not ensure the protection of environmental resources by emphasizing the conservation of productive agricultural lands, the encouragement of planned urban growth, the promotion of clean air strategies, and the promotion of long-term water conservation strategies. Compared to the Project, Alternative 1 would not create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County, DOGGR, and other responsible agencies. Since Alternative 1 would not implement the Project's proposed development standards and conditions, it would not ensure future oil and gas development in a manner that avoids impairing the economic strength derived from residential developments, agricultural, rangeland, mineral resources, other amenities that exist in Kern County. Finally, Alternative 1 would not encourage ongoing economic development by the oil and gas industry that creates quality, high paying jobs and proposed capital investment in Kern County.

6.6.2 Alternative 2 – CUP Alternative

Under Alternative 2, the CUP Alternative, all new oil and gas exploration, development, and production activities would be permitted in the Project Area only upon County's issuance of a

conditional use permit that authorizes such activities. Under Alternative 2, Chapter 19.98 of the Kern County Zoning Ordinance would be amended to eliminate its Sections 19.98.020 (Unrestricted Drilling) and 19.98.030 (Drilling By Ministerial Permit), and amend Section 19.98.040 to require a conditional use permit for new oil and gas development and production activities in the following zoning districts: Exclusive Agriculture (A); Limited Agriculture (A-1); Medium Industrial (M-2); Heavy Industrial (M-3); Natural Resource (NR); Light Industrial (M-1); Recreation-Forestry (RF); Estate District (E); Low, Medium, and High-Density Residential (R-1, R-2, R-3); Commercial Office (CO); Neighborhood Commercial (C-1); General Commercial (C-2); Highway Commercial (CH); Platted Lands (PL); Floodplain Primary (FPP); and Special Planning (SP). Conforming amendments would also be made to the Zoning Ordinance chapters applicable to each of the above zoning districts to clarify that oil and gas exploration, development and production activities are conditionally permitted uses within such districts. In effect, Alternative 2 would amend the Zoning Ordinance to eliminate all unrestricted, and ministerial approval of, oil and gas exploration, development, and production activities. Under Alternative 2, such activities would only be permitted upon issuance of a conditional use permit in all zoning districts, except the Mobile Home Park District (MP) and the Open Space District (OS), were new oil and gas development and production activities would continue to be prohibited.

Like the Project, Alternative 2 would amend Zoning Ordinance Chapter 19.98 to establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging and abandonment. Unlike the Project, however, Alternative 2 would not amend the Zoning Ordinance to establish a new "Oil and Gas Conformity Review" procedure to ensure compliance with all of the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. Instead, under Alternative 2, implementation of the updated development standards and conditions would occur on a case-by-case basis, as deemed necessary, through the standard conditional use permit approval and compliance monitoring processes.

Comparative Impacts of Alternative 2

Although, under Alternative 2, future oil and gas drilling projects in the County would require a discretionary conditional use permit approval from the County that would incorporate site-specific and project-specific conditions of approval to minimize or avoid each project's potential environmental effects, Alternative 2 is ultimately environmentally inferior to the proposed Project. Whereas the Project would implement a comprehensive avoidance and mitigation program specifically designed to reduce the environmental effects of the County's entire oil and gas industry as a well-planned cohesive whole, Alternative 2 would consider the potential environmental effects each oil or gas well permitted in the County on a case-by-case basis without benefit of a comprehensive industry-wide mitigation strategy specifically designed to address regional conservation priorities. In practice, the Project's ministerial approval procedure would be more protective of the environment overall than would Alternative 2. Under the Project,

each development standard and condition will apply to every well project irrespective of whether the proposed well development and operations would actually cause the environmental impacts such development standards and conditions are designed to reduce or avoid. Under the Project, future permit applicants will not have the opportunity to avoid compliance with many of the Project's new development standards or conditions by demonstrating that the Applicant's Project would not cause the impact any such development standard or conditions is intended to reduce or avoid, as might occur for some impact categories under Alternative 2. For example, under the Project's proposed regulatory structure, all Project Area ground disturbance is subject to a 1:1 or 1:0.5 compensatory mitigation requirement, irrespective of whether such disturbance will impact sensitive habitat or special status species. Such mitigation would not be implemented under Alternative 2 without evidence of a foreseeable impact. Thus, the Project is likely to over-mitigate with respect to some oil and gas wells that would be permitted under future Project conditions. Since the Project's comprehensive mitigation program would implement new impact avoidance and minimization measures at a scale that exceeds the impact avoidance and minimization potential of Alternative 2, Alternative 2 is generally environmentally inferior to the Project. However, by implementing a CUP program for all new wells in the Project Area, Alternative 2 does offer some opportunities for reducing overall aesthetic impacts by, for example, clustering multiple well sites in an aesthetically advantageous manner pursuant to a development plan approved under a single CUP, though such impact would remain significant and unavoidable, as compared to the Project. Otherwise, the environmental effects of Alternative 2 are comparable to the proposed Project.

Alternative 2's Relationship to the Project Objectives

Alternative 2 would achieve most, but not all, of the Project objectives. Although Alternative 2 would update the County's Zoning Ordinance to include additional procedures and compliance standards for future permitting of oil and gas exploration and development, it would not streamline the County's current oil and gas permitting procedures because it would impose a lengthy and cumbersome discretionary permitting process on all new oil and gas development within the County. Such a process would also discourage, rather than encourage, ongoing economic development by the oil and gas industry and thus would arguably frustrate this Project Objective.

Alternative 2 would help protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting long-term water conservation strategies, but not to the same extent as the Project. However, Alternative 2 would provide sufficient new development within an area large enough to meet generous projections of foreseeable need but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County. Finally, Alternative 2 would create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County and other responsible agencies, but it would not develop comprehensive mitigation strategy that implements industry-wide best practices, performance standards and mitigation measures that ensure adequate protection of public health and safety and the environment.

6.6.3 Alternative 3 – Reduced Ground Disturbance Alternative

Alternative 3, the Reduced Ground Disturbance Alternative, is identical to the Project, except that it would prohibit all new well drilling activities outside existing DOGGR-designated "Administrative Boundary" areas and would require subsurface oil and gas to be extracted from surface equipment located within such Administrative Boundary areas. This alternative would also limit the disturbance footprint on existing agricultural lands to requiring clustering of new wells in locations immediately adjacent to existing oil and gas equipment. As discussed in Chapter 3, Project Description, the vast majority of future oil and gas production in Kern County will occur in and adjacent to Administrative Boundary areas. Accordingly, this alternative assumes that subsurface oil and gas resources located outside of existing Administrative Boundary areas could still be accessed from inside existing Administrative Boundary areas through use of directional and horizontal drilling techniques. Thus, Alternative 3's restrictions on oil and gas exploration and development are assumed to be legally feasible.

Like the Project, Alternative 3 would amend sections of the Kern County Zoning Ordinance relating to oil and gas drilling, including Chapter 19.98 (Oil and Gas Production) to establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging and abandonment. Like the Project, Alternative 3 would amend Zoning Ordinance Chapter 19.98 to establish a new "Oil and Gas Conformity Review" ministerial permit procedure for County approval of future well drilling and operations within the Project Area to ensure compliance with the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. Unlike the Project, however, no new ground disturbance from well drilling activities would be allowed outside existing Administrative Boundary areas.

Comparative Impacts of Alternative 3

Since Alternative 3 would restrict new oil and gas well surface development to locations within existing Administrative Boundary areas, it will result in less overall ground disturbance than would the Project, which allows for new well development both inside and outside of existing Administrative Boundary areas. Thus, Alternative 3 would have somewhat reduced impacts to agricultural resources, biological resources, aesthetic resources, and hydrologic resources as compared to the Project. Further, Alternative 3 would reduce the Project's significant and unavoidable cumulative aesthetic impacts, though not to a less than significant level.

In addition to its environmental benefits, Alternative 3 would create certain environmental impacts greater than those caused by the Project. Since Alternative 3 would prohibit new wells outside of existing Administrative Boundary areas, compared to the Project, this alternative would result in more horizontal and directional subsurface drilling activities needed to recover subsurface oil and gas resources located outside Administrative Boundary areas. This additional

horizontal and directional subsurface drilling activity would generate greater air quality, greenhouse gas, and toxic air contaminant emissions than would the proposed Project because such activities generally require more time to complete than does the vertical drilling activity typically associated with Kern County oil and gas well development. Longer drilling periods require the additional combustion of fossil fuels that cause polluting emissions. The extended drilling times associated with Alternative 3 would also generate more noise impacts within Administrative Boundary areas than would the Project, and would result in a comparative increase in traffic within and around such Administrative Boundary areas due to the additional trips need to ferry drilling equipment to and from new well sites developed under Alternative 3. Otherwise, the environmental effects of Alternative 3 are comparable to the Project.

Alternative 3's Relationship to the Project Objectives

Alternative 3 would achieve most of the Project objectives. Alternative 3 would update the County's Zoning Code in a manner similar to the Project, though it would reduce the overall Project surface footprint. Alternative 3 would also encourage ongoing and increased economic development by the oil and gas industry in a manner consistent with the Project objectives, though perhaps not to the same extent as the Project. Like the Project, Alternative 3 would streamline the County's oil and gas regulations and environmental review processes. Alternative 3 would also help reduce California's dependence upon foreign sources of energy and would accommodate foreseeable need in appropriate locations, provided more oil and gas can be produced through increased horizontal and directional drilling techniques than would occur under the "No Project" scenario. Alternative 3 would also ensure the protection of environmental resources by emphasizing the conservation of productive agricultural lands and through the development and implementation of industry-wide best practices, performance standards, and mitigation measures, though it would have greater overall environmental effects in some impact categories than would the Project, as discussed above.

6.6.4 Alternative 4 – No Hydraulic Fracturing Alternative

Pursuant to its police power, the County has broad discretion to regulate oil and gas exploration and production activities within its jurisdiction. However, a local government's legal authority to regulate every step in the hydraulic fracturing process is the subject of legal disputes currently pending in certain California courts. Assuming the County has sufficient legal authority to regulate subsurface oil and gas exploration and development activities as contemplated by this alternative, Alternative 4, the No Hydraulic Fracturing Alternative, would implement the Project as proposed, except that it would amend Zoning Ordinance Chapter 19.98 to ban all hydraulic fracturing activities, a form of well stimulation, within the Project Area. In all other respects, the Alternative 4 is the same as the Project.

Alternative 4 would only prohibit hydraulic fracturing in the Project Area, but it would not prohibit acid fracturing or acid matrix well stimulation techniques. Were Alternative 4 approved, however, it is unlikely that its hydraulic fracturing ban would cause in increase in acid fracturing or acid matrix well stimulation in the Project Area. Hydraulic fracturing is a viable well

stimulation treatment in diatomite subsurface formations, as explained in Section 4.9, Hydrology and Water Quality. In contrast, acid fracturing and acid matrix stimulation techniques are only viable in carbonate reservoir rocks and siliciclastic reservoir formations, respectively. Thus, acid fracturing and acid matrix techniques do not serve as viable substitutes for hydraulic fracturing. Moreover, as explained in Section 4.9, there are no carbonate reservoir rocks in Kern County oil and gas fields that would be subject to acid fracturing techniques, in any case. A ban on hydraulic fracturing may, however, cause an increased use of Enhanced Oil Recovery techniques in the Project Area.

Comparative Impacts of Alternative 4

For most impacts, Alternative 4 is environmentally comparable to the Project. Indeed, as explained in Section 4.9, Hydrology and Water Quality, most wells that are hydraulically fractured in the Project Area are shallow vertical wells installed in diatomite subsurface formations located in the Western Subarea. Accordingly, in the Central and Eastern Subareas, where little to no hydraulic fracturing is expected to occur, Alternative 4 is essentially the same as Project and would cause generally identical impacts as the Project. Even in the Western Subarea, Alternative 4's environmental effects related to aesthetic, agricultural, and forest resources, biological resources, cultural resources, geology and soils, land use and planning, mineral resources, noise, population and housing, public services, recreation, and utilities and service systems would be generally the same as the Project.

As discussed in Section 4.8, Hazards and Hazardous Materials/Public Health Risks, hydraulic fracturing uses a variety of hazardous materials and non-hazardous materials, though the significant majority of such materials have been determined to have a low hazard potential in terms of oral toxicity and there is no confirmed degradation of groundwater in the Project Area attributable to hydraulic fracturing or to other well stimulation techniques. However, certain hazardous hydraulic fracturing fluid components, such as biocides, corrosion inhibitors and mineral acids used in very small amounts in the hydraulic fracturing process may present concerns for acute toxicity, as discussed in Section 4.8 and Section 4.9. If adopted, Alternative 4 would have reduced environmental impacts associated with hazardous materials transportation and handling, and fewer chemical constituents in produced water, as compared to the Project. As discussed above, however, Alternative 4 could cause an increased use of Enhanced Oil Recovery techniques in the Project Area, which would cause a corresponding increase in the emission of greenhouse gases and criteria air pollutants, as compared to the Project.

