EXHIBIT D:
Draft Environmental Impact Report and Technical Appendices

Exposition Corridor Transit Neighborhood Plan
CPC-2013-0621-ZC-GPA-SP; ENV-2013-0622-EIR

Recommended by the City Planning Commission on November 9, 2017.

May 2018

EXPOSITION CORRIDOR TRANSIT NEIGHBORHOOD PLAN

VOLUME I

DRAFT ENVIRONMENTAL IMPACT REPORT

Prepared for

CITY OF LOS ANGELES
DEPARTMENT OF CITY PLANNING
200 N. Spring Street, Room 667
Los Angeles, California 90012

Prepared by

TERRY A. HAYES ASSOCIATES INC.
3535 Hayden Avenue, Suite 350
Culver City, CA 90232

March 2017

TABLE OF CONTENTS

VOLUME I

Page

1.0 INTRODUCTION 1-1
1.1 Purpose of this Report 1-1
1.2 Authorization and Focus 1-2
1.3 Lead Agency 1-2
1.4 Scope and Intended Use of this Draft EIR 1-2
1.5 Draft EIR Organization 1-3
1.6 EIR Process 1-4
1.7 Availability of Draft EIR 1-5
1.8 Areas of Controversy/Issues to be Resolved 1-6

2.0 SUMMARY 2-1
2.1 Introduction 2-1
2.2 Summary of Proposed Project 2-2
2.3 Significant and Unavoidable Impacts 2-3
2.4 Significant Impacts that can be Mitigated to Less Than Significant; Less-Than-Significant Impacts; or No Impact 2-3
2.5 Summary of Alternatives 2-4
2.6 Summary of Project Impacts and Mitigation Measures 2-5

3.0 PROJECT DESCRIPTION 3-1
3.1 Project Background 3-1
3.2 Project Objectives 3-1
3.3 Location and Surrounding Land Uses 3-2
3.4 Project Description 3-5
3.5 Construction Schedule and Phasing 3-37
3.6 Discretionary Actions and Approvals 3-38

4.0 ENVIRONMENTAL IMPACTS 4-1
4.1 Aesthetics 4.1-1
4.2 Air Quality 4.2-1
4.3 Cultural Resources 4.3-1
4.4 Geology and Soils 4.4-1
4.5 Greenhouse Gas Emissions 4.5-1
4.6 Hazards and Hazardous Materials 4.6-1
4.7 Hydrology and Water Quality 4.7-1
4.8 Land Use and Planning 4.8-1
4.9 Noise 4.9-1
4.10 Population, Housing, and Employment 4.10-1
4.11 Public Services 4.11-1
4.12 Transportation and Traffic 4.12-1
4.13 Utilities and Service Systems 4.13-1
4.14 Cumulative Impacts 4.14-1

TABLE OF CONTENTS (cont.)

Page

5.0 ALTERNATIVES 5-1
5.1 Project-Level Impacts 5-2
5.2 Alternatives Considered But Rejected from Further Consideration 5-5
5.3 Alternatives to the Proposed Project 5-7

6.0 OTHER CEQA CONSIDERATIONS 6-1
6.1 Significant Environmental Effects of the Proposed Project 6-1
6.2 Significant Unavoidable Impacts 6-1
6.3 Significant Irreversible Environmental Effects 6-2
6.4 Growth Inducing Impacts 6-3
6.5 Potential Secondary Effects 6-4
6.6 Effects Not Found to be Significant 6-5

7.0 PERSONS AND SOURCES CONSULTED 7-1
7.1 Lead Agency 7-1
7.2 Sources Consulted 7-2

VOLUME II

APPENDICES

Appendix A Notice of Preparation and NOP Comments Letters
Appendix B Air Quality
Appendix C Cultural Resources
Appendix D Report of Hazardous Materials Sites
Appendix E Noise
Appendix F Population, Housing, and Employment Methodology
Appendix G Public Service Response Letters
Appendix H Traffic
Appendix I Utility Provider Response Letter
Appendix J ECTNP Utilities Calculations and Rates and Water Supply Assessment
Appendix K SCAG RTP/SCS Technical Memorandum
Appendix L Market Study
Appendix M Draft Exposition Corridor Transit Neighborhood Plan
Appendix N Revisions to the Specific Plan Technical Memo

ACRONYMS

°F	Fahrenheit
µg/m^3	Micrograms Per Cubic Meter
AB 2588	State Air Toxics Program
ACCMs	Asbestos Containing Construction Materials
ACMs	Asbestos-Containing Materials
ADA	Americans with Disabilities Act
af	Acre Feet
afy	Acre-Feet per Year
AIRFA	The American Indian Religious Freedom Act
ALUC	Airport Land Use Commission
APC	Area Planning Commission
AQMP	Air Quality Management Plan
ARPA	Archaeological Resources Protection Act
AVR	Average Vehicle Ratio
BACT	Best Available Control Technology
Basin	South Coast Air Basin
BAU	Business-As-Usual
Bcf	Billion cubic feet
BOE	Bureau of Engineering
C&D	Construction and Demolition
CAA	Federal Clean Air Act
CAAQS	California Ambient Air Quality Standards
Cal-ARP	California Accidental Release Prevention Program
CalEEMOd	California Emissions Estimator Model
Cal-EPA	California Environmental Protection Agency
CalGreen	California Green Building Code
California Register	California Register of Historical Resources
Cal-OES	California Office of Emergency Services
Cal-OSHA	California Occupational Safety and Health Administration
Caltrans	California Department of Transportation
CARB	California Air Resources Board
CAT	Climate Action Team
CBC	California Building Code
CCAA	California Clean Air Act
CCR	California Code of Regulations
CDO	Community Design Overlay District
CEQA	California Environmental Quality Act
CERC	China Clean Energy Research Center
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CERCLIS	Comprehensive Environmental Response, Compensation and Liability Information System
CERFA	Community Environmental Response Facilitation Act
CGS	California Geological Survey
CH4	Methane

ACRONYMS

CHAS	Comprehensive Housing Affordability Strategy
CiSWMPP	City of Los Angeles Solid Waste Management Policy Plan
City	City of Los Angeles Department of City Planning
CMP	Congestion Management Program
CNEL	Community Noise Equivalent Level
CO	Carbon Monoxide
CO_2	Carbon Dioxide
COMPSTAT	Computer Statistics Unit
CPTED	Crime Prevention Through Environmental Design
CPUC	California Public Utilities Commission
CSI	California Solar Initiative
CSSA	Collection System Settlement Agreement
CTCSP/WLA TIMP	West Los Angeles Traffic Improvement and Mitigation Specific Plan
CTR	Commute Trip Reduction
CUPA	Certified Unified Program Agency
CWA	Clean Water Act
CWC	California Water Code
DASH	Downtown Area Short Hop
dB	decibel
dBA	A-weighted scale
DCP	Department of City Planning
DCTWRP	Donald C. Tillman Water Reclamation Plant
DOGGR	California Division of Oil, Gas, and Geothermal Resources
DOSH	Division of Occupational Safety and Health
DOT	Department of Transportation
DPM	Diesel Particulate Matter
DPR	City of Los Angeles Department of Recreation and Parks
DTSC	Department of Toxic Substances Control
DWR	Department of Water Resources
E.O.	Executive Order
EOO	Emergency Operations Organization
ECTNP	Exposition Corridor Transit Neighborhood Plan
EDR	Environmental Data Resources
EIR	Environmental Impact Report
EMMA	Emergency Managed Mutual Aid
EMS	Emergency Medical Services
EPCRA	Emergency Planning and Community Right To Know Act
EWCP	Emergency Water Conservation Plan
EWMP	Enhanced Watershed Management Plan
FAA	Federal Aviation Administration
FAR	Floor Area Ratio
fc	Foot-candles
FEMA	Federal Emergency Management Agency
FHWA	Federal Highway Administration

ACRONYMS

FIFRA	Federal Insecticide, Fungicide, and Rodenticide Act
FIRM	Flood Insurance Rate Maps
FPS	Fire Preemption System
ft	Feet
FTA	Federal Transit Administration
FY	Fiscal Year
GCASP	General Construction Activities Stormwater Permit
GHG	Greenhouse Gas
gpd	Gallons Per Day
gpcd	Gallons Per Capita per Day
GSA	Groundwater Sustainability Agency
HAPs	Hazardous Air Pollutants
HazMat	Hazardous Materials
HCM	Historic-Cultural Monuments
HCP	Habitat Conservation Plan
HFCs	Hydrofluorocarbons
HMIS	Hazardous Material Identification System
HMMP	Hazardous Material Management Program
HMTA	Hazardous Materials Transportation Act
HPOZ	Historic Preservation Overlay Zone
HQTA	High Quality Transit Areas
HRS	Hazard Ranking System
HTP	Hyperion Treatment Plant
HUD	Housing and Urban Development
HVAC	Heating, Ventilation, and Air Conditioning
I-10	Interstate-10 (Santa Monica Freeway)
I-405	Interstate-405 (San Diego Freeway)
IBC	International Building Code
IIPP	Injury and Illness Prevention Program
ILUP	Memorandum on Staff Direction on Industrial Land Use and Potential Conversion to Residential or Other Uses
IOUs	Investor Owned Utilities
IRIS	Integrated Risk Information System
IRP	Integrated Resources Plan
L_{eq}	Equivalent Noise Level
L_{dn}	Day-Night Noise Level
LA&I	Los Angeles and Independence Railroad
LAA	Los Angeles Aqueduct
LAAC	Los Angeles Administrative Code
LABC	Los Angeles Building Code
LACDPW	Los Angeles County Department of Public Works
LACFCD	Los Angeles County Flood Control District
LACM	Natural History Museum of Los Angeles County
LADBS	Los Angeles Department of Building and Safety

ACRONYMS

LADPW	City of Los Angeles Department of Public Works
LADWP	Los Angeles Department of Water and Power
LAFD	Los Angeles Fire Department
LAGBC	Los Angeles Green Building Code
LAGWRP	Los Angeles-Glendale Water Reclamation Plant
LAMC	Los Angeles Municipal Code
LADOT	City of Los Angeles Department of Transportation
LAPD	Los Angeles Police Department
LAPL	Los Angeles Public Library
LARWQCB	Los Angeles Regional Water Quality Control Board
LASAN	Los Angeles Bureau of Sanitation
LAUSD	Los Angeles Unified School District
LBP	Lead-Based Paint
LEV	Low Emission Vehicle
LID	Low Impact Development
LOS	Level of Service
LRT	Light Rail Transit
LRTP	Metro 2009 Long Range Transportation Plan
LSTs	Localized Significance Thresholds
LUCE	Land Use and Circulation Element
MAA	Mutual Aid Agreements
MATES- IV	Multiple Air Toxics Exposure Study
MCL	Maximum Contaminant Level
Metro	Los Angeles County Metropolitan Transportation Authority
MEP	Maximum Extent Practicable
Mgd	Million Gallons per Day
mg/L	Milligrams Per Liter
mmt	Million Metric Ton
MMcf/d	Million Cubic Feet per Day
MMcf/y	Million Cubic Feet per Year

1.0 INTRODUCTION

This chapter provides an overview of the purpose and focus of the Draft Environmental Impact Report (EIR), a discussion of the intended use of this Draft EIR, a description of the organization of the Draft EIR, and a discussion of the public review process and potential areas of controversy.

1.1 PURPOSE OF THIS REPORT

The City of Los Angeles (City) Department of City Planning (DCP) has prepared this Draft EIR for the following purposes:

- To satisfy the requirements of the California Environmental Quality Act (CEQA) (Public Resources Code [PRC] Sections 21000–21178) and the CEQA Guidelines (California Code of Regulations [CCR] Title 4, Chapter 14, Sections 15000–15387).
- To inform the general public, local community, and responsible and interested public agencies of the nature of the proposed specific plan, known as the Exposition Corridor Transit Neighborhood Plan (ECTNP, Proposed Plan, or Proposed Project), its possible environmental effects, possible measures to mitigate those effects, and alternatives to the Proposed Project.
- To enable the City to consider environmental consequences when deciding whether to approve the proposed ECTNP. As the public agency with the authority to approve or deny the Proposed Project, the City of Los Angeles will consider the information in this EIR along with other information before taking any action on the Proposed Project. The conclusions of the EIR regarding environmental impacts do not control the City's discretion to approve, deny or modify the Proposed Project, but instead are presented as information intended to aid the decision-making process.
- While this Draft EIR has been prepared for a large scale specific plan, project details have been anticipated to the extent feasible and development assumptions have been made in order to perform environmental analysis that may be sufficient for many projects within the ECTNP Area provided they comply with the assumptions and mitigation measures included herein. Many of the mitigation measures require project specific evaluation of issues and compliance with performance standards. If a project is unable to comply with a performance standard, then additional project-specific environmental review will be required. Projects that require additional review would use the analyses contained in this EIR for the purpose of cumulative impacts analysis and may also use the information contained within this EIR in order to "tier" subsequent environmental documentation.

The determination that the City of Los Angeles is the "lead agency" is made in accordance with Sections 15051 and 15367 of the CEQA Guidelines, which define the lead agency as the public agency that has the principal responsibility for carrying out or approving a project. This Draft EIR reflects the independent judgment of the City regarding the potential environmental impacts, the level of significance of the impacts both before and after mitigation, and the mitigation measures proposed to reduce impacts.

As described in CEQA and the CEQA Guidelines, public agencies are charged with the duty to avoid or substantially lessen significant environmental impacts, where feasible. In discharging this duty, a public agency has an obligation to balance the project's significant impacts on the environment with other conditions, including economic, social, technological, legal, and other benefits. This Draft EIR is an informational document, the purpose of which is to identify the potentially significant impacts of the Proposed Project on the environment and to indicate the manner in which those significant impacts can be avoided or significantly lessened; to identify any significant and unavoidable adverse impacts that cannot be mitigated; and to identify reasonable and feasible alternatives to the Proposed Project that would eliminate or reduce any significant adverse environmental impacts as feasible.

This Draft EIR was prepared in accordance with Section 15151 of the CEQA Guidelines which defines the standards for EIR adequacy as follows:

> *An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR would summarize the main points of disagreement among the experts. The courts have looked not for perfection; but for adequacy, completeness, and a good faith effort at full disclosure.*

1.2 AUTHORIZATION AND FOCUS

The City's DCP is responsible for preparing this Draft EIR. Ultimately, the Los Angeles City Council, in taking action on the proposed ECTNP, is responsible for the review and certification of the Final EIR.

Although the Draft EIR does not determine the ultimate decision that will be made regarding implementation of the project, CEQA requires that, prior to taking action on the Proposed Project, the City Council consider the information in the EIR and make findings regarding each significant effect. Once certified, the Final EIR will serve as the base environmental document for the proposed ECTNP and will be used as a basis for decisions on development in the Project Area.

Specifically, this EIR evaluates the environmental effects that could result from implementation of the Proposed Project. The following topic areas are addressed in this Draft EIR.

- Aesthetics
- Air Quality
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use
- Noise
- Population, Housing, and Employment
- Public Services
- Transportation and Traffic
- Utilities and Service Systems
- Cumulative Impacts
- Alternatives

1.3 LEAD AGENCY

In accordance with Section 15367 of the CEQA Guidelines, the lead agency for the Proposed Project is the City of Los Angeles. The lead agency is "the public agency which has the principal responsibility for carrying out or approving the project."

1.4 SCOPE AND INTENDED USE OF THIS DRAFT EIR

The Proposed Project seeks to plan for development around the new Expo Light Rail Transit (LRT) Line Phase 2 stations in a manner consistent with state, regional, and local policies, including the General Plan Framework, which directs growth to designated centers and areas served by transit, as a means to improve air quality, mobility, and reduce greenhouse gas (GHG) emissions (see further discussion of existing land use policy in Section 4.8, Land Use). Without the Proposed Project, changes to land use and zoning would occur in an ad-hoc, disorganized fashion, with uncoordinated requests for General Plan amendments and/or zone changes on a site-by-site basis. Such ad-hoc development would likely result in increased impacts as compared to the Proposed Project. While CEQA does require analysis of the No Project Alternative, the No

Project analysis is confined to what is reasonably foreseeable. Therefore, while this EIR does include an analysis of the No Project Alternative in Chapter 5.0, Alternatives, the analysis is limited to what is anticipated to occur within existing regulations. This EIR does not analyze ad-hoc development as an alternative because such development is unpredictable and not reasonably foreseeable.

As required by CEQA, this EIR generally analyzes the impact of the Proposed Project compared to existing conditions. As appropriate, the analysis of some impacts - namely traffic and noise – compares No Project to Project conditions in 2015 (the Expo Light Rail Train Line opening year) as well as No Project to the Project conditions in 2035, the horizon year of the Proposed Plan. At the time of preparation of this EIR, the Expo LRT was under construction. The operation of the LRT is anticipated to affect mobility patterns and mobile noise conditions, so it is appropriate to consider impacts in a "base year" (2015) in which the LRT is operational, for purposes of identifying project impacts by comparing 2015 Project and 2015 No Project scenarios. This scenario is theoretical because the Proposed Plan could not be built out by 2015, and is presented for informational purposes only. (When analysis began on the ECTNP the opening year for the Expo LRT Phase 2 was anticipated to be 2015; it instead opened in 2016; this change does not substantially affect the analyses.)

This Draft EIR analyzes the environmental impacts that would occur upon implementation of the proposed ECTNP, including an Alternative Compliance scenario that would allow total development in the Project Area to shift from non-residential uses to more residential development subject to increased public benefits. The ECTNP anticipates growth in specific areas, identified interchangeably in this EIR as "areas of proposed change" or "Subareas." These are areas where there are proposed changes to land use and zoning, including an increase in allowable density. The ECTNP directs growth to these areas in order to protect properties outside of the areas of proposed change.

Reasonably foreseeable development under the Proposed Project was forecast based on a market study[1] undertaken for the general Project Area, as well as available data showing city and regional growth trends (see **Appendix F**). Under the Proposed Project, it is reasonable to expect the addition of 4,423 dwelling units, 8,976 residents, and 14,334 jobs above existing conditions (2013). Under the Proposed Project with the Alternative Compliance scenario, it is reasonable to expect the addition of 6,042 dwelling units, 12,215 residents, and 9,457 jobs above existing conditions (2013).

Future development projects within the areas of proposed change that are consistent with the Proposed Project are included in the analysis of environmental impacts. If development were to exceed this projected growth, additional environmental review will be required. Accordingly, this EIR represents sufficient and adequate environmental review of projects that are fully consistent with the ECTNP and provides a basis for preparation of future environmental documents, as appropriate, for projects that are not fully consistent with the assumptions contained in this EIR.

1.5 DRAFT EIR ORGANIZATION

As shown in the Table of Contents and outlined below, this Draft EIR is organized into seven chapters each dealing with a separate aspect of the required content of an EIR as identified in the CEQA Guidelines. To help the reader locate information of particular interest, a brief summary of the contents of each chapter of the EIR is provided below:

1.0 INTRODUCTION. As stated above, this chapter contains an overview of the purpose and focus of the Draft EIR, a discussion of the intended use of this Draft EIR, a description of the organization of the Draft EIR, a discussion of the public review process, availability of the Draft EIR, and potential areas of controversy.

[1]Pro Forma Advisors, LLC, *Expo and Crenshaw LRT Station Area Plans Market Analysis*, 2013 (See **Appendix L**).

2.0 SUMMARY. This chapter provides a summary of the Proposed Project, its potential environmental effects and mitigation measures, and a summary of the alternatives to the Proposed Project evaluated in this Draft EIR.

3.0 PROJECT DESCRIPTION. This chapter describes the project location, existing conditions, project objectives, and a description of the Proposed Project.

4.0 ENVIRONMENTAL IMPACTS. This chapter contains the environmental setting, regulatory context, thresholds of significance, project analyses, mitigation measures, and conclusions regarding the level of significance after mitigation for each of the environmental issues identified in Section 1.2, above.

5.0 ALTERNATIVES. This chapter provides analysis of each of the three alternatives to the Proposed Project: No Project Alternative, Reduced Project Alternative, and Increased Residential/Reduced Employment Alternative. In addition, alternatives considered but rejected from further discussion are addressed, including a no commercial alternative and a further increased density alternative.

6.0. OTHER CEQA CONSIDERATIONS. This chapter provides a discussion of the (1) significant environmental effects of the Proposed Project, (2) significant environmental effects that cannot be avoided if the Proposed Project is implemented, (3) significant irreversible environmental changes that would result from implementation of the Proposed Project, (4) growth-inducing impacts of the Proposed Project, and (5) secondary effects of the Proposed Project.

7.0 PERSONS AND SOURCES CONSULTED. This chapter lists all of the persons, public agencies, and organizations that were consulted or contributed and all the references and sources used in the preparation of the Draft EIR.

1.6 EIR PROCESS

As described in Section 15143 of the CEQA Guidelines:

> *The EIR shall focus on the significant effects on the environment. The significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence. Effects dismissed in an Initial Study as clearly insignificant and unlikely to occur need not be discussed further in the EIR unless the Lead Agency subsequently receives information inconsistent with the finding in the Initial Study.*

As a first step in complying with the procedural requirements of CEQA, the City of Los Angeles published a Notice of Preparation (NOP) to inform responsible agencies and interested parties that an EIR was to be prepared for the Proposed Project and to request information and concerns relative to the potential environmental impacts of the Proposed Project.

In compliance with CEQA, the City of Los Angeles completed a multi-step process to determine the appropriate scope of issues to be examined in this Draft EIR. The City filed the NOP with the State Clearinghouse in the Office of Planning and Research (SCH No. 2013031038) as an indication that an EIR would be prepared. The NOP for this Draft EIR was published on March 14, 2013 by the City's DCP for a 30-day public review period. Information, data and observations addressing comments from these letters are included throughout this Draft EIR where relevant. The NOP and copies of each comment letter received are included in **Appendix A** of this Draft EIR. A public scoping meeting was held on April 10, 2013. The purpose of this meeting was to provide early consultation for the public to express their concerns about the Proposed Project, and acquire information and make recommendations on issues to be addressed in the Draft EIR.

During the preparation of the EIR, agencies, organizations, and persons whom the City believed might have an interest in this proposed project were specifically contacted. Information, data, and observations from these contacts are included in the EIR. Agencies or interested persons who did not respond during the public review period of the NOP will have an opportunity to comment during the public review period of the Draft EIR, as well as at subsequent hearings on the Proposed Project.

This EIR has been prepared to meet all of the substantive and procedural requirements of CEQA (PRC Section 21000 *et seq.*), the CEQA Guidelines (CCR, Title 14, Section 15000 *et seq.*). Accordingly, the City of Los Angeles is the lead agency for this Proposed Project, taking primary responsibility for conducting the environmental review and approving or denying the project.

Any environmental impacts that cannot be mitigated to a less than significant level are considered to be significant and unavoidable. If a public agency approves a project that has significant and unavoidable impacts, the agency must state in writing the specific reasons for approving the project, based on the Final EIR and any other information in the public record for the project. This is termed a "statement of overriding considerations," which is used to explain the specific reasons why the benefits of a Proposed Project make its unavoidable environmental effects acceptable. The statement is prepared, if required, after the Final EIR has been completed, yet before action to approve the project has been taken.

1.7 AVAILABILITY OF DRAFT EIR

In accordance with Sections 15087 and 15105 of the CEQA Guidelines, this Draft EIR is being circulated for a 60-day public review period. Responsible and trustee agencies and the public are invited to comment in writing on the information contained in this document. Persons and agencies commenting are encouraged to provide information that they believe is missing from the Draft EIR and to identify where the information can be obtained. The City is required to respond to comments on significant environmental issues only. All such comment letters, received during the 60-day comment period, concerning the Draft EIR will be responded to in writing. Comment letters, together with the responses to those comments, will be included in the Final EIR.

The Draft EIR is available for review at the following locations:

Richard J. Riordan Central Library
630 W. 5th Street
Los Angeles, CA 90071

Palms-Rancho Park Library – Branch 22
2920 Overland Avenue
Los Angeles, CA 90064

Mar Vista Library – Branch 38
12006 Venice Boulevard
Los Angeles, CA 90066

Westwood Branch Library – Branch 71
1246 Glendon Avenue
Los Angeles, CA 90024

Robertson Branch Library – Branch 42
1719 S. Robertson Boulevard
Los Angeles, CA 90035

West Los Angeles Regional Library – Branch 27
11360 Santa Monica Boulevard
Los Angeles, CA 90025

Additionally, the Draft EIR can be downloaded or reviewed via the Internet at the Department of City Planning's website [http://planning.lacity.org/ (click on "Environmental Review" and then "Draft EIR")]. The Draft EIR can be purchased on cd-rom for $7.50 per copy. Contact **Lameese Chang** of the City of Los Angeles at **lameese.chang@lacity.org** to purchase one.

Interested parties may provide written comments on the Draft EIR. Written comments on the Draft EIR must be postmarked by May 30, 2017 and should be addressed to:

Lameese Chang
Los Angeles Department of City Planning
200 N. Spring Street, Room 667
Los Angeles, California 90012
(213) 978-1178 (phone)
(213) 978-1477 (fax)
lameese.chang@lacity.org (e-mail)

Upon completion of the 60-day public review period, written responses to all comments on environmental issues discussed in the Draft EIR and raised by commenters will be prepared and incorporated into the Final EIR. These comments, and their responses, will be included in the Final EIR for consideration by the City of Los Angeles, as well as other public decision makers.

1.8 AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED

Potential areas of controversy and issues to be resolved by the decision-makers may include those environmental issue areas where the potential for a significant unavoidable impact has been identified. These areas include Aesthetics; Air Quality; Cultural Resources; Noise; Public Services; and Transportation and Traffic. Based on the NOP comment letters provided in **Appendix A**, issues known to be of concern in the community include, but are not limited to, the following:

- Appropriate parking requirements for new development in transit areas;
- Insufficient parking and potential for spillover parking from transit stations and increased density;
- Lack of parking for transit riders at the Palms and Westwood Stations;
- Lack of green/open space around station areas;
- Increased traffic;
- Increased density and change in character, especially in proximity to established residential neighborhoods;
- Use of native plants and trees within streetscapes;
- Need to prioritize multiple modes of travel in the street design and configuration;
- Improvements to pedestrian/bicyclist mobility and accessibility, including protected bike lanes that would not block vehicular traffic;
- Concern about the impact of commercial development on traffic;
- Loss of industrial uses;
- Inclusion of cumulative projects in the traffic study;
- Opportunities and challenges in the South Robertson area, including connecting the South Robertson Corridor to the transit-oriented development around the Culver City Station;
- Scope of the project, with a recommendation to limit changes to within 100-foot radius of each station;
- Potential shading impacts and other impacts on adjacent residential uses;
- Zone changes in R1 zones; and
- Provision of affordable housing to preserve the current demographic characteristics of the Palms Station area.

2.0 SUMMARY

In accordance with California Environmental Quality Act (CEQA) Guidelines Section 15123, this chapter of the Draft Environmental Impact Report (EIR) contains an overview of the Exposition Corridor Transit Neighborhood Plan (ECTNP, Proposed Plan, or Proposed Project), its potential environmental effects and mitigation measures, and a summary of the alternatives to the Proposed Project evaluated in this Draft EIR.

2.1 INTRODUCTION

The purpose of an EIR, as defined in Section 15121(a) of the CEQA Guidelines for the implementation of the CEQA California Code of Regulations (CCR), Title 14, Division 6, Chapter 3 "Guidelines," is to "inform public agency decision-makers and the public generally of the potential significant environmental effects of a project, identify possible ways to minimize the significant effect and describe reasonable alternatives to the project." This document assesses the potential significant environmental impacts, including significant unavoidable impacts and cumulative impacts, related to the Proposed Project. Where there is potential for a significant adverse effect, this report identifies mitigation measures that would either eliminate the impact or reduce the effect to a less-than-significant level.

As the City of Los Angeles (City) is the lead agency, this Draft EIR was prepared under the supervision of the City of Los Angeles Department of City Planning (DCP). The intended use of this Draft EIR is to assist the City in making decisions regarding the approval of the Proposed Project.

A Notice of Preparation (NOP) for this Draft EIR was issued on March 14, 2013, by the City for a 30-day public review period. Information, data, and observations resulting from these letters are included throughout this Draft EIR where relevant. The NOP and copies of each comment letter received are included in **Appendix A** of this Draft EIR. A public scoping meeting was held on April 10, 2013. The purpose of this meeting was to provide early consultation for the public to express their concerns about the Proposed Project, and acquire information and make recommendations on issues to be addressed in the Draft EIR.

In accordance with Sections 15087 and 15105 of the CEQA Guidelines, this Draft EIR is being circulated for a 60-day public review period. Responsible and trustee agencies and the public are invited to comment in writing on the information contained in this document. Persons and agencies commenting are encouraged to provide information that they believe is missing from the Draft EIR and to identify where the information can be obtained. The City's DCP is required to respond to comments on significant environmental issues only. Such comments on the Draft EIR, received within the 60-day comment period, will be responded to in writing. The comment letters, together with the responses to those comments, will be included in the Final EIR.

Comment letters should be sent to:

Lameese Chang
Los Angeles Department of City Planning
200 N. Spring Street, Room 667
Los Angeles, California 90012
(213) 978-1178 (phone)
(213) 978-1477 (fax)
lameese.chang@lacity.org (e-mail)

2.2 SUMMARY OF THE PROPOSED PROJECT

The Los Angeles County Metropolitan Transportation Authority (Metro) Exposition (Expo) Light Rail Transit (LRT) is a 15.2-mile-long transit line running between downtown Los Angeles and the City of Santa Monica. The Proposed Project would establish a Specific Plan to guide future development within the Expo LRT Corridor around five stations. These stations include Exposition/Bundy (Bundy), Exposition/Sepulveda (Sepulveda), Westwood/Rancho Park (Westwood), National/Palms (Palms), and Culver City. The Specific Plan would include General Plan amendments and zone changes that encourage infill development and a mix of uses within the identified areas to promote transit ridership, reduce automobile dependence, and create vibrant neighborhoods around the transit stations.

The Proposed Project: (1) creates four new zones and one new land use designation, and changes zoning and land use designations within specified portions of the Project Area; (2) includes public benefit requirements associated with tiered floor area ratios (FAR) in the new zones; (3) creates streetscape plans for identified street segments in the Project Area; and (4) requires design standards for new development within the Project Area (excluding R1 and R2 zones). The Proposed Project also includes new open space regulations and parking regulations for select properties within the Project Area.

The proposed ECTNP would guide future development in identified areas by specifying the type of uses, FAR, development requirements and design standards that would apply. The Proposed Project encourages new development at transit station areas with the goal of promoting transit ridership and creating an active, mixed use environment in the station areas. The primary objectives for the proposed ECTNP are as follows:

Primary Objective 1: Implement the policies of the City of Los Angeles General Plan Framework, the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and the West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles Community Plans that encourage growth to be directed to transit-oriented areas and foster more sustainable, mixed use development patterns that improve mobility options and reduce auto dependence.

Primary Objective 2: Accommodate employment, housing, and population growth projections forecasted through the planning horizon year of 2035 by focusing residential development and new job-generating uses around transit stations.

Primary Objective 3: Maintain and expand the City's jobs base and increase opportunities for economic development in the Expo Corridor in order to increase the generation of tax revenue in the City that will help pay for the provision of City services.

Primary Objective 4: Implement the General Plan Framework goal to capture a significant share of regional growth in emerging environmentally oriented and clean industries such as technology industry jobs, which are clustered on the Westside and comprise a growing industry sector, and institute zoning that accommodates and creates incentives for the location and continued clustering of these technology industry jobs in the Expo Corridor where they will benefit from the proximity to transit and mixed use environments.

Primary Objective 5: Create incentives for the provision of affordable housing in new residential development near the Expo LRT Line to enhance accessibility and housing options for core transit riders and increase transit ridership.

Primary Objective 6: Improve circulation within the station areas; increase mobility choices; promote transit ridership and use of other alternative transit modes; and reduce vehicle miles traveled per capita for those who live and/or work within the Expo Corridor.

The ECTNP also includes secondary objectives that aim to develop a more comprehensive, cohesive, and sustainable planning document.

Secondary Objective 1: Ensure new development is pedestrian-oriented, acknowledges the transit stations, and is compatible with surrounding neighborhoods through the design of buildings, streets, and the public realm.

Secondary Objective 2: Stimulate vibrancy and activity and create a unique sense of place within each station area through the design of buildings, streets, and the public realm.

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans, modified street standards, and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would not affect every parcel within the Project Area; changes would only occur within specific "areas of proposed change."

2.3 SIGNIFICANT AND UNAVOIDABLE IMPACTS

Section 15382 of the CEQA Guidelines defines a significant impact on the environment as "a substantial, or potentially substantial, adverse change in any of the physical conditions within an area affected by the project, including land, air, water, flora, fauna, ambient noise, and objects of historic or aesthetic significance." In order to approve a project with significant and unavoidable impacts, the lead agency must adopt a Statement of Overriding Considerations (in accordance with Section 15093 of the CEQA Guidelines) indicating that the benefits of approving the Proposed Project outweigh the negative environmental consequences. Based on the analysis contained in this EIR, the Proposed Project would create significant and unavoidable impacts related to the following topics:

- Aesthetics (Visual Character and Shade)
- Air Quality (Standards during construction and sensitive receptors during construction)
- Cultural Resources (Historical Resources)
- Noise (Construction Noise Standards and Vibration; Operational Noise)
- Public Services (Parks and Recreational Facilities)
- Transportation and Traffic (Circulation System; Neighborhood Intrusion; Congestion Management Plan Arterial Intersection Analysis)

2.4 SIGNIFICANT IMPACTS THAT CAN BE MITIGATED TO LESS THAN SIGNIFICANT; LESS-THAN-SIGNIFICANT IMPACTS; OR NO IMPACT

Based on the analysis contained in this Draft EIR, the following were found to result in a less-than-significant impact or no impact:

- Aesthetics (Scenic Vistas; Scenic Resources; Light and Glare; Geological/Topographical Features)
- Air Quality (Implementation of Air Quality Plan; Odors)
- Cultural Resources (Archaeological or Paleontological Resources; Human Remains)
- Geology and Soils (Rupture of Faults; Seismic Ground Shaking; Liquefaction; Landslides; Expansive Soils; Unstable Geologic Units; Soil Erosion; and Septic Tanks)
- Greenhouse Gas Emissions (Emissions Generation; GHG Reductions Plans)
- Hazards and Hazardous Materials (Transport, Use and Disposal; Upset and Accident Conditions; Schools; Sites; Airport Hazards; Airstrip Hazards; Plans; Wildland Fire)

- Hydrology and Water Quality (Water Quality Standards; Groundwater Supplies; Drainage; and Streams or Rivers; Drainage and Erosion; Runoff Water and Stormwater; Flood Hazard; Seiche, Tsunami, and Mudflow/Mudslides)
- Land Use and Planning (Physically dividing an established community; Conflicting with any applicable land use plan, policy, or regulation; Habitat Conservation Plans and Natural Community Conservation Plans)
- Noise (Noise from public airports; Noise from private airstrips)
- Population, Housing and Employment (Inducing population Growth; Displacement of population; Displacement of housing units)
- Public Services (Fire; Police; Public Schools; Libraries)
- Transportation and Traffic (Transit, Bicycle, and Pedestrian Facilities and Plans; Congestion Management Plan Freeway Analysis and Transit Impact Review; Emergency Vehicle Access; Design Features; Construction in the Public Right-of-Way)
- Utilities (Water; Wastewater; Stormwater; Solid Waste; Energy)

2.5 SUMMARY OF ALTERNATIVES

CEQA requires that an EIR describe a range of reasonable alternatives to the project or to the location of the project that would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.[1] An EIR should also evaluate the comparative merits of the alternatives. The range of feasible alternatives is selected and discussed in a manner intended to foster meaningful public participation and informed decision making. Among the factors that may be taken into account when addressing the feasibility of alternatives (as described in CEQA Guidelines Section 15126.6[f][1]) are environmental impacts, site suitability, economic viability, availability of infrastructure, general plan consistency, regulatory limitations, jurisdictional boundaries, and whether the proponent could reasonably acquire, control, or otherwise have access to the alternative site.

The alternatives considered for the Proposed Project include:

Alternative 1 – No Project Alternative. The No Project Alternative is required by Section 15126.6(e)(2) of the CEQA Guidelines and assumes that the Proposed Project would not be implemented. The No Project Alternative allows the decision-maker to compare the impacts of approving the Proposed Project with the impacts of not approving the Proposed Project. However, "no project" does not mean that development within the ECTNP Area will be prohibited. The No Project Alternative includes "what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services" (CEQA Guidelines Section 15126.6[e][2]).

This Alternative assumes reasonably foreseeable development under existing zoning, General Plan designations, and land use regulations, and assumes no discretionary actions such as site-specific zone changes. However, the recent opening and operation of the Expo LRT Line, could result in uncoordinated requests for General Plan amendments and zoning changes that are not reasonably foreseeable in this document.

Alternative 2 – Reduced Project Alternative. Under this Alternative there would be an overall reduction in development as compared to the Proposed Project. This Alternative would have the same mix of uses as the Proposed Project but less overall density (i.e. all development reduced proportionately by 25 percent) to illustrate how impacts would differ with less development.

[1]CEQA Guidelines Section 15126.6.

Alternative 3 – Increased Residential / Reduced Employment Alternative. This Alternative would have approximately the same amount of development as the Proposed Project but would substantially increase the proportion of residential development and reduce the amount of non-residential square footage that could occur under the Proposed Plan. This Alternative would increase the reasonably expected number of residential units above existing by 25 percent as compared to the reasonably expected number of units under the Proposed Project with Alternative Compliance scenario.

2.6 SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

A summary of the environmental impacts associated with the proposed ECTNP and mitigation measures proposed to avoid or lessen the severity of potentially significant environmental impacts after mitigation is identified in **Table 2-1**. The level of significance of environmental impacts after mitigation is also identified in the table, where applicable.

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
AESTHETICS		
Impact 4.1-1: Would implementation of the Proposed Project have a substantial adverse effect on a scenic vista/obstruction of views?	None required.	Less than Significant
Impact 4.1-2: Would implementation of the Proposed Project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	None required.	Less than Significant
Impact 4.1-3: Would implementation of the Proposed Project substantially degrade the existing visual character or quality of the site and its surroundings?	Beyond the proposed Design Standards, no feasible mitigation measures have been identified.	Significant and Unavoidable
Impact 4.1-4: Would implementation of the Proposed Project create a new source of substantial light or glare that could adversely affect day- or nighttime views in the project area?	**AE1** The City shall require that glare effects be limited by using non-reflective building and construction materials, such as concrete, wood, composite materials, coated metal, non-reflective glass, and stone. This shall include, but not be limited to, art installations, fencing material, and recreational equipment.	Less than Significant
Impact 4.1-5: Would implementation of the Proposed Project result in development of structures that would shade shadow-sensitive uses for more than three hours between the hours of 9:00 a.m. and 3:00 p.m. Pacific Standard Time (between late October and early April), or for more than four hours between the hours of 9:00 a.m. and 5:00 p.m. Pacific Daylight Time (between early April and late October)?	Beyond the proposed Design Standards, no feasible mitigation measures have been identified.	Significant and Unavoidable
Impact 4.1-6: Would implementation of the Proposed Project destroy, permanently cover or materially and adversely modify one or more distinct and prominent geologic or topographic features such as hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds and wetlands?	None required.	Less than Significant
AIR QUALITY		
Impact 4.2-1: Would implementation of the Proposed Project conflict with or obstruct implementation of the applicable air quality plan?	None required.	Less than Significant
Impact 4.2-2: Would implementation of the Proposed Project violate an air quality standard or contribute substantially to an existing or projected air quality violation?	**AQ1** The City shall require all applicants to include in the agreements with contractors and subcontractors the following best management practices in contract specifications: • Use properly tuned and maintained equipment. • Contractors shall enforce the idling limit of five minutes as set forth in the California Code of Regulations. • Use diesel-fueled construction equipment to be retrofitted with after treatment products (e.g., engine catalysts) to the extent they are readily available and feasible. • Use heavy duty diesel-fueled equipment that uses low NO_X diesel fuel to the extent it is readily available and feasible. • Use construction equipment that uses low polluting fuels (i.e., compressed natural gas, liquid petroleum gas, and unleaded gasoline) to the extent available and feasible.	Significant and Unavoidable (construction); however, operational characteristics associated with implementing the Proposed Project would not result in a significant regional or localized air quality impact.

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
	• Maintain construction equipment in good operating condition to minimize air pollutants. • Project applicants shall ensure that all construction equipment meets or exceeds equivalent emissions performance to that of U.S. Environmental Protection Agency (USEPA) Tier 4 standards for non-road engines. In the event that Tier 4 engines are not available for any off-road equipment larger than 100 horsepower, that equipment shall be equipped with a Tier 3 engine, or an engine that is equipped with retrofit controls to reduce exhaust emissions of nitrogen oxides and diesel particulate matter to no more than Tier 3 levels unless certified by engine manufacturers or the on-site air quality construction mitigation manager that the use of such devices is not practical for specific engine types. For purposes of this condition, the use of such devices is "not practical" for the following, as well as other, reasons: - There is no available retrofit control device that has been verified by either the CARB or USEPA to control the engine in question to Tier 3; - The construction equipment is intended to be on site for five days or less; or - Relief may be granted from this requirement if a good faith effort has been made to comply with this requirement and that compliance is not practical. • The use of a retrofit control device may be terminated immediately, provided that a replacement for the equipment item in question meeting the required controls occurs within ten days of termination of the use, if the equipment would be needed to continue working at this site for more than 15 days after the use of the retrofit control device is terminated, if one of the following conditions exists: - The use of the retrofit control device is excessively reducing the normal availability of the construction equipment due to increased down time for maintenance, and/or reduced power output due to an excessive increase in back pressure; - The retrofit control device is causing or is reasonably expected to cause engine damage; - The retrofit control device is causing or is reasonably expected to cause a substantial risk to workers or the public; or - Any other seriously detrimental cause which has the approval of the project manager prior to implementation of the termination. • Construction contractors shall use electricity from power poles rather than temporary gasoline or diesel power generators, as feasible. • Use building materials, paints, sealants, mechanical equipment, and other materials that yield low air pollutants and are nontoxic. • Construction contractors shall utilize super-compliant architectural coatings as defined by the South Coast Air Quality Management District (Volatile Organic Compound standard of less than ten grams per liter). • Construction contractors shall utilize materials that do not require painting, as feasible. • Construction contractors shall use pre-painted construction materials, as feasible.	

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.2-3: Would implementation of the Proposed Project expose sensitive receptors to substantial pollutant concentrations?	Refer to Mitigation Measure **AQ1** for mitigation related to exposing sensitive receptors during construction activities.	Significant and Unavoidable (construction); however, operational characteristics associated with implementing the Proposed Project would not result in a significant impact related to exposing sensitive receptors.
Impact 4.2-4: Would implementation of the Proposed Project create objectionable odors affecting a substantial number of people?	None required.	Less than Significant
CULTURAL RESOURCES		
Impact 4.3-1: Would implementation of the Proposed Project cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5?	Beyond the existing regulatory framework and the Proposed Plan standards, no feasible mitigation measures have been identified.	Significant and Unavoidable
Impact 4.3-2: Would implementation of the Proposed Project cause a substantial adverse change in the significance of an archaeological resource?	**CR1** A qualified archaeologist shall be required to monitor excavation and grading activities in soils that have not been previously disturbed, to identify, record, and evaluate the significance of any archaeological finds during construction. If archaeological resources are uncovered (in either a previously disturbed or undisturbed area), the City Department of Building and Safety shall be notified immediately, and all work shall cease in the area of the find until a qualified archaeologist has evaluated the find in accordance with federal, state, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. Personnel of the project shall not collect or move any archaeological materials or associated materials. Construction activity may continue unimpeded on other portions of the project site. The found deposits shall be treated in accordance with federal, state, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. Construction activities in the area where resources were found may commence once the identified resources are properly assessed and processed by a qualified archeologist. **CR2** The City shall require that all cultural resources identified on a site be assessed and treated in a manner determined appropriate by a qualified archeologist in consultation with the City's Office of Historic Resources. A report shall be prepared according to current professional standards that describes the resource, how it was assessed, and disposition.	Less than Significant
Impact 4.3-3: Would implementation of the Proposed Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	**CR3** A qualified paleontologist shall be required to monitor excavation and grading activities in soils that have not been previously disturbed. If paleontological resources are uncovered (in either a previously disturbed or undisturbed area), the City Department of Building and Safety shall be notified immediately, and all work on the project site shall cease until a qualified paleontologist evaluates the find. The paleontologist shall determine the location, the time frame, and the extent to which any monitoring of earthmoving activities shall be required. Halted construction activities on the project site may commence once the identified resources are properly assessed and processed by a qualified paleontologist. **CR4** The City shall require that all paleontological resources identified on a project site be assessed and treated in a manner determined by a qualified paleontologist in consultation with the City's Office of Historic Resources. A report shall be prepared according to current professional standards that describes the resource, how it was assessed, and disposition. Any reports and surveys shall be submitted to the City's Office of Historic Resources and the Natural History Museum of Los Angeles County.	Less than Significant

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.3-4: Would implementation of the Proposed Project could disturb human remains, including those interred outside of formal cemeteries?	None required.	Less than Significant
GEOLOGY AND SOILS		
Impact 4.4-1: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving the rupture of a known earthquake fault?	None required.	No Impact
Impact 4.4-2: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from strong seismic ground shaking?	None required.	No Impact
Impact 4.4-3: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from seismic-related ground failure, including liquefaction?	None required.	No Impact
Impact 4.4-4: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from seismic-related ground failure, including landslides?	None required.	No Impact
Impact 4.4-5: Would implementation of the Proposed Project be located on geologic unit that is unstable, or that would become unstable as a result of the Proposed Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	None required.	No Impact
Impact 4.4-6: Would implementation of the Proposed Project lead to construction on existing expansive soils, as defined in Table 18-1-B of the Uniform Building Code (1994), Creating substantial risks to life or property?	None required.	No Impact
Impact 4.4-7: Would implementation of the Proposed Project result in substantial soil erosion or the loss of topsoil?	None required.	Less than Significant
Impact 4.4-8: Would implementation of the Proposed Project involve the use of septic tanks or alternative waste water disposal system and, therefore, result in hazards related to construction on soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems?	None required.	No Impact
GREENHOUSE GAS EMISSIONS		
Impact 4.5-1: Would implementation of the Proposed Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?	None required.	Less than Significant

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.5-2: Would implementation of the Proposed Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions?	None required.	Less than Significant
HAZARDS AND HAZARDOUS MATERIALS		
Impact 4.6-1: Would implementation of the Proposed Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	None required.	Less than Significant
Impact 4.6-2: Would implementation of the Proposed Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	None required.	Less than Significant
Impact 4.6-3: Would implementation of the Proposed Project result in hazardous emissions or the handling of acutely hazardous materials, substances, or waste within a quarter mile of an existing or proposed school, creating a risk to human health from such activities?	None required.	Less than Significant
Impact 4.6-4: Would development under the Proposed Project be located on a site that is included on a list of hazardous materials sites compiled pursuant to government code section 65962.5 and, as a result, could development create a significant hazard to the public or the environment?	**HM1** The City shall require that future development that involves new construction and soil disturbance document that the site is not on any government list of sites containing hazardous waste or hazardous materials (including lists prepared pursuant to Government Code, section 65962.5). A report setting forth the results of this database search (e.g. historical environmental reports prepared by Enviroscan, EDR, or similar firms) shall be provided to the City. If the report indicates the project site, or property within one-quarter mile of the project site has the potential to be contaminated with hazardous waste or hazardous materials for any reason, a Phase I Environmental Site Assessment (ESA) shall be prepared. The Phase I assessment shall be prepared by an appropriately qualified individual (with experience in the identification and mitigation of hazardous materials and wastes) in accordance with state standards and guidelines to evaluate whether the site or the surrounding area is contaminated from the past or current uses including storage, use, transport, generation, and disposal of toxic and hazardous waste or materials. Depending on the results of this study, further investigation and remediation may be required in accordance with local, state, and federal regulations and policies. Any further study found necessary by an appropriately qualified individual or relevant federal, state, or local agency shall be performed prior to project approval or made a condition of project approval. Prior to the Department of Building and Safety's issuance of any permits that allow for grading or construction on the project sites that were on a government list or within one-quarter mile of a site on a government list, the appropriately qualified individual or relevant agency shall provide written confirmation to the City that any necessary remediation has been completed to the satisfaction of the lead agency responsible for cleanup including confirmation that required site remediation was completed consistent with the relevant federal, state, or local requirements.	Less than Significant
Impact 4.6-5: Would Implementation of the Proposed Project result in a safety hazard for people residing or working in the project area near a public airport?	None required.	Less than Significant

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.6-6: Would implementation of the Proposed Project result in a safety hazard for people residing or working in the project area near a private airstrip?	None required.	No Impact
Impact 4.6-7: Would implementation of the Proposed Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	None required.	Less than Significant
Impact 4.6-8: Would implementation of the Proposed Project expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	None required.	No Impact
HYDROLOGY AND WATER QUALITY		
Impact 4.7-1: Would implementation of the Proposed Project violate any water quality standards or waste discharge requirements?	None required.	Less than Significant
Impact 4.7-2: Would implementation of the Proposed Project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)?	None required.	Less than Significant
Impact 4.7-3: Would implementation of the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?	None required.	Less than Significant
Impact 4.7-4: Would implementation of the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?	None required.	Less than Significant
Impact 4.7-5: Would implementation of the Proposed Project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	None required.	Less than Significant
Impact 4.7-6: Would implementation of the Proposed Project otherwise substantially degrade water quality?	None required.	Less than Significant
Impact 4.7-7: Would development under the Proposed Project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	**HWQ1** Buildings within a 100-year floodplain (i.e., the area of proposed change on the north side of Pico Boulevard between Westwood Boulevard and Overland Avenue) shall be designed and constructed a minimum of one foot above the 100-year flood water surface elevation to ensure the protection of structures from all flooding events.	Less than Significant
Impact 4.7-8: Would implementation of the Proposed Project place structures which would impede or redirect flood flows within a 100-year flood hazard area?	None required.	No Impact

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.7-9: Would implementation of the Proposed Project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	None required.	Less than Significant
Impact 4.7-10: Would implementation of the Proposed Project expose people or structures to risk from seiche, tsunami, or mudflow/mudslides?	None required.	No Impact
LAND USE		
Impact 4.8-1: Would implementation of the Proposed Project physically divide an established community?	None required.	Less than Significant
Impact 4.8-2: Would implementation of the Proposed Project be consistent with applicable adopted regional, state and local goals, policies and regulations and therefore, would not conflict with applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	None required.	Less than Significant
Impact 4.8-3: Would implementation of the Proposed Project conflict with any applicable habitat conservation plans or natural community conservation plans?	None required.	No Impact
NOISE		
Impact 4.9-1: Would implementation of the Proposed Project expose persons to or generate noise in levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	**N1** The City, as a condition of any approval for applicable projects within the ECTNP, shall require all contractors to include the following best management practices in contract specifications: • Construction haul truck and materials delivery traffic shall avoid residential areas whenever feasible. If no alternatives are available, truck traffic shall be routed on streets with the fewest residences. • The construction contractor shall locate construction staging areas away from sensitive uses. • When construction activities are located within 500 feet of noise-sensitive land uses, noise barriers (e.g., temporary walls or piles of excavated material) shall be constructed between activities and noise sensitive uses. • Impact pile drivers shall be avoided where possible in noise-sensitive areas. Drilled piles or the use of a sonic vibratory pile driver are quieter alternatives that shall be utilized where geological conditions permit their use. Noise shrouds shall be used when necessary to reduce noise of pile drilling/driving. • Construction equipment shall be equipped with mufflers that comply with manufacturers' requirements. • The construction contractor shall use on-site electrical sources to power equipment rather than diesel generators where feasible.	Significant and Unavoidable

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
	N2 The following conditions shall apply to future development within New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial-Residential Emphasis, and Mixed Use: Commercial/Residential zones with direct line-of-site to adjacent residential and other sensitive land uses: • Industrial activity yards that include the operation of heavy equipment shall be shielded by sound barriers that block line-of-sight to sensitive receptors. • Mechanical equipment (e.g., HVAC Systems) shall be enclosed with sound buffering materials. • Truck loading/unloading activity shall be prohibited between the hours of 10:00 p.m. and 7:00 a.m. when located within 200 feet of a residential land use. • Parking structures located within 200 feet of any residential use shall be constructed with a solid wall abutting the residences and utilize textured surfaces on garage floors and ramps to minimize tire squeal.	
Impact 4.9-2: Would implementation of the Proposed Project result in a substantial permanent increase in ambient noise levels in the proposed project vicinity above levels existing without the project?	Refer to Mitigation Measure **N2** above for mitigation related to permanent noise from operational activity.	Significant and Unavoidable
Impact 4.9-3: Would implementation of the Proposed Project result in a substantial temporary or periodic increase in ambient noise levels in the proposed project vicinity above levels existing without the project?	Refer to Mitigation Measure **N1** above for mitigation related to temporary and periodic noise from construction activity.	Significant and Unavoidable
Impact 4.9-4: Would implementation of the Proposed Project expose people to or generate excessive vibration or ground-borne noise levels?	**N3** As part of project conditions for new development within the ECTNP Area, the City shall require all contractors to include the following best management practices in contract specifications: • The construction contractor shall manage construction phasing (scheduling demolition, earthmoving, and ground-impacting operations so as not to occur in the same time period), use low-impact construction technologies, and shall avoid the use of vibrating equipment where possible to avoid construction vibration impacts. • The construction contractor shall utilize alternatives to impact pile drivers, such as sonic pile drivers or caisson drills. If geotechnical limitations require the use of pile driving, control measures shall be used to reduce vibration levels. These measures may include, but are not limited to: - Predrilled holes; - Cast-in-place or auger cast piles; - Pile cushioning (i.e., a resilient material placed between the driving hammer and the pile); - Jetting (i.e., pumping a mixture of air and water through high-pressure nozzles to erode the soil adjacent to the pile); and - Non-displacement piles (i.e., piles that achieve capacity from the end bearing rather than the pile shaft).	Significant and Unavoidable related to construction impacts; Impacts related to operational vibration were determined to be less than significant without mitigation.

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.9-5: Would implementation of the Proposed Project exacerbate levels of exposure for people working or residing within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport to excessive noise levels?	None required.	No Impact
Impact 4.9-6: Would implementation of the Proposed Project exacerbate levels of exposure for people working or residing within the vicinity of a private airstrip to excessive noise levels?	None required.	No Impact
POPULATION, HOUSING, AND EMPLOYMENT		
Impact 4.10-1: Would implementation of the Proposed Project induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	None required.	Less than Significant
Impact 4.10-2: Would implementation of the Proposed Project displace substantial numbers of existing housing units, necessitating the construction of replacement housing elsewhere?	None required.	Less than Significant
Impact 4.10-3: Would implementation of the Proposed Project displace substantial numbers of people necessitating the construction of replacement housing elsewhere?	None required.	Less than Significant
PUBLIC SERVICES		
Impact 4.11-1: Would implementation of the Proposed Project foreseeably require the addition of a new fire station or the expansion, consolidation, or relocation of an existing facility, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection and emergency response?	None required.	Less than Significant
Impact 4.11-2: Would implementation of the Proposed Project result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, and other performance objectives?	None required.	Less than Significant
Impact 4.11-3: Would implementation of the Proposed Project create additional demand for public school enrollment that could not be adequately accommodated by existing schools serving the project area, resulting in the need for new or physically altered school facilities?	None required.	Less than Significant
Impact 4.11-4: Would implementation of the Proposed Project create additional demand for parks and recreation facilities that could not be adequately accommodated by existing facilities serving the Project Area and likely result in the need for new or physically altered parks and recreation facilities?	No feasible mitigation measures exist.	Significant and Unavoidable
Impact 4.11-5: Would implementation of the Proposed Project create additional demand for library services that could not be adequately accommodated by existing facilities serving the project area and likely result in the need for new or physically altered library facilities?	None required.	Less than Significant

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
TRANSPORTATION AND TRAFFIC		
Impact 4.12-1: Would implementation of the Proposed Project disrupt existing public transit, bicycle, or pedestrian facilities or interfere with planned facilities, or create conflicts or inconsistencies with adopted public transit, bicycle, or pedestrian system plans, guidelines, policies, or standards or otherwise decrease the performance or safety of such facilities?	None required.	Less than Significant
Impact 4.12-2: Would implementation of the Proposed Project impact the circulation system by exceeding the applicable thresholds established by each jurisdiction?	**TR1** A trip generation analysis, as well as an access and circulation study per LADOT guidelines, will be required as part of the development application for projects within the Specific Plan boundary that result in net new square footage for purposes of determining consistency of the project with the transportation assumptions in the EIR. The Specific Plan area is divided into five ECTNP station segments, as shown in Figure 3-2 in the Project Description. To be consistent, a project cannot cause the total estimated 2035 trip forecasts (for the station segment in which it is located) to exceed the number of either AM or PM peak hour net new external trips analyzed in the EIR (see Table 4.12-5). If a project is determined to be consistent, no further traffic analysis will be required. However, if a project causes the number of either AM or PM peak hour net external trips to exceed the cumulative total number of trips in the corresponding station segment analyzed in the EIR, then a project-specific traffic analysis per current LADOT Guidelines will be required. The City will revise this traffic impact consistency determination methodology, if appropriate, to reflect new traffic impact guidance mandated by the State of California, Office of Planning and Research in response to SB 743. **2015 Intersection Improvement Mitigation Measures**. The following mitigation measures would partially or fully mitigate the significant impacts for 10 of the intersections identified in the 2015 impact analysis. **TR2** **Centinela Avenue & Exposition Boulevard (Intersection 6)**. Signalize the intersection. **TR3** **Bundy Drive & Olympic Boulevard (Intersection 16)**. Restripe the northbound and southbound approaches. The northbound restriping would add one northbound left-turn lane. This would result in a northbound approach of one right-turn lane, two through lanes, and two left-turn lanes. The southbound restriping would add one southbound left-turn lane and change one through lane and the right-turn lane into a shared through/right lane. This would result in a southbound approach of one shared through/right lane, one through lane, and two left-turn lanes. **TR4** **Barrington Avenue & Pico Boulevard (Intersection 27)**. Restripe the existing northbound curb lane to provide one through lane and one right-turn lane. This improvement would require the removal of one on-street parking space. **TR5** **Barrington Avenue & Gateway Boulevard (Intersection 28)**. Restripe the existing northbound shared through/right-turn lane to provide one through lane and one right-turn lane. This improvement would require the removal of four on-street parking spaces. **TR6** **Sepulveda Boulevard & Exposition Boulevard (Intersection 43)**. Restripe the existing eastbound shared left/through/right lane to provide one shared through/left-turn lane and one right-turn lane.	Significant and Unavoidable

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
	TR7 Sepulveda Boulevard & Palms Boulevard (Intersection 46). Restripe one existing northbound shared through/right-turn lane to provide one through lane and one right-turn lane. This improvement would require the removal of two on-street parking spaces. **TR8 Military Avenue & National Boulevard (Intersection 47)**. Restripe one existing southbound shared through/right-turn lane to provide one shared through/left-turn lane and one right-turn lane. This improvement would require the removal of four on-street parking spaces. **TR9 Overland Avenue & National Boulevard / I-10 Westbound On- and Off-Ramp (Intersection 53)**. Restripe the existing eastbound shared through/left-turn lane to a shared left-/through/right-turn lane. **TR10 La Cienega Boulevard & Venice Boulevard (Intersection 76)**. Remove the median to provide a second westbound left-turn lane. **TR11 Sepulveda Boulevard & Venice Boulevard (Intersection 84)**. Remove the medians on Venice Boulevard and restripe both the eastbound and westbound approaches to add one left-turn lane to each approach. **2035 Intersection Improvement Mitigation Measures**. The following mitigation measures would partially or fully mitigate the significant impacts for 12 of the intersections identified in the 2035 impact analysis. **TR12 Stewart Street & Olympic Boulevard (Intersection 3)**. Modify the existing signal phasing to change eastbound left-turn signal phasing from permitted to protected and change westbound left-turn signal phasing from protected/permitted to protected. **Centinela Avenue & Exposition Boulevard (Intersection 6)**. Mitigation Measure TR2 would also mitigate impacts in 2035. **Bundy Drive & Olympic Boulevard (Intersection 16)**. Mitigation Measure TR3 would also mitigate impacts in 2035. **TR13 Barrington Avenue & Mississippi Avenue (Intersection 25)**. Restripe the existing eastbound shared left/through/right lane to provide one shared through/left-turn lane and one right-turn lane. This improvement would require the removal of two on-street parking spaces. **Barrington Avenue & Pico Boulevard (Intersection 27)**. Mitigation Measure TR4 would also mitigate impacts in 2035. **Barrington Avenue & Gateway Boulevard (Intersection 28)**. Mitigation Measure TR5 would also mitigate impacts in 2035. **Sepulveda Boulevard & Exposition Boulevard (Intersection 43)**. Mitigation Measure TR6 would also mitigate impacts in 2035. **Sepulveda Boulevard & Palms Boulevard (Intersection 46)**. Mitigation Measure TR7 would also mitigate impacts in 2035. **Military Avenue & National Boulevard (Intersection 47)**. Mitigation Measure TR8 would also mitigate impacts in 2035. **Overland Avenue & National Boulevard/I-10 Westbound On- and Off-Ramp (Intersection 53)**. Mitigation Measure TR9 would also mitigate impacts in 2035.	

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
	La Cienega Boulevard & Venice Boulevard (Intersection 76). Mitigation Measure TR10 would also mitigate impacts in 2035. **Sepulveda Boulevard & Venice Boulevard (Intersection 84)**. Mitigation Measure TR11 would also mitigate impacts in 2035.	
Impact 4.12-3: Would implementation of the Proposed Project have a significant impact related to neighborhood intrusion by exceeding the established thresholds?	**TR14** In areas where implementation of the Proposed Project could result in diversion of traffic to adjacent residential streets, LADOT shall monitor traffic on identified residential streets, upon request submitted through the Council Office, to determine if traffic diversion occurs. If traffic on residential streets is found to be significantly impacted in accordance with current LADOT guidelines, LADOT will work with the project applicant and neighborhood residents to survey and monitor the residential street segment/s before and after project occupancy to assess the need for appropriate traffic calming measures. These measures could include the following (but are not limited to): • Traffic circles • Speed humps • Roadway narrowing effects (e.g. raised medians, traffic chokers etc.) • Landscaping features • Roadway striping changes • Stop signs In addition to the aforementioned traffic calming measures, neighborhood improvements can offset the effect of adding traffic. These could include (but are not limited to) measures such as street trees, sidewalks, landscaping, neighborhood identification features, and pedestrian amenities. It would be the project applicant's responsibility to implement any of the approved measures through the Bureau of Engineering's permit process.	Significant and Unavoidable
Impact 4.12-4: Would implementation of the Proposed Project have a significant impact related to the CMP Freeway Analysis by exceeding the established threshold?	None required.	Less than Significant
Impact 4.12-5: Would implementation of the Proposed Project have a significant impact related to the CMP Arterial Intersection Analysis by exceeding the established threshold?	**TR15** **Arterial Monitoring Station #70 (Venice Boulevard and Centinela Avenue)**. Restripe one existing northbound shared through/right-turn lane to provide one through lane and one right-turn lane and restripe one existing shared through/right-turn lane to provide one through lane and one right-turn lane. This improvement would require the removal of four on-street parking spaces on Venice Boulevard and the relocation of the bus stop on Centinela Avenue from the south side to the north side of the intersection.	Significant and Unavoidable
Impact 4.12-6: Would implementation of the Proposed Project have a significant impact related to the CMP Transit Impact Review by substantially impacting transit service?	None required.	Less than Significant
Impact 4.12-7: Would implementation of the Proposed Project result in inadequate emergency vehicle access such that there would be need for construction of new or physically altered emergency service facilities (police and/or fire)?	None required.	Less than Significant
Impact 4.12-8: Would implementation of the Proposed Project increase hazards due to a design feature or incompatible uses?	None required.	Less than Significant

TABLE 2-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Mitigation Measures	Significance After Mitigation
Impact 4.12-9: Would implementation of the Proposed Project require construction activities to take place within a major or secondary highway ROW which would necessitate temporary lane, alley, or street closures for more than one day; require construction activities to take place within a collector or local street ROW which would necessitate temporary lane, alley, or street closures for more than seven days; result in the loss of regular vehicular or pedestrian access to an existing land use for more than one day; or result in the temporary loss for more than one day of an existing bus stop or rerouting of a bus route that serves the project site?	**TR16** Projects that require a worksite traffic control plan per current LADOT guidelines shall submit to LADOT for review and approval a plan that mitigates the impact of traffic disruption and ensures the safety of all users of the affected roadway. The plan shall address construction duration and activities and include measures, such as operating a temporary traffic signal, using flagmen adjacent to construction activities, or providing a dedicated pedestrian walkway, as appropriate.	Less than Significant
UTILITIES AND SERVICE SYSTEMS		
Impact 4.13-1: Would implementation of the Proposed Project cause the construction of new water treatment facilities or expansion of existing treatment facilities, the construction of which could cause significant environmental effects?	None required.	Less than Significant
Impact 4.13-2: Would implementation of the Proposed Project result in the construction of new water lines?	None required.	Less than Significant
Impact 4.13-3: Would implementation of the Proposed Project result in LADWP making a determination that they have insufficient water supplies available to serve the Proposed Project from existing entitlements and resources, or would the Proposed Project result in LADWP needing new or expanded entitlements?	None required.	Less than Significant
Impact 4.13-4: Would implementation of the Proposed Project exceed wastewater treatment requirements of LARWQCB?	None required.	Less than Significant
Impact 4.13-5: Would implementation of the Proposed Project result in the construction of new wastewater treatment facilities or expansion of existing wastewater treatment facilities?	None required.	Less than Significant
Impact 4.13-6: Would implementation of the Proposed Project result in the construction of new wastewater conveyance systems or expansion of existing conveyance systems?	None required.	Less than Significant
Impact 4.13-7: Would implementation of the Proposed Project require the construction of new stormwater drainage facilities or expansion of existing facilities?	None required.	Less than Significant
Impact 4.13-8: Would implementation of the Proposed Project result in a determination by the BOS that it does not have adequate capacity to serve the Proposed Project in addition to their existing commitments?	None required.	Less than Significant
Impact 4.13-9: Would implementation of the Proposed Project comply with federal, state, and local statutes and regulations related to solid waste and be served by a landfill with sufficient permitted capacity to accommodate the Project's solid waste disposal needs?	None required.	Less than Significant
Impact 4.13-10: Would implementation of the Proposed Project result in the inefficient use of electricity?	None required.	Less than Significant
Impact 4.13-11: Would implementation of the Proposed Project result in the inefficient use of natural gas?	None required.	Less than Significant

3.0 PROJECT DESCRIPTION

This chapter provides a detailed description of the Exposition Corridor Transit Neighborhood Plan (ECTNP, Proposed Project, or Proposed Plan). The project description discussion includes the background of the Proposed Project, the Proposed Project objectives, the location of the Proposed Project, a description of the existing environment in the Project Area and in the surrounding area, a description of the proposed elements of the Proposed Project, and approval requirements for the Proposed Project to proceed. The estimated time-line for construction and operation are also included.

3.1 PROJECT BACKGROUND

The Los Angeles County Metropolitan Transportation Authority (Metro) Exposition (Expo) Light Rail Transit (LRT) Line is a 15.2-mile-long transit line running between downtown Los Angeles and the City of Santa Monica. The majority of the line runs along the Expo right-of-way, roughly parallel to the Santa Monica Freeway (I-10). Phase 1 of the line was completed in 2012; it extends from Downtown to Culver City. Phase 2 of the line was completed in May 2016; it extends 6.6 miles from the Phase 1 terminus in Culver City to the Colorado/4th Street Station in Santa Monica. The underlying purpose of the Proposed Project is to plan for development around the Phase 2 stations in a manner consistent with state, regional and local policies to encourage infill around transit stations as a means to accommodate growth (see further discussion of existing land use policy in Section 4.8, Land Use and Planning). Thus, the Proposed Project includes a variety of land use regulatory changes in the areas along the Expo Phase 2 LRT Corridor (Expo Corridor), encompassing five station areas within the City of Los Angeles boundaries. These stations include Exposition/Bundy (Bundy), Exposition/Sepulveda (Sepulveda), Westwood/Rancho Park (Westwood), National/Palms (Palms), and Culver City. Without the Proposed Project, it is anticipated that development would occur in an ad hoc, disorganized fashion, requiring uncoordinated requests for General Plan amendments and/or zone changes on a site-by-site basis. Such ad hoc development would likely result in increased impacts as compared to the Proposed Project.

3.2 PROJECT OBJECTIVES

The ECTNP would guide future development in identified areas by specifying the type of uses, floor area ratios (FAR), development requirements and design standards that would apply. The primary objectives for the ECTNP are as follows:

Primary Objective 1: Implement the policies of the City of Los Angeles General Plan Framework, the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and the West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles Community Plans that encourage growth to be directed to transit-oriented areas and foster more sustainable, mixed use development patterns that improve mobility options and reduce auto dependence.

Primary Objective 2: Accommodate employment, housing, and population growth projections forecasted through the planning horizon year of 2035 by focusing residential development and new job-generating uses around transit stations.

Primary Objective 3: Maintain and expand the City's jobs base and increase opportunities for economic development in the Expo Corridor in order to increase the generation of tax revenue in the City that will help pay for the provision of City services.

Primary Objective 4: Implement the General Plan Framework goal to capture a significant share of regional growth in emerging environmentally oriented and clean industries such as technology industry jobs, which are clustered on the Westside and comprise a growing industry sector, and institute zoning that accommodates and creates incentives for the location and continued clustering of these technology industry jobs in the Expo Corridor where they will benefit from the proximity to transit and mixed use environments.

Primary Objective 5: Create incentives for the provision of affordable housing in new residential development near the Expo LRT Line to enhance accessibility and housing options for core transit riders and increase transit ridership.

Primary Objective 6: Improve circulation within the station areas; increase mobility choices; promote transit ridership and use of other alternative transit modes; and reduce vehicle miles traveled per capita for those who live and/or work within the Expo Corridor.

The ECTNP also includes secondary objectives that aim to promote well-designed, cohesive, and sustainable neighborhoods around the Expo Corridor transit stations.

Secondary Objective 1: Ensure new development is pedestrian-oriented, acknowledges the transit stations, and is compatible with surrounding neighborhoods through the design of buildings, streets, and the public realm.

Secondary Objective 2: Stimulate vibrancy and activity and create a unique sense of place within each station area through the design of buildings, streets, and the public realm.

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans, modified street standards, and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would not affect every parcel within the Project Area; changes would only occur within specific "areas of proposed change."

3.3 LOCATION AND SURROUNDING LAND USES

The Project Area is located approximately eight miles west of downtown Los Angeles and contains approximately 1,971 acres (**Figures 3-1** and **3-2**). The Project Area is located entirely within the incorporated City of Los Angeles and is comprised of an approximately five-mile-long, one-mile-wide corridor along the Expo Phase 2 LRT Corridor (which generally includes the half-mile radii around five stations: Bundy, Sepulveda, Westwood, Palms, and Culver City). As shown in **Figure 3-1**, the half-mile radii extend into the neighboring cities of Santa Monica and Culver City, and therefore are not included in the Project Area. The Project Area is divided into five station segments to facilitate impact analysis in this EIR, and, as shown in **Figure 3-2**, multiple areas of proposed change/subareas are contained in each of the station segments.

Within the Project Area, there is currently a mix of zoning. The primary zoning around the Palms and Westwood Stations is residential. The Westwood Station Area is comprised almost entirely of R1 (single-family residential) zoned properties, and the Palms Station is comprised mostly of R3 (multi-family residential) zoned properties. Around the Culver City, Sepulveda, and Bundy Stations, there are concentrations of industrially zoned land in the immediate vicinity of the transit stations, with a mix of residential, commercial, and public facilities zoning nearby.

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

3.4 PROJECT DESCRIPTION

The Proposed Project would establish a Specific Plan to guide future development within the Expo Corridor. The Specific Plan would include General Plan amendments and zone changes that encourage infill development and a mix of uses within identified areas to promote transit ridership, reduce automobile dependence, and create vibrant neighborhoods around the transit stations.

The Proposed Project: (1) creates four new zones and one new land use designation, and changes zoning and land use designations within specified portions of the Project Area (see **Figure 3-2**); (2) includes public benefit requirements associated with tiered floor area ratios (FARs) in the new zones; (3) creates streetscape plans for identified street segments in the Project Area; and (4) requires design standards for new development within the Project Area (excluding R1 and R2 zones). Appendix A of the Specific Plan lists eligible public benefits, the potential environmental impacts of which have been analyzed and evaluated in this EIR. The Proposed Project also includes new open space regulations and parking regulations for select properties within the Project Area. Each of these Proposed Project components is discussed in detail below.

ANTICIPATED POPULATION, HOUSING AND EMPLOYMENT

The proposed General Plan land use designation and zoning changes are aimed at accommodating forecasted growth in the area, and are anticipated to result in growth in the number of dwelling units and non-residential floor area, exceeding the amount allowed by the current land use designation and zoning in the Project Area. That growth is summarized in the following **Table 3-1**, which compares existing conditions to the reasonable expected development under the Current Plan and the Proposed Plan (in 2035, the horizon year of the plan).

TABLE 3-1: DWELLING UNITS, POPULATION, EMPLOYMENT, AND NON-RESIDENTIAL SQUARE FOOTAGE FOR THE ECTNP AND THE ALTERNATIVE COMPLIANCE SCENARIO/g/

	Housing (dwelling units)	Population (persons)	Employment (jobs)	Non-Residential Square Footage
Existing Conditions (2013)	25,018/a/	50,595/a/	33,962/b/	11,424,485/c/
Current Plan Reasonable Expected Development (2035)	26,072	52,447	37,775	13,727,355
Proposed Plan Reasonable Expected Development (2035)	29,441/d/	59,571/e/	48,296/f/	16,957,415
Difference Between Existing Conditions and Proposed Plan	4,423	8,976	14,334	5,532,930
Difference Between Current Plan and Proposed Plan	3,369	7,124	10,521	3,230,060
Alternative Compliance Reasonable Expected Development (2035)	31,060/d/	62,810/e/	43,419/f/	15,311,503
Difference Between Existing Conditions and Alternative Compliance Scenario	6,042	12,215	9,457	3,887,018
Difference Between Current Plan and Alternative Compliance Scenario	4,988	10,363	5,644	1,584,148

SOURCES and NOTES:
/a/ Existing Population and Housing are estimates derived from the US Census (2010), adjusted to 2013 using average growth rates from the California Department of Finance. See Section 4.10, Population, Housing, and Employment and **Appendix F** of this EIR for detailed methodology.
/b/ U.S. Census "On The Map" application (2013).
/c/ Existing non-residential square footage is derived from the existing number of jobs in each station segment, multiplied by an average square foot per employee factor that reflects the types of land uses in each area.
/d/ Estimated number of dwelling units in Proposed Plan Reasonable Expected Development is based on a methodology using reasonably anticipated residential densities for each zone. See **Appendix F** for further discussion about the methodology and how population, housing, employment, and non-residential development were determined for the Proposed Project.
/e/ Population in Proposed Plan Reasonable Expected Development is derived from the estimated number of dwelling units multiplied by the SCAG estimated persons per household (by Community Plan Area) for 2035.
/f/ Employment in Proposed Plan Reasonable Expected Development is derived from the estimated square footage of non-residential use, using square foot per employee factors that reflect the types of land uses permitted by the proposed zoning.
/g/ DCP has considered SCAG 2012-2035 RTP/SCS base year estimates and 2040 growth projections contained in the 2016-2040 RTP/SCS and has concluded the estimates in this table remain reasonable and consistent with the 2016-2040 RTP/SCS estimates and projections. See **Appendix K** of this EIR for details.

ALTERNATIVE COMPLIANCE SCENARIO

The ECTNP includes an Alternative Compliance scenario that would allow designated sites (within the areas of proposed change) to have a different mix of residential and non-residential uses than required per the proposed zoning of the property. Projects utilizing this path would still be subject to the maximum FAR and other zoning and development standards, and would also be required to provide increased public benefits and affordable housing. **Table 3-1** shows the effect the Alternative Compliance scenario could have on population, housing, and employment in the future (2035), and compares the population, housing, and employment of the Proposed Project incorporating the Alternative Compliance scenario to the existing conditions and the Current Plan.

Figures 3-3a and **3-3b** show the parcels where the Alternative Compliance scenario would be permitted. Projects reviewed under the Alternative Compliance scenario of the Specific Plan would be required to obtain a "Director's Determination for Alternative Compliance."

SUMMARY OF LAND USE AND ZONE CHANGES

The Proposed Project proposes land use changes that can accommodate the anticipated growth in population, housing, and employment shown above. Of the approximately 1,971 acres that comprise the Project Area, approximately 258 acres (13 percent) are proposed for General Plan land use and zone changes that would modify the allowable intensity, density, and types of uses on those properties and thus increase the capacity for housing and jobs. These areas of proposed change, also known as Subareas in the Specific Plan and shown in **Figure 3-2**, are located directly around the transit stations and along major corridors within the Project Area.

Of the land use and zone changes, the majority (approximately 58 percent) involve a change from a Light Manufacturing land use designation to a Hybrid Industrial designation, creating an opportunity for higher-intensity office and light industrial development while also introducing limited capacity for residential development in areas where it is currently not permitted. Approximately 26 percent of the change areas involve rezoning properties along commercial corridors (primarily zoned as C2) to the Mixed Use: Commercial/Residential zone in order to encourage mixed use and higher intensity commercial development in areas currently dominated by low scale commercial buildings and single-use multi-family residential uses. Approximately six percent of the changes involve rezoning select properties along key corridors to the RAS4 zone to allow neighborhood-scale mixed use development that creates and/or maintains ground floor commercial activity on those streets while introducing capacity for multi-family housing. Approximately nine percent of the changes involve rezoning select R1 and R2 zoned properties proximate to the stations to the RD1.5 or R3 zones to encourage additional housing capacity proximate to the stations. Finally, approximately one percent of the changes comprise rezoning several currently vacant City-owned properties along the Expo right-of-way to the Open Space (OS) zone to make them consistent with plans for development of a public open space. Station specific zone, FAR, and height changes are discussed in Section 4.8, Land Use and Planning.

The Proposed Project also includes Urban Design Standards and Guidelines and Streetscape Plans (see below), which do not directly result in additional capacity for population, housing, and employment, but are key project features that contribute to the livability and walkability of the Project Area.

GENERAL PLAN AMENDMENTS AND ZONE CHANGES

General Plan Land Use

Figures 3-4a and **3-4b** show the existing General Plan land use designations. The Proposed Project would initiate several General Plan amendments, including land use designation, and would create a new General Plan land use designation: Hybrid Industrial. **Figures 3-5a** and **3-5b** show the proposed General Plan land use designations for the Project Area. The Hybrid Industrial designation encourages clean industry uses, including high tech, creative, and media industry functions. Specific General Plan land use designation changes are discussed in Section 4.8, Land Use and Planning.

2012-058

Zone Changes

Figures 3-6a and **3-6b** show the existing zoning. The Proposed Project would initiate zone changes, either to existing zone classifications (RAS4, R3, and RD1.5) or to new zone classifications created by the Proposed Project (New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial: Residential Emphasis, and Mixed Use: Commercial/Residential). **Figures 3-7a** and **3-7b** show the proposed zoning for the Project Area. These zones are generally described below, and are grouped by whether they are existing zones found in the current City zoning code or new zones established by the proposed Specific Plan.

Existing Zone Classifications

RAS4 (Residential Accessory Services). This zone is a multi-family residential zone that allows neighborhood-serving commercial use on the ground floor. Within the Proposed Project, a change to this zone is intended to revitalize commercial corridors while allowing uses that are compatible with abutting residential neighborhoods. The residential density in this zone is limited to one dwelling unit per 400 square feet of lot area (or approximately 108 dwelling units per acre). Typical building types include multi-story mixed use or residential-only buildings. The FAR is limited to 3.0:1.

R3 (Multi-family Residential). This zone is a medium density multi-family residential zone. Typically, developments include apartments or condominiums with sub-grade or structured parking. The residential density in this zone is limited to one dwelling unit per 800 square feet of lot area (or approximately 54 dwelling units per acre). The FAR is limited to 3.0:1.

RD1.5 (Restricted Density Multi-family Residential). This zone is a low medium density (per the General Plan Land Use) multi-family residential zone, which allows one dwelling unit per 1,500 square feet of lot area (or approximately 29 dwelling units per acre). Typical developments include a residential unit with accessory living quarters, duplexes, multi-family apartments or condominiums, or small lot subdivisions. The FAR is limited to 3.0:1.