Alternative 4's Relationship to the Project Objectives

Alternative 4 would achieve most of the Project objectives to some degree. Alternative 4 would update the County's Zoning Code in a manner similar to the Project, though it would also ban hydraulic fracturing in the Project Area. Alternative 4 would also encourage ongoing and increased economic development by the oil and gas industry in a manner consistent with the Project objectives, though not to the same extent as the Project (unless increases in EOR activities spurred by Alternative 4 are able to offset any decrease in oil and gas production caused by a

hydraulic fracturing ban). This alternative would also protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting sustainability and encouraging best management practices. Like the Project, Alternative 4 would streamline the County's oil and gas regulations and environmental review processes. Alternative 4 would also help reduce California's dependence upon foreign sources of energy and would accommodate foreseeable need in appropriate locations, but perhaps not to the same degree as the Project. Finally, Alternative 4 would ensure the protection of environmental resources through the development and implementation of industry-wide best practices, performance standards, and mitigation measures, though it may have greater overall environmental effects in some impact categories than would the Project, as discussed above.

6.6.5 Alternative 5 – Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative

Alternative 5, the Low-Emission Enhanced Oil Recovery (EOR) Alternative, is identical to the proposed Project, except that the updated development standards and conditions required by the Project's proposed Zoning Ordinance amendment would be expanded to require oil and gas well permit applicants to implement low-emission EOR technology as a condition of permit approval for new and replacement steam generators, and to replace existing steam generators constructed prior to 1990 within five years of enactment of the amended Ordinance. As explained in Chapter 3, Project Description, EOR is a production technique used to increase the mobility of oil, most commonly through steam injection techniques that reduce the viscosity of the hydrocarbons and allow produced fluids to flow. There are four major types of EOR operations: waterflood; thermal (i.e., steamflood, cyclic steam and in-situ combustion); CO_2 or other gas (miscible and immiscible); and chemical/polymer flooding (i.e., alkaline flooding or micellar-polymer flooding). With thermal EOR, steam is injected into a well, which necessitates the installation of steam generators at the well. Steam generators are large heaters that generate steam, usually from produced groundwater. Under Alternative 5, all new and replacement steam generators for thermal EOR activities would be required to implement low-emission steam generation technology, such as the ClearSign Duplex Tile combustion technology or the equivalent. In all other respects, Alternative 5 would be identical to the Project.

Comparative Impacts of Alternative 5

Alternative 5's environmental effects would be generally the same as the Project, except Alternative 5 would have reduced air quality and greenhouse gas impacts, as compared to the Project. With respect to new Project-level emissions, Alternative 5 and the Project, as mitigated, would have similar air quality and greenhouse gas impacts. However, Alternative 5's additional requirement that certain existing pre-1990 steam generators be replaced within five years of enactment of the amended Zoning Ordinance would further reduce emissions that are included in the baseline emissions inventory, a reduction that would not occur under Project conditions. In addition, it is expected that Alternative 5's required low-emission steam generation technology would be more fuel efficient than Project technology, thus reducing overall fuel transportation

and handling impacts, as compared to the Project. Alternative 5 is not expected to cause any environmental impacts that would be greater than those caused by the Project.

Alternative 5's Relationship to the Project Objectives

Alternative 5 would meet most of the Project objectives. This alternative would update the County's Zoning Ordinance to include additional procedures and compliance standards that address changes in laws and regulations by other agencies, and it would continue to improve and streamline current energy regulations and increase County monitoring and involvement in state and federal energy legislation. Alternative 5 would also protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting clean air strategies to address existing air quality issues. Alternative 5 would provide sufficient new development within an area large enough to meet generous projections of foreseeable need but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County. Alternative 5 would also create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County and other responsible agencies, and it would develop industry-wide best practices, performance standards and mitigation measures that ensure adequate protection of public health and safety and the environment. Finally, this alternative also has the potential to increase oil and gas exploration and production in Kern County as a means of (i) reducing California's dependence upon foreign sources of energy, and (ii) increasing employment opportunities and economic prosperity to Kern County's residents, businesses, and local government.

6.6.6 Alternative 6 – Recycled Water Alternative

Under Alternative 6, the Recycled Water Alternative, the Applicants would be required to treat an amount produced water that is currently being disposed of via underground injection wells which is equivalent to the amount of M&I water used in Applicant's operations. The produced water reuse goal is 30,000 acre-feet per year, which would offset more than the current use of imported water and groundwater from non-oil bearing zones by the oil and gas industry. Such produced water would be required to be treated, recycled and put to an alternate use such as agricultural irrigation to the extent feasible. As explained in Section 4.9, Hydrology and Water Quality, oil-bearing formations in the Project Area include a mixture of usually saline or other poor-quality groundwater and hydrocarbons. Production wells extract a mixture of water and hydrocarbons that is separated in surface facilities, typically a series of tanks or "tank batteries," where lighter oil and gas compounds are isolated and skimmed from the heavier water. Residual water generated by the hydrocarbon separation process is generally referred to as "produced water" in the context of oil and gas exploration and production. Under current practices, much of this produced water is used in future oil and gas recovery operations (e.g., steam and water flooding) and for oil and gas maintenance activities, and the remainder is disposed of primarily through underground injection wells. In some portions of the Project Area, produced water is also treated and reused for agricultural irrigation purposes, as explained in Section 4.9.

Produced water is often treated to remove salts and other constituents for reuse in the oil and gas exploration and production process. As explained in Section 4.9, over 234,000 acre-feet of produced water was extracted in 2010, and by 2035 the annual amount of produced water could increase to more than 324,000 acre-feet. As explained in Section 4.17, Utilities and Service Systems, about 38% of the total volume of produced water in 2012, or 88,812 acre-feet, was reused for water and steam injections, pressure maintenance, well pulling, coil tubing activities, dust control, and surface facility construction. Produced water demand for oil and gas reuse is expected to rise to 122,234 acre-feet by 2035. In addition, about 32,771 acre-feet per year of relatively high-quality produced water from oilfields located along the base of the Sierra Nevada in the Eastern Subarea is provided to Cawelo Water District for agricultural reuse. Produced water reuse for irrigation requires additional filtration and treatment to meet applicable water quality standards.

Under Alternative 6, Applicants would be required to fund treatment and conveyance facilities for produced water for local re-use (such as agricultural irrigation). For purposes of analysis in this EIR, this Alternative assumes that water treatment facilities would be located in Tier 1 areas more than 1000 feet away from the nearest sensitive receptor, that treatment facilities would be subject to New Source Review permit requirements (where applicable) including use of best available control technology to minimize air emissions, that remaining criteria and GHG emissions would be fully offset, and that waste products (including residuals from treated produced water) would be disposed of in accordance with applicable law. In all other respects, Alternative 6, the Recycled Water Alternative, is identical to the proposed Project.

Comparative Impacts of Alternative 6

As explained in Section 4.17, Utilities and Service Systems, the extent to which additional produced water can be reused in the Project Area depends on several facts, including produced water quality. Produced water is generated from hydrocarbon-bearing formations that are not suitable for M&I purposes due to typically high levels of total dissolved solids (TDS), hydrocarbon and related constituents, boron, chloride and other potential constituents of concern. As discussed in Section 4.9, Hydrology and Water Quality, the Central Valley Regional Water Quality Control Board has determined that, in certain instances, even relatively high-quality produced water present in certain oilfields in the Eastern Subarea has, on occasion, not met applicable arsenic or oil and grease water quality standards. Given the range of constituents present in some produced water, it is unlikely that all produced water can be feasibly treated for reuse under this alternative. Nevertheless, the water treatment facilities to be funded under Alternative 6 could feasibly treat some additional produced water for agricultural and other uses, thus reducing Project hydrology and water quality impacts associated with the extraction of produced water in Project Area wells, and potentially offsetting some oil and gas M&I water demand. This alternative would also create a potential regional benefit by adding to the net supply of irrigation water available for use in the County. However, construction and operation of the Alternative 6 treatment plants would result in adverse environmental effects otherwise avoided by the Project, including adverse impacts to aesthetic, agricultural, biological, and cultural resources,

noise and traffic. In all other respects, the environmental effects of Alternative 6 are comparable to the Project.

Alternative 6's Relationship to the Project Objectives

Alternative 6 would meet most of the Project objectives. This alternative would update the County's Zoning Ordinance to include additional procedures and compliance standards that address changes in laws and regulations by other agencies, and it would continue to improve and streamline current energy regulations and increase County monitoring and involvement in state and federal energy legislation. Alternative 6 would also protect areas of important mineral, petroleum, and agricultural resource potential for future use by promoting long-term water conservation strategies which will ensure the quality and adequacy of surface and groundwater supplies for future growth of all of Kern County's industries. Alternative 6 would provide sufficient new development within an area large enough to meet generous projections of foreseeable need but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County. The increased cost of oil and gas development and production attributable to this alternative's funding obligations could, however, discourage, rather than encourage, ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County. Offsetting the industry's M&I water use would require major capital investment, including construction of advanced water treatment systems to allow produced water for agricultural irrigation (e.g., reverse osmosis to remove dissolved solids, chemical treatment to remove trace metals such as arsenic and boron) and construction of new infrastructure (e.g., pipelines and storage facilities) to convey water from fields in which it is produced to agricultural users. This alternative could also require concentrating exploration and production in reservoirs where produced water is fresh enough to warrant use for agricultural irrigation. However, Alternative 6 would create an effective regulatory and permitting process for oil and gas exploration and production that can be relied on by the County and other responsible agencies, and it would develop industry-wide best practices, performance standards and mitigation measures that ensure adequate protection of public health and safety and the environment.

6.7 Comparative Impacts of Project to All Alternatives

A summary of the comparative impacts of the Project to all of the alternatives analyzed in this EIR is set forth in Table 6-1.

Table 6-1: Summary of Comparison of Alternative Impacts

	Project Summary of Impacts	**Alternative 1** No Project	**Alternative 2** CUP Alternative	**Alternative 3** Reduced Ground Disturbance Alternative	**Alternative 4** No Hydraulic Fracturing Alternative	**Alternative 5** Low-Emission EOR Technology Alternative	**Alternative 6** Recycled Water Alternative
Aesthetics and Visual Resource	Significant and Unavoidable	Greater than Project	Less than Project	Less than Project	Same as Project	Same as Project	Greater than Project

Transportation and Traffic	Less than Significant	Greater than Project	Greater than Project	Greater than Project	Same as Project	Less than Project	Same as Project
Utilities and Service Systems	Significant and Unavoidable	Greater than Project	Same as Project	Same as Project	Same as Project	Same as Project	Less than Project

6.8 Environmentally Superior Alternative

Identification of an environmentally superior alternative is required under CEQA (Cal. Code Regs. Section 15126.6(e)(2)).

As compared to the Project, Alternative 1, the No Project Alternative, would have greater impacts than the Project in most categories. Alternative 2, the CUP Alternative, would slightly reduce the Project's aesthetic impacts, but would also generate greater in environmental effects than the Project is multiple impact categories. As compared to the Project, Alternative 3, the Reduced Ground Disturbance Alternative, would have less impacts to aesthetic resources, agricultural resources, cultural resources, and biological resources, but these environmental benefits would be offset by greater environmental impacts related to air quality, greenhouse gas emissions, noise, and traffic. Alternative 4, the No Hydraulic Fracturing Alternative, would have less water quality and hazards impacts than the Project, but would have greater impacts related to air quality and greenhouse gas emission than would the Project. As compared to the Project, Alternative 6, the Recycled Water Alternative, would have less hydrology and water quality impacts, and less utilities and service system impacts, than the Project, but would have greater impacts related to aesthetics, air quality, biological resources, cultural resources, greenhouse gas emissions, and noise.

The environmentally superior alternative is Alternative 5, the Low-Emission EOR Technology Alternative. Compared to the Project, Alternative 5 would have less environmental effects related to air quality, greenhouse gases, and transportation and traffic. Moreover, Alternative 5 would not result in any environmental impacts that are greater than those of the Project.

Chapter 11

Acronyms, Abbreviations, and Glossary

Chapter 11

Acronyms, Abbreviations, and Glossary

11.1 Acronyms and Abbreviations

°F	Degrees Fahrenheit
µS/cm	MicroSiemens per Centimeter
AADT	Annual Average Daily Traffic
AB	Assembly Bill
ACBM	Asbestos Containing Building Material
ACEC	Areas of Critical Environmental Concern
ADSA	Axial Dimensional Stimulation Area
AF	Acre-Feet
AFB	Air Force Base
AFY	Acre-Feet per Year
AGL	Above Ground Level
AIR	Association of Irritated Residents
ALUCP	Airport Land Use Compatibility Plan
AMSL	Above Mean Sea Level
ANSI	American National Standards Institute
ANSS	Advanced National Seismic System
AOF	Administrative Oil Field
AOR	Area of Review
APCD	Air Pollution Control District
APCO	Air Pollution Control Officer
API	American Petroleum Institute
APSA	Aboveground Petroleum Storage Act
AQMD	Air Quality Management District
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
ATC	Authority to Construct
ATCM	Airborne Toxic Control Measure
AUC	Area Under the Curve

AWMP	Agricultural Water Management Plan
AWWA	American Water Works Association
B&B	Brown and Bryant Arvin facility
B&K	Bruel & Kjaer
B.P.	Before Present
BACT	Best Available Control Technology
BAU	Business-As-Usual
Bbls	Barrels
BFD	Bakersfield Fire Department
BFW	Base Freshwater Interface
BGEPA	Bald and Golden Eagle Protection Act
BGS	Below Ground Surface
bhp	Brake Horsepower
BLM	UNITED STATES Department of the Interior, Bureau of Land Management
BLS	Bureau of Labor Statistics
BMP	Best Management Practice
BNLL	Blunt-Nosed Leopard Lizard
BOPE	Blowout Prevention Equipment
BPD	Bakersfield Police Department
BPS	Best Performance Standards
Bq/m^3	Becquerels per Cubic Meter
BRM	Bedrock Mortar
BSK	BSK Associates
C&D	Construction and Demolition
C2ES	Center for Climate and Energy Solutions
CAA	Clean Air Act
CAAQS	California Ambient Air Quality Standards
CADTSC	California Department of Toxic Substances Control
CAL FIRE	California Department of Forestry and Fire Protection
Cal/OSHA	California Occupational Safety and Health Administration
CalARP	California Accidental Release Prevention Program
CALEEMOD	California Emission Estimator Model
CalEPA	California Environmental Protection Agency
CALFIRE	California Department of Forestry and Fire Protection

CalOES	California Office of Emergency Services
CalRecycle	California Department of Resources Recycling and Recovery
Caltrans	California Department of Transportation
CALVEG	Classification and Assessment with Landsat of Visible Ecological Groupings
CAPCOA	California Air Pollution Control Officers Association
CARB	California Air Resources Board
CASGEM	California Statewide Groundwater Elevation Monitoring
CBC	California Building Code
CBE	Communities for a Better Environment
CCAA	California Clean Air Act
CCAP	Climate Change Action Plan
CCR	California Code of Regulations
CCST	California Council on Science and Technology
CDFG	California Department of Fish and Game
CDFW	California Department of Fish and Wildlife
CDFW-OSPR	California Department of Fish and Wildlife-Office of Spill Prevention and Response
CDPH	California Department of Public Health
CEC	California Energy Commission
CEDD	California Employment Development Department
CEHP	California Essential Habitat Connectivity Project
CEPAM	California Emissions Projection Analysis Model
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act/Superfund Amendments And Reauthorization Act
CERS	California Environmental Reporting System
CESA	California Endangered Species Act
CFC	Chlorofluorocarbon
CFGC	California Fish and Game Code
CFR	Code of Federal Regulations
cfs	Cubic Feet per Second
CGS	California Geological Survey
CH_4	Methane
CHL	California Historical Landmark

CHNA	Community Health Needs Assessment
CHP	California Highway Patrol
CHRIS	California Historical Resources Information System
CIP	Capital Improvement Program
CIPA	California Independent Petroleum Association
CMP	Congestion Management Program
CNDDB	California Department of Fish and Wildlife Natural Diversity Database
CNEL	Community Noise Equivalent Level
CNPS	California Native Plant Society
CNRA	California Natural Resources Agency
CO	Carbon Monoxide
CO_2	Carbon Dioxide
CO2e (MtCO2e)	Carbon Dioxide Equivalent
COG	Council of Governments
COHb	Carboxyhemoglobin
County	Kern County
CPNM	Carrizo Plain National Monument
CPUC	California Public Utilities Commission
CRC	California Resources Corporation
CREED	Citizens for Responsible Equitable Environmental Development
CRHR	California Register of Historic Resources
CRPR	California Rare Plant Rank
CRWQCB	California Regional Water Quality Board
CSA	County Service Area
CSC	California Department of Fish and Wildlife Species of Special Concern
CSLC	California State Lands Commission
CT	California State Threatened
CTR	California Toxics Rule
CUP	Conditional Use Permit
CUPA	Certified Unified Program Agencies
CVC	California Vehicle Code
CVFPB	Central Valley Flood Protection Board
CVP	Central Valley Project

CVRWQCB	Central Valley Regional Water Quality Control Board
CWA	Clean Water Act
CWC	California Water Code
CWD	Cawelo Water District
CWHR	California Wildlife Habitat Relationships
DAUs	Detailed Analysis Units
dB	Decibel
dBA	A-weighted Sound Level Measurement
DBCP	1,2-dibromo-3-chloropropane
DBH	Diameter at Breast Height
DEIR	Draft Environmental Impact Report
DHS	Department of Homeland Security
DI	Drilling Island
DMC	Development Mitigation Contracts
DNL	Day-Night Level
DOC	Department of Conservation
DOD	U.S. Department of Defense
DOF	Department of Finance
DOGGR	(California) Department of Conservation Division of Oil, Gas, and Geothermal Resources
DPM	Diesel Particulate Matter
DPR	Department of Pesticide Regulation
DRR	Delivery Reliability Reports
DTSC	Department of Toxic Substances Control
DWR	Department of Water Resources
E & E	Ecology and Environment, Inc.
E&P	Exploration and Production
ECC	Emergency Communications Center
ECDMS	Energy Consumption Data Management System
ECP	Eagle Conservation Plan; *also* Emissions Control Plan
EDC	Endocrine Disruptor Chemicals
EHHCP	Elk Hills Habitat Conservation Plan
EHOF	Elk Hills Oil Field
EIR	Environmental Impact Report

EIS	Environmental Impact Statement
EMS	Kern County Emergency Medical Services Division
EO	Executive Order
EOA	Exclusive Operating Area
EOR	Enhanced Oil Recovery
EPA	U.S. Environmental Protection Agency
ERC	Environmental Review Committee
ESA	Endangered Species Act
ESAL	Equivalent Single-Axle Load
eTRIP	Employer-based Trips Reduction
FAA	Federal Aviation Administration
FAR	Federal Aviation Regulations
FC	Federal Candidate
FE	Federal Listed as Endangered
FEIR	Final Environmental Impact Report
FEMA	Federal Emergency Management Agency
FERC	Federal Energy Regulatory Commission
FHWA	Federal Highway Administration
FIFRA	Federal Insecticide, Fungicide, and Rodenticide Act
FIRM	Federal Insurance Rate Map
FLPMA	Federal Land Policy and Management Act
FMCSA	Federal Motor Carrier Safety Administration
FMMP	Farmland Mapping and Monitoring Program
FP	State Fully Protected
FPP	Floodplain Primary
FPPA	Farmland Protection Policy Act
FPS	Floodplain Secondary
FRA	Federal Railroad Administration
FRP	Facility Response Plan
FSZ	Farmland Security Zone
FT	Federal Listed as Threatened
FY	Fiscal Year
GAMA	Groundwater Ambient Monitoring and Assessment
GAMAQI	Guide for Assessing the Mitigation Air Quality Impacts

GHG	Greenhouse Gas
GHS	United Nations Globally Harmonized System of Classification and Labeling of Chemicals
GIS	Geographic Information Systems
GMA	Groundwater Management Agency
GPS	Global Positioning System
GSA	Groundwater Sustainability Agency
GSP	Groundwater Sustainability Plan
GWP	Global Warming Potential
H_2S	Hydrogen Sulfide
HABS	Historic American Buildings Survey
HAER	Historic American Engineering Record
HAP	Hazardous Air Pollutant
HARP2	Hotspots Analysis and Reporting Program, Version 2
HazMat	Hazardous Materials
HCA	High Consequence Areas
HCD	California Department of Housing and Community Development
HCP	Habitat Conservation Plan
HFC	Hydrofluorocarbon
HHWE	Household Hazardous Waste Element
HI	Hazard Index
HMBP	Hazardous Materials Business Plan
HMIS	Hazardous Materials Inventory Statement
HMMP/HMIS	California Uniform Fire Code Hazardous Materials Management Plans and Hazardous Materials Inventory Statement
HMRRP	Hazardous Materials Release Response Plan and Inventory Program
HMSP	Hazardous Materials Safety Permit
HMTA	Hazardous Material Transportation Act
HOV	High-Occupancy Vehicle
HRA	Health Risk Assessment
HRRS	Health-Risk Reduction Strategy
HSM	Habitat Suitability Model
HSWA	Associated Hazardous and Solid Waste Amendments
I-5	Interstate 5

IBC	International Building Code
ICC	International Code Council
ICF	ICF International, Inc.
ICS	Incident Management System
ID	Irrigation District
ILRP	Irrigated Lands Regulatory Program
IOPA	Independent Oil Producers Association
IRWMP	Integrated Regional Water Management Plan
IS	Initial Study
ITE	Institute of Transportation Engineers
ITP	Incidental Take Permit
ITS	Intelligent Transportation Systems
IWMB	Integrated Waste Management Board
KCEH	Kern County Environmental Health Division
KCFD	Kern County Fire Department
KCGP	Kern County General Plan
KCPCDD	Kern County Planning and Community Development Department
KCSOS	Kern County Superintendent of Schools
KCWA	Kern County Water Agency
KCWMD	Kern County Waste Management Department
KEDC	Kern Economic Development Corporation
KNWR	Kern National Wildlife Refuge
KOP	Key Observation Point
KRT	Kern Regional Transit
KSA	Kern Sanitation Authority
kV	Kilovolt
KWB	Kern Water Bank
KWBA	Kern Water Bank Authority
KWBHCP	Kern Water Bank Habitat Conservation Plan
Kwh	Kilowatt Hours
LBNL	Lawrence Berkeley National Laboratory
LCFS	Low Carbon Fuel Standard
LDA	Light Duty Autos
LDAR	Leak Detection and Repair

Ldn	Average Day-Night Level
Leq	Equivalent Sound Pressure Level
LEV	Low Emission Vehicle
LHCP	Lokern Habitat Conservation Plan
Lmax	Maximum Noise Level
LOS	Level of Service
LS	Length Slope
M&I	Municipal and Industrial
MAOP	Maximum Allowable Operating Pressure
MASP	Maximum Allowable Surface Injection Pressure
MBGP	Metropolitan Bakersfield General Plan
MBHCP	Metropolitan Bakersfield Habitat Conservation Plan
MBTA	Migratory Bird Treaty Act
MCF	Million Cubic Feet
MCL	Maximum Contaminant Level
MDAB	Mojave Desert Air Basin
MEI	Maximally Exposed Individual
mg/L	Milligrams per Liter
MMBtu	One Million Metric British Thermal Units
MMRP	Mitigation, Monitoring, and Reporting Program
MMS	Mineral Management Service
MOA	Memorandum of Agreement
MOU	Memorandum of Understanding
MPO	Metropolitan Planning Organization
MRR	Mandatory Reporting Regulation
MRZ	Mineral Resource Zone
MS4 NPDES permit	Municipal Separate Storm Sewer System (MS4) NPDES Permit
MSDS	Material Safety Data Sheet
MSHCP	Multiple Species Habitat Conservation Plan
MSL	Mean Sea Level
$MtCO_2e$	Million Metric Tons of Carbon Dioxide Equivalent
MUN	Municipal
MW	Megawatt(s)
N_2O	Nitrous Oxide

NAAQS	National Ambient Air Quality Standards
NAHC	California Native American Heritage Commission
NAS	National Academy of Sciences
NCCP	Natural Community Conservation Plan
NCP	National Oil and Hazardous Substance Pollution Contingency Plan
NDFE	Non-Disposal Facility Element
NEC	No Exposure Certification
NEES	Network For Earthquake Engineering Simulation
NEHRP	National Earthquake Hazards Reduction Program
NEPA	National Environmental Policy Act
NESHAP	National Emissions Standards for Hazardous Air Pollutants
NH^3	Ammonia
NHD	National Hydrology Dataset
NHPA	National Historic Preservation Act
NHTSA	National Highway Traffic and Safety Administration
NIMS	National Incident Management System
NIST	National Institute of Standards and Technology
NMFS	National Marine Fisheries Service
NO_2	Nitrogen Dioxide
NO_3	Nitrates
NOA	Naturally Occurring Asbestos
NOAA	National Oceanic and Atmospheric Administration
NOC	Notice of Completion
NOD	Notice of Determination
NOG	Non-Oil and Gas
NOI	Notice of Intent to Prepare an Environmental Impact Statement (CEQA); *also* Notice of Intent to Obtain Coverage under a General Permit (SWRCB); *also* Notice of Intention to Drill New Well (DOGGR)
NONA	Notice of Non-Applicability
NOP	Notice of Preparation
NORM	Naturally Occurring Radioactive Material
NO_X	Oxides of Nitrogen
NPDES	National Pollutant Discharge Elimination System

NPL	National Priorities List
NPR	Naval Petroleum Reserves
NPS	National Park Service
NR	Natural Resource
NRC	National Response Center
NRCS	Natural Resources Conservation Service
NRDC	Natural Resources Defense Council
NRF	National Response Framework
NRHP	National Register of Historic Places
NRP	National Response Plan
NSF	National Science Foundation
NSPS	New Source Performance Standards
NTSA	National Trails System Act
NTU	Nephelometric Turbidity Units
NWI	National Wetlands Inventory
NWIS	National Water Information System
O_3	Ozone
OADP	Ozone Attainment Demonstration Plan
OEHHA	Office of Environmental Health Hazard Assessment
OG-ERA	Oil and Gas Emission Reduction Agreement
OHV	Off-Highway Vehicle
OMR	Office of Mine Reclamation
OPA	Oil Pollution Act
OPR	Governor's Office of Planning and Research
OPS	Office of Pipeline Safety
OSFM	Office of the State Fire Marshal
OSHA	Occupational Safety and Health Administration
P.L.	Public Law
PAH	Polycyclic Aromatic Hydrocarbon
PASER	Pavement Surface and Evaluation Rating System
Pb	Lead
PBSD	Performance-Based Seismic Design
PCDD	Planning and Community Development Department
pCi/L	Picocuries per Liter