New Zone Classifications

New Industry. The proposed New Industry zone is intended to be an employment zone with uses tailored to 21st century and creative industries, such as digital technology, research and development, media, design, and publishing, motion pictures, and broadcasting. Light manufacturing and assembly uses associated with these industries are also appropriate in this zone. Retail and restaurant uses are intended to be ancillary uses that support the employment uses. Traditional residential uses are prohibited in this zone, but live/work units built to building code standards that allow non-residential employees are permitted. Permitted FARs range from 2.5:1 to 4.0:1, depending on the amount of public benefits provided.

Hybrid Industrial: Jobs Emphasis. This hybrid zone is intended to be an employment-focused zone while also allowing a limited amount of residential uses. The employment uses in this zone are similar to those in the New Industry zone, but can include a larger amount of retail, restaurant, and entertainment uses. Residential use is limited to 30 percent of the total square footage of a project, though projects would have the ability to include up to 50 percent residential use by providing additional public benefits. Projects that include residential uses would be permitted a FAR range of 2.0:1 to 4.0:1 (depending on the public benefits provided) and projects without residential uses would have a permitted FAR range of 2.5:1 to 4.0:1 (depending on the public benefits provided).

Hybrid Industrial: Residential Emphasis. This hybrid zone is intended to be a zone that requires a minimum level of employment uses (similar to New Industry and Hybrid Industrial: Jobs Emphasis) along with a greater but still limited amount of residential use. This zone allows residential use for up to 70 percent of the total square footage of a project, though projects would have the ability to include up to 75 percent residential use by providing additional public benefits. A project would be allowed to be entirely commercial or include a mix of residential and commercial uses.

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

SOURCE: City of Los Angeles, TAHA, and Gruen Assoicates, 2017.

2012-058

The Hybrid Industrial: Residential Emphasis zone would serve as a transition zone from residential-only neighborhoods to jobs centers. The permitted FAR for projects that include residential uses would range from 2.0:1 to 4.0:1 (depending on the public benefits provided), for projects without residential uses the permitted FAR would range from 2.5:1 to 4.0:1 (depending on the public benefits provided).

Mixed Use: Commercial / Residential. This zone is intended to allow neighborhood and community commercial uses and institutional uses, either alone or in combination with multi-family residential. This zone activates commercial corridors with a variety of uses that serve the local community while also providing housing. The Mixed Use: Commercial/Residential zone allows residential use for up to 90 percent of the total square footage, depending on the FAR of a development project. A project site could consist entirely of non-residential use or a mix of residential and commercial use. The permitted FAR would range from 2.0:1 to 3.6:1 (depending on the public benefits provided).

Development projects involving new construction or addition/redevelopment within the four new zones described above would have a base FAR that could be increased up to a bonus FAR level depending on the provision of public benefits (**Table 3-2**; see also Public Benefits, below).

TABLE 3-2: NEW ZONE CLASSIFICATIONS AND ASSOCIATED MAXIMUM FLOOR AREA RATIOS

	New Industry	Hybrid Industrial: Jobs Emphasis	Hybrid Industrial: Residential Emphasis	Mixed Use: Commercial/ Residential
Base FAR	2.5:1	2.0:1 /a/	2.0:1 /a/	2.0:1
Bonus FAR	4.0:1	4.0:1	4.0:1	3.6:1

/a/ Projects without residential uses are permitted a Base FAR of 2.5:1.
SOURCE: City of Los Angeles, 2017.

Corridor-Wide General Plan Land Use and Zone Changes

Table 3-3 shows the existing General Plan land use designations and zoning for properties within the areas of proposed change within the ECTNP Area. **Table 3-4** shows the proposed General Plan land use designations and zoning for the areas of proposed change within the ECTNP Area.

TABLE 3-3: EXISTING LAND USE AND ZONING WITHIN ECTNP AREAS OF PROPOSED CHANGE

General Plan Land Use	Acres	Zoning	FAR	Max Allowable Height (Stories) /d/	Max Allowable Height (Feet) /d/
Neighborhood Commercial	20.1	C2-1, P-1	1.5:1	N/A	N/A
		C2-1VL	1.5:1	3 /a/	45
General Commercial	40.7	C2-1, C4-1	1.5:1	N/A	N/A
		CR-1	1.5:1	6	75
		RD2-1, R3-1	3.0:1	N/A	45
		R4-1	3.0:1	N/A	N/A
Limited Manufacturing	11.65	M1-1, P-1	1.5:1	N/A	N/A
Light Manufacturing	139.1	M1-1, M2-1	1.5:1	N/A	N/A
		M2-1VL	1.5:1	3	45
		M2-2	6:1	N/A	75
Low Residential	26.3	R1-1	/b/	N/A	33 /c/
Low Medium I Residential	5.6	R2-1	3.0:1	N/A	33
Low Medium II Residential	7	RD1.5-1, RD2-1	3.0:1	N/A	45
Medium Residential	5.7	R3-1	3.0:1	N/A	45
High Medium Residential	1.5	R3-1	3.0:1	N/A	45

/a/ Buildings used entirely for residential (and ground floor commercial in RAS zones) are only limited as to height, not stories.
/b/ See LAMC Section 12.08 C.5 for limitations on the allowable floor area for properties in the R1-1 zone.
/c/ The maximum building height in the R1 zone is limited to 28 feet when the roof of the uppermost story of the building has a slope of less than 25 percent.
/d/ This represents a general height limitation for the zone; some properties have "Q" qualifying conditions which vary from the general limitations.
SOURCE: City of Los Angeles, 2017.

TABLE 3-4: PROPOSED LAND USE AND ZONING WITHIN ECTNP AREAS OF PROPOSED CHANGE

General Plan Land Use	Acres	Zoning	FAR	Height Range (Stories)	Max Height (Feet)
Community Commercial	21.8	Mixed Use: Commercial/ Residential	2:1 to 3.6:1	3 to 6 stories 3 to 7 stories	68 68 to 78
Hybrid Industrial	34.1	Hybrid Industrial: Jobs Emphasis	2:1 to 4.0:1 2.5:1 to 4.0:1	3 to 7 stories 4 to 11 stories 6 to 12 stories	96 148 161

BUILDING HEIGHTS AND FLOOR AREA RATIOS

Figures 3-8a and **3-8b** show the heights of existing buildings in the ECTNP Area. **Figures 3-9a** and **3-9b** show the maximum building heights that would be for the areas of proposed change under the ECTNP. **Figures 3-10a** and **3-10b** illustrate the existing maximum allowable FAR, **Figures 3-11a** and **3-11b** illustrate the proposed FAR, and **Figures 3-12a** and **3-12b** illustrate the difference between the maximum FAR allowable by the existing zoning and the maximum FAR allowed by the proposed zoning. Where the proposed zoning includes a range of FARs, the maximum Bonus FAR was used in order to demonstrate the greatest possible change in FAR between existing and proposed zoning. For properties currently zoned as R1, an FAR of 0.5:1 was assumed to account for the typical floor area allowed on a single-family property per Los Angeles Municipal Code (LAMC) Section 12.08 C.5. While additional floor area may be allowed in the R1 zone, an FAR of 0.5:1 was used to demonstrate the greatest possible change in FAR between existing and proposed zoning on these properties.

2012-058

PUBLIC BENEFITS

The ECTNP would require all projects in the areas of proposed change to provide basic public benefits, such as on-site streetscape improvements, on-site open space, bicycle facilities, unbundled parking, and other transportation demand management strategies, as applicable.

Community Amenities and Affordable Housing. Projects within the New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial: Residential Emphasis, and Mixed Use: Commercial/Residential zones would be eligible for increased FAR in exchange for providing additional public benefits in the form of affordable housing and community amenities. As shown in **Table 3-2**, each zone has a Base and Bonus FAR. In order to take advantage of Bonus FAR, additional public benefits are required in the form of affordable housing and community amenities.

Examples of community amenities include: off-site streetscape improvements; enhancements to freeway underpasses; publicly accessible open space; transit and bike amenities (e.g., enhanced bus shelters and kiosks, mobility hubs, long-term bike storage); and community facilities (e.g., childcare center, senior/youth/cultural facility). Projects using the Bonus FAR must also set aside a portion of the units as affordable housing for Extremely Low-, Very Low-, or Low-income households; the portion required varies based on household income category.

The public benefits are intended to correspond to the intensity of the project, and would be administered using a point system that is based on a project's location and square footage of residential and non-residential uses (**see Table 3-5**). Market studies prepared for the Project Area showed that residential uses can support greater levels of public benefits compared to non-residential uses, and that properties closer to the Bundy and Sepulveda Stations can support a greater level of public benefits compared to the Palms and Culver City station areas; therefore, residential uses and projects in the Bundy and Sepulveda station areas have a greater point factor. The square footage dedicated to restricted affordable housing units is not assessed a point value.

TABLE 3-5: PUBLIC BENEFITS POINT SCHEDULE

	Station Area			
	Bundy	**Sepulveda**	**Palms**	**Culver City**
Non-Residential Use (per 1,000 GSF)	0.050	0.050	0.010	0.010
Affordable Housing (per 1,000 NSF)	0	0	0	0
Market-rate housing and Live/Work Units (per 1,000 NSF)	0.105	0.105	0.011	0.011
Market-rate housing and Live/Work Units in projects using Alternative Compliance (per 1,000 NSF)	0.315	0.315	0.035	0.035
Live/Work Units in projects in the New Industry Zone with more than 30% Live/Work Units (per 1,000 NSF)	0.315	0.315	0.035	0.035

GSF (gross square footage) includes all building floor area, including common areas.
NSF (net square footage) excludes square footage of common areas within residential buildings, and includes only square footage of individual dwelling units.
SOURCE: City of Los Angeles, 2017.

Once the point value of a project is calculated, an equivalent amount of public benefits are assigned to the project based off of the menu found in Appendix A of the Specific Plan.

Vehicle Trip Reduction. In lieu of providing the above public benefits, projects within the New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial: Residential Emphasis, and Mixed Use: Commercial/Residential zones that are comprised of 70 percent or greater non-residential uses must meet the Vehicle Trip Reduction requirements (described below) to be eligible for the Bonus FAR.

Such projects would be required to demonstrate either a ten percent reduction in peak-hour vehicle trips from expected vehicle trip levels, or an Average Vehicle Ratio (AVR) of 1.75 for AM/PM peak-hour weekday vehicle trips. Expected vehicle trip levels would be based on a trip generation analysis prepared at the time of application.

The vehicle trip reduction strategies may include, but would not be limited to, the following Transportation Demand Management (TDM) strategies (which would be in addition to TDM strategies required in the City-wide ordinance):

- TDM Coordinator
- Area-wide Transportation Management Association (TMA)
- Commute Trip Reduction (CTR) Marketing (such as a Transportation Information Center [TIC])
- Transit Fare Subsidy
- On-site sale of monthly transit passes
- Bicycle Facilities
- Integrated Mobility Hubs
- On-site car share and/or bike share programs
- Provide Pedestrian Network Improvements
- Flexible Work Hours
- Telecommuting
- Employer-Sponsored Vanpool/Shuttle
- Ridesharing
- School Pool Program
- School Bus Program
- Parking Cash Out
- Unbundled Parking
- Workplace Parking Pricing
- Limiting Parking Supply

Beginning one year after a Certificate of Occupancy is obtained, the property owner would be required to submit annual reports, documenting counts of peak-hour weekday vehicle trips beginning and ending at the property. These annual reports would be reviewed by the Department of City Planning, in consultation with LADOT as needed, to monitor a project's compliance with the trip reduction requirements.

OTHER PLAN PROVISIONS

Parking Regulations. In addition to requiring that projects comply with current City-wide minimum parking standards, the ECTNP includes several requirements and provisions unique to select areas within the ECTNP Area. The Proposed Project requires that all parking for new development in areas of proposed change, with the exception of properties in the R3 or more restrictive zones, be unbundled from the sale or lease price of an individual dwelling unit or non-residential space. It also includes mechanisms to encourage shared parking among uses within a development site.

Finally, the Proposed Project allows individual neighborhood-serving retail and personal services uses that are less than 1,500 square feet within mixed use developments to be excluded from minimum parking requirements. This provision would also apply to individual neighborhood-serving restaurants less than 1,500 square feet, for up to a maximum of 50 percent of an individual project's non-residential square footage or 1,500 square feet, whichever is greater. This provision would apply only to specified Neighborhood Commercial properties in the ECTNP. The objective of these parking provisions is to encourage small neighborhood-serving commercial uses in specified areas where the commercial uses are intended to serve surrounding neighborhoods and not serve as a regional destination.

Open Space Regulations. All new development projects located in the ECTNP Area would be required to provide open space. This includes the open space for residential uses currently required by the LAMC. In addition, the ECTNP would require open space to be constructed based on non-residential square footage in a commercial or mixed use development. The ECTNP also allows for a reduction in required open space if the provided open space is made publicly accessible.

STREETSCAPE PLANS

The Proposed Project includes streetscape plans for a number of key corridors identified below. These plans illustrate streetscape improvements in the public right-of-way with the goal of creating a pedestrian-friendly environment that encourages walking, bicycling, and transit use while maintaining vehicular circulation. The location of the street segments included in the proposed streetscape plans are shown in **Figure 3-13** and listed below:

- Bundy Drive between Missouri Avenue and Pico Boulevard
- Olympic Boulevard between Centinela and Barrington Avenues
- Sepulveda Boulevard between Olympic and National Boulevards
- National Boulevard between Mentone Avenue and Castle Heights Boulevard
- Palms Boulevard between National Boulevard and Motor Avenue
- Exposition Corridor Streetscape Plan
- Motor Avenue between I-10 and Venice Boulevard (in Livable Boulevards Streetscape Plan)
- Pico Boulevard between I-405 and Patricia Avenue (in Livable Boulevards Streetscape Plan)
- Pico Boulevard between Centinela Avenue and I-405 (in Livable Boulevards Streetscape Plan)

The current dimensions, street designations per the adopted Mobility Plan 2035 (MP 2035), and proposed dimensions for these segments are shown in **Table 3-6**. The proposed dimensions are consistent with the Moiblity Plan 2035 street standards, and would accommodate the streetscape improvements in the proposed streetscape plans.

National Boulevard. The proposed streetscape plan for National Boulevard reflects an expanded right-of-way per the new Avenue II street classification standards in the MP 2035; the existing roadway width would be maintained. Between Mentone Avenue and Palms Boulevard/Exposition Boulevard the streetscape plan would provide consistent landscape treatment, including street trees.

On the north side of the street, the sidewalk would be widened to 14 feet by means of a dedication as properties are redeveloped. Between Palms Boulevard/Exposition Boulevard and Castle Heights Avenue, the proposed streetscape plan would provide wider sidewalks and parkways and consistent landscape treatment. Sidewalks in the range of 12 to 15 feet in width would be made possible through a combination of dedications and easements on private property as properties are redeveloped.

Bundy Drive. The proposed streetscape plan for Bundy Drive reflects and expanded roadway and right-of-way per the new Avenue I street classification standards in the MP 2035. The streetscape plan would increase the sidewalk width to 15 feet – including walkways and parkways, where relevant – on both sides of the street (from the current 7 to 10 feet), introduce a consistent pattern of street trees along the sidewalks, reduce travel lane widths, and incorporate parking on both sides of the street. The number of travel lanes would remain as existing. The streetscape plan would require the reconstruction of curbs, gutters, and driveways along the portion of Bundy Drive north of Olympic Boulevard. In order to achieve the right-of-way dimensions required, a dedication would be required as properties are redeveloped.

Olympic Boulevard. The proposed streetscape plan for Olympic Boulevard, which reflects the right-of-way per the new Boulevard II street classification in the MP 3025, would increase the sidewalk width from 12 feet to 15 feet, introduce a consistent pattern of street trees along the sidewalks, and install center landscaped medians between left-turn lanes. To achieve the wider sidewalk width, an easement on private properties fronting the street would be necessary as properties are redeveloped.

National Blvd.	Castle Heights Ave. to Palms Blvd.	8' to 10'	63'	81' to 83'	Avenue II	15'	56'	86'	Neighborhood Enhanced Network	12' to 15'/e/	63'/d/	86'
National Blvd.	Palms Blvd. to Mentone Ave.	12' to 15'	57'	84'	Avenue II	15'	56'	86'	Bicycle Lane Network; Bicycle Enhanced Network	14' to 15'	57'/d/	86'
Palms Blvd.	National Blvd. to Motor Ave.	7'	62'	76'	Avenue II	15'	56'	86'	Bicycle Lane Network	12'	62'/d/	86'
Pico Blvd. /f/	I-405 to Patricia Ave.	15'	70'	100'	Avenue I	15'	70'	100'	Bicycle Lane Network; Transit Enhanced Network	15'	70'	100'
Pico Blvd. /f/	Centinela to I-405	15'	70'	100'	Avenue I	15'	70'	100'	Bicycle Lane Network; Transit Enhanced Network	15'	70'	100'
Motor Ave. /f/	I-10 to Venice Blvd.	9'	62'	80'	Modified Avenue II	15'	56'	86'	Bicycle Enhanced Network	12'	62'	86'

/a/ The range indicated is the range of existing dimensions as of the date of adoption of this plan. All dimensions are approximate and should be field verified and should not be used for engineering purposes. LADOT's signing and striping plans, GIS parcel maps and Google aerials were used for roadway, sidewalk/parkway, and right-of-way widths.

/b/ Sidewalk includes both walkway (Pedestrian Zone) and tree well or parkway area (Amenity Zone).

/c/ Roadway width at the intersection of Pico and Sepulveda is 78'.

/d/ The proposed right-of-way for this street segment is consistent with the MP 2035 street designation. The roadway width does not need to comply with the MP 2035 street designation and shall be constructed to the proposed dimensions shown here.

/e/ The standard sidewalk width on this street segment is achieved through a required sidewalk easement.

/f/ These Streetscape Segments can be found in the Livable Boulevards Streetscape Plan; other plans are in the Exposition Corridor Streetscape Plan.

SOURCE: Gruen Associates, February 2014; Department of City Planning, 2017.

Sepulveda Boulevard. The proposed streetscape plan for Sepulveda Boulevard reflects an expanded roadway and right-of-way per the new Boulevard II street classification standards in the MP 2035. The streetscape plan includes two scenarios – one that anticipates a center-running transit line on Sepulveda Boulevard, and one that does not. In both scenarios, a dedication on each side of Sepulveda Boulevard would be required as properties are redeveloped, as well as reconstruction of curbs, gutters, and driveways. Within the widened right-of-way, the sidewalk width (including parkways, where existing) would be increased to 15 feet, and a consistent landscape treatment along the sidewalk would be installed. In the scenario with transit, parking along one or both sides of Sepulveda Boulevard may need to be removed. In the scenario without transit, parking along both sides of Sepulveda Boulevard would be maintained. The center-running transit line on Sepulveda Boulevard is not covered in this EIR, and a separate environmental clearance would be required in the future.

Palms Boulevard. The proposed streetscape plan for Palms Boulevard reflects an expanded right-of-way width per the new Avenue II street classification standards in the MP 2035; the existing roadway width would be maintained. Sidewalks (including parkways) would be widened to 12 feet by means of a dedication on each side as properties are redeveloped. The streetscape plan would also install street trees as well as landscaped curb extensions in between parking stalls and at intersections.

Motor Avenue. The proposed streetscape plan for Motor Avenue would expand the right-of-way per the new Avenue II streets classification in the MP 2035, while the existing roadway width would be maintained. On both sides of the street, the sidewalks would be widened to 12 feet by means of a dedication as properties are redeveloped. In addition, the streetscape plan would include a consistent landscape and street furniture treatment, as well as curb extensions at intersections.

Pico Boulevard. The proposed streetscape plan for Pico Boulevard between I-405 and Patricia Avenue maintains the existing right-of-way and roadway widths, consistent with the new Avenue I street classification standards in the MP 2035. Sidewalks currently 15 feet in width would be maintained, and a consistent landscape and street furniture treatment would be introduced. Several new landscaped medians would also be installed within the existing left-turn lane in between intersections.

The proposed streetscape plan for Pico Boulevard between Centinela Avenue and I-405 also maintains the existing right-of-way and roadway widths, consistent with the new Avenue I street classification standards in the MP 2035. Sidewalks currently 15 feet in width would be maintained, and a consistent landscape, street tree, and street furniture treatment would be introduced. Several new landscaped medians would also be installed within the existing left-turn lane in between intersections, as well as curb extensions.

URBAN DESIGN STANDARDS AND GUIDELINES

The Proposed Project establishes Urban Design Standards and Guidelines for all properties within the Project Area, excluding properties in the R1 and R2 zones. The Urban Design Standards and Guidelines are intended to create livable neighborhoods with an emphasis on walkability and the making of great streets and neighborhoods. The focus of the Urban Design Standards and Guidelines is on the relationship of buildings to the street and the public realm to create high quality public spaces and a walkable environment. The Urban Design Standards and Guidelines include requirements for the following:

- Setbacks and Yards
- Streetwall
- Massing and Lot Coverage
- Building Orientation and Entry
- Ground Floor Treatment
- Ground Floor Use
- Architectural Treatment
- Windows and Doors
- Exterior Lighting
- Mechanical and Utilities
- Open Space
- Parking and Access

The Proposed Project would incorporate in full the design standards of the existing West Pico Community Design Overlay District (CDO) and the CDO will be repealed. Where the existing Westwood/Pico Neighborhood Oriented District (NOD) overlaps with the ECTNP, all provisions of the ECTNP, including the Urban Design Standards and Guidelines, would apply; additionally, the use prohibitions and signage regulations of the NOD would also continue to apply.

PROJECT FEATURES

Following is a more detailed description of the components and features of the Proposed Project that are intended to implement the Project Objectives (See Section 3.2) while reducing potential impacts.

The Proposed Plan:

- Accommodates jobs
  - Allows light industrial uses in the New Industry, Hybrid Industrial: Jobs Emphasis, and Hybrid Industrial: Residential Emphasis zones, including manufacturing, packaging, distribution, and research and development (R&D), which support the creative, technology, media, and similar industries clustered in the area.
  - Requires a minimum amount of non-residential use (10 to 20 percent) in the Mixed Use: Commercial/Residential zone.
  - Prohibits residential use in the New Industry zone, with the exception of live/work units built to building code standards that allow non-residential employees.
  - Allows only a limited amount of residential use in the Hybrid Industrial: Jobs Emphasis zone (up to 50 percent) and Hybrid Industrial: Residential Emphasis zone (up to 75 percent).
  - Limits new retail and restaurant uses in the New Industry and Hybrid Industrial: Jobs Emphasis zones so they remain ancillary to the employment uses on the site.
  - Offers higher base floor area ratios for projects that are comprised entirely of non-residential use.
  - Allows additional floor area in exchange for vehicle trip reduction for projects comprised primarily (more than 70 percent) of non-residential use.

- Increases housing supply
  - Rezones select industrial properties to Hybrid Industrial zones to allow limited residential uses where such uses are not currently allowed.
  - Rezones properties along major commercial boulevards to Mixed Use: Commercial/Residential to provide opportunities for new multifamily housing while still requiring a minimum amount of neighborhood-serving and job-generating uses.

- Streamlines processes
  - Streamlines the development review process for projects that comply with the ECTNP.
  - Establishes an Alternative Compliance process for eligible sites to provide flexibility in maintaining jobs in the area while accommodating housing needs.

- Promotes transit supportive land use intensities and development patterns
  - Implements land use changes that accommodate additional jobs and housing within close proximity to transit.
    - Rezones single-family residential area adjacent to the Bundy Station to various low to medium density multifamily residential uses.
    - Prohibits or limits new auto-oriented and low-intensity uses on properties surrounding the transit stations, reserving these areas for compact, job-generating development.
    - Rezones select industrial properties within a half-mile of a transit station to the New Industry, Hybrid Industrial: Jobs Emphasis, and Hybrid Industrial: Residential Emphasis zones to direct jobs and housing to the station areas.

    - Applies new mixed use zones to currently single-use areas, which can lead to more walking trips among destinations.

- Creates incentives for new development to provide public benefits
    - Provides additional development rights in the form of greater FARs in exchange for the provision of public benefits
    - Creates an incentive for new development to provide affordable housing, placing more core transit riders close to stations and expanding their access to jobs.
    - Requires large mixed use developments to provide transportation-related public benefits, such as mobility hubs, bicycle facilities, and other amenities that address the first/last mile linkage to transit stations.
    - Requires publicly accessible open spaces to be located on the ground floor and open to the public, and contain seating and other programmatic elements.

- Requires pedestrian-friendly and quality urban design
    - Creates safe, interesting and inviting buildings that improve the pedestrian experience. Set maximum front yard setbacks. Creates a continuous pedestrian experience, uninterrupted by excessive driveways, with a required continuous street wall, no blank facades, and primary pedestrian entrances oriented to the street.
    - Requires new commercial, industrial, and multifamily residential development within transit neighborhoods to orient towards the street and other public space and include active ground floor uses that help define and activate the street and create visual interest.
    - Limits building lengths and requires projects on large sites to break up blocks with paseos, new streets, or other open space to ensure appropriate scale of development and facilitate pedestrian flow through the station areas.
    - Encourages new buildings to incorporate high-quality materials and appropriate architectural details.
    - Institutes transitional height requirements (stepbacks) where zone changes to New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial: Residential Emphasis, and Residential/Accessory Services (RAS4) zones is adjacent to single-family and two-family residential uses.
    - Ensures that surface parking and parking structures are concealed from the street.
    - Creates a hierarchy of "Active Streets" and "Retail Streets" within the Project Area that requires varying levels of ground-floor activity and transparency to provide nearby employees, residents, and visitors with services and amenities that are accessible on foot and inviting to people walking.
    - Establishes Streetscape Plans that improve the configuration and condition of public rights-of-way to better promote pedestrian, bicycle, and vehicular circulation.

- Improves mobility
    - Requires commercial developments that use a floor area bonus to demonstrate a reduction in vehicle trip generation using transportation demand management strategies.
    - Generally maintains current Code parking requirements and encourages shared parking among uses within a development.

3.5 CONSTRUCTION SCHEDULE AND PHASING

The Proposed Project is a Specific Plan that would guide development in the Project Area. There is no specifically planned development as a part of this Proposed Project. Therefore, there is no construction schedule or phasing. The ECTNP is anticipated to be adopted in 2017 with implementation starting after adoption and continuing through 2035.

3.6 DISCRETIONARY ACTIONS AND APPROVALS

Approval of the following would be required by the Planning Commission and City Council in order to implement the ECTNP:

- General Plan Amendments
- Zone Changes
- Exposition Corridor Transit Neighborhood Plan Specific Plan (Ordinance)
- Specific Plan Amendments
- Urban Design Guidelines
- Modified Street Classifications and Standards
- Streetscape Plans
- Other Ordinances, including modification of existing overlays, as appropriate
- Amendments to the General Plan Framework, Transportation (Mobility) Element, and other General Plan Elements, as appropriate.

After the adoption of the ECTNP, individual projects would be required to submit an application, which would be reviewed to determine consistency with the ECTNP. The subsequent environmental review required for subsequent projects determined to be consistent with the ECTNP will depend upon the circumstances of each project and may include the following approaches: (1) A determination pursuant Public Resources Code (PRC) Section 21166 and CEQA Guidelines Section 15162 that the project was fully assessed in this EIR and no further environmental review is required; (2) an addendum to this EIR pursuant to CEQA Guidelines Section 15164; (3) a determination that the project is statutorily or categorically exempt from CEQA; or (4) the project requires subsequent environmental review pursuant to PRC Section 21166 and CEQA Guidelines Section 15162.

Within the Project Area, a maximum of 1,200 dwelling units above what is permitted by the zoning would be allowed through the Alternative Compliance scenario. These additional 1,200 units, along with the corresponding reduction in non-residential square footage, are incorporated into the assumptions analyzed in the Alternative Compliance scenario of this EIR. Individual subsequent projects utilizing the Alternative Compliance scenario that are consistent with the land use designation, development intensity, design guidelines, and standards and the policies of the ECTNP and do not raise any of the circumstances set forth in PRC Section 21166 or CEQA Guidelines Section 15162 requiring subsequent environmental review, would be required to apply for a "Director's Determination for Alternative Compliance," but generally would not be required to prepare additional environmental review. Individual projects utilizing the Alternative Compliance scenario that exceed the 1,200-dwelling unit limit are not included in the EIR assumptions and would be required to conduct project-specific environmental review in addition to the application for a Director's Determination (Specific Plan Project Permit per LAMC Section 11.5.7) and a Specific Plan amendment. As set forth above, this environmental review may include (1) A determination pursuant PRC Section 21166 and CEQA Guidelines Section 15162 that the project was fully assessed in this EIR and no further environmental review is required; (2) an addendum to this EIR pursuant to CEQA Guidelines Section 15164; (3) a determination that the project is statutorily or categorically exempt from CEQA; or (4) the project requires subsequent environmental review pursuant to PRC Section 21166 and CEQA Guidelines Section 15162.

4.0 ENVIRONMENTAL IMPACTS

This chapter evaluates the reasonably foreseeable significant environmental impacts that could result from the implementation of the Proposed Project. These potential impacts are analyzed for the following environmental issues: aesthetics; air quality; cultural resources; geology and soils; greenhouse gas (GHG) emissions; hazards and hazardous materials; hydrology and hazardous materials; land use and planning; noise; population, housing and employment; public services; transportation and traffic; utilities and service systems; and cumulative impacts. Discussion is focused on the identification of changes that may be considered to be environmentally significant (a substantial, or potentially substantial, adverse change in the environment) relative to the existing environmental conditions.

Analysis of each environmental issue is organized to include the following subsections:

- **REGULATORY FRAMEWORK** – This subsection includes an identification of applicable federal, state, regional, and local regulations.

- **EXISTING SETTING** – This subsection includes a description of existing physical conditions that precede implementation of the Proposed Project.

- **THRESHOLDS OF SIGNIFICANCE** – This subsection identifies the environmental thresholds by which the Proposed Project components are measured to determine if the Proposed Project would cause a substantial or potentially substantial adverse change in the existing environmental conditions. In this subsection, both the California Environmental Quality Act (CEQA) Guidelines Appendix G thresholds and thresholds adopted by the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide) are generally presented and discussed. This Draft Environmental Impact Report (EIR) typically relies upon the CEQA Guidelines Appendix G thresholds for the purposes of determining whether the Proposed Project would cause a potentially significant impact on the environment. CEQA does not require that the City use its own adopted thresholds. In instances where this Draft EIR relies upon the City's thresholds, it is because the City's thresholds are typically more oriented to analyzing the impact of a specific development project and not of a long-range land use plan such as the ECTNP. In other instances, this EIR uses a combination of the CEQA Guidelines Appendix G and the Thresholds Guide to provide the most comprehensive analysis of the Proposed Project's potential environmental impacts. Discussion in both the thresholds and methodology subsections found in the sections associated with each individual impact area will provide further explanation of which thresholds are used. As to each environmental topic, the City has selected the thresholds that ensure as comprehensive an analysis of the potential environmental impacts from implementation of the ECTNP as possible given the constraints of attempting to analyze a plan that will be implemented over twenty years or more.

- **METHODOLOGY** – This subsection summarizes the methods, procedures and techniques used to estimate Proposed Project impacts. As is described in the "Thresholds of Significance" discussion above, the methodology subsection also further clarifies which thresholds—CEQA Guidelines Appendix G or Thresholds Guide—are used when describing the methods, procedures and techniques used to estimate Proposed Project impacts. Generally, a methodology will be modified, in part, based on whether the environmental impacts being analyzed identify potential impacts that are localized (e.g., population, housing, employment; land use) or would generally effect the entire plan area or region (e.g., air quality or greenhouse gas emissions). Consequently, this subsection describes the geographic extent of the analysis relevant to each impact area. A typical impact analysis for localized impacts will break down the impact analysis by potential impacts associated with development in the subareas (also called "change areas" or "areas of proposed change") and potential impacts associated with development in the areas within the Project Area boundary but outside the subareas (also called "non-change areas") to help determine the potential impacts of the Proposed Project; in some instances, like the cumulative impacts analysis discussion a comparative analysis is prepared for the Project Area versus a broader geographic

area beyond the boundaries of the Project Area (i.e., a one- or two-mile area outside of the Project Area, not including the Project Area) in order to assess potential impacts of the Proposed Project on the identified impact area. The methodology subsection of the chapters associated with each individual impact area will provide further explanation of what geographic area is used for the purposes of the impact analysis.

- **IMPACTS** – This subsection includes an analysis of the beneficial and adverse effects of the Proposed Project (compared to existing conditions per CEQA), including, where appropriate, assessments of the significance of potential impacts relative to established thresholds. The analysis reflects the recent court case, *California Building Industry Association v. Bay Area Air Quality Management District (CBIA v. BAAQMD),* which held that generally CEQA does not require that the existing environment's effect on a project be analyzed unless a project exacerbates existing risk.[1,2] For each significant impact identified, this subsection also recommends appropriate and reasonable measures to avoid or minimize impacts to the greatest extent feasible. In addition, this subsection includes a discussion of whether a significant impact would be reduced to a less than significant level after mitigation or would remain significant and unavoidable.

4.1 AESTHETICS

This section provides an overview of aesthetics and evaluates the impacts associated with the Proposed Project. Topics addressed include visual character, views and vistas, scenic resources, and light and glare.

REGULATORY FRAMEWORK

FEDERAL

There are no federal policies related to aesthetics.

STATE

Senate Bill 743 (SB 743) (Environmental Quality). On September 2013, Governor Jerry Brown signed into law SB 743, which instituted changes to California Environmental Quality Act (CEQA) when evaluating environmental impacts of projects in areas served by transit. While the thrust of SB 743 addressed a major overhaul on how transportation impacts are evaluated, it also limited the extent to which aesthetics impacts are evaluated under CEQA. SB 743 (Public Resources Code [PRC] Section 21099 (d)(1)) exempts development projects located in Transit Priority Areas (TPAs), from review of aesthetic impacts under CEQA. Specifically, this Bill provides that aesthetic impacts of a residential, mixed use residential, or employment center project on an infill site within a TPA shall not be considered significant impacts on the environment.[1] A TPA is defined as an area within one-half mile of a major transit stop that is existing or planned. Section 21064.3 of the PRC defines a "major transit stop" as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. The majority of the Project Area is located within a TPA; however, some portions fall just outside the TPA boundaries (**Figure 4.1-1**).

Visual resources, aesthetic character, shade and shadow, light and glare, and scenic vistas or any other aesthetic impacts, as defined in the City's Los Angeles CEQA Threshold Guide (Threshold Guide), shall not be considered an impact for applicable infill projects within TPAs pursuant to CEQA. However, this law does not limit the ability of the City to regulate or study aesthetic related impacts pursuant to its land use authority and regulations, such as found in the Los Angeles Municipal Code (LAMC) or the City's General Plan, and other zoning ordinances, such as specific plans. For example, Department of City Planning (DCP) staff would still need to address a development project's shade and shadow impacts if it is expressly required in a Specific Plan, Community Design Overlay (CDO), or Historic Preservation Overlay Zone (HPOZ). SB 743 expressly provides that impacts to historic or cultural resources are not "aesthetic impacts" for purposes of its provisions and therefore, SB 743 does not affect the City's obligations under CEQA to assess impacts to cultural resources.

Within the City, development projects within a TPA must be consistent with the use designation, density, building intensity, and applicable policies specified for the area in the Sustainable Communities Strategy (SCS) for which the California Air Resources Board (CARB) has accepted Southern California Association of Governments' (SCAG) determination that the SCS would, if implemented, achieve the greenhouse gas (GHG) emission reduction targets.

[1]PRC Section 21099(a)(1) defines "employment center project" as a project located on property zoned for commercial uses with a floor area ratio of no less than 0.75 and that is located within a TPA.

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

SOURCE: City of Los Angeles and TAHA, 2017.

2012-058

Within the City of Los Angeles, a development is considered to be within a TPA if all parcels for the development have no more than 25 percent of its area farther than one-half mile from the transit stop or corridor and if not more than 10 percent of the residential units or 100 units, whichever is less, in the development are farther than one-half mile from the transit stop or corridor. The City has developed a preliminary map of TPAs and parcels within TPAs are tagged in Zoning Information and Map Access System (ZIMAS).

California Department of Transportation (Caltrans) State Scenic Highways. California's Scenic Highway Program was created by the Legislature in 1963. Its purpose is to protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment. State laws governing the Scenic Highway Program are found in the Streets and Highways Code, Sections 260 through 263. A highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view. Caltrans defines a State Scenic Highway as any freeway, highway, road, or other public right-of-way that traverses an area of exceptional scenic quality. Eligibility for designation as a State Scenic Highway is based on vividness, intactness, and unity of the roadway. The status of a proposed State Scenic Highway changes from eligible to officially-designated when the local governing body applies to Caltrans for scenic highway approval, adopts a Corridor Protection Program, and receives notification that the highway has been officially designated a State Scenic Highway.

LOCAL

City of Los Angeles General Plan Framework, Conservation Element, and Mobility Plan 2035. The City of Los Angeles General Plan is a comprehensive, long-range declaration of purposes, policies and programs for the development of the City of Los Angeles. The General Plan Framework, Conservation Element and Mobility Plan 2035 (MP 2035) are elements of the City's General Plan. The General Plan Framework, adopted in December 1996 and amended in August 2001, is intended to guide the City's long-range growth and development through the year 2010. The Framework Element planning policies regarding urban form, neighborhood design and the conservation of open space and other scenic resources are intended to improve community and neighborhood livability in the City of Los Angeles. The Framework Element Open Space and Conservation policies seek to conserve significant resources and use open space to enhance community and neighborhood character in the City.

The Conservation Element (adopted in 2001) includes a discussion of the existing landforms and scenic vistas in the City of Los Angeles. Objectives, policies, and programs included in these elements are intended to ensure the protection of natural terrain and landforms, unique site features, scenic highways, and panoramic public views as City staff and decision-makers consider future land use development and infrastructure projects.

The MP 2035 (adopted in 2015, as subsequently amended) provides an inventory of city-designated scenic highways. Scenic highways depicted within the City have special controls for protection and enhancement of scenic resources. The MP 2035 includes Scenic Highway Guidelines for those designated scenic highways for which there is no adopted scenic corridor plan.

The General Plan Framework, Conservation Element and MP 2035 are intended to ensure the protection of natural terrain and landforms, unique site features, scenic highways, and panoramic public views as City staff and decision-makers consider future land use development and infrastructure projects. Applicable goals, objectives, and policies are shown in **Table 4.1-1**. See Section 4.8, Land Use and Planning, for a discussion of land use consistency of aesthetics goals, objectives, and policies.

TABLE 4.1-1: RELEVANT GENERAL PLAN AESTHETICS GOALS, OBJECTIVES, AND POLICIES	
GENERAL PLAN FRAMEWORK	
Goal 5A	A livable City for existing and future residents and one that is attractive to future investment. A City of interconnected, diverse neighborhoods that builds on the strengths of those neighborhoods and functions at both the neighborhood and Citywide scales.
Objective 5.1	Translate the Framework Element's intent with respect to Citywide urban form and neighborhood design to the community and neighborhood levels through locally prepared plans that build on each neighborhood's attributes, emphasize quality of development, and provide or advocate "proactive" implementation programs.
Policy 5.1.1	Use the Community Plan Update process and related efforts to define the character of communities and neighborhoods at a finer grain than the Framework Element permits.
Objective 5.2	Encourage future development in centers and in nodes along corridors that are served by transit and are already functioning as centers for the surrounding neighborhoods, the community or the region.
Policy 5.2.1	Designate centers and districts in locations where activity is already concentrated and/or where good transit service is, or will be provided.
Policy 5.2.2	Encourage the development of centers, districts, and selected corridor/boulevard nodes such that the land uses, scale, and built form allowed and/or encouraged within these areas allow them to function as centers and support transit use, both in daytime and nighttime (see Chapter 3: Land Use). Additionally, develop these areas so that they are compatible with surrounding neighborhoods, as defined generally by the following building characteristics. Buildings in neighborhood districts generally should be low rise (one- to two-stories), compatible with adjacent housing, and incorporate the pedestrian-oriented design elements defined in Policies 5.8.1 and 3.16.1 - 3.16.3. They should also be located along sidewalks with appropriate continuous storefronts. Buildings located at activity nodes along mixed use boulevards generally shall have the same characteristics as either neighborhood districts or community centers, depending on permitted land use intensities. Housing over ground floor storefronts or in place of commercial development shall be encouraged along mixed use boulevards.
Objective 5.5	Enhance the livability of all neighborhoods by upgrading the quality of development and improving the quality of the public realm.
Policy 5.5.3	Formulate and adopt building and site design standards and guidelines to raise the quality of design Citywide.
Policy 5.5.4	Determine the appropriate urban design elements at the neighborhood level, such as sidewalk width and materials, street lights and trees, bus shelters and benches, and other street furniture.
Policy 5.5.6	Identify building and site design elements for commercial or mixed use streets in centers that may include: the height above which buildings must step back; the location of the building base horizontal articulation; and other design elements.
Policy 5.5.7	Promote the undergrounding of utilities throughout the City's neighborhoods, districts, and centers.
Policy 5.6.1	Revise community plan designations as necessary to conserve the existing urban form and community character of areas not designated as centers, districts, or mixed use boulevards.
Objective 5.7	Provide a transition between conservation neighborhoods and their centers.
Policy 5.7.1	Establish standards for transitions in building height and for on-site landscape buffers.
Objective 5.8	Reinforce or encourage the establishment of a strong pedestrian orientation in designated neighborhood districts, community centers, and pedestrian-oriented subareas within regional centers, so that these districts and centers can serve as a focus of activity for the surrounding community and a focus for investment in the community.
Policy 5.8.1	Buildings in pedestrian-oriented districts and centers should have the following general characteristics: a. An exterior building wall high enough to define the street, create a sense of enclosure, and typically located along the sidewalk; b. A building wall more-or-less continuous along the street frontage; c. Ground floor building frontage designed to accommodate commercial uses, community facilities, or display cases; d. Shops with entrances directly accessible from the sidewalk and located at frequent intervals; e. Well-lit exteriors fronting on the sidewalk that provide safety and comfort commensurate with the intended nighttime use, when appropriate; f. Ground floor building walls devoted to display windows or display cases; g. Parking located behind the commercial frontage and screened from view and driveways located on side streets where feasible; h. Inclusion of bicycle parking areas and facilities to reduce the need for vehicular use; and i. The area within 15 feet of the sidewalk may be an arcade that is substantially open to the sidewalk to accommodate outdoor dining or other activities.

TABLE 4.1-1: RELEVANT GENERAL PLAN AESTHETICS GOALS, OBJECTIVES, AND POLICIES	
Policy 5.8.2	The primary commercial streets within pedestrian-oriented districts and centers should have the following characteristics: a. Sidewalks: 15-17 feet wide (see illustrative street cross-sections). b. Mid-block medians (between intersections): landscaped where feasible. c. Shade trees, pruned above business signs, to provide a continuous canopy along the sidewalk and/or palm trees to provide visibility from a distance. d. Pedestrian amenities (e.g., benches, pedestrian-scale lighting, special paving, window boxes, and planters).
Policy 5.8.4	Encourage that signage be designed to be integrated with the architectural character of the buildings and convey a visually attractive character.
CONSERVATION ELEMENT	
Land Form & Scenic Vista Objective	Protect and reinforce natural and scenic vistas as irreplaceable resources and for the aesthetic enjoyment of present and future generations.
Land Form & Scenic Vista Policy	Continue to encourage and/or require property owners to develop their properties in a manner that will, to the greatest extent practical, retain significant existing land forms (e.g., ridge lines, bluffs, unique geologic features) and unique scenic features (historic, ocean, mountains, unique natural features) and/or make possible public view or other access to unique features or scenic views.
MOBILITY PLAN 2035	
Objective 11	Preserve and enhance access to scenic resources and regional open space.
Policy 11.1	Designate scenic highways and scenic byways which merit special consideration for protection and enhancement of scenic resources.
Policy 11.2	Provide for protection and enhancement of views of scenic resources along or visible from designated scenic highways through implementation of guidelines set forth in this 2035 Mobility Plan.
Policy 11.3	Consider aesthetics and scenic preservation in the design and maintenance of designated scenic highways and of those scenic byways designated in Community Plans.
Policy 11.4	Establish Scenic Corridor Plans, where appropriate, which set forth corridor boundaries and development controls in harmony with each corridor's specific scenic character.
Policy 2.16	Ensure that future modifications to any scenic highway do not impact the unique identity or characteristic of that scenic highway.
SOURCE: City of Los Angeles, The Citywide General Plan Framework, re-adopted 2001; City of Los Angeles General Plan, Conservation Element, adopted 2001; City of Los Angeles General Plan, Mobility Plan 2035, adopted 2015, as subsequently amended.	

City of Los Angeles Planning and Zoning Code and Building Regulations. LAMC Chapter 1 contains the Planning and Zoning Code, and Chapter 9 contains Building Regulations. The purpose of the Planning and Zoning Code is to designate and regulate the location, use, height and size of buildings. The Planning and Zoning Code regulates the aesthetics and visual quality of development projects. It includes development regulations specific to each zone and addresses parking, landscaping, lighting, and a number of other topics that influence the aesthetics of a development project. The Planning and Zoning Code also includes design regulations that seek to affect the physical alteration of streets, intersections, alleys, pedestrian walkways, and landscaping.

The following are sections of the LAMC that regulate lighting:

- *Chapter 1, Article 2, Sec. 12.21 A5(k).* All lights used to illuminate a parking area shall be designed, located and arranged so as to reflect the light away from any streets and any adjacent premises.
- *Chapter 1, Article 7, Sec. 17.08C.* Plans for street lighting system shall be submitted to and approved by the Bureau of Street Lighting.
- *Chapter 9, Article 3, Sec. 93.0117.* No exterior light source may cause more than two foot-candles (21.5 lux) of lighting intensity or generate direct glare onto exterior glazed windows or glass doors; elevated habitable porch, deck, or balcony; or any ground surface intended for uses such as recreation, barbecue or lawn areas or any other property containing a residential unit or units.

- *Chapter 9, Article 1, Section 91.6205 (K)4*. Signs are prohibited if they contain flashing, mechanical and strobe lights in conflict with the provisions of Section 80.08.4 and 93.6215 of this code.
- *Chapter 9, Article 1, Section 91.6205M*. No sign shall be arranged and illuminated in such a manner as to produce a light intensity of greater than three foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property.

Los Angeles Administrative Code (LAAC) Cultural Heritage Ordinance (Section 22.171). The Cultural Heritage Ordinance was first adopted by the Los Angeles City Council in 1962 and has since been amended several times. The provisions of the Cultural Heritage Ordinance are codified in Division 22, Chapter 9, Article 1 of the LAAC, commencing with Section 22.171. The Ordinance created a Cultural Heritage Commission and criteria for designating Historic-Cultural Monuments (HCM). HCMs, along with all other historically significant resources, are considered scenic resources. The designation of a historic building as a HCM affords it protection from development and requires that resource be considered when analyzing the aesthetic impacts of a project.

The Cultural Heritage Commission is comprised of five citizens appointed by the Mayor, who have exhibited a knowledge of Los Angeles' history, culture and architecture. LAAC Section 22.171.7 states that an historical or cultural monument is:

> *"…any site (including significant trees or other plant life located on the site), building, or structure of particular historic or cultural significance to the City of Los Angeles, including historic structures or sites in which the broad cultural, economic or social history of the nation, State, or community is reflected or exemplified or which is identified with historic personages or with important events in the main currents of national, State, or local history; or which embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction; or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age."*

Each nomination for HCM designation is reviewed by the Commission, then by the Planning and Land Use Management Committee of the City Council, and the City Council as a whole. Once a property has been designated a monument, the Cultural Heritage Commission and its staff review permits for alteration, relocation, or demolition.

City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance. In addition to the designation of individual sites as HCMs, the City of Los Angeles also has a separate ordinance and procedure for the designation of historic districts, or HPOZ. The ordinance, which is found in LAMC Chapter I, Article 2, Section 12.20.3, is intended to recognize, preserve, and enhance buildings, structures, landscaping, natural features, and areas within the City having historic, architectural, cultural, or aesthetic significance in the interest of the health, economic prosperity, cultural enrichment, and general welfare of the people.

City of Los Angeles Tree Preservation Ordinance. Protected trees are considered aesthetic resources. The City of Los Angeles passed an ordinance for the Preservation of Protected Trees (Ordinance No. 177,404; LAMC Chapter IV, Article 6) which became law on April 23, 2006. The ordinance protects the following tree species:

- All native Oak tree species (*Quercus* spp), but excluding the Scrub Oak (*Quercus dumosa*)
- Western Sycamore (*Platanus racemosa*)
- California Bay (*Umbellularia californica*)
- Southern California Black Walnut (*Juglans californica var. californica*)

The Ordinance applies to trees that are four inches or greater in diameter at 4.5 feet above ground, and on any lot size. Protected tree removal requires a removal permit by the City of Los Angeles Department of Public Works (LADPW). Any act that may cause the failure or death of a protected tree requires inspection by the LADPW Urban Forestry Division. In the event, the LADPW approves a tree removal, replacement of the tree is required with at least two trees of a protected variety.

Heritage Trees. Similar to protected species of trees, Heritage Trees are considered aesthetic resources. Heritage Trees are individual trees of any size or species that are specially designated as heritage because of their historical, commemorative, or horticultural significance. The list of designated heritage trees is maintained by the City of Los Angeles Department of Recreation and Parks (DPR) and can be viewed on NavigateLA.[2] Section 17.02 of the LAMC, protects four native Californian tree species, including Oak Trees, Southern California Black Walnut, Western Sycamore, and California Bay Trees. The list of designated heritage trees remains open for new designations and the Department of Parks and Recreation is responsible for the maintenance and protection of these trees from injury.

EXISTING SETTING

SCENIC VIEWS AND VISTAS

The term views generally refer to visual access to, or the visibility of, a particular natural or man-made visual resource from a given vantage point or corridor. Focal views focus on a particular object, scene, setting, or feature of visual interest. The City's General Plan Conservation Element defines scenic views or vistas as the panoramic public view access to natural features, including views of the ocean, striking or unusual natural terrain, or unique urban or historic features. Public access to these views is typically from park lands, publicly owned sites, and public rights-of-way.

There are no designated, publicly accessible panoramic vista points within the Project Area. Due to the relatively flat nature of the Project Area, there are limited views from public rights-of-way within the Project Area to visual resources and landmarks either within or adjacent to the Project Area. Public views of historic buildings, parks, landscaped street medians, and Heritage and Ordinance Protected Trees are typically limited to close in foreground views from adjacent streets and sidewalks. **Figure 4.1-2** depicts views of recognized scenic resources and landmarks which are partially visible from within the Project Area. Some of these resources are located in the Project Area, while others are located outside. These views of scenic resources and landmarks include:

- South-facing views along Motor Avenue of the Sony Pictures Water Tower in Culver City (160 feet in height) (**Figure 4.1-2a**).
- Views of the Helms Bakery District from Venice Boulevard (**Figure 4.1-2b**).
- South facing views along Overland Avenue of the Veterans Memorial Building (122 feet in height) in Culver City, (**Figure 4.1-2c**).
- North facing views along Overland Avenue of the spire of the Mormon Temple (257 feet in height) on Santa Monica Boulevard (**Figure 4.1-2d**).

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

SOURCE: City of Los Angeles and TAHA, 2017.

Limited views of geologic features and mountains located outside of the Project Area are available from public rights-of-way within the Project Area. These views are often subject to atmospheric visibility conditions. On a clear day, distant background views are possible, including:

- South-facing views along National Boulevard near Venice Boulevard of portions of the Baldwin Hills ridge line.
- Views of the Santa Monica Mountains and the Hollywood Hills, located to the north of the Project Area, looking north from Bundy Drive, Barrington Avenue, and Sawtelle, Sepulveda, and Robertson Boulevards, as well as by motorist from the Interstate-405 (I-405) and Interstate-10 (I-10).
- Background views of the San Gabriel Mountains, located to the east of the Project Area can be seen from certain vantage points, when looking east and north, primarily along a number of east-west oriented roadways including Olympic, Pico, Palms, Venice, and Washington Boulevards, and the I-10.
- Distant views to the south and west of Baldwin Hills and the Santa Monica mountains from Manning Avenue and other east-west local streets in the Cheviot Hills area.

The Baldwin Hills Scenic Overlook in Culver City is the nearest designated public vista point to the Project Area. This vista point offers views of the Project Area and of recognized scenic resources located outside of the Project Area. The Baldwin Hills Scenic Overlook is located approximately two miles to the southeast of the Culver City Station Area at the intersection of Jefferson Boulevard and Hetzler Road in Culver City. The Baldwin Hills Scenic Overlook peak is 511 feet above sea level, which is higher in elevation than the Project Area. **Figure 4.1-3** represents a view of the Project Area from the Baldwin Hills Scenic Overlook looking to the northwest. The Project Area is in the middle ground of the photograph, with station areas indicated. The Sony Studios Water Tower, the Getty Center, and the Mormon Temple located outside of the Project Area are visible from the Baldwin Hills Scenic Overlook, as represented in **Figure 4.1-3**. The background vista is visually dominated by the Hollywood Hills, and the Santa Monica and San Gabriel mountains.

Views of the Project Area and beyond are available from the public rights-of-way of the I-10 and from the I-405. In the majority of the Project Area, the I-10 is elevated on an aerial structure or berms and views of the Project Area by freeway travelers is intermittently shielded by adjacent development and landscaping. Additionally, views of the Project Area are also available from the elevated portion of the Expo light rail transit (LRT) Line at the Culver City Station Area, which was recently constructed. Along the track segments of the Expo LRT Line that are elevated, transit riders also have momentary views of the Project Area; these include Exposition Boulevard at Palms Boulevard, Motor Avenue, Sawtelle Boulevard, Pico Boulevard, Bundy Drive, and Centinela Avenue. At these locations, there are no adjacent publically valued views. North of the Expo LRT Line, the Bundy and Sepulveda Station Areas are bounded by industrial and commercial-oriented uses. The remainder of the Expo LRT Line within the Project Area is bounded by primarily residential neighborhoods with low-scale buildings.

SCENIC RESOURCES

Scenic Highways. As described above in the Regulatory Framework, the California State Scenic Highway System is a list of highways that have been designated by Caltrans as Scenic Highways. There are no State-designated Scenic Highways located within the Project Area. Furthermore, there are no State-designated Scenic Highways in proximity to the Project Area that afford views of the Project Area. The nearest State-designated Scenic Highway is State Route 2, north of State Route 210 in La Canada Flintridge.

Figure 4.1-3 Baldwin Hills Scenic Overlook Visual Character

The southeastern portion of the Project Area is approximately two miles from the Baldwin Hills Scenic Overlook. Views of the Project Area and beyond are available from this panoramic view point. The background vista is visually dominated by the Santa Monica Mountains. The Project Area can be seen in the middle-ground views from this point. Views of the Sony Studios Water Tower in the foreground, the Getty Center, and the Mormon Temple beyond the Project Area are available from this panoramic view point.

SOURCE: City of Los Angeles and TAHA, 2017.

The City's MP 2035 identifies the entire length of Venice Boulevard within the Project Area as a locally-designated scenic highway.[3] According to the MP 2035, city-designated scenic highways may traverse an urban area of cultural, historic, or aesthetic value. Venice Boulevard is designated as a scenic highway, and features a landscaped median planted with grass and mature trees. About 30 percent of the Venice Boulevard median is landscaped with intermittent trees, small shrubs, and grassy areas within the Project Area. Vegetation on the median can be found predominantly in the road segment from Motor Avenue on the west to Helms Avenue on the east. No other city-designated scenic highways are located in the Project Area.

Scenic Natural Features, Landforms and Geology. Scenic resources may include natural or urban features. Natural features can include open space, native or ornamental vegetation/landscaping; topographic or geologic features; and natural water sources. Urban features can include structures of architectural or historic significance or visual prominence, public plazas, art or gardens, heritage oaks and other trees or landscaping protected by the City; consistent design elements along a street or within a district; pedestrian amenities; and landscaped medians or park areas. These scenic natural features contribute to a valued aesthetic character or image of a given area.[4]

The Project Area is highly urbanized and contains a limited number of natural features. With the exception of a narrow ravine along the Expo LRT right-of-way just east of Overland Avenue and a slight rise in topography in the Cheviot Hills area, there are no major topographic features within the Project Area.

Open Space and Parks. Open space and landscaping are primarily limited to public parks, which are considered urban features. The urban scenic features within the Project Area are discussed below. The most prominent open space area in the vicinity of the Project Area is the Rancho Park Golf Course. This 184-acre area is located just outside the northern boundary of the Project Area. The Project Area has four public parks: Stoner Recreation Center, Palms Recreation Center, Woodbine Park, and Media Park (refer to Figure 4.11-3 in Section 4.11, Public Services). Stoner Recreation Center, Palms Recreation Center, and Woodbine Park are located in residential neighborhoods, while Media Park is located at the major commercial intersection of Venice and Culver Boulevards. Trees, grassy areas, and other vegetation contribute to scenic quality of these parks. Additionally, Media Park contains the Ivy Substation, a City of Los Angeles designated HCM.

Parkways and Landscaped Roadway Medians. Of the numerous major and minor arterials within the Project Area, only a few streets have landscaped medians, including Venice, Culver, and Gateway Boulevards. Only the median along Venice Boulevard is part of a city-designated scenic highway.

Heritage and Ordinance Protected Trees. Heritage Trees are individual trees of any size or species that are specially designated as heritage because of their historic, commemorative, or horticultural significance.[5] The vast majority of Heritage Trees in the Project Area are located within city-designated community parks and at recreation centers.

Historic Resources. No HPOZs are located within the Project Area (refer to Figure 4.3-1 in Section 4.3, Cultural Resources). The nearest HPOZs are the Gregory Ain Mar Vista Tract and the South Carthay HPOZ. The Gregory Ain Mar Vista Tract is located approximately two miles south of the western portion of the Project Area and the South Carthay HPOZ is located approximately two miles north of the eastern portion of the Project Area.

Historic Buildings and Monuments. A number of properties located within the Project Area are listed in, or have been determined eligible for, listing in the National Register of Historic Places (National Register), the California Register of Historical Resources (California Register), or local listing. These properties that

[3]City of Los Angeles *Mobility Plan 2035*, adopted in 2015, as subsequently amended.
[4]City of Los Angeles *CEQA Thresholds Guide*, 2006.
[5]LADPW, *NavigateLA*, http://navigatela.lacity.org; City of Los Angeles, *Urban Forestry Division*, http://bss.lacity.org/urbanforestry/index.htm, accessed February 28, 2017.

are defined in part as visual resources are identified in Tables 4.3-3 and 4.3-4 and Figure 4.3-1 in Section 4.3, Cultural Resources. The majority of officially designated historic resources within the Project Area are concentrated in the Culver City Station Area, while a number of eligible buildings are located in the northern area between the Sepulveda and Bundy Station Areas. Although not officially designated as historic, the Helms Bakery District is a local landmark and is architecturally significant. It is valued as a scenic resource in part due to its Olympic style neon sign and landscaped pedestrian plaza. The Helms Bakery District has frontage on both Venice and Washington Boulevards. The Venice Boulevard portion of the site is in the City of Los Angeles, while the Washington Boulevard portion of the district is in the City of Culver City. There are two city-designated HCMs are located in the Project Area: the Ivy Park Substation (located southwest of the Culver City Station Area) and the Lawrence and Martha Joseph Residence and Apartments (located south of the Palms Station Area). Additionally, there are several historic resources within the Project Area that are eligible for local, state, and federal listing, as well as historic resources that are located just outside the Project Area, such as the Moreton Bay Fig Tree, a city-designated HCM.

VISUAL CHARACTER

The Project Area is highly urbanized and there is little vacant land or open space, except for the Rancho Park Golf Course. The Project Area is characterized by a mix of single- and multi-family residential neighborhoods, commercial corridors, and industrial uses. There is no one consistent style or type of development within the Project Area. Generally, development in the Project Area is low-rise, ranging in height from one to three stories. However, within certain areas, development may exceed three stories and can reach up to 12 stories, such as along Olympic and Pico Boulevards. Development exceeding four stories is typically interspersed among lower-scale development. Industrial uses are typically concentrated near the former railroad rights-of-way near Exposition Boulevard and in the Bundy and Sepulveda station areas. None of these non-residential areas have unique or outstanding features. Similarly, multi-family residential areas are compact, typically low scale and well landscaped (with lawns and trees) but comprise a wide variety of architectural styles and building ages that result in a lack of consistent visual character. Major streets in the project area have tall utility poles and overhead wires which detract from the visual character of the streetscape. This condition is apparent on Venice Boulevard, Bundy Drive, Sepulveda, and Olympic Boulevards.

Infrastructure elements such as elevated freeways and rail crossing play a large role in defining neighborhood boundaries within the Project Area. Specifically, the I-10 and I-405 are dominant visual features within the Project Area. The I-10 traverses the area in an east-west direction for approximately four miles, and the I-405 in the north-south direction for approximately 1.1 miles. The I-10 and I-405 are predominantly elevated in the Project Area, with a limited number of crossings over local streets. These crossings over local streets create a "gateway" effect between neighborhoods and commercial areas at the ground level. These freeways create a visual division between communities.

Similarly, the Expo LRT Line, which generally follows the east-west route of a former rail line is an emerging visual feature of the Project Area. The visual prominence of this facility is highlighted by overcrossing concrete bridge structures at Centinela Avenue, Bundy Drive, Barrington Avenue, Pico Boulevard, Sawtelle Boulevard, Sepulveda Boulevard, Motor Avenue, National Boulevard, and Venice Boulevard. Although these structures are generally less imposing than the freeway in the Project Area, they have a similar gateway visual effect for both neighborhoods and commercial areas.

The visual character specific to each of the five station areas, shown in Figure 3-1 in Chapter 3.0, Project Description, is described below. The boundaries of each station segment are indicated with a solid red line.

Bundy Station Area. **Figure 4.1-4a** includes images of some of the Bundy Station Areas of proposed change. **Figure 4.1-4b** identifies the location of these views. An aerial view of the Bundy Station Area is provided as **Figure 4.1-4c**. The areas of proposed change are adjacent to, but oriented away from the single-family neighborhoods to the north and east. The dominant visual features in the Bundy Station area are the elevated I-10 and associated ramps, Expo LRT Line where it crosses above Bundy Drive, and office buildings exceeding six-stories in height. These office buildings are mostly located in the vicinity of the Bundy Drive and Olympic Boulevard intersection. The I-10, which roughly parallels Pico Boulevard to the south, is mostly shielded from view by development and a densely-landscaped buffer. The I-10 is visible where it crosses above Barrington Avenue, Bundy Drive, Pico Boulevard, and Centinela Avenue.

Just over 50 percent of the Bundy Station Area is comprised of single-family residential neighborhoods. The single-family neighborhood clusters are similar with largely one story post-war residences. These neighborhoods generally have consistent layouts including single-story residences with side yards, driveways, and 20-30-foot street setbacks with landscaped front yards and sidewalks.

The primary characteristic difference between the neighborhood just south of the Expo LRT Line and east of Bundy Drive and the other neighborhoods are the unusually wide streets. While the residences are primarily single story in the neighborhood just south of Expo LRT Line and east of Bundy Drive, the street widths are approximately 80 feet and are substantially wider than streets in most residential areas in the Project Area and in the City. The wider streets give this neighborhood the appearance of being less dense and more open.

The character of commercial corridors and districts within the Bundy Station Area is summarized below:

- *Olympic Boulevard.* The most prominent non-residential visual feature on Olympic Boulevard in the Bundy Station Area is a series of office buildings that range from 4 to 12 stories in height. This stretch of Olympic Boulevard is shown in **Figure 4.1-4a**, View 2. The area generally lacks a cohesive character, as it does not have consistent height, scale, or massing and has very diverse and variable building forms. In addition to office buildings, the area includes auto-oriented uses such as gas stations, as well as a number of schools, a supermarket, and single-story strip mall style shopping centers. Tall utility poles and lines parallel the south side of Olympic Boulevard.
- *Pico Boulevard.* Pico Boulevard in the Bundy Station Area has generally a consistent commercial character. The roadway is mostly lined by one-story buildings consisting of restaurants, storefronts, and other businesses oriented towards the street, occasionally broken up by surface parking lots. Also, there are a number of corner strip malls and stand-alone buildings that are oriented around surface parking lots. The only exception to the low-scale character of this street segment is a new, approximately six-story residential mixed use building located at the northeast corner of Pico Boulevard and Centinela Avenue.
- *Bundy Drive.* The character of this segment is mixed. Along Bundy Drive, north of Expo LRT Line, development includes several one and two-story retail stores oriented around surface parking lots, however there are several office buildings ranging from three to eight stories. Buildings along Bundy Drive are mostly set back from the roadway by landscaping or parking areas. Tall utility poles and lines parallel the west side of the street and add to visual clutter.
- *Centinela Avenue.* The character of the east side of Centinela Avenue, within the station area has a distinct light industrial character. Several single-story warehouse-style buildings with surface parking lots line the east side of Centinela Avenue. These buildings are either built up to the street, shielded by walls or fences along the sidewalk or setback by paved strips. Utility lines parallel Centinela Avenue.

2012-058

Sepulveda Station Area. **Figure 4.1-5a** includes images of some of the Sepulveda Station Areas of proposed change. **Figure 4.1-5b** identifies the location of these views. An aerial view of the Sepulveda Station Area is provided as **Figure 4.1-5c**. Transportation infrastructure including the elevated I-405, Expo LRT Line, and I-10 are the dominant visual features in the area. The elevated I-405 crosses over Pico Boulevard between Sepulveda and Sawtelle Boulevards. Beneath the freeway is undeveloped land, landscaped in some locations and used as service yards in other locations. The I-10 freeway runs east-west and is highly visible between Sawtelle Boulevard and the I-405. The Expo LRT Line crosses above Sepulveda Boulevard just south of Pico Boulevard, as well as above Pico and Sawtelle Boulevards. The Expo LRT Line is at-grade through the remainder of the Sepulveda Station area.

Approximately 40 percent of the Sepulveda Station Area is single-family neighborhoods. Most of the neighborhood streets are tree-lined and have, one- and two-story single-family residences with landscaped front yards, driveways, and street setbacks with sidewalks. Along Exposition Boulevard between Sepulveda Boulevard and Westwood Boulevard approximately 6 acres are currently zoned as R2-1. These properties are mostly developed with one- and two-story two-family dwelling units that are set back from the street by landscaped front yards.

Medium density multi-family residential buildings in the Sepulveda Station Area are concentrated along Sepulveda south of the station, along Bentley Avenue just east of Sepulveda Boulevard and on or around Sawtelle Boulevard west of the I-405. These buildings are mostly four stories in height, and are either minimally set back from the street or have narrow landscaped front yards. Parking is typically provided in ground floor parking garages located below dwelling units and accessed from driveways along these streets or alleyways. Despite some consistency in building heights and orientation, the multi-family residential buildings comprise a wide variety of architectural styles and building ages that result in a lack of consistent visual character.

The character of commercial corridors and districts within the Sepulveda Station Area is summarized below:

- *Industrial-style development and uses are located just north of the Sepulveda Station, between Sepulveda Boulevard and the I-405, north of the Expo LRT Line.* The area is characterized by non-descript flat buildings, one to two stories in height, aligned with the roadways, and spaced out by surface parking lots and service yards. **Figure 4.1-5a**, Views 1 and 3, are representative of the visual character of this area. Fencing, gates, or low walls often buffer development from the street. Along the west side of Sepulveda Boulevard, businesses are setback from the street by a linear surface parking lot, with no curbs and gutters along the street. Businesses are built to the sidewalk along the east side of Sepulveda Boulevard, with utility poles and lines in the sidewalk. A concrete batch plant is located on the west side of Sepulveda Boulevard, south of Pico Boulevard.
- *Pico Boulevard.* This area has a fairly consistent low-scale commercial character, but setbacks and spacing between buildings is varied. Freestanding restaurants and businesses, and strips of retail line Pico Boulevard. Buildings are separated by surface parking lots. Development along Pico Boulevard is mostly one story in height; however, a few buildings reach up to three stories in height. Billboards and other forms of advertising are widely present along Sepulveda and Pico Boulevards. A view of the commercial development along Pico Boulevard east of Veteran Avenue is illustrated in **Figure 4.1-5a**, View 4. Tall utility poles and lines parallel both sides between the I-405 and Sepulveda Boulevard.
- *Sawtelle Boulevard.* Sawtelle Boulevard, north of Pico Boulevard has a mixed and inconsistent character. Sawtelle Boulevard is lined with a mix of freestanding buildings oriented toward surface parking lots and away from the street and buildings oriented toward the street with no parking in front, and a parking garage. Buildings along Sawtelle Boulevard are generally one to two stories in height. Additionally, there are three-story shopping centers, an eight-story office building, and a storage facility. Buildings are generally setback by a landscaped strip. Tall utility poles and lines parallel the west side of Sawtelle Boulevard.

Westwood Station Area. The Westwood Station Area is largely residential in character, except along Pico Boulevard, portions of Overland Avenue, and Westwood Boulevard north of Pico Boulevard. **Figure 4.1-6a** includes images of some of the Westwood Station areas of proposed change. **Figure 4.1-6b** identifies the location of these views. An aerial view of the Westwood Station Area is provided as **Figure 4.1-6c**. The four-story Westside Pavilion shopping center, located south of Pico Boulevard and bridging over Westwood Boulevard, and a six-story office building situated on the southeast corner of Pico Boulevard and Overland are significant visual features along Pico Boulevard. The visual contrast between the Westside Pavilion and the small-scale development adjacent to it on Pico Boulevard defines the area.

Approximately 55 percent of the Westwood Station Area is single-family residential.[6] Residences are mostly one- to two-stories in height and are set back from the streets by landscaped front yards and driveways.

The character of commercial and industrial corridors and districts in the Westwood Station Area are described below:

- *Pico Boulevard.* The north side of Pico has a consistent low-scale character with relatively uniform building setbacks. Pico Boulevard is lined primarily with retail continuous storefronts and restaurants, and is occasionally separated by parking lots, as illustrated in **Figure 4.1-6a**, Views 1 through 4. Development along Pico Boulevard is low-scale, rarely exceeding two-stories in height, and generally built to the sidewalk. The Westside Pavilion, a four-story indoor shopping mall, extends along the south side of Pico Boulevard from approximately Midvale Avenue to Overland Avenue, crossing over Westwood Boulevard via a bridge that extends three stories above the roadway. The Westside Pavilion is internally oriented with limited pedestrian access from Pico Boulevard, creating a dominant street wall that contrasts with the character of the north side of Pico Boulevard.
- *Westwood Boulevard.* North of Pico Boulevard, the character of Westwood Boulevard is consistently low-scale commercial. Westwood Boulevard is lined primarily with retail storefronts and restaurants, the occasional office building, and multi-family residential. South of Pico Boulevard, Westwood Boulevard is primarily single-family residential. Near National Boulevard south of I-10 there is a cluster of commercial uses, including several shopping centers oriented around surface parking lots, a six-story office building, and a synagogue.
- *Overland Avenue.* The height, scale, and type of development vary considerably along this segment of Overland Avenue. North of Exposition Boulevard, the east side of Overland Avenue is lined with a number of different uses including Overland Elementary School (immediately north of Exposition Boulevard), a four-story multi-family development, a seven-story office building, a two-story corner strip mall, and a one-story strip of commercial uses. The Palms Recreation Center and Notre Dame Elementary School are also located along Overland Avenue, just north of the I-10. Overland Avenue crosses above the I-10. The maze of freeway on- and off-ramps, the freeway right-of-way as well as billboards oriented towards the freeway influence the character of this area. South of the I-10 within the station area, the character of Overland Avenue becomes auto-oriented with a gas station and an oil-change shop. Tall utility poles and lines parallel the south side of the avenue.

[6]Properties zoned R-1 and R-2 are not subject to the regulations in the ECTNP Area.

2012-058

Palms Station Area. The Palms Station Area is largely multi-family residential in character, except along Motor Avenue, National Boulevard, and Venice Boulevard, which are mostly commercial in character. **Figure 4.1-7a** includes images of some of the Palms Station Areas of proposed change. **Figure 4.1-7b** identifies the location of these views. An aerial view of the Palms Station Area is provided as **Figure 4.1-7c**. The prominent visual character features in the Palms Station area are multi-family, multistory residential structures. Additional features include two new approximately six-story residential mixed use buildings located on Motor Avenue, north of Palms Boulevard. While the elevated I-10, which parallels the Expo LRT Line, bisects the Palms Station Area, the I-10 is mostly blocked from view by existing buildings. The I-10 is only highly visible along Exposition Boulevard, east of National Boulevard, where it crosses over Motor Avenue, north of National Boulevard, and at the intersection of National Boulevard and Palms Avenue where an on- and off-ramp is located.

Closely spaced apartment buildings line most of the streets in the Palms Station Area, south of the Expo LRT Line and National Boulevard. These buildings are typically two- to four-stories in height and are setback from the street by landscaping and driveways. Residential streets are often tree-lined; however, the distribution and type of trees is rarely consistent. Parking is typically provided in ground floor parking garages located below dwelling units and accessed from driveways along these streets or alleyways. In some cases, carports face local streets. Views of the multi-family residential development representative of the visual character of the area are shown in **Figure 4.1-7a**, View 1.

Approximately 38 percent of the Palms Station Area is single-family residential.[7] The single-family residential neighborhoods in the station area are grouped in one area—Cheviot Hills—located north of the Expo LRT Line and the I-10, where the topography becomes hilly.

The character of commercial and industrial corridors and districts in the Palms Station Area is described below:

- *Motor Avenue.* Motor Avenue is characterized by a mix of uses and building types, including apartment and office buildings, commercial strips, and stand-alone businesses, as well as a school, a fire station and a post office. Buildings range in height from one to four stories, although a few newer buildings reach up to six stories in height. Parking is allowed along both sides of Motor Avenue, which is also has Class II bike lanes. Street trees are distributed sporadically along Motor Avenue. Minimal landscaping is present along the frontages of most apartment buildings.
- *National Boulevard.* Development along National Boulevard south of I-10 mostly consists of three- to four-story apartment buildings set back from the street by narrow landscaped yards on the south side, and low-scale industrial-style development on the north side abutting the freeway. In the vicinity of National Boulevard's intersection with Motor Avenue, there are several commercial strip malls with on-site parking. North of the I-10 overpass the primarily multi-family residential character of the street is broken by a large commercial shopping center with large surface parking lots. This is shown in **Figure 4.1-7a**, View 3. Street trees and landscaping are sporadic along National Boulevard. Tall utility poles and lines and run along the south side of the boulevard south of I-10, and along the north-west side of the boulevard north of I-10.
- *Venice Boulevard.* Venice Boulevard within the Palms Station Area is an eight-lane divided highway, lined with a wide variety of commercial uses, including a number of corner strip malls and stand-alone buildings, mostly one or two-stories in height, setback from sidewalks by surface parking lots. As described above, Venice Boulevard features a center median that is landscaped with grass and trees in some locations. Aside from the landscaping associated with the median, the landscaping along Venice Boulevard within the Palms Station Area is extremely limited. A number of billboards are located along Venice Boulevard. Utility poles and lines are located on the northwest side of Venice Boulevard.

[7]Properties zoned R-1 and R-2 are not subject to the regulations in the ECTNP.

Culver City Station. The character of the Culver City Station Area is varied. With the exception of Robertson Boulevard north of I-10 and the industrial and commercial area adjacent to the station, roughly bound by Venice Boulevard, National Boulevard, I-10 and Durango Avenue, the remainder of the Culver City Station Area is residential in character. **Figure 4.1-8a** includes images of some of the Culver City Station's areas of proposed change. **Figure 4.1-8b** identifies the location of these views. An aerial view of the Culver City Station Area is provided as **Figure 4.1-8c**. The defining character features of the station area are the landscaped Venice Boulevard median; the elevated Expo LRT Line bridge; the I-10, where it crosses National and Robertson Boulevards; the Helm's Bakery development; and the I-10's on- and off-ramps from Robertson and National Boulevards.

Approximately 21 percent of the Culver City Station Area (within the boundaries of the City of Los Angeles) is zoned single-family residential (**Figure 4.1-8a)**.[8] Residences are mostly one- and two-stories in height and are setback from sidewalks by landscaped front yards. This area has sidewalks, and curb and gutter infrastructure. A view of a single-family residential neighborhood looking north along Robertson Place south of Cattaraugus Avenue is depicted in **Figure 4.1-8a**, View 4. The multi-family residential neighborhoods in the Culver City Station Area are concentrated north of Venice Boulevard and west of Robertson Boulevard. These buildings are typically two- to four-stories in height. These buildings are typically setback from the street by landscaped frontages and wide driveways. Parking is often located at street-level beneath dwelling units.

Commercial corridors and districts within the Culver City Station Area are described below:

- *Venice Boulevard.* Near the Culver City Station, Venice Boulevard is eight-lanes wide and includes a center median, the elevated Expo LRT Line over-crossing, and the I-10 ramps. The presence of a substantial commercial shopping center at the intersection of Venice and Culver Boulevards influences the visual character of the area. The shopping center is anchored by a supermarket and a number of other large retail establishments. Surrounding the shopping center are several commercial strip malls and stand-alone fast food restaurants oriented around surface parking lots, as well as the Culver City Media Park, which fronts Venice Boulevard. Although much of this area is commercial in nature, this portion of Venice Boulevard appears very industrial in character due in part to the absence of landscaping, abundance of paved areas, the types of buildings, and auto-related land uses. East of National Boulevard, the character of Venice Boulevard transitions to being more commercial in character. This is largely a result of the presence of a wide-landscaped median with mature trees, and landscaping along both sides of the roadways, as well as the presence of the Helms Bakery District which has a landscaped pedestrian plaza, home furnishing stores, and restaurants. The Helms Bakery District, a local landmark that straddles the cities of Culver City and Los Angeles, includes art-deco style signage visible from Venice Boulevard and Washington Boulevard. Development along this segment of Venice Boulevard is mostly two-stories in height, and setback from sidewalks by landscaped frontages or surface parking lots. Tall utility poles and lines parallel the north side of the boulevard. The character of Venice Boulevard is illustrated in **Figure 4.1-8a**, View 3.
- *Robertson Boulevard.* Where the I-10 crosses above Robertson Boulevard and Robertson Boulevard's intersection with National Boulevard, Robertson Boulevard is industrial and auto-oriented in character, and is heavily influenced by the I-10 overpass, ramps, associated buffer areas, and several auto-oriented uses including a car wash, gas station, and auto-repair mall, all predominately one story in height. North of this area, Robertson Boulevard transitions to being more commercial in character, and is lined by strips of single-story commercial development, with the exception of a four-story medical office building and parking structure located adjacent to the I-10. Hamilton High School is located on the west side of Robertson Boulevard, and set back from the roadways by a surface parking lot planted with a number of mature trees. A view looking south towards the commercial uses along Robertson Boulevard is available in **Figure 4.1-8a**, View 2.

[8]Properties zoned R-1 and R-2 are not subject to the regulations in the ECTNP.

LIGHT AND GLARE

A high level of ambient nighttime light exists in the Project Area due to its urbanized nature. Nighttime artificial lighting sources include street, security, and wayfinding outdoor lighting, vehicle headlights, and interior building illumination. While there is no visually dominant illumination source in the Project Area, street lighting is the most evident. Street lighting within the Project Area adheres to City of Los Angeles standards. These standards depict lighting levels in foot-candles (fc). A foot-candle is a unit of measure of the intensity of light falling on one square foot of surface area equal to one lumen per square foot. The City standards are based on a combination of factors including roadway type, the potential for conflicts between pedestrians and vehicles, and the degree of reflectivity of the pavement surface. The most stringent standards are imposed when there is a high probability of pedestrian and vehicle conflicts. For major arterial roadway segments the illumination standard ranges from 1.2 to 1.7 fc. For Collector roads, the standard is reduced somewhat to 0.8 to 1.2 fc and the lowest illumination standard is applied to local roads at 0.6 to 0.8 fc.

At roadway intersections, there is greater potential for conflicts and the lighting standards are increased. **Table 4.1-2** demonstrates the LADPW's Bureau of Street Lighting Design Standards and Guidelines for intersections under these reasonably worst-case conditions.

TABLE 4.1-2: CITY OF LOS ANGELES MAXIMUM INTERSECTION ILLUMINATION STANDARDS

Intersection Type	Maximum Illumination (Foot-candles)
Major Arterial to Major Arterial	3.4
Major Arterial to Collector Street	2.9
Major Arterial to Local Street	2.6
Collector Street to Collector Street	2.1
Local Street to Local Street	1.8

SOURCE: LADPW's *Bureau of Street Lighting Design Standards and Guidelines*, 2007.

A nighttime survey of representative intersections and street segments within each of the project station areas confirmed that lighting levels were generally within the range of the established street lighting standards. The most brightly lit areas in the Project Area are the I-10 and I-405 and near the Westside Pavilion, and the most dimly lit areas are those south of the Expo LRT Line alignment in the Bundy and Sepulveda Station Areas. **Table 4.1-3** describes the average existing nighttime ambient street lighting levels within each of the station areas.