PCR	Petro Capital Resources
PCS	Pavement Condition Survey
PCT	Pacific Crest Trail
PE	Petroleum Extraction
PERC	Perchloroethylene
PERP	Portable Equipment Registration Program
PFC	Perfluorocarbon
PFYC	Potential Fossil Yield Classification
PG&E	Pacific Gas and Electric
PHMSA	Pipeline and Hazardous Materials Safety Administration
PI	Pacific Institute
PM_{10}	Particulate Matter less than 10 Microns
$PM_{2.5}$	Particulate Matter less than 2.5 Microns
ppb	Parts per Billion
ppm	Parts per Million
ppmv	Parts per Million Volume
PPV	Peak Particle Velocity
PRC	Public Resources Code
Project or proposed Project	Amendment to Chapter 19.98 (Oil and Gas Production) of the Kern County Zoning Ordinance
PSD	Prevention of Signification Deterioration
PSIA	Pipeline Safety Improvement Act
PSM	Process Safety Management
PTO	Permits to Operate
PV	Photovoltaic
PVC	Polyvinyl Chloride
PXP	Plains Exploration and Production Company
QK	Quad Knopf
RACM	Reasonably Available Control Measures
RACT	Reasonably Available Control Technology
RCRA	Resource Conservation and Recovery Act
RECs	Reduced Emission Completions
REL	Recommended Exposure Limit
RFS-2	Reformulated Fuels Standard
RHNA	Regional Housing Needs Allocation

RMP	Resource Management Plan
ROD	Record of Decision
ROG	Reactive Organic Gases
ROP	Rate of Progress
ROW	Right of Way
RPF	Registered Professional Forester
RPS	Renewable Portfolio Standard
RSPA	Research and Special Provisions Administration
RTP	Regional Transportation Plan
RTPA	Regional Transportation Planning Agency
RUSLE	Revised Universal Soil Loss Equation
RV	Recreational Vehicle
RWQCB	Regional Water Quality Control Board
SANDAG	San Diego Association of Governments
SAPT	Standard Annular Pressure Test
SARA	Superfund Amendments and Reauthorization Act
SB	Senate Bill
SBM	Statistical-based Model
SCAQMD	South Coast Air Quality Management District
SCE	Southern California Edison
SCEDC	Southern California Earthquake Data Center
SCS	Sustainable Communities Strategy
SDS	Safety Data Sheet
SDWA	Safe Drinking Water Act
SF_6	Sulfur Hexafluoride
SHPO	State Historic Preservation Office(r)
SHS	State Highway System
SIC	Standard Industry Classification
SIP	State Implementation Plan
SJAPCD	San Joaquin Air Pollution Control District
SJV	San Joaquin Valley
SJV Recovery Plan	Recovery Plan for the Upland Species of the San Joaquin Valley
SJVAB	San Joaquin Valley Air Basin
SJVAPCD	San Joaquin Valley Air Pollution Control District

SMARA	Surface Mining and Reclamation Act
SMBRP	Site Mitigation and Brownfields and Reuse Program
SMGB	State Mining and Geology Board
SNF	Sequoia National Forest
SO_2	Sulfur Dioxide
SoCalGas	Southern California Gas Company
SO_X	Sulfur Oxides
SP	Special Planning
SPCC	Spill Prevention, Control, and Countermeasures
SR	State Route

11.2 Glossary

-A-

Abandoned Well When a well is no longer needed, either because the oil or gas reservoir becomes depleted, or because no oil or gas was found (called a dry-hole), the well is plugged and abandoned. A well is plugged by placing cement in the well-bore or casing at certain intervals as specified in California laws or regulations. The purpose of the cement is to seal the wellbore or casing and prevent fluid from migrating between underground rock layers. Cement plugs are required to be placed across the oil or gas reservoir (zone plug), across the base-of-fresh-water (BFW plug), and at the surface (surface plug). Other cement plugs may be required at the bottom of a string of open casing (shoe plug), on top of tools that may become stuck down hole (junk plug), on top of cut casing (stub plug), or anywhere else where a cement plug may be needed. Also, the hole is filled with drilling mud to help prevent the migration of fluids. (DOGGR 2013a)

Abandonment (also see "abandon", "plug and abandon") To temporarily or permanently cease production from a well or to cease further drilling operations. (OSHA 2014)

Acidize (also see acid well stimulation treatment) To pump acid into the wellbore to remove near-well formation damage and other damaging substances. This procedure commonly enhances production by increasing the effective well radius. When performed at pressures above the pressure required to fracture the formation, the procedure is often referred to as acid fracturing. (Schlumberger Limited 2014)

Acid Volume Threshold "Acid Volume Threshold" means a volume, in US gallons, per treated foot of well stimulation treatment, calculated as follows:
(((Size of the drill bit diameter in inches that was used in the treated zone/2 + 36 inches)^2 - (bit diameter in inches/2)^2) x 3.14159 x 12 inches x treated formation porosity)/231 (inches^3/gallon).

The lowest calculated or measured porosity in the zone of treated formation shall be the treated formation porosity used for calculating the Acid Volume Threshold. (SB-4)

Acid Well Stimulation Treatment	A well stimulation treatment that uses, in whole or in part, the application of one or more acids to the well or underground geologic formation. The acid well stimulation treatment may be at any applied pressure and may be used in combination with hydraulic fracturing treatments or other well stimulation treatments. Acid well stimulation treatments include acid matrix stimulation treatments and acid fracturing treatments. (SB-4)
Active Observation Well	A well being used for the sole purpose of gathering reservoir data, such as pressure or temperature in a reservoir being currently produced or injected by the operator, and the data is gathered at least once every three years. (DOGGR 2013a)
Alluvium	A fine-grained fertile soil consisting of mud, silt, and sand deposited by flowing water on flood plains, in river beds, and in estuaries.
Alquist-Priolo Earthquake Fault Zone	In 1972, the State of California delineated Special Studies Zones around active and potentially active faults in the State. The zones extend about six hundred and sixty (660) feet on either side of the identified fault traces. No structure for human occupancy may be built across an identified fault trace. An area of fifty (50) feet on either side of an active fault trace is assumed to be underlain by the fault unless proven otherwise.
American Petroleum Institute (API)	A trade association and standards organization that represents the interests of the oil and gas industry. It offers publications regarding standards, recommended practices, and other industry related information. (OSHA 2014)
Ancillary Equipment and Facilities (BLM)	Equipment, facilities, or structure(s) that often are required in oil and gas fields usually used to house or contain operating, maintenance, or support equipment and functions, other than wells and pipelines, such as compressor stations. Ancillary equipment and facilities required for enhanced recovery methods include producing steam, and pressurizing steam or water, typically through larger cogeneration plants serving the well fields where these techniques are utilized.
Annular Pressure	Pressure in an annular space (between the tubing and casing in a well [well bore]). (OSHA 2014)

Annular Valve (annular blowout preventer)	A large valve used to control wellbore fluids. In this type of valve, the sealing element resembles a large rubber doughnut that is mechanically squeezed inward to seal on either pipe (drill collar, drillpipe, casing, or tubing) or the openhole. The ability to seal on a variety of pipe sizes is one advantage the annular blowout preventer has over the ram blowout preventer. Most blowout preventer (BOP) stacks contain at least one annular BOP at the top of the BOP stack, and one or more ram-type preventers below. While not considered as reliable in sealing over the openhole as around tubulars, the elastomeric sealing doughnut is required by API specifications to seal adequately over the openhole as part of its certification process. (Schlumberger Limited 2014)
Annulus	The space around a pipe in a well bore, sometimes termed the annular space. (OSHA 2014)
API Number	American Petroleum Institute Well Number (also called **API**) is a unique, permanent, numeric identifier assigned to each oil and gas well in the US. An API Well number can have up to 14 digits divided into State Code (2 digits), County Code (3 digits), Unique Well Identifier (5 digits), Directional Sidetrack Code (2 digits), Event Sequence Code (2 digits). As of 2014, API Numbers in the DOGGR Well Finder database consist of 8 digits - County Code (first 3 digits) and Unique Well Identifier
Aquifer (BLM)	A water-bearing bed or layer or permeable rock, sand, of gravel capable of yielding water.
Archaeological Site	A site is defined by the National Register of Historic Places (NRHP) as the place or places where the remnants of a past culture survive in a physical context that allows for the interpretation of these remains. Archaeological remains usually take the form of artifacts (e.g., fragments of tools, vestiges of utilitarian, or non-utilitarian objects), features (e.g., remnants of walls, cooking hearths, or midden deposits), and ecological evidence (e.g., pollen remaining from plants that were in the area when the activities occurred). **Prehistoric archaeological sites** generally represent the material remains of Native American groups and their activities dating to the period before European contact. In some cases, prehistoric sites may contain evidence of trade contact with Europeans. **Ethnohistoric archaeological sites** are defined as Native American settlements occupied after the arrival of European settlers in California. **Historic archaeological sites** reflect the activities of nonnative populations during the Historic period.
Artifact	An object that has been made, modified, or used by a human being.
Assembly Bill 32	"Assembly Bill 32" (AB 32) is the Global Warming Solutions Act was passed in California on August 31, 2006 requiring the State's global warming emissions to be reduced to 1990 levels by 2020. The reduction will be accomplished through an enforced statewide cap on GHG emissions that will be phased.

-B-

Berm (BLM)

"Berm" means a raised area with vertical or sloping sides, often used to prevent, minimize, stabilize, mitigate or eliminate the release or threat of hazardous waste or hazardous substance. (Association of Environmental Professionals 2014)

Best Available Control Technology

Section 169(3) of the federal Clean Air Act defines "Best Available Control Technology" (BACT) as an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation under this Act emitted from or which results from any major emitting facility, which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such facility through application of production processes and available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of each such pollutant. In no event shall application of "best available control technology" result in emissions of any pollutant which will exceed the emissions allowed by any applicable standard established pursuant to section 111 or 112 of this Act. Emissions from any source utilizing clean fuels, or any other means, to comply with this paragraph shall not be allowed to increase above levels that would have been required under this paragraph as it existed prior to enactment of the federal Clean Air Act Amendments of 1990. (CAPCOA BACT Clearinghouse 2000)

Best Management Practice

"Best Management Practice" (BMP) means mandatory mitigation measures and/or development standards in the revised zoning ordinances, and as appropriate includes revisions to these BMPs to address the project-level circumstances in Core and non-Core areas, and Tiers.

Biological Resources (Baldwin Hills EIR)

"Biological Resources" means class of resources found on a project site, according to the California Environmental Quality Act, that includes plant or animal species or habitat that can be classified as either a significant ecological resource or sensitive environmental resource.

Blooie Line

A discharge line used in conjunction with a rotating head. (BLM 1988)

Blowout

An uncontrolled flow of reservoir fluids into the wellbore, and sometimes catastrophically to the surface. A blowout may consist of salt water, oil, gas or a mixture of these. Blowouts occur in all types of exploration and production operations, not just during drilling operations. If reservoir fluids flow into another formation and do not flow to the surface, the result is called an underground blowout. If the well experiencing a blowout has significant openhole intervals, it is possible that the well will bridge over (or seal itself with rock fragments from collapsing formations) downhole and intervention efforts will be averted. (Schlumberger Limited 2014)

-C-

Carrier Fluid A fluid that is used to transport materials into or out of the wellbore. Carrier fluids typically are designed according to three main criteria: the ability to efficiently transport the necessary material (such as pack sand during a gravel pack), the ability to separate or release the materials at the correct time or place, and compatibility with other wellbore fluids while being nondamaging to exposed formations. (Schlumberger Limited 2014)

Casing– (Drilling) Large-diameter pipe lowered into an openhole and cemented in place. The well designer must design casing to withstand a variety of forces, such as collapse, burst, and tensile failure, as well as chemically aggressive brines. Most casing joints are fabricated with male threads on each end, and short-length casing couplings with female threads are used to join the individual joints of casing together, or joints of casing may be fabricated with male threads on one end and female threads on the other. Casing is run to protect fresh water formations, isolate a zone of lost returns or isolate formations with significantly different pressure gradients. The operation during which the casing is put into the wellbore is commonly called "running pipe." Casing is usually manufactured from plain carbon steel that is heat-treated to varying strengths, but may be specially fabricated of stainless steel, aluminum, titanium, fiberglass and other materials. (Schlumberger Limited 2014)

(Well Completions) Steel pipe cemented in place during the construction process to stabilize the wellbore. The casing forms a major structural component of the wellbore and serves several important functions: preventing the formation wall from caving into the wellbore, isolating the different formations to prevent the flow or crossflow of formation fluid, and providing a means of maintaining control of formation fluids and pressure as the well is drilled. The casing string provides a means of securing surface pressure control equipment and downhole production equipment, such as the drilling blowout preventer (BOP) or production packer. Casing is available in a range of sizes and material grades. (Schlumberger Limited 2014)