TABLE 4.1-3: EXISTING AMBIENT STREET LIGHTING LEVELS WITHIN STATION AREAS (FOOT-CANDLES)

Average	Range (difference between maximum and minimum)	Spectrum (maximum to minimum range)

Glare is a common phenomenon in the Southern California area primarily due to the occurrence of a high number of days per year with direct sunlight and the highly-urbanized nature of the region, resulting in a large concentration of reflective surfaces. Glare can result from sunlight reflecting off plastic awnings or other structural fixtures of buildings located on adjacent streets in the Project Area. The majority of existing structures within the Project Area are comprised of non-reflective materials, such as concrete, wood, stucco and plaster. However, a number of office buildings with substantial amounts of glass are located along Olympic Boulevard and there are glare effects typically in the afternoon hours.

SHADE AND SHADOW

Shading refers to the effect of shadows cast upon adjacent areas. The consequences of shadows upon land uses may be positive, including cooling effects during warm weather, or negative such as the loss of natural light necessary for solar energy purposes or the loss of warming influences during cool weather. Shadows are cast in a clockwise direction from west/northwest to east/northeast from approximately 7:00 a.m. to 3:00 p.m. or later depending on the time of the year: Summer Solstice (June 21), Spring/Fall Equinoxes (March 20 and September 22), and Winter Solstice (December 21). Generally, the shortest shadows are cast during the Summer Solstice and grow increasingly longer until the Winter Solstice. During the Winter Solstice, the sun appears to be lower in the sky and shadows are at their maximum coverage lengths. Shadow-sensitive uses generally include routinely useable outdoor spaces associated with residential, recreational, or institutional land uses. **Table 4.1-4** provides an overview of the maximum shadow lengths for the latitude and longitude of the Project Area during the Winter Solstice. As described above, the majority of existing development in the Project Area ranges in height from one- to four-stories. This results in, shadow lengths ranging from 31 to 131 feet but can be much longer where there are taller buildings.

TABLE 4.1-4: SHADOW LENGTHS (FEET) – WINTER SOLSTICE

Time of Day	1-2 Story Bldg (20 ft.)	3-4 Story Bldg (40 ft.)	5-6 Story Bldg (60 ft.)	7-8 Story Bldg (80 ft.)	9-10 Story Bldg (100 ft.)	10-12 Story Bldg (120 ft.)
9:00 a.m.	56	112	168	224	280	336
10:00 a.m.	40	79	119	159	198	238
11:00 a.m.	33	66	99	132	165	198
Noon	31	63	94	126	157	189
1:00 p.m.	34	69	103	137	172	206
2:00 p.m.	43	86	130	173	216	259
3:00 p.m.	65	131	196	261	326	392

SOURCE: Planetcalc.com. Date = 12/21/14; Time Zone = -8; Lat=34 3 0 N Long=118 15 0 W. Altitude from US Naval Observatory, Astronomical Applications Dept. aa.usno.navy.mil/cgi-bin/aa_altazw.pl.

Due to the relatively dense arrangement of the existing commercial, industrial, and residential buildings within the Project Area, shadow effects on shadow-sensitive uses already exist in the Project Area. Shadow-sensitive uses located to the northwest, north and northeast of buildings exceeding three stories in height are particularly affected by shadows. The most significant shadows in the Project Area are created by development along Olympic Boulevard in the Bundy Station Area. Shadow-sensitive uses directly north and northeast of this area include single-family residential residences in the neighborhoods located adjacent to tall buildings.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the State CEQA Guidelines, the Proposed Project would have a significant impact related to aesthetics if it would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrade the existing visual character or quality of the site and its surroundings; and/or
- Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition to the thresholds set by the State CEQA Guidelines, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance is made on a case-by-case basis, considering the following factors:

View Obstruction

- Would the project occur within or adjacent to a valued focal or panoramic vista or within view of any designated scenic highway, corridor, or parkway?
- Would the project obstruct, interrupt, or diminish a valued focal and/or panoramic view?
- Does the project propose standards for height and bulk of structures and other elements that inadequately protect existing visual resources and/or views?

The determination of significance is made on a case-by-case basis, considering the following factors:

- The nature and quality of recognized or valued views (such as natural topography, settings, man- made or natural features of visual interest, and resources such as mountains or the ocean);
- Whether the project affects views from a designated scenic highway, corridor, or parkway;
- The extent of obstruction (e.g., total blockage, partial interruption, or minor diminishment); and
- The extent to which the project affects recognized views available from a length of a public roadway, bike path, or trail, as opposed to a single, fixed vantage point.

Shadows

- Shadow-sensitive uses would be shaded by project-related structures for more than three hours between the hours of 9:00 a.m. and 3:00 p.m. Pacific Standard Time (between late October and early April), or for more than four hours between the hours of 9:00 a.m. and 5:00 p.m. Pacific Daylight Time (between early April and late October).

The following threshold is from the Geology section, but given its relation to aesthetics, it is discussed herein:

The Proposed Project would have a significant impact on landform alteration if:

- One or more distinct and prominent geologic or topographic features would be destroyed, permanently covered, or materially and adversely modified. Such features may include, but are not limited to, hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds, and wetlands.

METHODOLOGY

Pursuant to SB 743 (PRC Section 21099 (d)(1)), aesthetic impacts of a residential, mixed use residential, or employment center project on an infill site within a TPA shall not be considered significant impacts on the environment. Such projects are typical of the kinds of projects anticipated by the Proposed Project. Although a majority of the Project Area is located in a Transit Priority Area, a portion of the Project Area is not (see **Figure 4.1-1**). Therefore, a discussion of aesthetic impacts is provided below. For this analysis, Appendix G criteria are used, supplemented by the thresholds identified in the City's Thresholds Guide, where appropriate. The method of assessment for individual aesthetic-related topics is discussed below. The assessment addresses the Proposed Project as described in Chapter 3.0, Project Description, as well as the Alternative Compliance scenario. This scenario would allow designated sites within the change areas or subareas to have a different mix of residential and non-residential uses than required per the zoning of the property. Projects utilizing this path would still be subject to the maximum FAR and other zoning and development standards but would also be required to provide increased public benefits in addition to affordable housing.

As discussed in the Chapter 3.0, Project Description and shown in Figure 3-2, the Project Area has two primary land use geographies –areas that are proposed for land use and zoning changes (known as "change areas" or "subareas"), and the areas that are outside of these change areas but are still within the boundary of the proposed Specific Plan (known as "non-change areas"). This section presents potential impacts in both geographic areas. Change area impacts are discussed on a station area basis, as impacts in these areas are dependent on the location of a project and the surrounding land uses. Aesthetic impacts may also result from development in other locations within the Project Area. Such impacts in the non-change areas are discussed generally in this section. Outside the change areas, projects are required to comply with the zoning and land use designations in the current community plan, but will also be subject to the urban design standards and guidelines of the ECTNP and the streetscape requirements of the associated Streetscape Plans, as applicable. If a project seeks a discretionary action from the DCP in order to vary from the current regulations, then aesthetic impacts must be analyzed under a separate environmental document.

SCENIC VISTAS/OBSTRUCTION OF VIEWS

A significant impact would occur if the Proposed Project would have a substantial adverse effect on a publicly available scenic vista, particularly a panoramic view of areas that have visual interest. The assessment method would identify whether such viewpoints exist within the Project area and whether the content of the view would be adversely affected by the Proposed Project. Diminishment of a scenic vista would occur if the bulk or design of a building or development contrasts enough with a visually interesting view, so that the content and quality of the view is permanently affected. Specifically, impacts would typically consist of loss or obstruction of a valued public view. This would include changes in the character of the viewshed that detract from a valued public view, such as the elimination or obstruction of natural and/or manmade features that were formerly part of a valued public viewshed.

SCENIC RESOURCES WITHIN A STATE HIGHWAY

The assessment method would identify whether there are state-designated scenic highways within the project area. If so, the assessment would characterize to what extent the scenic character of the state highway would be changed by the Proposed Project.

VISUAL CHARACTER

Significant impacts to the visual character of a site and its surroundings is generally based on the removal of features with aesthetic value, the introduction of contrasting urban features into a local area, and the degree to which the elements of the Proposed Project detract from the visual character of an area. Elements contributing to this impression include:

- Height and mass of proposed buildings compared to existing development
- Building setback distances from the street
- Loss of or reconfiguration of open space and landscaping

LIGHT AND GLARE

Light and glare impacts are typically associated with outdoor artificial light during the evening and nighttime hours. Glare may also be a daytime occurrence caused by the reflection of sunlight or artificial light from highly polished surfaces, such as window glass and reflective cladding materials, and may interfere with the safe operation of a motor vehicle on adjacent streets. The assessment would identify whether there would be any particular features within the Proposed Project design that would either produce unusual amounts of artificial light or where project features would entail large surface areas of reflective surface.

SHADE AND SHADOW

The Proposed Project would have a significant impact if it creates shade or shadows that affect shadow-sensitive uses for more than three consecutive hours between 9:00 a.m. and 3:00 p.m. from late October to early April, or for more than four consecutive hours between 9:00 a.m. and 5:00 p.m. from early April to late October. Shadow-sensitive uses, are typically considered to include routinely useable outdoor spaces associated with residential and recreational land uses. These uses are considered shade-sensitive because sunlight is important to function and physical comfort. For purposes of this assessment, shading would typically result from sensitive land uses being located to the north, northeast or northwest of Proposed Project areas slated for multi-story development.

GEOLOGICAL OR TOPOGRAPHIC FEATURES

According to the Thresholds Guide, a project would have a significant impact on landform alteration if one or more distinct and prominent geologic or topographic features would be destroyed, permanently covered, or materially and adversely modified. Such features may include, but are not limited to, hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds, and wetlands.

PROJECT FEATURES

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments, and introduce development and urban design standards. Proposed land use and zone changes, which apply to areas of proposed change only, would allow for increased development density, intensity, and heights, and/or a new mix of uses. Accordingly, implementation of the Proposed Project would allow physical changes to the visual character of areas proposed to have land use and zoning changes in order to achieve the vision of the ECTNP. The Proposed Project would encourage new development at select sites (subareas) within the transit station areas with the goal of promoting transit ridership and creating an active, mixed use environment in the station areas in an urbanized area of the City. The goals and visions of the Proposed Project would be achieved through the rezoning of selected areas and implementation of new development standards. The Proposed Project would also include specific environmental thresholds to address potential shade/shadow impacts as well as to protect historic resources.

The Proposed Project includes design standards and guidelines intended to preserve and/or enhance the existing visual character of the Project Area. These design standards and guidelines would be applicable to all future development within the Project Area, except for R1 and R2 zones. The design standards address factors which influence the visual character in the Project Area including building design, orientation,

frontages, massing and articulation, transitional height, landscaping, lighting, and signage, among a range of other topics with the intent of creating consistency in design and improving the visual quality of the area and the pedestrian environment. The design standards encourage development patterns that promote more compact, functional, and walkable neighborhoods and station areas, integrating greater density and height in a sensitive manner.

The Proposed Project would also involve new streetscape plans and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. The Proposed Project includes streetscape plans for eight street segments that aim to improve streets for pedestrians, transit users, and drivers. See Figure 3-13 in Chapter 3.0, Project Description for the specific locations of these segments.

Implementation of the Proposed Project would allow for future development to be built at heights and densities greater than what is currently permitted in the areas of proposed change. The allowable building heights under the Proposed Project vary according to zoning and location, and are depicted in Figures 3-9a and 3-9b in Chapter 3.0, Project Description; as shown in the figure, the greatest maximum permitted height of buildings under the Proposed Project would be 161 feet. The current allowable height of buildings in the Project Area ranges from 33 to 45 feet in residential zones. In many commercial zones, height is limited to 45 feet. In all industrial and a number of commercial zones, there is no maximum building height, though floor area ratios (FARs), typically 1.5:1, effectively limit feasible building heights. Existing and proposed building heights, as well as densities, are listed on a station area basis in Tables 4.8-2 through 4.8-11 of Section 4.8, Land Use and Planning. The existing building heights of the Project Area are presented in Figures 3-8a and 3-8b in Chapter 3.0, Project Description.

IMPACTS

IMPACT 4.1-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT HAVE A SUBSTANTIAL ADVERSE EFFECT ON A SCENIC VISTA/OBSTRUCTION OF VIEWS? THIS IMPACT IS LESS THAN SIGNIFICANT.

There are no publicly available scenic vista points within the Project Area. Views of scenic resources, which include public parks, historic buildings, landmarks, historic signage, and heritage trees, are limited to public rights-of-way and adjacent sidewalks. Changes proposed, including implementation of design standards, and streetscape plans would not substantially alter these views and less than significant impacts are anticipated.

While new development could be built to the maximum permitted heights adjacent to the freeways and the Expo LRT Line, intermittent views of the Project Area would be obstructed, however, views within the Project Area are not considered panoramic and do not meet the City's definition of a scenic view or vista. Changes are considered less than significant.

As previously described, views of recognized scenic resources outside of the Project Area include the Mormon Temple, the Sony Studios Water Tower, the Getty Center, the Santa Monica and San Gabriel Mountains, and the Hollywood and Baldwin Hills, are available from the Baldwin Hills Scenic Overlook. In some instances, onlookers must look beyond the Project Area to see some of these resources (such as to see the Pacific Ocean and the Getty Center).

Presently, existing buildings and infrastructure in the Project Area do not obstruct views of recognized scenic resources or mountains from the Baldwin Hills Scenic Overlook. While the Proposed Project would allow a maximum building height of up to 161 feet (roughly 12 stories), given the elevation of the Project Area, these buildings are unlikely to obstruct views of recognized scenic resources or mountains from the Baldwin Hills Scenic Overlook. Impacts from this scenic vista are considered less than significant.

ALTERNATIVE COMPLIANCE SCENARIO

As described in Chapter 3.0, Project Description, the Alternative Compliance scenario would allow designated sites (within the areas of change) to have a different mix of residential and non-residential uses than required per the zoning of the property. It is anticipated that use of this option would result in a greater amount of residential use, and corresponding lesser amount of non-residential use, than under the Proposed Project. However, the floor-area-ratios, building heights and design standards associated with the Proposed Project would be applicable to the Alternative Compliance scenario. In this respect, it is not anticipated that the effects of this option would differ from the Proposed Project and changes to scenic vistas or views would also be considered less than significant.

NON-CHANGE AREAS

Outside the subareas, new development would be governed by the General Plan land uses and associated zoning contained in the included portions of the West Los Angeles, Palms-Mar Vista-Del Rey and West Adams-Baldwin Hills-Leimert Community Plans. Specifically, building height, open space and setbacks in these areas would occur similar to current patterns of development with the exception that proposed design standards and guidelines described in the Specific Plan would also apply to these non-change areas. It is anticipated that as a result, existing land use controls taken together with new design standards/guidelines, which are intended to improve the visual quality of the area, would have a less than significant effect on scenic vistas or views within the non-change portions of the Project Area.

MITIGATION MEASURES

Impacts related to scenic vistas would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to scenic vistas were determined to be less than significant without mitigation.

IMPACT 4.1-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT SUBSTANTIALLY DAMAGE SCENIC RESOURCES, INCLUDING, BUT NOT LIMITED TO, TREES, ROCK OUTCROPPINGS, AND HISTORIC BUILDINGS WITHIN A STATE SCENIC HIGHWAY? THIS IMPACT IS LESS THAN SIGNIFICANT.

There are no state-designated scenic highways located within the Project Area. While not designated a scenic highway by the state, Venice Boulevard (State Route 187) is a City of Los Angeles-designated scenic highway.[9] This city-designated scenic highway features a center median that is intermittently planted with grass and mature trees. There is no proposed streetscape plan or other changes to the landscaped median. Future development occurring within areas of proposed change along Venice Boulevard would not result in the removal of the landscaped median or trees within the median. Accordingly, future development occurring under the Proposed Project would not result in the damage of a scenic resource within a state- or locally-designated scenic highway. Impacts in this category are considered less than significant.

ALTERNATIVE COMPLIANCE SCENARIO

As noted above, the FARs, building heights, and design standards associated with the Proposed Project would be applicable to the Alternative Compliance scenario. The designated geographic areas for land use change would also be the same as the Proposed Project. In this respect, it is not anticipated that the effects of this option would differ from the proposed project and changes to scenic resources within a state or locally designated scenic highway, such as Venice Boulevard, would be considered less than significant.

[9]City of Los Angeles, *Mobility Plan 2035*, adopted in 2015, as subsequently amended.

NON-CHANGE AREAS

Outside the geographic areas designated for change, new development would be governed by the General Plan land uses and associated zoning contained in the included portions of the West Los Angeles, Palms-Mar Vista-Del Rey and West Adams-Baldwin Hills-Leimert Community Plans. As noted above, Venice Boulevard is the only scenic highway designated within the Project Area. A 0.4-mile segment of Venice Boulevard, extending from National Boulevard to Cattaraugus Avenue, is beyond the limits of the areas proposed for change within the Project Area. This extent of Venice Boulevard is within the West Adams Community Plan. The community plan indicates that Venice Boulevard is a scenic resource with appropriate policies that encourage its protection. Thus, it is not anticipated that development in conformance with the community plan would result in an adverse effect on the scenic qualities of the roadway, and a less than significant impact is anticipated.

MITIGATION MEASURES

Impacts related to scenic resources within scenic highways would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to substantially damaging scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway, were determined to be less than significant without mitigation.

IMPACT 4.1-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT SUBSTANTIALLY DEGRADE THE EXISTING VISUAL CHARACTER OR QUALITY OF THE SITE AND ITS SURROUNDINGS? THIS IMPACT IS POTENTIALLY SIGNIFICANT AND UNAVOIDABLE.

In general, changes in visual character would be potentially significant within existing areas currently designated for low density residential use, where rezoning to RD1.5, R3 or RAS4 is proposed, and where increases in height and density would occur. Rezoning of low-density residential areas would occur in the Bundy Station Area, south of the Expo LRT Line, and in the Sepulveda and Westwood Station areas, along either side of the Expo LRT Line as shown in Figure 3-5 in Chapter 3.0, Project Description. Change in visual character would also be evident on some commercial corridors such as– Pico Boulevard, Motor Avenue, National Boulevard, Venice Boulevard, and Robertson Blvd (Mixed Use), where heights and density would be increased as a result of rezoning from C2 to RAS4 or Mixed Use: Commercial/Residential.

While changes to visual character would be most evident in the limited single-family areas where land use and zoning changes are proposed, increases in the height of permitted development throughout areas of proposed change would influence the visual character of the area. Under the Proposed Project, within areas of proposed change, maximum permitted building heights would range from 45 to 161 feet depending on the zone, station area, and adjacent land uses. The existing and proposed visual character for each station area, as indicated by land use and zoning changes, is characterized in Section 4.8, Land Use and Planning (Tables 4.8-2 through 4.8-11. The existing and proposed changes in maximum allowable building heights for the Project Area are illustrated in Figure 3-8a and Figure 3-9a (Bundy to Westwood Stations) and Figure 3-8b and Figure 3-9b (Palms to Culver City Stations) in Chapter 3.0, Project Description. The following briefly describes the proposed height changes by zone for areas of proposed change within each station area, as well as proposed transitional height standards that would be required for properties that abut R1 and R2 residential uses. Additional information regarding the proposed changes in station areas can be found in Chapter 3.0, Project Description.

Bundy Station. The proposed changes would affect approximately 114 acres within the station area. Land uses to be rezoned include light manufacturing and low residential parcels. The area of proposed change in the Bundy Station Area is generally north of Pico Boulevard, east of Centinela Avenue, south of Nebraska Avenue, and west of Barrington Avenue.

- The New Industry and Hybrid Industrial: Jobs Emphasis zones would allow for development ranging in height from six to 12 stories or a maximum height of 161 feet, with transitional height standards for locations that abut R1 or R2 residential uses.
- The Hybrid Industrial: Residential Emphasis zone would allow for development ranging in height from three to seven stories, with a maximum height of 78 to 96 feet, depending on the building uses, with transitional height standards for locations that abut R1 or R2 zones.
- RD1.5-1 and R3-1 zoned properties would have a maximum height of 45 feet. RAS4-1VL zoned properties would have a maximum height of 50 feet.

The Bundy Station Area currently has buildings in a range of heights, including buildings up to 6 to 12 stories along Olympic Boulevard. The Proposed Project would allow for increased building heights in a greater portion of the Bundy Station Area, though the increased height is primarily concentrated around the station. Where the increased height in the non-residential areas is increased, transitional height standards would limit impacts on adjacent low-density residential areas. Although industrial areas would have greater scale and mix of uses, these areas currently have no discernible, defining character. For these reasons the proposed changes to the non-residential areas would not degrade the visual character of the Bundy Station Area.

The Bundy Station Area would experience significant changes to visual character with implementation of the Proposed Project in the single-family residential neighborhoods south of Exposition Boulevard. To accommodate new multi-family development in existing neighborhoods currently zoned for low-density residential use, individual lots would have to be consolidated. New development under the Proposed Project would have allowable heights of up to 45 feet for RD1.5-1 and R3-1 zones and up to 50 feet for the RAS4-1VL zone which can result in buildings that are three to four stories tall. This represents an increase in height and massing compared to the consistently one- to two-story single-family development currently in the area.

Sepulveda Station. The Proposed Project would change the land use designation and zoning on approximately 46 acres. Land uses to be rezoned include light manufacturing, neighborhood commercial, and low-medium residential uses. Most of the areas of proposed change in the Sepulveda Station Area are located north of the Exposition right-of-way, east of the I-405, south of Olympic Boulevard, and west of Bentley Avenue, and along Pico Boulevard between Sepulveda Boulevard and Westwood Boulevard. Specific proposed changes include the following:

- The New Industry zone, west of Sepulveda Boulevard would allow for development ranging in height from four to 11 stories and a maximum height of 148 feet. This same zone, east of Sepulveda Boulevard would allow for development ranging in height from four to six stories, with a maximum height of 83 feet.
- The New Industry and Hybrid Industrial: Jobs Emphasis zones, south of Pico Boulevard, would allow for development ranging in height from four to 11 stories and a maximum height of 148 feet with transitional height requirements where properties about the R1 zone.
- The Hybrid Industrial: Residential Emphasis zone east of Sepulveda would allow development ranging in height from three to seven stories and a maximum height of 96 feet with transitional height requirements where properties about the R1 zone.
- On the north side of Pico Boulevard, the proposed RAS4-1VL zone would allow a maximum height of 50 feet with transitional height standards. These standards would limit the height of new development in this zone to 25 feet for portions of properties within 50 feet of the abutting R1 neighborhood.
- The R3-1 zone along Exposition Boulevard would allow a maximum height of 45 feet.

On Pico Boulevard between Sepulveda Boulevard and Westwood Boulevard, the Proposed Project would allow for small amount of additional height (5 feet more than is currently allowed in the C2-1VL zone) and a higher FAR than currently allowed, resulting in a potential change to the visual character of Pico Boulevard. In these areas where new development would be adjacent to single family residential, it is anticipated that transitional height standards incorporated into the Proposed Project would minimize the impact to these homes. Changes to visual character would be limited to the Pico Boulevard commercial frontage where taller buildings would be introduced. However, the impact of this change would be minimized by proposed design standards addressing ground floor treatment, which emphasize the pedestrian scale along the street and thus ensure consistency with the active, neighborhood-serving commercial character of the street today. As a result, visual character changes along the Pico Boulevard commercial corridor are anticipated to be less than significant.

Similar to the Bundy Station Area, the existing industrial areas around Sepulveda Boulevard lack a cohesive visual character, as they contain a wide variety of building type and heights. The proposed changes are focused on areas adjacent to the station and the I-405 freeway, and more limited increases in heights are proposed adjacent to residential uses. Therefore, the proposed changes to these areas, which would increase allowable height, would not have a negative impact on the visual character of the area.

Finally, the proposed changes to the properties fronting Exposition Boulevard in the Sepulveda Station Area would allow increased height and FAR. This would result in a potential change to the visual character of the area, which is currently characterized by low-scale dwelling units.

Westwood Station. The Proposed Project would change the land use designation and zoning on approximately 5.2 acres. Land uses to be rezoned include neighborhood commercial (C2-VL-POD) and low residential (R1). The areas of proposed change in the Westwood Station Area are located along the north side of Pico Boulevard between Westwood Boulevard and Overland Avenue, and along the Expo LRT Line generally between Westwood and Overland Boulevards. Specific proposed changes include the following:

- The RAS4-1VL zone along the north side of Pico Boulevard between Westwood Boulevard and Overland Avenue would allow for development to reach up to 50 feet with transitional height design standards, where 45 feet is allowed currently. In areas where the building heights on Pico Boulevard are typically about 30 feet, this proposed change would represent a significant change to the existing visual character to the Pico Boulevard commercial corridor. Similar to changes proposed in the Sepulveda Station Area along Pico Boulevard, the Proposed Project would allow for additional height and a higher FAR than currently allowed, resulting in a potential change to the visual character of Pico Boulevard. In these areas where new development would be adjacent to single family residential, it is anticipated that transitional height standards incorporated into the Proposed Project, would minimize the impact on these homes, and changes to visual character would be limited to the Pico Boulevard commercial frontage. However, this change would be moderated by proposed design standards addressing ground floor treatment, which emphasize the pedestrian scale along the street. As a result, visual character changes along the Pico Boulevard commercial corridor are anticipated to be less than significant.
- The Proposed Project would rezone approximately 2.2 acres flanking the Expo LRT Line right-of-way generally between Westwood and Overland Boulevards from R1 to OS (open space). These properties are currently vacant, and thus this change would maintain the existing undeveloped visual character of this area.

Palms Station. The Proposed Project would change the land use designation and zoning on approximately 51 acres. Land uses to be rezoned include limited manufacturing (M1-1), general and neighborhood commercial (C2-1), high medium residential (R4-1), and medium residential (R3-1) uses. The areas of proposed change in the Palms Station Area are generally south of the I-10, along National Boulevard, Motor Avenue, and Venice Boulevard, as well as a triangular parcel north of the I-10, located east of National Boulevard.

- The New Industry zone would allow for development ranging in height from three to seven stories, with a maximum height of 96 feet.
- The Mixed Use: Commercial/Residential zone along National Boulevard, north of the I-10, would allow for development ranging in height from three to seven stories, with a maximum height of 78 feet.
- The Mixed Use: Commercial/Residential zone along Motor Avenue north of Palms Boulevard and along National Boulevard would allow for development ranging from three to five stories, with a maximum height of 58 feet.
- Along Motor Avenue south of Palms Boulevard and along Venice Boulevard, the Mixed Use: Commercial/Residential zone would allow for development ranging in height from three to six stories, with a maximum height of 68 feet.

Overall, the changes proposed would allow for a mix of residential and commercial developments at mid-rise heights, which is not unlike the scale of many existing multi-family and commercial development located in this area. These changes would not represent substantial degradation of visual character to the station area.

Culver City Station. The Proposed Project would change the zoning designation on approximately 42 acres. Land uses to be rezoned include industrial, commercial, and residential. The areas of proposed change in the Culver City Station Area include a shopping center on Venice and Culver Boulevards, the area between the I-10 and Venice Boulevard, and along Robertson Boulevard between the I-10 and Cattaraugus Avenue.

- The New Industry and Hybrid Industrial: Jobs Emphasis zones would have a height range of 3 to 7 stories, with a maximum height of 96 feet.
- The Mixed Use: Commercial/Residential zone would have a height range of 3 to 6 stories, with a maximum height of 68 feet.

The Proposed Project would allow additional height and FAR in the industrial areas along Venice Boulevard within a quarter mile of the station. As these areas currently comprise a variety of low-scale auto-oriented commercial and industrial uses with no distinct visual character, and because the changes are concentrated around the station and the I-10 freeway, the proposed changes would not result in a degradation of visual character in this area. The proposed changes to the commercial areas along Venice Boulevard would similarly not have a negative impact on visual character, as these areas do not currently have a cohesive character and do not abut sensitive low-density residential uses.

In the northeast portion of the station area, between I-10 and Robertson Boulevard, the residential area currently zoned as RD2-1 primarily contains homes that are one or two stories in in height. The proposed change to Mixed Use: Commercial/Residential would allow for more intense residential development as well as commercial use, including buildings up to six stories in height. These changes would constitute a substantial change, and can be considered a degradation in visual character in this area.

Along portions of Robertson Boulevard north of I-10, currently commercial areas zoned as C2 would be also rezoned to Mixed Use: Commercial/Residential. Since these areas currently contain a diversity of commercial, industrial, and institutional uses at a variety of heights, the proposed changes would not degrade the visual character in this area.

Streetscape Improvements. The Proposed Project includes streetscape plans for eight street segments in the Project area. These streetscape plans illustrate streetscape improvements in the public right-of-way with the goal of creating a pedestrian-friendly environment that encourages walking, bicycling, and transit use while maintaining vehicular circulation. The location of the street segments included in the proposed streetscape plans are shown in Figure 3-13 in Chapter 3.0, Project Description and listed below:

- Bundy Drive between Missouri Avenue and Pico Boulevard
- Olympic Boulevard between Centinela and Barrington Avenues
- Sepulveda Boulevard between Olympic and National Boulevards
- National Boulevard between Mentone Avenue and Castle Heights Boulevard
- Palms Boulevard between National Boulevard and Motor Avenue
- Motor Avenue between I-10 and Venice Boulevard
- Pico Boulevard between I-405 and Patricia Avenue
- Pico Boulevard between Centinela Avenue and I-405

The proposed streetscape plans are intended to be beneficial and improve the existing visual character of street segments in the Project Area, and their immediately surrounding areas, through the reconstruction of curbs, gutters, and sidewalks; the installation of landscaped curb extensions in between parking stalls and at intersections; an introduction of a consistent pattern of street trees along the sidewalks; the installation of center landscaped medians between left-turn lanes and wider sidewalks and parkways; and the introduction of consistent landscape and street furniture treatments. These improvements are constructed: 1) as a condition of development for all new projects, to be provided along the frontage of their property, and also 2) as a public benefit requirement for new projects that are using Bonus development rights, to be provided along street segments beyond the project's frontage. While these changes are proposed to enhance visual character, they do represent change to visual character within these street segments.

Design Standards. As discussed above, the Proposed Project establishes design standards for all properties within the Project Area, excluding properties in the R1 and R2 zones. The design standards are intended to be beneficial and create livable neighborhoods with an emphasis on walkability and the making of great streets and neighborhoods. The focus of the design standards is on the relationship of buildings to the street and the public realm to create high quality public spaces and a walkable environment, as well as on the building form and design to create increased consistency along each street and improved visual quality. These design standards would help minimize the effects of land use and zone changes on the existing character of the area, and would also enhance visual character and quality through transitional height requirements, massing restrictions, requirements for use of high quality materials and façade articulation. Projects proposed within the ECTNP Area, regardless of whether they are within an area of proposed change, would be required to comply with the proposed design standards.

Compliance with existing and proposed development regulations and design standards would help establish consistency in the visual character of the Project Area, which is currently lacking in industrial areas and commercial corridors. However, the proposed land use and zoning changes that allow increases in height, scale and density in the Project Area would represent a significant change in the visual character in some portions of the Project Area, particularly in the limited single family areas that are proposed to have land use and zoning changes. Therefore, implementation of the Proposed Project over time would result in significant visual contrast and change in visual character.

ALTERNATIVE COMPLIANCE SCENARIO

As noted in the Chapter 3.0, Project Description, the Proposed Project allows for Alternative Compliance, in which certain properties can be developed with more residential use while remaining within the maximum allowable FAR for the site. As noted, the ability of an owner to pursue this path is tied directly to the provision of increased public benefits such as affordable housing, open space, streetscape improvements and other amenities. Figure 3-3a and Figure 3-3b in Chapter 3.0, Project Description illustrate the sites eligible

for the Alternative Compliance scenario. Development under Alternative Compliance on these sites would have a similar impact on visual character as the Proposed Project, as the allowable FAR and heights are the same. The areas where Alternative Compliance scenario can be applied are currently industrial areas that lack any consistent development patterns and heights. The development and design standards in the Proposed Project would be applicable to new development on these sites and help to improve the visual quality and character of the areas. Thus, the Alternative Compliance scenario would similarly have a significant impact on visual character in these locations.

NON-CHANGE AREAS

Outside the geographic areas designated for change, new development would be governed by the General Plan land uses and associated zoning contained in the included portions of the West Los Angeles, Palms, and West Adams Community Plans. Specifically, density, building height, open space requirements and setbacks in these areas would occur similar to current trends with the exception that proposed design standards described in the Specific Plan would also apply to these non-change areas. It is anticipated that as a result, existing land use controls and policies taken together with new design standards/guidelines would result in a less than significant effect on the visual character of the non-change portions of the Project Area.

MITIGATION MEASURES

Beyond the proposed Design Standards, no feasible mitigation measures have been identified to reduce the potentially significant impacts on visual character.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

As discussed above, design standards would be enforced to reduce visual change, yet it is anticipated that visual effects associated with new building heights and site development intensities would remain potentially significant and unavoidable.

IMPACT 4.1-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE A NEW SOURCE OF SUBSTANTIAL LIGHT OR GLARE THAT COULD ADVERSELY AFFECT DAY- OR NIGHTTIME VIEWS IN THE PROJECT AREA? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION.

As described above, existing sources of nighttime lighting include street, security, and wayfinding outdoor lighting, vehicle headlights, and interior building illumination. This relatively high level of ambient light currently reduces the visibility of the nighttime sky. With implementation of the Proposed Project, additional sources of nighttime lighting associated with increased development capacity within areas of proposed change, streetscape improvements, crime prevention, and increased vehicle traffic can be anticipated. While there is anticipated to be increased illumination from sidewalk lighting, and light from commercial and residential windows in mixed use and stand-alone projects, these effects would be incremental and less-than significant impacts related to lighting are anticipated. The LAMC contains specific regulations with respect to lighting. LAMC Section 12.21 A.5 (k) (amended by Ordinance No. 171,858) states that all lights used to illuminate parking areas shall be designed, located and arranged so as to reflect the light away from any street and any adjacent premises. Additionally, any new lighting would be designed to conform to applicable standards including LAMC Sections 93.0117 and 12.21 A.5 (k), which pertains to outdoor lighting affecting residential property (no more than two foot-candles of lighting intensity from a light source is allowed on adjacent residential property). All new development would be required to be consistent with these LAMC regulations to reduce impacts from light. In addition, General Plan Framework Policies 5.5.3, 5.5.4, and 5.8.1 call for the formulation of building and site design standards, determination of appropriate urban design elements, and lighting commensurate with intended nighttime use. Illuminated signs are regulated by City Ordinance and other design provisions of the Proposed Project, and it is not anticipated that lighting levels from these elements would result in significant impacts. Compliance with proposed design standards and the

LAMC regulations would help to reduce the light impacts of future development occurring under the ECTNP to less than significant.

Due to proposed design standards and Title 24 energy standards, it is not anticipated that the Proposed Project would result in development with extensive glazing that would generate substantial glare and annoyance. However substantial glare may still result due to building facades being constructed with other highly reflective materials. Therefore, glare impacts would be potentially significant.

ALTERNATIVE COMPLIANCE SCENARIO

As noted in the Chapter 3.0, Project Description, the Proposed Project allows for an Alternative Compliance scenario in which certain properties can be developed with more residential use while remaining within the maximum allowable FAR for the site. As noted, the ability of an owner to pursue this path is tied directly to the provision of increased public benefits, such as affordable housing, open space, streetscape improvements and other amenities. These improvements would not result in additional sources of spillover lighting or glare compared to the Proposed Project. Current City regulations and Project design standards related to lighting would continue to apply to Alternative Compliance projects, and therefore a less than significant impact related to light is anticipated. Without mitigation, glare impacts in the Alternative Compliance scenario would be potentially significant.

NON-CHANGE AREAS

Outside the geographic areas designated for change, new development would be governed by the General Plan land uses and associated zoning contained in the included portions of the West Los Angeles, Palms-Mar Vista-Del Rey, and West Adams-Baldwin Hills-Leimert Community Plans. As described above, existing City regulations would address new sources of spillover lighting, and it is anticipated that these effects would be reduced to a less than significant level within the non-change area portions of the Project Area. However, impacts related to glare could remain potentially significant.

MITIGATION MEASURES

AE1 The City shall require that glare effects be limited by using non-reflective building and construction materials, such as concrete, wood, composite materials, coated metal, non-reflective glass, and stone. This shall include, but not be limited to, art installations, fencing material, and recreational equipment.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Implementation of the Proposed Project would result in a less-than- significant impact related to creating a new source of substantial light. Impacts related to creating a new source of substantial glare that could adversely affect day- or nighttime views in the Project Area were determined to be potentially significant without mitigation. Mitigation Measure **AE1** would reduce those impacts to less than significant.

IMPACT 4.1-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN DEVELOPMENT OF STRUCTURES THAT WOULD SHADE SHADOW-SENSITIVE USES FOR MORE THAN THREE HOURS BETWEEN THE HOURS OF 9:00 A.M. AND 3:00 P.M. PACIFIC STANDARD TIME (BETWEEN LATE OCTOBER AND EARLY APRIL), OR FOR MORE THAN FOUR HOURS BETWEEN THE HOURS OF 9:00 A.M. AND 5:00 P.M. PACIFIC DAYLIGHT TIME (BETWEEN EARLY APRIL AND LATE OCTOBER)? THIS IMPACT IS POTENTIALLY SIGNIFICANT AND UNAVOIDABLE.

Due to the sun's angle in the northern hemisphere, shadows from buildings are cast to the north and move from the west to east throughout daylight hours and in the Los Angeles area, the maximum shadow a building can cast is usually equivalent to three times its height during the Winter Solstice. The potential for off-site effects is dependent on the distance between the project site and the nearest shade-sensitive land uses.

In general, the Proposed Project would implement zone changes which would allow for increased development density, intensity, and heights, and/or a new mix of uses. Changes that could result in new shade and shadow impacts would occur at areas of proposed change, where increased FAR and height would be allowed.

Based on the maximum allowable building heights under the Proposed Project, **Figures 4.1-9a** and **4.1-9b** demonstrate the maximum shadow footprints, or areas of greatest potential shading, that could be created adjacent to the areas of proposed change if buildings were constructed to the maximum allowable heights. It is important to note that, while changes in permitted densities, intensities and design standards are being proposed, existing as-built conditions already create shade and shadow impacts.

According to **Figures 4.1-9a** and **4.1-9b**, the areas which would be the most vulnerable to shade and shadow impacts if buildings in the areas of proposed change were to be constructed to the maximum heights allowable under the Proposed Project would be the single-family residential areas located immediately adjacent to the areas of proposed change. These include the following single-family residential neighborhoods:

- Northeast and northwest of the areas of proposed change in the Bundy Station Area
- Northeast to Olympic Boulevard and southeast to Exposition Boulevard in the Sepulveda Station Area
- South of Manning Avenue in the Palms Station Area
- Northeast of the areas of proposed change in the Culver City Station Area

PROJECT FEATURES

The ECTNP includes a design standard for transitional height, which requires new construction that directly abuts or is across an alley from R1 or R2 residential zones to step back heights to minimize casting shadows on these residential uses. In addition, individual projects located outside of Transit Priority Areas (TPAs) with increased heights adjacent to shadow-sensitive uses would be required to prepare individual shade and shadow studies to assess the potential for shade/shadow impacts and to determine whether such impacts can be reduced or minimized through the project's design. Although the Proposed Project includes protections for shadow-sensitive areas, future development could still cast shadows on shadow-sensitive land uses for a potentially significant period of time. Therefore, implementation of the Proposed Project would result in a significant and unavoidable impact related to development of structures that would shade shadow-sensitive uses.

ALTERNATIVE COMPLIANCE SCENARIO

As noted in the Chapter 3.0, Project Description, the Proposed Project allows for an Alternative Compliance scenario for property owners wishing to focus more on residential than on non-residential development. Similar to the Proposed Project, properties using this alternative approach would be subject to building height and massing requirements similar to the Proposed Project, as well proposed design guide lines, particularly setback and stepback requirements. Where taller buildings are directly adjacent to low scale residential or other light sensitive uses to the north, northwest or southeast, a significant shadow impact is anticipated.

NON-CHANGE AREAS

Outside the geographic areas designated for change, new development would be governed by the General Plan land uses and associated zoning contained in the included portions of the West Los Angeles, Palms, and West Adams Community Plans. In a number of areas, it is anticipated that there would be increased building heights compared to existing conditions, particularly where heights are classified as unlimited. In those areas where taller building are directly adjacent to low scale residential or other light sensitive uses to the north, northwest or southeast, a significant shadow impact is anticipated.

MITIGATION MEASURE

Beyond the Design Standards included in the Proposed Project, no feasible mitigation measures have been identified to reduce the potentially significant impact related to development of structures that would shade shadow-sensitive uses under the Proposed Project. Although implementation of the design standards and other plan standards described above may serve to reduce or eliminate impacts related to shade-shadow, in these highly-urbanized areas it is infeasible to relocate development in such a way that shade-shadow impacts could be avoided altogether.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

No feasible mitigation measures have been identified and impacts related to shading shadow-sensitive uses would remain potentially significant and unavoidable.

IMPACT 4.1-6 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT DESTROY, PERMANENTLY COVER OR MATERIALLY AND ADVERSELY MODIFY ONE OR MORE DISTINCT AND PROMINENT GEOLOGIC OR TOPOGRAPHIC FEATURES SUCH AS HILLTOPS, RIDGES, HILL SLOPES, CANYONS, RAVINES, ROCK OUTCROPS, WATER BODIES, STREAMBEDS AND WETLANDS? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

There are no ridges, canyons, ravines, and other topographic features within the Project Area; however, as described above, the Project Area contains a small portion the Cheviot Hills area north of the Palms station area (north of the I-10 and west of Club Drive). There are no proposed changes within the Cheviot Hills portion of the Project Area. Thus, the Proposed Project would continue to allow the development of the Project Area as envisioned by the existing community plans, wherein development in hillside areas would be minimal. Given the location of proposed areas of change (see Figure 3-2 in Chapter 3.0, Project Description) in areas with no geologic landforms, the Proposed Project would not destroy, permanently cover, or materially and adversely modify distinct and prominent geologic or topographic features. Therefore, implementation of the Proposed Project would have a less than significant impact. Less than significant effects are also anticipated for Alternative Compliance scenario where the development focus would shift from non-residential to residential use, as well as for other geographic areas not designated for change that would be governed by the existing community plans and zoning. Importantly, hillside areas would be governed by existing City regulations and hillside-related ordinances.

MITIGATION MEASURES

Impacts related to related to destroying, permanently covering or materially and adversely modifying one or more distinct and prominent geologic or topographic features would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to destroying, permanently covering or materially and adversely modifying one or more distinct and prominent geologic or topographic features would be less than significant without mitigation.

4.2 AIR QUALITY

This section provides an overview of air quality and evaluates the impacts associated with the Proposed Project. This analysis focuses on air pollution from two perspectives: daily emissions and pollutant concentrations. "Emissions" refer to the quantity of pollutants released into the air, measured in pounds per day (ppd). "Concentrations" refer to the amount of pollutant material per volumetric unit of air, measured in parts per million (ppm) or micrograms per cubic meter ($\mu g/m^3$).

The following provides background information on the pollutants discussed in this section.

POLLUTANTS AND EFFECTS

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards for outdoor concentrations to protect public health. The federal and state standards have been set at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter 2.5 microns or less in diameter ($PM_{2.5}$), particulate matter ten microns or less in diameter (PM_{10}), and lead (Pb).

Carbon Monoxide (CO). CO is a colorless and odorless gas formed by the incomplete combustion of fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft and trains. In urban areas, such as the project location, automobile exhaust accounts for the majority of CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly, so ambient CO concentrations generally follows the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions, primarily wind speed, topography and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas between November and February.[1] The highest levels of CO typically occur during the colder months of the year when inversion conditions are more frequent. In terms of health, CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can be dizziness, fatigue, and impairment of central nervous system functions.

Ozone (O_3). O_3 is a colorless gas that is formed in the atmosphere when reactive organic gases (ROG), which includes volatile organic compounds (VOC) and nitrogen oxides (NO_X) react in the presence of ultraviolet sunlight. O_3 is not a primary pollutant; it is a secondary pollutant formed by complex interactions of two pollutants directly emitted into the atmosphere. The primary sources of ROG and NO_X, components of O_3, are automobile exhaust and industrial sources. Meteorology and terrain play major roles in O_3 formation. Ideal conditions occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures and cloudless skies. The greatest source of smog-producing gases is the automobile. Short-term exposure (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue and some immunological changes.

Nitrogen Dioxide (NO_2). NO_2, like O_3, is not directly emitted into the atmosphere but is formed by an atmospheric chemical reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO_2 are collectively referred to as NO_X and are major contributors to O_3 formation. NO_2 also contributes to the formation of PM_{10}. High concentrations of NO_2 can cause breathing difficulties and result in a brownish-red

[1]Inversion is an atmospheric condition in which a layer of warm air traps cooler air near the surface of the earth, preventing the normal rising of surface air.

cast to the atmosphere with reduced visibility. There is some indication of a relationship between NO_2 and chronic pulmonary fibrosis. Some increase of bronchitis in children (two and three years old) has also been observed at concentrations below 0.3 ppm.

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids and metals. Particulate matter also forms when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Fine particulate matter, or $PM_{2.5}$, is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., motor vehicles, power generation and industrial facilities), residential fireplaces and wood stoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as SO_2, NO_X and VOC. Inhalable particulate matter, or PM_{10}, is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood burning stoves and fireplaces; dust from construction, landfills and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances, such as lead, sulfates and nitrates can cause lung damage directly. These substances can be absorbed into the blood stream and cause damage elsewhere in the body. These substances can transport absorbed gases, such as chlorides or ammonium, into the lungs and cause injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility.

Sulfur Dioxide (SO_2). SO_2 is a colorless, pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. Main sources of SO_2 are coal and oil used in power plants and industries. Generally, the highest levels of SO_2 are found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. SO_2 can also yellow plant leaves and erode iron and steel.

Lead (Pb). Pb in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturers of batteries, paint, ink, ceramics, ammunition and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phase-out of leaded gasoline reduced the overall inventory of airborne lead by nearly 95 percent. With the phase-out of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities have become lead-emission sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time and growth.

Toxic Air Contaminants (TACs). TACs, also referred to as hazardous air pollutants (HAPs), are generally defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects; however, the emission of a toxic chemical does not automatically create a health hazard. Other factors, such as the amount of the chemical;

its toxicity, and how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust and may exist as PM_{10} and $PM_{2.5}$ or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources.

The emission of toxic substances into the air can be damaging to human health and to the environment. Human exposure to these pollutants at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. Pollutants deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer.

The public's exposure to TACs is a significant public health issue in California. The Air Toxics "Hotspots" Information and Assessment Act is a state law requiring facilities to report emissions of TACs to air districts. The program is designated to quantify the amounts of potentially hazardous air pollutants released, the location of the release, the concentrations to which the public is exposed, and the resulting health risks.

The State Air Toxics Program (AB 2588) identified over 200 TACs, including the 188 TACs identified in the Federal Clean Air Act. The U.S. Environmental Protection Agency (USEPA) has assessed this expansive list of toxics and identified 21 TACs as Mobile Source Air Toxics (MSATs). MSATs are compounds emitted from highway vehicles and nonroad equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. USEPA also extracted a subset of these 21 MSAT compounds that it now labels as the six priority MSATs: benzene, formaldehyde, acetaldehyde, diesel particulate matter (DPM)/diesel exhaust organic gases, acrolein, and 1,3-butadiene. While these six MSATs are considered the priority transportation toxics, USEPA stresses that the lists are subject to change and may be adjusted in future rules.[2] USEPA has issued a number of regulations that will dramatically decrease MSATs through cleaner fuels and cleaner engines. According to an FHWA analysis, even if the number of vehicle miles traveled increases by 64 percent, reductions of 57 percent to 87 percent in MSATs are projected from 2000 to 2020.

The California-specific transportation air quality analysis model, EMFAC, is designed to model MSATs at the project-level. Health effects from MSATs/TACs, i.e., cancer risks and chronic non-cancer risks from on-road traffic, have been associated primarily with DPM, benzene, and 1,3-butadiene. EMFAC can be used to estimate DPM, benzene, and 1,3-butadiene emissions. In addition to DPM, benzene, 1,3-butadiene, acetaldehyde, carbon tetrachloride, hexavalent chromium, paradichlorobenzene, formaldehyde, methylene chloride, and perchloroethylene pose the greatest existing ambient TAC risk, for which data are available, in California. DPM poses the greatest health risk among these ten TACs mentioned. Based on receptor modeling techniques, South Coast Air Quality Management District (SCAQMD) estimated that DPM accounts for 84 percent of the total regional risk.[3]

To date, the most comprehensive regional study of air toxics is the Multiple Air Toxics Exposure Study (MATES-IV) conducted by SCAQMD. The monitoring program measured more than 30 air pollutants, including both gases and particulates. The monitoring study was accompanied by a computer modeling

[2]FHWA, *Updated Interim Guidance on Mobile Source Air Toxics Analysis in NEPA Documents*, October 18, 2016.
[3]SCAQMD, *MATES IV Final Report Multiple Air Toxics Exposure Study in the South Coast Air Basin*, May 2015.

study in which SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. MATES-IV found that the cancer risk in the region from carcinogenic air pollutants ranges from about 600 in a million to 1,600 in a million, with an average regional risk of about 900 in a million.

Diesel Particulate Matter (DPM). According to the 2006 California Almanac of Emissions and Air Quality, the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from the exhaust of diesel-fueled engines. DPM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances.

Diesel exhaust is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of many of the urban hazardous air pollutants, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra fine diesel particulates are of the greatest health concern, and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on road diesel engines of trucks, buses and cars and the off road diesel engines that include locomotives, marine vessels and heavy duty equipment. Although DPM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present.

The most common exposure to DPM is breathing the air that contains DPM. The fine and ultra-fine particles are respirable (similar to $PM_{2.5}$), which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. Exposure to DPM comes from both on-road and off-road engine exhaust that is either directly emitted from the engines or lingering in the atmosphere.

Diesel exhaust causes health effects from both short-term or acute exposures, and long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to just DPM but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.

Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat and lungs, some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Chronic exposures to DPM in experimental animal inhalation studies have shown a range of dose-dependent lung inflammation and cellular changes in the lung and immunological effects. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a likely carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings.[4] Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. For the average Californian, 70 percent of cancer risk from breathing toxic air pollutants stem from diesel exhaust particles.[5]

USEPA's National Scale Assessment uses several types of health hazard information to provide a quantitative "threshold of concern" or a health benchmark concentration at which it is expected that no adverse health effects occur at exposures to that level. Health effects information on carcinogenic, short- and long-term non-carcinogenic end points are used to establish selective protective health levels to compare to the modeled exposures levels. Unfortunately, the exposure response data in human studies are considered

[4]USEPA, *Diesel Particulate Matter*, http://www.epa.gov/region1/eco/airtox/diesel.html.

[5]Office of Environmental Health Hazard Assessment, *Health Effects of Diesel Exhaust*, http://oehha.ca.gov/public_info/facts/dieselfacts.html.

too uncertain to develop a carcinogenic unit risk for USEPA's use. There is a Reference Concentration (RFC) that is used as a health benchmark protective of chronic non-carcinogenic health effects but it is for diesel exhaust and not specifically set for DPM. The RFC for diesel exhaust, which includes DPM, is 5 $\mu g/m^3$.[6] This value is similar to, but less than, the National Ambient Air Quality Standards (NAAQS) established for fine particulate matter ($PM_{2.5}$), which is 15 $\mu g/m^3$.

Unlike other TACs, no ambient monitoring data are available for DPM because no routine measurement method currently exists. However, California Air Resources Board (CARB) has made preliminary concentration estimates based on a PM exposure method. This method uses the CARB emissions inventory's PM_{10} database, ambient PM_{10} monitoring data, and the results from several studies to estimate concentrations of DPM.

REGULATORY FRAMEWORK

The Federal Clean Air Act (CAA) governs air quality in the United States. In addition to being subject to the requirements of CAA, air quality in California is also governed by more stringent regulations under the California Clean Air Act (CCAA). At the federal level, CAA is administered by USEPA. In California, the CCAA is administered by the CARB at the state level and by the air quality management districts and air pollution control districts at the regional and local levels.

FEDERAL

U.S. Environmental Protection Agency (USEPA). CAA governs air quality and USEPA is responsible for enforcing the CAA. USEPA is also responsible for establishing the NAAQS. NAAQS are required under the 1977 CAA and subsequent amendments. USEPA regulates emission sources that are under the exclusive authority of the Federal Government, such as aircraft, ships, and certain types of locomotives. USEPA has jurisdiction over emission sources outside state waters (e.g., beyond the outer continental shelf) and establishes various emission standards, including those for vehicles sold in states other than California. Automobiles sold in California must meet stricter emission standards established by CARB.

The USEPA has adopted multiple tiers of emission standards to reduce emissions from non-road diesel engines by integrating engine and fuel controls as a system to gain the greatest emission reductions. The first federal standards (Tier 1) for new non-road (or off-road) diesel engines were adopted in 1994 for engines over 50 horsepower, to be phased-in from 1996 to 2000. On August 27, 1998, the USEPA introduced Tier 1 standards for equipment under 37 kilowatts (50 horsepower) and increasingly more stringent Tier 2 and Tier 3 standards for all equipment with phase-in schedules from 2000 to 2008. Tier 1 through 3 standards were met through advanced engine design, with no or only limited use of exhaust gas after-treatment (oxidation catalysts). Tier 3 standards for nitrogen oxides and hydrocarbons are similar in stringency to the 2004 standards for highway engines; however, Tier 3 standards for particulate matter were never adopted. On May 11, 2004, the USEPA signed the final rule introducing Tier 4 emission standards, which were phased-in between 2008 and 2015. Tier 4 standards require that emissions of particulate matter and NO_X be further reduced by about 90 percent. Such emission reductions are achieved through the use of control technologies, including advanced exhaust gas after-treatment, similar to those required by the 2007 to 2010 standards for highway engines.

[6]Office of Environmental Health Hazard Assessment, *Health Effects of Diesel Exhaust*, http://oehha.ca.gov/public_info/facts/dieselfacts.html.

As required by the CAA, NAAQS have been established for seven major air pollutants: CO, NO_2, O_3, $PM_{2.5}$, PM_{10}, SO_2, and Pb. The CAA requires USEPA to designate areas as attainment, nonattainment, or maintenance (previously nonattainment and currently attainment) for each criteria pollutant based on whether the NAAQS have been achieved. The federal standards are summarized in **Table 4.2-1**. The USEPA has classified the South Coast Air Basin (Basin) as a nonattainment area for O_3, $PM_{2.5}$, and Pb.

TABLE 4.2-1: STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS AND ATTAINMENT STATUS FOR THE SOUTH COAST AIR BASIN

		California		Federal	
Pollutant	**Averaging Period**	**Standards**	**Attainment Status**	**Standards**	**Attainment Status**
Ozone (O_3)	1-hour	0.09 ppm (180 µg/m^3)	Nonattainment	--	--
	8-hour	0.070 ppm (137 µg/m^3)	n/a	0.070 ppm (137 µg/m^3)	Nonattainment
Respirable Particulate Matter (PM_{10})	24-hour	50 µg/m^3	Nonattainment	150 µg/m^3	Maintenance
	Annual Arithmetic Mean	20 µg/m^3	Nonattainment	--	--
Fine Particulate Matter ($PM_{2.5}$)	24-hour	--	--	35 µg/m^3	Nonattainment
	Annual Arithmetic Mean	12 µg/m^3	Nonattainment	12.0 µg/m^3	Nonattainment
Carbon Monoxide (CO)	1-hour	20 ppm (23 mg/m^3)	Attainment	35 ppm (40 mg/m^3)	Maintenance
	8-hour	9.0 ppm (10 mg/m^3)	Attainment	9 ppm (10 mg/m^3)	Maintenance
Nitrogen Dioxide (NO_2)	1-hour	0.18 ppm (338 µg/m^3)	Attainment	100 ppb (190 µg/m^3)	Maintenance
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	Attainment	53 ppb (100 µg/m^3)	Maintenance
Sulfur Dioxide (SO_2)	1-hour	0.25 ppm (655 µg/m^3)	Attainment	75 ppb (196 µg/m^3)	Attainment
	24-hour	0.04 ppm (105 µg/m^3)	Attainment	--	--
Lead (Pb)	30-day average	1.5 µg/m^3	Attainment	--	--
	Calendar Quarter	--	--	0.15 µg/m^3	Nonattainment

STATE

California Air Resources Board (CARB). In addition to being subject to the requirements of CAA, air quality in California is also governed by more stringent regulations under the CCAA. In California, the CCAA is administered by CARB at the state level and by the air quality management districts and air pollution control districts at the regional and local levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for meeting the state requirements of the CAA, administering the CCAA, and establishing the California Ambient Air Quality Standards (CAAQS). The CCAA, as amended in 1992, requires all air districts in the state to endeavor to achieve and maintain the CAAQS. CAAQS are generally more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. CARB regulates mobile air pollution sources, such as motor vehicles. CARB is responsible for setting emission

standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. CARB established passenger vehicle fuel specifications, which became effective in March 1996. CARB oversees the functions of local air pollution control districts and air quality management districts, which, in turn, administer air quality activities at the regional and county levels. The state standards are summarized in **Table 4.2-1**.

The CCAA requires CARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment. Under the CCAA, the Los Angeles County portion of the Basin is designated as a nonattainment area for O_3, $PM_{2.5}$, and PM_{10}.[7]

Toxic Air Contaminants (TACs) Regulations. CARB's statewide comprehensive air toxics program was established in the early 1980s. The Toxic Air Contaminant Identification and Control Act created California's program to reduce exposure to air toxics. Under the Toxic Air Contaminant Identification and Control Act, CARB is required to use certain criteria in the prioritization for the identification and control of air toxics. In selecting substances for review, CARB must consider criteria relating to "the risk of harm to public health, amount or potential amount of emissions, manner of, and exposure to, usage of the substance in California, persistence in the atmosphere, and ambient concentrations in the community" [Health and Safety Code Section 39666(f)]. The Toxic Air Contaminant Identification and Control Act also requires CARB to use available information gathered from the Air Toxics "Hot Spots" Information and Assessment Act program to include in the prioritization of compounds.

California has established a two-step process of risk identification and risk management to address the potential health effects from air toxic substances and protect the public health of Californians. In the first step (identification), CARB and the Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified as a TAC in California. During this process, CARB and the OEHHA staff draft a report that serves as the basis for this determination. CARB staff assesses the potential for human exposure to a substance and the OEHHA staff evaluates the health effects. After CARB and the OEHHA staff hold several comment periods and workshops, the report is then submitted to an independent, nine-member Scientific Review Panel (SRP), who reviews the report for its scientific accuracy. If the SRP approves the report, they develop specific scientific findings, which are officially submitted to CARB. CARB staff then prepares a hearing notice and draft regulation to formally identify the substance as a TAC. Based on the input from the public and the information gathered from the report, the CARB decides whether to identify a substance as a TAC. In 1993, the California Legislature amended the Toxic Air Contaminant Identification and Control Act by requiring CARB to identify 189 federal HAPs as state TACs.

In the second step (risk management), CARB reviews the emission sources of an identified TAC to determine if any regulatory action is necessary to reduce the risk. The analysis includes a review of controls already in place, the available technologies and associated costs for reducing emissions, and the associated risk.

The Air Toxics "Hot Spots" Information and Assessment Act (Health and Safety Code Section 44360) supplements the Toxic Air Contaminant Identification and Control Act by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks. The "Hot Spots" Act also requires facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

[7]CARB, *Area Designation Maps*, http://www.arb.ca.gov/desig/adm/adm.htm, accessed on October 13, 2016.

California's Diesel Risk Reduction Program. CARB identified particulate emissions from diesel-fueled engines TACs in August 1998. Following the identification process, CARB was required by law to determine if there is a need for further control, which led to the risk management phase of the program.

For the risk management phase, CARB formed the Diesel Advisory Committee to assist in the development of a risk management guidance document and a risk reduction plan. With the assistance of the Diesel Advisory Committee and its subcommittees, CARB developed the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles and the Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines. The Diesel Advisory Committee approved these documents on September 28, 2000, paving the way for the next step in the regulatory process: the control measure phase.

During the control measure phase, specific statewide regulations designed to further reduce DPM emissions from diesel-fueled engines and vehicles have and continue to be evaluated and developed. The goal of each regulation is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce DPM emissions.

California Public Resources Code (PRC) Section 21151.8. PRC Section 211518 contains provisions to protect the environmental health of California's students by restricting the certification of an EIR or approval of a negative declaration for a project involving the purchase of a school site or the construction of a new elementary or secondary school by a school district. The following conditions must be met for project approval:

- The environmental impact report or negative declaration determines that the site is not a current or former hazardous waste disposal site or solid waste disposal site, and if so, that the site has been remediated to an environmentally safe level.
- The environmental impact report or negative declaration must identify both permitted and non-permitted facilities within the air pollution district's authority including, but not limited to, freeways and busy traffic corridors, large agricultural operations, and rail yards within one-fourth of a mile of the proposed school site, that might reasonably be anticipated to emit hazardous emissions or handle hazardous or extremely hazardous substances or waste.
- The environmental impact report or negative declaration must determine that the health risks from the facilities or other pollution sources do not and will not constitute an actual or potential endangerment of public health to persons who would attend or be employed at the proposed school. For a school site with a boundary that is within 500 feet of the edge of the closest traffic lane of a freeway or other busy traffic corridor, the environmental document must analyze and demonstrate that, based on appropriate dispersion modeling and after consideration of any potential mitigation measures, the air quality at the proposed site is such that neither short-term nor long-term exposure poses significant health risks to pupils.

REGIONAL

Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[8] While Southern California is a leader in reducing emissions, and ambient levels of air pollutants are improving, the SCAG region continues to have the worst air quality in the nation. SCAG completed the 2012-2035 RTP/SCS, which includes a strong commitment to reduce emissions from transportation sources to comply with Senate Bill 375. Goals of the 2012-2035

[8]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP Draft EIR. The 2016-2040 RTP/SCS is discussed for informational purposes.

RTP/SCS to reduce air pollution include, locating uses adjacent to transit stations, encouraging mixed use and encouraging active transportation (i.e., non-motorized transportation such as walking and bicycling). SCAG promotes the following policies and actions related to active transportation to help the region confront congestion and mobility issues and consequently improve air quality:

- Implement Transportation Demand Management (TDM) strategies including integrating bicycling through folding bikes on buses programs, triple racks on buses, and dedicated racks on light and heavy rail vehicles;
- Encourage and support local jurisdictions to develop "Active Transportation Plans" for their jurisdiction if they do not already have one;
- Expand Compass Blueprint program to support member cities in the development of bicycle plans;
- Expand the Toolbox Tuesday's program to encourage local jurisdictions to direct enforcement agencies to focus on bicycling and walking safety to reduce multimodal conflicts;
- Support local advocacy groups and bicycle-related businesses to provide bicycle-safety curricula to the general public;
- Encourage children, including those with disabilities, to walk and bicycle to school;
- Encourage local jurisdictions to adopt and implement the proposed SCAG Regional Bikeway Network; and
- Support local jurisdictions to connect all of the cities within the SCAG region via bicycle facilities.

Southern California Association of Governments (SCAG) 2016–2040 RTP/SCS.[9] On April 7, 2016, SCAG adopted the 2016–2040 RTP/SCS. The 2016-2040 RTP/SCS builds on the success of the 2012-2035 RTP/SCS and continues the commitment to reduce emissions from transportation sources to comply with Senate Bill (SB) 375. Goals of the 2016–2040 RTP/SCS remain similar to those of the 2012-2035 RTP/SCS.

South Coast Air Quality Management District (SCAQMD). The 1977 Lewis Air Quality Management Act created the SCAQMD to coordinate air quality planning efforts throughout Southern California. This Act merged four county air pollution control agencies into one regional district to better address the issue of improving air quality in Southern California. This Act was renamed the Lewis-Presley Air Quality Management Act in 1988, the SCAQMD is the agency principally responsible for comprehensive air pollution control in the region. Specifically, the SCAQMD is responsible for monitoring air quality, as well as planning, implementing, and enforcing programs designed to attain and maintain state and federal ambient air quality standards in the district. Programs that were developed include air quality rules and regulations that regulate stationary sources, area sources, point sources, and certain mobile source emissions. SCAQMD is also responsible for establishing stationary source permitting requirements and for ensuring that new, modified, or relocated stationary sources do not create net emission increases.

SCAQMD monitors air quality within the project area. SCAQMD has jurisdiction over an area of 10,743 square miles, consisting of Orange County; the non-desert portions of Los Angeles, Riverside, and San Bernardino counties; and the Riverside County portion of the Salton Sea Air Basin and Mojave Desert Air Basin. The Basin portion of SCAQMD's jurisdiction covers an area of 6,745 square miles. The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. The Basin is bounded by the Pacific Ocean to the west; the San Gabriel, San Bernardino and San Jacinto Mountains to the north and east; and the San Diego County line to the south (**Figure 4.2-1**).

[9]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP Draft EIR. The 2016-2040 RTP/SCS is discussed for informational purposes.

Air Quality Management Plan (AQMP). All areas designated as nonattainment under the CCAA are required to prepare plans showing how the area would meet the state air quality standards by its attainment dates. AQMP is the SCAQMD plan for improving regional air quality. It addresses CAA and CCAA requirements and demonstrates attainment with state and federal ambient air quality standards. The AQMP is prepared by SCAQMD and SCAG. The AQMP provides policies and control measures that reduce emissions to attain both state and federal ambient air quality standards by their applicable deadlines. Environmental review of individual projects within the Basin must demonstrate that daily construction and operational emissions thresholds, as established by the SCAQMD, would not be exceeded. The environmental review must also demonstrate that individual projects would not increase the number or severity of existing air quality violations.

The 2012 AQMP was adopted in December 2012 and continues the progression toward clean air and compliance with state and federal requirements.[10] It includes a comprehensive strategy aimed at controlling pollution from all sources, including stationary sources, on- and off-road mobile sources and area sources. The 2012 AQMP includes demonstration of attainment of the federal 24-hour $PM_{2.5}$ standard by 2014 in the Basin through adoption of all feasible measures while incorporating current scientific information and meteorological air quality models. It also updates the USEPA approved 8-hour O_3 control plan with new commitments for short-term NO_X and VOC reductions. The 2012 AQMP also addresses several state and federal planning requirements.

The 2012 AQMP builds upon the approach taken in the 2007 AQMP, for the attainment of federal PM and O_3 standards, and highlights the significant amount of reductions needed and the urgent need to engage in interagency coordinated planning to identify additional strategies, especially in the area of mobile sources, to meet all federal criteria pollutant standards within the timeframes allowed under the CAA.

All projects in the SCAQMD jurisdiction are also subject to SCAQMD rules and regulations, including, but not limited to the following:

- Rule 401 Visible Emissions – This rule prohibits an air discharge that results in a plume that is as dark or darker than what is designated as No. 1 Ringelmann Chart by the United States Bureau of Mines for an aggregate of three minutes in any one hour.
- Rule 402 Nuisance – This rule prohibits the discharge of "such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of people or the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."
- Rule 403 Fugitive Dust – This rule requires that future projects reduce the amount of particulate matter entrained in the ambient air as a result of fugitive dust sources by requiring actions to prevent, reduce, or mitigate fugitive dust emissions from any active operation, open storage pile, or disturbed surface area.
- Rule 1113 Architectural Coatings – This rule limits VOC in architectural coatings used in the SCAQMD jurisdiction. These limits are application-specific and are updated as availability of low-VOC products expands.
- Rule 1168 Adhesive and Sealant Applications – This rule reduces emissions of VOCs and eliminates emissions of chloroform, ethylene dichloride, methylene chloride, perchloroethylene, and trichloroethylene from the application of adhesives, adhesive bonding primers, adhesive primers, sealants, sealant primers, or any other primers.

[10]SCAQMD, *Final 2012 Air Quality Management Plan*, February 2013.

- Regulation XIII New Source Review – This regulation contains Rules 1300 through 1325, which set forth pre-construction review requirements for new, modified, or relocated facilities, to ensure that the operation of such facilities does not interfere with progress in attainment of the NAAQS, and that future growth within SCAQMD is not unnecessarily restricted. The specific air quality goal of this regulation is to achieve no net increases from new or modified permitted sources of nonattainment air contaminants or their precursors.

The SCAQMD recently released the Draft Final 2016 AQMP (2016 AQMP) that incorporates updated growth projections from the 2016–2040 RTP/SCS. The 2016 AQMP represents a thorough analysis of existing and potential regulatory control options, includes available, proven, and cost-effective strategies, and seeks to achieve multiple goals in partnership with other entities promoting reductions in greenhouse gases and toxic risk, as well as efficiencies in energy use, transportation, and goods movement. The 2016 AQMP includes both stationary and mobile source strategies to ensure that rapidly approaching attainment deadlines are met and that public health is protected to the maximum extent feasible. The 2016 AQMP acknowledges that the most significant air quality challenge in the Basin is to reduce NO_X emissions sufficiently to meet the upcoming ozone standard deadlines.

LOCAL

Clean Up Green Up Ordinance. The City of Los Angeles adopted a Clean Up Green Up Ordinance (Ordinance Number 184,245) on April 13, 2016, which among other provisions, includes provisions related to ventilation system filter efficiency in mechanically ventilated buildings.[11] This Ordinance added Sections 95.314.3 and 99.04.504.6 to the Los Angeles Municipal Code (LAMC) and amended Section 99.05.504.5.3 to implement building standards and requirements to address cumulative health impacts resulting from incompatible land use patterns. Section 99.04.504.6, which became effective June 4, 2016, mandates that regularly occupied areas in mechanically ventilated buildings within 1,000 feet of a freeway be provided with air filtration media for outside and return air that meet a Minimum Efficiency Report Value (MERV) of 13. This Ordinance requires that these filters be installed prior to occupancy, and recommendations for maintenance with filters of the same value shall be included in the operation and maintenance manual. The only exception to Section 99.04.504.3 applies to existing mechanical equipment. Additionally, Section 99.05.504.5.3 states that regularly occupied areas in all mechanically ventilated buildings shall be provided with air filtration media for outside and return air that meets a MERV of 8. An exception is provided for existing mechanical equipment and for new ventilation units meeting certain 2013 California Energy Code requirements. These additions to the LAMC are designed to address cumulative health impacts in highly polluted areas resulting from incompatible land use patterns within the City of Los Angeles.

City of Los Angeles Air Quality Element of the General Plan. The principal objective of the Air Quality Element of the General Plan is to aid the region in attaining the state and federal ambient air quality standards while continuing economic growth and improvement in the quality of life afforded to City residents.[12] The Air Quality Element documents how the City will implement programs contained in the General Plan. Goals, objectives, and policies of the Air Quality Element applicable to the Proposed Project are listed in **Table 4.2-2**.

[11]City of Los Angeles Department of City Planning, *Ordinance Number 184,245 Clean Up Green Up, Council File No. 15-1026*, adopted April 13, 2016.

[12]City of Los Angeles, *Air Quality Element of the General Plan*, November 1992.

TABLE 4.2-2: RELEVANT GENERAL PLAN AIR QUALITY GOALS, OBJECTIVES, AND POLICIES	
Goal/Objective/Policy	**Goal/Objective/Policy Description**
AIR QUALITY ELEMENT	
Goal 1	Good air quality and mobility in an environment of continued population growth and healthy economic structure.
Objective 1.1	Reduce air pollutants consistent with the regional AQMP, increase traffic mobility, and sustain economic growth.
Objective 1.3	Reduce particulate air pollutants emanating from unpaved areas, parking lots, and construction sites.
Policy 1.3.1	Minimize particulate matter emissions from construction sites.
Goal 3	Efficient management of transportation facilities and system infrastructure using cost effective system management and innovative demand management techniques.
Objective 3.2	Reduce vehicular traffic during peak periods.
Policy 3.2.1	Manage traffic congestion during peak periods.
Objective 3.3	Install Automated Traffic Surveillance and Control Systems, utilize channelization of streets and other capital programs commensurate with the City's portion of regional goals.
Policy 3.3.1	Implement best available system management techniques and transportation management and mobility action plans to improve the efficiency of existing transportation facilities, subject to availability of funding.
Goal 4	Minimal impact of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality.
Objective 4.1	Include the regional attainment of ambient air quality standards as a primary consideration in land use planning.
Policy 4.1.1	Coordinate with all appropriate regional agencies the implementation of strategies for the integration of land use, transportation, and air quality policies.
Policy 4.1.2	Ensure that project level review and approval of land use development remain at the local level.
Policy 4.2.1	Revise the City's General Plan/Community Plans to achieve a more compact, efficient urban form and to promote more transit-orientated development and mixed use development.
Objective 4.2	Reduce vehicle trips and vehicle miles traveled associated with land use patterns.
Policy 4.2.2	Improve accessibility for the City's residents to places of employment, shopping centers and other establishments.
Policy 4.2.3	Ensure that new development is compatible with pedestrians, bicycles, transit, and alternative fuel vehicles.
Policy 4.2.4	Require that air quality impacts be a consideration in the review and approval of all discretionary projects.
Policy 4.2.5	Emphasize trip reduction, alternative transit and congestion management measures for discretionary projects.
Objective 4.3	Ensure that land use plans separate major sources of air pollution from sensitive receptors such as schools, hospitals, and parks.
Policy 4.3.1	Revise the City's General Plan/Community Plans to ensure that new or relocated sensitive receptors are located to minimize significant health risks posed by air pollution sources.
Policy 4.3.2	Revise the City's General Plan/Community Plans to ensure that new or relocated major air pollution sources are located to minimize significant health risks posed by air pollution sources.

EXISTING SETTING

AIR POLLUTION CLIMATOLOGY

The Basin is in an area of high air pollution potential due to its climate and topography. The general region lies in the semi-permanent high pressure zone of the eastern Pacific Ocean, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The Basin experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The Basin is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the west and high mountains around the rest of its perimeter.

The Basin experiences frequent temperature inversions. Temperature typically decreases with height. However, under inversion conditions, temperature increases as altitude increases, thereby preventing air close to the ground from mixing with the air above it. As a result, air pollutants are trapped near the ground. During the summer, air quality problems are created due to the interaction between the ocean surface and the lower layer of the atmosphere. This interaction creates a moist marine layer. An upper layer of warm air mass forms over the cool marine layer, preventing air pollutants from dispersing upward. Additionally, hydrocarbons and NO_2 react under strong sunlight, creating smog. Light, daytime winds, predominantly from the west, further aggravate the condition by driving air pollutants inland, toward the mountains. During the fall and winter, air quality problems are created due to CO and NO_2 emissions. CO concentrations are generally worse in the morning and late evening (around 10:00 p.m.). In the morning, CO levels are relatively high due to cold temperatures and the large number of cars traveling. High CO levels during the late evenings are a result of stagnant atmospheric conditions trapping CO in the area. Since CO emissions are produced almost entirely from automobiles, the highest CO concentrations in the Basin are associated with heavy traffic. NO_2 concentrations are also generally higher during fall and winter days.

LOCAL CLIMATE

The mountains and hills within the Basin contribute to the variation of rainfall, temperature, and winds throughout the region. The average wind speed, as recorded at the West Los Angeles Wind Monitoring Station, is approximately 2.8 miles per hour with calm winds occurring approximately 19 percent of the time. Wind in the vicinity of the Project Area predominately blows from the southwest.[13] The annual average temperature recorded in the Project Area is 62.8°F.[14] Total precipitation averages approximately 13 inches annually. Precipitation occurs mostly during the winter and relatively infrequently during the summer.[15]

AIR MONITORING DATA

The SCAQMD monitors air quality conditions at 38 locations throughout the Basin. Typical air quality conditions in the project area are best represented by the West Los Angeles-VA Hospital Monitoring Station, located approximately one mile northeast of the Exposition/Bundy Station Area (**Figure 4.2-2**). Particulate matter (PM_{10} and $PM_{2.5}$) are not monitored at the West Los Angeles-VA Hospital Monitoring Station. Information for these pollutants was obtained from the Downtown Los Angeles Monitoring Station, located approximately eight miles east of the Culver City Station Area. The SCAQMD no longer collects publishes air monitoring data for CO or SO_2 after years of reporting demonstrated concentrations consistently below the applicable air quality standards. As shown in **Table 4.2-3**, O_3, PM_{10}, and $PM_{2.5}$ standards were exceeded numerous times between 2013 and 2015.

SENSITIVE RECEPTORS

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. CARB has identified the following groups who are most likely to be affected by air pollution: children less than 14 years of age, adults over 65 years of age, athletes and people with cardiovascular and chronic respiratory diseases. According to the SCAQMD, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers and retirement homes. The Project Area encompasses 1,971 acres, which includes all of the sensitive receptors described above. In addition, there are sensitive receptors outside the boundaries of the project area which may be impacted by the project due to their proximity to it.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to air quality if it would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors). (This threshold question is discussed in Section 4.14, Cumulative Impacts)
- Expose sensitive receptors to substantial pollutant concentrations; and/or
- Create objectionable odors affecting a substantial number of people.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

The criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide) refers to the SCAQMD CEQA Air Quality Handbook for appropriate air quality significance thresholds.[16,17] The Thresholds Guide also identifies a threshold of either of the following conditions occurring at an intersection or roadway within one-quarter mile of a sensitive receptor:

- The Proposed Project causes or contributes to an exceedance of the California 1-hour or 8-hour CO standards of 20 or 9.0 ppm, respectively;
- The incremental increase due to the project is equal to or greater than 1.0 ppm for the California 1-hour CO standard, or 0.45 ppm for the 8-hour CO standard; or
- The Proposed Project creates an objectionable odor at the nearest sensitive receptor.

The SCAQMD has developed specific CEQA regional and localized significance thresholds (LSTs) to assess air quality impacts associated with individual development projects. LSTs vary depending on the air monitoring areas, or source receptor areas, in which a development project is located. The Project Area is located within the Northwest Los Angeles County Coastal Air Monitoring Area. The regional and local construction significance thresholds for the Project Area are shown in **Table 4.2-4**. The regional operational significance thresholds for individual projects are shown in **Table 4.2-5**.

TABLE 4.2-4: SCAQMD DAILY CONSTRUCTION EMISSIONS THRESHOLDS

Criteria Pollutant /a/	Regional Emissions (Pounds Per Day)	Localized Emissions (Pounds Per Day) /b/		
		1-Acre	2-Acre	5-Acre
Volatile Organic Compounds (VOC)	75	--	--	--
Nitrogen Oxides (NO_X)	100	103	147	221
Carbon Monoxide (CO)	550	562	827	1,531
Sulfur Oxides (SO_X)	150	--	--	--
Fine Particulates ($PM_{2.5}$)	55	4	6	13
Particulates (PM_{10})	150	3	4	6

/a/ The SCAQMD has adopted three pounds per day significance threshold for lead. The Proposed Project does not include sources of lead emissions, and lead is not assessed in the air quality impact analysis.
/b/ Localized significance thresholds are based on a 25 meter receptor distance because the project area is densely developed.
SOURCE: SCAQMD, 2015.

TABLE 4.2-5: SCAQMD DAILY OPERATIONAL EMISSIONS THRESHOLDS

Criteria Pollutant	Net Pounds Per Day /a/
Volatile Organic Compounds (VOC)	55
Nitrogen Oxides (NO_X)	55
Carbon Monoxide (CO)	550
Sulfur Oxides (SO_X)	150
Fine Particulates ($PM_{2.5}$)	55
Particulates (PM_{10})	150

/a/ Net pounds per day refers to difference between existing conditions and Proposed Project.
SOURCE: SCAQMD, 2015.

[16]SCAQMD, *Air Quality Significance Thresholds*, March 2015.

[17]Section B.2. of the Thresholds Guide references an operational significance threshold of 10 tons per year of volatile organic gases or 55 pounds per day of Reactive Organic Gases (ROG). These thresholds have been superseded and are no longer supported by SCAQMD.

METHODOLOGY

This analysis uses Appendix G thresholds to make a significance determination, which is supplemented by screening criteria found in the City's Thresholds Guide for additional guidance as appropriate. The City's Thresholds Guide sets forth guidance for the determination of significance for air quality impacts. The guidance is generally based on the CEQA Guidelines Appendix G and the SCAQMD CEQA Air Quality Handbook published in 1993. The Thresholds Guide provides specific criteria to be considered when making a significance determination. For purposes of this analysis, the CEQA Guidelines Appendix G criteria are used, supplemented by the thresholds identified in the City's Thresholds Guide and current SCAQMD guidance where appropriate.

Construction emissions were estimated for equipment exhaust emissions and truck trips for a number of examples of individual construction projects. The analysis for the proposed project assumed a baseline of zero construction emissions. These example projects account for four scales of intensity with respect to equipment usage and truck trips, as itemized below.

- Two (2) pieces of heavy-duty equipment and 25 truck trips per day;
- Four (4) pieces of heavy-duty equipment and 50 truck trips per day;
- Eight (8) pieces of heavy-duty equipment and 100 truck trips per day; and
- Eight (8) pieces of heavy-duty equipment and 150 truck trips per day.