Casing Shoe– 1. The bottom of the casing string, including the cement around it, or the equipment run at the bottom of the casing string. 2. A short assembly, typically manufactured from a heavy steel collar and profiled cement interior, that is screwed to the bottom of a casing string. The rounded profile helps guide the casing string past any ledges or obstructions that would prevent the string from being correctly located in the wellbore. (Schlumberger Limited 2014)

Casing String– An assembled length of steel pipe configured to suit a specific wellbore. The sections of pipe are connected and lowered into a wellbore, then cemented in place. The pipe joints are typically approximately 40 ft [12 m] in length, male threaded on each end and connected with short lengths of double-female threaded pipe called couplings. Long casing strings may require higher strength materials on the upper portion of the string to withstand the string load. Lower portions of the string may be assembled with casing of a greater wall

thickness to withstand the extreme pressures likely at depth. Casing is run to protect or isolate formations adjacent to the wellbore. The following are the most common reasons for running casing in a well: 1) protect fresh-water aquifers (surface casing) 2) provide strength for installation of wellhead equipment, including BOPs 3) provide pressure integrity so that wellhead equipment, including BOPs, may be closed 4) seal off leaky or fractured formations into which drilling fluids are lost 5) seal off low-strength formations so that higher strength (and generally higher pressure) formations may be penetrated safely 6) seal off high-pressure zones so that lower pressure formations may be drilled with lower drilling fluid densities 7) seal off troublesome formations, such as flowing salt 8) comply with regulatory requirements (usually related to one of the factors listed above). (Schlumberger Limited 2014)

(Well Completions) An assembly of valves, spools, pressure gauges and chokes fitted to the wellhead of a completed well to control production. Christmas trees are available in a wide range of sizes and configurations, such as low- or high-pressure capacity and single- or multiple-completion capacity. (Schlumberger Limited 2014) It is used when reservoir pressure is sufficient to cause reservoir fluids to rise to the surface. (OSHA 2014)

Cathodic Devices (also see sacrificial anode) A protective device to prevent electrolytic corrosion. Anodes (often made of Mg or Al metal) are sacrificed intentionally to protect a steel system, such as a buried pipeline or offshore platform. (Schlumberger Limited 2014)

Christmas Tree (Drilling) The set of valves, spools and fittings connected to the top of a well to direct and control the flow of formation fluids from the well. (Schlumberger Limited 2014)

Cogeneration The process of generating two or more forms of energy from a single energy source. For example, in a heavy oil field, turbines are often used to generate electricity while their waste heat is removed to generate steam. Other alternatives exist, with turbines being run by burning gas or crude oil. Alternatively, the primary heat source can be used to generate steam directly at extremely high pressure and temperature, with the steam being run through a turbine to generate electricity before the steam is distributed to injection wells. (Schlumberger Limited 2014)

Color The hue (e.g., red, brown) and value (e.g., light, dark) of the light reflected by objects in the visual landscape.

Completion Operations A generic term used to describe the assembly of downhole tubulars and equipment required to enable safe and efficient production from an oil or gas well. The point at which the completion process begins may depend on the type and design of well. However, there are many options applied or actions performed during the construction phase of a well that have significant impact on the productivity of the well. (Schlumberger Limited 2014)

Contrast The opposition or unlikeness of different forms, lines, colors, or textures in a landscape.

Critical Well A well within 300 feet of the following: Any building intended for human occupancy that is not necessary to the operation of the well or Any airport runway; or 100 feet of the following: Any dedicated public street, highway, or nearest rail of an operating railway that is in general use or any navigable body of water or watercourse perennially covered by water or any public recreational facility such as a golf course, amusement park, picnic ground, campground, or any other area of periodic high-density population, or any officially recognized wildlife preserve. (State of California 2011)

Cuttings (Drilling) Small pieces of rock that break away due to the action of the bit teeth. Cuttings are screened out of the liquid mud system at the shale shakers and are monitored for composition, size, shape, color, texture, hydrocarbon content and other properties by the mud engineer, the mud logger and other on-site personnel. The mud logger usually captures samples of cuttings for subsequent analysis and archiving. (Schlumberger Limited 2014)

Cyclic Steaming (Cyclic Steam Injection) A method of thermal recovery in which a well is injected with steam and then subsequently put back on production. A cyclic steam-injection process includes three stages. The first stage is injection, during which a slug of steam is introduced into the reservoir. The second stage, or soak phase, requires that the well be shut in for several days to allow uniform heat distribution to thin the oil. Finally, during the third stage, the thinned oil is produced through the same well. The cycle is repeated as long as oil production is profitable. Cyclic steam injection is used extensively in heavy-oil reservoirs, tar sands, and in some cases to improve injectivity prior to steamflood or in situ combustion operations. Cyclic steam injection is also called steam soak or the huff `n puff (slang) method. (Schlumberger Limited 2014)

-D-

Derrick The structure used to support the crown blocks and the drillstring of a drilling rig. Derricks are usually pyramidal in shape, and offer a good strength-to-weight ratio. If the derrick design does not allow it to be moved easily in one piece, special ironworkers must assemble them piece by piece, and in some cases disassemble them if they are to be moved. (Schlumberger Limited 2014)

Direct or Primary Impact Impact that is caused by the proposed project and occur at the same time and place of project implementation.

Disposal Well A well, often a depleted oil or gas well, into which waste fluids can be injected for safe disposal. Disposal wells typically are subject to regulatory requirements to avoid the contamination of freshwater aquifers. (Schlumberger Limited 2014)

Directional Drilling

The intentional deviation of a wellbore from the path it would naturally take. This is accomplished through the use of whipstocks, bottomhole assembly (BHA) configurations, instruments to measure the path of the wellbore in three-dimensional space, data links to communicate measurements taken downhole to the surface, mud motors and special BHA components and drill bits, including rotary steerable systems, and drill bits. The directional driller also exploits drilling parameters such as weight on bit and rotary speed to deflect the bit away from the axis of the existing wellbore. In some cases, such as drilling steeply dipping formations or unpredictable deviation in conventional drilling operations, directional-drilling techniques may be employed to ensure that the hole is drilled vertically. While many techniques can accomplish this, the general concept is simple: point the bit in the direction that one wants to drill. The most common way is through the use of a bend near the bit in a downhole steerable mud motor. The bend points the bit in a direction different from the axis of the wellbore when the entire drillstring is not rotating. By pumping mud through the mud motor, the bit turns while the drillstring does not rotate, allowing the bit to drill in the direction it points. When a particular wellbore direction is achieved, that direction may be maintained by rotating the entire drillstring (including the bent section) so that the bit does not drill in a single direction off the wellbore axis, but instead sweeps around and its net direction coincides with the existing wellbore. Rotary steerable tools allow steering while rotating, usually with higher rates of penetration and ultimately smoother boreholes. Directional drilling is common in shale reservoirs because it allows drillers to place the borehole in contact with the most productive reservoir rock. (Schlumberger Limited 2014)

Distribution Lines (medium-voltage, NOT high-voltage transmission lines)

"Distribution Lines" means an electrical line which delivers power through conductors, usually medium voltage (not more than 50kV), to the end user. Typical construction of distribution lines consist mainly of poles, insulator, connectors, and wires. Distribution systems are typically set up in an overhead configuration but highly urbanized areas may utilize an underground system by using power cables and cabinet substations.

Drilling

To prepare a well to be closed permanently, usually after either logs determine there is insufficient hydrocarbon potential to complete the well, or after production operations have drained the reservoir. Different regulatory bodies have their own requirements for plugging operations. Most require that cement plugs be placed and tested across any open hydrocarbon-bearing formations, across all casing shoes, across freshwater aquifers, and perhaps several other areas near the surface, including the top 20 to 50 ft [6 to 15 m] of the wellbore. The well designer may choose to set bridge plugs in conjunction with cement slurries to ensure that higher density cement does not fall in the wellbore. In that case, the bridge plug would be set and cement pumped on top of the plug through drillpipe, and then the drillpipe withdrawn before the slurry thickened. (Schlumberger Limited 2014)

Drill/Drilling – (NOR)

Drilling is the process of drilling a hole or "wellbore" in the ground for the purpose of extracting crude oil or natural gas resources or for the injection of a fluid from surface to a subsurface reservoir. Drilling may be in field, exploratory or development. In field drilling is intended to maximize recovery of oil and natural gas within the defined and known subsurface reserves. (Kern County 2013)

"Prospect well" or **"exploratory well"** means any well drilled to extend a field or explore a new, potentially productive reservoir. **"Development well"** is a well drilled into a known producing formation in a previously discovered field, to be distinguished from a wildcat, exploratory, or offset well. (California Department of Conservation, Division of Oil, Gas, and Geothermal Resources 2014)

Exploratory drilling is intended to determine whether the resource exists in a specific area and whether extraction is economically viable. Exploration can also be characterized as defining the lateral limits of hydrocarbons outside of a known producing area (i.e., step-out zone). Development drilling consists of drilling wells to extract known hydrocarbon resources to efficiently maximize the development of the reservoir or field. Most current drilling projects are classified as development within existing administrative field boundaries or "in field." (Kern County 2013)

Drilling Island (DI) District

A Zoning District in the Kern County Zoning Ordinance (Chapter 1948) applied to single lots and relatively small areas within the boundaries of final map subdivisions and mobilehome parks that contain productive or potentially productive petroleum resources. Uses in the DI District are limited to petroleum and gas exploration, production and transportation, and to compatible open space and recreational uses. (Kern County 2012)

Drilling Fluids

(Rock pieces dislodged by the drill bit as it cuts rock in the hole. Cuttings are distinct from cavings, rock debris that spalls as a result of wellbore instability. Visual inspection of rock at the shale shaker usually distinguishes cuttings from cavings. (Schlumberger Limited 2014)

Drilling Muds

Any of a number of liquid and gaseous fluids and mixtures of fluids and solids (as solid suspensions, mixtures and emulsions of liquids, gases and solids) used in operations to drill boreholes into the earth. Synonymous with "drilling fluid" in general usage, although some prefer to reserve the term "drilling fluid" for more sophisticated and well-defined "muds." Classification of drilling fluids has been attempted in many ways, often producing more confusion than insight. One classification scheme, given here, is based only on the mud composition by singling out the component that clearly defines the function and performance of the fluid: (1) water-base, (2) non-water-base and (3) gaseous (pneumatic). Each category has a variety of subcategories that overlap each other considerably. (Schlumberger Limited 2014)

Drilling Pad

A temporary drilling site, usually constructed of local materials such as gravel, shell or even wood. For some long-drilling-duration, deep wells, such as the ultradeep wells of western Oklahoma, or some regulatory jurisdictions such as The Netherlands, pads may be paved with asphalt or concrete. After the drilling operation is over, most of the pad is usually removed or plowed back into the ground. (Schlumberger Limited 2014)

Drilling Rig

The machine used to drill a wellbore. In onshore operations, the rig includes virtually everything except living quarters. Major components of the rig include the mud tanks, the mud pumps, the derrick or mast, the drawworks, the rotary table or topdrive, the drillstring, the power generation equipment and auxiliary equipment. Offshore, the rig includes the same components as onshore, but not those of the vessel or drilling platform itself. The rig is sometimes referred to as the drilling package, particularly offshore. (Schlumberger Limited 2014)

Drilling Sumps

"Drilling Sump" means a sump used in conjunction with well drilling operations. (California Code of Regulations. Title 14, Division 2, Chapter 4. Development, Regulation, and Conservation of Oil and Gas Resources, Subchapter 2, Article 3, Section 1770(c))

Drilling sumps are large earthen pits historically used to contain oil, production water, and drilling mud during drilling operations. Sumps vary in size from an average residential lot, to the size of a football field. (Shell Oil Products US 2014)

DOGGR requires all free fluids to be removed from drilling sumps within 30 days after the date the drill rig is disconnected from the well. (California Code of Regulations. Title 14, Division 2, Chapter 4. Development, Regulation, and Conservation of Oil and Gas Resources, Subchapter 2, Article 3, Section 1770(c)).

Dwelling Unit

"Dwelling Unit" means (1) or more habitable rooms which are designed to be occupied by one (1) family with facilities for living, sleeping, cooking, eating, and sanitation

-E-

Emergency Work (Delano)

"Emergency Work" means any work performed for the purpose of preventing or alleviating the physical trauma or property damage threatened or caused by an emergency.

Emerging Production Field

A production field with an "emerging" resource type, such as shale oil and gas or coal bed natural gas. In some instances, these areas may not have seen large scale exploration and production activities until the last 10 to 15 years and as a result, they might be held to a higher environmental protection standard. These fields typically are emerging due to a combination of rising energy costs and new extraction technologies, which can introduce unique issues associated with the exploration and production. specifically the lack of existing infrastructure (roads, pipelines, power, etc.) necessary to effectively deliver the resource to market, and therefore, the amount of new disturbances can be greater than infill drilling in a vintage field (even for the same number of wells). (IOGCC 2008)

Enhanced Oil Recovery (EOR)

An oil recovery enhancement method using sophisticated techniques that alter the original properties of oil. Once ranked as a third stage of oil recovery that was carried out after secondary recovery, the techniques employed during enhanced oil recovery can actually be initiated at any time during the productive life of an oil reservoir. Its purpose is not only to restore formation pressure, but also to improve oil displacement or fluid flow in the reservoir. The three major types of enhanced oil recovery operations are chemical flooding (alkaline flooding or micellar-polymer flooding), miscible displacement (carbon dioxide [CO_2] injection or hydrocarbon injection), and thermal recovery (steamflood or in-situ combustion). The optimal application of each type depends on reservoir temperature, pressure, depth, net pay, permeability, residual oil and water saturations, porosity and fluid properties such as oil API gravity and viscosity. Enhanced oil recovery is also known as improved oil recovery or tertiary recovery and it is abbreviated as EOR. (Schlumberger Limited 2014)

Environment

The physical conditions that exist within the area that will be affected by the proposed project, including, but not limited to land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance. The area involved is the locale in which significant direct or indirect impacts would occur as a result of the project. The environment includes both natural and man-made conditions.