Equipment emission factors were obtained from off-road mobile source emission factors provided by SCAQMD and based on CARB data.[18] Equipment was assumed to operate for eight hours per day. Truck emission factors were obtained using EMFAC2014 and trucks were assumed to travel 20 miles per day. Fugitive dust and architectural coating emissions are qualitatively discussed because it would be speculative to quantify site preparation and the size of buildings to be coated.

The implementation of the ECTNP would generate mobile source emissions and area source emissions associated with increased development. Mobile source emissions were estimated using vehicle miles traveled (VMT) data presented in Section 4.12, Transportation and Traffic, and vehicle emission rates from the EMFAC2014 model. The VMT data included speed information, which allowed the analysis to account for increased congestion in the Future with Project scenario. Additional sources of emissions associated with land use development include natural gas use and volatile emissions of reactive organic gases (ROG) from consumer products and cleaning supplies. These emissions were estimated based on the methodology used in the California Emissions Estimator Model (CalEEMod) and data presented in Section 4.13, Utilities and Service Systems.

Localized CO concentrations were estimated using the Caltrans CALINE4 dispersion model. CALINE4 is a line source air quality model based on the Gaussian diffusion equation and employs a mixing zone concept to characterize pollutant dispersion over the roadway. Peak hour traffic volumes were obtained from the intersection analysis prepared for the Proposed Project.

This discussion of air quality addresses impacts for the entire Project Area. No distinction is made between areas of change and areas within the ECTNP Area where zoning controls would not change because potential emissions and concentrations of pollutants are a direct function of both transportation activity and construction activity throughout the ECTNP Area.

[18]SCAQMD, *Off-road Mobile Source Emission Factors*, available at http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/off-road-mobile-source-emission-factors, accessed March 9, 2017.

IMPACTS

IMPACT 4.2-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF THE APPLICABLE AIR QUALITY PLAN? THIS IMPACT IS LESS THAN SIGNIFICANT.

The overall control strategy for the 2012 AQMP is designed to meet applicable federal and state requirements, including attainment of ambient air quality standards.[19] The focus of the 2012 AQMP is to demonstrate attainment of the federal 2006 24-hour $PM_{2.5}$ ambient air quality standard by the 2014 attainment date, as well as an update to further define measures to meet the federal and state 8-hour ozone standards. The attainment demonstration for the recent 8-hour ozone standard (75 ppb) will be addressed in the 2015 ozone plan.

The 2012 AQMP provides base year emissions and future baseline emission projections. In doing so, the 2012 AQMP relies upon the most recent planning assumptions and the best available information including: CARB's EMFAC model for the on-road mobile source emissions inventory; CARB's in-use fleet inventory for the off-road mobile source emission inventory; the latest point source inventory; updated area source inventories; and SCAG's forecast growth assumptions based on its recent 2012-2035 RTP/SCS.[20] The baseline emission projections provide a snapshot of the future air quality conditions, including the effects from already adopted rules and regulations, but without a proposed control strategy. Unanticipated growth could result in inaccurate baseline emission projections.

As discussed in Section 4.8, Land Use and Planning, the Proposed Project would be consistent with applicable goals of the 2012-2035 RTP/SCS. Specifically, the Proposed Project would direct new development to areas served by transit, foster mixed use development, and enhance the public realm through design standards and streetscape plans, and therefore encourages transit use and the use of non-motorized transportation such as bicycling and walking. This would protect the environment and health of residents by improving air quality and encouraging active transportation. A University of Southern California study of the Metro Expo Line Phase 1 demonstrated that the introduction of transit resulted in local VMT reductions.[21] In particular, households in the experimental group, which were within a half mile of an Metro Expo Line Phase 1 station reduced daily household VMT by approximately 10 miles per day compared to the control households that were located more than a half mile from a station. Rail ridership increased, and in some instances that effect was statistically significant. The decrease in VMT corresponded to a decrease in mobile source CO_2 emissions, with households within a half mile of a station having 30 percent less vehicle emissions than households further away after transit was introduced. The Proposed Project concentrates jobs and housing within a half-mile of the Metro Expo Line Phase 2, and thus is anticipated to achieve these types of reductions in VMT and CO_2 emissions. Following are the average weekday boarding numbers for the Exposition Light Rail Line: June 2014: 31,031; June 2015: 30,507; and June 2016 45,876.[22] The City of Los Angeles has recently adopted the Mobility Plan 2035 (MP 2035). MP 2035 was prepared in compliance with California's Complete Streets Act of 2008 (AB 1358), which mandates that the circulation element of the General Plan be modified to plan for a balanced, multimodal transportation network.

[19]SCAQMD, *2012 Air Quality Management Plan*, February 2013.

[20]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP Draft EIR.

[21]Boarnet M. and Houston D., University of Southern California, Sol Price School of Public Policy, *The Exposition Light Rail Line Study: A Before-and-After Study of the Impact of New Light Rail Transit Service*, December 15 2013.

[22]Metro, *Ridership Statistics*, https://www.metro.net/news/ridership-statistics/ for additional information.

Several transportation metrics have been calculated to analyze the influence of the Proposed Project on future transportation conditions in the Project Area. These metrics were calculated for the West Los Angeles Area Planning Commission geography, which includes the Project Area and assumes MP 2035 to be in place. The results of this analysis are discussed in detail in Section 4.12, Transportation and Traffic, and summarized below.

The transportation analysis (see Section 4.12, Transportation and Traffic) evaluates VMT outcomes for two future cumulative scenarios: Future MP 2035 With Project and Future MP 2035 No Project. This analysis concluded that there would be approximately 0.6 percent more peak period VMT under Future MP 2035 With Project conditions than under Future MP 2035 No Project conditions. Although peak period vehicle trips increase by 1.2 percent, peak period VMT increases by only 0.6 percent, indicating that, although more trips are made under Future MP 2035 With Project conditions, those trips tend to be shorter on average than those under Future MP 2035 No Project conditions. The shorter trips would be consistent with the policies and goals in SCAG's adopted 2012-2035 RTP/SCS, and would contribute to reducing regional emissions.

In order to capture the effect of increased travel due to additional jobs and housing in the station areas as a result of the Proposed Project, per capita VMT was calculated on a service population basis. Service population is defined as the total number of jobs plus the total population of a given area. While peak period VMT increases approximately 0.6 percent between Future MP 2035 No Project and Future MP 2035 With Project conditions, service population increases by 1.4 percent. As a result, peak period per capita VMT is 0.8 percent lower under Future MP 2035 With Project conditions than under Future MP 2035 No Project conditions. Therefore, the anticipated per capita VMT reduction indicates that the Proposed Project would be consistent with the 2012-2035 RTP/SCS, and would contribute to reducing regional emissions.

As discussed in Section 4.12, Transportation and Traffic, the Citywide Ordinance on TDM and Trip Reduction Measures (Ordinance No. 168,700) would continue to be implemented within the Project Area. This Ordinance calls for several measures to be taken by non-residential developments in an effort to reduce single-occupancy vehicle trips. In addition, the ECTNP includes requirements for individual projects to incorporate other TDM strategies, including unbundled parking, parking cash out, and transit pass subsidies, that aim to reduce vehicle trips among residents and employees. Development projects in the ECTNP that utilize an FAR bonus would further be required to provide public benefits such as streetscape improvements and mobility amenities, which can also encourage the use of alternative modes of transportation. Projects that are comprised primarily of non-residential use and that utilize an FAR bonus would be required to demonstrate a reduction in vehicle trip generation through a comprehensive TDM program, which can include approaches such as alternative work schedules, opportunities for telecommuting, on-site car share or bike share programs, employer-subsidized vanpools or shuttles, and workplace parking pricing, in addition to the required TDM strategies noted above. These requirements all aim to reduce the number of vehicle trips generated by new development, which is consistent with the goals of the 2012-2035 RTP/SCS and thus contributes to the implementation of the AQMP.

As discussed in Chapter 3.0, Project Description, the Proposed Project (without the Alternative Compliance scenario) would increase dwelling units by 18 percent, population by 18 percent, and employment by 42 percent over existing conditions within the Project Area. While at the neighborhood level, this increased density may not be fully accounted for in the SCAG land use assumption provided to SCAQMD for incorporation into the 2012 AQMP, on a citywide basis this increased population and employment is within the assumptions of the 2012-2035 RTP/SCS provided to SCAQMD for the 2012 AQMP. Therefore, the Proposed Project is considered consistent with the goals and policies of the 2012-2035 RTP/SCS and AQMP and with the citywide growth assumptions for the City of Los Angeles and as such would not conflict with or obstruct implementation of applicable air quality plans.

The City has coordinated with SCAG and SCAQMD to ensure that the most recent neighborhood level population, housing, and employment assumptions (including the Proposed Project) were utilized in preparing the 2016 AQMP and the 2016-2040 RTP/SCS.

MITIGATION MEASURES

Less than significant impacts related to consistency with the AQMP are anticipated. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to consistency with the AQMP were determined to be less than significant without mitigation.

IMPACT 4.2-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT VIOLATE AN AIR QUALITY STANDARD OR CONTRIBUTE SUBSTANTIALLY TO AN EXISTING OR PROJECTED AIR QUALITY VIOLATION? THIS IMPACT IS SIGNIFICANT AND UNAVOIDABLE.

The potential for significant impacts has been assessed for construction and operational activity.

Construction

The Proposed Project would guide development in the Project Area. There is no specifically planned development as a part of this Proposed Project. Therefore, there is no construction schedule or phasing, and it is difficult to accurately characterize emissions from the wide range of projects that may be constructed. Emissions would vary broadly depending on the type of development, the area to be disturbed, possible excavation and export activity, the square feet of material to be painted, and many other construction factors. The majority of construction emissions would be related to equipment exhaust, architectural coatings, truck trips, and worker commute trips.

Table 4.2-6 shows average estimated construction exhaust emissions associated with four sample construction projects that include different equipment use and truck trips, as compared to regional significance thresholds.

TABLE 4.2-6: ESTIMATED AVERAGE DAILY CONSTRUCTION EMISSIONS

	Pounds Per Day					
Example Scenarios - Daily Activity /a/	**VOC**	**NO_X**	**CO**	**SO_X**	**$PM_{2.5}$**	**PM_{10}**
2 Heavy-Duty Equipment, 25 Truck Trips	3	31	13	<1	1	1
4 Heavy-Duty Equipment, 50 Truck Trips	6	63	26	<1	2	2
8 Heavy-Duty Equipment, 100 Truck Trips	12	127	51	<1	4	4
8 Heavy-Duty Equipment, 150 Truck Trips	13	146	54	<1	4	5
Regional Significance Threshold	**75**	**100**	**550**	**150**	**55**	**150**

/a/ Equipment exhaust was estimated using OFFROAD and 8 hour per day of operation. Truck emissions were estimated using EMFAC and a trip length of 20 miles.
SOURCE: TAHA, 2017.

Exhaust-related NO_X emissions could exceed the SCAQMD regional significance threshold, depending primarily on truck activity. In addition, it is likely that the construction of individual projects would generate emissions that exceed the SCAQMD regional VOC significance threshold (related to architectural coatings).

In addition to regional thresholds, SCAQMD has established localized thresholds that are dependent on the size of the project site and the distance from emissions to sensitive land uses. Depending on the specifics of the project being developed, it is anticipated that emissions from construction activities would exceed the localized thresholds due to the dense nature of development and the associated proximity of existing sensitive land uses.

It is also likely that specific projects constructed within the Project Area would have overlapping construction activities and combined emissions that exceed the thresholds. Therefore, without mitigation, the Proposed Project would result in a significant impact related to regional and localized construction emissions as the Project would exceed specified thresholds and therefore could contribute to violations of an air quality standard and/or could contribute substantially to an existing or projected air quality violation.

The significant construction emissions identified above could result in adverse health effects to sensitive receptors. For example, high concentrations of NO_2, which has been assessed as NO_X, can cause breathing difficulties and chronic pulmonary fibrosis. $PM_{2.5}$ and PM_{10} can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances, such as lead, sulfates and nitrates can cause lung damage directly. These substances can be absorbed into the blood stream and cause damage elsewhere in the body. These substances can transport absorbed gases, such as chlorides or ammonium, into the lungs and cause injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissues. In addition, USEPA has classified the Basin as a nonattainment area for O_3 and $PM_{2.5}$, and the CARB has designated the Los Angeles County portion of the Basin as a nonattainment area for O_3, $PM_{2.5}$, and PM_{10}. In broad terms, the existing air quality in the Basin has been established as unhealthy as it relates to O_3, $PM_{2.5}$, and PM_{10}.

Operation

The Proposed Project would generate mobile source emissions and area source emissions associated with increased development. Mobile source emissions were estimated using cumulative VMT data presented in Section 4.12, Transportation and Traffic, and vehicle emission rates from CARB's EMFAC2014 model. Additional sources of emissions associated with land use development include natural gas use and volatile emissions of ROG from consumer products and cleaning supplies. These emissions were estimated based on the methodology used in the CalEEMod and data presented in Section 4.13, Utilities and Service Systems.

Table 4.2-7 shows regional emissions comparisons between Existing and 2015 With Project conditions, and Existing and 2035 With Project conditions. When comparing Existing to 2015 With Project conditions, VOC emissions would exceed the SCAQMD threshold. This impact is a result of consumer product emissions (e.g., cleaning compounds) associated with placing the entire Proposed Plan in the existing condition. This is a hypothetical and extremely conservative scenario because it assumes the ECTNP will be fully implemented and all anticipated development constructed and occupied by 2015 or within a short time after adoption of the ECTNP. However, this would not occur. Nevertheless, this conservative scenario results in a theoretical calculated significant impact. This impact does not occur in comparing Existing to the 2035 With Project condition as decreased mobile source emissions associated with a more fuel-efficient vehicle fleet would offset increases in consumer product emissions. (It is also likely that increasing stringent controls on consumer products that are not accounted for in the CalEEMod model will likely reduce emissions from consumer products in the future.)

The 2035 With Project scenario would result in a less than significant impact related to regional operational emissions. However, 2015 With Project Scenario would result in a theoretical calculated significant impact related to regional operational emissions. The Proposed Project would not generate emissions that exceed the SCAQMD regional significance thresholds shown in **Table 4.2-7**. Therefore, the Proposed Project would result in a less than significant impact related to regional operational emissions and would not violate an air quality standard or contribute substantially to an existing or projected air quality violation.

TABLE 4.2-7: OPERATIONAL EMISSIONS

Scenario and Source	Pounds Per Day					
	VOC	NO_X	CO	SO_X	$PM_{2.5}$	PM_{10}

2035 With Project Net Emissions Compared to 2035 No Project	120	160	383	2	12	27

SOURCE: TAHA, 2017.

The 2035 With Project to 2035 No Project comparison is presented for informational purposes (existing conditions are the baseline for the air quality analysis). The majority of emissions would be related to mobile sources. Based on the current vehicle-centric traffic modeling, 2035 With Project emissions when compared to 2035 No Project emissions would increase between 8 and 14 percent. The traffic model has a margin of error of approximately 5 to 15 percent.

Despite the increased emissions in the 2035 With Project scenario, it is not substantial given the vehicle-centric nature of the analysis and the error margin of the model. Therefore, the difference between 2035 With Project and 2035 No Project emissions would not be considerable. CO concentrations in the future are expected to be lower than existing conditions due to stringent state and federal mandates for lowering vehicle emissions. Although traffic volumes would be higher in the future both with and without the implementation of the Proposed Project, CO emissions from mobile sources are expected to be much lower due to technological advances in vehicle emissions systems and normal turnover in the vehicle fleet.

Accordingly, increases in traffic volumes are expected to be offset by increases in cleaner-running cars as a percentage of the entire vehicle fleet on the road.[23]

CO concentrations in the Basin have not exceeded California standards since 1992 due to stringent state and federal mandates for lowering vehicle emissions. This is accurate even when considering the most congested city intersections with the highest traffic volumes and largest percentage of vehicle idle time. It is not anticipated that any intersection affected by the Proposed Project contains the requisite vehicle volumes and delays to generate a CO hotspot. With this in mind, the following intersections with high traffic volumes and poor levels of service were analyzed during the AM and PM peak hours to assess the potential for substantial localized concentrations:

- Centinela Avenue/Exposition Boulevard
- National Boulevard/Venice Boulevard
- Westwood Boulevard/Pico Boulevard
- Sepulveda Boulevard/Pico Boulevard
- Bundy Drive/Pico Boulevard
- Bundy Drive/Ocean Park Boulevard

The Caltrans CALINE4 dispersion model was used to estimate CO concentrations in 2035 with the Proposed Project. As shown in **Table 4.2-8**, intersection CO concentrations associated with the Proposed Project would not exceed the state standards. The incremental increase in project-related concentrations would not increase total concentrations above (or even close to) the state standards. Therefore, the Proposed Project would result in a less than significant impact related to localized CO pollutant concentrations and would not violate an air quality standard or contribute substantially to an existing or projected air quality violation.

TABLE 4.2-8: 2035 ESTIMATED CARBON MONOXIDE CONCENTRATIONS WITH PROPOSED PROJECT

Intersection	Peak Hour	1-hour (parts per million)	8-hour (parts per million)
Centinela Ave. and Exposition Blvd.	AM	0.8	0.56
	PM	0.8	0.56
National Blvd. and Venice Blvd.	AM	2.0	1.40
	PM	2.1	1.47
Westwood Blvd. and Pico Blvd.	AM	1.9	1.33
	PM	2.0	1.40
Sepulveda Blvd. and Pico Blvd.	AM	1.9	1.33
	PM	2.1	1.47
Bundy Dr. and Pico Blvd.	AM	1.9	1.33
	PM	2.0	1.40
	State Standard	**20**	**9.0**

Note: The City threshold identified in the Threshold Guide for CO 1-hour and 8-hour is the same as the State Standard of 20 and 9.0 parts per million, respectively.
SOURCE: TAHA, 2017.

[23]Consistent with CARB's vehicle emissions inventory.

MITIGATION MEASURES

AQ1 The City shall require all applicants to include in the agreements with contractors and subcontractors the following best management practices in contract specifications:

- Use properly tuned and maintained equipment.
- Contractors shall enforce the idling limit of five minutes as set forth in the California Code of Regulations.
- Use diesel-fueled construction equipment to be retrofitted with after treatment products (e.g., engine catalysts) to the extent they are readily available and feasible.
- Use heavy duty diesel-fueled equipment that uses low NO_X diesel fuel to the extent it is readily available and feasible.
- Use construction equipment that uses low polluting fuels (i.e., compressed natural gas, liquid petroleum gas, and unleaded gasoline) to the extent available and feasible.
- Maintain construction equipment in good operating condition to minimize air pollutants.
- Project applicants shall ensure that all construction equipment meets or exceeds equivalent emissions performance to that of U.S. Environmental Protection Agency (USEPA) Tier 4 standards for non-road engines. In the event that Tier 4 engines are not available for any off-road equipment larger than 100 horsepower, that equipment shall be equipped with a Tier 3 engine, or an engine that is equipped with retrofit controls to reduce exhaust emissions of nitrogen oxides and diesel particulate matter to no more than Tier 3 levels unless certified by engine manufacturers or the on-site air quality construction mitigation manager that the use of such devices is not practical for specific engine types. For purposes of this condition, the use of such devices is "not practical" for the following, as well as other, reasons:
  - There is no available retrofit control device that has been verified by either the CARB or USEPA to control the engine in question to Tier 3;
  - The construction equipment is intended to be on site for five days or less; or
  - Relief may be granted from this requirement if a good faith effort has been made to comply with this requirement and that compliance is not practical.

- The use of a retrofit control device may be terminated immediately, provided that a replacement for the equipment item in question meeting the required controls occurs within ten days of termination of the use, if the equipment would be needed to continue working at this site for more than 15 days after the use of the retrofit control device is terminated, if one of the following conditions exists:
  - The use of the retrofit control device is excessively reducing the normal availability of the construction equipment due to increased down time for maintenance, and/or reduced power output due to an excessive increase in back pressure;
  - The retrofit control device is causing or is reasonably expected to cause engine damage;
  - The retrofit control device is causing or is reasonably expected to cause a substantial risk to workers or the public; or
  - Any other seriously detrimental cause which has the approval of the project manager prior to implementation of the termination.

- Construction contractors shall use electricity from power poles rather than temporary gasoline or diesel power generators, as feasible.
- Use building materials, paints, sealants, mechanical equipment, and other materials that yield low air pollutants and are nontoxic.
- Construction contractors shall utilize super-compliant architectural coatings as defined by the South Coast Air Quality Management District (Volatile Organic Compound standard of less than ten grams per liter).
- Construction contractors shall utilize materials that do not require painting, as feasible.
- Construction contractors shall use pre-painted construction materials, as feasible.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Mitigation Measure **AQ1** would reduce regional and local emissions generated by various construction activities, including equipment operation, truck trips, and painting. However, a reduction in emissions below the SCAQMD significance thresholds cannot be demonstrated in the absence of specific project details to assess. It is reasonable to assume that a construction project within the Project Area could generate emissions that would exceed the significance thresholds despite Mitigation Measure **AQ1**. Therefore, construction activities associated with implementing the Proposed Project could result in a significant and unavoidable regional and localized construction impact related to violating an air quality standard and/or contributing substantially to an existing or projected air quality violation after mitigation. As discussed above, operational characteristics associated with implementing the Proposed Project would not result in a significant regional or localized air quality impact.

The 2015 With Project operational impact would be associated with VOC emissions from consumer products (e.g., cleaning compounds). The City cannot impose restrictions on the use of consumer products by the community within the ECTNP. The emissions estimate based on change in land use development patterns results in a theoretical calculated significant and unavoidable impact. The ECTNP cannot be fully implemented and all anticipated development constructed and occupied by 2015; therefore, this is a theoretical impact. This impact would not exist with the full implementation of the Proposed Project in 2035 as a result of decreased mobile source emissions associated with a more fuel-efficient vehicle fleet offsetting increases in consumer product emissions.

IMPACT 4.2-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXPOSE SENSITIVE RECEPTORS TO SUBSTANTIAL POLLUTANT CONCENTRATIONS? THIS IMPACT IS SIGNIFICANT AND UNAVOIDABLE.

Construction

The greatest potential for TAC emissions during construction would be diesel particulate emissions associated with heavy-duty equipment operations and truck traffic. According to SCAQMD methodology, health effects from carcinogenic air toxics are described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person continuously exposed to concentrations of TACs over a 70-year lifetime will contract cancer based on the use of standard risk assessment methodology. The SCAQMD has stated that the incremental cancer risk should not exceed 10 persons in one million, and the chronic and acute risks should not exceed a calculated Hazard Index value of 1.0. There is no specifically planned development as a part of this Proposed Project. There is no construction schedule or phasing, and it is difficult to accurately characterize emissions from the wide range of projects that may be constructed. Construction emissions were assessed as a new source and example projects were compared to the SCAQMD thresholds. Depending on the specifics of future development projects (i.e., diesel particulate emissions and sensitive receptor locations), it is anticipated that emissions from construction activities would exceed the health risk significance thresholds established by the SCAQMD. It is also likely that specific development projects constructed within the Project Area would have overlapping construction activities and combined emissions that exceed the thresholds. Therefore, without mitigation, the Proposed Project would result in a significant construction impact related to exposing people to substantial pollutant concentrations.

The significant construction emissions identified above could result in adverse health effects to sensitive receptors. Diesel exhaust causes health effects from both acute (short-term) exposures, and chronic (long-term) exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat and lungs, some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Chronic exposure to diesel exhaust in experimental animal inhalation studies have shown a range of dose-dependent lung inflammation and cellular changes in the lung and immunological effects. Based upon human and laboratory studies, there is

considerable evidence that diesel exhaust is a carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings.[24]

Construction activity within the Project Area is anticipated to occur adjacent to sensitive receptors (e.g., residences and schools). It is likely that intense construction projects (e.g., projects with a high volume of haul trucks) would exceed the health risk significance thresholds due to equipment and truck exhaust emissions. In response to the 2015 Health Risk Assessment (HRA) guidance issued by the OEHHA, the SCAQMD conducted extensive research into the types of construction projects that could potentially pose significant air quality impacts associated with exposure of sensitive receptors to substantial pollutant concentrations as a result of DPM emissions.[25] Through exercises in modeling the effects of emissions from construction sites on local air quality, the SCAQMD determined that releasing one pound per day of DPM during six months of construction could result in an exposure to toxic air exceeding the applicable risk threshold of 10 excess cancers per million. The magnitude of construction activity that could generate one pound of DPM per day is exemplified by the use of an excavator, a generator, a bulldozer, and a loader for 8 hours per day. This is considered a typical equipment inventory for in-fill construction projects anticipated under the Proposed Plan, and therefore, without mitigation, implementation of the Proposed Plan would result in a significant impact related to substantial pollutant concentrations during construction activities.

Operation

Residential and commercial (e.g., retail and restaurants) land uses typically do not generate TAC emissions that would expose people to substantial pollutant concentrations. Employment-related land uses anticipated in the Project Area include uses associated with 21st century clean-tech/high-tech industries, such as creative office, research and development, media, and technology, as well as some light manufacturing uses. The majority of these proposed land uses are not typically associated with TAC emissions. In addition, the use of toxic compounds by an employment-related use would be strictly regulated through the SCAQMD permitting process, which includes detailed health risk assessments, when applicable. This process would ensure that new land uses would not generate TAC emissions that exceed the SCAQMD significance thresholds at sensitive land uses.

As noted in the discussion of Existing Setting above, the population residing close to freeways or busy roadways may experience adverse health effects beyond those typically found in urban areas. Several studies found an association between adverse health effects (e.g., asthma) and living near heavily traveled urban roadways. Studies also found that the roadway and truck traffic densities were key factors affecting the strength of association with adverse health impacts. For urban roadways, the association of traffic-related emissions with adverse health impacts was generally strongest between 300 and 1,000 feet.[26] Within the Project Area, four of the five station areas, with the Westwood Station Area being the exception, include the potential for new residential land uses to be located within 1,000 feet of Interstate 405 or Interstate 10. These land uses could be exposed to substantial pollutant concentrations.

However, with respect to health risks from existing emissions sources, in the California Supreme Court *California Building Industry Association vs. Bay Area Air Quality Management District* (December 17, 2015), the Court held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project's

[24]USEPA, *Diesel Particulate Matter*, http://www.epa.gov/region1/eco/airtox/diesel.html.

[25]SCAQMD, *Special Meeting of the SCAQMD Governing Board, Agenda No. 8b Potential Impacts of New OEHHA Risk Guidelines on SCAQMD Programs,* http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2014/may-specsess-8b.pdf?sfvrsn=4, accessed December 21, 2016.

[26]SCAG, *2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*, December 2011.

impact on the environment – and not the environment's impact on the project – that compels an evaluation of how future residents or users could be affected by exacerbated conditions."

The Proposed Plan would not directly exacerbate any existing conditions. Assessing health risks from existing land uses equates to assessing the environment's impact on the project. The California Supreme Court ruled that this analysis would not be consistent with CEQA. In addition, new industrial sources of emissions are subject to SCAQMD Regulation XIII (New Source Review). Under this rule, hazardous facilities are legally subject to provisions that require public notice and modeling analysis to determine and, if necessary, mitigate, the downwind impact prior to permit issuance. Refer to Section 4.10, Land Use and Planning for additional discussion related to land use compatibility and existing conditions.

In addition, as discussed in the Regulatory Framework subsection above, the City recently adopted the Clean Up Green Up Ordinance, adding Sections 95.314.3 and 99.04.504.6 to the LAMC and amending Section 99.05.504.5.3 to implement building standards and requirements to address cumulative health impacts resulting from incompatible land use patterns. Section 95.314.3 defines unacceptable locations for obtaining outside or return air for heating or cooling air systems (e.g., a closet, bathroom, toilet room, or kitchen). Section 99.04.504.6 states that, "[i]n mechanically ventilated buildings within 1,000 feet of a freeway, provide regularly occupied areas of the building with air filtration media for outside and return air that provides a MERV of 13. Filters shall be installed prior to occupancy, and recommendations for maintenance with filters of the same value shall be included in the operation and maintenance manual." An exception is provided for existing mechanical equipment. Section 99.05.504.5.3 requires MERV 8 filters for mechanically ventilated buildings located farther than 1,000 feet from freeways. An exception is provided for existing mechanical equipment and for new ventilation units meeting certain 2013 California Energy Code requirements. In addition, PRC Section 21151.8 requires assessment of hazardous pollutants within 0.25 miles of a new elementary or secondary school. This legal requirement within the PRC protects staff and students of new schools from significant health risks from exposure to TACs.

Therefore, taking into consideration existing regulatory requirements, without mitigation the Proposed Project would result in less than significant operational impacts related to exposing sensitive receptors to substantial pollutant concentrations.

MITIGATION MEASURES

Mitigation Measure **AQ1** would address construction emissions.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Regarding exposure to construction emissions, Mitigation Measure **AQ1** would reduce TAC emissions generated by various construction activities, including equipment operation after mitigation. For example, Tier 4 engines with horsepower ratings between 175 and 750 generate 90 percent less exhaust emissions, including particulate matter, than Tier 2 or 3 engines.[27] Projects will additionally be required to comply with standards established by a variety of federal, state and regional regulations discussed in the regulatory framework. However, a reduction in emissions below the SCAQMD significance thresholds cannot be demonstrated in the absence of specific project details to assess. Therefore, this analysis concludes that a construction project within the Project Area could generate emissions that would exceed the significance thresholds, exposing sensitive receptors to substantial pollutant concentrations, despite Mitigation Measure **AQ1**. As such, this impact (construction) is determined to be significant and unavoidable.

With compliance with existing regulations, impacts related to sensitive receptor exposure to substantial pollutant concentrations for operation would be less than significant.

[27]USEPA, *Nonroad Diesel Engines General Information*, http://www.epa.gov/otaq/nonroad-diesel.htm#info, accessed October 16, 2016.

IMPACT 4.2-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE OBJECTIONABLE ODORS AFFECTING A SUBSTANTIAL NUMBER OF PEOPLE? THIS IMPACT IS LESS THAN SIGNIFICANT.

Construction

Potential sources that could emit odors during construction activities include equipment exhaust and paving and painting activities. Such odors are localized, generally confined to the immediate area surrounding a construction site and transitory in nature. In addition, odors associated with construction activities are not those typically associated with odor complaints. Construction projects within the Project Area would utilize typical construction techniques, and the odors would be typical of most construction sites and temporary duration. Construction activity would not cause a significant odor nuisance. Therefore, the Proposed Project would result in a less than significant impact related to construction odors.

Operation

According to the SCAQMD *CEQA Air Quality Handbook*, land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies and fiberglass molding. The Proposed Project does not include land uses that are typically associated with odor complaints. Therefore, the Proposed Project would result in a less than significant impact related to operational odors. For these same reasons, in addressing the City's odor threshold set forth above, it has been determined the project is not anticipated to create an objectionable odor at the nearest sensitive receptor. As such, this impact has also been determined to be less than significant.

MITIGATION MEASURES

Impacts related to odors would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to odors were determined to be less than significant without mitigation.

4.3 CULTURAL RESOURCES

This section provides an overview of cultural resources and evaluates the potential construction and operational impacts associated with the Proposed Project. Topics addressed include historical, archaeological, and paleontological resources, as well as human remains. The analysis of cultural resources is based on a review of historic, archaeological, and paleontological records searches. A paleontological records search was conducted for the Project Area by the Natural History Museum of Los Angeles County in April 2013. In addition, the following SurveyLA reports were utilized: *Historic Resources Survey Report: Palms-Mar Vista-Del Rey Community Plan Area* (prepared by Historic Resources Group, dated July 2012); *Historic Resources Survey Report: West Los Angeles Community Plan Area* (prepared by Sapphos Environmental, Inc., dated August 2012); and *Historic Resources Survey Report: West Adams-Baldwin Hills-Leimert Community Plan Area* (prepared by Architectural Resources Group, Inc., dated September 2012, revised July 2016). An archaeological records search was conducted by the South Central Coastal Information Center in October 2013. These reports are included in their entirety as **Appendix C**.

The Proposed Project is evaluated for its potential to indirectly or directly destroy, damage, or disturb historical, archaeological, and/or paleontological resources located within the ECTNP Area.

REGULATORY FRAMEWORK

Several levels of government maintain jurisdiction over historic resources. The framework for the identification and, in certain instances, protection of historic resources is established at the federal level, while the identification, documentation, and protection of such resources are often undertaken by state and local governments. The principal federal, state, and local laws governing and influencing the preservation of historic resources of national, state, and local significance include the National Historic Preservation Act (NHPA) of 1966, as amended; the California Environmental Quality Act (CEQA); the California Register of Historical Resources (California Register); Public Resources Code [PRC] Sections 5020.1, 5024 and 5024.1; the City of Los Angeles Cultural Heritage Ordinance (Los Angeles Administrative Code [LAAC] Section 22.171); and City of Los Angeles Historic Preservation Overlay Zone Ordinance (Los Angeles Municipal Code [LAMC] Section 12.20.3).

FEDERAL

National Historic Preservation Act (NHPA) of 1966. The NHPA was passed to preserve historical and archaeological sites from federal development. Cultural resources are considered during federal undertakings, primarily under NHPA Section 106. Section 106 requires federal agencies to take into account the effects of their undertakings on any district, site, building, structure, or object that is included in or eligible for inclusion in the National Register of Historic Places (National Register) and to afford the Advisory Council on Historic Preservation a reasonable opportunity to comment on such undertakings (36 Code of Federal Regulations [CFR] Part 800.1). Under Section 106, cultural resources must be identified and evaluated, and effects to historic properties must be reduced to acceptable levels through mitigation measures or agreements among consulting and interested parties.

National Register of Historic Places (National Register). The National Register was established by the NHPA as part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect the nation's historic and archaeological resources. The National Register recognizes properties that are significant at the national, state, and/or local levels. Although administered by the National Park Service, the federal regulations explicitly provide that National Register listing of private property "does not prohibit under federal law or regulation any actions which may otherwise be taken by the property owner with respect to the property." Listing in the National Register assists in preservation of historic properties

through: recognition that a property is of significance to the nation, the state, or the community; consideration in the planning for federal or federally-assisted projects; eligibility for federal tax benefits; consideration in the decision to issue a surface coal mining permit; and qualification for federal assistance for historic preservation, when funds are available. In addition, for projects that receive federal funding, a clearance process must be completed in accordance with Section 106 of the NHPA. Furthermore, state and local regulations may apply to properties listed in the National Register.

To be considered eligible for listing in the National Register, buildings, objects, sites, districts, or structures must meet any or all the following criteria:

A. Associated with events that have made a significant contribution to the broad patterns of our history.
B. Associated with the lives of persons significant in our past.
C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.
D. Yield, or may be likely to yield, information important in prehistory or history.

In addition to meeting any or all of the above criteria, properties must also possess integrity of location, design, setting, feeling, workmanship, association, and materials.

Historic integrity is the ability of a property to convey its significance and is defined as "the authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."

The National Register recognizes seven aspects or qualities that comprise integrity: location, design, setting, materials, workmanship, feeling, and association. These qualities are defined as follows:

- Location is the place where the historic property was constructed or the place where the historic event occurred;
- Design is the combination of elements that create the form, plan, space, structure, and style of a property;
- Setting is the physical environment of a historic property;
- Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property;
- Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory;
- Feeling is a property's expression of the aesthetic or historic sense of a particular period of time; and
- Association is the direct link between an important historic event or person and a historic property.

In assessing a property's integrity, the National Register criteria recognize that properties change over time. In this regard, National Register Bulletin 15 indicates:

> *"To retain historic integrity a property will always possess several, and usually most, of the aspects. The retention of Specific aspects of integrity is paramount for a property to convey its significance.*
>
> *It is not necessary for a property to retain all its historic physical features or characteristics. The property must retain, however, the essential physical features that enable it to convey its historic identity.*
>
> *A property that has lost some historic materials or details can be eligible if it retains the majority of the features that illustrate its style in terms of the massing, spatial relationships, proportion, pattern of windows and doors, texture of materials, and ornamentation. The property is not eligible, however, if it retains some basic features conveying massing but has lost the majority of the features that once characterized its style."*

For properties that are considered significant under National Register Criteria A and B, National Register Bulletin 15 indicates:

> *"A property that is significant for its historic association is eligible if it retains the essential physical features that made up its character or appearance during the period of its association with the important event, historical pattern, or person(s).*
>
> *A property important for illustrating a particular architectural style or construction technique must retain most of the physical features that constitute that style or technique."*

Archaeological Resources Protection Act (ARPA). The ARPA applies when a project may involve archaeological resources located on federal or tribal land. ARPA requires that a permit be obtained before excavation of an archaeological resource on such land can take place.

The American Indian Religious Freedom Act (AIRFA). The AIRFA proclaims that the U.S. Government will respect and protect the rights of Indian tribes to the free exercise of their traditional religions; the courts have interpreted this as requiring agencies to consider the effects of their actions on traditional religious practices.

Native American Graves Protection and Repatriation Act of 1990 (NAGPRA). The NAGPRA requires federal agencies and federally assisted museums to return "Native American cultural items" to the federally recognized Indian tribes or Native Hawaiian groups with which they are associated. If Native American human remains are discovered, compliance with the following provisions would be required (43 CFR Part 10):

- Notify, in writing, the responsible federal agency;
- Cease activity in the area of discovery and protect the human remains;
- Certify receipt of the notification;
- Take steps to secure and protect the remains;
- Notify the Native American tribes or tribes likely to be culturally affiliated with the discovered human remains within one working day; and
- Initiate consultation with the Native American tribe or tribes in accordance with regulations described in 43 CFR, Part 10, Subpart B, Section 10.5.

STATE

Office of Historic Preservation (OHP). As an office of the California Department of Parks and Recreation, the OHP implements the policies of the NHPA on a statewide level. The OHP also carries out the duties set forth in the PRC and maintains the California Historic Resources Inventory.

The State Historic Preservation Officer (SHPO) is an appointed official who implements historic preservation programs within the state's jurisdiction. Also, implemented at the state level, CEQA requires projects to identify any substantial adverse impacts that may affect the significance of identified historical resources.

California Register of Historical Resources (California Register). The California Register is "an authoritative listing and guide to be used by state and local agencies, private groups, and citizens in identifying the existing historical resources of the state and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change."[1] The criteria for eligibility for the California Register are based upon National Register criteria. These criteria are:

- **Criterion 1**: Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California of the United States;
- **Criterion 2**: Associated with the lives of persons important to local, California or national history;

[1]California Public Resources Code Section 50241(e).

- **Criterion 3**: Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; and
- **Criterion 4**: Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

The California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register (Category 1 in the State Inventory of Historical Resources) and those formally Determined Eligible for listing in the National Register (Category 2 in the State Inventory of Historical Resources);
- California Registered Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the OHP and have been recommended to the State Historical Resources Commission for inclusion in the California Register.

Other resources which may be nominated for listing in the California Register include:

- Historical resources with a significance rating of Categories 3 through 5 in the State Inventory of Historical Resources (Categories 3 and 4 refer to potential eligibility for the National Register, while Category 5 indicates a property with local significance);
- Individual historical resources;
- Historical resources contributing to historic districts; and
- Historical resources designated or listed as a local landmark.

Additionally, a historic resource eligible for listing in the California Register must meet one or more of the criteria of significance described above and retain enough of its historic character or appearance to be recognizable as a historic resource and to convey the reasons for its significance. Historical resources that have been rehabilitated or restored may be evaluated for listing.

California Penal Code Section 622.5. California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

California Public Resources Code (PRC) Sections 5020.1, 5024 and 5024.5. PRC Section 5020.1 provides definitions associated with historic resources. PRC Section 5020.1(h) defines a historic district as "a definable unified geographic entity that possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." PRC Section 5020.1(j) defines a historical resource as "any object, building, structure, site, area, place, record, manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California." PRC Section 5020.1(p) defines State Historic Resources Inventory as "the compilation of all identified, evaluated, and determined historical resources maintained by the office and specifically those resources evaluated in historical resource surveys conducted in accordance with criteria established by the office, formally determined eligible for, or listed in, the National Register of Historic Places, or designated as historical landmarks or points of historical interest." Section 5020.1(q) defines substantial adverse change to a historic resource as "demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

The California State Legislature enacted PRC Sections 5024 and 5024.5 as part of a larger effort to establish a state program to preserve historical resources. These sections require state agencies to take a number of actions to ensure preservation of state-owned historical resources under their jurisdictions. These actions

include evaluating resources for National Register eligibility and California Historical Landmark (California Landmark) eligibility; maintaining an inventory of eligible and listed resources; and managing these historical resources so that that they will retain their historic characteristics.

PRC Sections 5097.5, 5097.9, and 5097.98-99. PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that:

> *No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.*

PRC Section 5097.9 establishes the California Native American Heritage Commission (NAHC) to make recommendations to encourage private property owners to protect and preserve sacred places in a natural state and to allow appropriate access to Native Americans for ceremonial or spiritual activities. NAHC is authorized to assist Native Americans in obtaining appropriate access to sacred places on public lands, and to aid state agencies in any negotiations with federal agencies for the protection of Native American sacred places on federally administered lands in California.

PRC Sections 5097.98-99 require that the NAHC be consulted whenever Native American graves are found. According to these sections, it is illegal to take or possess remains or artifacts taken from Native American graves; however, it does not apply to materials taken before 1984.

California Environmental Quality Act (CEQA). Under CEQA, a "project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment."[2] This statutory standard involves a two-part inquiry. The first involves a determination of whether the project involves a historic resource. If so, then the second part involves determining whether the project may involve a "substantial adverse change in the significance" of the resource. To address these issues, guidelines that implement the 1992 statutory amendments relating to historical resources were adopted in final form on October 26, 1998 with the addition of CEQA Guidelines Section 15064.5. CEQA Guidelines Section 15064.5, as well as PRC Section 21084.1 provide that for the purposes of CEQA compliance, the term "historical resources" shall include the following:[3]

- A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register;
- A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements in PRC Section 5024.1(g), shall be presumed to be historically or culturally significant. Public agencies must treat such resources as significant for purposes of CEQA unless the preponderance of evidence demonstrates that it is not historically or culturally significant;
- Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets one of the criteria for listing on the California Register; and

[2]California Public Resources Code Section 21084.1.
[3]California Code of Regulation, Title 14, Section 15064.f(e).

- The fact that a resource is not listed in, or determined to be eligible for listing in the California Register, not included in a local register of historical resources (pursuant to PRC Section 5020.1(k)), or identified in a historical resources survey (meeting the criteria in PRC Section 5024.1(g)) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

Section 15064.5 of the CEQA Guidelines also provides that "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired."[4] Material impairment occurs when a project alters or demolishes in an adverse manner "those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion" in a state or local historic registry.[5]

California Health and Safety Code Sections 7050.5. California Health and Safety Code Section 7050.5(b) specifies protocol when human remains are discovered. The Code states:

> *In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of section 27492 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in PRC Section 5097.98.*

Senate Bill (SB) 18. As of March 1, 2005, SB 18 (Government Code Sections 65352.3 and 65352.4) requires that, prior to the adoption or amendment of a general plan proposed on or after March 1, 2005, a city or county must consult with Native American tribes with respect to the possible preservation of, or the mitigation of impacts to, specified Native American places, features, and objects located within that jurisdiction.

Assembly Bill (AB) 52. AB 52 establishes that a project with a significant impact on tribal resources is a significant effect on the environment. [6] AB 52 also requires that a lead agency consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a proposed project prior to the determination of whether a negative declaration, mitigated negative declaration, or an environmental impact report is required for a project. Furthermore, it provides examples of mitigation measures that may be considered to mitigate any impact. These provisions are applicable to projects that have a notice of preparation (NOP) for an environmental impact report or a notice of negative declaration or mitigated negative declaration filed on or after July 1, 2015. AB 52 also established a definition for "tribal cultural resources" which is codified in PRC Section 21074. In addition, AB 52 directed the Governor's Office of Planning and Research and the Secretary of the Natural Resources Agency to certify and adopt revisions to the CEQA Guidelines that update Appendix G to add consideration of tribal cultural resources. This update to Appendix G was approved on September 27, 2016.

[4]California Code of Regulations, Title 14, Section 15064.5(b)(1).
[5]California Code of Regulations, Title 14 Section 15064.5(b)(2)(A-C).
[6]Assembly Bill (AB 52) amended Public Resources Code Section 5097.94, and added Public Resources Code Sections 1073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3.

LOCAL

City of Los Angeles General Plan Conservation Element (1991). The City of Los Angeles General Plan contains growth and development policies that reflect a comprehensive long-range view of the City as a whole. The General Plan provides a comprehensive strategy for accommodating long-term growth should it occur as projected. Applicable goals, objectives, and policies that apply to all development within the City of Los Angeles include a balanced distribution of land uses, adequate housing for all income levels, and economic stability. The Conservation Element of the General Plan consists of an identification and analysis of the existing natural and historic resources in the City of Los Angeles. Policies of the Conservation Element include the preservation of resources of historical, archaeological, and paleontological significance. Any proposed development plan must consider the potential for encountering and preserving these cultural resources. Goals, objectives, and policies from the Conservation Element related to paleontological, archeological, and historical resources are listed below in **Table 4.3-1**.

TABLE 4.3-1: RELEVANT GENERAL PLAN CULTURAL RESOURCES GOALS, OBJECTIVES, AND POLICIES

CONSERVATION ELEMENT – ARCHAEOLOGICAL AND PALEONTOLOGICAL	
Objective	Protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.
Policy	Continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition or property modification activities.
CONSERVATION ELEMENT – CULTURAL AND HISTORICAL	
Objective	Protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.
Policy	Continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition or property modification activities.
SOURCE: City of Los Angeles General Plan, *Conservation Element*, adopted September 2001.	

City of Los Angeles Cultural Heritage Ordinance (LAAC Section 22.171). The City's Cultural Heritage Ordinance was first adopted by the Los Angeles City Council in 1962 and has since been amended several times. The provisions of the Cultural Heritage Ordinance are codified in Division 22, Chapter 9, Article 1 of the LAAC, commencing with Section 22.171. The Ordinance created a Cultural Heritage Commission and criteria for designating Historic-Cultural Monuments (HCMs). The Commission comprise of five citizens, appointed by the Mayor, who have exhibited a knowledge of Los Angeles' history, culture and architecture. Any interested party may apply for a proposed designation of an HCM. Section 22.171.7 of the LAAC states that a historical or cultural monument is:

> *Any site (including significant trees or other plant life located on the site), building, or structure of particular historic or cultural significance to the City of Los Angeles, including historic structures or sites in which the broad cultural, economic or social history of the nation, state, or community is reflected or exemplified or which is identified with historic personages or with important events in the main currents of national, state, or local history; or which embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction; or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.*

Each nomination is reviewed by the Commission, then by the Planning and Land Use Management Committee of the City Council, and the City Council as a whole. Once a property has been designated a Monument, the Commission and its staff review permits for alteration, relocation, or demolition. The Commission can delay demolition of a monument for 180 days and has the authority to recommend to the City Council to delay demolition for another 180 days. Locally designated cultural resources are presumed to be historically significant under CEQA. Therefore, demolition and/or alterations of HCMs are subject to review under CEQA.

City of Los Angeles Historic Preservation Overlay Zone Ordinance (LAMC Section 12.20.3). The City of Los Angeles Ordinance Number 175891, found in Section 12.20.3 of the LAMC, describes the procedures for creation of new Historic Preservation Overlay Zones (HPOZs), the powers and duties of HPOZ Boards, and the review processes for projects within HPOZs. This Ordinance was adopted by the Los Angeles City Council on March 19, 2004, and became effective on May 12, 2004. This Ordinance is intended to recognize, preserve, and enhance buildings, structures, landscaping, natural features, and areas within the City having historic, architectural, cultural or aesthetic significance in the interest of the health, economic prosperity, cultural enrichment and general welfare of the people. The ordinance describes the procedures for the creation of new HPOZs, the powers and duties of HPOZ Boards, and the review processes for projects within HPOZs.

As required by this Ordinance, the construction, addition, demolition, reconstruction, alteration, removal, or relocation of any publicly or privately owned building, structure, landscaping, natural feature, lot, street features, furniture or fixtures within a HPOZ identified as a contributing element in the historic resources survey for the zone must obtain a certificate of appropriateness by the Director of the City's Department of City Planning (DCP) or Area Planning Commission. The determination to approve, conditionally approve or disapprove of a certificate of appropriateness for construction, addition, alteration or reconstruction is based on the project's conformance to the HPOZ's Preservation Plan, compliance with the United States Secretary of Interior's Standards of Rehabilitation, if no Preservation Plan exists, and whether the project protects and preserves the historic and architectural qualities and the physical characteristics which make the building, structure, landscape, or natural feature a contributing element of the preservation zone. Any person proposing to demolish, remove or relocate any contributing building, structure, landscaping, or natural feature within a preservation zone not qualifying as conforming work on contributing elements shall apply for a certificate of appropriateness and must conduct appropriate environmental review. No certificate of appropriateness shall be issued to demolish, remove or relocate any building, structure, landscaping, natural feature or lot within a HPOZ that is designated as a contributing element unless it can be demonstrated that the owner would be deprived of all economically viable use of the property.

Los Angeles Municipal Code (LAMC) Article 1 Chapter IX Section 91.106.4.5. All building permits on sites designated as historic at the local, state, or federal level must be reviewed by the Department of Building and Safety to determine whether the project will result in the loss of, or serious damage to, a significant historical or cultural asset. Section 91.106.4.5 states that the City's Department of Building and Safety "shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register, or has been included on the City of Los Angeles list of HCMs, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset."

If it is determined that loss or damage to an historic resource could occur, the project applicant is required to conduct a CEQA analysis to determine if the impact is significant, and the City's Department of Building and Safety may not issue a permit without first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure."

LAMC Article 1 Chapter IX Section 91.106.4.5.1. Permits for the demolition of a building over 45 years old will not be issued unless abutting properties owners and the Council Office are notified in writing and a public notice of application for demolition has been posted at the site at least 30 days prior to the date of issuance.

City of Los Angeles Cultural Heritage Master Plan (2000). The City of Los Angeles Cultural Affairs Department developed a Cultural Heritage Master Plan, adopted by the City Council in 2000. The Master Plan contains numerous important policy recommendations on historic preservation in City of Los Angeles, many of which have shaped the creation and early work of the Office of Historic Resources (OHR).

City of Los Angeles Community Plans. The ECTNP Area traverses through portions of the West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles Community Plan Areas. Goals, objectives, and policies that are directly and indirectly related to cultural resources are presented in **Table 4.3-2**.

TABLE 4.3-2: EXISTING COMMUNITY PLAN CULTURAL RESOURCES GOALS, OBJECTIVES, AND POLICIES

WEST ADAMS-BALDWIN HILLS-LEIMERT COMMUNITY PLAN	
Goal LU 68	A community that recognizes its historic and cultural heritage by encouraging continued designation, preservation and restoration of the monuments, cultural resources, neighborhoods and landmarks of the area for the benefit of future generations.
Policy LU 68-1	Celebrate Designated Historic and Cultural Monuments. Continue to identify and celebrate all designated City of Los Angeles Historic and Cultural Monuments within the West Adams-Baldwin Hills-Leimert Community Plan Area as a means to foster public appreciation of the area's invaluable historic resources and to promote civic pride in preserving Los Angeles' historic past.
Policy LU 68-2	Protect Historic Resources. Continue efforts to protect, preserve, maintain and appropriately enhance the Community Plan Area's significant cultural and historical resources.
Policy LU 68-3	Identify Future Resources. Promote the survey and identification of buildings and places with unique architectural and historical significance.
Goal LU 69	A community where careful consideration of applicable preservation criteria is encouraged when reviewing projects affecting designated and eligible historic resources.
Policy LU 69-1	Apply Preservation Standards. Apply the Secretary of the Interior's Standards for the Treatment of Historic Properties to all projects that affect designated historic resources.
Policy LU 69-2	Ensure CEQA Review of Eligible Resources. Continue careful review pursuant to the California Environmental Quality Act (CEQA) regarding project proposals affecting resources identified through the Los Angeles Historic Resources Survey (Survey LA) as eligible for historic designation.
Policy LU 69-3	Evaluate Potential Significance. Consult with the Office of Historic Resources regarding projects that require environmental review in order to adequately evaluate the potential significance of buildings 45 years of age or more.
Goal LU 70	A community where new Historic Preservation Overlay Zones (HPOZ) are initiated and adopted for neighborhoods that have been identified and/or appear to be eligible for historic district status.
Policy LU 70-1	Support the continued progress in the district designation, as well as maintenance and rehabilitation of structures of historic significance in the Victoria Park, Leimert Park, Arlington Heights, Wellington Square and other potential and proposed historic districts.
Goal LU 71	A community that protects and enhances historic and architectural resources in commercial areas in a manner that will encourage context sensitive revitalization and investment in these areas.
Policy LU 71-1	Façade Restoration. Encourage the preservation, conservation, rehabilitation and adaptive reuse of existing buildings in commercial areas through the restoration of original facades and the design of new construction which complements the old in a harmonious fashion that enhances the prevailing historic pattern of development.
Goal LU 73	A community where the contribution of existing cultural resources is enhanced and capitalized upon.
Policy LU 73-1	Promote Community Awareness. Promote community awareness of cultural amenities by implementing the City's Cultural Master Plan and the Cultural Heritage Master Plan.
PALMS-MAR VISTA-DEL REY COMMUNITY PLAN	
Goal 17	Preservation and restoration of cultural resources neighborhoods and landmarks which have historical and/or cultural significance.
Objective 17-1	To ensure that the Community's historically significant resources are protected, preserved and/or enhanced.
Policy 17-1.1	Encourage the preservation, maintenance, enhancement and reuse of existing historic buildings and the restoration of original façades.
Objective 17-2	To preserve and enhance neighborhoods with a distinctive and significant historical character.
WEST LOS ANGELES COMMUNITY PLAN	
Goal 17	Preservation and restoration of cultural resources neighborhoods and landmarks which have historical and/or cultural significance.
Objective 17-1	To ensure that the Community's historically significant resources are protected, preserved and/or enhanced.
Policy 17-1.1	Encourage the preservation, maintenance, enhancement and reuse of existing historic buildings and the restoration of original façades.
Objective 17-2	To preserve and enhance neighborhoods with a distinctive and significant historical character.

NOTE: Other goals, policies, or objectives in these Plans may also be related to Cultural Resources.

SurveyLA. SurveyLA, the Los Angeles Historic Resources Survey, is a program of the City of Los Angeles that identifies and documents significant historic resources throughout each of the City's 35 Community Plan Areas.[7] While these historic resources are evaluated for significance and eligibility for historical designation through this survey, it does not designate or protect identified sites and/or properties. Designation at the federal, state, or local levels would require additional review through each respective designation process.

EXISTING SETTING

HISTORICAL RESOURCES

The following historical resources discussion is based on SurveyLA historic resources reports completed for the West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles Community Plan Areas. The northeastern portion of the ECTNP Area falls within the West Adams-Baldwin Hills-Leimert Community Plan Area. The southern portion falls within the Palms-Mar Vista-Del Rey Community Plan Area, and the northern portion falls within the West Los Angeles Community Plan Area.

West Adams-Baldwin Hills-Leimert Community Plan Area. Before the Spaniards arrived, this area was inhabited by the Gabrielino or Tongva Native American people. The first Spanish settlement in this area occurred nearly half a century after the founding of the original pueblo of Los Angeles in 1781. The Sanchez and Higuera families were the first Spanish settlers in the area and used the land primarily for growing grain and grapes, and raising cattle. After Mexico gained its independence from the Spanish Empire in 1821, jurisdiction over these Spanish territories was transferred to Mexico.

During the real estate boom of the 1880s, many of the large ranchos were split into smaller properties and sold. In 1875, the Santa Monica section of the Los Angeles and Independence Railroad (LA&I) Line was completed, extending from a wharf north of the current Santa Monica Pier to the LA&I San Pedro Street Depot in Downtown Los Angeles. Other local rail lines further extended the network, thereby facilitating continued growth within the West Adams-Baldwin Hills-Leimert Community Plan Area. The Crenshaw Corridor, in particular, benefitted from the transportation network, and commercial development boomed.

Commercial property types are commonly found on the large thoroughfares that run east-west and north-south throughout the area, including the ECTNP Area. Commercial buildings that are recorded individually in the survey are typically exemplary of the property type or a particular style; these examples included banks, department stores, car washes and service stations, and movie theaters.

The surrounding area has a number of institutional property types that serve the local residential communities. Institutional properties that are commonly eligible for historic designation include churches, schools, and government buildings, such as Los Angeles Department of Water and Power (LADWP) facilities, post offices, and fire stations. Nearly all are individually eligible as exemplary of the property type and their representative architectural style. Finally, a number of non-parcel resources are identified in this area. These include air raid sirens, historic street lamps, and individual single-specimen trees.

Palms-Mar Vista-Del Rey Community Plan Area. The Palms-Mar Vista-Del Rey Community Area started developing during the 1880s with the advent of the railroad. In 1886, a triangular tract bounded by Washington Boulevard, Overland Avenue, and Manning Avenue was subdivided, a school district organized, and a town named Palms was incorporated. In 1904, an area called Ocean Park Heights changed its name to Mar Vista to avoid confusion with its neighbor Ocean Park, which later became Venice. In 1927, Del Rey, known as Barnes City, which was the winter quarters of the Barnes circus, was incorporated into the City of Los Angeles. The Palms-Mar Vista-Del Rey Community was devoted largely to bean fields and truck gardening until the 1920s. Much of the area was subdivided in 1928 as part of the largest subdivision in Los Angeles City history.

[7] Please see **Appendix C** for a discussion of the SurveyLA Methodology.

Rapid growth continued into the 1940s when jobs in nearby defense and aircraft industries made the area a desirable place to live. By mid-1950s, the single-family homes started to convert to higher density multi-family dwelling units to accommodate the population growth. Through the 1970s, the area was considered a "bedroom community," which served the aerospace industry.

Palms-Mar Vista-Del Rey remains primarily a residential community; however, it does contain a variety of historical-cultural resources and services. The Venice Japanese Community Center on Braddock Drive serves the Japanese-American Community, which has resided adjacent to Centinela Avenue since the 1920s.

The Ivy Substation, a cultural landmark located at 9015 Venice Boulevard, was completed in July 1907, to provide power for the expanding system of the Los Angeles Pacific Railway. This landmark is located within the ECTNP approximately one quarter-mile from the Culver City Station. The landmark is a renovated former switching station for the Red Cars, located in the Community Plan Area and leased to the City of Culver City for 50 years, according to the Palms-Mar Vista-Del Rey Community Plan, last updated in September 1997. The Ivy Substation now houses community events and theatrical presentations and it could serve as a focal point for both communities in maintaining interest and pedestrian traffic.

SurveyLA identified a number of intact single-family houses, primarily dating from the first two decades of the 20th century, which represent the area's earliest phase of residential development. A number of examples of commercial properties exist, constructed between the 1920s and the 1950s, primarily serving adjacent residential neighborhoods. SurveyLA also identified one example of a Los Angeles Unified School District school building constructed following the 1933 Long Beach Earthquake. Isolated examples of government service and public utility buildings were identified, including LADWP distributing and receiving stations, a post-World War II fire station, and a former post office. In addition, several properties were identified for their architectural merit, including a Spanish Colonial Revival church, a Late Modern school, and a Googie-style bowling alley.

The following historic districts, planning districts, and multi-property resources were identified as meeting eligibility standards and criteria for the National Register, California Register, and/or local listing by the SurveyLA report:

- Barrington Multi-Family Residential Historical District
- Colonial Corners Commercial Historical District
- "The Oval" Planning District
- Golden State Water Company (located at 11607 Charnock Road)
- Mar Vista Gardens
- Palm Gardens Garden Apartment
- Palms Elementary School
- Sepulveda Rose Apartments
- Short Avenue Elementary School
- Villa Marina Apartments
- Westdale Residential Planning District

The list also includes other planning districts, which do not meet eligibility standards and criteria for listing and are not subject to CEQA or the NHPA, but may warrant special consideration for local planning purposes.

West Los Angeles Community Plan Area. Prior to the arrival of Spanish explorers in 1769, members of the group historically known as the Gabrieleño tribe occupied the vast territory that comprises the present-day range of metropolitan Los Angeles. The Sawtelle neighborhood, which occupies the Community Plan Area's westernmost portion, is the only neighborhood in the Community Plan Area that was an incorporated city prior to its consolidation with the City of Los Angeles in 1922.

In West Los Angeles, streetcars played an important role in the early development of the Sawtelle area with its interurban line. In 1904, the National Home for Disabled Volunteer Soldiers became a stop on the Pacific Electric "Balloon Route," a tourist excursion trolley that covered a balloon-shaped loop of Los Angeles attractions. In other parts of the Community Plan Area, however, development patterns clearly reflect automobile influences, as evidenced by the numerous low-density single-family residential tracts located in its hilly eastern portion that were developed beginning in the 1920s. The evolution of Pico Boulevard, a narrow dirt road that was paved in 1926, indicates the development that occurred in the area during the mid-1920s.

With its expanses of open land consisting of level agricultural fields and pastoral hills, West Los Angeles was poised for residential development in the early years of the 20th century. A combination of factors contributed to the area's desirability among individuals with middle-class and upper-middle-class incomes, including the development of the University of California's Los Angeles campus in nearby Westwood (opened in 1929), the charms of beach accessible living in adjacent Santa Monica and Venice, and the local entertainment industry presence.

During the 1920s, large residential tracts were developed by several of Los Angeles' key community builders, including the Janss Investment Company, Frank Meline, Frans Nelson, and Ole Hansen, who recognized the opportunity in the relatively cheap land and the pressing demand for single-family homes.

The entertainment industry has a long-standing association with West Los Angeles. Fox Studios (now Twentieth Century Fox), one of Los Angeles' "Big Eight" major motion picture studios, established its West Los Angeles operations in 1928 on a large open tract that had been previously used as a "ranch" set location in silent-era films for Hollywood cowboy movie star Tom Mix. The presence of the studio contributed to the area's "Hollywood" cachet, as well as its residential development by providing employment, which, in turn, furthered the need for local housing.

Today, most of the land uses surrounding the ECTNP Area consist of a wide range of residential, commercial and institutional resource types that represent a range of historic contexts and themes. A small number of intact residential properties, typically single-family dwellings and duplexes in the Craftsman style, which date from approximately 1905 to 1922, were identified for their association with the City of Sawtelle prior to its consolidation with the City of Los Angeles in 1922. The survey also identified several single-family residential subdivisions within the survey area that date generally from the 1920s to the 1950s. Built by several of the most notable developers working in Los Angeles during this period, these residential subdivisions maximized the use of local topography and offered residents deep lots with consistent setbacks, tree-lined streets, ornamental street lights, and, in some cases, small parks and parkways. Several notable examples of multi-family residential properties were also identified as significant for their representative architectural styles. One multi-family historic district, the Smithwood Edris Multi-Family Historic District, was identified in the survey area.

The surrounding area has significant examples of residential properties dating from the 1920s through the 1960s that were identified for their architectural merit. Architectural styles recorded represent Spanish Colonial Revival, Tudor Revival, Late American Colonial Revival, Mid-Century Modernism, and Late Modern Residential. Several of these properties reflect the work of noted architects from the post–World War II period, including A. Quincy Jones, Ray Kappe, Carl Marston, and I.M. Pei.

SurveyLA identified numerous examples of commercial property types, constructed from the 1920s to the 1960s, which serve the needs of adjacent residential neighborhoods. Typically located along major commercial corridors, examples include small retail businesses as well as isolated examples of neighborhood theaters, restaurants, a car wash, and a department store. Many of these businesses have remained in continuous operation since they were established decades ago. Examples of commercial signage were also identified. Commercial properties in the survey area reflect a variety of architectural styles, including Mid-

Century Modernism, Corporate International, New Formalism, High Tech (Structural Expressionism), and Brutalism. High-rise examples of commercial properties were identified in Century City.

Additionally, SurveyLA identified several examples of institutional property types with educational, religious, civic, and recreational functions, including schools, fraternal clubs, municipal fire stations, a LADWP distribution station, and recreational facilities in the surrounding area. Although not located within the ECTNP, several institutional properties were also recorded as excellent examples of their style, which included Mediterranean Revival, Spanish Colonial Revival, and Mid-Century Modernism. One local branch civic administrative center, the West Los Angeles Civic Center, was identified as a historic district. A school from the pre-consolidation period of the City of Sawtelle was also identified. Two designed landscapes located in the western portion of the Community Plan Area were identified under the Cultural Landscapes Context: a Japanese style garden and a small park.

The ECTNP Area does not fall within any City of Los Angeles HPOZs, as shown in **Figure 4.3-1**. The nearest HPOZs are the Gregory Ain Mar Vista Tract and the South Carthay Tract. The Gregory Ain Mar Vista Tract is located approximately two miles south of the western portion of the ECTNP Area and the South Carthay Tract is located approximately two miles north of the eastern portion of the ECTNP Area.

Two City-designated HCMs are located in the ECTNP Area. The Ivy Park Substation is located south of the Culver City Station and the Lawrence and Martha Joseph Residence and Apartments are located south of the proposed Palms Station Area. The Moreton Bay Fig Tree, also a City-designated HCM, is located just outside the south central portion of the ECTNP Area.

HISTORIC RESOURCES RECORDS SEARCH RESULTS

Records from the South Central Coastal Information Center, the California Historic Resources Inventory, and SurveyLA reports for the three community plan areas, in which the Project Area is located, were reviewed to identify potentially historic resources in the Project Area. Numerous properties were found to have been evaluated for historical significance within a quarter-mile radius of the Project Area. SurveyLA identifies individual resources, potentially historic districts, and non-parcel cultural resources, such as landscapes and public art that may be eligible for the National Register, California Register, and/or HCM Status. These properties and their eligibility statuses are listed in **Table 4.3-3** and shown in **Figure 4.3-1**. As shown in **Table 4.3-3**, three properties are listed in the National Register or California Register. The Washington Building was commissioned by Charles E. Lindblade, who was a business associate of the City of Culver City's founder, Harry H. Culver. This building was constructed during Lindblade's most notable years, professionally, when he and Culver actively developed Culver City. The Washington Building reportedly cost $30,000 at construction. Its triangular shape earned its nickname "The Flatiron Building" although it is only two stories tall unlike the famous tall one in New York. The structure occupies 135 feet of Washington Boulevard frontage, stretching 152 feet along Culver Boulevard. The two long sides converge to a flattened east wall of 12 feet (where Starbucks is located), while the west wall measures 68 feet wide. In 1931, the Washington Building housed the local post office until the Gateway Station was completed down the street in 1940. The Washington Building was awarded Landmark status by the City of Culver City, which protects and preserves its exterior.[8]

The Citizen Publishing Company Building, which was the home of a weekly community newspaper, has won national recognition and numerous editorial and typographical awards of excellence. Its publisher's (Eugene Donovan) editorial policies and social involvements yielded him a major role in the civic life of Culver City over a period of more than 20 years. The newspaper was also known for the substantial scope of its printing activities and its noteworthy associations with the Southern California film industry.[9]

California Historical Resource Status Codes

Properties Listed in the National Register (NR) or the California Register (CR)

1D Contributor to a district or multiple resource property listed in NR by the Keeper. Listed in the CR.
1S Individual property listed in NR by the Keeper. Listed in the CR.
1CD Listed in the CR as a contributor to a district or multiple resource property by the SHRC.
1CS Listed in the CR as individual property by the SHRC.
1CL Automatically listed in the California Register – Includes State Historical Landmarks 770 and above and Points of Historical Interest nominated after December 1997 and recommended for listing by the SHRC.

Properties Determined Eligible for Listing in the National Register (NR) or the California Register (CR)

2B Determined eligible for NR as an individual property and as a contributor to an eligible district in a federal regulatory process. Listed in the CR.
2D Contributor to a district determined eligible for NR by the Keeper. Listed in the CR.
2D2 Contributor to a district determined eligible for NR by consensus through Section 106 process. Listed in the CR.
2D3 Contributor to a district determined eligible for NR by Part I Tax Certification. Listed in the CR.
2D4 Contributor to a district determined eligible for NR pursuant to Section 106 without review by SHPO. Listed in the CR.
2S Individual property determined eligible for NR by the Keeper. Listed in the CR.
2S2 Individual property determined eligible for NR by a consensus through Section 106 process. Listed in the CR.
2S3 Individual property determined eligible for NR by Part I Tax Certification. Listed in the CR.
2S4 Individual property determined eligible for NR pursuant to Section 106 without review by SHPO. Listed in the CR.
2CB Determined eligible for CR as an individual property and as a contributor to an eligible district by the SHRC. Contributor to a district determined eligible for listing in the CR by the SHRC.
2CS Individual property determined eligible for listing in the CR by the SHRC.

Appears Eligible for National Register (NR) or California Register (CR) through Survey Evaluation

3B Appears eligible for NR both individually and as a contributor to a NR eligible district through survey evaluation.
3D Appears eligible for NR as a contributor to a NR eligible district through survey evaluation.
3S Appears eligible for NR as an individual property through survey evaluation.
3CB Appears eligible for CR both individually and as a contributor to a CR eligible district through a survey evaluation.
3CD Appears eligible for CR as a contributor to a CR eligible district through a survey evaluation.
3CS Appears eligible for CR as an individual property through survey evaluation.

Appears Eligible for National Register (NR) or California Register (CR) through other evaluation

4CM Master List - State Owned Properties – PRC §5024.

Properties Recognized as Historically Significant by Local Government

5D1 Contributor to a district that is listed or designated locally.
5D2 Contributor to a district that is eligible for local listing or designation.
5D3 Appears to be a contributor to a district that appears eligible for local listing or designation through survey evaluation.
5S1 Individual property that is listed or designated locally.
5S2 Individual property that is eligible for local listing or designation.
5S3 Appears to be individually eligible for local listing or designation through survey evaluation.
5B Locally significant both individually (listed, eligible, or appears eligible) and as a contributor to a district that is locally listed, designated, determined eligible or appears eligible through survey evaluation.

Not Eligible for Listing or Designation as specified

6C Determined ineligible for or removed from California Register by SHRC.
6J Landmarks or Points of Interest found ineligible for designation by SHRC.
6L Determined ineligible for local listing or designation through local government review process; may warrant special consideration in local planning.
6LQ Determined ineligible for local listing or designation as a historic district through a survey process; neighborhood or area may warrant special consideration for local planning. This status code is used for Planning Districts.
6T Determined ineligible for NR through Part I Tax Certification process.
6U Determined ineligible for NR pursuant to Section 106 without review by SHPO.
6W Removed from NR by the Keeper.
6X Determined ineligible for the NR by SHRC or Keeper.
6Y Determined ineligible for NR by consensus through Section 106 process – Not evaluated for CR or Local Listing.
6Z Found ineligible for NR, CR or Local designation through survey evaluation.

Not Evaluated for National Register (NR) or California Register (CR) or Needs Revaluation

7J Received by OHP for evaluation or action but not yet evaluated.
7K Resubmitted to OHP for action but not reevaluated.
7L State Historical Landmarks 1-769 and Points of Historical Interest designated prior to January 1998 – Needs to be reevaluated using current standards.
7M Submitted to OHP but not evaluated - referred to NPS.
7N Needs to be reevaluated (Formerly NR Status Code 4).
7N1 Needs to be reevaluated (Formerly NR SC4) – may become eligible for NR w/restoration or when meets other specific conditions.
7R Identified in Reconnaissance Level Survey: Not evaluated.
7RQ Individual property identified in a SurveyLA Survey – Not evaluated. This status code is used to identify properties that were considered during the field survey process, but were not recorded as significant based on the following: (1) field observations regarding the overall quality of the resource and alterations and/or (2) no preloaded information relating to the social, cultural or historical significance of the resource was obtained through SurveyLA research or the Public Participation and Outreach Program. A 7RQ status code does not preclude that a resource may be found to be significant with additional research, new information, and analysis.
7SQ Individual property assessed for significance in accordance with the SurveyLA Multiple Property Documentation approach and citywide Historic Context Statement, but does not meet eligibility standards.
7W Submitted to OHP for action – withdrawn.
QQQ Properties requiring additional research to evaluate or that cannot be evaluated due to limited or no visibility.

SOURCE: South Central Coastal Information Center, October 2013; SurveyLA Report-*Palms-Mar Vista-Del Rey Community Planning Area*, *Palms-Mar Vista-Del Rey Community Plan Area, West Adams-Baldwin Hills-Leimert Community Plan Area*; TAHA, 2017.

The Culver Hotel opened in 1924, on September 4 headlines in the Culver City Daily News announced, "City Packed with Visitors for Opening of Culver Skyscraper." The six-story hotel, then named the Hotel Hunt, was called the "latest monument to his vision," his referring to Culver. The wedge-shaped Renaissance Revival style Culver Hotel is concrete and brick with mahogany and walnut interiors. It was built on property in the center of downtown, on what has been called "the shortest Main St. in the USA." Over the years, the hotel has become recognizable from the many movies filmed here, including Laurel and Hardy shorts like Putting Pants on Philip (1927). The Culver Hotel was restored in the 1990s, with the rooms renovated with individual baths and furnished with antiques. The halls are hung with nostalgic scenes from the movies. The hotel renovation and seismic retrofitting were in partnership with the Culver City Redevelopment Agency. The Culver Hotel is protected with Landmark status by the City of Culver City under its historic preservation ordinance and is listed on the National Register.[10]

In addition, **Table 4.3-3** identifies five properties that have been determined eligible for listing in either the National Register or the California Register. Two properties have been recognized as historically significant by a local government (i.e., City of Santa Monica or Culver City).

The California Register includes eight properties/buildings at six addresses within a quarter-mile radius of the ECTNP Area. These are properties that have at least one of the following: (1) a National Register Status of 1 or 2 (i.e., they are either on or eligible for the National Register), (2) a California Historical Landmark number 770 and higher, or (3) a California Point of Historical Interest listing after January 1, 1998.

- 9720 Washington Boulevard, Washington Building/Flatiron Building
- 9355 Culver Boulevard, Citizen Publishing Company Building
- 9400 Culver Boulevard, Culver Hotel/Hunt Hotel
- 9942 Culver Boulevard, Gateway Station Post Office
- 2955 Robertson Boulevard, Hamilton High School
- 2955 Robertson Boulevard, Hamilton High School Main Building
- 2955 Robertson Boulevard, Hamilton High School Assembly Hall
- 3430 McManus Avenue, Horizon School/Washington School

In addition to the resources identified above, the Los Angeles Cultural Heritage Commission lists two properties as HCMs within the ECTNP Area. HCM No. 182 is the Ivy Substation, completed in July 1907 and located at 9015 Venice Boulevard, which was built to provide power for the ever-expanding system of the Los Angeles Pacific Railway. Its architecture is described as Mission Revival style. HCM No. 624 is the Lawrence and Martha Joseph Residence Apartments, constructed in 1970 and located at 3819-3827 Dunn Drive, which is one of the most significant examples of Storybook architecture in Los Angeles.

ARCHAEOLOGICAL RESOURCES

Pre-historic and historic archaeological sites, including sites that may contain subsurface tribal cultural resources, exist throughout the City. Hunter-gatherer tribes inhabited the Los Angeles region long before Europeans arrived. Remnants of their various cultures continue to be unearthed and documented. Before the Spaniards arrived, portions of the City, including the ECTNP Area was inhabited by the Gabrielino or Tongva-speaking Indians, who may have left behind archaeological resources that may still exist within the ECTNP Area. Various federal, state and local regulations have been promulgated to protect archaeological sites and resources. Although the state general plan law calls for mapping of the sites, the location of sites are confidential, pursuant to California Government Code Section 6254.10, to protect sites from disturbance, scavenging and vandalism.

[10]City of Culver City, *City History & Info* available at http://www.culvercity.org/how-do-i-/learn/about-culver-city/history-of-culver-city, accessed on February 28, 2017.

The South Central Coastal Information Center conducted a records search for the ECTNP Area in October 2013. The records search identified one site (19-003803) within the ECTNP Area and seven additional sites within a half-mile radius of the ECTNP Area. No sites are listed on the Archaeological Determination of Eligibility list. Additionally, one isolate (19-100249) was identified within a half-mile radius of the ECTNP Area. The NAHC was contacted during the scoping process on March 14, 2013 and indicated outreach for a Sacred Lands File Check; however, to date, no information regarding the Sacred Lands File Check has been received.

PALEONTOLOGICAL RESOURCES

Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. These include mineralized, partially mineralized, or unmineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered non-renewable resources because the organisms they represent no longer exist. Thus, once destroyed, a fossil can never be replaced.

Three major groups of rocks are represented within the Los Angeles Basin: older igneous and metamorphic bedrock (100 to 75 million years old), older sedimentary rocks (about 65 to 15 million years old), and younger sedimentary rocks (15 to 1 million years old). The sedimentary rock layers contain shale, siltstone, sandstone, and conglomerates, as well as some interbedded volcanic rocks. Over 22 million years ago, the Los Angeles Basin was a deep marine basin formed by tectonic forces between the North American and Pacific plates. Since that time, over five miles of marine and non-marine sedimentary rock, as well as intrusive and extrusive igneous rocks, have filled the basin. During the last two million years, defined by the Pleistocene and Holocene epochs, the Los Angeles Basin and surrounding mountain ranges have been uplifted to form the present day landscape. Erosion of the surrounding mountains has resulted in deposition of unconsolidated sediments in low-lying areas by rivers, such as the Los Angeles River.

Surficial deposits in most of the Project Area consist of younger Quaternary Alluvium beneath soil, primarily as alluvial fan deposits in the western portion of the Project Area and as fluvial deposits in the eastern portion. These deposits usually do not contain significant vertebrate fossils, at least in the uppermost layers, and no vertebrate fossil localities have been identified nearby such deposits. There are older Quaternary deposits exposed in the Cheviot Hills crossed by the Project Area, however, from about Butterfield Road eastward to around National Boulevard. These older Quaternary deposits also probably occur at relatively shallow depth in the rest of the Proposed Project route area. The paleontological records search conducted for the Project Area by the Natural History Museum of Los Angeles County (LACM) in April 2013 identified one vertebrate fossil locality (HWT 2520) from these older Quaternary deposits that occurs directly within the Project Area. A fossil specimen of mammoth, *Mammuthus*, was collected at unknown depth in the rail line right of way where Cheviot Drive dead ends at Northvale Road.

In the City of Santa Monica (west of the Project Area), the vertebrate fossil locality LACM 5462[11], located south of Olympic Boulevard along Michigan Avenue and east of Cloverfield Boulevard north of the Santa Monica Freeway (I-10), produced a specimen of extinct lion, *Felis atrox*, at a depth of six feet below grade. The fossil locality LACM 3368[12] lies east of the Project Area, located in sediments around Ballona Creek near the intersection of Jefferson Boulevard and Sentous Avenue, and contained a specimen of a fossil horse, *Equus*, at unknown depth. Further east of the Project Area, LACM 4250, located just south of Washington Boulevard and west of La Cienega Boulevard, remains of a fossil mammoth, *Mammuthus*, were collected at

[11]Natural History Museum of Los Angeles County, "*Paleontological Records Search for the Proposed Exposition Corridor Transit Neighborhood Plan Project, in the City of Santa Ana, Orange County, project area,*" April 24, 2013.
[12]*Ibid.*

unknown depth. **Table 4.3-4** shows the location of these localities in relation to the Project Area and proposed station areas.

TABLE 4.3-4: PALEONTOLOGICAL LOCALITES WITHIN AND IN PROXIMITY TO THE ECTNP AREA

Locality/Field No.	Approximate Street Location	Location in relation to the ECTNP Area
HWT 2520	Rail line ROW near Cheviot Dr./Northvale Rd.	Along the proposed corridor near Palms Station area
LACM 5462	South of Olympic Blvd. along Michigan Ave., East of Cloverfield Blvd.	West of western terminus of Project Area
LACM 3368	Intersection of Jefferson Blvd./Sentous Ave.	Eastern end of Project Area near Jefferson Blvd.
LACM 4250	South of Washington Blvd./West of La Cienega Blvd.	South of the eastern portion of the Project Area

SOURCE: Natural History Museum of Los Angeles County, *Paleontological Records Search for Project Area*, 2013.

HUMAN REMAINS

Though the Project Area is heavily developed and graded with various urban uses, the Project Area falls within the Los Angeles Basin, which includes the Mission-associated Native American history of Los Angeles. It was often Native American practice to bury people outside Mission grounds in informal cemeteries. In compliance with SB 18, letters describing the Proposed Project were sent to Native American tribes. One response from a Native American tribe, which involved a request to be notified when the Draft EIR was available for review, was received as of the preparation of this document.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to cultural resources if it would:

- Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5;
- Cause a substantial adverse change in the significance of an archeological resource pursuant to Section 15064.5;
- Directly or indirectly destroy a unique paleontological resources or site or unique geologic feature; and/or
- Disturb any human remains, including those interred outside of formal cemeteries.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors.

For impacts related to historical or architectural resources, a project would result in a significant impact if it causes a substantial adverse change in the significance of a historical resource based on the following criteria:

- Substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration in the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired.

- The significance of a historical resource is materially impaired when a project:
  - Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the California Register of Historical Resources; or
  - Demolishes or materially alters in an adverse manner those physical characteristics (of a historical resource) that account for its inclusion in a local register of historical resources (pursuant to PRC Section 5021.1(k)), or its identification in a historical resources survey meeting the criteria in PRC Section 5024.1(g), unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
  - Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.
- Generally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historical resource.

For impacts related to archaeological and paleontological resources, a Proposed Project would have a significant adverse environmental impact if it causes a substantial or potentially substantial adverse change in the significance of an archaeological or paleontological resource.

Environmental review of individual projects is required to comply with CEQA and the CEQA Guidelines, which direct lead agencies to first determine whether an archaeological site is a "historically significant" cultural resource. Generally, a cultural resource shall be considered by the lead state agency to be "historically significant" if the resource meets any of the following criteria for listing on the California Register:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Has yielded, or may be likely to yield, information important in prehistory or history.

CEQA Section 21084.1 specifies how cultural resources are to be managed for individual (as opposed to plan-level) projects. These regulations require that archival and field surveys are conducted, and identified cultural resources are inventoried and evaluated in prescribed ways. Prehistoric and historic resources deemed "historically significant" must be considered in project planning and development.

If potentially significant archaeological resources are discovered during implementation of a project, those resources must be inventoried and evaluated to ascertain whether they meet the criteria for listing on the California Register.

Significant impacts to archaeological or paleontological properties, of either prehistoric or historical origin, would occur from any surface or subsurface modifications, which disturb, scatter, relocate, or otherwise reduce the integrity and scientific research potential of the cultural resource.

Any process of demolition, grading, construction, landscaping, installation of utilities, or other modification of the surface or subsurface could impair the condition and associations of structures or cultural material.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance for impacts on historic, archaeological and paleontological resources. This guidance is generally based on Appendix G of the CEQA Guidelines, and provides specific criteria to be considered when making a significance determination

The following analysis considers the presence and absence of known cultural resources within the ECTNP Area, as well as the potential for significant cultural resources to occur within the Project Area, against the potential impacts on such resources from implementation and adoption of the ECTNP. Where cultural resources are present and could be disturbed by future construction, a potentially significant impact is assumed.

The analysis of archaeological and paleontological resources identifies the likelihood of ground disturbing activities to encounter rock units with potential for containing significant nonrenewable archaeological and paleontological resources, which is considered high in quaternary alluvial fan deposits exhibiting a composition conducive to the preservation of fossil resources. Archaeological and paleontological resources in the Project Area were evaluated qualitatively based on general information about ECTNP Area. Where such sensitive units are present and could be disturbed by future construction, a potentially significant impact is assumed.

This discussion of cultural resources addresses impacts within the entire Project Area. No distinction is made between areas of change and areas within the Project Area, where zoning controls would not change, because potential impacts to cultural resources are generally site-specific and not based on whether future development projects are located within or outside of the change areas.

IMPACTS

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans, and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would not affect every parcel within the Project Area; changes would only occur within the identified "areas of proposed change," or "subareas." As discussed in Chapter 3.0, Project Description, the ECTNP would allow for Alternate Compliance that could affect the mix of residential and non-residential uses in each area of proposed change. Alternative Compliance development would have the same impacts on cultural resources as are discussed below, and, therefore, it is not discussed separately. The ECTNP includes eight streetscape plans that aim to improve streets for pedestrians, transit users, and drivers. The streetscape plans are located along Pico Boulevard between Centinela Avenue and I-405, Pico Boulevard between I-405 and Patricia Avenue, Bundy Drive between Missouri Avenue and Pico Boulevard, Olympic Boulevard between Centinela and Barrington Avenues, Sepulveda Boulevard between Olympic and National Boulevards, National Boulevard between Mentone and Castle Heights Avenues, Palms Boulevard between Exposition Boulevard and Motor Avenue, and Motor Avenue between Venice Boulevard and I-10.

IMPACT 4.3-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A HISTORICAL RESOURCE AS DEFINED IN CEQA GUIDELINES SECTION 15064.5? THIS IS A POTENTIALLY SIGNIFICANT IMPACT.

The Proposed Project does not intend to affect designated historical resources (e.g., HCMs) or reasonably expect to incentivize development of properties with designated historical resources. The ECTNP includes plan standards that further protect historical and potentially historical resources by requiring additional

review by either the Cultural Heritage Commission or the Office of Historic Resources for any project located on sites with historical resources designated at the federal, state, or local level and potentially historical resources identified in the City of Los Angeles' SurveyLA report, as updated. For informational purposes, when compared to current processes, the Proposed Plan is expected to have a neutral or beneficial impact to designated historical resources and a beneficial impact to non-designated resources, due to these plan standards. Nonetheless, based on the requirements of CEQA, the analysis below compares the Proposed Plan and the development that is reasonably foreseeable to occur under the Plan, to the existing environment.

Designated Historical Resources. As discussed in the Regulatory Framework section above, designated historical resources are historical resources under CEQA. There are city, state, and federally designated and eligible historical resources in the ECTNP (**Table 4.3-3**). Some of these historically significant properties are located within the change areas of the ECTNP (**Figure 4.3-1**).

Generally, it is not expected that designated historical resources would be impacted by the project based on the regulatory control ordinances that designated resources are subject to, such as the Cultural Heritage Ordinance, discussed above. The Proposed Project does not introduce any features that would preclude implementation of, or alter these policies or procedures in the Cultural Heritage Ordinance. Nonetheless, over time, it is not impossible that one or more designated resources may be lost by redevelopment in the ECTNP Area. The Cultural Heritage Ordinance cannot completely prevent a property from being demolished and the property being redeveloped or structures being altered so long as an applicant has gone through all necessary processes, including environmental review. The City's OHR reports that it is extremely uncommon in the City to lose designated resources when a property owner has complied with the City's regulations. Additional losses could result during the life of the plan from factors such as "demolition by neglect", illegal activities, fire or other remedy of unsafe conditions. Therefore, although it is very unlikely, it is not impossible that future development under the Proposed Project could result in a potentially significant impact to a designated historical resource. For informational purposes, it should be noted that this type of impact would not be any different from what would occur under current processes or likely, any adopted general plan and zoning update. Additionally, it is likely that such an impact may be less likely than under current processes based on the Proposed Project's plan standards.

SurveyLA Identified Resources. Resources identified in SurveyLA are presumptive historical resources under PRC Section 21084.1 (and case law interpreting PRC Section 21084.1). Individual resources identified by SurveyLA as appearing eligible for listing on the National Register, the California Register, or local listing or designation have the potential to be historically significant, but are not currently protected by City Ordinance. However, the Proposed Project includes mandatory regulations that provide additional protections for these identified, non-designated resources. When a project site is identified as an eligible resource in SurveyLA, the Proposed Project requires that those projects be reviewed by the City's OHR Staff to determine if the existing structures are historically significant. If an applicant contests the historic or cultural significance of a potential resource as decided by the City's OHR Staff, a historic resource assessment prepared by a qualified architectural historian[13] may be provided to the City's OHR Staff to help determine the potential resource's significance. If the potential resource is found to be historically significant, the applicant should comply with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings (1995) (Secretary's Standards). If they comply with the Secretary's Standards, subject to the review of OHR, the project may proceed without any additional action or environmental review (related solely to the historical resource status) (see CEQA Guideline Section 15064.5(b)(3)). If the project does not comply with the Secretary's Standards, additional analysis and environmental review will be required to determine if the project will result in a significant impact to a historical resource. Additionally, OHR may recommend and the City may initiate and complete formal designation of any potential resource at any time,

[13]Qualified architectural historians shall meet the Professional Qualification Standards set forth by the Secretary of the Interior.

including after reviewing a project. If a formal designation is initiated, the project would be put on hold until the designation process is completed.

Thus, the ECTNP incorporates changes that will assist in further protecting both designated and eligible historic resources (including a new process that requires historical resource review of projects involving properties in SurveyLA) and the City has an existing regulatory framework for the protection of historical resources. However, it is possible that demolition and/or significant alteration to some of the historical resources identified in this EIR may occur. Therefore, impacts from the project related to historic resources would be significant and unavoidable.

Streetscape plans are a component of the Proposed Project. Improvements included under the proposed streetscape plans would include the installation of landscaped medians, increase of sidewalk widths, installation of bike lanes and landscape treatments. However, since no historical resources are located in the public rights of way, designated historical resources would not be disturbed by these changes.

MITIGATION MEASURES

Beyond the existing Regulatory Framework, outlined above, and the Proposed Project standards, no feasible mitigation measures have been identified.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts relating to historical resources under the Proposed Project would remain potentially significant and unavoidable.

IMPACT 4.3-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF AN ARCHAEOLOGICAL RESOURCE? THIS IS LESS THEN SIGNIFICANT WITH MITIGATION.

For purposes of this analysis "archeological resources" include "tribal cultural resources" as that term is defined by PRC Section 21074. As previously described, the October 2013 records search conducted for the ECTNP Area identified one archaeological site (19-003803) within the ECTNP Area and seven additional sites within one half-mile radius of the ECTNP Area. Additionally, one isolate (19-100249) was identified within one half-mile radius of the ECTNP Area. The ECTNP Area is highly disturbed and any archeological resources that may have existed at the surface have likely been disturbed by past development. Therefore, the uppermost sediments are not anticipated to contain substantial numbers of archeological resources. However, based upon the archaeological sensitivity of the surrounding area, buried prehistoric or historic cultural resources may be present within the ECTNP Area. Consequently, the potential exists for new development or ground-disturbing activities within the ECTNP Area to disturb or impact known or previously undetected archaeological resources. If archaeological resources are discovered during the construction of these future developments, these resources must be inventoried and evaluated. Consequently, without mitigation, the Proposed Project would result in a potentially significant impact related to archeological resources.

MITIGATION MEASURES

CR1 A qualified archaeologist shall be required to monitor excavation and grading activities in soils that have not been previously disturbed, to identify, record, and evaluate the significance of any archaeological finds during construction. If archaeological resources are uncovered (in either a previously disturbed or undisturbed area), the City Department of Building and Safety shall be notified immediately, and all work shall cease in the area of the find until a qualified archaeologist has evaluated the find in accordance with federal, state, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. Personnel of the project shall not collect or move any archaeological materials or associated materials. Construction activity may continue unimpeded on other portions of

the project site. The found deposits shall be treated in accordance with federal, state, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. Construction activities in the area where resources were found may commence once the identified resources are properly assessed and processed by a qualified archeologist.

CR2 The City shall require that all cultural resources identified on a site be assessed and treated in a manner determined appropriate by a qualified archeologist in consultation with the City's Office of Historic Resources. A report shall be prepared according to current professional standards that describes the resource, how it was assessed, and disposition.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Mitigation Measures **CR1** and **CR2** would reduce impacts related to archaeological resources to less than significant.

IMPACT 4.3-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT DIRECTLY OR INDIRECTLY DESTROY A UNIQUE PALEONTOLOGICAL RESOURCE OR SITE OR UNIQUE GEOLOGIC FEATURE? THIS IMPACT IS LESS THAN SIGNIFICANT WITH MITIGATION.

The Project Area is highly urbanized and any paleontological resources that may exist at the surface have likely been disturbed by past development. Accordingly, surface grading or very shallow excavations in much of the Project Area likely would not uncover significant vertebrate fossils. However, there is a reasonable potential that excavations, including excavations in the exposures of older Quaternary deposits in the Project Area, could encounter significant fossil vertebrate remains. As such, any future development occurring in the ECTNP Area has the potential to significantly affect paleontological resources during construction-related earth moving activities. If paleontological resources are discovered during the construction of potential future development, those resources would be inventoried and evaluated. Therefore, although compliance with applicable regulations would help to protect unknown and previously undetected paleontological resources, without mitigation, the Proposed Project would result in a potentially significant impact related to paleontological resources.

MITIGATION MEASURES

CR3 A qualified paleontologist shall be required to monitor excavation and grading activities in soils that have not been previously disturbed. If paleontological resources are uncovered (in either a previously disturbed or undisturbed area), the City Department of Building and Safety shall be notified immediately, and all work on the project site shall cease until a qualified paleontologist evaluates the find. The paleontologist shall determine the location, the time frame, and the extent to which any monitoring of earthmoving activities shall be required. Halted construction activities on the project site may commence once the identified resources are properly assessed and processed by a qualified paleontologist.

CR4 The City shall require that all paleontological resources identified on a project site be assessed and treated in a manner determined by a qualified paleontologist in consultation with the City's Office of Historic Resources. A report shall be prepared according to current professional standards that describes the resource, how it was assessed, and disposition. Any reports and surveys shall be submitted to the City's Office of Historic Resources and the Natural History Museum of Los Angeles County.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Mitigation Measures **CR3** and **CR4** would reduce impacts to paleontological resources to less than significant.

IMPACT 4.3-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT COULD DISTURB HUMAN REMAINS, INCLUDING THOSE INTERRED OUTSIDE OF FORMAL CEMETERIES? THIS IS CONSIDERED A LESS THAN SIGNIFICANT IMPACT.

The Project Area is highly urbanized and has been heavily disturbed and developed. Unmarked cemeteries or graves have likely been disturbed by past development. Given the Mission-associated Native American history of the Los Angeles Basin, and the practice to bury people outside Mission grounds in informal cemeteries, the potential to unearth human remains during excavation and grading activities exists. However, in accordance with California Health and Safety Code Section 7050.5, if any human remains are encountered during construction, the City will require that work in the immediate area of the find be halted and the Los Angeles County Coroner be contacted. No further disturbance will occur until the Los Angeles County Coroner has made the necessary findings as to origin and disposition. If the remains are determined to be those of a Native American, the Native American Heritage Commission in Sacramento shall be contacted before the remains are removed in accordance with PRC Section 21083.2. Therefore, the Proposed Project would result in a less than significant impact related to human remains.

MITIGATION MEASURES

Impacts related to the disturbance of human remains were determined to be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the disturbance of human remains were determined to be less than significant without mitigation.

4.4 GEOLOGY AND SOILS

This section provides an overview of geology and soils and evaluates impacts associated with the Proposed Project. Topics addressed include suitability of soil for development, seismicity, faults, ground shaking, liquefaction, and landslides. This section was prepared utilizing documents and maps published by the United States Geological Survey (USGS), California Department of Conservation, California Geological Survey (CGS), the County of Los Angeles, and the City of Los Angeles, as well as other applicable sources.

REGULATORY FRAMEWORK

FEDERAL

International Building Code (IBC). The IBC is published by the International Code Council and forms the basis of the California's building code. It has been adopted by the California Legislature to address the specific building conditions and structural requirements for California. The IBC contains provisions that are intended to ensure that structures can adequately resist seismic forces during earthquakes. These seismic provisions represent the best available guidance on how structures should be designed and constructed to limit seismic risk. See Section 4.7, Hydrology and Water Quality for further discussion of the National Pollutant Discharge Elimination System (NPDES).

National Pollutant Discharge Elimination System (NPDES). NPDES permits are authorized by Section 402 of the Clean Water Act. The goal of the NPDES diffuse-source regulations is to improve the quality of stormwater discharged to receiving waters to the "maximum extent practicable" through the use of best management practices (BMPs). The NPDES permit system regulates point source discharges (e.g., a municipal or industrial discharge at a specific location or pipe) and certain types of diffuse source dischargers (e.g., municipal stormwater and construction runoff). The NPDES permit sets erosion control standards and requires implementation of nonpoint source control of surface drainage through the application of a number of BMPs to decrease the effects of erosion and sedimentation associated with grading.

STATE

Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act). The Alquist-Priolo Act, which is codified in the Public Resources Code (PRC) Division 2, Chapter 7.5, provides policies and criteria to assist cities, counties, and state agencies in the development of structures for human occupancy across the trace of active faults.[1] The Alquist-Priolo Act was intended to provide the citizens of the state with increased safety and to minimize the loss of life during and immediately following earthquakes by facilitating seismic retrofitting to strengthen buildings, including historical buildings, against ground shaking. This Act requires the State Geologist to establish regulatory zones known as "Earthquake Fault Zones" around the surface traces of active faults and to issue appropriate maps. Before a project can be permitted within an Alquist-Priolo Earthquake Fault Zone, the City of Los Angeles requires a geologic investigation to demonstrate that proposed building(s) will not be constructed across active faults. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back from the fault (generally 50 feet).

Seismic Hazards Mapping Act of 1990. To address the effects of strong ground shaking, liquefaction, landslides, and other ground failures due to seismic events, the State of California passed the Seismic Hazards Mapping Act. Under the Seismic Hazards Mapping Act, which is codified in PRC Chapter 7.8, Section 2690-2699.6, the State Geologist is required to delineate "seismic hazard zones." Cities and counties must regulate certain development projects within these zones to ensure the geologic and soil conditions are investigated and appropriate mitigation measures, if any, are incorporated into development plans. The State

[1] A fault trace is the intersection of a geological fault with the ground surface, leaving a visible mark; also, the line commonly plotted on geologic maps to represent a fault (https://earthquake.usgs.gov/learn/glossary/?term=fault%20trace).

Mining and Geology Board provides additional regulations and policies to assist municipalities in preparing the Safety Element of their General Plan and encourage land use management policies and regulations to reduce and mitigate those hazards to protect public health and safety. Under PRC Section 2697, cities and counties shall require, prior to the approval of a project located in a seismic hazard zone, a geotechnical report defining and delineating any seismic hazard. The requirement for a report may be waived if the city finds that no undue seismic hazard exists, based on information resulting from studies conducted on sites in the immediate vicinity of the project and of similar soil composition to the project site. Each city or county shall submit one copy of each geotechnical report, including mitigation measures, to the State Geologist within 30 days of its approval.

California Building Code (CBC). The CBC, found in California Code of Regulations (CCR) Title 24, is a compilation of the State building standards, including seismic safety standards for new buildings. Each jurisdiction in California must adopt its own building code that incorporates the CBC. Local codes are permitted to be more stringent than the CBC (with limitations), but, at a minimum, are required to meet all State standards and enforce the regulations of the CBC. The CBC standards are based on (1) building standards that have been adopted by State agencies without change from the IBC, (2) building standards based on the IBC that have been changed to address particular California conditions, and (3) building standards authorized by the California legislature but not covered by the IBC.

Given the state's susceptibility to seismic events, the seismic standards within the CBC are among the strictest in the world. The CBC applies to all occupancies in the state, except where stricter standards have been adopted by local agencies. Chapter 16 of the CBC deals with structural design requirements governing seismically resistant construction (Section 1604), including (but not limited to) factors and coefficients used to establish seismic site class and seismic occupancy category for the soil/rock at the building location and the proposed building design (Sections 1613.5 through 1613.7). Chapter 18 includes (but is not limited to) the requirements for foundation and soil investigations (Section 1803); excavation, grading, and fill (Section 1804); allowable load-bearing values of soils (Section 1806); and the design of footings, foundations, and slope clearances (Sections 1808 and 1809), retaining walls (Section 1807), and pier, pile, driven, and cat-in-place foundation support systems (Section 1810). Chapter 33 includes (but is not limited to) requirements for safeguards at worksites to ensure stable excavations and cut or fill slopes (Section 3304).

CBC Appendix J applies to grading, excavation, and earthwork construction, and requires that no grading shall be performed without first having obtained a permit from the building official. Section J104.3 requires the preparation of a geotechnical report that contains at least the following:

- The nature and distribution of existing soils,
- Conclusions and recommendations for grading procedures,
- Soil design criteria for any structures or embankments required to accomplish the proposed grading, and
- Where necessary, slope stability studies, and recommendations and conclusions regarding site geology.

LOCAL

City of Los Angeles General Plan, Conservation Element and Safety Element. The Conservation Element of the General Plan is intended to provide for the conservation and preservation of natural resources. Policies of the Conservation Element address the effect of erosion on such natural resources as beaches, watersheds and watercourses. The Conservation Element cites erosion of hillsides resulting in the loss of natural watersheds and features, as well as flooding and endangerment to structures and people, as continuing issues. The Conservation Element also contains limited policies related to erosion and refers to the Los Angeles Municipal Code (LAMC) Sections 91.700 *et seq*. and Specific Plan for Management of Flood Hazards (Ordinance 172,081) for specific guidance.

State law requires that the City's General Plan includes a safety element, which addresses the issue of protecting its people from unreasonable risks associated with natural disasters (e.g., fires, floods, and earthquakes). The Safety Element of the General Plan contains policies that emphasize seismic safety issues

because seismic events present the most widespread threat of devastation to life and property. The Safety Element provides a contextual framework for understanding the relationship between hazard mitigation, response to a natural disaster, and initial recovery from a natural disaster. Policy 1.1.6 of the Safety Element addresses compliance with applicable state and federal planning and development regulations (e.g., Alquist-Priolo Act, Seismic Hazards Mapping Act and Cobey-Alquist Flood Plain Management Act).

Los Angeles Building Code (LABC). Earthwork activities, including grading, are governed by the LABC, which is contained in LAMC Chapter IX, Article 1. Specifically, Section 91.7006.7 of the LABC includes requirements regarding import and export of material; Section 91.7010 includes regulations pertaining to excavations; Section 91.7011 includes requirements for fill materials; Section 91.7013 includes regulations pertaining to erosion control and drainage devices; Section 91.7014 includes general construction requirements; and Section 91.7016 includes regulations for areas that are subject to slides and unstable soils. Additionally, the LABC includes specific requirements addressing seismic design, site grading, foundation design, cut and fill slope design, soil expansion, geologic investigations and reports before and during construction, retaining walls, soil and rock testing, basement walls, shoring of adjacent properties, and potential primary and secondary seismic effects and groundwater.

City requirements to address grading, excavation, and fill are specified in LABC (i.e., LAMC Chapter IX, Article 1, Division 70). Under this part of the LABC, the Los Angeles Department of Building and Safety (LADBS) has the authority to withhold building permit issuance if a project cannot mitigate potential hazards to the project or which are associated with the project. The Grading Code periodically is revised to reflect new technology and improved standards and requirements.

The LABC incorporates by reference the CBC, with City amendments for additional requirements; LADBS is responsible for implementing the provisions of the LABC. Throughout the permitting, design, and construction phases of a building project, LADBS engineers and inspectors confirm that the requirements of the LABC pertaining specifically to geoseismic and soils conditions are being implemented by project architects, engineers, and contractors.

Standard Urban Stormwater Mitigation Plan (SUSMP) Requirements. On March 8, 2000, SUSMP requirements were approved by the Los Angeles Regional Water Quality Control Board to address stormwater pollution from new construction and redevelopment projects. The SUSMP requirements contain a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control peak flow discharge, and reduce the post-project discharge of pollutants from stormwater conveyance systems. SUSMP requirements include BMPs to decrease the effects of erosion. See Section 4.7, Hydrology and Water Quality for further discussion of the SUSMP.

Stormwater Pollution Prevention Plan (SWPPP). As part of the NPDES permitting system, an SWPPP is required to be prepared prior to the beginning of construction activities. The SWPPP specifies BMPs that will prevent construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off-site into receiving waters. See Section 4.7, Hydrology and Water Quality for further discussion of the SWPPP.

EXISTING SETTING

SEISMICITY

The entire Southern California region is considered a seismically active region. Seismic events present the most widespread threat of devastation to life and property. With an earthquake, there is no containment of potential damage. Since 1800, there have been approximately 60 damaging seismic events, or earthquakes, in the Los Angeles Region; in 1857 one earthquake exceeded Richter magnitude 8.0. Since 1933, there have been four moderate-size earthquakes which have caused numerous deaths and substantial property damage in the metropolitan Los Angeles area. These four events are identified by their location as the Long Beach

(March 11, 1933; magnitude 6.3), San Fernando (February 9, 1971; magnitude 6.4), Whittier Narrows (October 1, 1987; magnitude 5.9), and Northridge (January 17, 1994; magnitude 6.7) earthquakes.

The Project Area is located within Seismic Zone 4, which the UBC defines as the zone with the highest potential for seismic hazards to occur. Seismic zones are based on a statistical compilation of the number and the magnitude of past earthquakes. Since the Project Area is within the seismically-active Southern California region, it may be exposed to strong ground shaking during a seismic event. Issues of concern relating to earthquakes include fault rupture, strong ground shaking, liquefaction, landslides, and tsunamis.

Faults. A fault is a fracture or line of weakness in the earth's crust, along which rocks on one side of the fault are offset relative to the same rocks on the other side of the fault. Based on criteria established by the CGS, faults may be categorized as active, potentially active, or inactive. Active faults are those that show evidence of surface displacement within the last 11,000 years (Holocene age). Potentially active faults are those that show evidence of displacement within the last 1.6 million years (Quaternary age). Faults showing no evidence of displacement within the last 1.6 million years may be considered inactive in most cases.

The Alquist-Priolo Act, passed in 1972, requires the State Geologist to establish regulatory zones known as "Earthquake Fault Zones" around the surface traces of active faults and to issue appropriate maps. Before a project can be permitted within an Alquist-Priolo Earthquake Fault Zone, the City of Los Angeles requires a geologic investigation to demonstrate that proposed building(s) will not be constructed across active faults. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back from the fault (at a minimum of 50 feet).

Many active earthquake fault zones are mapped in the Los Angeles area. Typically, they are visible, above ground faults, such as the San Andreas Fault. However, earthquakes along unmapped faults, such as the blind thrust fault associated with the Northridge earthquake, are increasingly becoming the focus of study and concern. These faults may dominate the geology of the Los Angeles Basin in a way not previously known. **Table 4.4-1** provides a summary of major active faults in Southern California.

TABLE 4.4-1: MAJOR NAMED ACTIVE FAULTS IN SOUTHERN CALIFORNIA

Fault	Maximum Magnitude	Slip Rate (mm/yr)	Type of Fault	Most Recent Seismic Event
Cabrillo	6.0 - 6.8	Uncertain	Right normal	Holocene
Cucamonga	6.0 - 7.0	5.0 - 14.0	Thrust	Holocene
Elsinore (Glen Ivy Segment)	6.8	5.0	Right lateral strike-slip	Late Quaternary
Hollywood	5.8 - 6.5	0.33 - 0.75	Left reverse	Holocene
Los Alamitos Thrust	Uncertain	Uncertain	Thrust	Uncertain
Malibu Coast	Uncertain	0.3	Reverse	Late Quaternary
Northridge Thrust	6.5 - 7.5	3.5 - 6.0	Thrust	1994
Newport-Inglewood	6.0 - 7.4	0.6	Right lateral	1933
Oak Ridge	6.5 - 7.5	3.5 - 6.0	Thrust	Holocene
Palos Verdes	6.0 - 7.0	0.1 - 3.0	Right reverse	Holocene
Raymond	6.0 - 7.0	0.1 - 0.22	Left lateral	Holocene
San Andreas (Southern Segment)	6.8 - 8.0	20.0 - 35.0	Right lateral strike-slip	1857
San Cayetano	6.5 - 7.3	1.3 - 9.0	Thrust	Uncertain
San Fernando	6.0 - 6.8	5.0	Thrust	1971
San Gabriel	Uncertain	1.0 - 5.0	Right-lateral strike-slip	Late Quaternary
San Jacinto (San Bernardino Segment)	6.5 - 7.5	7.0 - 17.0	Right lateral strike-slip	1968
Santa Monica	6.0 - 7.0	0.27 - 0.39	Left reverse	Late Quaternary
Sierra Madre	6.0 - 7.0	0.36 - 4.0	Reverse	Holocene
Simi-Santa Rosa	Uncertain	Uncertain	Reverse	Holocene
Verdugo	6.0 - 6.8	0.5	Reverse	Holocene
Whittier	6.0 - 7.2	2.5 - 3.0	Right lateral strike-slip	1987

SOURCE: Southern California Earthquake Data Center, *http://www.data.scec.org/significant/fault-index.html*, accessed March 1, 2017.

Four faults are located within two miles of the Project Area – the Overland Fault, Santa Monica Fault, Newport-Inglewood Fault and Charnock Fault (see **Figure 4.4-1**). A segment of the Overland Fault has been mapped within the Project Area, approximately one half mile southeast of the Westwood/Rancho Park Station. It extends from the northwest flank of Baldwin Hills to Santa Monica Boulevard in the vicinity of Overland Avenue. The next nearest fault to the Project Area is the Santa Monica Fault. This fault is located approximately one-quarter mile north of the Project Area and traverses east-west from the City of Beverly Hills area on the east to the Santa Monica coastline on the west.

A segment of the Newport-Inglewood Fault is located approximately one half mile southeast of the Culver City Station. This fault starts south of the City of Signal Hill, roughly parallels the coastline until just south of Newport Bay, where it heads offshore and becomes the Newport-Inglewood-Rose Canyon Fault Zone. A little further from the Project Area is the Charnock Fault. This fault is a northwest trending fault that runs parallel to the Overland Fault and the Newport-Inglewood Fault Zone and is approximately two miles south of the Project Area. **Figure 4.4-1** identifies the faults in the Southern California region, including the four faults in the vicinity of the Project Area.

Ground Failure. The principal seismic hazard occurring as a result of an earthquake produced by local faults is strong ground shaking. The intensity of ground shaking depends on several factors, including the magnitude of the earthquake, distance from the earthquake epicenter, and the underlying soil conditions. In general, the larger the magnitude of an earthquake and the closer a site to the epicenter of the event, the greater the effects will be. However, soil conditions can also amplify the earthquake shock waves. Generally, the shock waves remain unchanged in bedrock, are amplified to a moderate degree in thick alluvium, and are greatly amplified in thin alluvium, which is present in the Project Area.

Modern, well-constructed buildings are designed to resist ground shaking through the use of shear walls and reinforcements. The entire Southern California area, which includes the Project Area, is considered a seismically active region, and every building in the region is susceptible to ground shaking and earthquakes. The LABC includes regulations and requirements designed to reduce risks to life and property to the maximum extent feasible.

Liquefaction. Liquefaction involves the sudden loss of strength in saturated, cohesionless soils that are subjected to ground vibration and result in temporary transformation of the soil into a fluid mass. If the liquefying layer is near the surface, the effects are much like that of quicksand for any structures located on top of it. If the layer is deeper in the subsurface, it may provide a sliding surface for the material above it. The effects of liquefaction include the loss of the soil's ability to support footings and foundations, which can cause buildings and foundations to buckle. These failures were observed in the 1971 San Fernando and the 1994 Northridge earthquakes. Liquefaction-related phenomena include subsidence and lateral spreading. Subsidence is the gradual settling or sudden sinking of land due to movement or removal of underlying earth materials. Lateral spreading can occur on relatively shallow slopes. Liquefaction of shallow layers causes a loss of shear strength, allowing the surface to move laterally across gentle slopes. Areas with lateral spreading potential would most likely be adjacent to drainages where slopes are steepest and water may be more likely to accumulate.

The Beverly Hills Quadrangle Seismic Hazard Zones Map prepared by the California Department of Conservation, Division of Mines and Geology identifies portions of the Project Area, including portions of the Bundy and Culver City Station areas, that are located in a liquefaction zone and is susceptible to liquefaction (**Figure 4.4-2**).[2]

Landslide. A landslide is a mass down-slope movement of earth materials under the influence of gravity, and includes a variety of forms including rockfalls, debris slides, mudflows, block slides, soil slides, slumps, and creeps. These mass movements are triggered or accelerated by earthquake-induced ground motion, increased water content, excessive surface loading, or alteration of existing slopes by man or nature. Earthquake-induced landslides, usually associated with steep canyons and hillsides, can originate on, or move down, slopes as gentle as one degree in areas underlain by saturated, sandy materials, such as alluvium, playa, and terrace which are present in the Project Area. The Project Area contains hills to the north of the Palms Station area in the Cheviot Hills neighborhood, north of I-10. According to the City's Safety Element, Exhibit C: Landslide Inventory and Hillside Areas in the City, the center of the Project Area is in an area where small shallow landslides could occur, as shown in **Figure 4.4-3**.[3] According to the Beverly Hills Quadrangle Seismic Hazard Zones Map, there is a small landslide zone area near Overland Avenue and I-10 within the Project Area (see **Figure 4.4-3**).[4]

Soil Erosion. Factors that contribute to potential soil erosion include climate, the physical characteristics of soils, topography, land use, and the amount of soil disturbance. Excessive soil erosion can eventually lead to damage of building foundations, roadways and dam embankments. Rates of erosion can vary depending on the soil material, structure, and placement by human activity. Erosion potential is also directly related to the terrain's steepness. While the Project Area contains the Cheviot Hills area north of the Palms Station area, no change is anticipated in that area. The actual potential for erosion is difficult to predict, as the conditions where erosion occurs are site-specific. LABC regulates grading, excavations, landfill, and other construction activities that might cause or be impacted by slope or ground instability, erosion, or flooding in hillside areas.

Unstable Soils. Under certain circumstances, strong ground shaking can cause densification or compaction of soils, resulting in local or regional settlement of the ground surface. This can result in local differential settlement and damage to foundations and structures, as well as damage to water and sewer lines. The potential for seismically-induced settlement to occur is controlled by the intensity and duration of ground shaking, and the relative density of the subsurface soils.[5]

The Project Area is composed of marine sedimentary rocks, specifically alluvium, lake, playa, and terrace.[6] Recently deposited alluvial sediments within the Project Area are potentially subject to seismically induced settlement.

Expansive Soils. Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. The ability of clayey soil to change volume can result in uplift or cracking to foundation elements or other rigid structures, such as slabs-on-grade, rigid pavements, sidewalks, or other slabs or hardscape located on these soils. Expansive soils, such as alluvium, which is clay and silt based, are present within the Project Area.

Septic Tanks. The Project Area is served by City-owned wastewater treatment and disposal facilities and does not utilize a septic system.[7]

2012-058

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to geology and soils if it would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault;
  - Strong seismic ground shaking;
  - Seismic-related ground failure, including liquefaction;
  - Landslides;
- Be located on a geologic unit that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property;
- Result in substantial soil erosion or the loss of topsoil; and/or
- Have soils capable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors.

The Proposed Project would have a significant impact on geologic hazards if:

- The project causes or accelerates geologic hazards which would result in substantial damage to structures or infrastructure, or expose people to substantial risk of injury.

The Proposed Project would have a significant impact on sedimentation and erosion if:

- The project causes or accelerates instability from erosion so as to result in a geologic hazard to other properties; or
- The project accelerates natural processes of wind and water erosion and sedimentation, resulting in sediment runoff or deposition which would not be contained or controlled on-site.

The following threshold is discussed in Section 4.1, Aesthetics. The Proposed Project would have a significant impact on landform alteration if:

- One or more distinct and prominent geologic or topographic features would be destroyed, permanently covered, or materially and adversely modified. Such features may include, but are not limited to, hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds, and wetlands.

METHODOLOGY

This analysis uses Appendix G thresholds to make a significance determination, which is supplemented by screening criteria found in the City's Thresholds Guide for additional guidance as appropriate. The Thresholds Guide sets forth guidance for the determination of significance of geology and soils impacts. This guidance is based on Appendix G of the CEQA Guidelines and provides specific criteria to be considered when making a significance determination. In some cases, the Thresholds Guide includes quantitative

thresholds. For purposes of this analysis, the Thresholds Guide criteria are used, supplemented by the thresholds identified in Appendix G of the CEQA Guidelines, where appropriate.

The Proposed Project would not have a direct effect related to geologic and soils conditions, but development that is likely to occur as a result of the Proposed Project could be subject to geologic or soils hazards. However, a recent court case[8] found that how existing environmental conditions impact a project's future users or residents, is not required to be analyzed in CEQA documents unless a project exacerbates existing risk. The Proposed Project would not change existing risks associated with existing geologic or soils conditions. Nonetheless, for informational purposes, baseline information was compiled from a review of published geologic maps and reports, as well as information compiled and evaluated by the City of Los Angeles in conjunction with its overall planning and hazard mitigation processes to identify geologic conditions and geologic hazards in the Project Area

Potential hazards associated with geologic and soils conditions, as well as regular oil and surface mining, are well regulated by the state and City. The design-controllable aspects of building foundation support, protection from seismic ground motion, and soil instability are governed by existing regulations. The analysis presented herein assumes compliance with all applicable laws, regulations, and standards.

This discussion of geology and soils addresses impacts within the entire Project Area. No distinction is made between areas of change and areas within the Project Area, where zoning controls would not change, because potential impacts related to geology and soils are generally site-specific and not based on whether future development projects are located within or outside of the change areas.

IMPACTS

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans that enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone Changes and General Plan amendments would not occur on every parcel within the Project Area; changes would only occur within specific "areas of proposed change," also known as "Subareas" in the Proposed Plan. While there are geology and soil impacts to consider within the Project Area, future development is subject to the federal, state, and local policies and guidelines mentioned above.

IMPACT 4.4-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE OR ACCELERATE GEOLOGIC HAZARDS THAT WOULD EXPOSE PEOPLE OR STRUCTURES TO POTENTIAL SUBSTANTIAL ADVERSE EFFECTS, INCLUDING THE RISK OF LOSS, INJURY, OR DEATH, INVOLVING THE RUPTURE OF A KNOWN EARTHQUAKE FAULT? THE PROPOSED PROJECT WOULD NOT EXACERBATE EXISTING GEOLOGIC CONDITIONS AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH THIS ISSUE. COMPLIANCE WITH EXISTING CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS WOULD MINIMIZE RISK.

The Project Area is located within Seismic Zone 4, which the UBC defines as the zone with the highest potential for seismic hazards to occur. The Proposed Project would not exacerbate existing conditions and therefore, as noted above, CEQA does not require an analysis of the environment's impact on the project, this discussion is provided for informational purposes. There are four faults, the Overland, Santa Monica, Newport-Inglewood, and Charnock faults, within two miles of the Project Area. However, none of these faults traverse any of the areas of proposed change. In addition, due to the high potential for seismic hazards, all development in the Los Angeles area, including development that would occur under the Proposed

[8] *California Building Industry Association v. Bay Area Air Quality Management District* (2015), Cal.4th (Case No. S213478)

Project, would be required to adhere to the current seismic design requirements of the CBC and the LABC, which ensure new buildings are designed to withstand seismic events through modern construction techniques. Thus, the Proposed Project would not cause or accelerate substantial damage to structures or infrastructure, or expose people to substantial risk of loss, injury, or death involving a known earthquake fault. Therefore, the Proposed Project would result in no impacts related to fault rupture.

MITIGATION MEASURES

The Proposed Project would not exacerbate existing conditions with respect to risks associated with fault rupture. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to fault rupture were identified to result from the Proposed Project.

IMPACT 4.4-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE OR ACCELERATE GEOLOGIC HAZARDS THAT WOULD EXPOSE PEOPLE OR STRUCTURES TO POTENTIAL SUBSTANTIAL ADVERSE EFFECTS, INCLUDING THE RISK OF LOSS, INJURY, OR DEATH FROM STRONG SEISMIC GROUND SHAKING? THE PROPOSED PROJECT WOULD NOT AFFECT EXISTING GEOLOGIC CONDITIONS AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH POSSIBLE GROUND SHAKING. COMPLIANCE WITH EXISTING CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS WOULD MINIMIZE RISKS.

As noted above, the Project Area is located in the seismically active region of Southern California and would likely be subjected to strong ground shaking during the life of the Proposed Project. While the proposed zoning changes would increase development capacity in the identified subareas of the Project Area, thereby potentially increasing the number of people and structures exposed to strong seismic ground shaking, the Proposed Project would not cause or accelerate existing geologic hazards. This condition exists throughout the Los Angeles area given that it is a seismically active area. The Proposed Project would not exacerbate existing conditions and therefore, as noted above, CEQA does not require an analysis of the environment's impact on the project, this discussion is provided for informational purposes. As discussed above, any new development in the State of California would be required to conform to the current seismic design provisions to ensure new buildings are designed to resist ground shaking through modern construction techniques. Therefore, with compliance with the CBC, the LABC, and Policy 1.1.6 of the Safety Element of the General Plan (as described in the Regulatory Framework, above), the Proposed Project would not change existing conditions with respect to risks associated with seismic ground shaking. Therefore, the Proposed Project would result in no impacts related to ground shaking.

MITIGATION MEASURES

The Proposed Project would not exacerbate existing conditions with respect to risks associated with ground shaking. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to seismic ground shaking were identified to result from the Proposed Project.

IMPACT 4.4-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE OR ACCELERATE GEOLOGIC HAZARDS THAT WOULD EXPOSE PEOPLE OR STRUCTURES TO POTENTIAL SUBSTANTIAL ADVERSE EFFECTS, INCLUDING THE RISK OF LOSS, INJURY, OR DEATH FROM SEISMIC-RELATED GROUND FAILURE, INCLUDING LIQUEFACTION? THE PROPOSED PROJECT WOULD NOT EXACERBATE EXISTING GEOLOGIC AND SOIL CONDITIONS AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH LIQUEFACTION. COMPLIANCE WITH EXISTING CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS WOULD MINIMIZE RISKS.

As shown in **Figure 4.4-2** above, portions of the Project Area, including portions of the Bundy and Culver City Station areas are located within a liquefaction zone. The areas of proposed change around the Bundy Station, which are subject to potential liquefaction, are currently developed with existing structures. While the ECTNP would involve the redevelopment of these areas, it would not cause or accelerate geologic hazards which are common to areas throughout the City and region due to its seismically active nature. The Proposed Project would not exacerbate existing conditions and therefore, as noted above, CEQA does not require an analysis of the environment's impact on the project, this discussion is provided for informational purposes. Prior to construction of new structures in liquefaction-prone areas, a site-specific geotechnical evaluation is required as specified by PRC Section 2697 that would specifically address and include measures to minimize liquefaction. The City also requires that site-specific geotechnical analysis be undertaken to address geologic and soil issues, such as liquefaction. Required compliance with recommendations identified in the project-specific geotechnical evaluation, the LABC, and any specific requirements established by the Los Angeles Department of Public Works (LADPW) and/or the City's Engineer would ensure that future development would not be exposed to substantial risks associated with liquefaction. Compliance with the CBC, the LABC, and Policy 1.1.6 of the Safety Element of the General Plan (as described in the Regulatory Framework, above) would minimize risks associated with existing geology. Therefore, the Proposed Project would result in no impacts related to liquefaction.

MITIGATION MEASURES

The Proposed Project would not exacerbate existing conditions with respect to risks associated with liquefaction. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to liquefaction were identified to result from the Proposed Project.

IMPACT 4.4-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE OR ACCELERATE GEOLOGIC HAZARDS THAT WOULD EXPOSE PEOPLE OR STRUCTURES TO POTENTIAL SUBSTANTIAL ADVERSE EFFECTS, INCLUDING THE RISK OF LOSS, INJURY, OR DEATH FROM SEISMIC-RELATED GROUND FAILURE, INCLUDING LANDSLIDES? THE PROPOSED PROJECT WOULD NOT EXACERBATE EXISTING GEOLOGIC CONDITIONS AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH GROUND FAILURE. COMPLIANCE WITH EXISTING CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS WOULD MINIMIZE RISKS.

As shown in **Figure 4.4-3**, above, the central portion of the ECTNP is susceptible to landslides. The Proposed Project would change the zoning and could encourage growth in landslide areas; however, the Proposed Project would not exacerbate the existing conditions. As noted above, CEQA does not require an analysis of the environment's impact on the project, this discussion is provided for informational purposes. Each new development within the landslide area would have the potential to contain expansive soils but again, the Proposed Project would not exacerbate existing conditions. Expansive soils are generally removed during foundation work to avoid structural damage and may have already been removed by previous

development. Additionally, the City requires that specific geotechnical reports are required to address geologic and soil issues, such as landslide potential. Compliance with the CBC, the LABC, and Policy 1.1.6 of the Safety Element of the General Plan (as described in the Regulatory Framework, above) would minimize risks. Therefore, the Proposed Project would result in no impacts related to landslides and/or expansive soils.

MITIGATION MEASURES

The Proposed Project would not exacerbate conditions with respect to ground failure. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to ground failure were identified to result from the Proposed Project.

IMPACT 4.4-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT BE LOCATED ON GEOLOGIC UNIT THAT IS UNSTABLE, OR THAT WOULD BECOME UNSTABLE AS A RESULT OF THE PROPOSED PROJECT, AND POTENTIALLY RESULT IN ON- OR OFF-SITE LANDSLIDE, LATERAL SPREADING, SUBSIDENCE, LIQUEFACTION OR COLLAPSE? THE PROPOSED PROJECT WOULD NOT EXACERBATE EXISTING GEOLOGIC CONDITIONS AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH GROUND FAILURE. COMPLIANCE WITH EXISTING CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS WOULD MINIMIZE RISKS.

See Impact 4.4-3 for a discussion of liquefaction and Impact 4.4-4 for a discussion of landslides. Future development occurring under the Proposed Project could take place on unstable soils, such as alluvium, which is present in the Project Area. The Proposed Project would not exacerbate existing conditions and therefore, as noted above, CEQA does not require an analysis of the environment's impact on the project, this discussion is provided for informational purposes.

Future development on marine sedimentary rocks, specifically alluvium, lake, playa, and terrace, is potentially subject to seismically induced settlement and could result in lateral spreading, subsidence, liquefaction, or collapse, particularly around the Bundy and Culver City Stations, which are located in a liquefaction zone and where the water table is high. As previously stated, the City requires the approval of a site-specific geotechnical report, required under PRC Section 2697, for new developments where unstable soils may be indicated. In addition, all earthwork and grading activities require grading permits from the LADBS that include requirements and standards designed to limit potential impacts related to soil instability. Compliance with the recommendations of required project-specific geotechnical reports and the LABC, which addresses grading, excavation, and fill, as well as with any specific requirements established by the LADPW and/or the City Engineer would reduce hazards related to unstable soils. Compliance with the CBC, the LABC, and Policy 1.1.6 of the Safety Element of the General Plan (as described in the Regulatory Framework, above) would minimize risks. Therefore, the Proposed Project would result in no impacts related to geologic conditions.

MITIGATION MEASURES

The Proposed Project would not exacerbate existing unstable geologic conditions. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to existing unstable geologic conditions were identified to result from the Proposed Project.

IMPACT 4.4-6 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT LEAD TO CONSTRUCTION ON EXISTING EXPANSIVE SOILS, AS DEFINED IN TABLE 18-1-B OF THE UNIFORM BUILDING CODE (1994), CREATING SUBSTANTIAL RISKS TO LIFE OR PROPERTY? THE PROPOSED PROJECT WOULD NOT EXACERBATE EXISTING SOIL CONDITIONS AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH EXPANSIVE SOILS. COMPLIANCE WITH CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS WOULD MINIMIZE RISKS.

While the Proposed Project may result in redevelopment in areas of expansive soils such as alluvium, it would not create substantial risks to life and property. The Proposed Project would not exacerbate existing conditions and therefore, as noted above, CEQA does not require an analysis of the environment's impact on the project; this discussion is provided for informational purposes. The City requires the preparation, review, and approval of geotechnical reports for new development required under PRC Section 2697. In addition, all earthwork and grading activities require grading permits from the LADBS, compliance with the LAMC, and adherence to the recommendations of a site-specific geotechnical report. Therefore, with compliance with the existing codes and requirements, the Proposed Project would result in no impacts related to expansive soil.

MITIGATION MEASURES

The Proposed Project would not exacerbate existing expansive soils. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to existing expansive soils were identified to result from the Proposed Project.

IMPACT 4.4-7 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN SUBSTANTIAL SOIL EROSION OR THE LOSS OF TOPSOIL? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT WITH COMPLIANCE WITH EXISTING CALIFORNIA BUILDING CODE AND CITY OF LOS ANGELES BUILDING CODE REGULATIONS.

Implementation of the Proposed Project would increase development capacity in the areas of proposed change, which could result in increased grading and subsequent erosion and loss of topsoil within these areas. However, all future construction within these areas of proposed change that would involve earthwork and grading activities would be required to obtain grading permits from the LADBS that include requirements and standards designed to limit potential impacts related to soil erosion. Projects would also be required to comply with the City's Low Impact Development Ordinance (See Section 4.7, Hydrology and Water Quality). All on-site grading and site preparation must comply with applicable provisions of the LABC, which addresses grading, excavation, and fill, as well as recommendations of a site-specific geotechnical report which is required under PRC Section 2697.

Compliance with the City's codes, regulatory requirements, standard grading and building permit requirements, and the application of best management practices would ensure that potential impacts from erosion or loss of top soils would be less than significant. Therefore, the Proposed Project would result in less than significant impacts related to soil erosion and the loss of topsoil.

MITIGATION MEASURES

Impacts related to soil erosion and the loss of topsoil would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to soil erosion and the loss of topsoil under the Proposed Project would be less than significant without mitigation.

IMPACT 4.4-8 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT INVOLVE THE USE OF SEPTIC TANKS OR ALTERNATIVE WASTE WATER DISPOSAL SYSTEM AND, THEREFORE, RESULT IN HAZARDS RELATED TO CONSTRUCTION ON SOILS INCAPABLE OF ADEQUATELY SUPPORTING THE USE OF SEPTIC TANKS OR ALTERNATIVE WASTE WATER DISPOSAL SYSTEMS? NO IMPACTS WOULD OCCUR.

The Project Area, including the areas of proposed change, is currently served by City-owned wastewater treatment and disposal facilities and does not utilize a septic system. Therefore, no impacts related to soil stability around septic tanks or alternative waste water disposal system would occur.

MITIGATION MEASURES

No impacts related to soil stability around septic tanks or alternative waste water disposal system would occur under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to septic tanks would occur under the Proposed Project.

4.5 GREENHOUSE GAS EMISSIONS

This section provides an overview of greenhouse gases (GHG) and evaluates the construction and operational impacts associated with the Proposed Project. Topics addressed include construction emissions and consistency with applicable GHG reduction plans and policies.

GHG emissions refer to a group of emissions that are generally believed to affect global climate conditions. The greenhouse effect compares the Earth and the atmosphere surrounding it to a greenhouse with glass panes. The glass panes in a greenhouse let heat from sunlight in and reduce the amount of heat that escapes. GHGs, such as carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), keep the average surface temperature of the Earth close to 60 degrees Fahrenheit (°F). Without the natural greenhouse effect, the Earth's surface would be about 61°F cooler.[1]

In addition to CO_2, CH_4, and N_2O, GHGs include hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), black carbon (black carbon is the most strongly light-absorbing component of particulate matter emitted from burning fuels such as coal, diesel, and biomass), and water vapor. CO_2 is the most abundant pollutant that contributes to climate change through fossil fuel combustion. The other GHGs are less abundant but have higher global warming potential than CO_2. To account for this higher potential, emissions of other GHGs are frequently expressed in the equivalent of CO_2, denoted as CO_2e. CO_2e is a measurement used to account for the fact that different GHGs have different potential to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. This potential, known as the global warming potential (GWP) of a GHG, is dependent on the lifetime, or persistence, of the gas molecule in the atmosphere. **Table 4.5-1** shows various GWPs.

TABLE 4.5-1: GLOBAL WARMING POTENTIAL FOR VARIOUS GREENHOUSE GASES

Pollutant	Lifetime (Years)	Global Warming Potential (20-Year)	Global Warming Potential (100-Year)
Carbon Dioxide	100	1	1
Nitrous Oxide	121	264	265
Nitrogen Trifluoride	500	12,800	16,100
Sulfur Hexafluoride	3,200	17,500	23,500
Perfluorocarbons	3,000-50,000	5,000-8,000	7,000-11,000
Black Carbon	days to weeks	270-6,200	100-1,700
Methane	12	84	28
Hydrofluorocarbons	Uncertain	100-11,000	100-12,000

SOURCE: CARB, *First Update to the Climate Change Scoping Plan*, May 2014.

REGULATORY FRAMEWORK

In response to growing scientific and political concern with global climate change, a series of federal and state laws have been adopted to reduce GHG emissions.

INTERNATIONAL

U.S.-China Climate Agreement. In November 2014, the United States and China made a joint announcement to cooperate on combatting climate change and promoting clean energy. In the U.S., President Obama announced a climate target to reduce GHG emissions by 26 to 28 percent below 2005

[1]California Environmental Protection Agency Climate Action Team, *Climate Action Report to Governor Schwarzenegger and the California Legislator*, March 2006.

levels by 2025. In China, President Xi Jinping announced a climate target to reduce peak CO_2 emissions by 2030 and to increase the renewable energy share across all sectors to 20 percent by 2030. China will need to build an additional 800 to 1,000 gigawatts of nuclear, wind, solar, and other zero emission generation capacity by 2030 to reach this target. Together, the United States and China have agreed to: expand joint clean energy research and development at the U.S.-China Clean Energy Research Center (CERC), advance major carbon capture, use and storage demonstrations, enhance cooperation on HFCs, launch a climate-smart/low-carbon cities initiative, promote trade in green goods, and demonstrate clean energy on the ground.[2]

Paris United Nations Framework Convention on Climate Change. A new international climate change agreement was adopted at the Paris United Nations Framework Convention on Climate Change climate conference in December 2015. The last two climate conferences in Warsaw (2013) and Lima (2014) decided that countries were to submit their proposed emissions reduction targets for the 2015 conference as "intended nationally determined contributions" prior to the Paris conference. The European Union has committed to an economy-wide, domestic GHG reduction target of 40 percent below 1990 levels by 2030. The United States has set its intended nationally determined contribution to reduce its GHG emissions by 26 to 28 percent below its 2005 level in 2025 and to make best efforts to reduce its emissions by 28 percent. These targets are set with the goal of limiting global temperature rise to well below 2 degrees Celsius and getting to the 80 percent emission reduction by 2050.

North American Climate, Clean Energy, and Environment Partnership Action Plan. The North American Climate, Clean Energy, and Environment Partnership Action Plan was announced by Prime Minister Justin Trudeau, President Barack Obama, and President Enrique Peña Nieto on June 29, 2016, at the North American Leaders Summit in Ottawa, Canada.[3] This Action Plan identifies the deliverables to be achieved and activities to be pursued by the three countries as part of this enduring Partnership. The three leaders declared their common vision in a historic North American Climate, Clean Energy, and Environment Partnership, described in a Leaders' Statement and Action Plan that details the actions our leaders will pursue. These actions include:

- Setting a target to increase clean power to 50 percent of the electricity generated across North America by 2025.
- Reducing methane emissions from the oil and gas sector by 40 to 45 percent by 2025.
- Strengthening standards for energy efficiency and vehicle emissions, including aligning energy efficiency standards that will amount to over $4 billion per year in annual savings for United States businesses and consumers by 2025.
- Strengthening vehicle efficiency, improving fuel quality, and reducing tailpipe pollutants.
- Affirming their support for joining and implementing the Paris Agreement this year and committing to work together to address climate issues through the Montreal Protocol, International Civil Aviation Organization, G-20, and other forums.
- Celebrating our strong environmental cooperation, including expanding cooperation on early warning systems for natural disasters, supporting habitat for migratory species including Monarchs and birds, and developing action plans to combat wildlife trafficking.

FEDERAL

Supreme Court Ruling. The U.S. Supreme Court ruled in *Massachusetts v. Environmental Protection Agency, 127 S. Ct. 1438 (2007)*, that CO_2 and other GHGs are pollutants under the Clean Air Act (CAA), which the U.S. Environmental Protection Agency (USEPA) must regulate if it determines they pose an endangerment to public health or welfare. On December 7, 2009, the USEPA Administrator made two distinct findings: 1) the current and projected concentrations of the six key GHGs in the atmosphere

[2]The White House, *Fact Sheet: U.S.-China Joint Announcement on Climate Change and Clean Energy Cooperation*, November 11, 2014.

[3]The White House, *Fact Sheet: United States Key Deliverables for the 2016 North American Leaders' Summit*, June 29, 2016.

(i.e., CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) threatens the public health and welfare of current and future generations; and 2) the combined emissions of these GHGs from motor vehicle engines contribute to GHG pollution which threatens public health and welfare.

On June 23, 2014, the U.S. Supreme Court ruled in *Utility Air Regulatory Group. v. EPA* that the USEPA exceeded its statutory authority under the CAA when it determined that stationary source emissions of GHGs would trigger permitting obligations under the Prevention of Significant Deterioration (PSD) program and Title V of the CAA. The Court, however, upheld those portions of USEPA's rulemaking that require a source to apply best available control technology (BACT) to GHG emissions where the source would otherwise trigger PSD permitting on account of its emissions of other pollutants. The Supreme Court's decision was limited to USEPA's regulation of GHG emissions under the PSD and Title V provisions of the CAA, and it left unanswered other questions regarding USEPA's permitting and BACT authority under the PSD program, and the USEPA's efforts to regulate GHG emissions from stationary sources.

Energy Independence and Security Act. The Energy Independence and Security Act of 2007 includes several key provisions that will increase energy efficiency and the availability of renewable energy, which will reduce GHG emissions as a result. First, this Act sets a Renewable Fuel Standard that requires fuel producers to use at least 36 billion gallons of biofuel by 2022.[4] Second, this Act increases Corporate Average Fuel Economy Standards to require a minimum average fuel economy of 35 miles per gallon for the combined fleet of cars and light trucks by 2020. Third, this Act includes a variety of new standards for lighting and for residential and commercial appliance equipment. The equipment includes residential refrigerators, freezers, refrigerator-freezers, metal halide lamps, and commercial walk-in coolers and freezers.

National Fuel Efficiency Policy. On May 19, 2009, President Barack Obama announced a new National Fuel Efficiency Policy aimed at increasing fuel economy and reducing GHG pollution.[5] This policy is expected to increase fuel economy by more than five percent by requiring a fleet-wide average of 35.5 miles per gallon by 2016 starting with model year 2012.

Fuel Economy Standards. On September 15, 2009, the USEPA and the Department of Transportation's (DOT) National Highway Traffic Safety Administration (NHTSA) issued a joint proposal to establish a national program consisting of new standards for model year 2012 through 2016 light-duty vehicles that will reduce GHG emissions and improve fuel economy. The proposed standards would be phased in and would require passenger cars and light-duty trucks to comply with a declining emissions standard. In 2012, passenger cars and light-duty trucks would have to meet an average emissions standard of 295 grams of CO_2 per mile and 30.1 miles per gallon. By 2016, the vehicles would have to meet an average standard of 250 grams of CO_2 per mile and 35.5 miles per gallon.[6] The final standards were adopted by the USEPA and DOT on April 1, 2010.

On December 7, 2009, the USEPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA (42 United States Code Section 7521):

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed GHGs (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations.
- Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

[4]According to the United States Energy Information Administration, 36 billion gallons of fuel represents approximately 26 percent of current gasoline consumption.

[5]The White House, Office of the Press Secretary, May 19, 2009, http://www.whitehouse.gov/the_press_office/President-Obama-Announces-National-Fuel-Efficiency-Policy/.

[6]USEPA, *EPA and NHTSA Propose Historic Nation Program*, 2009.

While these findings do not impose additional requirements on industry or other entities, this action is a prerequisite to finalizing the USEPA's proposed GHG emissions standards for light-duty vehicles, which were jointly proposed by the USEPA and the NHTSA. On April 1, 2010, the USEPA and NHTSA issued final rules requiring that by the 2016 model-year, manufacturers must achieve a combined average vehicle emission level of 250 grams CO_2 per mile, which is equivalent to 35.5 miles per gallon as measured by USEPA standards.

Heavy-Duty Vehicle Program. The Heavy-Duty Vehicle Program was adopted on August 9, 2011 to establish the first fuel efficiency requirements for medium- and heavy-duty vehicles beginning with the model year 2014.

Executive Order (E.O.) 13693. Published in June 10, 2015, E.O. 13693, Planning for Federal Sustainability in the Next Decade, revokes multiple prior E.O.s and memorandum including E.O. 13514. The goal of E.O. 13693 is to maintain federal leadership in sustainability and GHG emission reductions. The new E.O. outlines forward-looking goals for federal agencies in the area of energy, climate change, water use, vehicle fleets, construction, and acquisition. Federal agencies shall, where life-cycle cost-effective, beginning in 2016:

- Reduce agency building energy intensity as measured in British Thermal Units per square foot by 2.5 percent annually through 2025;
- Improve data center energy efficiency at agency buildings;
- Ensure a minimum percentage of total building electric and thermal energy shall be from clean energy sources;
- Improve agency water use efficiency and management (including storm water management); and
- Improve agency fleet and vehicle efficiency and management by achieving minimum percentage GHG emission reductions.

STATE

California's Energy Efficiency Standards for Residential and Nonresidential Buildings. Located in Title 24, Part 6 of the California Code of Regulations (CCR) and commonly referred to as "Title 24," these energy efficiency standards were established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods.[7] The most recent update to Title 24 was adopted by the California Energy Commission on April 23, 2008. The requirement for when the 2008 standards must be followed is dependent on when the application for the building permit is submitted. If an application for a building permit is submitted on or after January 1, 2010, the 2008 standards must be met. The California Energy Commission adopted the 2008 changes to the Building Energy Efficiency Standards to respond to the mandates of Assembly Bill (AB) 32 and to pursue California energy policy that energy efficiency is the resource of first choice for meeting California's energy needs.

Assembly Bill (AB) 1493 (Pavley I). AB 1493 adopted in 2002, required the California Air Resource Board (CARB) to develop and adopt standards for vehicle manufacturers to reduce GHG emissions coming from passenger vehicles and light-duty trucks at a "maximum feasible and cost effective reduction" by January 1, 2005. Pavley I took effect for model years starting in 2009 and extending to 2016 and the Low Emission Vehicle (LEV) III GHG will cover 2017 to 2025. It is estimated that the standard will reduce climate change emissions by 30 percent in 2016 compared to the emissions in the same year without the standards.[8]

[7]California Energy Commission, *California's Energy Efficiency Standards for Residential and Nonresidential Buildings, Title 24, Part 6, of the California Code of Regulations*, http://www.energy.ca.gov/title24.

[8]CARB, *Clean Air Standards - Pavley, Assembly Bill 1493*, May 6, 2013.

Senate Bill 1078 (SB 1078), Senate Bill 107 (SB 107), and Executive Order (E.O.) S-14-08 (Renewables Portfolio Standard). Signed on September 12, 2002, SB 1078 required California to generate 20 percent of its electricity from renewable energy by 2017. SB 107, signed on September 26, 2006 changed the due date for this goal from 2017 to 2010, which was achieved by the state. On November 17, 2008, E.O. S-14-08, which established a Renewables Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Increased use of renewable energy sources will decrease California's reliance on fossil fuels, reducing emissions of GHG from the energy sector.

Executive Order (E.O.) S-3-05. On June 1, 2005, E.O. S-3-05 set the following GHG emission reduction targets: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; and by 2050, reduce GHG emissions to 80 percent below 1990 levels. E.O. S-3-05 calls for the Secretary of California Environmental Protection Agency (Cal-EPA) to be responsible for coordination of state agencies and progress reporting. A recent California Energy Commission report concludes, however, that the primary strategies to achieve this target should be major "decarbonization" of electricity supplies and fuels, and major improvements in energy efficiency.[9]

In response to the E.O. S-3-05, the Secretary of the Cal-EPA created the Climate Action Team (CAT). California's CAT originated as a coordinating council and included the Secretaries of the Natural Resources Agency, and the Department of Food and Agriculture, and the Chairs of the CARB, Energy Commission, and Public Utilities Commission. The original council was an informal collaboration between the agencies to develop potential mechanisms for reductions in GHG emissions in the state. The original mandate for the CAT was to develop proposed measures to meet the emission reduction targets set forth in E.O. S-3-05. The CAT has since expanded and currently has members from 18 state agencies and departments. The CAT also has ten working groups which coordinate policies among their members. The working groups and their major areas of focus are:

- Agriculture: Focusing on opportunities for agriculture to reduce GHG emissions through efficiency improvements and alternative energy projects, while adapting agricultural systems to climate change;
- Biodiversity: Designing policies to protect species and natural habitats from the effects of climate change;
- Energy: Reducing GHG emissions through extensive energy efficiency policies and renewable energy generation;
- Forestry: Coupling GHG mitigation efforts with climate change adaptation related to forest preservation and resilience, waste to energy programs and forest offset protocols;
- Land Use and Infrastructure: Linking land use and infrastructure planning to efforts to reduce GHG from vehicles and adaptation to changing climatic conditions;
- Oceans and Coastal: Evaluating the effects sea level rise and changes in coastal storm patterns on human and natural systems in California;
- Public Health: Evaluating the effects of GHG mitigation policies on public health and adapting public health systems to cope with changing climatic conditions;
- Research: Coordinating research concerning impacts of and responses to climate change in California;
- State Government: Evaluating and implementing strategies to reduce GHG emissions resulting from state government operations; and
- Water: Reducing GHG impacts associated with the state's water systems and exploring strategies to protect water distribution and flood protection infrastructure.

The CAT is responsible for preparing reports that summarize the state's progress in reducing GHG emissions. The most recent CAT Report was published in December 2010. The CAT Report discusses mitigation and adaptation strategies, state research programs, policy development, and future efforts.

[9]California Energy Commission, *California's Energy Future – The View to 2050*, May 2011.

Senate Bill 1 (SB 1) and Senate Bill 1017 (SB 1017) (Million Solar Roofs). SB 1 and SB 1017 enacted in August 2006 sets a goal to install 3,000 megawatts of new solar capacity by 2017 - moving the state toward a cleaner energy future and helping lower the cost of solar systems for consumers. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time. It provides up to $3.3 billion in financial incentives that decline over time.

Assembly Bill 32 (AB 32). In September 2006, the California Global Warming Solutions Act of 2006, also known as AB 32, was signed into law. AB 32 focuses on reducing GHG emissions in California, and requires the CARB to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020. The CARB initially determined that the total statewide aggregated GHG 1990 emissions level and 2020 emissions limit was 427 million metric tons of CO_2e. The 2020 target reductions estimated to be 174 million metric tons of CO_2e.

To achieve the goal, AB 32 mandates that the CARB establish a quantified emissions cap, institute a schedule to meet the cap, implement regulations to reduce statewide GHG emissions from stationary sources, and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. Because the intent of AB 32 is to limit 2020 emissions to the equivalent of 1990, it is expected that the regulations would affect many existing sources of GHG emissions and not just new general development projects. SB 1368, a companion bill to AB 32, requires the California Public Utilities Commission (CPUC) and the California Energy Commission to establish GHG emission performance standards for the generation of electricity. These standards will also apply to power that is generated outside of California and imported into the state.

AB 32 charges CARB with the responsibility to monitor and regulate sources of GHG emissions in order to reduce those emissions. On June 1, 2007, CARB adopted three discrete early action measures to reduce GHG emissions. These measures involved complying with a low carbon fuel standard, reducing refrigerant loss from motor vehicle air conditioning maintenance, and increasing methane capture from landfills.[10] On October 25, 2007, CARB tripled the set of previously approved early action measures. The approved measures include improving truck efficiency (i.e., reducing aerodynamic drag), electrifying port equipment, reducing PFCs emissions from the semiconductor industry, reducing propellants in consumer products, promoting proper tire inflation in vehicles, and reducing SF_6 emissions from the non-electricity sector.

The CARB AB 32 Scoping Plan (Scoping Plan) contains the main strategies to achieve the 2020 emissions cap. The Scoping Plan was developed by the CARB with input from the CAT and proposes a comprehensive set of actions designed to reduce overall carbon emissions in California, improve the environment, reduce oil dependency, diversify energy sources, and enhance public health while creating new jobs and improving the state economy. The GHG reduction strategies contained in the Scoping Plan include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms such as a cap-and-trade system. Key approaches for reducing GHG emissions to 1990 levels by 2020 include:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
- Achieving a statewide renewable electricity standard of 33 percent;
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system;
- Establishing targets for transportation-related GHG emissions for regions throughout the state, and pursuing policies and incentives to achieve those targets; and
- Adopting and implementing measures to reduce transportation sector emissions.

[10]CARB, *Proposed Early Action Measures to Mitigate Climate Change in California*, April 20, 2007.

CARB has adopted the First Update to the AB 32 Scoping Plan.[11] This Update identifies the next steps for California's leadership on climate change. The First Update to the initial AB 32 Scoping Plan describes progress made to meet the near-term objectives of AB 32 and defines California's climate change priorities and activities for the next several years. It also frames activities and issues facing the state as it develops an integrated framework for achieving both air quality and climate goals in California beyond 2020. Specifically, the Update covers a range of topics:

- An update of the latest scientific findings related to climate change and its impacts, including short-lived climate pollutants.
- A review of progress-to-date, including an update of Scoping Plan measures and other state, federal, and local efforts to reduce GHG emissions in California.
- Potential technologically feasible and cost-effective actions to further reduce GHG emissions by 2020.
- Recommendations for establishing a mid-term emissions limit that aligns with the state's long-term goal of an emissions limit 80 percent below 1990 levels by 2050.
- Sector-specific discussions covering issues, technologies, needs, and ongoing state activities to significantly reduce emissions throughout California's economy through 2050.

As discussed above, in December 2007, CARB approved a total statewide GHG 1990 emissions level and 2020 emissions limit of 427 million metric tons of CO_2e. As part of the Update, CARB revised the 2020 statewide limit to 431 million metric tons of CO_2e, an approximately one percent increase from the original estimate. The revised estimate includes incorporation of the Pavley standards in the business-as-usual (BAU) forecast. The 2020 BAU forecast in the Update is 509 million metric tons of CO_2e. The state would need to reduce those emissions by 15 percent to meet the 431 million metric tons of CO_2e 2020 limit.

Senate Bill 1368 (SB 1368). SB 1368 adopted on September 19, 2006, directs the California Energy Commission and the CPUC to adopt a performance standard for GHG emissions for the future electricity used in California, regardless of whether it is generated in-state or purchased from other states.

Executive Order (E.O.) S-1-07, the Low Carbon Fuel Standard. On January 18, 2007, E.O. S-1-07 was issued requiring a reduction of at least ten percent in the carbon intensity of California's transportation fuels by 2020. Regulatory proceedings and implementation of the Low Carbon Fuel Standard are CARB's responsibility. The Low Carbon Fuel Standard has been identified by CARB as a discrete early action item in the CARB Scoping Plan. CARB expects the Low Carbon Fuel Standard to achieve the minimum ten percent reduction goal; however, many of the early action items outlined in the Scoping Plan work in tandem with one another. To avoid the potential for double-counting emission reductions associated with Assembly Bill 1493 (see previous discussion), the Scoping Plan has modified the aggregate reduction expected from the Low Carbon Fuel Standard to 9.1 percent.

Assembly Bill 811 (AB 811). AB 811, enacted July 21, 2008, authorizes California cities and counties to designate districts within which willing property owners may enter into contractual assessments to finance the installation of renewable energy generation and energy efficiency improvements that are permanently fixed to the property.

Senate Bill 375 (SB 375). SB 375, adopted in September 30, 2008, provides a means for achieving Assembly Bill 32 goals through the reduction in emissions by cars and light trucks. SB 375 requires Regional Transportation Plans (RTPs) prepared by metropolitan planning organizations (MPOs) to include Sustainable Communities Strategies (SCSs). In adopting SB 375, the Legislature found that improved coordination between land use planning and transportation planning is needed in order to achieve the GHG emissions reduction target of AB 32. Further, the staff analysis for the bill prepared for the Senate Transportation and Housing Committee's August 29, 2008 hearing on SB 375 began with the following

[11]CARB, *First Update to the Climate Change Scoping Plan*, May 2014.

statement: "According to the author, this bill will help implement AB 32 by aligning planning for housing, land use, transportation and greenhouse gas emissions for the 17 MPOs in the state."

Executive Order (E.O.) S-13-08. On November 14, 2008, E.O. S-13-08 was signed to direct California to develop methods for adapting to climate change impacts through preparation of a statewide plan. In response to this order, the California Natural Resources Agency coordinated with ten state agencies, multiple scientists, a consulting team, and stakeholders to develop the first statewide, multi-sector adaptation strategy in the country. The resulting report, 2009 California Climate Adaptation Strategy, summarizes the best-known science to assess the vulnerability of the state to climate change impacts, and outlines possible solutions that can be implemented within and across state agencies to promote resiliency. This strategy is the first step in an evolving process to reduce California's vulnerability to climate change impacts.

Adaptation refers to efforts that prepare the state to respond to the impacts of climate change – adjustments in natural or human systems to actual or expected climate changes to minimize harm or take advantage of beneficial opportunities. California's ability to manage its climate risks through adaptation depends on a number of critical factors. These include its baseline and projected economic resources, technology, infrastructure, institutional support and effective governance, public awareness, access to the best available scientific information, sustainably-managed natural resources, and equity in access to these resources.

State CEQA Guidelines Section 15064.4. Requires that, in performing environmental review under CEQA, an agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. The lead agency has discretion to determine whether to use a model or methodology to quantify GHG emissions, and which model or methodology to use, or rely on a qualitative analysis or performance-based standards. The lead agency should consider the following factors, among others, when assessing the significance of impacts from GHG emissions on the environment.

- The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

Senate Bill 743 (SB 743). SB 743, adopted September 27, 2013, encourages land use and transportation planning decisions and investments that reduce vehicle miles traveled (VMT), which contribute to GHG emissions, as required by AB 32. Key provisions of SB 743 include reforming aesthetics and parking CEQA analysis for urban infill projects and eliminating the measurement of auto delay, including level of service (LOS), as a metric that can be used for measuring traffic impacts in transit priority areas. SB 743 requires the Governor's Office of Planning and Research (OPR) to develop revisions to the CEQA Guidelines establishing criteria for determining the significance of transportation impacts of projects within transit priority areas that promote the "…reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses". It also allows OPR to develop alternative metrics outside of transit priority areas.

California Green Building Code (CalGreen). The California Green Building Code, referred to as CalGreen, is the first statewide green building code. It was developed to provide a consistent, approach for green building within California. CalGreen lays out minimum requirements for newly constructed buildings in California, which will reduce GHG emissions through improved efficiency and process improvements. It

requires builders to install plumbing that cuts indoor water use by as much as 20 percent, to divert 50 percent of construction waste from landfills to recycling, and to use low-pollutant paints, carpets, and floors. CalGreen is updated every three years.

Senate Bills 1078/107/X 1-2, Renewables Portfolio Standard and Renewable Energy Resources Act. SB 1078 and 107, California's Renewables Portfolio Standard, obligated investor-owned energy service providers and Community Choice Aggregations to procure an additional 1 percent of retail sales per year from eligible renewable sources until 20 percent was reached (by 2010). The CPUC and California Energy Commission are jointly responsible for implementing the program. SB X 1-2, called the California Renewable Energy Resources Act, obligates all California electricity providers to obtain at least 33 percent of their energy from renewable resources by 2020.

Executive Order (E.O.) S-01-07. This E.O. S-01-07 established a Low-Carbon Fuel Standard and directed the Secretary of the California Environmental Protection Agency (Cal/EPA) to develop and propose protocols for measuring the life-cycle carbon intensity of transportation fuels.

Executive Order B-30-15. On April 29, 2015, Governor Brown issued E.O. B-30-15, stating a new statewide policy goal to reduce GHG emissions 40 percent below their 1990 levels by 2030. The EO establishes GHG emissions reduction targets to reduce emissions to 80 percent below 1990 levels by 2050 and sets an interim target of emissions reductions for 2030 as being necessary to guide regulatory policy and investments in California and put California on the most cost-effective path for long-term emissions reductions. The EO orders "all state agencies with jurisdiction over sources of [GHG] emissions [to] ... implement measures, pursuant to statutory authority, to achieve reductions of [GHG] emissions to meet the 2030 and 2050 [GHG] emissions reductions targets." It directs CARB to "update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent." It directs the Natural Resources Agency to update "Safeguarding California" (the state's climate adaptation strategy) every three years, as specified; directs state agencies to "take climate change into account in their planning and investment decisions, and employ full life-cycle cost accounting to evaluate and compare infrastructure investments and alternatives"; and orders the "Five-Year Infrastructure Plan [to] take current and future climate change impacts into account in all infrastructure projects." Among its other directives, the E.O. provides that "state agencies' planning and investment shall be guided by the ... principle that priority should be given to actions that both build climate preparedness and reduce GHG emissions."

Senate Bill No. 32 (SB 32). On September 8, 2016, California signed into law SB 32, which adds Section 38566 to the Health and Safety Code and requires a commitment to reducing statewide GHG emissions by 2020 to 1990 levels and by 2030 to 40 percent less than 1990 levels. SB 32 was passed with companion legislation AB 197, which provides additional direction for developing the Scoping Plan. Recently, CARB released the Proposed 2017 Climate Change Scoping Plan Update (Proposed 2017 Update), which outlines the proposed framework of action for achieving California's new SB 32 2030 GHG target: a 40 percent reduction in GHG emissions by 2030 relative to 1990 levels.[12] The 2030 target is intended to ensure that California remains on track to achieve the goal set forth by E.O. B-30-15 to reduce statewide GHG emissions by 2050 to 80 percent below 1990 levels.

The Proposed 2017 Update identifies key sectors of the implementation strategy, which includes improvements in low carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 MMTCO2e, and that further commitments will need to be made to achieve an additional reduction of 50 MMTCO2e beyond current policies and programs. Key elements of the Proposed 2017 Update include a proposed 20 percent reduction in GHG emissions from refineries and an

[12]CARB, *The 2017 Climate Change Scoping Plan Update: The Proposed Strategy for Achieving California's 2030 Greenhouse Gas Target*, January 20, 2017.

expansion of the Cap-and-Trade program to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2050 limit set forth by E.O. B-30-15. The Proposed 2017 Update indicates that stronger SB 375 reduction targets are needed to meet the state's 2030 and 2050 goals and that, "[m]ore needs to be done to fully exploit synergies with emerging mobility solutions like ridesourcing and more effective infrastructure planning to anticipate and guide the necessary changes in travel behavior, especially among millennials. Stronger SB 375 reduction targets will likely encourage further densification around transit infrastructure.

REGIONAL

Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS).[13] While Southern California is a leader in reducing emissions and ambient levels of air pollutants are improving, the SCAG region continues to have the worst air quality in the nation. SCAG is the MPO for the six-county region that includes Los Angeles, Orange, Riverside, Ventura, San Bernardino and Imperial counties. SCAG adopted the 2012-2035 RTP/SCS on April 4, 2012, and it includes a strong commitment to reduce emissions from transportation sources to comply with SB 375. Goals and policies included in the RTP/SCS to reduce air pollution consist of adding density in proximity to transit stations, mixed-use development and encouraging active transportation (i.e., non-motorized transportation such as bicycling). SCAG promotes the following policies and actions related to active transportation to help the region confront congestion and mobility issues and consequently improve air quality:

- Implement Transportation Demand Management (TDM) strategies including integrating bicycling through folding bikes on buses programs, triple racks on buses, and dedicated racks on light and heavy rail vehicles;
- Encourage and support local jurisdictions to develop "Active Transportation Plans" for their jurisdiction if they do not already have one;
- Expand Compass Blueprint program to support member cities in the development of bicycle plans;
- Expand the Toolbox Tuesday's program to encourage local jurisdictions to direct enforcement agencies to focus on bicycling and walking safety to reduce multimodal conflicts;
- Support local advocacy groups and bicycle-related businesses to provide bicycle-safety curricula to the general public;
- Encourage children, including those with disabilities, to walk and bicycle to school;
- Encourage local jurisdictions to adopt and implement the proposed SCAG Regional Bikeway Network; and
- Support efforts by local jurisdictions to connect all of the cities within the SCAG region via bicycle facilities.

SB 375 requires CARB to develop regional CO_2 emission reduction targets (exclusive of Pavley emissions that are counted separately), compared to 2005 emissions, for cars and light trucks only for 2020 and 2035 for each MPO. Each MPO is to prepare an SCS as part of the RTP in order to reduce CO_2 by better aligning transportation, land use, and housing. For SCAG, the targets in the adopted 2012-2035 RTP/SCS were to reduce per capita emissions 8 percent below 2005 levels by 2020 and 13 percent below 2005 levels by 2035. The 2012-2035 RTP/SCS determined that per capita CO_2 emissions from cars and light trucks only (not counting emission reductions from implementation of Pavley regulations) would be 20.5 pounds per day in 2035. The 2012-2035 RTP/SCS would have resulted in a 16 percent decrease in per capita CO_2 emissions

[13]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. The 2016-2040 RTP/SCS is discussed for informational purposes.

from 2005 to 2035 (again not counting Pavley emissions reductions), which exceeds the SCAG emissions reduction target. During the preparation of the ECTNP Draft EIR the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available.

Southern California Association of Governments (SCAG) 2016–2040 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS).[14] On April 7, 2016, SCAG adopted the 2016–2040 RTP/SCS, after the analysis in the ECTNP EIR was completed. The 2016-2040 RTP/SCS builds on the success of the 2012-2035 RTP/SCS and continues the commitment to reduce emissions from transportation sources to comply with SB 375. Goals of the 2016–2040 RTP/SCS remain similar to those of the 2012-2035 RTP/SCS. The 2016-2040 RTP/SCS continues to chart a course for closely integrating land use and transportation in certain areas of the region so that the region can grow smartly and sustainably. It outlines $556.5 billion in transportation system investments through 2040. The 2016-2040 RTP/SCS was prepared through a collaborative, continuous and comprehensive process by SCAG, and it serves as an update to SCAG's 2012-2035 RTP/SCS.