Ethnographic

Relating to the study of human cultures. "Ethnographic resources" represent the heritage resource of a particular ethnic or cultural group, such as Native Americans or African, European, Latino, or Asian immigrants. They may include traditional resource-collecting areas, ceremonial sites, value-imbued landscape features, cemeteries, shrines, or ethnic neighborhoods and structures.

Exploration or Exploratory Drilling

Exploration is the initial phase in petroleum operations that includes generation of a prospect or play or both, and drilling of an exploration well. Appraisal, development and production phases follow successful exploration. "Exploratory Drilling" means the drilling intended to determine whether the resource exists in a specific area and whether extraction is economically viable. (Schlumberger Limited 2014)

-F-

Flare An arrangement consisting of a vertical tower and burners used to burn combustible vapors. A flare is usually situated near a producing well or at a gas plant or refinery. A flare is also called a flare stack. (Schlumberger Limited 2014)

Flowback The process of allowing fluids to flow from the well following a treatment, either in preparation for a subsequent phase of treatment or in preparation for cleanup and returning the well to production. (Schlumberger Limited 2014)

Flowback Fluid The fluid recovered from the treated well before the commencement of oil and gas production from that well following a well stimulation treatment. The flowback fluid may include materials of any phase. (SB-4)

Forest Land Land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. (Public Resources Code Section 12220 (g))

Fracking Hydraulic fracturing (also known as hydrofracturing, "fracking," or "fracing") is the injection of a mixture of water, chemicals, and substances (primarily silica sand) called "proppants" into a well at pressures greater than the fracturing pressure of the oil-bearing formation.

Fugitive Dust "Fugitive Dust" is particulate matter (or solid particles which come primarily from the soil) suspended in the air by wind action and hum activities. It has not come out of a vent or a stack, and is usually not a by-product of burning. Fugituve dust particles are composed mainly of soil minerals (e.g., oxides of silicon, aluminum, calcium, and iron), but can also contain sea salt, pollen, spores, tire particles, etc. (CARB 2007)

-G-

Gas Any natural hydrocarbon gas coming from the earth. (DOGGR 2013a)

Gathering Line A pipeline (independent of size) that transports liquid hydrocarbons between any of the following: multiple wells, a testing facility, a treating and production facility, a storage facility, or a custody transfer facility (ACTF). (DOGGR, n.d.)

Geophysical Surveys The tests conducted to determine the extent of the presence of natural gas and oil reserves and whether the resources require additional development for production. The surveys generate low-frequency sound waves and the date is recorded by small geophones strategically placed in the survey area. The low-frequency sound waves are produced by using specialized trucks to vibrate the ground (vibroseis) or through detonating charges underground (shothole). (Kern County 2013)

-H-

Historic Period The period that begins with the arrival of the first nonnative population and thus varies by area. In 1772, Commander Don Pedro Fages was the first European to enter Kern County, initiating the historic period in the project study area.

Historical Resource This term is used for the purposes of CEQA and is defined in the CEQA Guidelines (§15064.5) as: (1) a resource listed in, or determined to be eligible for listing in the California Register of Historical Resources (CRHR); (2) a resource included in a local register of historical resources, as defined in Public Resources Code (PRC) §5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC §5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

Holocene Of, denoting, or formed in the second and most recent epoch of the Quaternary period, which began 10,000 years ago at the end of the Pleistocene.

Horizontal Drilling A subset of the more general term "directional drilling," used where the departure of the wellbore from vertical exceeds about 80 degrees. Note that some horizontal wells are designed such that after reaching true 90-degree horizontal, the wellbore may actually start drilling upward. In such cases, the angle past 90 degrees is continued, as in 95 degrees, rather than reporting it as deviation from vertical, which would then be 85 degrees. Because a horizontal well typically penetrates a greater length of the reservoir, it can offer significant production improvement over a vertical well. (Schlumberger Limited 2014)

Hydraulic Fracturing A well stimulation treatment that, in whole or in part, includes the pressurized injection of hydraulic fracturing fluid or fluids into an underground geologic formation in order to fracture or with the intent to fracture the formation, thereby causing or enhancing, the production of oil or gas from a well. (SB-4)

Hydrostatic Testing One of the primary ways in which California pipeline safety standards exceed the minimum federal standards is in pipeline integrity testing. Federal regulations mandate that a pipeline system be hydrostatically tested before initial operation begins. California laws mandates that each pipeline system be tested at least every five years by an independent third-party approved by the Office of the State Fire Marshal (SFM). In these hydrostatic tests the hazardous liquid is removed from the pipe and replaced with water. The pipe is then pressurized to 125% of the maximum pipeline operating pressure and held for eight hours. Testing results are submitted to SFM for review and concurrence. Tests are randomly witnessed by SFM engineers. In certain cases, SFM has approved the use of internal inspection tools "smart pigs" in lieu of hydrostatic testing. In these cases, the test results are also submitted to the SFM for review and concurrence. (Office of the State Fire Marshall 2013)

-I-

Idle Well **"Idle well"** means a well, other than a suspended well, that has not been officially plugged and abandoned, on which the operator has ceased all activity, including but not limited to drilling, production or injection. California Code of Regulations. Title 14, Division 2, Chapter 4. Development, Regulation, and Conservation of Oil and Gas Resources, Subchapter 2, Article 3, Section 1770(c)). Testing of idle wells is required for any well that has not produced oil or natural gas or has not been used for injection for six (6) consecutive months of continuous operation during the last five (5) or more years. It does not include an active observation well. (DOGGR 2013b)

Indirect or Secondary Impacts Impacts that are caused by the proposed project at a later time or farther removed in distance but are still reasonably foreseeable. Indirect or secondary impacts may include growth-inducing impacts and other effects related to induced changes in the pattern of land use, population density or growth rate, or related effects on air, water, and other natural systems, including ecosystems.

Infrastructure Necessary Infrastructure" is any on-site and off-site facilities which are necessary to the development and maintenance of the well pad such as: access roads, electrical transmission lines, and pipelines; but are not directly related to the exploration and drilling process.

Injection Well A well into which fluids are injected rather than produced, the primary objective typically being to maintain reservoir pressure. Two main types of injection are common: gas and water. Separated gas from production wells or possibly imported gas may be reinjected into the upper gas section of the reservoir. Water-injection wells are common offshore, where filtered and treated seawater is injected into a lower water-bearing section of the reservoir. (Schlumberger Limited 2014)

Intactness The visual integrity of the natural and human-built landscape and its freedom from encroaching elements; this factor can be present in well-kept urban and rural landscapes, as well as in natural settings. (FHWA 1981)

Isolate An isolated artifact or small group of artifacts that appear to reflect a single event, loci, or activity. It may lack identifiable context but has the potential to add important information about a region, culture, or person. Isolates are not considered under CEQA to be significant and, thus, do not require avoidance mitigation (CEQA Statute §21083.2 and CEQA Guidelines §15064.5). All isolates located during the field effort, however, are recorded and the data are transmitted to the appropriate California Historical Resources Information System (CHRIS) Information Center.

-K-

Key Observation Point (KOP) One or a series of points on a travel route or at a use area or potential use area where the view of a management activity (project) would be the most revealing (USFS 1995).

-L-

Landslides and Rock falls Landslides and Rock falls are large movements of land downhill. They can be induced by seismic events (earthquakes) or wet saturated soil conditions and can cause significant damage to life and property.

Line (in reference to aesthetics and visual resources) The well-defined edges of shapes or masses created in the visual landscape by horizons, silhouettes, or human-made features. This element of visual character is usually the second strongest (USFS 1995).

Liquefaction A process by which water-saturated sediment temporarily loses strength and acts as a fluid, like when you wiggle your toes in the wet sand near the water at the beach. This effect can be caused by earthquake shaking. (USGS Earthquake Hazards Program 2012)

Lithic Of or pertaining to stone. Specifically, in archaeology lithic artifacts are chipped or flaked stone tools, and the stone debris resulting from their manufacture.

Long-Term Idle Well Any well that has not produced oil or natural gas or has not been used for injection for six (6) consecutive months of continuous operation during the last ten (10) or more years. A long-term idle well does not include an active observation well. (DOGGR 2013b)

-M-

Maintenance

The division (DOGGR) shall, by regulation, prescribe minimum facility maintenance standards for all production facilities in the state. The regulations shall include, but are not limited to, standards for all of the following:

(1) Leak detection.
(2) Corrosion prevention and testing.
(3) Tank inspection and cleaning.
(4) Valve and gauge maintenance, and secondary containment maintenance.
(5) Other facility or equipment maintenance that the supervisor deems important for the proper operation of production facilities and that the supervisor determines are necessary to prevent damage to life, health, property, and natural resources; damage to underground oil and gas deposits from infiltrating water and other causes; loss of oil, gas, or reservoir energy; and damage to underground and surface waters suitable for irrigation or domestic purposes by the infiltration of, or the addition of, detrimental substances.

(b) An operator who constructs, acquires, maintains, or alters an oil well or a production facility shall comply with the standards prescribed pursuant to subdivision (a).

(c) In a form and at a time prescribed by the division in regulation, an operator shall notify the supervisor of the construction, alteration, or decommissioning of a production facility.

(d) An operator shall maintain at the production facility's local office records of maintenance and repair operations, tests, and inspections, and shall provide the supervisor with access to these records at all times during normal business hours and with copies of the records immediately, upon request. (DOGGR 2013a).

Master Development Plan

"Master Development Plan" provides information common to multiple planned wells, including drilling plans, Surface Use Plans of Operations, and plans for future production; they are typically prepared for a planned cluster of wells and associated facilities in close proximity, or for multiple in-fill wells scattered throughout an oil and gas Unit or field, and include information on associated facilities (roads, pipelines, utility corridors, compressor stations, etc.). (BLM 2015).

Midstream Operation (Loyalsock, PA)

"Midstream Operations" means the compressors, compressor stations, meters and processing plants that support more than one well pad. (All operations and facilities constructed or installed between the well heads and the main product transportation line.)

Ministerial Decision "Ministerial decision" means a decision requiring the application of the statutes, ordinance, or regulations to the facts as prescribed and involving little or no personal judgment by the public official or decision-making body as to the wisdom or manner of carrying out a project.

Mitigation Measures "Mitigation Measures" are actions taken to reduce or minimize potential impacts to the environment.

Mitigation Monitoring or Reporting Program In 1989, the Legislature added to CEQA a requirement that a public agency, in approving feasible mitigation measures contained in EIRs and negative declarations, must also adopt a mitigation monitoring and reporting program. Such a program is to be designed to ensure compliance with the changes to a project which were required by the public agency in order to reduce or avoid significant environmental effects. (City of Winters 2015)

-N-

Native American Sacred Site An area that has been, and often continues to be, of religious significance to Native American peoples, such as an area where religious ceremonies are practiced or an area that is central to their origins as a people. They also include areas where Native Americans gather plants for food, medicinal or economic purposes.

Native Species (BLM) "Native Species" are plants or animals that originated in the area in which they are found (i.e. they naturally occur in that area); with respect to a particular ecosystem, a species that, other than as a result of an introduction, historically occurred or currently occurs in that ecosystem.

Natural Gas (Geology) A naturally occurring mixture of hydrocarbon gases that is highly compressible and expansible. Methane [CH_4] is the chief constituent of most natural gas (constituting as much as 85% of some natural gases), with lesser amounts of ethane [C_2H_6], propane [C_3H_8], butane [C_4H_{10}] and pentane [C_5H_{12}]. Impurities can also be present in large proportions, including carbon dioxide, helium, nitrogen and hydrogen sulfide. (Shale Gas) Natural gas produced from shale reservoirs is known as shale gas. The composition of the gas stream is a function of the thermal maturity of the rock. Thermally immature rocks will contain heavier hydrocarbon components, possibly even liquid components. Overmature reservoirs typically contain appreciable quantities of carbon dioxide [CO_2]. (Schlumberger Limited 2014)

New Well (Baldwin Hills EIR) "New well" means a well bore established at the ground surface and not including the redrilling or reworking of an existing well. An abandoned well that is reentered will be considered a new well for purposes of drilling, redrilling, and reworking.

Non-Associated Gas Natural gas which is in reservoirs that do not contain significant quantities of crude oil (Schlumberger Limited 2014)

Nonnative Invasive Species (BLM) "Nonnative Invasive Species" are plant species that are introduced into an area in which they did not evolve, and in which they usually have few or no natural enemies to limit their reproduction and spread. These species can cause environmental harm by significantly changing ecosystem composition, structure, or processes, and can cause economic harm or harm to human health.

Notice of Preparation (Baldwin Hills EIR) "Notice of Preparation" is a document preceding an Environmental Impact Report, that provides notice to interested agencies (responsible, trustee, and federal) and stakeholders, that the Lead Agency plans to prepare and Environmental Impact Report for a project. The Notice of Preparation includes a project description and a scope of content to be covered by the Environmental Impact Report.

-O-

Oil and Gas Conformity Review A new "Oil and Gas Conformity Review" would be established as a ministerial permit procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions and provide for ongoing tracking and compliance monitoring. This review will allow for comprehensive review of all drilling activities and will require consistent, comprehensive mitigation based on defined tiers of surrounding land uses as specified in the Amended Zoning Ordinance. An application package must be submitted that includes a site plan and written documentation assuring compliance with all applicable Development Standards and Conditions.

Oil and Gas Lease Any contact, profit-share agreement, joint venture, or other agreement issued or approved by the United States under a mineral leasing law that authorizes exploration for, extraction of, or removal of oil or gas (see 43 CFR 3160.0-5). (BLM 1988)

A contract between mineral owner, otherwise known as the lessor and a company or working interest owner, otherwise known as the lessee in which the lessor grants the lessee the right to explore, drill and produce oil, gas and other minerals for a specified primary term and as long thereafter as oil, gas or other minerals are being produced in paying quantities. This lease gives the lessee a working interest. The oil and gas lease is granted in exchange for royalty payments to the lessor. (Schlumberger Limited 2014)

Oil Operation (Baldwin Hills EIR)	"Oil Operation" means the use or maintenance of any installation, facility, or structure used, either directly or indirectly, to carry out or facilitate one or more of the following functions: drilling, redrilling, reworking and repair, production, processing, extraction, Enhanced Recovery, stimulation, abandonment, storage or shipping of oil or gas from the subsurface of the earth. It does not include administrative operations (e.g., work carried on in the administrative office buildings).
Oil or Gas Exploration by Scientific Means	Includes, but is not limited to, the following: seismic surveys, magnetotelluric, magnetometer or gravity meter surveys; surface mapping and holes less than five hundred (500) feet deep drilled for the purpose of taking core samples, velocity readings, temperature measurements, or water samples. (USFS 1995) Oil Field – means an accumulation, pool or group of pools of oil in the subsurface. An oil field consists of a reservoir in a shape that will trap hydrocarbons and that is covered by an impermeable or sealing rock. Typically, industry professionals use the term with an implied assumption of economic size. (Schlumberger Limited 2014)
Oil Well	A producing well with oil as its primary commercial product. Oil wells almost always produce some gas and frequently produce water. Most oil wells eventually produce mostly gas or water. (Schlumberger Limited 2014)
Operations	Any one or all of the activities of an operator covered by Division 3 of the Public Resources Code. (State of California 2011)
Operation Sumps	"Operations sump" means a sump used in conjunction with an abandonment or rework operation. For operational sumps, DOGGR requires that all free fluids shall be removed from operations sumps within 14 days after the rig removal or from completion of operations, whichever occurs first. (California Code of Regulations. Title 14, Division 2, Chapter 4. Development, Regulation, and Conservation of Oil and Gas Resources, Subchapter 2, Article 3, Section 1770(c)).
Orphan Well	A well that has been deserted and has no viable operator or owner. The Division maintains a list of orphan wells that are available for adoption under the "adopt a well" program. The well list may be downloaded in Acrobat PDF or Excel formats. This program allows prospective operators to enter into a three-way agreement (PDF) to test an orphan well for up to 90 days without incurring any liability for plugging the well. If the test is successful, the prospective operator can adopt the well by posting a bond and becoming its permanent operator. If the test is unsuccessful, the prospective operator can walk away from the agreement with no liability incurred. (Kern County 2012)

-P-

Paleontological Resources (Fossils)

The physical remains of plants and animals preserved in soils and sedimentary rock formations. Paleontological resources contribute to the understanding of past environments, environmental change, and the evolution of life.

Percolation Ponds

Similar to a sump, a percolation pond acts as a holding facility while gravity allows the water to percolate or seep through the soils. A percolation pond is used to dispose of water associated with hydrocarbon production. A natural or artificial evaporation pond is a pond with a large surface area that is designed to efficiently evaporate water by exposure to sunlight. In contrast to sumps, evaporation and percolation ponds are not designed to separate oil and other contaminates from water, but rather are intended for water disposal. Percolation and evaporation ponds vary in size, but are typically between two and five acres and can be as shallow as five feet deep. Some facilities contain multiple ponds totaling as much as 80 acres. The State Water Resources Control Board adopts site-specific WDRs for percolation and evaporation ponds.

Perforate

To create holes in the casing or liner to achieve efficient communication between the reservoir and the wellbore. The characteristics and placement of the communication paths (perforations) can have significant influence on the productivity of the well. Therefore, a robust design and execution process should be followed to ensure efficient creation of the appropriate number, size and orientation of perforations. A perforating gun assembly with the appropriate configuration of shaped explosive charges and the means to verify or correlate the correct perforating depth can be deployed on wireline, tubing or coiled tubing. (Shale Gas) The creation of holes in the casing or liner to achieve efficient communication between the reservoir and the wellbore. This process is integral to the optimal creation of hydraulic fractures. Geomechanical analysis is commonly conducted before perforating shale reservoirs to account for the relationship between formation stresses and productivity. (Schlumberger Limited 2014)

Perforated Interval (DOC)

The section of wellbore that has been prepared for production by creating channels between the reservoir formation and the wellbore. In many cases, long reservoir sections will be perforated in several intervals, with short sections of unperforated casing between each interval to enable isolation devices, like packers, to be set for subsequent treatments or remedial operations. (Schlumberger Limited 2014)

Permanently Illuminated Oil, Gas, Or Other Hydrocarbon Well Activities

Does not include drilling operations, reworks.

Pigging	The act of forcing a device called a pig through a pipeline for the purposes of displacing or separating fluids, and cleaning or inspecting the line. (Schlumberger Limited 2014)
Pipeline	A tube or system of tubes used for transporting crude oil and natural gas from the field or gathering system to the refinery. (Schlumberger Limited 2014)
Planning Director	"Planning Director" means the Director of the Planning and Community Development Department of the County of Kern or his/her designee.
Pleistocene (Ice Age)	An epoch in the Quaternary period of geologic history lasting from 1.8 million to 10,000 years ago. The Pleistocene was an epoch of multiple glaciation, during which continental glaciers covered nearly one fifth of the earth's land.
Pool	An underground reservoir containing, or appearing at the time of determination to contain, a common accumulation of crude petroleum oil or natural gas or both. Each zone of a general structure which is separated from any other zone in the structure is a separate pool. (State of California 2011)
Prehistoric Period	The era prior to 1772. The later part of the prehistoric period (post-1542) is also referred to as the protohistoric period in some areas, which marks a transitional period during which native populations began to be influenced by European presence resulting in gradual changes to their lifeways.
Production Facility	Any equipment attendant to oil and gas production or injection operations including, but not limited to, tanks, flow lines, headers, gathering lines, wellheads, heater treaters, pumps, valves, compressors, injection equipment, and pipelines that are not under the jurisdiction of the State Fire Marshal pursuant to Section 51010 of the Government Code. (DOGGR 2013a)
Production Well	Production wells are current producing wells, whereas, I have no doubt WZI has intermingled these two terms and created a mess. We need to use them correctly.
Producible Well	All wells that "can" produce.
Project Area	The area within which the proposed amendment to Title 19 – Kern County Zoning Ordinance would apply.
Proppant (also Propping Agent)	Materials inserted or injected into the underground geologic formation that are intended to prevent fractures from closing. (DOGGR 2013a) A granular substance (sand grains, crushed walnut shells, aluminum pellet, or other material) that is carried in suspension by the fracturing fluid. Proppant keeps fractures open in a formation when fracturing fluid is withdrawing after a fracture treatment. (OSHA 2014)

Prospect Well/Exploratory well (DOGGR)	Any well drilled to extend a field or explore a new, potentially productive reservoir. (DOGGR 2013a)
Protected Water	"Protected water" means water outside of a hydrocarbon zone that contains no more than 10,000 mg/l total dissolved solids unless the water has been determined to be an exempt aquifer pursuant to the Code of Federal Regulations, title 40, part 146.4.

-Q-

Quaternary Age	The most recent of the three periods of the Cenozoic Era in the geologic time scale of the International Commission on Stratigraphy (ICS). It follows the Tertiary Period, spanning 2.588 ± 0.005 million years ago to the present. The Quaternary includes two geologic epochs: the Pleistocene and the Holocene Epochs.

-R-

Redrilling (Culver City)	Redrilling" means any drilling operation, including deviation from original well bore, to recomplete the well in the same or different geologic zone, excluding sidetracking (Bakersfield Municipal Code n.d.).
Remediation	Cleanup or other methods used to remove or contain a toxic spill or hazardous materials from a Superfund site. (EPA 2011)
Repressuring Operations	Gas injection operations, water injection operations, water flooding operations, or any combination thereof, or any other operations intended primarily to arrest or ameliorate subsidence, or to restore or increase the pressure in a pool, or to avoid or minimize a reduction of pressure within a pool. (DOGGR 2013a)
Reservoir	A subsurface body of rock having sufficient porosity and permeability to store and transmit fluids. Sedimentary rocks are the most common reservoir rocks because they have more porosity than most igneous and metamorphic rocks and form under temperature conditions at which hydrocarbons can be preserved. A reservoir is a critical component of a complete petroleum system. (Schlumberger Limited 2014)
Retention Basin (Baldwin Hills EIR)	"Retention Basic" is a type of best management practice that is used to manage stormwater runoff to prevent flooding and downstream erosion and improve water quality in an adjacent river, stream, lake, or bay. It is essentially an artificial lake with vegetation around the perimeter, and includes a permanent pool of water in its design.

Rework

To restore production from an existing formation when it has fallen off substantially or ceased altogether. (OSHA 2014)

Any operation subsequent to drilling that involves deepening, redrilling, plugging, or permanently altering in any manner the casing of a well or its function. (State of California 2011)

Right-of-Way (BLM)

"Right-of-Way" is the legal right for use, occupancy, or access across land or water areas for a specified purpose or purposes.

Rural Agriculture and/or Ranching (IOGCC)

"Rural Agriculture and/or Ranching" means a rural area where agriculture and livestock dominate the surface land use and will have surface disturbance issues specific to the area, including concerns about: Crops, Grazing/pasturelands, Water supply for livestock and irrigation, and Impacts to soil quality and vegetation stability.

-S-

Sacrificial Anode (also Galvanic Anode)

A protective device to prevent electrolytic corrosion. Anodes (often made of Mg or Al metal) are sacrificed intentionally to protect a steel system, such as a buried pipeline or offshore platform. (Schlumberger Limited 2014)

Scoping

Early consultation, also called scoping, provides the opportunity to identify the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in the environmental impact report. Guidelines Section 15083 provides that the lead agency may also consult with other persons or organizations which may be concerned with the environmental effects of the project. PRC Sections 21104 and 21153 require the lead agency to consult with responsible and trustee agencies and with adjoining cities and counties. (OPR 2001)

Seismic Hazards

Seismicity is the geographic and historical distribution of earthquakes, including their frequency, intensity, and distribution. Seismic hazards include surface rupture, ground shaking, liquefaction, landslides, subsidence, expansive soils, and soil erosion.

Sensitive Habitat

Areas which provide habitat for rare or endangered species which meet the definition of Section 15380 of the California Environmental Quality Act guidelines.

Set Back (also Lay Down Pipe)

To place stands of drill pipe and drill collars in a vertical position to one side of the rotary table in the derrick or mast of a drilling or workover rig. (OSHA 2014)

Shale Gas	A generic term used to describe the events and equipment necessary to bring a wellbore into production once drilling operations have been concluded, including but not limited to the assembly of downhole tubulars and equipment required to enable safe and efficient production from an oil or gas well. Completion quality can significantly affect production from shale reservoirs. (Schlumberger Limited 2014)
Shallow Cyclic Thermal Production	"Shallow Cyclic Thermal Production" is the low permeability shallow cyclic thermal production operation in shallow, low permeability reservoirs that are produced primarily or exclusively through intermittent steam injection to create permeability channels or dilate a reservoir. It is a form of Enhanced Oil Recovery, steam injection.
Significant and Unavoidable Impact	An impact that exceeds the defined thresholds of significance and cannot be eliminated or reduced to a less-than-significant level through the implementation of mitigation measures.
Significant Impact	An impact that exceeds the defined thresholds of significance and would or could cause a substantial adverse change in the environment. Mitigation measures are recommended to eliminate the impact or reduce it to a less-than-significant level.
Slant Drilling	See Directional drilling.
Slurry (DOC)	1. (Drilling) a plastic mixture of cement and water that is pumped into a well to harden. There it supports the casing and provides a seal in the wellbore to prevent migration of underground fluids. 2. a mixture in which solids are suspended in a liquid. (OSHA 2014)
Spill Prevention, Response, and Remediation (secondary containment structures)	DOGGR regulates the minimum facility maintenance standards for production facilities. The regulations (14 CCR Sections 1722 – 1777.3) require operators to develop and implement spill contingency plans where condensate storage volume exceeds 50 barrels or at facilities that produce at least one barrel per day. The implementing regulations provide specific requirements for the spill contingency plan that include emergency contacts, available safety equipment, checklist for spill response, maps of the facility, a list of chemicals at the facility, containment features, corrosion prevention techniques, and the sensor and alarm systems. These plans may be fulfilled by SPCC plans if the SPCC plan is deemed adequate by DOGGR. Production facilities storing and/or processing fluids, with specific exceptions, shall have secondary containment that is capable of containing the volume of liquids from the container with the largest gross capacity within the secondary containment and should be able to confine the liquid for 72 hours. (AB 1960 Public Resources, Facilities and Oil Spills.)