For SCAG, the SB 375 targets are to reduce per capita emissions 8 percent below 2005 levels by 2020 and 13 percent below 2005 levels by 2035. The 2016–2040 RTP/SCS states that the region will meet or exceed the SB 375 per capita targets, lowering regional per capita GHG emissions (below 2005 levels) by eight percent by 2020 and 18 percent by 2035. The 2016–2040 RTP/SCS also states that regional 2040 per capita emissions would be reduced by 22 percent, although CARB has not established a 2040 per capita emissions target.

Major themes in the 2016-2040 RTP/SCS that are relevant to the Proposed Project include integrating strategies for land use and transportation, striving for sustainability, protecting and preserving the existing transportation infrastructure, increasing capacity through improved system management, and giving people more transportation choices. Importantly, the 2016-2040 RTP/SCS states that the region will meet or exceed the SB 375 per capita targets, lowering regional per capita GHG emissions (below 2005 levels) by eight percent by 2020 and 18 percent by 2035. The 2016-2040 RTP/SCS also states that regional 2040 per capita emissions would be reduced by 22 percent, although CARB has not established a 2040 per capita emissions target.

South Coast Air Quality Management District (SCAQMD). The SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the AQMP. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy.

SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds. In its October 2008 document, the SCAQMD proposed the use of a percent emission reduction target (e.g., 30 percent) to determine significance for commercial/residential projects that emit greater than 3,000 metric tons per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where the SCAQMD is the lead agency. However, SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects) and has formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds.

[14]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. The 2016-2040 RTP/SCS is discussed for informational purposes.

The GHG CEQA Significance Threshold Working Group is tasked with providing guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. Members of the working group include government agencies implementing CEQA and representatives from various stakeholder groups that will provide input to the SCAQMD staff on developing CEQA GHG significance thresholds. The working group is currently discussing multiple methodologies for determining project significance. These methodologies include categorical exemptions, consistency with regional GHG budgets in approved plans, a numerical threshold, performance standards, and emissions offsets.

LOCAL

GreenLA Climate Action Plan (CAP). The City of Los Angeles has issued guidance promoting sustainable development to reduce GHG emissions citywide in the form of a CAP. The objective of GreenLA is to reduce GHG emissions 35 percent below 1990 levels by 2030.[15] GreenLA identifies goals and actions designed to make the City a leader in confronting global climate change. The measures would reduce emissions directly from municipal facilities and operations, and create a framework to address citywide GHG emissions. GreenLA lists various focus areas in which to implement GHG reduction strategies. Focus areas include energy, water, transportation, land use, waste, port, airport, and ensuring that changes to the local climate are incorporated into planning and building decisions. City goals for each focus area are identified as follows:

Energy
- Increase the generation of renewable energy;
- Encourage the use of mass transit;
- Develop sustainable construction guidelines;
- Increase City-wide energy efficiency; and
- Promote energy conservation.

Water
- Decrease per capita water use to reduce electricity demand associated with water pumping and treatment.

Transportation
- Power the City vehicle fleet with alternative fuels; and
- Promote alternative transportation (e.g., mass transit and rideshare).

Other Goals
- Create a more livable City through land use regulations;
- Increase recycling, reducing emissions generated by activity associated with the Port of Los Angeles and regional airports;
- Create more City parks, promoting the environmental economic sector; and
- Adapt planning and building policies to incorporate climate change policy.

In order to provide detailed information on action items discussed in GreenLA, the City published an implementation document titled "ClimateLA". ClimateLA presents the existing GHG inventory for the City, includes enforceable GHG reduction requirements, provides mechanisms to monitor and evaluate progress, and includes mechanisms that allow the plan to be revised in order to meet targets. By 2030, the plan aims to reduce GHG emissions by 35 percent from 1990 levels which were estimated to be approximately 54.1 million metric tons.

Therefore, the City will need to lower annual GHG emissions to approximately 35.1 million metric tons per year by 2030. To achieve these reductions the City has developed strategies that focus on energy, water use, transportation, land use, waste, open space and greening, and economic factors. To reduce emissions from

[15]City of Los Angeles, *GreenLA: An Action Plan to Lead the Nation in Fighting Global Warming*, May 2007.

energy usage, ClimateLA proposes the following goals: increase the amount of renewable energy provided by the Los Angeles Department of Water and Power; present a comprehensive set of green building policies to guide and support private sector development; reduce energy consumed by City facilities and utilize solar heating where applicable; and help citizens to use less energy. With regard to waste, ClimateLA sets the goal of reducing or recycling 70 percent of trash by 2015. With regard to open space and greening, ClimateLA includes the following goals: create 35 new parks; revitalize the Los Angeles River to create open space opportunities; plant one million trees throughout the City; identify opportunities to "daylight" streams; identify promising locations for stormwater infiltration to recharge groundwater aquifers; and collaborate with schools to create more parks in neighborhoods.

Sustainable City pLAn. In addition to GreenLA, Mayor Eric Garcetti released Los Angeles' first-ever Sustainable City pLAn on April 8, 2015.[16] The Sustainable City pLAn is a roadmap to achieving short-term results, and sets a path to strengthen and transform the City in future decades. Recognizing the risks posed by climate change, Mayor Garcetti set time-bound outcomes on climate action, most notably to reduce GHG emissions by 45 percent by 2025, 60 percent by 2035, and 80 percent by 2050, all against a 1990 baseline. Through the completion and verification of the GHG inventory update, the City concluded that:

- The City accounted for approximately 36.2 million metric tons of CO_2e in 1990;
- The City's most recent inventory shows that emissions fell to 29 million metric tons of CO_2e in 2013.
- L.A.'s emissions are 20 percent below the 1990 baseline as of 2013, putting L.A. nearly halfway to the 2025 Sustainable City pLAn reduction target of 45 percent. In addition, the 20 percent reduction exceeds the 15 percent statewide goal listed in the First Update to the AB 32 Scoping Plan.

Los Angeles Green Building Code (LAGBC). The purpose of the City's Green Building Code is to reduce the use of natural resources, create healthier living environments and minimize the negative impacts of development on local, regional, and global ecosystems. The program consists of a Standard of Sustainability and Standard of Sustainable Excellence. The program addresses five key areas:

- Site: location, site planning, landscaping, storm water management, construction and demolition recycling;
- Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation;
- Energy & Atmosphere: energy efficiency, and clean/renewable energy;
- Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and
- Indoor Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control.

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50 percent of the existing building's replacement cost.

The voluntary Standard of Sustainable Excellence establishes an incentive program for projects that register with the LEED program, contract with a certified LEED professional, and can demonstrate how the project will achieve LEED certification at a Silver or higher level.

[16]City of Los Angeles, *Los Angeles Climate Action Report: Updated 1990 Baseline and 2013 Emissions Inventory Summary*, 2015.

EXISTING SETTING

GLOBAL

GHGs are the result of both natural and human-influenced activities. Volcanic activity, forest fires, decomposition, industrial processes, landfills, consumption of fossil fuels for power generation, transportation, heating, and cooling are the primary sources of GHG emissions. Without human activity, the Earth would maintain an approximate, but varied, balance between the emission of GHGs into the atmosphere and the storage of GHGs in oceans and terrestrial ecosystems. Increased combustion of fossil fuels (e.g., gasoline, diesel, coal, etc.) has contributed to a rapid increase in atmospheric levels of GHGs over the last 150 years.

The primary effect of rising global concentrations of atmospheric GHG levels is a rise in the average global temperature of approximately 0.2 degrees Celsius per decade, determined from meteorological measurements worldwide between 1990 and 2005. Climate change modeling using 2000 emission rates shows that further warming is likely to occur given the expected rise in global atmospheric GHG concentrations from innumerable sources of GHG emissions worldwide (including from economically developed and developing countries and deforestation), which would induce further changes in the global climate system during the current century.[17] Adverse impacts from global climate change worldwide and in California include:

- Declining sea ice and mountain snowpack levels, thereby increasing sea levels and sea surface evaporation rates with a corresponding increase in atmospheric water vapor due to the atmosphere's ability to hold more water vapor at higher temperatures;[18]
- Rising average global sea levels primarily due to thermal expansion and the melting of glaciers, ice caps, and the Greenland and Antarctic ice sheets;[19]
- Changing weather patterns, including changes to precipitation, ocean salinity, and wind patterns, and more energetic aspects of extreme weather including droughts, heavy precipitation, heat waves, extreme cold, and the intensity of tropical cyclones;[20]
- Declining Sierra Mountains snowpack levels, which account for approximately half of the surface water storage in California, by 70 percent to as much as 90 percent over the next 100 years;[21]
- Increasing the number of days conducive to ozone formation (e.g., clear days with intense sun light) by 25 percent to 85 percent (depending on the future temperature scenario) in high ozone areas located in the Southern California area and the San Joaquin Valley by the end of the 21st Century;[22] and
- Increasing the potential for erosion of California's coastlines and seawater intrusion into the Sacramento Delta and associated levee systems due to the rise in sea level.[23]

Scientific understanding of the fundamental processes responsible for global climate change has improved over the past decade. However, there remain significant scientific uncertainties, for example, in predictions of local effects of climate change, occurrence of extreme weather events, and effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, volcanic activity, and changes in oceanic circulation. Due to the complexity of the climate system, the uncertainty surrounding the implications of climate change may never be completely eliminated. Because of these uncertainties, there continues to be significant debate as to the extent to which increased concentrations of GHGs have caused or will cause

[17]See, e.g., Environmental Protection Agency, Draft Endangerment Finding, 74 Fed. Reg. 18886, 18904 (April 24, 2009) ("cumulative emissions are responsible for the cumulative change in the stock of concentrations in the atmosphere"); see also 74 Fed. Reg. 66496, 66538 (same in Final Endangerment Finding).

climate change, and with respect to the appropriate actions to limit and/or respond to climate change. Given the scale over which climate change occurs, as well as the uncertainties described above, it is not possible to link specific development projects to future specific climate change impacts, though estimating project-specific emissions is possible.

STATE

CARB has prepared a statewide emissions inventory covering 2000 to 2014, which demonstrates that GHG emissions have decreased by 7.9 percent over that period.[24] Emissions in 2014 from the transportation sector, which represents California's largest source of GHG emissions and contributed 37 percent of total annual emissions, declined marginally relative to 2011 even while the economy and population continued to grow over that three-year time period.[25]

The long-term direction of transportation-related GHG emissions is another clear trend, with a 13 percent drop over the past ten years. **Table 4.5-2** shows GHG emissions from 2005 to 2014 in California. On a local level, the majority of GHG emissions within the Project Area can be attributed to automobile exhaust. Major freeways and a number of primary roadways are adjacent to or within the limits of the Project Area. There are also a number of primary roadways. Direct sources of emissions include solid waste decomposition, haul trucks, and the use of refrigerant compounds.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to greenhouse gases if it would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; and/or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

The criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide) was published prior to the implementation of the GHG requirements in the CEQA Guidelines. The City's Thresholds Guide does not include GHG significance thresholds. The City has not adopted GHG significance thresholds. The

[24] CARB, *California Greenhouse Gas Inventory 2000-2014*, March 30, 2016.
[25] *Ibid.*

SCAQMD has yet to adopt a GHG significance threshold for land use development projects, although it has adopted significance thresholds for industrial-type projects for which it is the lead agency. Those industrial thresholds are not relevant to the Proposed Project. In the absence of adopted thresholds, the City has the discretion to use a significance threshold relevant to the Proposed Project.

On November 30, 2015, the California Supreme Court issued an opinion on GHG significance thresholds for CEQA in the case *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife*. The following discussion is paraphrased from that case, which assessed the use of GHG significance thresholds.

The Court stated that California air pollution control officials and air quality districts have made several proposals for numerical thresholds. Multiple agencies' efforts at framing GHG significance issues have not yet coalesced into any widely-accepted set of numerical significance thresholds, but have produced a certain level of consensus on the value of AB 32 consistency as a criterion. Neither AB 32 nor the CARB Scoping Plan set out a mandate or method for CEQA analysis of GHG emissions from a proposed project. A 2007 CEQA amendment, however, required the preparation, adoption and periodic update of guidelines for mitigation of GHG impacts. The resulting state direction was that a lead agency should attempt to describe, calculate or estimate the amount of GHG the project will emit, but recognizes that agencies have discretion in how to do so. It goes on to provide that when assessing the significance of GHG emissions, the agency should consider these factors among others: (1) The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

The Court also acknowledged that the scope of global climate change and the fact that GHGs, once released into the atmosphere, are not contained in the local area of their emission means that the impacts to be evaluated are global rather than local. For many air pollutants, the significance of their environmental impact may depend greatly on where they are emitted; for GHG, it does not. For projects, like the ECTNP, which are designed to accommodate long-term growth in California population and economic activity in a sustainable manner, this fact gives rise to an argument that a certain amount of GHG emissions is as inevitable as population growth. Under this view, a significance criterion framed in terms of efficiency and conservation in land use (as compared to a BAU pattern of growth) is superior to a simple numerical threshold because CEQA is not intended as a population control measure.

This consideration favors consistency with AB 32's statewide goals as a permissible significance criterion for project GHG emissions. Meeting statewide reduction goals does not preclude all new development. Rather, the Scoping Plan, the state's roadmap for meeting AB 32's target, assumes continued growth and depends on increased efficiency and conservation in land use and transportation from all Californians. To the extent, a project incorporates efficiency and conservation measures sufficient to contribute its portion of the overall GHG reductions necessary for the entire state, one can reasonably argue that a project's impact is not cumulatively considerable, because it would be helping to solve the cumulative problem of greenhouse gas emissions as envisioned by California law. Given the reality of growth, some GHG emissions from new housing and commercial developments are inevitable. The critical CEQA question is the cumulative significance of a project's GHG emissions, and from a climate change point of view it does not matter where in the state those emissions are produced. Under these circumstances, evaluating the significance of a residential or mixed use project's GHG emissions by their effect on the state's efforts to meet its long-term goals is a reasonable threshold.

Using consistency with AB 32's statewide goal for GHG reduction, rather than a numerical threshold, as a significance criterion is also consistent with the broad guidance provided by Section 15064.4 of the CEQA Guidelines. Section 15064.4 was drafted to reflect that there is no iron-clad definition of significance. Section 15064.4 was not intended to restrict agency discretion in choosing a method for assessing GHG emissions, but rather to assist lead agencies in investigating and disclosing all that they reasonably can regarding a project's GHG emissions impacts.

Based on the above discussion provided by the California Supreme Court, the City of Los Angeles has chosen to use as a threshold of significance for this EIR consistency with the following plans: AB 32, the 2012-2035 RTP/SCS,[26] SB 375 and objectives of the GreenLA Climate Action Plan.

Emissions are estimated for purposes of quantifying the magnitude of GHG emissions that could result from the Proposed Project, but consistency with AB 32, the 2012-2035 RTP/SCS, and SB 375 is assessed based on a qualitative evaluation as land use patterns can only contribute to a portion of the state and regional emission reduction goals. Consistency with AB 32 is assessed based on meeting the statewide goals, as described above, which have annual targets for the state, but no specific thresholds for individual projects. Additionally, the *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife* case held that individual projects are not responsible for meeting a specific numerical threshold. Consistency with the 2012-2035 RTP/SCS is assessed by a review of project consistency with relevant goals and/or objectives in those documents including a discussion of how the Proposed Project relates to those goals and/or objectives. Consistency with SB 375 is based on consistency with the estimated per capita emission rate for passenger vehicles and light trucks of 20.5 pounds per day in 2035, as identified in the 2012-2035 RTP/SCS.

METHODOLOGY

GHG emissions result from direct and indirect sources. Direct emissions include emissions from fuel combustion in vehicles and natural gas combustion from stationary sources. Indirect sources include off-site emissions occurring as a result of electricity and water consumption and solid waste. In addition, construction activities would result in direct and indirect emissions.

Mobile source emissions were estimated using vehicle miles traveled (VMT) data presented in Section 4.12 Transportation & Traffic, and vehicle emission rates from the CARB's EMFAC2014 model. The VMT data included speed information, which allowed the analysis to account for increased congestion in build scenarios.

Area source emissions related to existing and future demand for water, wastewater treatment and conveyance, solid waste disposal, and energy were obtained according to the methodology explained in Appendix A of the Calculation Details for California Emissions Estimator Model (CalEEMod).[27] GHG emissions result from the energy used to supply, distribute, and treat water and wastewater, as well as from solid waste disposal by landfilling, recycling, or composting as methane and CO_2 gas is emitted in the process.

GHG emissions would also be generated by construction activity within the Project Area consistent with the ECTNP. No specific development projects have been proposed in this planning analysis, and an annualized

[26]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR.

[27]California Air Pollution Control Officers Association, California Emissions Estimator Model (Version 2016.3.1), September 2016.

quantification of construction emissions would be speculative. In addition, construction-related GHG emissions would be a negligible percentage of total regional emissions when considering the emissions generated by mobile sources. For example, the 2012-2035 RTP/SCS construction emissions presented for 2035 conditions in Los Angeles County were approximately 0.3 percent of annual mobile source emissions. A similar percentage is expected for construction emissions related to the Proposed Project. Construction emissions are presented below based on this methodology, and amortized over 30 years in accordance with SCAQMD recommendations.

ALTERNATIVE COMPLIANCE SCENARIO

As discussed in Chapter 3.0, Project Description, the ECTNP includes an Alternative Compliance procedure that would allow designated sites (within the areas of proposed change) to have a different mix of residential and non-residential uses than required per the zoning of the property. Projects utilizing this path would still be subject to the maximum floor area ratio (FAR) and other zoning and development standards. Alternative Compliance would result in increased residential land use and decreased non-residential land use on a given parcel, but not increased FAR. Because residential uses demand less energy and water and generate less wastewater and solid waste than non-residential uses, GHG emissions under Alternative Compliance scenario would be the same or less than the Proposed Project. Therefore, a separate Alternative Compliance scenario is not analyzed herein.

IMPACTS

IMPACT 4.5-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT GENERATE GHG EMISSIONS, EITHER DIRECTLY OR INDIRECTLY, THAT MAY HAVE A SIGNIFICANT IMPACT ON THE ENVIRONMENT?

IMPACT 4.5-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CONFLICT WITH AN APPLICABLE PLAN, POLICY OR REGULATION ADOPTED FOR THE PURPOSE OF REDUCING GHG EMISSIONS?

THESE POTENTIAL IMPACTS ARE RELATED AND WOULD BE LESS THAN SIGNIFICANT.

GHG Emissions Generation. Implementation of the Proposed Project would generate GHG emissions through the construction and operation of new land uses throughout the Project Area. GHG emissions would specifically arise from construction and from sources associated with operation, including direct sources such as motor vehicles, natural gas consumption, solid waste handling/treatment, and indirect sources such as electricity generation.

Table 4.5-3 shows annual GHG emissions for Existing (2013), 2015 With Project, 2035 No Project, and 2035 With Project conditions within the entire ECTNP. The conservative analysis includes some of the known emission control requirements (such as Pavley regulations) but does not fully account for anticipated laws (such as increasingly stringent Title 24 standards) that will further reduce future GHG emissions. Quantification of emissions in the Project Area is presented for the purposes of identifying the magnitude of anticipated emissions that could result from the Project in order to inform the public and decision makers. The quantified emissions are not used to compare against a numeric threshold, because as explained above, there is no consensus as to an appropriate threshold for individual projects, let alone land use plans.

As shown in **Table 4.5-3**, 2035 With Project emissions would be 16,785 Metric Tons per year less than Existing (2013) conditions. Although the 2035 With Project conditions reflect increased development and associated energy use, transportation emissions in 2035 With Project would be less than Existing (2013) due to lower vehicle exhaust emissions anticipated in the future. **Table 4.5-3** also shows that 2015 With Project emissions would be greater than Existing (2013) emissions, since the 2015 With Project scenario reflects the increased development and VMT from the Project without the benefit of vehicle emissions benefits expected in the future. Finally, **Table 4.5-3** shows that in the Project Area, 2035 With Project would result in 75,965 Metric Tons per year greater emissions than 2035 No Project due to the increased development anticipated from the Proposed Project. Even though 2035 With Project shows greater emissions compared to 2035 No Project, emissions in 2035 With Project are less than Existing (2013) emissions.

TABLE 4.5-3: GREENHOUSE GAS EMISSIONS

	CO_2e Emissions in ECTNP Area (Metric Tons per Year)

Regional Perspective. To assess future GHG emission reductions resulting from a development project, the Future with Project condition is often compared to a BAU condition – typically the proposed development without regulatory or standard GHG reduction measures. For a planning project, such as the ECTNP, BAU is much more difficult to determine and would be entirely speculative to quantify. While the 2035 No Project condition for the immediate Project Area, shown in **Table 4.5-3**, identifies what is reasonably foreseeable to occur in the Project area if the Project were not to proceed, it is not a complete picture of BAU for the region. The Project is a planned response to forecast growth, so if growth does not occur in the Project area it would occur elsewhere in the City or region. The Proposed Project combines sustainable strategies (e.g. proximity to transit, mixed use, increased density) to respond to state, regional and local policies aimed at reducing GHG. If development were to occur elsewhere in a less sustainable fashion (BAU), regional emissions would be greater. However, for a land use plan such as ECTNP full quantification of BAU is not possible because at this scale it is not possible to anticipate where growth would go and how different it would be as compared to the project in terms of proximity to transit, mix of uses and density. Therefore, a comparison of Project emissions in the future to emissions under BAU is not possible.

Based on the plan-level analysis, the ECTNP would not increase emissions in the immediate Project Area, compared to Existing (2013) and therefore, considered in isolation, would contribute to reducing emissions in California below Existing (2013) emissions and would contribute to the AB 32 goal of reducing future emissions to 1990 levels. The ECTNP implements feasible land use measures to support AB 32 emissions reduction goals; additional efforts to achieve the goals of AB 32 would require cross-sector actions throughout the state, which are beyond the ability and scope of the ECTNP, but the ECTNP would not impede the implementation of such actions.

The City is undertaking a number of complementary and parallel planning efforts that are anticipated to reduce total and per capita VMT and therefore GHG emissions. The Proposed Project is not occurring in isolation, it is part of a regional strategy (contained in both the 2012-2035 RTP/SCS and the 2016-2040 RTP/SCS) to direct growth to urban areas served by transit in order to achieve the following:

- Develop areas in close proximity to transit in order to reduce vehicular trips.
- Create a mix of uses that encourages pedestrian and bicycle activity reducing vehicle trips; and
- Undertake modern, efficient construction techniques and compact development patterns, both of which result in using less energy and less water as compared to lower intensity, dispersed development patterns.

The Project would also be consistent with the Sustainable City pLAn by accommodating growth while providing transportation options. This strategy would result in lower per capita emissions than less dense growth, and would contribute to the City reaching the Sustainable City pLAn reduction target

Consistency with Plans, Policies, and Regulations. The State of California has adopted plans and policies designed to reduce regional and local GHG emissions. Under the guidance of the goals and objectives adopted by SCAG's Regional Council, the 2012-2035 RTP/SCS, the adopted RTP/SCS at the time of the ECTNP EIR preparation, was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system. The 2012-2035 RTP/SCS represents the culmination of several years of work involving dozens of public agencies, 191 cities, hundreds of local, county, regional and state officials, the business community, environmental groups, as well as various nonprofit organizations. The 2012-2035 RTP/SCS was formally adopted by the SCAG Regional Council on April 4, 2012. The updated 2016-2040 RTP/SCS was adopted April 7, 2016.

The 2012-2035 RTP includes a Sustainable Communities Strategy, as required by SB 375. The primary goal of the SCS is to provide a vision for future growth in southern California that will decrease per capita GHG emissions from passenger vehicles. However, the strategies contained in the 2012-2035 RTP/SCS will produce benefits for the region far beyond simply reducing GHG emissions. The SCS integrates the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas on existing main streets, in downtowns, and on commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. The Project Objectives relevant to the GHG analysis are found in **Table 4.5-4.**

In addition to SB 375, the 2012-2035 RTP/SCS assessed compliance with AB 32.[28] The 2012-2035 RTP/SCS stated that by meeting the SB 375 targets, the 2012-2035 RTP/SCS successfully contributed its share of meeting the objectives of AB 32. The SB 375 targets are to reduce per capita emissions from cars and light duty trucks 8 percent below 2005 levels by 2020 and 13 percent below 2005 levels by 2035.[29] The 2012-2035 RTP/SCS determined that per capita CO_2 emissions from cars and light trucks only (not counting emission reductions from implementation of Pavley regulations) were 23.9 pounds of CO_2 per person per day in 2005. **Table 4.5-5** shows the per capita CO_2 emissions in 2035 for the SCAG region as projected by the 2012-2035 RTP/SCS as well as the 2016-2040 RTP/SCS. It also shows the emissions in 2035 for the Project Area resulting from the reasonable expected development in the ECTNP. The CO_2 emissions in **Table 4.5-5** were generated using the EMFAC model for cars and light duty trucks.

[28]SCAG, *2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*, December 2011.
[29]*Ibid*.

TABLE 4.5-4: OBJECTIVES AND FEATURES OF THE PROPOSED PLAN RELEVANT TO GHG
RELEVANT PROJECT OBJECTIVES
Primary Objective 1: Implement the policies of the City of Los Angeles General Plan Framework, the SCAG RTP/SCS, and West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles Community Plans that encourage growth to be directed to transit-oriented areas and foster more sustainable, mixed use development patterns that improve mobility options and reduce auto dependence.
Primary Objective 2: Accommodate employment, housing, and population growth projections forecasted through the planning horizon year of 2035 by focusing residential development and new job-generating uses around transit stations.
Primary Objective 5: Create incentives for the provision of affordable housing in new residential development near the Exposition Light Rail Transit Line to enhance accessibility and housing options for core transit riders and increase transit ridership.
Primary Objective 6: Improve circulation within the station areas; increase mobility choices; promote transit ridership and use of other alternative transit modes; and reduce vehicle miles traveled per capita for those who live and/or work within the Exposition Corridor.
RELEVANT PROJECT FEATURES
Implements land use changes that accommodate additional jobs and housing within close proximity to transit.
Prohibits or limits new auto-oriented and low-intensity uses on properties surrounding the transit stations, reserving these areas for compact, job-generating development.
Rezones select industrial properties within a half-mile of a transit station to the New Industry or Hybrid Industrial zones to direct jobs and housing to the station areas.
Applies new mixed-use zones to currently single-use areas, which can lead to more walking trips among destinations.
Creates an incentive for new development to provide affordable housing, placing more core transit riders close to stations and expanding their access to jobs.
Requires commercial developments that use a floor area bonus to demonstrate a reduction in vehicle trip generation using transportation demand management strategies.

TABLE 4.5-5: SB 375 ANALYSIS

	2012-2035 RTP/SCS (2035) /a/	2016-2040 RTP/SCS (2035) /a/	ECTNP (2035)
Resident Population	21,773,000	21,475,000	59,570
CO_2 Emissions (Pounds) /b/	445,800,000	412,000,000	953,696
Per Capita Emissions (Pounds)	20.5	19.5	16.0
Percent Reduction from 2005 Levels	14%	18%	33%

/a/ RTP/SCS data is presented for the entire SCAG region. The population, CO_2 emissions, and per capita emissions match the data in Table 3.6-5 in the 2012-2035 RTP/SCS Program Environmental Impact Report (PEIR) and Table 3.8.4-3 in the 2016-2040 RTP/SCS PEIR. Rounding conventions have been applied by SCAG to the CO_2 emissions.
/b/ The CO_2 emissions shown here are based on EMFAC2011, which included CO_2 emission rates without Pavley reductions. The more recent EMFAC2014 only provides CO_2 emission rates with Pavley reductions. In order to assess consistency with the RTP/SCS SB 375 targets, which are based on CO_2 emission rates without the Pavley reductions, this analysis used the EMFAC2011 CO_2. No other component of EMFAC2014 affects the SB 375 analysis.
SOURCE: City of Los Angeles Travel Demand Model, 2015; CARB, EMFAC2011; SCAG, *2012-2035 RTP/SCS*, April 4, 2012; SCAG, *2016-2040 RTP/SCS*, April 7, 2016.

While both the 2012-2035 RTP/SCS and 2016-2040 RTP/SCS projections meet the SB375 target of reducing emissions 13 percent below 2005 by 2035, the ECTNP significantly exceeds the reduction target, reducing emissions levels by 33 percent. The Proposed Project is focused on compact, mixed-use development oriented around transit. This is expected to result in reductions in VMT per capita as a result of shorter trips, more trips being made using modes other than vehicles, and more trips being internally captured through mixed-use development.

To assess the consistency with the AB 32 Scoping Plan, the Proposed Project is compared against the recommended GHG reduction measures and discrete early action measures found in the First Update to Scoping Plan. The majority of these measures are relevant to statewide policies and not applicable to local, project-level analyses. For example, increasing the regional renewable energy portfolio or encouraging sustainable forests are outside a reasonable assessment for an individual land-use development plan or

project. However, a number of the GHG reduction measures in the Scoping Plan are applicable to the Proposed Project, such as increasing building/appliance efficiency, showing progress toward regional transportation-related GHG goals, constructing green buildings, and increasing construction recycling rates.

The First Update to the Scoping Plan includes detailed discussions related to promoting TODs and alternatives to driving such as public transportation. It states that, "Metropolitan areas are beginning to change and trend toward more urban development designed to minimize energy consumption, waste output, air pollution, and water pollution. Business districts are encouraging more infill development that offers a mix of residential space, entertainment, restaurants, shopping, and other amenities within close proximity, which reduces dependence on private vehicles. These trends create opportunities for developers to satisfy changing consumer desires and for land use planners to establish policies for more sustainable development patterns. It takes decades for changes in land use and transportation policies to result in tangible changes, including GHG emission reductions. The next generation of regional integrated plans is expected to result in climate benefits well beyond the 2035-time horizon. Integrated regional planning efforts under SB 375 enable communities to understand the differences between alternative development patterns and to make choices accordingly. Recently approved SCSs reflect regional goals for a more sustainable form of community development that brings with it economic, social, and environmental benefits. The implementation of these regional goals through individual action by local governments and the development community will be essential to meeting the state's ongoing climate objectives." The type of compact, urban development along public transportation lines, such as that proposed in the ECNTP, would be entirely consistent with policies in the First Update to the Scoping Plan.

The transportation modeling for the ECTNP makes assumptions with regard to vehicular trip generation, which results in per capita emissions potentially increasing in the short-term. Phase 2 of the Expo Line LRT began providing service in May 2016; similar to a study of the Metro Expo Line Phase 1, it is anticipated that per capita emissions will decrease now that the line is operational and as transit ridership increases. A University of Southern California study of the Metro Expo Line Phase 1 demonstrated that the introduction of transit resulted in local VMT reductions.[30] In particular, households in the experimental group, which were within a half mile of a Metro Expo Line Phase 1 station reduced daily household VMT by approximately 10 miles per day compared to the control households that were located more than a half mile from a station. Rail ridership increased, and in some instances that effect was statistically significant. The decrease in VMT corresponded to a decrease in mobile source emissions, with households within a half mile of a station having 30 percent less vehicle emissions than households further away after transit was introduced. The Proposed Project concentrates jobs and housing within a half-mile of the Metro Expo Line Phase 2 and, thus, is anticipated to achieve similar reductions in VMT per capita and CO_2 emissions, thus contributing to GHG reductions and consistency with the goals of AB 32.

Several transportation metrics have been calculated to analyze the influence of the Proposed Project on future transportation conditions. These metrics were calculated for the West Los Angeles Area Planning Commission boundary, which includes the Project Area, and assumed the recently adopted Mobility Plan (MP) 2035 is in place. The results of this analysis are discussed in detail in Section 4.12, Transportation and Traffic, and summarized below.

The transportation analysis studied VMT outcomes for two scenarios: Future MP 2035 With Project and Future MP 2035 No Project. This analysis concluded that there would be approximately 0.6 percent more peak period VMT under Future MP 2035 With Project conditions than under Future MP 2035 No Project conditions. Although peak period vehicle trips increase by 1.2 percent, peak period VMT increases by only 0.6 percent, indicating that, although more trips are made under Future MP 2035 With Project conditions, those trips tend to be shorter on average than those under Future MP 2035 No Project conditions. The

[30]Boarnet M. and Houston D., University of Southern California, Sol Price School of Public Policy, *The Exposition Light Rail Line Study: A Before-and-After Study of the Impact of New Light Rail Transit Service*, December 15, 2013.

shorter trips would be consistent with the policies and goals in SCAG's 2012-2035 RTP/SCS, and would contribute to reducing regional GHG emissions.

In order to capture the effect of increased travel due to additional jobs and housing in the Project Area as a result of the Proposed Project, per capita VMT was calculated on a service population basis. Service population is defined as the total number of jobs plus the total population of a given area. While peak period VMT increases approximately 0.6 percent between Future MP 2035 No Project and Future MP 2035 With Project conditions, service population increases by 1.4 percent. As a result, peak period per capita VMT is 0.8 percent lower under Future MP 2035 With Project conditions than under Future MP 2035 No Project conditions. The anticipated per capita VMT reduction indicates that the Proposed Project would be consistent with the 2012-2035 RTP/SCS, and would contribute to reducing regional GHG emissions.

As discussed in Section 4.12, Transportation and Traffic, the Citywide Ordinance on Transportation Demand Management (TDM) and Trip Reduction Measures (Ordinance No. 168,700) would continue to be implemented within the Project Area. This Ordinance calls for several measures to be taken by non-residential developments in an effort to reduce single-occupancy vehicle trips. In addition, the Proposed Project includes several requirements for individual projects to incorporate other TDM strategies, including unbundled parking, parking cash out, and transit pass subsidies, that aim to reduce vehicle trips among residents and employees. Development projects in the ECTNP that use a FAR bonus would be required to provide public benefits such as streetscape improvements and mobility amenities, which can also encourage the use of alternative modes of transportation. In lieu of these public benefits, projects that are primarily non-residential in use would be required to demonstrate a reduction in vehicle trip generation through a comprehensive TDM program, which can include alternative work schedules, opportunities for telecommuting, on-site car share or bike share programs, employer-subsidized vanpools or shuttles, and workplace parking pricing. These project features can all contribute to reducing vehicle trips and thus reducing GHG emissions.

The City of Los Angeles enacted its GreenLA Climate Action Plan in 2007 to outline strategies for reducing the City's emissions of GHG and consequent effects on climate change. The GreenLA Climate Action Plan's primary long-term objective was to establish a framework for implementing GHG emissions reductions efforts that would achieve a goal of reducing City-wide emissions to 35 percent below 1990 levels by 2030. With regards to planning, elements of the GreenLA Climate Action Plan is designed to aid in regional GHG reductions include promotion of high-density housing and mixed-use development close to major transportation arteries, implementation of TOD, and expanding availability of City land for housing, mixed-use development, parks, and open space. As discussed in Section 4.9, Land Use and Planning, the Proposed Plan would add substantial multi-family housing to the CPAs, incorporate TOD, and create more open space. Furthermore, implementation of the Proposed Plan would encourage pedestrian-friendly, mixed-use neighborhoods that would require less use of passenger vehicles. The combination of these strategies is consistent with the goals of GreenLA Climate Action Plan.

In addition, individual projects constructed within the Project Area would be required to comply with the City's Green Building Code. The City's Green Building Code includes energy and water saving measures that reduce GHG emissions below 2013 Title 24 requirements. It promotes sustainable building practices by creating a series of requirements and incentives for developers to meet the U.S. Building Council's Energy and Design standards. The City's Green Building Code includes several mandatory measures for non-residential and high-rise residential buildings related to GHG reduction, including requirements for short- and long-term bike parking, electric vehicle parking, energy conservation, and use of renewable energy.

Conclusion

The Proposed Project would be consistent with AB 32, SB 375, and regional and local strategies outlined in the RTP/SCS to reduce GHG and can be expected to contribute to reductions in per capita GHG emissions when viewed at the regional level. The ECTNP implements feasible land use measures to support AB 32

emissions reduction goals; additional efforts to achieve the goals of AB 32 would require cross-sector actions throughout the state, which are beyond the ability and scope of the ECTNP, but the ECTNP would not impede the implementation of such actions. Secondly, the Proposed Project would contribute to regional SB 375 requirements for reducing GHG emissions from cars and light trucks by reducing per capita VMT. Lastly, the Proposed Project implements strategies outlined in the RTP/SCS as it will concentrate development around transit, comprise a wide mix of uses, and will better accommodate pedestrians and bicyclists. These characteristics, as well as the TDM strategies discussed above, are anticipated to reduce per capita GHG emissions associated with cars and light trucks below those set forth in the RTP/SCS. Therefore, the Proposed Project would result in a less-than-significant impact related to GHG emissions and consistency with GHG reduction plans.

MITIGATION MEASURES

Impacts related to GHG emissions and consistency with GHG reduction plans would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to GHG emissions and consistency with GHG reduction plans were determined to be less than significant without mitigation.

4.6 HAZARDS AND HAZARDOUS MATERIALS

This section provides an overview of the hazards and hazardous materials and evaluates the construction and operational impacts associated with the Proposed Project. Topics addressed include transport use/disposal and upset/accident condition of hazardous material, hazardous material sites, airport hazards, emergency response plans, and wildland fire within the Project Area. This section was prepared utilizing the Environmental Data Resources (EDR) Data Map Area Study, compiled in September 2013 and included in its entirety in **Appendix D**. The Proposed Project is evaluated in terms of whether its implementation would expose people or structures to adverse effects related to hazardous materials compared to existing conditions.

Hazard versus Risk. Workers' health and general public health are potentially at risk whenever hazardous materials have been used or where there could be an exposure to such materials. Inherent in the setting and analyses presented in this section are the concepts of the "hazard" of these materials and the "risk" they pose to human health. Exposure to some chemical substances may harm internal organs or systems in the human body, ranging from temporary effects to permanent disability, or death. Hazardous materials that result in adverse effects are generally considered "toxic." Other chemical materials, however, may be corrosive, or react with other substances to form other hazardous materials, but they are not considered toxic because organs or systems are not affected. Because toxic materials can result in adverse health effects, they are considered hazardous materials, but not all hazardous materials are necessarily "toxic." For purposes of the information and analyses presented in this section, the terms hazardous substances or hazardous materials are used interchangeably and include materials that are considered toxic.

The risk to human health is determined by the probability of exposure to a hazardous material and the severity of harm such exposure would pose. That is to say, the likelihood and means of exposure, in addition to the inherent toxicity of a material, are used to determine the degree of risk to human health. For example, a high probability of exposure to a low toxicity chemical would not necessarily pose an unacceptable human health or ecological risk, whereas a low probability of exposure to a very high toxicity chemical might. Various regulatory agencies, such as the U.S. Environmental Protection Agency (USEPA), California Environmental Protection Agency (Cal/EPA), State Water Resources Control Board (SWRCB), Cal/EPA Department of Toxic Substances Control (DTSC), and state and federal Occupational Safety and Health Administration (OSHA) are responsible for developing and/or enforcing risk-based standards to protect the public and the environment.

REGULATORY FRAMEWORK

FEDERAL

U.S. Environmental Protection Agency (USEPA) Regulations. The USEPA's mission is to protect human health and the environment. The USEPA takes action to reduce risks associated with exposure to chemicals in commerce, indoor and outdoor environments, and products and food. The USEPA oversees the introduction and use of pesticides, improvement of the Integrated Risk Information System (IRIS) program, reduction of radon risks, identification of and response to children's health risks in schools and homes, and improvement of chemical management practices. Oversight of chemical storage and manufacturing in coordination with their interagency partners is also a key focus of the USEPA, as well as efforts to reduce urban air toxics.

U.S. Department of Transportation (USDOT) Regulations. USDOT prescribes strict regulations for the safe transportation of hazardous materials, including requirements for hazardous waste containers and licensed haulers who transport hazardous waste on public roads. The Secretary of the Department of Transportation receives the authority to regulate the transportation of hazardous materials from the Hazardous Materials Transportation Act (HMTA), as amended and codified in 49 United States Code

Section 5101 *et seq*. The Secretary is authorized to issue regulations to implement the requirements of 49 United States Code. The Pipeline and Hazardous Materials Safety Administration (PHMSA), formerly the Research and Special Provisions Administration, is delegated the responsibility to write the hazardous materials regulations, which are contained in 49 Code of Federal Regulations (CFR) Parts 100-180. Title 49 of the CFR, which contains the regulations set forth by the HMTA, specifies requirements and regulations with respect to the transport of hazardous materials. It requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Under the HMTA, the Secretary "...may authorize any officer, employee, or agent to enter upon inspect, and examine, at reasonable times and in a reasonable manner, the records and properties of persons to the extent such records and properties relate to: (1) the manufacture, fabrication, marking, maintenance, reconditioning, repair, testing, or distribution of packages or containers for use by any "person" in the transportation of hazardous materials in commerce; or (2) the transportation or shipment by any "person" of hazardous materials in "commerce."

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Enacted in 1980, CERCLA, commonly known as Superfund, creates a tax on the chemical and petroleum industries and provides broad Federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. The tax goes into a trust fund for cleaning up abandoned or uncontrolled hazardous waste sites. CERCLA:

- Established prohibitions and requirements concerning closed and abandoned hazardous waste sites;
- Provided for liability of persons responsible for releases of hazardous waste at these sites; and
- Established a trust fund to provide for cleanup when no responsible party could be identified.

CERCLA established the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS). CERCLIS is the USEPA's system for tracking potential hazardous-waste sites within the Superfund program. A site's presence on CERCLIS does not imply a level of federal activity or progress at a site, nor does it indicate that hazardous conditions necessarily exist at the location.

In addition, CERCLA authorizes two kinds of response actions:

- Short-term removals, where actions may be taken to address releases or threatened releases requiring prompt response.
- Long-term remedial response actions, that permanently and significantly reduce the dangers associated with releases or threats of releases of hazardous substances that are serious, but not immediately life threatening. These actions can be conducted only at sites listed on the USEPA's National Priorities List (NPL).

CERCLA also enabled the revision of the National Contingency Plan (NCP). The NCP provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, or contaminants. The NCP also established the NPL.

Resource Conservation and Recovery Act (RCRA). RCRA gives the USEPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste by "large-quantity generators" (1,000 kilograms/month or more). Under RCRA regulations, hazardous wastes must be tracked from the time of generation to the point of disposal. At a minimum, each generator of hazardous waste must register and obtain a hazardous waste activity identification number. If hazardous wastes are stored for more than 90 days or treated or disposed at a facility, any treatment, storage, or disposal unit must be permitted under RCRA. Additionally, all hazardous waste transporters are required to be permitted and must have an identification number. RCRA allows individual states to develop their own program for the regulation of hazardous waste as long as it is at least as stringent as RCRA. The USEPA has delegated RCRA enforcement to the State of California.

Toxic Substances Control Act (TSCA). Congress enacted the TSCA of 1976, codified in Title 40 of the Code of Federal Regulations (CFR), to give USEPA the ability to track the 75,000 industrial chemicals currently produced or imported into the United States. USEPA repeatedly screens these chemicals and can require reporting or testing of those that may pose an environmental or human-health hazard. USEPA can ban the manufacture and import of those chemicals that pose an unreasonable risk. More specifically, in California, polychlorinated biphenyls (PCBs) are regulated by both state (RCRA and Title 22 of the California Code of Regulations) and federal (TSCA) rules; the TSCA has banned the manufacture, processing, use, and distribution in commerce of PCBs. The TSCA gives USEPA the authority to develop, implement and enforce regulations concerning the use, manufacture, cleanup, and disposal of PCBs. The TSCA also establishes USEPA's Lead Abatement Program regulations, which provide a framework for lead abatement, risk assessment, and inspections. Those performing these services are required to be trained and certified by USEPA.[1]

Research and Special Programs Administration (RSPA) Regulations. RSPA regulations cover definition and classification of hazardous materials, communication of hazards to workers and the public, packaging and labeling requirements, operational rules for shippers, and training. They apply to interstate, intrastate, and foreign commerce by air, rail, ships, and motor vehicles, and also cover hazardous waste shipments. The Federal Highway Administration (FHWA) is responsible for highway routing of hazardous materials and highway safety permits. The U.S. Coast Guard regulates bulk transport by vessel. The hazardous material regulations include emergency response provisions, including incident reporting requirements. Reports of major incidents go to the National Response Center, which in turn is linked with CHEMTREC, a service of the chemical manufacturing industry that provides details on most chemicals shipped in the United States.

Superfund Amendments and Reauthorization Act of 1986 (SARA). SARA amended CERCLA on October 17, 1986. SARA reflected USEPA's experience in administering the complex Superfund program during its first six years and made several important changes and additions to the program. Primarily, SARA:

- Stressed the importance of permanent remedies and innovative treatment technologies in cleaning up hazardous waste sites;
- Required Superfund actions to consider the standards and requirements found in other state and federal environmental laws and regulations;
- Provided new enforcement authorities and settlement tools;
- Increased state involvement in every phase of the Superfund program;
- Increased the focus on human health problems posed by hazardous waste sites;
- Encouraged greater citizen participation in making decisions on how sites should be cleaned up; and
- Increased the size of the trust fund to $8.5 billion.

SARA also required USEPA to revise the Hazard Ranking System (HRS) to ensure that it accurately assessed the relative degree of risk to human health and the environment posed by uncontrolled hazardous waste sites that may be placed on the NPL.

Occupational Safety and Health Act of 1970. The U.S. Department of Labor's Occupational and Safety Health Administration (OSHA) was created by the Occupational Safety and Health Act to assure safe and healthful working conditions by setting and enforcing standards and by providing training, outreach, education, and assistance. OSHA provides standards for general industry and construction industry on hazardous waste operations and emergency response. The Occupational Safety and Health Act, implemented by the federal OSHA, contains provisions with respect to hazardous materials handling. Federal OSHA requirements, as set forth in Title 29 of the CFR Section 1910, *et. seq.*, are designed to promote worker safety, worker training, and a worker's right–to-know. OSHA has delegated the authority to administer OSHA regulations to the State of California.

[1]U.S. Environmental Protection Agency, 40 CFR Park 745, Rules 402 and 404, August 29, 1996.

Title 49 of the CFR, which contains the regulations set forth by the Hazardous Materials Transportation Act of 1975, specifies additional requirements and regulations with respect to the transport of hazardous materials. Title 49 of the CFR requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Drivers are also required to be trained in function and commodity specific requirements.

Emergency Planning and Community Right–to-Know Act (EPCRA). EPCRA was enacted by Congress as the national legislation on community safety. This law was designated to help local communities protect public health, safety, and the environment from chemical hazards. EPCRA was passed in response to concerns regarding the environmental and safety hazards posed by the storage and handling of toxic chemicals. EPCRA establishes requirements for federal, state and local governments, tribes and industry regarding emergency planning and "Community Right-to-Know" reporting on hazardous and toxic chemicals. The Community Right-to-Know provisions help increase the public's knowledge and access to information on chemicals at individual facilities, their uses, and releases into the environment. States and communities, working with facilities, can use the information to improve chemical safety and protect public health and the environment. To implement EPCRA, Congress required each state to appoint a State Emergency Response Commission (SERC). The SERC is required to divide their states into Emergency Planning Districts and to name a Local Emergency Planning Committee for each district.

Other Hazardous Materials Regulations. In addition to the USDOT regulations for the safe transportation of hazardous materials, there are other applicable federal laws that also address hazardous materials:

- Community Environmental Response Facilitation Act (CERFA) of 1992
- Clean Water Act
- Clean Air Act
- Safe Drinking Water Act
- Atomic Energy Act
- Toxic Substances Control Act (TSCA)

FEDERAL INSECTICIDE, FUNGICIDE, AND RODENTICIDE ACT (FIFRA)STATE

Authority for the statewide administration and enforcement of RCRA rests with the California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control (DTSC). While the DTSC has primary state responsibility in regulating the generation, storage and disposal of hazardous materials, DTSC may further delegate enforcement authority to local jurisdictions. In addition, the DTSC is responsible and/or provides oversight for contamination cleanup, and administers state-wide hazardous waste reduction programs. DTSC operates programs to accomplish the following: (1) deal with the aftermath of improper hazardous waste management by overseeing site cleanups; (2) prevent releases of hazardous waste by ensuring that those who generate, handle, transport, store, and dispose of wastes do so properly; and (3) evaluate soil, water, and air samples taken at sites.

The storage of hazardous materials in underground storage tanks (USTs) is regulated by CalEPA's State Water Resources Control Board (SWRCB), which has delegated authority to the Regional Water Quality Control Board (RWQCB) and typically on the local level, to the local fire department.

The California Occupational Safety and Health Administration (Cal/OSHA) program is administered and enforced by the Division of Occupational Safety and Health (DOSH). Cal/OSHA is very similar to the federal OSHA program. For example, both programs contain rules and procedures related to exposure to hazardous materials during demolition and construction activities. In addition, Cal/OSHA requires employers to implement a comprehensive, written Injury and Illness Prevention Program (IIPP). An IIPP is an employee safety program for potential workplace hazards, including those associated with hazardous materials.

The State Office of Emergency Services Hazardous Materials (HazMat) section under the Fire and Rescue Division coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats. In response to any hazardous materials emergency, the HazMat section staff is called upon to provide state and local emergency managers with emergency coordination and technical assistance.

Hazardous Waste Source Reduction and Management Review Act of 1989. This act requires generators of 12,000 kilograms/year of typical/operational hazardous waste to conduct an evaluation of their waste streams every four years and to select and implement viable source reductions alternatives. This act does not apply to non-typical hazardous waste (such as asbestos and PCBs).

California Vehicle Code Title 13. The California Vehicle Code (Title 13 of the CCR) states that every motor carrier transporting hazardous materials (for which the display of hazardous materials placards is required or in excess of 500 pounds, transported for a fee, which would require placarding if shipped in greater amounts in the same manner) must have a Hazardous Materials Transportation License issued by the California Highway Patrol.

California Health and Safety Code. The transport of hazardous waste materials is further governed by the California Health and Safety Code Section 25163 and Title 22, Chapter 13 of the CCR. Specifically, Section 25163 of the Health and Safety Code requires transporters of hazardous waste to hold a valid registration issued by the DTSC in his/her possession while transporting hazardous waste. Additionally, Title 22, Chapter 13 of the CCR contains a number of requirements including, but are not limited to, the following:

- Transporters shall not transport hazardous waste without first receiving an identification number and a registration certificate from DTSC.
- Registration as a hazardous waste transporter expires annually, on the last day of the month in which the registration was issued.
- To be registered as a hazardous waste transporter, an application must be submitted.
- Hazardous waste shall not be accepted for transport without a Uniform Hazardous Waste Manifest that has been properly completed and signed by generator and transporter.
- Hazardous waste shall be delivered to authorized facilities only.

California Occupational Safety and Health Administration (Cal/OSHA) Regulations. Cal/OSHA has set forth work requirements for disturbance of Asbestos Containing Construction Materials (ACCMs) including removal operations for all types of ACCMs. Cal/OSHA requires contractors and employers that remove ACCMs to be registered and consultants and technicians who conduct sampling and/or removal to be certified. In addition, the agency has developed standards for general industry and the construction industry hazardous waste operations and emergency response. Cal/OSHA ensures that employers must have controls to reduce and monitor exposure levels of hazardous materials, an informational program describing any exposure during operations and the inspection of drums and containers prior to removal or opening. Decontamination procedures and emergency response plans must be in place before employees begin working in hazardous waste operations.

California Office of Emergency Services (CalOES) Regulations. The CalOES Hazardous Materials Section under the Fire and Rescue Division coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats. In response to any hazardous materials emergency, the Section staff is called upon to provide state and local emergency managers with emergency coordination and technical assistance.

California Code of Regulations (CCR) Title 8 Section 1529. This section of the CCR regulates asbestos exposure in all worked defined in Section 1502, including demolition or salvage of structures where asbestos is present, removal or encapsulation of materials containing asbestos, construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain asbestos, installation of products containing asbestos, asbestos spill/emergency cleanup, transportation, disposal, storage, containment of and housekeeping activities involving asbestos or products containing asbestos, on the site or location at which construction activities are performed, and excavation which may involve exposure to asbestos as a natural constituent which is not related to asbestos mining and milling activities.

California Code of Regulations (CCR) Title 8 Section 1532.1. This section of the CCR applies to all construction work where employees could be occupationally exposed to lead, including demolition or salvage of structures where lead or materials containing lead are present; removal or encapsulation of materials containing lead; new construction, alteration, repair, or renovation of structures, substrates, or portions thereof, that contain lead or materials containing lead; installation of products containing lead; lead contamination/emergency clean-up; transportation, disposal, storage, or containment of lead or materials containing lead on the site or location at which construction activities are performed; and maintenance operations associated with construction activities. This section sets a maximum exposure limit; requires an assessment to determine whether employees may be exposed to lead; requires employees to create a compliance program to ensure that employee exposure to lead are at or below the permissible exposure limit to the extent feasible; and requires that employees with exposure to lead are provided with respiratory protection, protective work clothing and equipment.

Hazardous Waste Control Act. The Hazardous Waste Control Act created the state hazardous waste management program, which is similar to but more stringent than the RCRA program. This Act is implemented by regulations contained in Title 26 of the CCR, which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements. These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under this Act and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator to transporter to the ultimate disposal location. Copies of the manifest must be filed with DTSC.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The Unified Program required the administrative consolidation of six hazardous materials and waste programs (Program Elements) under one agency, a Certified Unified Program Agency (CUPA). The Program Elements consolidated under the Unified Program are:

- Hazardous Waste Generator and On-site Hazardous Waste Treatment Programs (also known as Tiered Permitting);
- Aboveground Petroleum Storage Tank Spill Prevention Control and Countermeasure Plan (SPCC);
- Hazardous Materials Release Response Plans and Inventory Program (also known as Hazardous Materials Disclosure or "Community-Right-To-Know");
- California Accidental Release Prevention Program (Cal/ARP);
- Underground Storage Tank (UST) Program; and
- Uniform Fire Code Plans and Inventory Requirements.

The Unified Program is intended to provide relief to businesses complying with the overlapping and sometimes conflicting requirements of formerly independently managed programs. The Unified Program is implemented at the local government level by CUPAs. Most CUPAs have been established as a function of a local environmental health or fire department. Some CUPAs have contractual agreements with another local agency, a participating agency, which implements one or more Program Elements in coordination with the CUPA.

Hazardous Materials Release Response Plans and Inventory Act of 1985. This Act, also known as the Business Plan Act, requires businesses using hazardous materials to prepare a plan that describes their facilities, inventories, emergency response plans, and training programs. Hazardous materials are defined as unsafe raw or unused materials that are part of a process or manufacturing step. They are not considered hazardous waste. Health concerns pertaining to the release of hazardous materials, however, are similar to those relating to hazardous waste.

2009 State of California Emergency Plan. The 2009 State of California Emergency Plan, also referred to as the State Emergency Plan (SEP), addresses the state's response to extraordinary emergency situations associated with natural disasters or human-caused emergencies. The California Emergency Services Act provides the basic authorities for conducting emergency operations following the proclamation of emergencies by appropriate local officials and/or the Governor.[2] The provisions of this act are further reflected and expanded upon by local emergency ordinances. In accordance with this act, the SEP describes the methods for carrying out emergency operations, the process for rendering mutual aid, the emergency services of governmental agencies, how resources are mobilized, how the public will be informed and the process to ensure continuity of government during an emergency or disaster. The SEP emphasizes mitigation programs to reduce the vulnerabilities to disaster and preparedness activities to ensure the capabilities and resources are available for an effective response. To assist communities and governments to recover from the disaster, the SEP outlines programs that establish a consistent, statewide framework to enable state, local, tribal governments, federal government and the private sector to work together to mitigate, prepare for, respond to and recover from the effects of emergencies regardless of cause, size, location, or complexity.[3]

Asbestos Regulations. The Clean Air Act regulates asbestos as a hazardous air pollutant, which subjects it to regulation by South Coast Air Quality Management District (SCAQMD) under its Rule 1403. OSHA also regulates asbestos as a potential worker safety hazard. These rules and regulations prohibit emissions of asbestos from demolition or construction activities, require medical examinations and monitoring of employees engaged in activities that could disturb asbestos fibers, and require notice to federal and local government agencies prior to renovation or demolition activities that could disturb asbestos.

Lead Regulations. Because of its toxic properties, lead is regulated as a hazardous material. Lead is also regulated as a toxic air contaminant. State-certified contractors must perform inspection, testing, and removal (abatement) of lead-containing building materials in compliance with applicable health and safety and hazardous materials regulations, including those outlined in Title 17 of the CCR. Other state laws include:

- Hazardous Waste Control Law
- Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65)
- Carpenter-Presley-Tanner Hazardous Substances Account Act
- Hazardous Waste Management Planning and Facility Siting (Tanner Act)
- Hazardous Materials Release Response Plan and Inventory Law of 1985 (Business Plan Act)
- California Medical Waste Management Act

LOCAL

The primary local agency with responsibility for implementing federal and State laws and regulations pertaining to hazardous materials management is the Los Angeles County Health Department, Environmental Health Division. The Los Angeles County Health Department is the CUPA for the County of Los Angeles. The Unified Program is the consolidation of six state environmental regulatory programs into one program under the

[2]California Government Code Section 8560.
[3]California Emergency Management Agency, *State of California Emergency Plan*, July 2009.

authority of a CUPA. A CUPA is a local agency that has been certified by CalEPA to implement the six state environmental programs within the local agency's jurisdiction. This program was established under the amendments to the California Health and Safety Code made by Senate Bill 1082 in 1994. The six consolidated programs are:

- Hazardous Materials Release Response Plan and Inventory (Business Plans)
- California Accidental Release Prevention (CalARP)
- Hazardous Waste (including Tiered Permitting)
- Underground Storage Tanks (USTs)
- Above Ground Storage Tanks (Spill Prevention Control and Countermeasures [SPCC] requirements)
- Uniform Fire Code (UFC) Article 80 Hazardous Material Management Program (HMMP) and Hazardous Material Identification System (HMIS)

As the CUPA for the County of Los Angeles, the Los Angeles County Health Department, Environmental Health Division maintains the records regarding location and status of hazardous materials sites in the county and administers programs that regulate and enforce the transport, use, storage, manufacturing, and remediation of hazardous materials. By designating a CUPA, Los Angeles County has accurate and adequate information to plan for emergencies and/or disasters and to plan for public and firefighter safety.

A Participating Agency is a local agency that has been designated by the local CUPA to administer one or more Unified Programs within their jurisdiction on behalf of the CUPA. The Los Angeles Fire Department (LAFD) is a Participating Agency with the Los Angeles County Health Department, Environmental Health Division as the CUPA. The LAFD monitors the storage of hazardous materials in the City for compliance with local requirements. Specifically, businesses and facilities which store more than threshold quantities of hazardous materials as defined in Chapter 6.95 of the California Health and Safety Code are required to file an Accidental Risk Prevention Program with the LAFD. This program includes information such as emergency contacts, phone numbers, facility information, chemical inventory, and hazardous materials handling and storage locations. The LAFD also has delegated authority to administer and enforce federal and state laws and local ordinances for USTs. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LAFD Inspectors.

South Coast Air Quality Management District (SCAQMD) Rule 1403. SCAQMD Rule 1403 establishes asbestos survey requirements, notification, and work practice requirements to prevent asbestos emissions from emanating during building renovation and demolition activities. Rule 1403 incorporates the requirements of the federal asbestos requirements found in the National Emission Standards for Hazardous Air Pollutants (NESHAP) found in CFR Title 40, Part 61, Subpart M. USEPA delegated SCAQMD the authority to enforce the federal asbestos NESHAP and SCAQMD is the local enforcement authority for asbestos.

Los Angeles County Operational Area Emergency Response Plan (ERP). The County of Los Angeles developed the ERP to ensure the most effective allocation of resources for the maximum benefit and protection of the public in time of emergency. The ERP does not address normal day-to-day emergencies or the well-established and routine procedures used in coping with them. Instead, the operational concepts reflected in this plan focus on potential large-scale disasters like extraordinary emergency situations associated with natural and man-made disasters and technological incidents which can generate unique situations requiring an unusual or extraordinary emergency response. The purpose of the plan is to incorporate and coordinate all the facilities and personnel of County government, along with the jurisdictional resources of the cities and special districts within the County, into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System, mutual aid and other appropriate response procedures. The goal of the plan is to take effective life-safety measures and reduce property loss, provide for the rapid resumption of impacted businesses and community services, and provide accurate documentation and records required for cost-recovery.

City of Los Angeles General Plan Safety and Conservation Elements. The Safety Element provides a contextual framework for understanding the relationship between hazard mitigation, response to a natural disaster, and initial recovery from a natural disaster. The policies of the Safety Element address the storage, accidental release, and containment of hazardous materials.

Policies of the Conservation Element address the conservation of petroleum resources (i.e., oil and gas) and appropriate, environmentally sensitive extraction of petroleum deposits to protect the petroleum resources for the use of future generations and to reduce the city's dependency on imported petroleum and petroleum products.

Goals, objectives, and policies from the Safety and Conservation Elements related to Hazards and Hazardous Materials are listed below in **Table 4.6-1**.

TABLE 4.6-1: RELEVANT GENERAL PLAN HAZARDOUS MATERIALS GOALS, OBJECTIVES, AND POLICIES	
SAFETY ELEMENT – HAZARD MITIGATION	
Policy 1.1.1	Coordination. Coordinate information gathering, program formulation and program implementation between City agencies, other jurisdictions and appropriate public and private entities to achieve the maximum mutual benefit with the greatest efficiency of funds and staff.
Policy 1.1.2	Disruption reduction. Reduce, to the greatest extent feasible and within the resources available, potential critical facility, governmental functions, infrastructure and information resource disruption due to natural disaster.
Policy 1.1.3	Facility/systems maintenance. Provide redundancy (back-up) systems and strategies for continuation of adequate critical infrastructure systems and services so as to assure adequate circulation, communications, power, transportation, water and other services for emergency response in the event of disaster related systems disruptions.
Policy 1.1.4	Health/environmental protection. Protect the public and workers from the release of hazardous materials and protect City water supplies and resources from contamination resulting from accidental release or intrusion resulting from a disaster event, including protection of the environment and public from potential health and safety hazards associated with program implementation.
Policy 1.1.5	Risk reduction. Reduce potential risk hazards due to natural disaster to the greatest extent feasible within the resources available, including provision of information and training.
SAFETY ELEMENT – EMERGENCY RESPONSE (MULTI-HAZARD)	
Policy 2.1.1	Coordination. Coordinate program formulation and implementation between City agencies, adjacent jurisdictions and appropriate private and public entities so as to achieve, to the greatest extent feasible and within the resources available, the maximum mutual benefit with the greatest efficiency of funds and staff.
Policy 2.1.2	Health and environmental protection. Develop and implement procedures to protect the environment and public, including animal control and care, to the greatest extent feasible within the resources available, from potential health and safety hazards associated with hazard mitigation and disaster recovery efforts.
Policy 2.1.3	Information. Develop and implement, within the resources available, training programs and informational materials designed to assist the general public in handling disaster situations in lieu of or until emergency personnel can provide assistance.
Policy 2.1.4	Interim procedures. Develop and implement pre-disaster plans for interim evacuation, sheltering and public aid for disaster victims displaced from homes and for disrupted businesses, within the resources available. Plans should include provisions to assist businesses, which provide significant services to the public and plans for reestablishment of the financial viability of the City.
Policy 2.1.5	Response. Develop, implement, and continue to improve the City’s ability to respond to emergency events.

TABLE 4.6-1: RELEVANT GENERAL PLAN HAZARDOUS MATERIALS GOALS, OBJECTIVES, AND POLICIES	
Policy 2.1.6	Standards/fire. Continue to maintain, enforce and upgrade requirements, procedures and standards to facilitate more effective fire suppression. The Fire Department and/or appropriate City agencies shall revise regulations or procedures to include the establishment of minimum standards for location and expansion of fire facilities, based upon fire flow requirements, intensity and type of land use, life hazard, occupancy and degree of hazard so as to provide adequate fire and emergency medical event response. At a minimum, site selection criteria should include the following standards which were contained in the 1979 General Plan Fire Protection and Prevention Plan: • Fire stations should be located along improved major or secondary highways. If, in a given service areas, the only available site is on a local street, the site must be on a street which leads directly to an improved major or secondary highway. • Fire station properties should be situated so as to provide drive-thru capability for heavy fire apparatus. • If a fire station site is on the side of a street or highway where the flow of traffic is toward a signalized intersection, the site should be at least 200 feet from that intersection in order to avoid blockage during ingress and egress. The total number of companies which would be available for dispatch to first alarms would vary with the required fire flow and distance as follows: (a) less than 2,000 g.p.m. would require not less than 2 engine companies and 1 truck company; (b) 2,000 but less than 4,500 g.p.m., not less than 2 or 3 engine companies and 1 or 2 truck companies; and (c) 4,500 or more g.p.m., not less than 3 engine companies and 2 truck companies.
Policy 2.1.7	Volunteers. Develop and implement, within the resources available, strategies for involving volunteers and civic organizations in emergency response activities.
SAFETY ELEMENT – DISASTER RECOVERY (MULTI-HAZARD)	
Policy 3.1.1	Coordination. Coordinate with each other, with other jurisdictions and with appropriate private and public entities prior to a disaster and to the greatest extent feasible within the resources available, to plan and establish disaster recovery programs and procedures which will enable cooperative ventures, reduce potential conflicts, minimize duplication and maximize the available funds and resources to the greatest mutual benefit following a disaster.
Policy 3.1.2	Health/safety/environment. Develop and establish procedures for identification and abatement of physical and health hazards which may result from a disaster. Provisions shall include measures for protecting workers, the public and the environment from contamination or other health and safety hazards associated with abatement, repair and reconstruction programs.
Policy 3.1.4	Interim services/systems. Develop and establish procedures prior to a disaster for immediate reestablishment and maintenance of damaged or interrupted essential infrastructure systems and services so as to provide communications, circulation, power, transportation, water and other necessities for movement of goods, provision of services and restoration of the economic and social life of the City and its environs pending permanent restoration of the damaged systems.
Policy 3.1.5	Restoration. Develop and establish prior to a disaster short- and long-term procedures for securing financial and other assistance, expediting assistance and permit processing and coordinating inspection and permitting activities so as to facilitate the rapid demolition of hazards and the repair, restoration and rebuilding, to a comparable or a better condition, those parts of the private and public sectors which were damaged or disrupted as a result of the disaster.
CONSERVATION ELEMENT – RESOURCE MANAGEMENT (FOSSIL LIBRARY) - PETROLEUM (OIL AND GAS)	
Policy 1	Continue to encourage energy conservation and petroleum product reuse.
Policy 3	Continue to protect neighborhoods from potential accidents and subsidence associated with drilling, extraction and transport operations, consistent with California Department of Conservation, Division of Oil and Gas requirements.

Los Angeles Municipal Code (LAMC). One of the primary purposes of zoning is to segregate uses that are thought to be incompatible; in practice, zoning is used as a permitting system to prevent new development from harming existing residents or businesses and to preserve the "character" of a community. With respect to hazards, the City uses zoning to separate businesses that use, store, transport, treat, or dispose of hazardous materials, or businesses that engage in potentially hazardous activities, such as manufacturing or refining, from residential areas and the general public.

The Methane Seepage Regulations, contained within LAMC Chapter IX, Article 1, Division 71 (Sections 91.7101 through 91.7109), establishes requirements for mitigation and other general building requirements to prevent potential environmental and harmful health effects that could be caused by the construction of buildings located in a defined Methane Hazard Zone within the City of Los Angeles. All new buildings and paved areas located in a Methane Zone or Methane Buffer Zone must comply with the requirements of LAMC Sections 91.7103 and 91.7104 and the Methane Mitigation Standards established by the Superintendent of Building. The Methane Mitigation Standards identify installation procedures, design parameters and test protocols for the methane gas mitigation system. As established under LAMC Section 91.106.4.1, LADBS has the authority to withhold permits on projects located within a Methane Zone or Methane Buffer Zone. Building permits may be issued upon submittal of detailed plans that show adequate protection against flammable gas incursion by providing the installation of suitable methane mitigation and monitoring systems.

Section 91.7109.2 of the LAMC requires LAFD notification when an abandoned oil well is encountered during construction activities, and requires that any abandoned oil well not in compliance with existing regulations be re-abandoned in accordance with applicable rules and regulations of the California Division of Oil, Gas, and Geothermal Resources (DOGGR).

Los Angeles Fire Department (LAFD). The LAFD monitors the storage of hazardous materials in the City for compliance with local requirements. Specifically, businesses and facilities which store more than threshold quantities of hazardous materials as defined in Chapter 6.95 of the California Health and Safety Code are required to file an Accidental Risk Prevention Program with the LAFD. This program includes information such as emergency contacts, phone numbers, facility information, chemical inventory, and hazardous materials handling and storage locations. The LAFD also has delegated authority to administer and enforce Federal and State laws and local ordinances for USTs. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LAFD Inspectors.

Los Angeles Fire Code. Chapter V, Article 7 of the LAMC contains the Los Angeles Fire Code. The purpose of the Fire Code is to prescribe laws for the safeguarding of life and property from fire, explosion, panic, or other hazardous conditions that may arise in the use or occupancy of buildings, structures, or premises and other laws that may be the duty of LAFD to enforce.

EXISTING SETTING

HAZARDOUS MATERIALS

The term "hazardous material" can have varying definitions for different regulatory programs. For the purpose of the Proposed Project, the term "hazardous materials" refers to both hazardous materials and hazardous waste. The California Health and Safety Code Section 25501 defines hazardous materials as follows:[4]

> *"Hazardous material means any material that because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include but are not limited to hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or environment."*

[4]California Health and Safety Code, Section 25501

A material is hazardous if it exhibits one or more of the following characteristics: ignitability, corrosivity, reactivity, and toxicity.[5]

Soil and groundwater can become contaminated by hazardous material releases in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, with the result that numerous industrial properties and public landfills became dumping grounds for unwanted chemicals. The largest and most contaminated of these sites became Superfund sites, so named for their eligibility to receive cleanup money from a federal fund established under CERCLA. The NPL is the list of national priorities among the known releases or threatened releases of hazardous substances, pollutants, or contaminants throughout the United States and its territories. The NPL is intended primarily to guide the USEPA in determining which sites warrant further investigation. Sites are added to the NPL following a hazard ranking system.

Numerous smaller properties have been designated as contaminated sites. Often these are gas station sites where leaking USTs were upgraded under a federal requirement in the late 1980s. Another category of sites which may have some overlap with the types already mentioned is "brownfields" – previously used, often abandoned, sites that because of actual or suspected contamination are undeveloped or underused. Both the USEPA and DTSC maintain lists of known brownfields sites. These sites are often difficult to inventory due to their owners' reluctance to publically label their property as potentially contaminated.

Asbestos-containing materials (ACMs) were widely used in structures built between 1945 and 1978. Common ACMs include vinyl flooring and associated mastic, wallboard and associate joint compound, plaster, stucco, acoustic ceiling spray, ceiling tiles, heating system components, and roofing materials. Commercial/industrial structures are affected by asbestos regulations if damage occurs or if remodeling, renovation, or demolition activities disturb ACMs. Lead-based paint (LBP) was primarily used during the same time period. Commercial/industrial structures are affected by lead-based paint regulations if the paint is in a deteriorated condition or if remodeling, renovation, or demolition activities disturb LBP surfaces.

PCBs are mixtures of up to 209 individual chlorinated compounds. There are no known natural sources of PCBs. PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they do not burn easily and are good insulators. The manufacture of PCBs was stopped in the United States in 1977 because of evidence that they build up in the environment and can cause harmful health effects. Products made before 1977 that may contain PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

TRANSPORT, USE, AND DISPOSAL

The use of hazardous materials is typically associated with industrial land uses. Activities, such as manufacturing, plating, cleaning, refining, and finishing, frequently involve chemicals that are considered hazardous when accidentally released into the environment. Industrial land uses are primarily located in the western portion of the ECTNP Area north of the Expo LRT Line around the Bundy and Sepulveda Stations and surrounding the Culver City Station.

To a lesser extent, hazardous materials may also be used by various commercial enterprises as well as residential uses. Dry cleaners, in particular, use cleaning agents considered to be hazardous materials. Hardware stores typically stock paints and solvents, as well as fertilizers, herbicides and pesticides; swimming pool supply stores stock acids, algaecides, and caustic agents. In fact, most commercial business occasionally use commonly available cleaning supplies which, when used in accordance with manufacturers' recommendations, are considered safe by the State of California, but when not handled properly can be considered hazardous. Private residences also use and store commonly available cleaning materials, paints, solvents, swimming pool and spa chemicals, as well as fertilizers, herbicides, and pesticides.

[5]Title 22, California Code of Regulations, Division 4.5, Chapter 11, Article 3, Section 66261.20-66261.24.

If improperly handled, hazardous materials can result in public health hazards through human contact with contaminated soils or groundwater, or through airborne releases in vapors, fumes, or dust. There is also the potential for accidental or unauthorized releases of hazardous materials that would pose a public health concern. The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state and local regulations. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous waste transporters are required to complete and carry a hazardous waste manifest (which is a set of forms, reports, and procedures designed to seamlessly track hazardous waste). Most transportation of hazardous materials within the ECTNP Area and the surrounding area is via trucks along highways, such as I-10, and major thoroughfares, such as Venice, Washington and Jefferson Boulevards. Two railroad rights-of-way, currently owned by the Los Angeles County Metropolitan Transportation Authority (Metro), extend through the ECTNP Area. The abandoned Southern Pacific alignment was developed as part of the Expo LRT Line.

HAZARDOUS MATERIALS SITES

As previously discussed, hazardous materials are found throughout the ECTNP Area in a multitude of forms and quantities. The locations where such materials are used, stored, treated and/or disposed comes to the attention of regulatory agencies through various means including licensing and permitting, enforcement actions, anonymous tips, and so forth. In some cases, businesses that use hazardous materials in quantities greater than certain established thresholds are required to file business plans with the LAFD. Other businesses that engage in the transport, storage, treatment, or disposal of hazardous materials are required to maintain detailed records of all their hazardous materials-related activities. To the extent possible, locations of these businesses and operations are recorded in several database lists maintained by various local, state, and federal regulatory agencies.

Federal, state, local, tribal and proprietary environmental databases were searched to determine the environmental regulatory status of the properties within the search area, including the Project Area and an approximate one-mile buffer around the Project Area. **Table 4.6-2** provides a summary of the number of recorded hazardous material sites within the search area. The database information represents a general indicator of the amount of possible hazardous material sites in the search area.

TABLE 4.6-2: NUMBER OF IDENTIFIED HAZARDOUS MATERIAL SITES WITHIN THE SEARCH AREA

Database	Description	Number of Sites /a/
FEDERAL RECORDS		
Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS)	The U.S. Environmental Protection Agency (USEPA) uses this database to track activities conducted under the Superfund program.	6
Comprehensive Environmental Response, Compensation-No Further Remedial Action Planned Report (CERC-NFRAP)	This database contains information pertaining to sites that have been removed from the CERCLIS database.	30
Resource Conservation and Recovery Act (RCRA), Treatment, Storage and/or Disposal Facility (TSD)	This database includes sites, which generate, transport, store, treat, and/or dispose of hazardous waste.	1
RCRA Information System – Large-Quantity Generator (RCRA-LQG)	This database includes sites that generate, transport, store, treat, and/or dispose of hazardous waste.	17
RCRA Information System – Small-Quantity Generator (RCRA-SQG)	This database includes sites that generate, transport, store, treat, and/or dispose of hazardous waste.	162
RCRA Information System- Conditionally Exempt Small Quantity Generators (RCRA-CESEQ)	This database includes sites that generate less than 100 kg of hazardous waste.	3
RCRA Information System – Non-Generator (RCRA NonGen/NLR)	This database includes selective information on sites that generate, transport, store, treat and/or dispose of hazardous waste. Non-Generators do not presently generate hazardous waste.	21

TABLE 4.6-2: NUMBER OF IDENTIFIED HAZARDOUS MATERIAL SITES WITHIN THE SEARCH AREA

Database	Description	Number of Sites /a/
Emergency Response Notification System (ERNS)	This database includes sites of reported releases of oil or hazardous substances to the air, soil and/or water.	16
Hazardous Material Information Resource System (HMIRS)	This database is the central repository for Material Safety Data Sheets for the U.S. Government military services and civil agencies.	1
Toxic Release Inventory System (TRIS)	This database is the USEPA's database on all sites that have or may be prone to toxic material releases.	3
Federal Toxics Tracking System (FTTS)	This database includes a list of pesticide enforcement actions and compliance activities.	2
Historical Federal Toxics Tracking System	This database includes a list of historical pesticide enforcement actions and compliance activities.	2
Facility Index System (FINDS)	FINDS is facility information and "pointers" to other sources of information that contain more detail (e.g., RCRA Info, CERCLIS).	215
Aerometric Information Retrieval System (US AIRS)	This database contains compliance data on air pollution point sources regulated by the USEPA and/or state and local air regulatory agencies.	1
STATE AND LOCAL RECORDS		
Department of Health Services Site-Specific Expenditure Plan (BOND EXP PLAN)	The Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds.	1
State School Evaluation Program	This category contains proposed and existing school sites that are being evaluated by Department of Toxic Substance Control (DTSC) for possible hazardous materials contamination.	7
Solid Waste Facilities/Landfill Sites (SWF/LF)	This data comes from the Integrated Waste Management Board's Solid Waste Information database.	6
Waste Management Unit Database System (WMUDS/SWAT)	This data is used for program tracking and inventory of waste management units	6
California Water Resources Control Board Waste Discharge Systems (WDS)	The WDS database lists Regional Water Quality Control Board (RWQCB) sites that have been issued waste discharge requirements	13
National Pollutant Discharge Elimination System (NPDES)	This database contains a listing of NPDES permits.	15
Underground Control Injection Wells (UIC)	This database contains listings of underground control injection wells.	11
DTSC Hazardous Waste and Substances Sites (Cortese)	Cortese is a database maintained by the DTSC used by State, local agencies and developers to comply with CEQA requirements in providing information about the location of hazardous material release sites.	1
HIST Cortese	HIST Cortese is the historical listing of the Cortese sites.	80
SWRCY Recycling Facilities	This database contains a listing of recycling facilities.	2
Leaking Underground Storage Tanks (UST)	This database is a listing of reported leaking UST incidents.	137
Facility Inventory Database (FID UST)	This database is a listing of active and inactive UST locations.	139
Spills, Leaks, Investigations, and Cleanups (SLIC)	This database is a listing of unauthorized discharges from spills and leaks, other than from USTs.	45
Underground Storage Tanks (USTs)	This database is a listing of Registered USTs.	62
Historical Underground Storage Tanks (HIST UST)	This database is the historical listing of UST sites from State Water Resources Control Board (SWRCB).	109
NY Manifest	This is a document that lists and tracks hazardous waste from the generator through transporters to a TSD facility.	2
UST Statewide Environmental Evaluation and Planning System	This database is a listing from SWRCB that is no longer maintained or updated.	179
California Hazardous Material Incident Report System	This database is a listing of reported hazardous material incidents (i.e., accidental releases or spills).	27
Above Ground Storage Tank	This database provides a listing of USTs that are permitted within the State.	2

TABLE 4.6-2: NUMBER OF IDENTIFIED HAZARDOUS MATERIAL SITES WITHIN THE SEARCH AREA

Database	Description	Number of Sites /a/
Notify 65 Proposition 65 Notification records	Notify 65 records contain facility notifications about any release that could impact drinking water and thereby expose the public to a potential health risk. The data come from the SWRCB's Proposition 65 database.	2
CA DEED: Recorded Land Use Restrictions	This includes recorded land use restrictions that DTSC uses to protect the public from unsafe exposure to hazardous substances and wastes.	2
CA VCP	This is a listing of low threat level properties with either confirmed or unconfirmed releases and the project proponents have requested DTSC oversee investigation and/or cleanup activities.	8
CA Drycleaners	Drycleaners is a list of drycleaner facilities with USEPA ID numbers.	21
CA WIP: Well Investigation Program	This is a well investigation program case.	1
CA ENF: Water Board Enforcement Actions	This is a listing of Water Board Enforcement Actions	8
CA CDL	This is a listing of drug lab locations.	3
CA Response	This identifies confirmed released sites where DTSC is involved in remediation.	2
CA HAZNET	This data is extracted from copies of hazardous waste manifests received each year by the DTSC.	606
CA EMI	This includes toxics and criteria pollutant emissions data collected by the CARB.	148
CA ENVIROSTAR	The DTSC's Site Mitigation and Brownfield's Reuse Program database identifies sites that have known contamination or sites for which there may be reasons to investigate further.	43
CA HWP	This includes detailed information on permitted hazardous waste facilities and corrective action tracked in Envirostar.	1
EDR PROPRIETARY RECORDS		
EDR US Hist Auto Stat	This falls within EDR's High Risk Historical Records category.	302
EDR US Hist Cleaners	This falls within EDR's High Risk Historical Records category	119

/a/ Most of the listed sites are included on more than one database, resulting in numerous overlaps (redundancies) in the listing.

Figure 4.6-1 identifies properties within the search area that may pose potential hazards. The search area includes the Project Area plus an approximately one-mile buffer around the Project Area.

METHANE GAS

Methane gas is produced by anaerobic decay of organic matter deep under the Earth's surface and is the major component of natural gas, about 87 percent by volume.[6] In common usage, deposits rich in natural gas (i.e., methane) are called natural gas fields. At room temperature and standard pressure, methane is a colorless, odorless gas. While not toxic, it is highly flammable and may form explosive mixtures with air. Methane is also an asphyxiant and may displace oxygen in an enclosed space. The concentrations at which flammable or explosive mixtures form are much lower than the concentration at which asphyxiation risk is significant. Because natural gas is lighter than water, it tends to rise from its sources until it either seeps to the surface or is trapped by a non-permeable layer of rock. When structures are built on or near landfills or naturally occurring natural gas fields, methane gas can penetrate the buildings' interiors and expose occupants to significant levels of methane.

[6]Anaerobic Decay is the process by which microorganisms break down biodegradable material in the absence of oxygen.

2012-058

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

Methane Zones and Methane Buffer Zones in the ECTNP Area are shown in **Figure 4.6-2**. Generally, parcels within the Methane Zone are subject to more restrictive mitigation requirements, while parcels within the Methane Buffer Zone are subject to less restrictive mitigation requirements, though requirements are site-specific and can vary. As shown, a very small portion of the ECTNP Area is located within a Methane buffer zone. This includes the north central, northeastern, and southeastern portions of the ECTNP Area.

SCHOOLS

An analysis of hazardous materials in relation to schools is required as part of the CEQA Guidelines. As shown in **Figure 4.6-2**, there are over 30 schools, including public schools that serve the Project Area (15 public schools identified in Table 4.11-9 in Section 4.11, Public Services) and other schools that are located within a quarter mile of the Project Area.

AIRPORT HAZARDS

Santa Monica Airport and Los Angeles International Airport (LAX) are the two closest airports to the ECTNP Area. Santa Monica Airport, located at 2828 Donald Douglas Loop N in the City of Santa Monica, is located less than two miles south of the western portion of the ECTNP Area. The Federal Aviation Administration (FAA) and the City of Santa Monica plan to maintain airport operations through 2028, after which the City may discontinue its use as an airport.[7]

LAX, located at One World Way, is located more than 10 miles south of the ECTNP Area. The ECTNP Area is not located within the Los Angeles County Airport Land Use Commission (ALUC) planning boundaries of either airport.[8]

EMERGENCY RESPONSE PLANS

Rescue and provision of medical care to victims of fires and other emergencies are the responsibilities of the LAFD. However, because the ECTNP Area adjoins other jurisdictions (the Cities of Culver City and Santa Monica), the City of Los Angeles has several joint-use agreements with other jurisdictions for cooperative response and management of fires and other emergency incidences. Under such agreements, the first respondents would usually be the nearest fire or police units, regardless of jurisdictional boundaries. Key to a successful rapid response is the LAFD's goal of maintaining adequate response distances from any given fire outbreak to the closest fire station. See Section 4.11, Public Services, for further discussion of LAFD.

WILDLAND FIRE

Brush fires continue to be a major threat to life and property throughout the region due to unique fuel, terrain, and climatic conditions. The hazard is especially great when the dry "Santa Ana" winds arrive, usually in the fall and winter seasons. The ECTNP Area is not located in a hilly or mountainous portion of the city. The ECTNP Area is not located in an area identified as a wildland fire hazard area, according to Exhibit D Selected Wildfire Hazard Areas of the Safety Element.[9]

2012-058

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to hazards and hazardous materials if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area;
- For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area;
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; and/or
- Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are adjacent to urbanized areas or where residences are intermixed with wildlands.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors:

For impacts related to risk of upset/emergency preparedness:

- The regulatory framework for the risk of upset/emergency preparedness;
- The probable frequency and severity of consequences to people or property as a result of a potential accidental release or explosion of a hazardous substance;
- The degree to which the project may require a new, or interfere with an existing emergency response evacuation plan, and the severity of consequences; and
- The degree to which the project design will reduce the frequency or severity of a potential accidental release or explosion of a hazardous substance.

For impacts related to human health hazards:

- The regulatory framework for the health hazard;
- The probable frequency and severity of consequences to people from exposure to the health hazard; and
- The degree to which project design would reduce the frequency of exposure or severity of consequences of exposure to the health hazard.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance for impacts from hazards and hazardous materials. The guidance is generally based on the CEQA Guidelines Appendix G, and provides specific criteria to be considered when making a significance determination. For purposes of this analysis, the CEQA Guidelines Appendix G criteria are used.

Analysis in this section focuses on the use, disposal, transport, or management of hazardous or potentially hazardous materials resulting from development or redevelopment envisioned under the Proposed Project. Disposal options, the probability for risk of upset, and the severity of consequences to people or property associated with the increased use, handling, transport, and/or disposal of hazardous materials associated with implementation of the Proposed Project are also analyzed. This section also addresses short-term construction impacts resulting from demolition of existing (usually older) structures, as well as from disturbance of contaminated soils. Operational impacts would generally be associated with the type of uses proposed and the materials that operation of these uses would entail. In determining the level of significance, the analysis assumes that any development under the Proposed Project would comply with relevant federal and state laws and regulations, as well as the LAMC.

This discussion of hazards and hazardous materials addresses impacts within the entire Project Area. No distinction is made between areas of change and areas within the Project Area, where zoning controls would not change, because potential impacts related to hazards and hazardous materials are generally site-specific and not based on whether future development projects are located within or outside of the change areas.

IMPACTS

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans and parking strategies that together enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. The ECTNP would guide future development by specifying the type of uses, densities, intensities, and design standards and guidelines that would be permitted. The Proposed Project encourages new development at transit station areas with the goal of promoting transit ridership and creating an active, mixed-use environment in the station areas. Zone Changes and General Plan amendments would not occur on every parcel within the Project Area; changes would only occur within specific "areas of proposed change," also known as "Subareas" in the Proposed Plan. Future development projects within the ECTNP Area would be required to comply with applicable regulatory requirements pertaining to hazardous materials during construction and operation.

Individual businesses are subject to intensive regulatory review as part of the permit and approval process, as well as being subject to a myriad of regulations regarding hazardous material use, storage, transportation and disposal. This regulatory review and regulatory compliance review ensures that adjacent populations are protected from unusual hazards from such uses. While the Proposed Project may encourage greater redevelopment of older potentially contaminated sites, they are subject to the federal, state, and local policies and guidelines mentioned above.

IMPACT 4.6-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE A SIGNIFICANT HAZARD TO THE PUBLIC OR THE ENVIRONMENT THROUGH THE ROUTINE TRANSPORT, USE, OR DISPOSAL OF HAZARDOUS MATERIALS? COMPLIANCE WITH EXISTING LOCAL, STATE, AND FEDERAL REGULATIONS WOULD ENSURE THIS IMPACT REMAINS LESS THAN SIGNIFICANT.

Industrial facilities tend to store, use, and generate larger quantities of hazardous materials and wastes than other types of land uses. As described in Chapter 3.0, Project Description, the Proposed Project would introduce four new zones, three of which are job-generating zones with a Hybrid Industrial land use designation. The zone changes to these new zones would occur on land currently zoned for traditional industrial and manufacturing uses at the Bundy Station (89.4 acres), Sepulveda Station (33.2 acres), Culver City Station (22.2 acres), and Palms Station (5.3 acres). The proposed zones would limit the types of industrial uses allowed to those tailored towards 21st century clean-tech/high-tech industries, such as research and development, media, and digital technology. Light manufacturing and assembly uses associated with these industries would also be allowed.

The Proposed Project may result in an increase of industrial land uses by up to approximately 370,000 square feet in the areas of proposed change or Subareas.[10] This would increase the risk of hazardous material accidents during use, transport, and disposal. However, individual facilities that use or store large quantities of hazardous materials on-site are required to comply with numerous federal, state, and local regulations that address hazardous materials use, transport, storage and disposal, including the Resource Conservation and Recovery Act (RCRA), Title 22, the Hazardous Waste Control Law, Hazardous Materials Transportation Act, and Hazardous Materials Business Plans. In addition, a majority of the industrial land use located within the Project Area would be light industrial and light manufacturing uses, which do not involve the use of hazardous materials.

Asbestos-containing materials (ACMs) and lead-based paint (LBP) were widely used in structures built between 1945 and 1978 and PCBs in structures built or renovated between 1950 and 1979. It is reasonable to assume that these materials would be encountered during rehabilitation and demolition of some of these structures. However, removal of these materials is also well regulated. Prior to any rehabilitation or demolition activities involving structures within the time periods identified above, any development project within the Project Area will be required to retain a Certified Asbestos Consultant to determine the presence of asbestos and ACMs in compliance with Cal/OSHA requirements and a state-certified Lead Inspector/Assessor to conduct LBP testing in compliance with Title 17 of the CCR. If asbestos and/or LBPs are discovered, a licensed asbestos and/or LBP/materials abatement contractor is required to be retained to safely remove ACM in accordance with Cal/OSHA regulations and SCAQMD Rule 1403 (Asbestos Emissions from Demolition/Renovation Activities) and/or lead-based paint in accordance with USEPA's Lead Abatement Program regulations under the TSCA. Similarly, prior to any rehabilitation or demolition activities for any development project within the Project Area, inspections for PCB-containing electrical features will be required. In California, USEPA enforces the federal regulations for PCB disposal and storage (under the TSCA), and DTSC administers and enforces the state's additional requirements for PCB hazardous waste (under RCRA). Mandatory compliance with Title 40 of the CFR and Title 22 of the CCR would ensure that proper procedures are followed to minimize potential exposure to significant health hazards associated with PCBs. Therefore, with implementation of all applicable local, state, and federal regulations, the Proposed Project would result in less than significant impacts related to the use, transport, and disposal of hazardous materials.

[10]City of Los Angeles Department of City Planning, as part of preparation of the Water Supply Assessment, LADWP, *Water Supply Assessment for the Exposition Corridor Transit Neighborhood Plans (Proposed Project)*, February 6, 2014.

MITIGATION MEASURES

Impacts related to the use, transport, and disposal of hazardous materials would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the use, transport, and disposal of hazardous materials were determined to be less than significant without mitigation.

IMPACT 4.6-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE A SIGNIFICANT HAZARD TO THE PUBLIC OR THE ENVIRONMENT THROUGH REASONABLY FORESEEABLE UPSET AND ACCIDENT CONDITIONS INVOLVING THE RELEASE OF HAZARDOUS MATERIALS INTO THE ENVIRONMENT? COMPLIANCE WITH EXISTING REGULATIONS WOULD ENSURE THIS IMPACT REMAINS LESS THAN SIGNIFICANT.

As mentioned above, the Proposed Project encourages targeted redevelopment within the ECTNP Area. Elements such as rezoning around transit stations would encourage the construction of new buildings. The demolition of existing buildings on these sites could release hazardous materials into the environment. However, all demolition and construction within the ECTNP Area would be required to comply with all local, state, and federal regulations.

New buildings would replace older structures that may have been built prior to the most recent building codes and regulations. Therefore, the proposed zone changes would reduce the risk of exposure to hazardous materials for those occupying buildings in the area as a result of accidents that can occur, as current building codes and regulations require development projects to adhere to the seismic design requirements of the California Building Code (CBC) and the Los Angeles Building Code (LABC) to ensure new buildings are designed to withstand seismic events through modern construction techniques and minimize damage to structures or infrastructure that could result in the accidental release of hazardous materials into the environment.

As shown in **Figure 4.6-2**, Methane Buffer Zones occur in the north-central, northeastern, and southeastern portions of the ECTNP Area. However, as previously discussed, any new construction would be required to comply with the California Department of Conservation, Division of Oil and Gas requirements, the SCAQMD regulations, the City of Los Angeles Methane Ordinance, and LAMC Section 91.7102 regarding methane gas. Therefore, impacts related to methane gas would be reduced to less than significant.

Businesses are required to comply with health and safety, and environmental protection laws and regulations, which require businesses handling or storing certain amounts of hazardous materials to prepare a hazardous materials business plan that includes an inventory of hazardous materials used or stored on-site, and procedures to be used in the event of a significant or threatening significant release of a hazardous material. The hazardous materials plan must include a Material Safety Data Sheet (MSDS) for each hazardous material used or stored on-site. To accomplish this, and to otherwise provide a safe and healthy environment, businesses that use hazardous materials must implement health and safety policies and procedures. In addition, future projects within the ECTNP Area will be required to complete all applicable environmental review processes and to conform with environmental regulations related to new construction and hazardous materials storage, use and transport. Existing hazardous materials regulations would minimize the potential for exposure to adverse health or safety effects. Therefore, the Proposed Project would result in less than significant impacts related to upset and accident conditions.

MITIGATION MEASURES

Impacts related to upset and accident conditions involving the release of hazardous materials would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to upset and accident conditions were determined to be less than significant without mitigation.

IMPACT 4.6-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN HAZARDOUS EMISSIONS OR THE HANDLING OF ACUTELY HAZARDOUS MATERIALS, SUBSTANCES, OR WASTE WITHIN A QUARTER MILE OF AN EXISTING OR PROPOSED SCHOOL, CREATING A RISK TO HUMAN HEALTH FROM SUCH ACTIVITIES? COMPLIANCE WITH EXISTING REGULATIONS WOULD ENSURE THIS IMPACT REMAINS LESS THAN SIGNIFICANT.

As shown in **Figure 4.6-1**, there are over 30 schools, including public schools that serve the Project Area (the 15 public schools identified in Table 4.11-9 in Section 4.11, Public Services) and other schools that are located within a quarter mile of the Project Area. Construction activities would involve the utilization of diesel powered trucks and equipment, which result in diesel emissions that have been determined to be a health hazard. These impacts are discussed in Section 4.2, Air Quality.

Individual projects developed as part of the ECTNP would be required to comply with federal, state, and local hazardous materials regulations. Compliance with all applicable local, state, and federal laws and regulations, as described in the Regulatory Framework, would regulate, control, or respond to hazardous waste, transport, store, disposal, and clean-up in order to ensure that hazardous materials do not pose a significant risk to nearby receptors. Therefore, the Proposed Project would result in less than significant impacts related to schools.

MITIGATION MEASURES

Impacts related to handling hazardous materials within a quarter mile of a school would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to schools were determined to be less than significant without mitigation.

IMPACT 4.6-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT BE LOCATED ON A SITE THAT IS INCLUDED ON A LIST OF HAZARDOUS MATERIALS SITES COMPILED PURSUANT TO GOVERNMENT CODE SECTION 65962.5 AND, AS A RESULT, COULD DEVELOPMENT CREATE A SIGNIFICANT HAZARD TO THE PUBLIC OR THE ENVIRONMENT? THIS IMPACT IS LESS THAN SIGNIFICANT WITH MITIGATION.

As described above and summarized in **Table 4.6-2**, the EDR record search (**Appendix D**) conducted for the Proposed Project identified numerous sites, including, but not limited to, cleanup sites and permitted underground UST facilities within the ECTNP Area. **Figure 4.6-1** shows all identified sites within the Project Area; of these sites, ten are located within the areas of proposed change, where zoning would change under the Proposed Project. Although some of these sites either have been cleaned up or are in the process of being cleaned up, the potential remains for USTs or contaminated soils to be uncovered or encountered during construction activities. Future development on a site identified as previously occupied by hazardous materials generating facility would have the potential to create a significant hazard to the public or the

environment unless an environmental site assessment is conducted to determine potential risks and to ensure appropriate remediation is implemented. Therefore, the Proposed Project could result in a significant impact related to hazardous materials sites.

MITIGATION MEASURES

HM1 The City shall require that future development that involves new construction and soil disturbance document that the site is not on any government list of sites containing hazardous waste or hazardous materials (including lists prepared pursuant to Government Code, section 65962.5). A report setting forth the results of this database search (e.g. historical environmental reports prepared by Enviroscan, EDR, or similar firms) shall be provided to the City. If the report indicates the project site, or property within one-quarter mile of the project site has the potential to be contaminated with hazardous waste or hazardous materials for any reason, a Phase I Environmental Site Assessment (ESA) shall be prepared. The Phase I assessment shall be prepared by an appropriately qualified individual (with experience in the identification and mitigation of hazardous materials and wastes) in accordance with state standards and guidelines to evaluate whether the site or the surrounding area is contaminated from the past or current uses including storage, use, transport, generation, and disposal of toxic and hazardous waste or materials. Depending on the results of this study, further investigation and remediation may be required in accordance with local, state, and federal regulations and policies. Any further study found necessary by an appropriately qualified individual or relevant federal, state, or local agency shall be performed prior to project approval or made a condition of project approval. Prior to the Department of Building and Safety's issuance of any permits that allow for grading or construction on the project sites that were on a government list or within one-quarter mile of a site on a government list, the appropriately qualified individual or relevant agency shall provide written confirmation to the City that any necessary remediation has been completed to the satisfaction of the lead agency responsible for cleanup including confirmation that required site remediation was completed consistent with the relevant federal, state, or local requirements.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Implementation of Mitigation Measure **HM1** would reduce the impacts related to development on or near an identified hazardous materials site, which could have the potential to create a significant hazard to the public or the environment, to less than significant.

IMPACT 4.6-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN A SAFETY HAZARD FOR PEOPLE RESIDING OR WORKING IN THE PROJECT AREA NEAR A PUBLIC AIRPORT? THIS IMPACT IS LESS THAN SIGNIFICANT.

Santa Monica Airport is located less than two miles south of the western portion of the ECTNP Area, while LAX is located more than 10 miles south of the ECTNP Area. The FAA and the City of Santa Monica plan to maintain airport operations through 2028, after which the City may discontinue its use as an airport.[11] The ECTNP Area is not located within the ALUC planning boundaries of either airport. Implementation of the Proposed Project could allow for increased height at the areas of proposed change. Due to the distance from Santa Monica Airport and LAX, even this increased height would not interfere with flight patterns. Compliance with applicable airport safety procedures would be followed by development proposed for the western portion of the ECTNP Area to ensure that development would not result in a safety hazard or be exposed to safety hazard related to the operation of the Santa Monica Airport. Therefore, the Proposed Project would result in less than significant impacts related to airport hazards.

[11]FAA, *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

MITIGATION MEASURES

Impacts related to airport hazards would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to airport hazards were determined to be less than significant without mitigation.

IMPACT 4.6-6 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN A SAFETY HAZARD FOR PEOPLE RESIDING OR WORKING IN THE PROJECT AREA NEAR A PRIVATE AIRSTRIP? AS NO PRIVATE AIRSTRIPS ARE LOCATED IN THE PROJECT VICINITY, NO IMPACT WOULD OCCUR.

There are no private airstrips located in the vicinity of the ECTNP Area. In addition, the ECTNP Area is not located within a designated airport hazard area. Therefore, implementation of the Proposed Project would not result in an airstrip-related safety hazard for people residing or working in the ECTNP Area. Accordingly, no impact related to hazards associated with the operation of a private airstrip would occur.

MITIGATION MEASURES

No impacts related to airstrip hazards would occur under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to airstrip hazards would occur.

IMPACT 4.6-7 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT IMPAIR IMPLEMENTATION OF OR PHYSICALLY INTERFERE WITH AN ADOPTED EMERGENCY RESPONSE PLAN OR EMERGENCY EVACUATION PLAN? COMPLIANCE WITH EXISTING LOCAL, STATE, AND FEDERAL REGULATIONS WOULD ENSURE THAT THIS IMPACT REMAINS LESS THAN SIGNIFICANT.

The Proposed Project would not impair implementation of, or physically interfere with, the State Emergency Plan or the Los Angeles County Operational Area Emergency Response Plan.[12] Although the Proposed Project would include new land uses and zoning, any future development would be required to comply with county and local emergency response plans. The City of Los Angeles Department of Transportation and LAFD would be responsible for ensuring that the Proposed Project (including proposed land uses) does not impair or physically interfere with an adopted emergency response or evacuation plan. This would be accomplished in a number of ways, including ensuring that the land uses developed under the Proposed Project include adequate access and escape routes (clearly marked and delineated) and residents and patrons of on-site businesses are aware of emergency evacuation plans in the event of a major emergency/catastrophe.

As discussed in Section 4.11, Public Services, designated emergency evacuation and disaster routes within the Project Area would be maintained with the Proposed Project. In addition, local policies, such as the City's General Plan Safety Element Policies 1.1.1, 1.1.2, 1.1.3, 2.1.1, and 3.1.1 provide procedures for coordination among City agencies and other jurisdictions to provide mutual assistance in the event of an emergency or natural disaster and establishment of disaster recovery programs.[13] Compliance with these policies would help minimize the potential impact of interference with the County's emergency response plan. Therefore, the Proposed Project would result in less than significant impacts related to emergency response plans.

[12]County of Los Angeles Office of Emergency Management, *Operational Area Emergency Response Plan*, February 1998.
[13]City of Los Angeles General Plan *Safety Element,* April 1996.

MITIGATION MEASURES

Impacts related to emergency response plans would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to emergency response plans were determined to be less than significant without mitigation.

IMPACT 4.6-8 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXPOSE PEOPLE OR STRUCTURES TO A SIGNIFICANT RISK OF LOSS, INJURY, OR DEATH INVOLVING WILDLAND FIRES, INCLUDING WHERE WILDLANDS ARE ADJACENT TO URBANIZED AREAS OR WHERE RESIDENCES ARE INTERMIXED WITH WILDLANDS? AS NO WILDLAND FIRE HAZARD AREAS EXIST WITHIN THE ECTNP AREA, NO IMPACT WOULD OCCUR.

The ECTNP Area is located in a highly-urbanized portion of the City of Los Angeles and is not located in an area identified as a wildland fire hazard area according to Exhibit D, Selected Wildfire Hazard Areas of the Safety Element.[14] Construction of the Proposed Project would not result in impacts to wildland fires and would not place residences in areas prone to wildfires. Therefore, the Proposed Project would result in no impacts related to wildland fire.

MITIGATION MEASURES

No impacts related to wildland fires would occur under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to wildland fires would occur.

[14]City of Los Angeles General Plan *Safety Element. Exhibit D- Selected Wildfire Hazard Areas*, April 1996.

4.7 HYDROLOGY AND WATER QUALITY

This section provides an overview of hydrology and water quality. Topics addressed include water quality, groundwater, stormwater and drainage, and flooding and inundation. The Proposed Project is evaluated in terms of whether its implementation and the corresponding increase in development capacity would result in impacts related to hydrology and water quality.

REGULATORY FRAMEWORK

FEDERAL

Federal Water Pollution Control Act (Clean Water Act [CWA]). The federal CWA was first enacted in 1948 to (1) restore and maintain the chemical, physical, and biological integrity of the Nation's waters by preventing point and non-point pollution sources, (2) provide assistance to publicly owned treatment works for the improvement of wastewater treatment, and (3) maintain the integrity of wetlands. With subsequent amendments, current regulations provide that discharges of stormwater to waters of the United States from industrial and construction activities that encompass one acre or more of soil disturbance are effectively prohibited unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. In November 1990, the United States Environmental Protection Agency (USEPA) published final regulations that established stormwater permit application requirements for specified categories of industries. With subsequent amendments, current regulations provide that discharges of stormwater to "waters of the United States" from industrial activities and from construction activities that encompass one acre or more of soil disturbance are effectively prohibited unless the discharge is in compliance with a NPDES permit. Federal regulations allow two permitting options for stormwater discharges, individual permits and general permits. The State Water Resource Control Board (SWRCB) has elected to adopt one statewide general permit for construction activity at this time. The General Construction Activities Stormwater Permit (GCASP) applies to all stormwater discharges associated with construction activity, except for those on tribal lands, those in the Lake Tahoe Hydrologic Unit, and those performed by the California Department of Transportation (Caltrans). Currently, the GCASP requires all dischargers where construction activity disturbs one acre or more to conduct the following:

- Develop and implement a Stormwater Pollution Prevention Plan (SWPPP), which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving off-site into receiving waters;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the United States; and
- Perform inspections of all BMPs.

The CWA directs states to establish water quality standards for all "waters of the United States" and to review and update such standards on a triennial basis. The USEPA has delegated responsibility for implementation of portions of the CWA, including water quality control planning and control programs, in California to SWRCB, and the nine Regional Water Quality Control Boards (RWQCB). CWA Section 303(c)(2)(B) requires states to adopt water quality standards for all surface waters of the United States based on the water body's designated beneficial use. Where multiple uses exist, water quality standards must protect the most sensitive use. Water quality standards for the Los Angeles region are set forth in the *Water Quality Control Plan: Los Angeles Region Basin Plan* (2014), and are administered by the Los Angeles Regional Water Quality Control Board (LARWQCB).

The goal of the NPDES diffuse-source regulations is to improve the quality of stormwater discharged to receiving waters to the "maximum extent practicable" through the use of BMPs. The NPDES permit system was established in the CWA to regulate point source discharges (a municipal or industrial discharge at a

specific location or pipe) and certain types of diffuse source dischargers. As defined in the federal regulations, non-point sources are generally exempt from federal NPDES permit program requirements. Non-point pollution sources are diffuse and originate over a wide area rather than from a definable point. Non-point pollution often enters receiving water in the form of surface runoff and is not conveyed by way of pipelines or discrete conveyances. Urban stormwater runoff and construction site runoff, however, are diffuse-sources regulated under the NPDES permit program because they discharge to receiving waters at discrete locations in a confined conveyance system. CWA Sections 401 and 402 contain general requirements regarding NPDES permits. CWA Section 307 describes the factors that the USEPA must consider in setting effluent limits for priority pollutants. For point source discharges, each NPDES permit contains limits on allowable concentrations and mass emissions of pollutants contained in the discharge. For diffuse-source discharges (e.g., municipal stormwater and construction runoff), the NPDES program establishes a comprehensive stormwater quality program to manage urban stormwater and minimize pollution of the environment to the maximum extent practicable. The NPDES program consists of (1) characterizing receiving water quality, (2) identifying harmful constituents, (3) targeting potential sources of pollutants, and (4) implementing a Comprehensive Stormwater Management Program. State implementation of the NPDES program as it relates to the Proposed Project is discussed below under State and regional regulations.

CWA Section 401 requires water quality certification from the SWRCB or from a RWQCB when the project requires a CWA Section 404 permit. CWA Section 404 requires a permit from the U.S. Army Corps of Engineers (USACE) to discharge dredged or fill material into waters of the United States.

CWA Section 303(d) and Total Maximum Daily Loads (TMDLs). CWA Section 303(d) bridges the technology-based and water quality-based approaches for managing water quality. Section 303(d) requires that States make a list of waters that are not attaining standards after the technology-based limits are put in place. For waters on this list (and where the USEPA administrator deems they are appropriate), the States are to develop TMDLs. TMDLs are established at the level necessary to implement applicable water quality standards. A TMDL must account for all sources of pollutants that cause the water to be listed. Federal regulations require that TMDLs, at a minimum, account for contributions from point sources and nonpoint sources.

National Flood Insurance Program (NFIP). In response to Executive Order 11988 (Flood Plain Management), Congress acted to reduce the costs of disaster relief by passing two acts that resulted in the NFIP, which is administered by the Federal Emergency Management Agency (FEMA). FEMA issues Flood Insurance Rate Maps (FIRMs), which delineate flood hazard zones in communities participating in the NFIP. The maps indicate the risk premium zones applicable in the community and when those rates are effective. They are used in making flood plain determinations and to determine if a proposed action is located in the base or critical action flood plain, as appropriate. The City of Los Angeles is a participating member of the NFIP, and flood insurance is available to property owners in the Project Area.

STATE

Porter-Cologne Water Quality Control Act. The Porter-Cologne Water Quality Control Act establishes the SWRCB and each RWQCB as the principal state agencies for coordinating and controlling water quality in California. Specifically, the Porter-Cologne Water Quality Control Act authorizes the SWRCB to adopt, review, and revise policies for all waters of the state (including both surface and groundwaters) and directs the RWQCBs to develop regional Basin Plans. Section 13170 of the California Water Code also authorizes the SWRCB to adopt water quality control plans on its own initiative. The Porter-Cologne Act is administered in the Project Area by the LARWQCB and is implemented at the city-level through various programs.

California State Water Resource Control Board (SWRCB). The SWRCB was established through the California Porter Cologne Water Quality Act of 1969. At the state level, the SWRCB has responsibility for the protection of water quality. The SWRCB sets statewide policies and regulations for the implementation of water quality control programs mandated by federal and state water quality statutes and regulations. The SWRCB delegates to the nine RWQCBs the responsibility for the protection of water quality in each major drainage basin throughout the state. The LARWQCB has jurisdiction over the coastal drainages between Rincon Point (on the coast of western Ventura County) and the eastern Los Angeles County line. A more detailed discussion of the LARWQCB is presented below.

Groundwater Management Act. Effective in 2015, the Sustainable Groundwater Management Act (SGMA) requires local regions to create a groundwater sustainability agency (GSA) and to adopt groundwater management plans. The SGMA identifies 43 groundwater basins as high-priority and 84 as medium-priority statewide. These 127 basins must adopt groundwater management plans by 2020 or 2022, depending upon whether the basin is in critical overdraft. GSAs will have until 2040 or 2042 to achieve groundwater sustainability. The Project Area is located within the Central and Santa Monica Sub-basins that are classified as high and medium priority, respectively. This Act further defines "sustainable groundwater management" as the "management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results. "Undesirable result" means any of the following effects caused by groundwater conditions occurring throughout the basin: chronic lowering of groundwater levels, but excluding reductions in groundwater levels during a drought if they are offset by increases in groundwater levels during other periods; significant and unreasonable reductions in groundwater storage; significant and unreasonable seawater intrusion; significant and unreasonable degradation of water quality; significant and unreasonable land subsidence; and/or surface water depletions that have significant and unreasonable adverse impacts on beneficial uses. The GSA for the Project Area is the Water Replenishment District of Southern California of which the City of Los Angeles is a member.

NPDES General Construction Activity Stormwater Permit (GCASP). Pursuant to CWA Section 402(p) and the Porter-Cologne Water Quality Control Act, SWRCB has issued a statewide NPDES General Permit, or GCASP, under Order No. 2009-0009-DWQ, NPDES No. CAR000002, adopted on September 2, 2009.[1] This Order requires that prior to the beginning of construction activities, the permit applicant must obtain coverage under a GCASP permit by preparing and submitting a Notice of Intent (NOI) along with the appropriate fee to SWRCB. Construction activities subject to GCASP include clearing, grading, and disturbances to the ground, such as stockpiling or excavation, that result in soil disturbances of one acre of total land area or more.

Prior to obtaining the GCASP, an adequate SWPPP has to be prepared. The SWPPP specifies BMPs that will prevent construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off-site into receiving waters. BMPs are intended to diminish impacts to the Maximum Extent Practicable (MEP), which is a standard developed by Congress to allow regulators the flexibility needed to shape programs to the site-specific nature of municipal stormwater discharges. The SWPPP has two major objectives: (1) to help identify the sources of sediment and other pollutants that affect the quality of stormwater discharges and (2) to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in stormwater as well as non-stormwater discharges. The SWPPP includes a description of: (1) the site, (2) erosion and sediment controls, (3) means of waste disposal, (4) implementation of approved local plans, (5) control of post-construction sediment and erosion control measures and maintenance responsibilities, and (6) non-stormwater management controls. Dischargers are also required to inspect their construction sites before and after storms to identify stormwater discharge associated with construction activity and to identify and implement controls where necessary.

[1] *California Water Code Section 13263(i).*

BMPs are intended to diminish impacts to the MEP, which is a standard developed by Congress to allow regulators the flexibility needed to shape programs to the site-specific nature of municipal stormwater discharges. Reducing impacts to the MEP generally relies on BMPs that emphasize pollution prevention and source control, with additional structural controls as needed

Within the City of Los Angeles, SWPPP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, development project plans are reviewed for compliance with the stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

Regional Dewatering General Waste Discharge Requirements (WDR). California Water Code (CWC) Section 13263(i) authorizes RWQCBs to issue WDRs for a category of discharges if it finds or determines that the discharges in that category: 1) are produced by the same or similar operations, 2) involve the same or similar types of waste, 3) require the same or similar treatment standards, and 4) are more appropriately regulated under general discharge requirements than individual discharge requirements. LARWQCB has issued a general permit for construction dewatering (Waste Discharge Requirements for Discharges of Groundwater from Construction Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties Order No. R4-2008-0032, and NPDES No. CAG994004). Discharges covered by this permit include, but are not limited to, treated or untreated groundwater generated from permanent or temporary dewatering operations (removing or draining water from ground or surface water), treated or untreated wastewater from permanent or temporary construction dewatering operations; subterranean seepage dewatering; and incidental collected stormwater from basements.

Cobey-Alquist Flood Plain Management Act. CWC Sections 8400 et seq. documents the State's intent to support local governments in their use of land use regulations to accomplish floodplain management and to provide assistance and guidance, as appropriate.

Sustainable Groundwater Management Act (SGMA). Effective in 2015, SGMA creates a framework for sustainable, local groundwater management in California. SGMA allows local agencies to customize groundwater sustainability plans to their regional economic and environmental needs. This Act requires local regions to create a GSA and to adopt groundwater management plans for groundwater basins or sub-basins that are designated as medium or high priority. High-priority and medium-priority basins or sub-basins must adopt groundwater management plans by 2020 or 2022, depending upon whether the basin is in critical overdraft. GSAs will have until 2040 or 2042 to achieve groundwater sustainability. The Proposed Plan is located within the Hollywood Sub-basin of the Coastal Plain of Los Angeles Basin (south of the Santa Monica Mountains) and San Fernando Valley Basin (the northern and eastern foothills of the Santa Monica Mountains). The Hollywood Sub-basin is classified as very low priority and the San Fernando Valley Basin is classified as medium priority.

The act defines "sustainable groundwater management" as the "management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results. "Undesirable result" means any of the following effects caused by groundwater conditions occurring throughout the basin: chronic lowering of groundwater levels, but excluding reductions in groundwater levels during a drought if they are offset by increases in groundwater levels during other periods; significant and unreasonable reductions in groundwater storage; significant and unreasonable seawater intrusion; significant and unreasonable degradation of water quality; significant and unreasonable land subsidence; and/or surface water depletions that have significant and unreasonable adverse impacts on beneficial uses.

LOCAL

Los Angeles Regional Water Quality Control Board (LARWQCB) and Water Quality Management Plan for the Los Angeles Region (Basin Plan). The Project Area is within the jurisdiction of the LARWQCB, which is one of the nine RWQCBs in California. LARWQCB protects ground and surface water quality in the Los Angeles Region, including the coastal watersheds of Los Angeles and Ventura Counties, along with very small portions of Kern and Santa Barbara Counties. LARWQCB provides permits for projects that may affect surface waters and groundwater locally. LARWQCB is responsible for preparing the Basin Plan, which is updated as necessary every three years. The latest Basin Plan was updated in 2014. The Basin Plan establishes water quality objectives for surface waters and groundwater within the Los Angeles region. The Basin Plan designates the beneficial uses of inland surface waters, including the Hollywood Reservoir and Los Angeles River, and specifies both narrative and numerical water quality objectives for these surface waters in the County. Water quality objectives, as defined by the CWA Section 13050(h), are the "limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses or the prevention of nuisance within a specific area."

The Basin Plan, under CWA Section 303(d), is intended to protect surface waters and groundwater from both point and nonpoint sources of pollution within the Project Area, and for establishing water quality standards and objectives in its Basin Plan that protect the beneficial uses of various waters. To do this, the Basin Plan designates beneficial uses for surface water and groundwater, sets narrative and numerical water quality objectives that must be attained (or maintained) to protect the designated beneficial uses, and describes implementation programs to protect all waters in the region. According to the Basin Plan:

> *Beneficial uses form the cornerstone of water quality protection under the Basin Plan. Once beneficial uses are designated, appropriate water quality objectives can be established and programs that maintain or enhance water quality can be implemented to ensure the protection of beneficial uses. The designated beneficial uses, together with water quality objectives (referred to as criteria in federal regulations), form water quality standards.*

The state has developed TMDLs, which is a calculation of the maximum amount of a pollutant that a water body can have and still meet Water Quality Objectives (WQOs) established in the Basin Plan, in order to protect the valuable uses of its waters.

Municipally-Owned Separate Storm Sewer Systems (MS4) Permit and Stormwater Quality Management Plan (SQMP). Since the Project Area falls within the jurisdiction of the LARWQCB, discharges of urban runoff into MS4s are regulated under the general NPDES stormwater permit that has been issued by the LARWQCB for the Los Angeles Region (MS4 Permit). The City is a co-permittee under the MS4 Permit and therefore has joint/concurrent legal authority to enforce the terms of the permit within its jurisdiction. The MS4 Permit is intended to ensure that combinations of site planning, source control and treatment control practices are implemented to protect the quality of receiving waters. The permit requires that new development employ BMPs designed to control pollutants in stormwater runoff to the MEP, details specific sizing criteria for BMPs, and specifies flow control requirements. These BMPs include structural practices, source control and treatment techniques and systems, and site design planning principles addressing water quality.

Site design or planning management BMPs are used to minimize runoff from new development and to discourage development in environmentally sensitive areas that are critical to maintaining water quality. The MS4 Permit also requires co-permittees to prepare a SQMP, specifying the BMPs that will be implemented to reduce the discharge of pollutants in stormwater. The SQMP is expected to reduce pollutants in stormwater and urban runoff. Within the City of Los Angeles, which includes the Project Area, SQMP is implemented through the City's Standard Urban Stormwater Mitigation Plan (SUSMP).

Standard Urban Stormwater Mitigation Plan (SUSMP) Requirements. On March 8, 2000, SUSMP requirements were approved by LARWQCB as part of the MS4 permit to address stormwater pollution from new construction and redevelopment projects. SUSMP is a comprehensive stormwater quality program to manage urban stormwater and minimize pollution of the environment. The purpose of SUSMP is to reduce the discharge of pollutants in stormwater by outlining BMPs that must be incorporated into the design plans of new development and redevelopment. The SUSMP requirements contain a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control peak flow discharge, and reduce the post-project discharge of pollutants from stormwater conveyance systems. The SUSMP requirements define, based upon land use type, the types of practices that must be included and issues that must be addressed as appropriate to the development type and size. The SUSMP requirements apply to all development and redevelopment projects that fall into one of the following categories:

- Single-family hillside residences
- One acre or more of impervious surface area for industrial/commercial developments
- Automotive service facilities
- Retail gasoline outlets
- Restaurants
- Ten or more residential units
- Parking lots of 5,000 square feet or greater or with 25 or more spaces
- Projects located in or directly discharging to an Ecologically Sensitive Area

The SUSMP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, development project plans are reviewed for compliance with stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

County of Los Angeles Hydrology Manual. Drainage and flood control within the Project Area is regulated by the City of Los Angeles Department of Public Works (LADPW) and the Los Angeles County Department of Public Works (LACDPW). The County has jurisdiction over regional drainage facilities. The County's Hydrology Manual requires a storm drain system be designed for a 25-year storm event and that the combined capacity of a storm drain and street flow system accommodate flow from a 50-year storm event.[2] The County also limits the allowable discharge into existing storm drain facilities based on the MS4 Permit and is enforced on all new developments that discharge directly into the County's storm drain system.

Enhanced Watershed Management Plans (EWMPs). On November 8, 2012, RWQCB adopted the current municipal stormwater permit (NPDES Permit No. CAS004001, Order No. R4-2012-0175), which contains the most extensive provisions to date with 32 incorporated TMDLs, of which 22 affect the City, expanded programs for Minimum Control Measures, development and implementation of watershed management plans, and expanded monitoring provisions. The NPDES permit provides for the development of EWMPs by the MS4 permittees to implement the requirements of the permit on a watershed scale through customized strategies, control measures, and BMPs. EWMPs also address compliance requirements of the 22 TMDLs that are currently effective, as well as other elements of the City's Stormwater Program.

Los Angeles Stormwater and Urban Runoff Pollution Control Ordinance (Los Angeles Municipal Code [LAMC] Article 4.4). The Stormwater and Urban Runoff Pollution Control Ordinance contains requirements for construction activities and facility operations of development and redevelopment projects to comply with the requirements of the SUSMP, integrate low impact development practices and standards for stormwater pollution mitigation, and maximize open, green and pervious space on all developments and redevelopments consistent with the City's landscape ordinance and other related requirements in the Development BMPs Handbook. Provisions include prohibitions of illicit discharges, illicit connections, and spills, dumping and disposals to the MS4; pollutant control requirements from sites of industrial activities;

[2]County of Los Angeles Department of Public Works, *Hydrology Manual*, January 2006.

and requirements for construction activity stormwater measures. This Ordinance also promulgates requirements for stormwater BMPs, which include the following:

- For parking lots with more than 25 spaces, BMPs must be implemented to reduce the discharge of pollutants to the MEP.
- For other premises exposed to stormwater, BMPs, if they exist, or other steps shall be used to reduce the discharge of pollutants to the MEP. This includes the removal and lawful disposal from all parts of the premises exposed to stormwater of any solid waste or any other substance, which if discharged to the MS4, would be a pollutant. The primary purpose of zoning is to segregate uses that are thought to be incompatible; in practice, zoning is used as a permitting system to prevent new development from harming existing residents or businesses and to preserve the "character" of a community. With respect to hydrology hazards, the City implements zoning ordinances to ensure safe construction practices.

Any proposed drainage improvements within the street right-of-way or any other property owned by, to be owned by, or under the control of the City requires the approval of a B-permit (LAMC Section 62.105). Under the B-permit process, storm drain installation plans are subject to review and approval by the LADPW Bureau of Engineering (BOE). Additionally, any connections to the City's storm drain system from a property line to a catch basin or a storm drain pipe requires a storm drain permit from the BOE.

Proposition O. Proposition O, a $500 million bond, authorized the City to fund projects that protect public health, capture stormwater for reuse and meet the federal CWA through removal and prevention of pollutants entering regional waterways. Proposition O projects include but are not limited to: the Temescal Canyon Park Stormwater BMP, Los Angeles Zoo Parking Lot, the Westchester Stormwater BMP, Echo Park Lake Rehabilitation Project, and the Hansen Dam Recreational Area Parking Lot and Wetlands Restoration. In addition, Proposition O funds were utilized for the Catch Basin Screen Cover and Insert Project, which provided for the installation of catch basin inserts and screen covers throughout the City beginning in 2005 with completion on September 30, 2007 (Phase I and Phase II). Phase III began in the spring of 2008 and will retrofit approximately 34,000 remaining catch basins with opening screen covers.[3]

Low Impact Development (LID) Ordinance. The intent of the LID Ordinance is to expand the applicability of the existing SUSMP requirements. It provides stormwater and rainwater LID strategies for all projects that require building permits in order to maintain or restore the natural hydrologic character of a development site, reduce off-site runoff, improve water quality, and provide groundwater recharge. The LID Ordinance requires a variety of BMPs to manage stormwater and urban runoff and reduce runoff pollution. It incorporates environmental practices including infiltration, capture and use, and biofiltration.

Flood Control Authority within the City of Los Angeles. In general, flood control authority can be summarized as follows: (1) the USACE oversees construction of projects associated with navigable bodies of water, including the Los Angeles River-related flood control systems and ocean harbors; (2) LACDPW oversees construction of ancillary Los Angeles County Flood Control District (LACFCD) facilities and designs and/or maintains the flood control drainage facilities, including the Los Angeles River system (under the guidance of the USACE) to mitigate 100- and 500-year storms; and (3) LADPW BOE oversees construction and maintenance of the City's storm drainage system which is designed to mitigate 50-year magnitude storms. Various City agencies implement development permit, slope stability, and watershed protection regulations.

Water Quality Compliance Master Plan for Urban Runoff (WQCMP). In 2009, the City adopted the WQCMP, a 20- year strategy for clean stormwater and urban runoff in the City and to meet all water quality regulations for the City's rivers, lakes, and coastal waters. The Master Plan provides an overview of the existing status of urban runoff management in the City, including a description of watersheds in the City, urban runoff pollutant sources, regulatory requirements for water quality, existing watershed management,

[3]City of Los Angeles Stormwater Program, *Proposition O*, http://www.lastormwater.org/green-la/proposition-o/, accessed March 6, 2017.

and plans for compliance with regulatory requirements. In addition, the Master Plan plans for the future of urban runoff management in the City and discusses three initiatives: Water Quality Management Initiative, Citywide Collaboration Initiative, and Outreach Initiative. The WQCMP also contains a financial outlook that evaluates current and future revenues, provides an estimate of the costs needed for implementing the strategies proposed, and presents opportunities for funding.

City of Los Angeles General Plan Safety, Conservation, and Framework Elements. The Safety Element provides a contextual framework for understanding the relationship between hazard mitigation, response to a natural disaster, and initial recovery from a natural disaster. The policies of the Safety Element reflect the comprehensive scope of the City's Emergency Operations Organization, which is tasked with integrating the City's emergency operations into a single operation. The intent of the Conservation Element is the conservation and preservation of natural resources. Policies of the Conservation Element address the effect of erosion on such natural resources as beaches, watersheds, and watercourses. The General Plan Framework Element is a more general, long-term, programmatic element. The Framework Element is a long-range, citywide, comprehensive growth strategy. The policies in the Framework Element address infrastructure and public service systems, many of which are interrelated, and all of which support the City's population and economy. Relevant objectives and policies of the Safety, Conservation, and Framework Elements related to hydrology and water quality are listed in **Table 4.7-1**.

TABLE 4.7-1: RELEVANT GENERAL PLAN HYDROLOGY AND WATER QUALITY OBJECTIVES AND POLICIES

SAFETY ELEMENT	
Policy 1.1.6	State and federal regulations. Assure compliance with applicable state and federal planning and development regulations, e.g., Alquist-Priolo Earthquake Fault Zoning Act, State Mapping Act and Cobey-Alquist Flood Plain Management Act.
CONSERVATION ELEMENT – EROSION	
Policy 2	Continue to prevent or reduce erosion that will damage the watershed or beaches or will result in harmful sedimentation that might damage beaches or natural areas.
CONSERVATION ELEMENT – OCEAN	
Policy 1	Continue to reduce pollutant discharge into the bays from both natural and human sources.
Policy 2	Continue to support legislation and to seek funding and legislation intended for bay and coastal protection, enhancement and habitat restoration.
Policy 3	Continue to support and/or participate in programs to clean bay sediments and/or mitigate potentially harmful effects of contaminants in the sediments and waters of the bays.
CONSERVATION ELEMENT – FISHERIES	
Policy 2	Continue to consider and implement measures that will mitigate potential damage to and will encourage maintenance or restoration of fisheries.
FRAMEWORK ELEMENT – CHAPTER 9 INFRASTRUCTURE AND PUBLIC SERVICES	
Policy 9.3.2	Consider the use of treated wastewater for irrigation, groundwater recharge, and other beneficial purposes.
Objective 9.5	Ensure that all properties are protected from flood hazards in accordance with applicable standards and that existing drainage systems are adequately maintained.
Policy 9.5.1	Develop a stormwater management system that has adequate capacity to protect its citizens and property from flooding which results from a 10-year storm (or a 50-year storm in sump areas, a pit or hollow in which liquid collects).
Policy 9.5.2	Assign the cost of stormwater system improvements proportionately to reflect the level of runoff generated and benefits.
Policy 9.5.3	Implement programs to correct any existing deficiencies in the stormwater collection system.
Policy 9.5.4	Ensure that the City's drainage system is adequately maintained.
Objective 9.6	Pursue effective and efficient approaches to reducing stormwater runoff and protecting water quality.
Policy 9.6.1	Pursue funding strategies which link the sources of revenues for stormwater system improvement to relevant factors including sources of runoff and project beneficiaries.

TABLE 4.7-1:	RELEVANT GENERAL PLAN HYDROLOGY AND WATER QUALITY OBJECTIVES AND POLICIES
Policy 9.6.2	Establish standards and/or incentives for the use of structural and non-structural techniques which mitigate flood-hazards and manage stormwater pollution.
Policy 9.6.3	The City's watershed-based approach to stormwater management will consider a range of strategies designed to reduce flood hazards and manage stormwater pollution. The strategies considered will include, but not necessarily be limited to: a. Support regional and City programs which intercept runoff for beneficial uses including groundwater recharge; b. Protect and enhance the environmental quality of natural drainage features; c. Create stormwater detention and/or retention facilities which incorporate multiple-uses such as recreation and/or habitat; d. On-site detention/retention and reuse of runoff; e. Mitigate existing flood hazards through structural modifications (floodproofing) or property by-out; f. Incorporate site design features which enhance the quality of off-site runoff; and g. Use land use authority and redevelopment to free floodways and sumps of inappropriate structures which are threatened by flooding and establish appropriate land uses which benefit or experience minimal damages from flooding.
Policy 9.6.4	Proactively participate in inter-agency efforts to manage regional water resources, such as the Santa Monica Bay Restoration Project, the Los Angeles River Master Plan, the Los Angeles River Parkway Project and the Los Angeles County Drainage Area Water Conservation and Supply Feasibility Study.
Objective 9.7	Continue to develop and implement management practices based stormwater program which maintains and improves water quality.
Policy 9.7.1	Continue the City's active involvement in the regional NPDES municipal stormwater permit.
Policy 9.7.2	Continue to aggressively develop and implement educational outreach programs designed to foster an environmentally-aware citizenry.
Policy 9.7.3	Investigate management practices which reduce stormwater pollution to identify technically feasible and cost effective-approaches, through: a. Investigation of sources of pollution using monitoring, modeling and special studies; b. Prioritization of pollutants and sources; c. Conducting research and pilot projects to study specific management practices for the development of standards; and d. Developing requirements which establish implementation standards for effective management practices.
Objective 9.9	Manage and expand the City's water resources, storage facilities, and water lines to accommodate projected population increases and new or expanded industries and businesses.
Policy 9.9.3	Protect existing water supplies from contamination, and clean up groundwater supplies so those resources can be more fully utilized.
Policy 9.9.4	Work to improve water quality and reliability of supply from the State Water Project and other sources.
Policy 9.9.5	Maintain existing rights to groundwater and ensure continued groundwater pumping availability.
Objective 9.11	Ensure, to the maximum extent possible, the continued provision of water capacity, quality and delivery after an earthquake or other emergency.
Policy 9.11.1	Provide for the prompt resumption of water service with adequate quantity and quality of water after an emergency.

EXISTING SETTING

The Project Area is located within the Los Angeles Basin. The annual average temperature in the area is 63 degrees Fahrenheit (°F) with an average winter temperature of approximately 55°F and an average summer temperature of approximately 73°F.[4] Total precipitation in the Project Area averages approximately 13.5 inches annually. Precipitation occurs mostly during the winter and relatively infrequently during the summer.[5]

On January 17, 2014, California Governor Jerry Brown proclaimed a state of emergency due to drought conditions. This proclamation directs all local urban water suppliers and municipalities immediately implement their local water shortage contingency plans. In response to the proclamation, the City and the LADWP activated Water Conservation Response Unit to implement the Emergency Water Conservation Plan (EWCP).

On May 9, 2016, California Governor Jerry Brown signed Executive Order B-37-16 that established a new water use efficiency framework for California. The order bolstered the state's drought resilience and preparedness by establishing longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating clearly wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans. Based on monthly water use reporting, the majority of urban water suppliers reported sufficient supplies to meet demand in three additional dry years and are not subject to state conservation mandates. On February 8, 2017, the SWRCB adopted an emergency water conservation regulation to amend and extend the May 2016 regulation. The amended regulation allows certain suppliers the opportunity to submit or resubmit their water supply reliability assessments by March 15, 2017 and does not require mandatory conservation unless water suppliers determine that they have a shortfall. Prohibitions against homeowner's associations penalizing homeowners for certain outdoor conservation practices during a declared drought remain and similar requirements are extended to cities and counties. The extension maintains urban water supplier monthly reporting and basic water conservation measures. Accordingly, the SWRCB will separately take action to make reporting and wasteful water practices permanent.[6]

For planning purposes, the LARWQCB divides surface waters into hydrologic units, watersheds, waterways, and groundwater into major groundwater basins. The Los Angeles-San Gabriel Hydrologic Unit covers most of Los Angeles County and small areas of southeastern Ventura County. This drainage area totals 1,608 square miles. This hydrologic unit is highly urbanized and most of the area is covered with semi-permeable or impermeable material (i.e., paved). The Los Angeles River, San Gabriel River, and Ballona Creek (the major drainage systems in Los Angeles County) drain the coastal watersheds of the Transverse Ranges, which include the Santa Monica Mountains and Hollywood Hills located approximately five and six miles, respectively from the Project Area. These surface waters also recharge large reserves of groundwater that exist in alluvial aquifers underlying the San Fernando and San Gabriel Valleys and the Los Angeles Coastal Plain.

The Project Area is located within the Ballona Creek Watershed (**Figure 4.7-1**). Ballona Creek is a flood control channel that drains the West Coast Basin. The Ballona Creek Watershed is comprised of all or parts of the Cities of Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, West Hollywood, and unincorporated Los Angeles County. This watershed area is bounded by the Santa Monica Mountains on the north, downtown Los Angeles on the east, Baldwin Hills on the south, and Santa Monica Bay on the west.

The total watershed area is approximately 127 square miles and is the largest drainage tributary to the Santa Monica Bay, discharging to the ocean adjacent to the entrance of the Marina del Rey Harbor. The area is substantially developed but also includes undeveloped areas on the south slope of the Santa Monica Mountains. The major tributaries to the watershed include Centinela Creek, Sepulveda Canyon Channel, Benedict Canyon Channel, and numerous storm drains. Sepulveda Canyon Channel and Benedict Canyon Channel both traverse the Project Area. The Ballona Creek Watershed planning area includes the coastal interface zone and coastal waters of Marina del Rey, the Venice Canals, Ballona Lagoon, Del Rey Lagoon, and Oxford Lagoon, also known as the Oxford Flood Control Basin.[7]

The Project Area is located within the geographic boundaries of the Santa Monica Subbasin of the Coastal Plain of the Los Angeles Groundwater Basin (**Figure 4.7-2**). The Santa Monica Subbasin covers approximately 50.2 square miles and is bounded by impermeable rocks of the Santa Monica Mountains on the north and the Ballona Escarpment on the south. The Santa Monica Subbasin extends from the Pacific Ocean on the west to the Inglewood Fault on the east. Ballona Creek is the dominant hydrologic feature and drains surface waters to the Pacific Ocean.[8] The Santa Monica Subbasin is within the service areas of the Metropolitan Water District of California (MWD) member agencies of the cities of Santa Monica, Los Angeles, Beverly Hills, and West Basin MWD and underlies the cities of Santa Monica, Culver City, and Beverly Hills and the communities of Pacific Palisades, Brentwood, Venice, Marina del Rey, West Los Angeles, Century City and Mar Vista. The Santa Monica Subbasin is further divided into five additional subbasins: Arcadia, Olympic, Coastal, Charnock, and Crestal.[9] The Project Area is located in four (with the exception of the Arcadia Subbasin) of the five subbasins. Groundwater recharge in the Santa Monica Subbasin occurs primarily through percolation of precipitation and surface runoff onto the subbasin from the Santa Monica Mountains.

Ballona Creek is the dominant hydrologic feature within the Santa Monica Subbasin. Groundwater in the Santa Monica Subbasin moves mainly southward toward the Ballona escarpment and then flows toward to the ocean on the west side. Groundwater in the Santa Monica Subbasin is generally confined with some areas of unconfined or perched groundwater.[10]

Much of the Santa Monica Subbasin area is served by the Los Angeles Department of Water and Power (LADWP), the City of Santa Monica, or West Basin Municipal Water District (WBMWD). LADWP water supplies are provided primarily from imported MWD water, as well as water from the Eastern Sierra Nevada, and do not include the use of local groundwater.[11]

WATER QUALITY

The major surface water feature within the Project Area is Ballona Creek, as shown in **Figure 4.7-1**. About four miles of Ballona Creek are located within the City of Culver City and five miles are located in the City of Los Angeles and the County of Los Angeles.[12] Ballona Creek is designed to discharge approximately 71,400 cubic feet per second of water to Santa Monica Bay during a 50-year frequency storm event.

2012-058

Groundwater in the Santa Monica Subbasin is high in total dissolved solids (TDS) and hardness and contains some volatile and semi-volatile organic contaminants. TDS is the sum of all dissolved organic and inorganic substances in the water, such as sodium, chloride, calcium, potassium, magnesium, bicarbonates, nitrates, and phosphates, but also many others. TDS is often referred to as "salt" to represent the mineralization of water and is commonly present in all groundwater but at varying concentrations. It enters groundwater naturally, such as dissolving aquifer minerals or from seawater intrusion. It also can be added to groundwater from human activities, such as fertilizer applications, oil field brines, industrial discharges, and sewage effluents. TDS can also be brought into groundwater basins in replenishment water if the imported sources are more mineralized than the local water. TDS is persistent in the environment and can build up in concentrations over time in a process known as "salt loading." Water with TDS greater than 3,000 ppm (equivalent to 2,000 milligrams per liter [mg/L]) is typically considered too salty to drink.[13] Average TDS in the Santa Monica Subbasin is about 916 mg/L and ranges from about 729 to 1,156 mg/L.[14] Average TDS in adjacent subbasins range from 200 to 2,500 mg/L (Central) and from 170 to 5,510 mg/L (West Coast); the measured TDS in the Hollywood Subbasin is approximately 526 mg/L.

Potential for seawater intrusion may limit ability to store and extract water in this basin. Groundwater levels in the Charnock subbasin are typically at mean sea level and groundwater levels in the Arcadia subbasin are about 200 feet above mean sea level.[15]

STORMWATER DRAINAGE

The City's storm drain system, maintained by the Los Angeles County Department of Public Works, is a vast network of underground pipes and open channels that were designed to prevent flooding. Runoff drains from the street into the gutter and enters the system through an opening in the curb called a catch basin. Curbside catch basins are the primary points-of-entry for urban runoff. From there, runoff flows into underground tunnels that empty into flood control channels, such as Ballona Creek. Stormwater runoff within the Project Area is directed into flood control channels via storm drains, curbs and gutters (street flows), and urban sheet flow. The flood control channels eventually discharge to over 65 shoreline outfalls rimming the Los Angeles area coastline. The storm drain system receives no treatment or filtering process and is completely separate from the City's sewer system.

FLOODING AND INUNDATION

Los Angeles County is subject to a wide range of flood hazards, including those caused by intense storms, earthquakes, and failure of man-made structures. Storm conditions, topography, drainage patterns, and the adequacy of the stormwater system combine under certain conditions to create areas of flooding. FEMA has identified areas affected by both the 100-year storm frequency flood and the 500-year storm frequency flood (**Figure 4.7-3**).

A portion of the Project Area is within the 100-year flood plain; there are no 500-year flood plains within the Project Area. Ballona Creek is the major flood control measure for draining stormwater from the Project Area and directing it safely to the Santa Monica Bay. Stormwater runoff within the Project Area is directed toward Ballona Creek via storm drains, curbs and gutters, and urban sheet flow.

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

Aside from Ballona Creek, no other large bodies of water are present in the immediate vicinity of the Project Area. The Proposed Project is located approximately four miles inland from the Pacific Ocean. The General Plan Safety Element identifies the entire Project Area as being located within a potential inundation zone due to its location, approximately five miles south of the Stone Canyon Reservoir. However, the Project Area is not located within an area potentially impacted by a tsunami or an area with the potential to be inundated by seiche, a surface wave created when a body of water is shaken.[16,17] As the Project Area is highly urbanized and the amount of exposed soils is extremely limited, inundation by mudflow is also unlikely.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to hydrology and/or water quality if it would:

- Violate any water quality standards or waste discharge requirements;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner, which would result in substantial erosion or siltation on- or off-site;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
- Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- Otherwise substantially degrade water quality;
- Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows;
- Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam; and/or
- Expose people or structures to a significant risk of loss, injury or death involving inundation by seiche, tsunami, or mudflow.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of impact significance shall be made on a case-by-case basis, considering whether a project would:

- Cause flooding during the projected 50-year developed storm event, which would have the potential to harm people or damage property or sensitive biological resources;
- Substantially reduce or increase the amount of surface water in a water body;
- Result in a permanent, adverse change to the movement of surface water sufficient to produce a substantial change in the current or direction of water flow.
- Create discharges associated with the project that would create pollution, contamination or nuisance as defined in Section 13050 of the California Water Code (CWC) or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

[16]California Geological Survey, *Los Angeles County Tsunami Inundation Maps*, http://www.conservation.ca.gov/cgs/geologic_hazards/Tsunami/Inundation_Maps, accessed March 6, 2017.

[17]City of Los Angeles Department of City Planning, *Safety Element*, Exhibits F and G, November 26, 1996.

- Change potable water levels sufficiently to:
  - Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/winter peaking, or to respond to emergencies and drought; and/or
  - Reduce yields of adjacent wells or well fields (public or private);
  - Adversely change the rate or direction of flow of groundwater;
- Result in demonstrable and sustained reduction of groundwater recharge capacity.
- Affect the rate or change the direction of movement of existing contaminants;
- Expand the area affected by contaminants;
- Result in an increased level of groundwater contamination (including that from direct percolation, injection, or salt water intrusion); and/or
- Cause regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations (CCR), Title 22, Division 4, and Chapter 15 and the Safe Drinking Water Act.

METHODOLOGY

Baseline information for the analysis was compiled from a review of data and reports published by state agencies and information compiled and evaluated by the City of Los Angeles in conjunction with its stormwater management and hazard mitigation programs. The result of the effort is a general and qualitative analysis of the types of hydrologic and water quality changes that could be expected relative to the proposed types and locations of land use changes and related zoning.

Independent of the CEQA process, there is a comprehensive regulatory framework implemented at the state and city level to reduce the impacts of effects related to storm drainage, urban pollutants, and flood hazards. Compliance with these regulations is required, not optional. Compliance must be demonstrated by the project proponent to have been incorporated in the project's design before permits for project construction would be issued. The analysis presented herein assumes compliance with all applicable laws, regulations, and standards. Development permitted under the Proposed Project potentially having significant impacts to hydrology and water quality would be subject to further analysis and environmental review.

The Thresholds Guide sets forth guidance for the determination of significance of hydrology and water quality impacts. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. For purposes of this analysis, the thresholds identified in Appendix G are used, supplemented by the Thresholds Guide criteria, where appropriate.

This discussion of hydrology and water quality addresses impacts within the entire Project Area. No distinction is made between areas of change and areas within the Project Area, where zoning controls would not change, because potential impacts related to hydrology and water quality are generally not based on whether future development projects are located within or outside of the change areas.

IMPACTS

The Proposed Project would establish a Specific Plan and initiate zone changes, General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone Changes and General Plan amendments would not affect every parcel within the Project Area; changes would only occur within identified "areas of proposed change." As discussed in Chapter 3.0, Project Description, the ECTNP would allow for Alternate Compliance that could affect the mix of residential and non-residential uses in each area of proposed change.

Alternative Compliance development would have the same impacts on hydrology as are discussed below, and, therefore, it is not discussed separately. The streetscape plans may involve relocation of drains, sumps, curbs, and gutters. While there are hydrology and water quality impacts to consider within the Project Area, future development is subject to the federal, state, and local policies and guidelines mentioned above.

In addition, the Proposed Project would require all individual projects within the ECTNP Area to comply with the LID Ordinance (City Ordinance No. 181899) and to implement the following BMPs that have stormwater recharge or reuse benefits, as applicable:

- Infiltration Basin (drainage area of 5-50 acres) – captures first-flush stormwater, removes particulate pollutants and some soluble pollutants, and contributes toward recharging groundwater
- Infiltration Trench (drainage area of less than 5 acres) – similar to infiltration basin but used for smaller drainage areas to capture and infiltrate rainwater
- Catch Basin Insert - a device that can be inserted into an existing catch basin design to provide some level of runoff contaminant removal
- Catch Basin Screens
- Pervious Pavements – captures runoff by allowing stormwater to pass through the pavement surface and then infiltrate into the groundwater basin
- Cistern - captures stormwater runoff as it comes down through the roof gutter system
- Greywater Systems
- Primary (On-Site) Waste Water Treatment Systems

Therefore, the ECTNP and its implementing ordinances do not contain any specific policies that would directly affect hydrology and water quality.

IMPACT 4.7-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT VIOLATE ANY WATER QUALITY STANDARDS OR WASTE DISCHARGE REQUIREMENTS? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction

Impacts to surface water quality during construction would be short-term for any individual project, but as a result of construction over time, construction-type impacts would be expected over the entire planning period. Grading, excavation, and other construction activities associated with the implementation of the ECTNP could impact water quality due to erosion resulting from exposed soils that may be transported from the Project Area in stormwater runoff. In addition, construction activities have the potential to generate short-term water pollutants, including sediment, trash, construction materials, and equipment fluids. However, all construction activities are subject to the City's Stormwater and Urban Runoff Pollution Control Ordinance. This Ordinance requires construction activities to comply with the requirements of the SUSMP to address stormwater pollution from construction and redevelopment projects.

The SUSMP identifies the types and size of individual projects that are subject to these requirements. Required elements of the SUSMP include provisions for:

- Peak stormwater runoff discharge rates
- Conservation of natural areas
- Minimization of stormwater pollutants of concern
- Protection of slopes and channels
- Storm drain system stenciling and signage
- Properly designed outdoor material storage areas
- Properly designed trash storage areas
- Proof of ongoing BMP Maintenance

- Design standards for structural or treatment control BMPs
- Provisions for individual priority project categories
- Limitations on use of infiltration BMPs

Requirements of the SUSMP are enforced through the City's plan approval and permit process and all new individual projects are subject to City inspection. Compliance with the LAMC would ensure that construction does not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality.

Similarly, for projects where construction activities will disturb more than one acre of land, construction activities are also subject to NPDES GCASP requirements which require the preparation and implementation of a SWPPP. Compliance with the NPDES requirements would ensure that stormwater pollutants resulting from construction would not substantially degrade water quality.

Operation

Future development would also be subject to the City's LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES permit requirements, which prohibit the discharge of pollutants, into the storm drain system or receiving waters, and require the implementation of BMPs to prevent, control and reduce stormwater pollutants. The City's Stormwater and Urban Runoff Pollution Control Ordinance requires future development to comply with the SUSMP requirements; integrate LID practices and standards for stormwater pollution mitigation; and maximize open, green, and pervious space on all development consistent with the City's landscape ordinance and other related requirements. Therefore, operation of the Proposed Project would result in less than significant impacts related to compliance with any water quality standards or waste discharge requirements.

MITIGATION MEASURES

Impacts related to violating water quality standards or waste discharge requirements under the Proposed Project would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to violating water quality standards or waste discharge requirements would be less than significant without mitigation.

IMPACT 4.7-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT SUBSTANTIALLY DEPLETE GROUNDWATER SUPPLIES OR INTERFERE SUBSTANTIALLY WITH GROUNDWATER RECHARGE SUCH THAT THERE WOULD BE A NET DEFICIT IN AQUIFER VOLUME OR A LOWERING OF THE LOCAL GROUNDWATER TABLE LEVEL (E.G., THE PRODUCTION RATE OF PRE-EXISTING NEARBY WELLS WOULD DROP TO A LEVEL THAT WOULD NOT SUPPORT EXISTING LAND USES OR PLANNED USES FOR WHICH PERMITS HAVE BEEN GRANTED)? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

The Project Area is not a significant area for groundwater recharge due to the highly-urbanized nature of the Project Area. Permeable surfaces in the Project Area are limited to open space areas, including parks and fields. Interference with groundwater recharge is largely caused by the construction of impervious surface area (e.g., buildings, road, parking lots, etc.). Where increased densities are proposed in the designated areas of proposed change, the amount of impervious surfaces could increase. However, since the Project Area is already highly urbanized and covered largely by impermeable surfaces, any new development resulting from implementation of the ECTNP, whether more intense than existing conditions or not, would not result in a substantial increase in impervious surfaces.

Future development is subject to the City's LID Ordinance and Stormwater and Urban Runoff Pollution Control Ordinance, which require compliance with the SUSMP requirements. Implementation of BMPs would ensure that the increase of water infiltration at individual project sites would not result in groundwater contamination. When a specific development project begins construction, compliance with the City's Stormwater and Urban Runoff Pollution Control Ordinance and NPDES GCASP permit requirements would ensure that construction activities would not substantially deplete groundwater supplies or interfere with groundwater recharge. Therefore, the Proposed Project would result in less than significant impacts related to depleting groundwater supplies or interfering substantially with groundwater recharge.

Water supply for residential and commercial uses in the Project Area is provided by the LADWP. While LADWP does obtain some of its water from groundwater sources within the City of Los Angeles (approximately 12 percent in 2015), the majority of water is provided by the Los Angeles Aqueduct and MWD. The Project's impact on water supply is discussed in Section 4.13, Utilities and Service Systems.

The Project is located within the Santa Monica groundwater basin and directly overlays both the Charnock and the Olympic groundwater Sub-basins. There are no City of Los Angeles groundwater well fields within the Project Area. However, according to the 2015 City of Santa Monica Urban Water Management Plan, the City of Santa Monica operates three well sites within the Project Area. The Olympic Sub-basin has two operating well sites within the far western portion of the Project Area and they extend to just over 500 feet below the ground surface. The City of Santa Monica Urban Water Management Plan indicates that there is an additional well that is not technically part of the Olympic Sub-basin operating in the same area. These wells are located on publicly owned land in the City of Los Angeles and provide groundwater to the City of Santa Monica.[18] Publicly-owned lands are located in the Westwood change area; however, public lands with wells are not located within the areas of proposed change. In addition, the areas of proposed change are already substantially developed and covered with impermeable surfaces; with the exception of the subarea containing City-owned properties along the Expo right-of-way near the Westwood Station.

There is little likelihood that development within the Project Area would have direct physical impacts on the well sites nor would development within the Project Area result in substantial changes to recharge or (since Los Angeles does not use groundwater from the Project Area) over-drafting of groundwater. Therefore, impacts are anticipated to be less than significant.

MITIGATION MEASURES

Impacts related to depleting groundwater supplies or interfering substantially with groundwater recharge under the Proposed Project would be less than significant. (The Proposed Project's impact on water supply is discussed in Section 4.13, Utilities and Service Systems.) No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to depleting groundwater supplies or interfering substantially with groundwater recharge were determined to be less than significant without mitigation.

[18]City of Santa Monica, *2015 Urban Water Management Plan*, June 2016.

IMPACT 4.7-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT SUBSTANTIALLY ALTER THE EXISTING DRAINAGE PATTERN OF THE SITE OR AREA, INCLUDING THROUGH THE ALTERATION OF THE COURSE OF A STREAM OR RIVER, IN A MANNER THAT WOULD RESULT IN SUBSTANTIAL EROSION OR SILTATION ON- OR OFF-SITE? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Stormwater runoff is influenced by rainfall intensity, ground surface permeability, watershed size and shape, and physical barriers. The introduction of impermeable surfaces greatly reduces natural infiltration, allowing for a greater volume of runoff. In addition, paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations. However, any new development within the areas of proposed change resulting from implementation of the ECTNP, whether more intense than existing conditions or not, would not result in a substantial increase in impervious surfaces as the area is already highly urbanized and covered largely by impervious surfaces. Accordingly, it is not anticipated that any new development within the areas of proposed change would result in increased runoff that would result in substantial erosion or siltation on- or off-site.

Because the Project Area is highly urbanized and covered largely by paved and other impermeable surfaces, future development, regardless of building densities and lot coverage, does not have the potential to significantly alter drainage patterns on individual project sites. While there are no water bodies located within the Project Area and the Proposed Project would not alter the course of a stream or river, stormwater runoff within the Project Area would continue to be directed toward Ballona Creek via storm drains, curbs and gutters (street flows), and urban sheet flow. Development within the Project Area could result in grading on individual parcels, which could change surface drainage patterns in small, localized areas that could cause increased erosion potential when soils are exposed during construction. Grading for individual projects would be minimal, consisting of grading for foundations, building pads, access roads, and utility trenches in areas that are already developed.

Future development would also be subject to the City's LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES permit requirements, which prohibit the discharge of pollutants into the storm drain system or receiving waters and require the implementation of BMPs to prevent, control and reduce erosion and siltation. The City's Stormwater and Urban Runoff Pollution Control Ordinance requires future development to comply with the SUSMP requirements; integrate LID practices and standards for stormwater pollution mitigation; and maximize open, green, and pervious space on all development consistent with the City's landscape ordinance and other related requirements. In addition, all earthwork and grading activities require grading permits from the Department of Building and Safety that include requirements and standards designed to limit potential impacts related to erosion and siltation to acceptable levels. All on-site grading and site preparation must comply with applicable provisions of LAMC Chapter IX, Division 70 that address grading, excavations, and fills, and the recommendations of a site-specific geotechnical report. As discussed in Section 4.4, Geology and Soils, the City will require the preparation of a site-specific geotechnical report to evaluate soils issues, and all applicable projects must comply with LAMC Article 4.4, Section 664.72, which governs pollutant control requirements and construction activity.

Compliance with city ordinances and regulations, as well as NPDES permit requirements, would ensure that any future development does not result in substantial erosion or siltation. Therefore, the Proposed Project would result in less than significant impacts related to substantially altering an existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site.

MITIGATION MEASURES

Impacts related to substantially altering an existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site under the Proposed Project would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to substantially altering an existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site were determined to be less than significant without mitigation.

IMPACT 4.7-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT SUBSTANTIALLY ALTER THE EXISTING DRAINAGE PATTERN OF THE SITE OR AREA, INCLUDING THROUGH THE ALTERATION OF THE COURSE OF A STREAM OR RIVER, OR SUBSTANTIALLY INCREASE THE RATE OR AMOUNT OF SURFACE RUNOFF IN A MANNER THAT WOULD RESULT IN FLOODING ON- OR OFF-SITE? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Similar to the discussion under Impact 4.7-3, any new development within the areas of proposed change resulting from implementation of the ECTNP, whether more intense than existing conditions or not, would not result in a substantial increase in impervious surfaces as the area is already highly urbanized and covered largely by impervious surfaces. Because the Project Area is highly urbanized and covered largely by paved and other impermeable surfaces, future development, regardless of building densities and lot coverage, does not have the potential to significantly alter drainage patterns on individual project sites that would result in flooding on- or off-site where no such flooding currently occurs.

Future development would also be subject to the City's building codes, which establish design standards that include those that deal with flood prevention and control; the City's zoning codes that establish zoning designations that allow for floodplains and flood control facilities; and the City's LID Ordinance, which requires all development or redevelopment that is 500 square feet or more in size to capture and manage 100 percent of the first three-quarter-inch of stormwater on-site by implementing on-site infiltration, capture and use, and biofiltration/bio-treatment best management practices to the maximum extent feasible. Compliance with city ordinances and regulations would ensure that any future development does not result in substantial flooding on- or off-site. Accordingly, it is not anticipated that any new individual project to be developed within the areas of proposed change would result in increased runoff that could result in flooding on- or off-site.

MITIGATION MEASURES

Impacts related to altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that could result in flooding on- or off-site under the Proposed Project would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which could result in flooding on- or off-site would be less than significant without mitigation.

IMPACT 4.7-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE OR CONTRIBUTE RUNOFF WATER WHICH WOULD EXCEED THE CAPACITY OF EXISTING OR PLANNED STORMWATER DRAINAGE SYSTEMS OR PROVIDE SUBSTANTIAL ADDITIONAL SOURCES OF POLLUTED RUNOFF? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

See the discussion under Impacts 4.7-1 and 4.7-3. As discussed therein, the Proposed Project would comply with the City's building and zoning codes, LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, NPDES permit requirements, and applicable provisions of LAMC Chapter IX, Division 70, which would regulate stormwater flow to minimize flooding and reduce any potential sources of polluted runoff. As discussed above, the City's LID Ordinance requires all development or redevelopment that is 500 square feet or more in size to capture and manage 100 percent of the first three-quarter-inch of stormwater on-site by implementing on-site infiltration, capture and use, and biofiltration/bio-treatment best management practices to the maximum extent feasible. Accordingly, future development would be required to regulate its stormwater runoff to ensure that any development under the Proposed Project would not exceed the capacity of the existing or planned stormwater drainage system. Therefore, the Proposed Project would result in less than significant impacts related to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

MITIGATION MEASURES

Impacts related to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems and or providing substantial additional sources of polluted runoff under the Proposed Project would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems and or providing substantial additional sources of polluted runoff were determined to be less than significant without mitigation.

IMPACT 4.7-6 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT OTHERWISE SUBSTANTIALLY DEGRADE WATER QUALITY? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

As discussed under Impact 4.7-1, individual projects as a result of the implementation of the Proposed Project would be required to implement BMPs and comply with the City's LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, SWPPP, SUSMP, and NPDES permit requirements, and thus would not degrade water quality. These regulatory requirements control or reduce the discharge of pollutants into the storm drain system or receiving waters to prevent the substantial degradation of water quality. More specifically, the City's LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES permit requirements prohibit the discharge of pollutants into the storm drain system or receiving waters and require the implementation of BMPs to prevent, control and reduce erosion and siltation. The City's Stormwater and Urban Runoff Pollution Control Ordinance requires future development to comply with the SUSMP requirements; integrate LID practices and standards for stormwater pollution mitigation; and maximize open, green, and pervious space in all development consistent with the City's landscape ordinance and other related requirements. In addition, all earthwork and grading activities require grading permits from the Department of Building and Safety that include requirements and standards designed to limit potential impacts related to the discharge of pollutants to acceptable levels. Therefore, the Proposed Project would result in a less than significant impact related to substantially degrading the existing water quality.

MITIGATION MEASURES

Impacts related to the substantial degradation of the water quality under the Proposed Project would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the substantial degradation of water quality under the Proposed Project were determined to be less than significant without mitigation.

IMPACT 4.7-7 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT PLACE HOUSING WITHIN A 100-YEAR FLOOD HAZARD AREA AS MAPPED ON A FEDERAL FLOOD HAZARD BOUNDARY OR FLOOD INSURANCE RATE MAP OR OTHER FLOOD HAZARD DELINEATION MAP? THIS IMPACT IS LESS THAN SIGNIFICANT WITH MITIGATION.

As described above, a small portion in the central part of the Project Area is located within a 100-floodplain. More specifically, an area of proposed change on the north side of Pico Boulevard between Westwood Boulevard and Overland Avenue is located within a designated 100-year floodplain. Accordingly, redevelopment of these parcels could place housing within a 100-year flood hazard area. Therefore, the Proposed Project could result in significant impacts related to placing housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary, Flood Insurance Rate Map, or other flood hazard delineation map.

MITIGATION MEASURES

HWQ1 Buildings within a 100-year floodplain (i.e., the area of proposed change on the north side of Pico Boulevard between Westwood Boulevard and Overland Avenue) shall be designed and constructed a minimum of one foot above the 100-year flood water surface elevation to ensure the protection of structures from all flooding events.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Implementation of Mitigation Measure **HWQ1** would reduce impacts to a less than significant level related to placing housing in a 100-year flood hazard area, as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.

IMPACT 4.7-8 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT PLACE STRUCTURES WHICH WOULD IMPEDE OR REDIRECT FLOOD FLOWS WITHIN A 100-YEAR FLOOD HAZARD AREA? NO IMPACT WOULD OCCUR.

See discussion under Impact 4.7-4. Any new development within the areas of proposed change resulting from implementation of the ECTNP, whether more intense than existing conditions or not, would not result in a substantial increase in impervious surfaces as the area is already highly urbanized and covered largely by impervious surfaces. Because the Project Area is highly urbanized and covered largely by paved and other impermeable surfaces, future development, regardless of building densities and lot coverage, does not have the potential to significantly alter drainage patterns on individual project sites that would impede or redirect flood flows within a 100-year flood hazard area. Accordingly, although a small portion in the central part of the Project Area is located within a 100-year flood hazard area, it is not anticipated that the Proposed Project would place structures that would impede or redirect flood flows within a 100-year flood hazard area. Therefore, no impact would occur.

MITIGATION MEASURES

There would be no impacts related to placing housing in a 100-year flood hazard that would impede or redirect flood flows under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

There would be no impacts related to placing housing in a 100-year flood hazard that would impede or redirect flood flows under the Proposed Project without mitigation.

IMPACT 4.7-9 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXPOSE PEOPLE OR STRUCTURES TO A SIGNIFICANT RISK OF LOSS, INJURY OR DEATH INVOLVING FLOODING, INCLUDING FLOODING AS A RESULT OF THE FAILURE OF A LEVEE OR DAM? THIS IMPACT IS LESS THAN SIGNIFICANT.

The Project Area is located within the Stone Canyon Reservoir inundation zone. However, Stone Canyon Reservoir is located approximately five miles from the Project Area. Due to its distance from the Project Area and the intervening structures and topography separating the reservoir from the Project Area, it is not anticipated to expose people or structures within the Project Area to significant risk of loss, injury, or death involving flooding. Therefore, the Proposed Project would result in less than significant impacts related to exposing people or structures to a significant risk of loss, injury or death involving flooding.

MITIGATION MEASURES

Impacts related to exposing people or structures to a significant risk of loss, injury or death involving flooding hazard under the Proposed Project would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to exposing people or structures to a significant risk of loss, injury or death involving flooding hazard were determined to be less than significant without mitigation.