Spud or Spudding	Spud or Spudding means to begin drilling a well; to start the hole.
Standard Annular Pressure Test	"Standard Annular Pressure Test" is a pressure test conducted using a fluid to fill the annular space between the casing, tubing and packer. Pressure is maintained for a specified time as a specified pressure. If the closed system retains the pressure after the pressure source is removed, the well is determined to have mechanical integrity.
Steam Injection (also Steamflood, Continuous Steam Injection)	A method of thermal recovery in which steam generated at surface is injected into the reservoir through specially distributed injection wells. When steam enters the reservoir, it heats up the crude oil and reduces its viscosity. The heat also distills light components of the crude oil, which condense in the oil bank ahead of the steam front, further reducing the oil viscosity. The hot water that condenses from the steam and the steam itself generate an artificial drive that sweeps oil toward producing wells. Another contributing factor that enhances oil production during steam injection is related to near-wellbore cleanup. In this case, steam reduces the interfacial tension that ties paraffins and asphaltenes to the rock surfaces while steam distillation of crude oil light ends creates a small solvent bank that can miscibly remove trapped oil. (Schlumberger Limited 2014)
Step-Out Zone	Step-out Zone" means an area of exploration drilling outside a known hydrocarbon producing area.
Stimulation (well stimulation treatment)	Any treatment of a well designed to enhance oil and gas production or recovery by increasing the permeability of the formation. Well stimulation treatments include, but are not limited to, hydraulic fracturing treatments and acid well stimulation treatments. (State of California 2013)
Storage Facilities	Includes Tanks, conveyance facilities, supportive piping. Various sizes of tanks typically are utilized to store oil prior to off-site transport. Such storage facilities can range in size from small to large tank arrangements with supportive piping and conveyance facilities. Storage facilities may also be located offsite. Crude oil produced in Kern County is shipped to offsite storage facilities or refineries to be processed into gasoline and other products via distribution pipelines, and/or tanker trucks.
Stratigraphy	The natural and cultural layers of soil that make up an archaeological deposit, and the order in which they were deposited relative to other layers.

Subsidence Land subsidence is the gradual, local settling or shrinking of the earth's surface with little or no horizontal motion. Subsidence is normally the result of gas, oil, or water extraction, hydro compaction, peat oxidation and not the result of landslide or ground failure. There are four types of subsidence occurring in the County: tectonic subsidence; subsidence from extraction of oil and gas; subsidence from groundwater withdrawal; and subsidence caused by hydrocompaction of moisture-deficient alluvial deposits.

Sump "Sump" means a lined or unlined, covered, or uncovered excavation pit which holds petroleum or other liquids incidental thereto, or solids associated with drilling or production operations. (Bakersfield Municipal Code n.d.)

Surface Disturbing Activities (BLM) "Surface Disturbing Activities" mean any authorized action that disturbs vegetation and surface soil, increasing erosion potential above normal site conditions. This definition typically applies to mechanized or mechanical disturbance. However, intense or extensive use of hand or motorized hand tools may fall into this category. Examples include construction of well pads and roads, pits and reservoirs, pipelines and power lines, mining, and vegetation treatments.

Surface Rupture Surface rupture occurs when movement on a fault deep within the earth breaks through to the surface. Fault ruptures almost always follow pre-existing faults that are zones of weakness. Rupture may occur suddenly during an earthquake or slowly in the form of fault creep. Sudden displacements are more damaging to structures because they are accompanied by shaking. Fault creep is the slow rupture of the earth's crust.

Swabbing (Drilling) To reduce pressure in a wellbore by moving pipe, wireline tools or rubber-cupped seals up the wellbore. If the pressure is reduced sufficiently, reservoir fluids may flow into the wellbore and towards the surface. Swabbing is generally considered harmful in drilling operations, because it can lead to kicks and wellbore stability problems. In production operations, however, the term is used to describe how the flow of reservoir hydrocarbons is initiated in some completed wells. (Well Completion) To unload liquids from the production tubing to initiate flow from the reservoir. A swabbing tool string incorporates a weighted bar and swab cup assembly that are run in the wellbore on heavy wireline. When the assembly is retrieved, the specially shaped swab cups expand to seal against the tubing wall and carry the liquids from the wellbore. (Schlumberger Limited 2014)

-T-

Tank A metal or plastic vessel used to store or measure a liquid. The three types of tanks in an oil field are drilling, production and storage tanks. (Schlumberger Limited 2014)

Tank Battery For crude oil production facilities, a tank battery is an aggregation of two or more tanks where the tanks are located so that no one tank is more than 150 feet from another tank as measured from the closest tank edges, and the tanks are located in the same crude oil production field. (SJVAPCD Rule 4623)

Temporary Facilities Any structure or other man-made improvement that can be readily and completely dismantled and/or removed from the site when the authorized use terminates.

Texture The apparent surface coarseness of the visual landscape caused by the aggregation or density of surface features and vegetation (e.g., fine, medium, coarse). This element of visual character is usually the least dominant (USFS 1995)

Texture (BLM) The visual manifestations of the interplay of light and shadow created by the variations in the surface of an object or landscape.

Threatened Species (BLM) "Threatened Species" are any species (plant or animal) that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. Threatened species are identified by the Secretary of the Interior in accordance with the 1973 Endangered Species Act.

Timberland Privately owned land, or land acquired for State forest purposes, which is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, and which is capable of growing an average annual volume of wood fiber of at least 15 cubic feet per acre. (Public Resources Code Section 51104 (f))

Traditional Well A well completed without the use of well stimulation methodology

Trip Distribution A model of the number of trips that occur between each origin zone and each destination zone. It uses the predicted number of trips originating in each origin zone (trip production model) and the predicted number of trips ending in each destination zone (trip attraction model).

-U-

Unique Archaeological Resource This term is used for the purposes of CEQA and is defined in the CEQA Guidelines (§15064.5) as an archaeological artifact, object, or site, about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it either contains information needed to answer important scientific research questions; has a special and particular quality such as being the oldest of its type or best available example of its type; or, is directly associated with a scientifically recognized important prehistoric or historic event or person.

Unique Paleontological Resource There is currently no legislated definition of this term. Current professional practice utilizes a definition parallel to that for Unique Archaeological Resources above. A unique paleontological resource is a fossil or locality about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it either provides information needed to answer important scientific research questions; has a special and particular quality such as being the oldest of its type or best available example of its type; or, is directly associated with a scientifically recognized important natural event.

Unity The visual coherence and compositional harmony of the landscape considered as a whole; it frequently attests to the careful design of individual components in the landscape. (FHWA 1981).

-V-

View Corridor A view corridor is typically defined as the line of sight of an observer from a public viewpoint, looking toward an object of significance to the community (e.g., ridgeline, river, historic building) or as the route that directs the viewers' attention. (USFS 1995)

Viewshed The landscape that can be directly seen under favorable atmospheric conditions, from a viewpoint or along a transportation corridor. (BLM 1984)

The landscape that can be directly seen under favorable atmospheric conditions, from a viewpoint or along a transportation corridor. (USFS 1995)

Vintage Production Field "Vintage Production Field" means a production field where oil and gas activities have been ongoing for several decades or more. The development of these fields often pre-date environmental laws and / or conservation efforts, and as a result they might pose unique restoration and management challenges. (IOGCC 2008)

Vividness The visual power or memorability of landscape components as they combine in striking or distinctive visual patterns. (FHWA 1981).

-W-

Water Injection "Water Injection", also referred to as "Water Flooding" is the process of injecting water into the reservoir via an injection well for the purposes of "sweeping" the hydrocarbons to a nearby production well where it can be recovered to the surface.

Watershed A watershed is the area of land where all of the water that is under it or drains off of it goes into the same place. (EPA 2012)

Waters of the States (Water Code Section 13050(e)	Any surface water or groundwater, including saline waters, within the boundaries of the state.
Waters of the United States or Waters of the US (40 CFR 122.2)	**(a)** All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; **(b)** All interstate waters, including interstate "wetlands;" **(c)** All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters: **(1)** Which are or could be used by interstate or foreign travelers for recreational or other purposes; **(2)** From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or **(3)** Which are used or could be used for industrial purposes by industries in interstate commerce; **(d)** All impoundments of waters otherwise defined as waters of the United States under this definition; **(e)** Tributaries of waters identified in paragraphs (a) through (d) of this definition; **(f)** The territorial sea; and **(g)** "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.
Well	Any oil or gas well or well for the discovery of oil or gas; any well on lands producing or reasonable presumed to contain oil or gas; any well drilled for the purpose of injecting fluids or gas for stimulating oil or gas recovery, repressuring, or pressure maintenance of oil or gas reservoirs, or disposing of waste fluids from an oil or gas field; any well used to inject or withdraw gas from an underground storage facility; or any well drilled within or adjacent to an oil or gas pool for the purpose of obtaining water to be used in production stimulation or repressuring operations. (DOGGR 2013a) (State of California 2011)
Wellbore	The drilled hole or borehole, including the openhole or uncased portion of the well. Borehole may refer to the inside diameter of the wellbore wall, the rock face that bounds the drilled hole. (Schlumberger Limited 2014)
Well Completion	1. The activities and methods of preparing a well for the production of oil and gas or for other purposes, such as injection; the method by which one or more flow paths for hydrocarbons are established between the reservoir and the surface. 2. The system of tubulars, packers, and other tools installed beneath the wellhead in the production casing; that is, the tool assembly that provides the hydrocarbon flow path or paths. (OSHA 2014) To prepare a wellbore to be shut in and permanently isolated. There are typically regulatory requirements associated with the P&A process to ensure that strata, particularly freshwater aquifers, are adequately isolated. In most cases, a series of

	cement plugs is set in the wellbore, with an inflow or integrity test made at each stage to confirm hydraulic isolation. (Schlumberger Limited 2014)
Wellfield (BLM)	"Wellfield" is an area containing one or more wells that produce usable amounts of water or oil.
Wellhead	The system of spools, valves and assorted adapters that provide pressure control of a production well. (Schlumberger Limited 2014)
Well Pad Preparation	Well pad preparation begins with clearing and grading an area to accommodate the well and any drilling activities or ancillary facilities that may be required. The size of the well pad is dependent upon the size of the drilling rig footprint, the number of wells anticipated to be drilled on the pad, the type of equipment that would be placed on the well during production, the depth of the well, and the number of additional wells (if any) from this well pad.
Well Remedial Operations (Workover)	(Drilling) The repair or stimulation of an existing production well for the purpose of restoring, prolonging or enhancing the production of hydrocarbons. (Well Workover and Intervention) The process of performing major maintenance or remedial treatments on an oil or gas well. In many cases, workover implies the removal and replacement of the production tubing string after the well has been killed and a workover rig has been placed on location. Through-tubing workover operations, using coiled tubing, snubbing or slickline equipment, are routinely conducted to complete treatments or well service activities that avoid a full workover where the tubing is removed. This operation saves considerable time and expense. (Schlumberger Limited 2014)
Well-Spacing Plan	A well spacing plan describes the pool to which it applies and set forth the surface and subsurface well spacing pattern for all wells to be drilled or redrilled into the pool. The Supervisor gives the greatest consideration to the minimum spacing, in acres per well, that can be established based on the geologic geometry of the pool and the area that can be effectively and eff ciently drained by a well without economic loss. (Section 3609, Public Resources Code.)
Well Stimulation Treatment	Well stimulation treatment does not include routine well cleanout work; routine well maintenance; routine treatment for the purpose of removal of formation damage due to drilling; bottom hole pressure surveys; routine activities that do not affect the integrity of the well or the formation; the removal of scale or precipitate from the perforations, casing, or tubing; a gravel pack treatment that does not exceed the formation fracture gradient; or a treatment that involves emplacing acid in a well and that uses a volume of fluid that is less than the Acid Volume Threshold for the operation and is below the formation fracture gradient. (Final Text of SB-4. 12-30-14)

Williamson Act Lands Lands preserved for agricultural production under the California Land Conservation Act of 1965 or "Williamson Act." In exchange for a ten-year agreement that agricultural land will not be developed or converted to another use, the land is taxed at a rate based on the actual use of the land for agricultural purposes, as opposed to its unrestricted market value.

Woodlands Forest lands composed mostly of hardwood species such as oak (Public Resources Code Section 12220 (l))

Workover Rig A portable rig used for working over a well. (OSHA 2014)

-Z-

Zonal Isolation Zonal Isolation means that oil and gas coming up a well form the productive, underground geologic zone will not escape the well and migrate into other geologic zones, including zones that might contain fresh water. Zonal Isolation also means that the fluids an oil and gas operator puts down a well for any purpose will stay in that zone and not migrate to another zone. (California Department of Conservation 2012)