IMPACT 4.7-10 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXPOSE PEOPLE OR STRUCTURES TO RISK FROM SEICHE, TSUNAMI, OR MUDFLOW/MUDSLIDES? NO IMPACT WOULD OCCUR.

The Project Area is not located within areas that have the potential for inundation by seiche, tsunami, or mudflow/mudslides. The western boundary of the Project Area is located approximately 2.5 miles from the tsunami inundation limits identified by the County of Los Angeles.[19] The southern boundary Project Area is located approximately three quarters of a mile from landslide hazard areas in the Baldwin Hills designated by the State of California and the northern Project Area boundary is approximately 2.5 miles south of the designated landslide areas in the Hollywood Hills.[20] Therefore, no impact related to seiche, tsunami, or mudflow/mudslides would occur.

MITIGATION MEASURES

No impacts related to exposing people or structures to risk from seiche, tsunami, or mudflow/mudslides under the Proposed Project would occur. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to exposing people or structures to risk from seiche, tsunami, or mudflow/mudslides would occur without mitigation.

[19]County of Los Angeles, *Tsunami Inundation Map for Emergency Planning, Beverly Hills Quadrangle*, March 1, 2009.
[20]California Department of Conservation, *Seismic Hazard Zones Map, Beverly Hills Quadrangle*, March 25, 1999.

4.8 LAND USE AND PLANNING

This section provides an overview of land use and planning policies as proposed in the Proposed Project. Topics addressed include the division of an established community, land use compatibility, and consistency with applicable land use plans, policies, and regulations. This section was prepared utilizing a variety of sources, including the City of Los Angeles General Plan; the City of Los Angeles Zone Information and Map Access System (ZIMAS); existing community plan documents; and Southern California Association of Governments' (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[1]

REGULATORY FRAMEWORK

FEDERAL

There are no federal plans, policies, or regulations related to land use and planning that apply to the Proposed Project for the purpose of determining land use and planning impacts.

STATE

Senate Bill 375 (SB 375). The Sustainable Communities and Climate Protection Act of 2008 (Sustainable Communities Act, SB 375, Chapter 728, Statutes of 2008) supports the state's climate action goals to reduce greenhouse gas (GHG) emissions through coordinated transportation and land use planning with the goal of creating more sustainable communities. SB 375 amends California Environmental Quality Act (CEQA) to add Chapter 4.2 Implementation of the Sustainable Communities Strategy (SCS), which allows a CEQA exemption for Sustainable Community Projects (SCP), as well as streamlined CEQA analysis for Transit Priority Projects (TPPs) and certain residential or mixed use projects. The following is a summary of the CEQA streamlining provisions in SB 375.

A TPP is eligible for four types of CEQA relief: (1) SCP CEQA Exemption; or (2) Sustainable Communities Environmental Assessment (SCEA), or (3) a streamlined EIR, or (4) traffic mitigation measures. Different types of CEQA relief are associated with different criteria that are to be met.

As a threshold matter, to qualify as a TPP, a project must be consistent with the general use designation, density, building intensity and applicable policies in a SCS accepted by the California Air Resources Board. The TPP must also meet the following criteria:

- Be at least 50 percent residential use based on area;
- Contain at least 20 dwelling units/acres;
- Have a floor area ratio for the commercial portion of the project at 0.75 if the project contains between 26 percent and 50 percent nonresidential uses; and
- Be within 0.5 mile of a major transit stop[2] or high-quality transit corridor[3] included in the RTP.

[1]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. The 2016-2040 RTP/SCS is discussed for informational purposes. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. Please see **Appendix K** for a more detailed discussion.

[2]Defined as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.

[3]Defined as a corridor with fixed route bus service with 15-minute service intervals during peak commute hours.

(1) Sustainable Communities Project (SCP) Exemption. An SCP is a TPP that is consistent with the SCS and meets the following criteria:

- The project and approved projects can be served by utilities, and project will pay applicable in-lieu or development fees;
- The project site does not include wildlife habitat of significant value or protected species;
- The project site is not contaminated (i.e., the site is not on the Cortese list);
- The project site is subject to preliminary endangerment assessment regarding potential exposure to health hazards from nearby activities. Any hazards are to be mitigated to less than significant;
- The project would not significantly affect an historic resource;
- The project site is not subject to wildland fire hazard, unusually high risk of fire/explosion from materials on adjacent properties, health hazard, seismic risk, landslide, or flood plain;
- The project site is not located on developed open space; and
- The project would be 15 percent more-efficient than Title 24 and landscaping would use 25 percent less water than the regional average household.

In addition, the project must meet the following:

- The site is not more than 8 acres;
- The project does not contain more than 200 units;
- The project does not result in the net loss of affordable housing;
- No single level building exceeds 75,000 square feet;
- Applicable mitigation, performance standards, criteria from prior EIRs will be incorporated into the TPP;
- The project would not conflict with nearby operating industrial use; and
- The project site is located within 0.5 mile of rail transit station, ferry terminal included in the RTP, or 0.25 mile of high quality transit corridor.

Moreover, the project must meet at least one of the following:

- At least 20 percent of the housing will be for moderate income or 10 percent rented to low income, or not less than 5 percent rented to very low income, and developer provides commitment to ensure continued availability to these income groups for the period;
- Developer pays in-lieu fees pursuant to local ordinance to result in an equivalent number of units that would otherwise be required in a) above; and
- Project provides public open space at a ratio of at least 5 acres/1,000 residents.

After a public hearing where a legislative body finds that a TPP meets all the requirements, a project can be declared as an SCP and can be exempted from CEQA.

(2) Sustainable Communities Environmental Assessment (SCEA). A TPP that does not meet the SCP Exemption may nevertheless qualify for a SCEA if the project incorporates all feasible mitigation measures, performance standards, or criteria set forth in prior applicable certified environmental impact reports (including the RTP/SCS Program EIR) (Public Resource Code (PRC) Section 21155.2(b)). A SCEA is comparable to a Negative Declaration since the lead agency must find that all potentially significant impacts of a project have been identified, adequately analyzed, and mitigated to a level of insignificance. However, unlike a Negative Declaration, the SCEA need not consider the cumulative effects of the project that have been adequately addressed and mitigated in prior EIRs. Also, growth-inducing impacts are not required to be referenced, described, or addressed. Additionally, project-specific or cumulative impacts from cars and light duty truck trips on global warming or the regional transportation network need not be referenced, described, or discussed. The SCEA will be circulated for 30 days; comments will be considered; and then the SCEA may be approved after a public hearing provided impacts are mitigated. The SCEA will be reviewed under the substantial evidence standard, which means a court will uphold an agency's decision if there is substantial evidence in light of the whole record to support its action. This is different from the normal

CEQA fair argument standard, which is less deferential and states that an EIR must be prepared when, after examining the entire record, there is substantial evidence to support a fair argument that the project may have a significant effect on the environment. The substantial evidence standard makes it more difficult for a petitioner to challenge an SCEA.

(3) Transit Priority Project (TPP) Streamlined Environmental Impact Report (EIR). Instead of an SCEA, a lead agency may choose to perform a streamlined EIR. If, after conducting an Initial Study, the lead agency determines that an EIR is required, it only need address potentially significant impacts. Where a cumulative effect has been adequately addressed and mitigated in a previous EIR (such as the 2008 RTP EIR) that cumulative effect shall not be treated as cumulatively considerable. The EIR is not required to analyze off-site alternatives to the TPP or discuss a reduced residential density alternative to address the effects of car and light duty truck trips generated by the project. Furthermore, the EIR is not required to include an analysis of growth-inducing impacts or any project-specific or cumulative impacts from cars and light duty trucks trips generated by the project on global warming or the regional transportation network. The Initial Study must identify any cumulative effects that have been adequately addressed and mitigated in prior applicable certified EIRs and these cumulative effects are not to be treated as cumulatively considerable in the EIR.

(4) Traffic Mitigation Measures. After a public hearing a legislative body or local jurisdiction may adopt traffic mitigation measures that apply to TPPs (such measures must be updated as necessary every five years), including requirements for the installation of traffic control improvements, street or road improvements, and contributions to road improvement or transit funds, transit passes for future residents, or other measures that will avoid or mitigate traffic impacts of TPPs. If such measures are adopted by a local jurisdiction, no additional traffic mitigation are required for TPPs (measures addressing public health and bicycle safety may still be imposed).

Senate Bill 743 (SB 743). SB 743, adopted September 27, 2013, amends the State Congestion Management Act (California Government Code Section 65088) to harmonize the Act and its definitions with SB 743 and the SCS. This includes new definitions for "bus rapid transit corridor" and "infill opportunity zone." Key provisions of SB 743 include adding a new chapter to CEQA for Modernization of Transportation Analysis for Transit-Oriented Infill Projects, beginning with the PRC Section 21099. An infill site is defined by the PRC Section 21099(a)(4) as "a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins or is separated only by an improved public right-of-way from parcels that are developed with qualified urban uses." A transit priority area is defined by PRC 21099(a)(7) as "an area that is within ½ mile of a major transit stop that is existing or planned, if the project is scheduled to be completed within the planning horizon included in an adopted federal Transportation Improvement Program adopted pursuant to Section 450.216 or 450.322 of Title 23 of the Code of Federal Regulations." SB 743 also requires that the State Office of Planning and Research (OPR) develop revisions to the CEQA Guidelines to establish criteria for determining the significance of transportation impacts of projects within transit priority areas that promote the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses. It also allows OPR to develop alternative metrics outside of transit priority areas. In addition, PRC 21099(d) provides that aesthetic and parking impacts of a residential, mixed use residential, or employment center project on an infill site within a transit priority area, shall not be considered significant impacts on the environment. See Sections 4.1, Aesthetics and 4.12, Transportation and Traffic for further discussion.

Complete Streets Act. Assembly Bill 1358, the Complete Streets Act (Government Code Sections 65040.2 and 65302), was signed into law by former Governor Arnold Schwarzenegger in September 2008. As of January 1, 2011, the law requires cities and counties, when updating the part of a local general plan that addresses roadways and traffic flows, to ensure that those plans account for the needs of all roadway users. Specifically, the legislation requires cities and counties to ensure that local roads and streets adequately accommodate the needs of bicyclists, pedestrians and transit riders, as well as motorists.

At the same time, the California Department of Transportation (Caltrans) unveiled a revised version of Deputy Directive 64, an internal policy document that now explicitly embraces Complete Streets as the policy covering all phases of state highway projects, from planning to construction to maintenance and repair. *Deputy Directive-64-Revision 2: Complete Streets- Integrating the Transportation System (DD-64-R2)* is an administrative update of the State's complete streets policy signed in October 2014. The policy content remains the same as DD-64-R1 from 2008 and reaffirms Caltrans commitment to provide for the needs of all travelers of all ages and ability in all planning, programming, design, construction, operations, and maintenance activities, and products on the State highway system.

Complete Streets Implementation Action Plan 2.0. *Deputy Directive-64-Revision 2* requires a Complete Streets Implementation Action Plan be developed and implemented. The Complete Streets Implementation Action Plan describes the current Caltrans complete streets policy framework and provides an overview of Caltrans' continued complete street efforts. This Action Plan lays out the structure for monitoring, reporting, and overcoming barriers to further integrate complete streets into all Caltrans functions and processes.

REGIONAL

SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[4] The 2012-2035 RTP/SCS presents the transportation and overall land use vision for Los Angeles, Orange, San Bernardino, Imperial, Riverside, and Ventura Counties. The RTP portion of the 2012-2035 RTP/SCS identifies priorities for transportation planning within the Southern California region, sets goals and policies, and identifies performance measures for transportation improvements to ensure that future projects are consistent with other planning goals for the area. Transportation projects being constructed within the SCAG region must be listed in the 2012-2035 RTP/SCS. The SCS portion of the 2012-2035 RTP/SCS presents an overall land use concept for the region with increasing focus on densification of urban areas and development around transit stations and increased focus on use of transit and active transportation. Policies included in the 2012-2035 RTP/SCS (as well as an analysis of project consistency) are identified in **Table 4.8-3** in the impact section below.

2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[5] On April 7, 2016, SCAG adopted the 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The 2016-2040 RTP/SCS builds on the success of the 2012-2035 RTP/SCS and continues the commitment to reduce emissions from transportation sources to comply with Senate Bill (SB) 375. Goals of the 2016–2040 RTP/SCS remain similar to those of the 2012-2035 RTP/SCS.

Sustainability Planning Grant Program. The Sustainability Planning Grant Program, previously known as the Compass Blueprint Growth Grant Program, provides direct technical assistance to SCAG member jurisdictions to complete planning and policy efforts that enable implementation of the regional SCS. Since starting in 2005, 133 projects have been completed through the program, with another 69 projects to be completed by the end of 2016. Grants are available to SCAG member jurisdictions in through categories: integrated land use, active transportation, and green region. The Compass Blueprint Growth Vision was replaced by SCAG's RTP/SCS.[6]

[4]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. The 2016-2040 RTP/SCS is discussed for informational purposes.

[5]*Ibid.*

Congestion Management Program (CMP). As the Congestion Management Agency for Los Angeles County, Metro is responsible for implementing the CMP. On October 28, 2010, the Metro Board adopted the 2010 CMP for Los Angeles County.[7] The 2010 CMP summarizes the results of 18 years of CMP highway and transit monitoring and 15 years of monitoring local growth. CMP implementation guidelines for local jurisdictions are also contained in the 2010 CMP.

The CMP was created for the following purposes:

- To link local land use decisions with their impacts on regional transportation and air quality; and
- To develop a partnership among transportation decision makers on devising appropriate transportation solutions that include all modes of travel.

To meet these goals, the CMP provides:

- Track and analyze to determine how the regional highway and transit systems are performing;
- Locally analyze the impacts of local land use decisions on regional transportation;
- Locally implement Transportation Demand Management (TDM) design guidelines that ensure new development includes improvements supportive of transit and TDM; and
- Track new building activity throughout Los Angeles County.

Elements of the CMP include Highway and Roadway System monitoring, multi-modal system performance analysis, the TDM Program, the Land Use Analysis Program and local conformance for all the county's jurisdictions. See Section 4.12, Transportation and Traffic for more information.

LOCAL

City of Los Angeles General Plan Framework Element. The City of Los Angeles General Plan Framework Element establishes the overall policy and direction for the General Plan. It includes a long-range strategy to guide the comprehensive update for the General Plan's other elements.

Los Angeles Municipal Code (LAMC). Development in the City is also governed by the City of Los Angeles Zoning Code (Chapter 1 of the LAMC) which regulates development through zoning designations and development standards. The Comprehensive Zoning Plan of the City of Los Angeles (Zoning Ordinance) set forth in LAMC Section 12.00 et seq. includes development standards for zoning districts in the City. LAMC Section 13.00 et seq. includes development standards for various supplemental use districts in the City that apply specifically to parcels (as distinguished from regulations of general applicability with which all projects must comply). The LAMC is currently undergoing a comprehensive update to all Zoning Code sections as part of the re:code LA effort. re:code LA, which started in 2014 and will continue through 2019, will update the 1946 Zoning Code in order to make the Code more streamlined and easy to use. For now, the ECTNP will still be subject to language found within the current version of the LAMC and will not be impacted by the code update.

City of Los Angeles Mobility Plan (MP) 2035. MP 2035 was adopted in August 2015 and re-adopted in January 2016 and now serves as the new Transportation Element of the General Plan. MP 2035 establishes new street designations, classifies each of the City's arterial streets, and incorporates "complete street" policy framework, thus providing a foundation for future policies and principles related to how the street serves a variety of users.

City of Los Angeles Community Plans. The City of Los Angeles General Plan includes 35 community plans that collectively comprise the Land Use Element of the General Plan. The ECTNP Area is encompassed within several community planning areas: West Los Angeles, Palms-Mar Vista-Del Rey, and West Adams-Baldwin Hills-Leimert Community Plan areas.

[7]Metro, *2010 Congestion Management Program*.

City of Los Angeles Industrial Land Use Survey (**May 2006**). In an effort to identify the City's utilization of industrially-zoned areas, the City began to survey existing land uses within key industrial areas in May 2006. The west side of the City was included in the survey area.[8] The survey area, which is located in the West Los Angeles Community Plan, contains the western portion of the Project Area. The survey divided the west side into the following three subareas:

SA1: This area includes smaller parcels and collector streets along Sepulveda Boulevard and includes automotive related, entertainment and light industrial uses. Of the 78 acres in this subarea, approximately 31 acres (44 percent) were zoned for industrial uses.

SA2: This area includes a mix of parcel sizes with commercial uses along Olympic Boulevard. Of the 49 acres in this subarea, approximately 20 acres (47 percent) were zoned for industrial uses.

SA3: This area includes larger parcels west of Barrington Avenue and includes automotive-related, entertainment and light industrial uses. Of the 86 acres in this subarea, approximately 43 acres (53 percent) were zoned for Industrial uses.

Following the survey and additional research in January 2008, the Department of City Planning (DCP) prepared the *Memorandum on Staff Direction on Industrial Land Use and Potential Conversion to Residential or Other Uses (ILUP)*. Attached to the ILUP were Geographically-Specific Staff Directions that identified four types of areas (two of which – Transition Districts and Correction Areas – were not identified in proximity to the Project Area):

- Employment Protection District (EMP). Areas where industrial zoning should be maintained (i.e., where adopted General Plan, Community Plan and Redevelopment Plan industrial land use designations should continue to be implemented). Residential uses in these Districts are not appropriate.
- Industrial Mixed Use District (IMU). Areas that should remain as predominantly industrial/employment districts but which may support a limited amount of residential uses.

The Staff directions recommended the following two areas as Industrial Mixed Use areas: (1) the area bounded by Centinela Avenue, Bundy Drive, Nebraska Avenue and the Expo light rail transit (LRT); and (2) the area bounded by Pico Boulevard, the Expo LRT, Interstate 405 (I-405), and Military Avenue. Staff directions for both areas are to: *[p]reserve industrial zoning consistent with [the] West Los Angeles Community Plan. As part of the West Los Angeles Community Plan update, study opportunities for a new mixed use zone to include: industrial, commercial, and a limited amount of compatible residential uses and a significant mandatory minimum job component (no freestanding residential developments should be allowed). New development should provide a transition between proposed projects and low-scale residential neighborhoods*.

The following areas are identified in the ILUP as Employment Protection Districts: 1) from Bundy Drive to I-405 and roughly from the Expo LRT to La Grange Avenue; 2) a rectangular portion of the West Los Angeles Community Plan area from Pico Boulevard to the northern Community Plan area boundary and from I-405 to just past Sepulveda Boulevard; and 3) a triangle located along the western edge of the West Lost Angeles Community Plan area, south of the Expo LRT along Centinela Avenue. Staff directions for these areas are to: [*p]reserve industrial zoning consistent with [the] West Los Angeles Community Plan; encourage retention of neighborhood industrial services and allow industrial and ancillary commercial uses only. As part of the West Los Angeles Community Plan update, allow a mix of uses with a jobs component along the Olympic Blvd. frontage to provide a transition between industrial and adjacent residential and commercial districts.*

[8]City of Los Angeles Department of City Planning. *Industrial Land Use Policy Project,* http://cityplanning.lacity.org/Code_Studies/LanduseProj/TOC_Recommendations.htm, accessed March 6, 2017.

City of Los Angeles Great Streets Initiative (2013). Mayor Eric Garcetti enacted the Great Streets Initiative in October of 2013 to add bike racks, medians, plazas, sidewalk repairs, bus stops, pocket parks, crosswalks, and other improvements aimed at attracting pedestrians and new businesses. The first 15 projects include one in each council district:

- District 1: North Figueroa Street between Avenue 50 and Avenue 60
- District 2: Lankershim Boulevard between Chandler and Victory Boulevards
- District 3: Sherman Way between Wilbur and Lindley Avenues
- District 4: Western Avenue between Melrose Avenue and 3rd Street
- District 5: Westwood Boulevard between Le Conte Avenue and Wilshire Boulevard
- District 6: Van Nuys Boulevard between Victory Boulevard and Oxnard Street
- District 7: Van Nuys Boulevard between Laurel Canyon Boulevard and San Fernando Road
- District 8: Crenshaw Boulevard between 78th Street and Florence Avenue
- District 9: Central Avenue between Martin Luther King Jr. Boulevard and Vernon Avenue
- District 10: Pico Boulevard between Hauser Boulevard and Fairfax Avenue
- District 11: Venice Boulevard between Beethoven Street and Inglewood Boulevard
- District 12: Reseda Boulevard between Plummer Street and Parthenia Avenue
- District 13: Hollywood Boulevard between La Brea Avenue and Gower Street
- District 14: Cesar Chavez Avenue between Evergreen Avenue and St. Louis Street
- District 15: Gaffey Street between 15th Street and I-110

West Pico Boulevard Community Design Overlay (CDO) District. The West Pico Boulevard CDO District provides guidelines and standards for development projects on commercially and industrially designated properties located between I-405 on the east, Tennessee Avenue to Federal Avenue on the north, Pico Boulevard to the south, and Centinela Avenue (City boundary) on the west. The intent of the CDO is to provide guidance and direction in the design of buildings including storefronts that will enhance the appearance, pedestrian-orientation, and economic viability of the area.

Westwood/Pico Neighborhood Overlay District. The Westwood/Pico Neighborhood Overlay District was established by Ordinance No. 171,859. The District was established to regulate portions of Westwood Boulevard, Pico Boulevard, and Overland Avenue, which have a variety of commercial uses and activities. Portions of these streets are occupied with structures of a similar size and with architectural details, such as the location of windows, building walls, and pedestrian entrances, which, if preserved and enhanced, would encourage people in the surrounding neighborhoods to walk and shop along these streets.

The following pedestrian-oriented streets have been identified as part of the Westwood/Pico Neighborhood Oriented District: Westwood Boulevard (both sides of Westwood Boulevard between Missouri Avenue and the alley north of Pico Boulevard); Pico Boulevard (the north side of Pico Boulevard between Bentley Avenue and Patricia Avenue; and the south side of Pico Boulevard between Military Avenue and Patricia Avenue); and Overland Avenue (the east side of Overland Avenue between Blythe Avenue and the alley south of Pico Boulevard).

EXISTING SETTING

PROJECT AREA

The Proposed Project is located entirely within the incorporated City of Los Angeles and is comprised of an approximately five-mile-long corridor around five Expo LRT stations: Exposition/Bundy (Bundy), Exposition/Sepulveda (Sepulveda), Westwood/Rancho Park (Westwood), National/Palms (Palms), and Culver City. Specifically, the Project Area is located approximately eight miles to the west of Downtown Los Angeles and contains approximately 1,970 acres. The Project Area is defined to be the area in the City of Los Angeles within approximately one-half mile of stations along the Expo LRT Line. The City of Santa Monica (to the west) and the City of Culver City (to the south) both contain substantial areas within the one-

half mile radii of stations, and, therefore, potential impacts within these cities are addressed throughout the EIR.

Land uses in the Project Area include mostly Low Density Residential, Medium Density Residential, and Light Industrial uses. Smaller areas comprise Limited Industrial, Community Commercial, Public Facilities, and General Commercial uses. I-405 bisects the western portion of the Project Area and I-10 runs through the southern and eastern portions of the Project Area.

The following discussion describes land use designations and existing land uses in each of the station segments. See also the General Plan Land Use maps in Figures 3-4a and 3-4b in Chapter 3.0, Project Description.

Bundy Station. The Bundy Station segment within the City of Los Angeles contains approximately 320 acres. As shown in Figure 3-4a in Chapter 3.0, Project Description, the existing General Plan land use designations mostly consist of Low Density Residential and Light Industrial uses. Pockets of Low Medium I and II Residential, Medium Residential, High Medium Residential, General Commercial, Open Space, and Public Facilities are also scattered in this area. Light industrial uses are primarily located north of Exposition Boulevard, Low Density Residential uses are located south of Exposition Boulevard and in the northernmost part of this station area, and Low Medium I and Low Medium II Residential are located on the northeastern portion of the station area.

Land uses immediately adjacent to the station are highly varied, including light industrial, office, commercial, retail, single-family residential, and two gas stations. There is also a strong cluster of creative office uses, such as the Westside Media Center. Single- and multi-family residential uses are located north of Olympic Boulevard and south of Exposition Boulevard. Single-family homes, limited multi-family, and industrial zoned parcels are located south of the station. Neighborhood-oriented uses, such as retail and restaurants, are located on Pico and Olympic Boulevards. I-10 runs through the southern portion of this station area, south of the proposed change areas.

The areas of proposed change generally encompass land north of the Bundy Station, designated for Industrial uses, as well as land south of the station designated for Low Density between Exposition and Pico Boulevards. The total area of the areas of proposed change in the Bundy Station Area is approximately 114 acres out of a total area of 320 acres amounting to 36 percent of the land area in the Bundy Station Area.

Sepulveda Station. The Sepulveda Station segment contains approximately 422 acres. The existing General Plan land use designations mostly consist of Low Density Residential, Light Industrial, and Public Facilities uses. Medium Density Residential uses are also located along Sepulveda Boulevard and south of the Expo LRT, to the west of I-405. The majority of Low Density Residential and Light Industrial uses are located north of the Expo LRT, and Medium Density Residential, Low Density Residential, and Public Facilities uses are located south of the Expo LRT. Neighborhood Commercial uses are located along Pico Boulevard to the east of Sepulveda Boulevard. There are also Low Medium Residential uses along the Expo LRT to the east of Sepulveda Boulevard.

Manufacturing, light industrial, and retail uses are located adjacent to the station. There are some single- and multi-family residential uses north of Pico Boulevard, as well as east and west of Sepulveda Boulevard directly south of the station. Neighborhood-oriented uses, such as retail stores and restaurants, are primarily located along Pico Boulevard east of Sepulveda Boulevard. I-10 runs through the southern portion of this station area (south of the change areas), and I-405 runs through the western portion of this station area (immediately west of the change areas). Two schools are located within this station area (although outside the change areas); both are located south of I-10 and west of I-405.

The areas of proposed change generally encompass land to the east of the Sepulveda Station straddling the Expo LRT designated for Low Medium I Residential; the industrial land north of the station between the Expo LRT and Olympic Boulevard, easterly of the I-405; and the commercial corridor along Pico Boulevard

between Sepulveda and Westwood Boulevards designated for Neighborhood Commercial land uses. The total area of the areas of proposed change in the Sepulveda Station Area is approximately 46 acres out of a total 422 acres amounting to 11 percent of the land area in the Sepulveda Station Area.

Westwood Station. The Westwood Station segment contains approximately 532 acres. The area is comprised almost entirely of Low Density Residential General Plan designated land uses, with some Neighborhood Commercial and Community Commercial land uses along Pico Boulevard, Westwood Boulevard, and Overland Avenue. A few Low Medium Density Residential areas are also located west of the Westwood Station.

Land uses located adjacent to the station site are single-family residential, with some low-medium density multi-family residential along Exposition Boulevard. A shopping mall, retail stores, and restaurants are located along Pico Boulevard. There is also one public elementary school in the station area.

The areas of proposed change generally encompass the land designated for Neighborhood Commercial on the north side of Pico Boulevard between Westwood and Overland Avenue as well as the City-owned land designated for Low Density Residential straddling the Expo LRT. The total area of the areas of proposed change is approximately five acres or one percent of the land area in the Westwood Station Area.

Palms Station. The Palms Station Area contains approximately 504 acres. This area is mostly comprised of Low and Medium Residential General Plan designated land uses. Neighborhood Commercial, General Commercial and Public Facilities land uses are located south of Exposition Boulevard in this area.

The land uses located adjacent to the station primarily consist of residential and retail uses, with a shopping center to the north of the station. Specifically, the northern portion of this station area is comprised of single-family and multi-family residences, while the area south of the station is a largely multi-family residential neighborhood. I-10 runs through the southern portion of this station area. Retail and office uses, as well as a large concentration of neighborhood-serving public facilities, such as Palms Elementary School and the U.S. Post Office, are located on Motor Avenue and Venice Boulevard.

The areas of proposed change generally encompass land designated for General Commercial on the north and south sides of Venice Boulevard between the alley Westerly of Motor and Watseka Avenues; the land designated for General Commercial and Neighborhood along Motor Avenue between the alley southerly of Venice Boulevard and National Boulevard; and other parcels along National Boulevard designated for Neighborhood Commercial, Limited Industrial, General Commercial, and Medium and High Medium Density Residential. The total area of the areas of proposed change is approximately 51 acres or 10 percent of the land area in the Palms Station Area.

Culver City Station. The Culver City Station Area within the City of Los Angeles contains approximately 193 acres. General Plan land use designations north of the Expo LRT in this area include Light Industrial, Limited Industrial, General Commercial uses, and Public Facilities. Low Density and Medium Density Residential areas are also scattered north of the Expo LRT. Medium Density Residential, General Commercial, and Light Industrial uses and the City of Culver City border the southern portion of this station area.

Specifically, commercial and light industrial uses are located along Venice Boulevard, Robertson Boulevard, and around the I-10 corridor. These uses include a shopping center, restaurants, auto-oriented businesses, and creative office spaces near the Downtown Culver City area. The historic Helms Bakery district, located in the City of Los Angeles, includes restaurants, offices, and home furnishing stores and is located east of the station. Station area neighborhoods include multi-family residential to the west of the station and north of I-10, as well as single-family homes, which are largely concentrated north of I-10 and southwest of this station. There is one public high school located in this station area.

The areas of proposed change generally encompass land designated for General Commercial, Light Industrial, and Limited Industrial along Venice, Robertson, and National Boulevards. The total area of the areas of proposed change is approximately 42 acres or 22 percent of the land area in the Culver City Station Area.

SURROUNDING LAND USES

The Project Area is located entirely within the incorporated City of Los Angeles and abuts the City of Culver City and the City of Santa Monica. Surrounding land uses consist of a mix of urban uses. Specifically, Low and Medium Residential uses are located both north and south of the Project Area. Commercial uses are generally located along major thoroughfares and light industrial along the I-405 corridor. Directly southeast of the Project Area along Washington and La Cienega Boulevards is the Culver City Arts District, which includes several art galleries, and to the southwest of the Project Area is the Santa Monica Airport. The Federal Aviation Administration and the City of Santa Monica plan to maintain airport operations through 2028, after which the City may discontinue its use as an airport.[9] Additionally, similar to the Project Area, the surrounding area includes a variety of commercial and open space uses.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to land use if it would:

- Physically divide an established community;
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; and/or
- Conflict with any applicable Habitat Conservation Plan or Natural Community Conservation Plan.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

For purposes of this analysis, Appendix G thresholds are supplemented by the criteria identified in the 2006 City of Los Angeles CEQA Thresholds Guide (Thresholds Guide). The Thresholds Guide indicates that the determination of significance is to be made on a case-by-case basis, considering the following factors. These factors are discussed as appropriate based on the impact area.

- Whether the proposal is inconsistent with the adopted land use/density designation in the Community Plan, redevelopment plan or specific plan for the site;
- Whether the proposal is inconsistent with the General Plan or adopted environmental goals or policies contained in other applicable plans;
- The extent of the area that would be impacted, the nature and degree of impacts, and the type of land uses within the area;
- The extent to which existing neighborhoods, communities, or land uses would be disrupted, divided, or isolated, and the duration of the disruptions; and
- The number, degree, and type of secondary impacts to surrounding land uses that could result from implementation of the Proposed Project.

METHODOLOGY

The analysis in this section focuses on the consistency of the Proposed Project with any applicable land use plans, policies, or regulations, as well as the compatibility of land uses identified in the Proposed Project with existing and planned land uses within the ECTNP Area.

The consistency analysis presented in this section was prepared in compliance with CEQA Guidelines Section 15125(d). The purpose of the required analysis is to identify potential inconsistencies between the Proposed Project and applicable general plans and regional plans. Neither CEQA nor the CEQA Guidelines set forth standards for determining when a project is inconsistent with an applicable plan, but the final determination that a project is consistent or inconsistent with an applicable plan should be made by the Lead Agency when it acts on the project. Using the methodology described below, the analysis in this EIR presents the findings of the policy review and is intended to provide a guide to the decision-makers for policy interpretation.

A project's inconsistency with a policy is only considered significant if such inconsistency would cause significant physical environmental impacts (as defined by CEQA Guidelines Section 15382). Under this approach, a policy conflict is not in and of itself considered to be a significant environmental impact. An inconsistency between a Proposed Project and an applicable plan is a legal determination that may or may not indicate the likelihood of a physical environmental impact. In some cases, an inconsistency may be evidence that an underlying physical impact is significant and adverse. For example, if a proposed project affected agricultural land, one standard for determining whether the impacts were significant would be to determine whether the project violated a plan or policy protecting agricultural land; the environmental impact, however, would be the physical conversion of agricultural land to nonagricultural uses.

A project may be considered consistent with the provisions of an identified regional and/or local plan if it meets the general intent of the plan or policy and would not preclude the attainment of the primary intent of the plan or policy. If the Proposed Project is determined to be inconsistent with specific objectives or policies of a land use plan but is largely consistent with the goals of that plan and would not preclude the attainment of the primary intent of the plan, the Proposed Project would not be considered inconsistent with the plan. Moreover, and as described above, inconsistency with specific objectives or policies of a land use plan does not necessarily mean that the Proposed Project would result in a significant impact on the physical environment.

A project may be considered incompatible with surrounding land uses if it has the potential to disrupt the physical arrangement of an established community by introducing new infrastructure or isolating land uses that could interrupt the typical activities or change the land use conditions in a community. It also may be considered incompatible if it includes land uses which create noise, odor, safety hazards, visual, or other environmental impacts that conflict with surrounding land uses and the activities and conditions typically associated with those land uses. However, the presence of such secondary environmental impacts does not automatically indicate a land use compatibility impact, and the effect of these impacts is evaluated within each applicable impact category in this EIR.

As discussed in Chapter 3.0, Project Description, the Project Area has two primary land use geographies – developments that would take place within the areas of proposed change (also referred to as change areas or subareas) and development outside of these areas within of the proposed ECTNP Area. Potential land use and planning impacts are highly dependent on location and surrounding land uses within and adjacent to the areas of proposed change. On a more general basis, for parcels outside the change areas, land use and planning impacts could result from development in accordance with current zoning and the current community plan. This section presents potential impacts for development both within the areas of change and areas within the ECTNP Area where zoning would not change. Change area effects are discussed for each station segment based on the proposed zone changes and detailed estimates of reasonably foreseeable growth; a more general discussion of

potential effects in non-change areas is provided based on generalized estimates of reasonably foreseeable growth within the limits established by the relevant community plan and associated zoning.

PROJECT FEATURES

The Proposed Project would establish the ECTNP to guide future development within the Project Area. The ECTNP would include General Plan amendments and zone changes that encourage infill development and a mix of uses within the identified areas to promote transit ridership, reduce automobile dependence, and create vibrant neighborhoods around the transit stations. Zone changes and General Plan amendments would not occur on every parcel within the Project Area; these changes would only occur within identified "areas of proposed change."

The Proposed Project: (1) creates four new zones and one new land use designation and changes zoning and land use designations within change areas as identified in Figure 3-2 in Chapter 3.0, Project Description; (2) includes public benefit requirements associated with tiered floor area ratios (FARs) in the new zones; (3) creates streetscape plans for identified street segments in the Project Area; and (4) requires design standards for new development within the Project Area (excluding single- and two-family zones). Analysis in this EIR includes projects throughout the Project Area that are consistent with either the existing community plan and zone in the non-change areas or the proposed land use and zoning in the change areas. Projects outside of the change areas are subject to the urban design standards and streetscape requirements of the Proposed Plan and applicable mitigation measures.

The Proposed Project also includes new open space and parking regulations for select properties within the Project Area. As discussed in Chapter 3.0, Project Description, the Proposed Project includes an Alternative Compliance scenario that would allow designated sites within the change areas to have a different mix of residential and non-residential uses than required per the zoning of the property. Projects utilizing this path would still be subject to the maximum FAR and other zoning and development standards but would also be required to provide increased public benefits in addition to affordable housing. Projects reviewed under the Alternative Compliance procedure of the ECTNP would be required to obtain a "Director's Determination for an Alternative Compliance Project."

The Proposed Project involves zone changes, either to existing zone classifications (RAS4, R3, and RD1.5) or to new zone classifications created by the Proposed Project (New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial: Residential Emphasis, and Mixed Use: Commercial/Residential).

Existing Zone Classifications

RAS4 (Residential Accessory Services). This zone is a multi-family residential zone that allows neighborhood-serving commercial use on the ground floor. Within the Proposed Project, a change to this zone is intended to revitalize commercial corridors while allowing uses that are compatible with abutting residential neighborhoods. The RAS4 zone creates additional capacity for multi-family housing while providing neighborhood-serving retail and services. The residential density in this zone is limited to one dwelling unit per 400 square feet of lot area (or approximately 108 dwelling units per acre). Typical building types include multi-story mixed use or residential only buildings. The FAR is limited to 3.0:1.

R3 (Multi-family Residential). This zone is a medium density multi-family residential zone. Typically, developments include apartments or condominiums with sub-grade or structured parking. The residential density in this zone is limited to one dwelling unit per 800 square feet of lot area (or approximately 54 dwelling units per acre). The FAR is limited to 3.0:1.

RD1.5 (Restricted Density Multi-Family Residential). This zone is a low-medium multi-family residential zone, which allows one dwelling unit per 1,500 square feet of lot area (or approximately 29 dwelling units per acre). Typical developments include a residential unit with accessory living quarters, duplexes, multi-family apartments or condominiums, or small lot subdivisions. The FAR is limited to 3.0:1.

New Zone Classifications

New Industry. The proposed New Industry zone is intended to be an employment zone with uses tailored to 21st century and creative industries, such as digital technology, research and development, media, design, and entertainment. Light manufacturing and assembly uses associated with these industries are also appropriate in this zone. Retail and restaurant uses are intended to be ancillary uses that support the employment uses. Traditional residential uses are prohibited in this zone, but live work units built to building code standards that allow up to five non-resident employees are permitted. Permitted FARs range from 2.5:1 to 4.0:1, depending on the amount of public benefits provided.

Hybrid Industrial: Jobs Emphasis. This hybrid zone is intended to be an employment-focused zone while also allowing a limited amount of residential uses. The employment uses in this zone are similar to those in the New Industry zone but can include a larger amount of retail, restaurant, and entertainment uses. Residential use is limited to 30 percent of the total square footage of a project, though projects would have the ability to include up to 50 percent residential use by providing additional public benefits. Projects that include residential uses would be permitted a FAR range of 2.0:1 to 4.0:1 (depending on the public benefits provided), and projects without residential uses would have a permitted FAR range of 2.5:1 to 4.0:1 (depending on the public benefits provided).

Hybrid Industrial: Residential Emphasis. This hybrid zone is intended to be a zone that requires a minimum level of employment uses (similar in type to the New Industry zone) along with a greater but still limited amount of residential use. This zone allows residential use for up to 70 percent of the total square footage of a project, though projects would have the ability to include up to 75 percent residential use by providing additional public benefits. A project would be allowed to be entirely commercial or include a mix of residential and commercial uses. The Hybrid Industrial: Residential Emphasis zone would serve as a transition zone residential-only neighborhoods to jobs centers. The permitted FAR would range from 2.0:1 to 4.0:1 (depending on the public benefits provided); for projects without residential uses the permitted FAR would range from 2.5:1 to 4.5:1 (depending on the public benefits provided.

Mixed Use: Commercial/Residential. This zone is intended to allow neighborhood and community commercial uses and institutional uses, either alone or in combination with multi-family residential. This zone activates commercial corridors with a variety of uses that serve the local community while also providing housing options. The Mixed Use: Commercial/Residential zone allows residential use for up to 90 percent of the total square footage depending on the FAR of a development project. A project site could consist entirely of non-residential use or a mix of residential and commercial use. The permitted FAR would range from 2.0:1 to 3.6:1 (depending on the public benefits provided).

IMPACTS

IMPACT 4.8-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT PHYSICALLY DIVIDE AN ESTABLISHED COMMUNITY? THIS IMPACT IS LESS THAN SIGNIFICANT.

Construction

Construction activities in the ECTNP Area can be expected to result in temporary impacts to land. Construction impacts could temporarily divide a community if roadways and sidewalks are temporarily blocked or partially blocked. Construction activities can discourage pedestrian activity and interfere with traffic movement thereby affecting land uses in the area. However, these effects are transitory and do not rise to the level of significance.

Operation

The operation of the Proposed Project includes four primary components: (1) Zoning and Land Use Changes, (2) Urban Design Standards, (3) Streetscape Plans, and (4) Public Benefits. All of these components are applicable to the change areas, whereas only the urban design standards and streetscape plans are applicable to the non-change areas.

CHANGE AREAS

Zoning and Land Use Changes. Operation of the Proposed Project would occur around five Expo LRT Line stations (Bundy, Sepulveda, Westwood, Palms, and Culver City), as shown in Figure 3-1 in Chapter 3.0, Project Description. The Project Area includes an urbanized section of the City of Los Angeles with a variety of land uses. The Proposed Project would include the establishment of a Specific Plan that would result in zone changes and General Plan amendments to properties within the identified areas of proposed change, or also referred to as change areas. In these change areas, which comprise approximately 256 acres of the 1,971-acre Project Area, the ECTNP would regulate development standards, such as building heights, setbacks, density, open space, land use, parking, and design. The Proposed Project would not include any land use changes that would disrupt or substantially change land use patterns outside the identified change areas.

Within the areas of change, the Proposed Project includes a number of changes to existing land use and zoning, with the majority of the changes being focused on land currently zoned for industrial and commercial use. See Figures 3-4 through 3-7 in Chapter 3.0, Project Description for details on existing and proposed General Plan land use and zoning for the Project Area. Overall, the proposed changes in land use and zoning would not substantially change development patterns in the area but, instead, would reinforce and strengthen existing development patterns while having the added benefit of creating more compact, walkable neighborhoods that also accommodate future growth.

Hybrid Industrial. The Proposed Project would rezone approximately 149 acres of existing Light Industrial (M2) land to the New Industry, Hybrid Industrial: Jobs Emphasis, or Hybrid Industrial: Residential Emphasis zone. These changes would be concentrated around the Bundy, Sepulveda, and Culver City Stations, with a small portion near the Palms Station, and would be adjacent to a mix of low and medium density residential (R1, R2, RD1.5, and R3), light industrial (M2), and public facilities (PF) zones. This proposed change would not disrupt existing land use patterns in the vicinity as the new zones would continue existing land use patterns, such as many of the employment uses that currently exist in these areas, and would result in additional jobs close to the transit stations. The Hybrid Industrial: Jobs Emphasis and Hybrid Industrial: Residential Emphasis zones would introduce a limited amount of residential use not previously allowed in the industrially zoned area. This would help transition the new employment zones to the surrounding residential neighborhood. The changes in zoning and associated increase in allowable floor area would encourage redevelopment of underutilized or vacant properties around the stations, creating more vibrant neighborhoods that link surrounding areas to the stations and support transit ridership. These changes would allow the intensification of land uses in an urbanized area of the city, promote a greater mix of uses that would foster more compact and walkable development patterns, and allow the City to meet growth demands for jobs and housing in the area. These changes would not divide the neighborhood but, instead, allow for better transition of higher intensity development and jobs closest to the stations to adjacent residential neighborhoods through stepping down of massing, scale, and intensity.

Mixed Use. The Proposed Project would rezone approximately 67 acres of land on commercial boulevards, currently zoned for Commercial (C2) and Multi-family uses (R3 and RD2), to the Mixed Use: Commercial/Residential zone. These changes would be concentrated around the Palms and Culver City Stations. The Mixed Use: Commercial/Residential zone would be immediately adjacent to multi-family residential uses (R3 and R4), as well as the I-10 corridor. This proposed change would not disrupt land use patterns in the vicinity as it would continue to allow commercial uses, which currently exist along most of these

boulevards. In addition, the new zoning would facilitate mixed use development with residential uses on upper floors at a density and scale that would be compatible with the adjacent multi-family residential neighborhoods.

Along Pico Boulevard within the Sepulveda and Westwood Station areas, approximately nine acres currently zoned as Commercial (C2-1VL) are proposed to be rezoned to the Residential/Accessory Services zone (RAS4). Immediately adjacent to this change area are single-family neighborhoods, as well as large commercial properties that currently serve as the location for the Westside Pavilion shopping mall. This change would not disrupt existing land use patterns as the RAS4 zone would continue to allow ground floor commercial development on Pico Boulevard, and the neighborhood-serving uses within RAS4 development would serve the adjacent residential community. Urban design standards would ensure a continuation of pedestrian-friendly retail activity along this corridor, as well as appropriate transitions in building height from new development to the adjacent single-family neighborhoods. In addition, the greater floor area allowed by the RAS4 zone would facilitate the development of residential uses on upper floors, which, in turn, would be compatible with the surrounding residential neighborhood. The RAS4 zone would create modest additional housing capacity while still retaining the pedestrian-friendly neighborhood-serving district on Pico Boulevard. It would encourage a mixed use development pattern that is consistent with existing patterns of development and create a more walkable neighborhood, where basic shopping and services needs can be met within a walking distance of existing and future residents.

Multi-family Residential. Along the Expo LRT right-of-way between the Sepulveda and Westwood Stations, approximately six acres currently zoned for two-family dwellings (R2) are proposed to be changed to a medium density multi-family zone (R3). Immediately surrounding this change area are single-family neighborhoods to the north and south. The Proposed Project would not disrupt existing land use patterns in the area as the new zoning would continue the pattern of residential development and contain similar activities as in the adjacent single-family neighborhoods. Given that these properties are in close proximity to the Sepulveda and Westwood stations and front the Expo LRT, the increase in residential density would allow more residents to access nearby transit and recognize the expected change in character of the street.

The existing 24-acre single-family residential neighborhood located immediately south of the Bundy Station is proposed to be rezoned to a mix of RAS4, R3, and RD1.5 zoning. Immediately adjacent to this change area are commercial land use to the south, industrial land use to the north, and some multi-family residential use to the south and west. The proposed zone change would not disrupt land use patterns in this area as it involves rezoning the entire single-family neighborhood, and no other single-family uses are adjacent. The proposed change would, instead, make the area more compatible with the higher intensity commercial and industrial uses that currently surround the single-family area. The proposed RAS4 zone would introduce ground floor commercial uses along Bundy Drive that would link existing commercial uses on Pico Boulevard to the south to the transit station and other commercial activity and jobs to the north and provide neighborhood retail and services to the surrounding neighborhood. The proposed RD1.5 and R3 uses would make this residential neighborhood more compatible with surrounding commercial and industrial uses, and increased residential density within close proximity to a transit station would support increased ridership.

Open Space. Within the Westwood Station Area, 2.2 acres currently owned by the City of Los Angeles and zoned for single-family residential (R1) are proposed to be rezoned to Open Space (OS). These properties, which are located along the Expo LRT right-of-way between Westwood Boulevard and Overland Avenue, are directly adjacent to single-family neighborhoods to the north and south. This change in land use and zoning would not disrupt existing land use patterns. Rezoning these currently vacant properties to open space would facilitate the construction of the Westwood Neighborhood Greenway, introducing a new open space use that would be compatible with and supports the surrounding residential uses, as well as continues the pattern of open space use found to the west of Westwood Station where the Sara Berman Greenway lines the Expo LRT right-of-way.

The zoning and land use changes described above include modifications to the allowable FARs and building heights. The majority of the areas of proposed change zoned for commercial or industrial use currently allow a maximum FAR of 1.5:1. By increasing the allowable FAR in those areas (from 2:1 to 4:1 depending on the zone and public benefits provided), the Proposed Project would enable mixed use development that accommodates anticipated growth in jobs and housing. The additional floor area would allow additional development without disrupting the existing land use patterns and can contribute to land use compatibility by creating a greater mix of uses within the neighborhoods. In existing residential areas, increased FAR would allow for more residential development in locations proximate to transit stations.

The Proposed Project would increase allowable building heights throughout much of the areas of proposed changes, ranging from 58 feet to 161 feet depending on the zone and location. Greater height would be focused along major boulevards, I-405, and the Expo LRT stations and right-of-way, while lower heights are proposed for areas adjacent to, or across the street or alley from, residential areas. Increasing the allowable height would accommodate new commercial development, such as creative office, that demands higher floor-to-ceiling heights, thus encouraging these uses to locate around transit and in areas where such uses already exist. In areas proposed for change to the RAS4 zone, increased allowable height (from 45 feet with the current zoning up to 50 feet with the RAS4 zone) would allow for commercial uses on the ground floor, creating or continuing an active street environment in these areas.

The tables below summarize how the above land use and zone changes and corresponding FARs and heights are applied to each station area.

Bundy Station. The Bundy Station Area contains approximately 289 acres. The proposed changes would affect approximately 114 acres within the station area. Land uses to be rezoned include Light Manufacturing and Low Density Residential parcels (**Table 4.8-1**).

TABLE 4.8-1: EXISTING LAND USE AND ZONING WITHIN THE BUNDY STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories)	Max Allowable Height (Feet)
Light Industrial	M2-1 M2-2	89.4	1.5:1 6:1	N/A	N/A
Low Density Residential	R1-1	24.4	N/A /a/	N/A	33 /b/
TOTAL		**113.8**			

/a/ The maximum allowable floor area in the R1 zone varies. See LAMC Section 12.08 C.5 for details.
/b/ The maximum building height in the R1 zone is limited to 28 feet when the roof of the uppermost story of the building has a slope of less than 25 percent.
SOURCE: City of Los Angeles, 2017.

In order to accomplish the Proposed Project's stated objectives, the ECTNP would rezone specific Light Industrial (M2) properties within the change area to New Industry, Hybrid Industrial: Jobs Emphasis, and Hybrid Industrial: Residential Emphasis zones. The Proposed Project would also rezone select R1 properties within the change area to RAS4-1VL, RD1.5-1, and R3-1. **Table 4.8-2** below shows a breakdown of the change in acres by new zone designations.

TABLE 4.8-2: PROPOSED LAND USE AND ZONING WITHIN THE BUNDY STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories) /a/	Max Allowable Height (Feet)
Hybrid Industrial	New Industry	58.8	2.5:1 to 4:1	Up to 12	161
Hybrid Industrial	Hybrid Industrial: Jobs Emphasis	20.0	2:1 to 4:1	Up to 12	161 (128 /b/)
Hybrid Industrial	Hybrid Industrial: Residential Emphasis	10.6	2:1 to 4:1	Up to 7	96 (78 /b/)
Neighborhood Commercial	RAS4-1VL	6.4	3:1	Up to 4	50
Medium Density Residential	R3-1	4.0	3:1	Up to 4	45
Low Medium Density II Residential	RD1.5-1	14.0	3:1	Up to 4	45
TOTAL		**113.8**			

/a/ Maximum height in stories is shown for illustrative purposes only. Height is limited only by feet and not stories.
/b/ Lower height applies to buildings with residential use above the ground floor.
SOURCE: City of Los Angeles, 2017.

Sepulveda Station. The Sepulveda Station Area contains approximately 325 acres. The Proposed Project would change the zoning designation on approximately 46 acres. Land uses to be rezoned include Light Industrial, Neighborhood Commercial, and Low Medium Density Residential uses (**Table 4.8-3**).

TABLE 4.8-3: EXISTING LAND USE AND ZONING WITHIN THE SEPULVEDA STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories)	Max Allowable Height (Feet)
Light Industrial	M2-1; M2-1VL	33.2	1.5:1	N/A; 3	N/A; 45
Neighborhood Commercial	C2-1VL	6.3	1.5:1	3 /a/	45
Low Medium Density I Residential	R2-1	6.0	3:1	N/A	33
TOTAL		**45.5**			

/a/ Buildings used entirely for residential (and ground floor commercial in RAS zones) are only limited as to height, not stories.
SOURCE: City of Los Angeles, 2017.

In order to accomplish the Proposed Project's stated objectives, the ECTNP would rezone specific M2 properties adjacent to the station location to Hybrid Industrial: Jobs Emphasis and Hybrid Industrial: Residential Emphasis, and other M2 properties in the station area to New Industry. In addition, the Proposed Project would rezone multi-family residential (R2-1) properties fronting the Expo LRT Line to R3-1 to allow increased residential development and would rezone commercial property on Pico Boulevard to RAS4-1VL to facilitate mixed use (residential and retail) development. **Table 4.8-4** below shows a breakdown of the change in acres by new zone designations.

TABLE 4.8-4: PROPOSED LAND USE AND ZONING WITHIN THE SEPULVEDA STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories) /a/	Max Allowable Height (Feet)
Hybrid Industrial	New Industry	21.1	2.5:1 to 4:1	Up to 11	148
Hybrid Industrial	Hybrid Industrial: Jobs Emphasis	5.7	2.0:1 to 4:1	Up to 11	148 (118 /b/)
Hybrid Industrial	Hybrid Industrial: Residential Emphasis	6.4	2.0:1 to 4:1	Up to 7	96 (78 /b/)
Neighborhood Commercial	RAS4-1VL	6.3	3:1	Up to 4	50
Medium Density Residential	R3-1	6.0	3:1	Up to 4	45
TOTAL		**45.5**			

/a/ Maximum height in stories is shown for illustrative purposes only. Height in these zones is limited only by feet and not stories.
/b/ Lower height applies to buildings with residential use above the ground floor.
SOURCE: City of Los Angeles, 2017.

Westwood Station. The Westwood Station Area contains approximately 222 acres. The Proposed Project would change the zoning designation on approximately 5.2 acres from C2-1VL (Neighborhood Commercial) to RAS4-1VL along the north side of Pico Boulevard between Westwood Boulevard and Overland Avenue (**Tables 4.8-5** and **4.8-6**). The RAS4-1VL zone has a height maximum of 50 feet and a FAR of 3.0. In addition, the project would rezone approximately 2.2 acres flanking the Expo right-of-way roughly between Westwood and Overland Boulevards from R1 to OS (open space). These parcels are currently City-owned, vacant parcels and are intended to become the Westwood Neighborhood Greenway. The Proposed Project would maintain all other existing R1 zoning within the station area.

TABLE 4.8-5: EXISTING LAND USE AND ZONING WITHIN THE WESTWOOD STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories)	Max Allowable Height (Feet)
Neighborhood Commercial	C2-1VL	3.0	1.5:1	3 /a/	45
Low Density Residential	R1-1	2.2	N/A /b/	N/A	33 /c/
TOTAL		**5.2**			

/a/ Buildings used entirely for residential (and ground floor commercial in RAS zones) are only limited as to height, not stories.
/b/ The maximum allowable floor area in the R1 zone varies. See LAMC Section 12.08 C.5 for details.
/c/ The maximum building height in the R1 zone is limited to 28 feet when the roof of the uppermost story of the building has a slope of less than 25 percent.

TABLE 4.8-6: PROPOSED LAND USE AND ZONING WITHIN THE WESTWOOD STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories)	Max Allowable Height (Feet)
Neighborhood Commercial	RAS4-1VL	3.0	3:1	Up to 4 /a/	50
Open Space	OS	2.2	N/A	N/A	N/A
TOTAL		**5.2**			

/a/ Maximum height in stories for the RAS4-1VL zone is shown for illustrative purposes only. Height in this zone is limited only by feet and not stories.
SOURCE: City of Los Angeles, 2017.

Palms Station. The Palms Station Area contains approximately 357 acres. The Proposed Project would change the zoning designation on approximately 51 acres. Land uses to be rezoned include Limited Industrial, General and Neighborhood Commercial, High Medium Residential, and Medium Residential uses (**Table 4.8-7**).

TABLE 4.8-7: EXISTING LAND USE AND ZONING WITHIN THE PALMS STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories)	Max Allowable Height (Feet)
Limited Industrial	M1-1	5.3	1.5:1	N/A	N/A
General Commercial	C2-1, CR-1; R3-1, R4-1	29.4	1.5:1; 3:1	N/A	N/A
Neighborhood Commercial	C2-1, P-1	10.8	1.5:1	N/A	N/A
High Medium Density Residential	R3-1	1.5	3:1	N/A	45
Medium Density Residential	R3-1	3.7	3:1	N/A	45
TOTAL		**50.7**			

SOURCE: City of Los Angeles, 2017.

In order to accomplish the Proposed Project's stated objectives, the ECTNP would rezone properties within the change area to New Industry and Mixed Use: Commercial/Residential zones. Below is a breakdown of the change in acres by new zone designations (**Table 4.8-8**).

TABLE 4.8-8: PROPOSED LAND USE AND ZONING WITHIN THE PALMS STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories) /a/	Max Allowable Height (Feet)
Hybrid Industrial	New Industry	5.3	2.5:1 to 4:1	Up to 7	96
Community Commercial	Mixed Use: Commercial/ Residential	28.1	2.0:1 to 3.6:1	Up to 6 Up to 7	68 78
Neighborhood Commercial	Mixed Use: Commercial/ Residential	17.2	2.0:1 to 3.6:1	Up to 5	58
TOTAL		**50.7**			

/a/ Maximum height in stories is shown for illustrative purposes only. Height in these zones is limited only by feet and not stories.
SOURCE: City of Los Angeles, 2017.

Culver City Station. The Culver City Station Area contains approximately 190 acres. The Proposed Project would change the zoning designation on approximately 42 acres. Land uses to be rezoned include Light and Limited Industrial, General Commercial, and Medium Residential uses (**Table 4.8-9**).

TABLE 4.8-9: EXISTING LAND USE REGULATIONS AND ZONING WITHIN THE CULVER CITY STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories)	Max Allowable Height (Feet)
Light Industrial	M1-1, M2-1	15.8	1.5:1	N/A	N/A
Limited Industrial	M1-1, P-1	6.35	1.5:1	N/A	N/A
General Commercial	C2-1, C4-1 RD2-1	11.3	1.5:1 3:1	N/A	N/A; 45
Medium Density Residential	R3-1	2.0	3:1	N/A	45
Low Medium Density II Residential	RD2-1	6.7	3:1	N/A	45
TOTAL		**42.2**			

SOURCE: City of Los Angeles, 2017.

In order to accomplish the Proposed Project's objectives, the ECTNP would rezone the shopping center on Venice and Culver Boulevards to Hybrid Industrial: Jobs Emphasis. The Proposed Project would also rezone industrial properties between I-10 and Venice Boulevard to New Industry and rezone commercial properties on Venice Boulevard to the Mixed Use: Commercial/Residential zone. Finally, the Proposed Project would rezone commercial and residential properties along Robertson Boulevard between I-10 and Cattaraugus Avenue to Mixed Use: Commercial/Residential. Below is a breakdown of the change in acres by new zone designations (**Table 4.8-10**).

TABLE 4.8-10: PROPOSED LAND USE REGULATIONS WITHIN THE CULVER CITY STATION AREAS OF PROPOSED CHANGE

General Plan Land Use	Zoning	Acres	FAR	Max Allowable Height (Stories) /a/	Max Allowable Height (Feet)
Hybrid Industrial	New Industry	12.0	2.5:1 to 4.0:1	Up to 7	96
Hybrid Industrial	Hybrid Industrial: Jobs Emphasis	8.4	2.0:1 to 4.0:1	Up to 7	96
Community Commercial	Mixed Use: Commercial/ Residential	21.8	2.0:1 to 3.6:1	Up to 6	68
TOTAL		**42.2**			

/a/ Maximum height in stories is shown for illustrative purposes only. Height in these zones is limited only by feet and not stories.
SOURCE: City of Los Angeles, 2017.

Public Benefits. The Proposed Project requires individual projects that use floor area bonuses to provide public benefits. The menu of public benefits includes streetscape improvements, mobility amenities (e.g., bike share and car share stations), publicly accessible open space, community facilities (e.g., childcare or recreation center), and enhanced transportation demand management strategies. These public benefits can help to connect neighborhoods, ensure compatibility between new and existing development, and minimize the effects of new development. Streetscape improvements and mobility amenities would create and enhance linkages for pedestrians, bicyclists, and transit riders, encouraging more people to circulate within the station areas and across existing barriers, such as freeways and wide arterial streets. Open space and community facilities would serve the existing community while also supporting additional residents and employees of new development. Transportation demand management strategies, including the requirement for commercial projects to demonstrate a reduction in vehicle trips, would help reduce the effect of new development on the roadways while supporting the use of nearby transit, bicycle facilities, and other non-vehicular modes.

Urban Design Standards. The Proposed Project includes urban design standards that would create a more vibrant, pedestrian-friendly environment and ensure compatibility between existing and new development by addressing scale, orientation, and building design. The urban design standards include requirements for active uses on the ground floors, transparency on building frontages, pedestrian-scaled building massing, and paseos through large blocks, which encourage pedestrian activity, linking new uses with the surrounding neighborhood and the transit stations. Urban design standards would also address adjacencies of new more intense uses to existing lower density residential uses (R1 and R2) through transitional height requirements, requiring buildings to step down in height towards these uses.

Streetscape Plans. The Proposed Project includes streetscape plans for eight street segments, which would create a safer, more comfortable and attractive pedestrian experience through wider sidewalks, new street trees and landscaping, pedestrian crossings, street furniture, and other amenities. This can encourage pedestrian activity that improves connectivity between new uses and the surrounding neighborhood and transit stations, and in some instances, reconnects neighborhoods that are currently separated by freeways and wide streets that are inhospitable to pedestrians.

NON-CHANGE AREAS

The Proposed Project would not include land use changes that would disrupt or substantially change land use patterns outside the identified change areas. Existing zoning and community plan land use designations in the affected portions of the West Los Angeles, Palms-Mar Vista-Del Rey and West Adams-Baldwin Hills-Leimert Community Plan areas in the non-change areas would remain unchanged. Each of these plans contains policies that are intended to safeguard against new development that would result in physical incompatibility or negative impacts on adjacent uses. The plans also contain policies encouraging an enhanced transportation network that connects communities via a variety of modes. As a result, no physical divisions or barriers to communities and neighborhoods are anticipated in the non-change areas within the Project Area. Additionally, the Urban Design Standards and Streetscape Plans, discussed above for the change areas, would also be applicable to the non-change areas. The Urban Design Standards would ensure that new development in the non-change areas is appropriately oriented to the street and allows for safe and convenient pedestrian activity through the neighborhoods. The Streetscape Plans would also help link residential and commercial areas in the non-change areas with the transit stations and other nearby nodes. These aspects of the Proposed Project would serve to unify these areas with the entire Project Area.

CONCLUSION

The types of land uses proposed by the ECTNP would be compatible in character with the surrounding community. In addition, the ECTNP contains, as project features, unifying urban design standards, streetscape plans, and public benefits as discussed above. Therefore, the Proposed Project would have a less than significant impact on land use compatibility. Furthermore, the Proposed Project would not disrupt, divide, or isolate any existing neighborhoods or communities as it generally allows similar uses as those that currently exist although with a greater mix of uses and building intensity than currently exists. The result would be a vibrant neighborhood that focuses intensity around transit stations and provides services and amenities that support new and existing residential areas. The Proposed Project would not include new major infrastructure or roadways and, therefore, would not physically divide an existing established community or isolate an existing land use. Therefore, implementation of the Proposed Project would result in a less than significant impact related to land use compatibility and division of an established community.

ALTERNATIVE COMPLIANCE SCENARIO

As described in Chapter 3.0, Project Description, this EIR also analyzes an Alternative Compliance scenario, which allows specific parcels to have a greater amount of housing than allowed by the zoning, while simultaneously reducing the amount of non-residential square footage, maintaining the same anticipated overall levels of growth. This provision would provide development flexibility over the life of the ECTNP, while maintaining the intent and regulatory requirements of the Proposed Project. Parcels eligible for the Alternative Compliance procedure are shown in Figures 3-3a and 3b in Chapter 3.0, Project Description and are located in the Bundy, Sepulveda, and Culver City Station Areas only.

Under the Alternative Compliance scenario, the land uses reasonably anticipated within the change areas would include more residential space and less non-residential space. As with the Proposed Project, the Alternative Compliance scenario would not introduce new land uses that do not already exist in the area or would be incompatible with existing uses or result in any division of neighborhoods. Proposed land uses would continue to be generally similar to uses under the Proposed Project and subject to the same urban design standards. The process would not result in incompatibility with surrounding uses as it would allow similar uses to those that already exist and are proposed by the ECTNP. Applicants that utilize the Alternative Compliance scenario process would also be required to provide increased public benefits, which can further contribute to compatibility of new residential land uses in an area where residential uses have historically not existed. Similar to the Proposed Project, the Alternative Compliance scenario would not include any extensions of roadways or other development features through currently developed areas that could physically divide or isolate existing neighborhoods or an established community. Therefore, similar to the Proposed Project,

implementation of the Proposed Project with the Alternative Compliance scenario would result in less than significant impacts related to land use compatibility and division of an established community.

MITIGATION MEASURES

Impacts related to land use compatibility and division of an established community would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to land use compatibility and division of an established community were determined to be less than significant under the Proposed Project without mitigation.

IMPACT 4.8-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT BE CONSISTENT WITH APPLICABLE ADOPTED REGIONAL, STATE AND LOCAL GOALS, POLICIES AND REGULATIONS AND THEREFORE, WOULD NOT CONFLICT WITH APPLICABLE LAND USE PLAN, POLICY, OR REGULATION OF AN AGENCY WITH JURISDICTION OVER THE PROJECT (INCLUDING, BUT NOT LIMITED TO, THE GENERAL PLAN, SPECIFIC PLAN, LOCAL COASTAL PROGRAM, OR ZONING ORDINANCE) ADOPTED FOR THE PURPOSE OF AVOIDING OR MITIGATING AN ENVIRONMENTAL EFFECT? THIS IS A LESS THAN SIGNIFICANT IMPACT.

REGIONAL AND STATE PLANS AND POLICIES

The Proposed Project is consistent with applicable regional and state plans and policies, which encourage compact, walkable patterns of development proximate to transit stations to reduce auto dependence and greenhouse gas emissions.

As described in the Regulatory Framework above, applicable regional and state plans and policies include SB 375, SB 743, the Complete Streets Act and Directive, the Great Streets Initiative and the 2012-2035 RTP/SCS as well as community plans in the area.

The Proposed Project would be consistent with SB 375's goals to reduce GHG emissions through coordinated transportation and land use planning. The Proposed Project was specifically developed to respond to SB 375; it is a land use plan coordinated with transportation infrastructure. The Proposed Project also specifically responds to SB 743 as it focuses development in a transit priority area around transit stations. See Sections 4.2, Air Quality and 4.12, Transportation and Traffic for further analysis of anticipated changes in emissions and transportation as a result of the ECTNP.

The Proposed Project would be consistent with the goals of the Complete Streets Act and Directive and the Great Streets Initiative by accommodating the needs of bicyclists and pedestrians and expanding and enhancing sidewalks and streetscapes through the proposed streetscape plans. Additionally, the Proposed Project would be consistent with applicable goals of the 2012-2035 RTP/SCS as shown in **Table 4.8-11**, below. Specifically, the Proposed Project would locate mixed uses, including goods and services for existing and new residents, and new jobs and housing adjacent to transit. The Proposed Project would also improve streetscapes in the vicinity of transit stations. The Proposed Project would thereby facilitate and encourage the use of transit and non-motorized transportation including bicycling and walking.

Through increased use of transit and active transportation, the Proposed Project would reduce vehicle miles traveled (VMT) per capita by 0.8 percent (see Section 4.12, Transportation and Traffic) and protect the environment and health of residents by improving air quality and encouraging an active healthier lifestyle.

TABLE 4.8-11 CONSISTENCY WITH 2012-2035 RTP/SCS GOALS

Goal	Goal Description	Analysis
1	Align the plan investments and polices with improving regional economic development and competitiveness.	**Consistent**. The Proposed Project's land uses would result in development that is consistent with market study's projection for demand for jobs, so that proposed uses are aligned with demand in the area. The Proposed Project would encourage job-generating uses and allow increased intensity and a broader mix of uses that would maximize use of the Expo LRT Corridor.
2	Maximize mobility and accessibility for all people and goods in the region.	**Consistent**. The Proposed Project specifies types of land uses, densities, intensities and design standards with the goal of encouraging transit ridership and walking. Proposed streetscape plans would facilitate pedestrian access to stations. Specifically, the new streetscape plans would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Streetscape improvements could include wider sidewalks and the installation of bike lanes.
3	Ensure travel safety and reliability for all people and goods in the region.	**Consistent**. The Proposed Project would establish urban design standards for industrial, multi-family, commercial and mixed uses within the transit corridor in order to maintain a safe and comfortable pedestrian environment.
4	Preserve and ensure a sustainable regional transportation system.	**Consistent**. See analysis of Goals 1, 2, and 3.
5	Maximize the productivity of our transportation system.	**Consistent**. See analysis of Goals 1, 2, and 3.
6	Protect the environment and health for our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking).	**Consistent**. The Proposed Project encourages mixed use infill development along transit corridors, which would allow residents to access goods and services in their immediate vicinity using active transportation. It would improve streetscapes in the vicinity of stations to facilitate and encourage active transportation. In addition, by locating new development in proximity to transit, it would encourage transit ridership among residents and commuters in the area, thereby reducing VMT per capita, improving air quality, and encouraging a more active lifestyle.
7	Actively encourage and create incentives for energy efficiency, where possible.	**Consistent**. See analysis of Goal 6. The Proposed Project would encourage transit use and reduce VMT per capita and, therefore, greenhouse gas emissions per capita by encouraging infill development along transit corridors and reducing automobile dependence. Additionally, as redevelopment occurs, the Proposed Project would encourage replacement of older buildings with new buildings that would comply with current building codes and best management practices, which are more energy efficient.
8	Encourage land use and growth patterns that facilitate transit and non-motorized transportation.	**Consistent**. The Proposed Project would modify zoning around light rail transit to encourage infill development that would provide increased job and housing opportunities in proximity to each other and transit. The Proposed Project would improve the configuration and condition of the public rights-of-way to better promote pedestrian, bicycle, and vehicular circulation. The Proposed Project would also involve new streetscape plans that enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options.
9	Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.	**Consistent**. The Proposed Project is a plan document; it does not address specific safety measures around Expo LRT facilities. However, as individual projects are proposed, they would be required to consult with the California Public Utilities Commission to ensure safe operation of the Expo LRT Line.

SOURCE: SCAG, 2012-2035 RTP/SCS, Table 1.1; TAHA 2017.

LOCAL PLANS AND POLICIES

The ECTNP addresses the creation of new housing and employment options in accordance with General Plan Framework guiding policy to focus growth in higher-intensity commercial centers close to transportation and services. Many of the community's neighborhoods, including single-family neighborhoods, are established and not expected to change significantly as growth in other parts of the community occurs. The Proposed Project would generally preserve the character of existing single-family and lower-density neighborhoods by maintaining lower-density land use designations. The Proposed Project generally seeks to direct growth away from these existing residential neighborhoods and towards corridors near commercial centers and industrial areas. Therefore, the Proposed Project would be consistent with the City of Los Angeles General Plan Framework, and consistency with applicable plans would be considered a less than significant impact.

As shown in **Table 4.8-12**, the Proposed Project would also be generally consistent with goals and objectives of the relevant City of Los Angeles community plans, which focus on maintaining a safe, secure and quality environment through preserving existing neighborhoods, maintaining industrial use, meeting diverse economic needs, improving commercial areas, increasing transit and bicycle use, improving the pedestrian experience, and improving recreational opportunities. As discussed above, the Proposed Project would direct commercial, industrial, and residential growth near transit; encourage the use of alternative transportation; and improve the pedestrian experience through the public benefits, streetscape plans, and locating development near transit. The Proposed Project would also encourage recreational opportunities by rezoning an area to open space and requiring individual projects to provide publicly accessible open space as a public benefit in exchange for additional development rights.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
WEST LOS ANGELES COMMUNITY PLAN (1999)		
Goal 1	A safe, secure, and quality residential environment for all economic, age, and ethnic segments of the community.	**Consistent**. The Proposed Project would create opportunities for the development of new housing that meets the diverse needs and income levels of City residents. Additionally, the Proposed Project aims to conserve stable single-family residential neighborhoods. Furthermore, the Proposed Project aims to maintain existing multifamily residential stock (much of which is rent-stabilized) and provide opportunities for new multi-family housing in select areas, which will expand upon and diversify the existing housing stock, while making walking and bicycling a safe and viable means of circulating through neighborhoods. The Proposed Plan also allows for the construction of live/work units, which add to the diversity of the housing stock in the area. Under the Proposed Project, the provision of affordable housing is encouraged by being required in exchange for floor area bonuses within a new development.
Objective 1-1	To provide for the preservation of existing housing and for the development of new housing to meet the diverse economic and physical needs of the existing residents and projected population of the Plan area to the year 2010.	**Consistent**. See Response to Goal 1. Additionally, the Proposed Project would allow a mix of commercial, industrial and limited residential uses within the Hybrid Industrial zones and the Mixed Use: Commercial/Residential zone. These zones facilitate residential uses near employment and commercial corridors. See Section 4.10, Population, Housing, and Employment for a more detailed discussion of how the project would help the City meet SCAG's 2035 population and housing projections.
Objective 1-2	To reduce vehicular trips and congestion by developing new housing in proximity to adequate services and facilities.	**Consistent**. The Proposed Project would encourage new multi-family residential and mixed use development adjacent to transit stations with the goal of promoting transit ridership and creating an active, mixed use, pedestrian-friendly environment in the station areas. Specifically, the Proposed Project would rezone land around transit stations and establish urban design standards in order to promote more intense, compact development – including housing, jobs, and retail and services – while maintaining a safe and comfortable pedestrian environment and buffering between uses. As discussed in Section 4.12, Transportation and Traffic, under Impact 4.12-2, subheading "2015 and 2035 with Project," as a result of increased density with the Project as compared to without the Project, congestion in West Los Angeles would increase. However, peak period VMT per capita is anticipated to be 0.8 percent lower under Future MP 2035 with Project conditions than under Future MP 2035 No Project conditions. The model used to demonstrate this reduction in VMT per capita does not fully account for anticipated changes in travel behavior in the future, and therefore these conclusions are conservative.
Objective 1-4	To promote adequate and affordable housing and increase its accessibility to more segments of the population, especially students and senior citizens.	**Consistent**. See Response to Goal 1 above. Additionally, the Proposed Project requires that affordable housing be provided as a public benefit by projects that take advantage of higher floor area ratios permitted by the new zoning.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Goal 2	A strong and competitive commercial sector which promotes economic vitality, serves the needs of the community through well-designed safe and accessible areas while preserving historic and cultural character.	**Consistent**. The proposed General Plan amendments and zone changes would help to maintain and enhance job growth in commercial and industrial zones near transit stations. Additionally, the Proposed Project would initiate land use and zoning changes of industrially zoned land in proximity to stations to encourage jobs and allow increased intensity and/or a wider mix of uses. The Proposed Project would also include urban design standards for industrial, commercial, and multifamily residential development, which should improve the design of buildings and their orientation to the street. Proposed streetscape plans should lead to improvements in the public realm. The Proposed Project would adhere to applicable City of Los Angeles requirements and guidelines pertaining to historic and cultural buildings. See Section 4.3, Cultural Resources for further discussion of historic resources.
Objective 2-1	To conserve and strengthen viable commercial development and to provide additional opportunities for new commercial development and services within existing commercial areas.	**Consistent**. See Response to Goal 2. The New Industry and Hybrid Industrial: Jobs Emphasis zones created by the Proposed Project require job-generating uses, with an emphasis on the high-tech, information, and creative industries, allowing opportunities for job growth in sectors currently found in the area. The new zones also allow for retail and services to support employment uses as well as surrounding residential.
Objective 2-2	To promote distinctive commercial districts and pedestrian-oriented areas.	**Consistent**. See Response to Goal 2 regarding the promotion of commercial districts. The Proposed Project would create Urban Design Standards to ensure development in commercial districts is pedestrian-oriented and visually interesting. Additionally, the Proposed Project would include streetscape improvements aimed at improving pedestrian and bicycle circulation. This would help achieve the Proposed Project's objective of improving the pedestrian and bike environment within and between neighborhoods and to transit.
Objective 2-3	To enhance the appearance of commercial districts.	**Consistent**. See Responses to Goal 2, Objectives 2-1 and 2-2.
Goal 3	Sufficient land for a variety of industrial uses with employment opportunities that are safe for the environment and the workers, and which have minimal adverse impact on adjacent uses.	**Consistent**. The Proposed Project would initiate land use and zoning changes of industrially zoned land in proximity to transit stations to encourage job growth and allow increased intensity and/or a wider mix of uses, as appropriate. The new zoning of industrial land is intended to maintain areas suitable for employment uses in high-tech and clean-tech industries while allowing for a mix of other compatible uses.
Objective 3-1	To retain existing industrial uses and promote future development which contributes to job opportunities and minimizes environmental impacts.	**Consistent**. See Response to Goal 3.
Objective 3-2	To improve the aesthetic quality and design of industrial areas, eliminate blight and detrimental visual impact and mitigate negative impacts generated by industrial uses on nearby residential neighborhoods.	**Consistent**. See Response to Goal 3. Additionally, the Proposed Project's Urban Design Standards would apply to industrial areas to ensure quality design and minimize visual impact of new development.
Objective 3-3	To provide locations for future industrial development and employment which are convenient to transportation facilities and compatible with surrounding land use.	**Consistent**. See Response to Goal 3. The Proposed Project would maintain currently industrially zoned land near the Expo LRT stations for job-generating uses, while also allowing a mix of uses that are compatible with surrounding residential and commercial land uses.
Goal 4	Adequate recreation and park facilities which meet the needs of the residents in the community.	**Consistent**. The Proposed Project would include new open space near the Westwood Station. In addition, some individual projects requesting increased FARs would provide open space as a part of the public benefits requirement.
Objective 4-1	To conserve, maintain and better utilize existing recreation and park facilities which promote the recreational needs of the community.	**Consistent**. The Proposed Project would not remove or rezone existing recreational or open space areas.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Goal 5	Sufficient open space in balance with new development to serve the recreational, environmental, health and safety needs of the community and to protect environmental and aesthetic resources.	**Partially Consistent**. As discussed in Section 4.11, Public Services, due to the existing park and open space deficit and limited availability of land that could be used for parks and open space purposes, the population growth associated with the proposed increase in housing capacity would create additional demand for parklands that cannot be accommodated in the Project Area. To help address this deficit in open space, the Proposed Project would require the provision of open space for non-residential uses in addition to open space already required for all new residential development per LAMC Section 12.21 G. This would ensure that new mixed use and commercial development would include open space for employees, as well as residents and other users. The Proposed Project would also require the provision of public benefits by projects utilizing a floor area ratio (FAR) bonus. These public benefits include publicly accessible open space, which would be provided in addition to other required on-site open space and would be open and accessible to the general public. Finally, residential development within the Project Area would be required to dedicate land for recreation or park purposes or pay an in-lieu (Quimby) fee pursuant to LAMC Section 12.17 to ensure the provision of open space in balance with new development.
Objective 5-1	To preserve existing open space resources and where possible develop new open space.	**Consistent**. The Proposed Project would not remove or rezone existing recreational or open space areas. See Response to Goals 4 and 5, above.
Objective 10-2	To increase the work trips and non-work trips made on public transit.	**Consistent**. The Proposed Project would retain existing industrial land around the Expo LRT stations to ensure that there is capacity for future jobs to be located proximate to transit.
Goal 11	Encourage alternative modes of transportation over the use of single occupant vehicles (SOV) to reduce vehicular trips.	**Consistent**. The Proposed Project aims to reduce automobile dependence and encourage the use of alternative modes of transportation, including transit, walking, and bicycling by implementing the following: • The Proposed Project would incorporate a mix of land uses, including housing, jobs, and neighborhood-serving retail, and focus higher intensity development around transit stations, thus encouraging transit use and walking between destinations. • The Proposed Project would require new development to implement transit demand management (TDM) strategies, such as unbundled parking and transit pass subsidies, which aim to reduce vehicle trips and encourage transit use. Larger commercial projects would further be required to implement a more robust TDM program and demonstrate a quantifiable reduction in vehicle trips to and from the project site. • The Proposed Project also would require some new development projects to provide public benefits in the form of streetscape improvements, freeway underpass improvements, mobility hubs, and transit and bicycle amenities, which can encourage residents, employees, and visitors to use non-auto modes of travel by making it more convenient, safe, and attractive. • Finally, the Proposed Project would include streetscape plans that would ensure wider, more pedestrian-friendly sidewalks leading to transit stations, as well as on-street bicycle facilities in designated locations.
Objective 11-1	To pursue transportation management strategies that can maximize vehicle occupancy, minimize average trip length and reduce the number of vehicle trips.	**Consistent**. See Response to Goal 11.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Goal 12	A system of safe, efficient and attractive bicycle and pedestrian routes.	**Consistent**. Primary objectives of the Proposed Project include improving the pedestrian and bicycle environment within and between neighborhoods, commercial centers, and to transit, and improving multi-modal circulation modes on major streets. Proposed streetscape improvements aim to improve pedestrian circulation in segments of the Project Area through features such as wider sidewalks, crosswalks, raised landscaped medians, sidewalk paving, curb extensions, a coordinated street tree palette, and coordinated street furniture and street lighting. Mobility amenities provided by private developments as public benefits, such as bicycle share stations and mobility hubs, would help complete the bicycle network by providing first/last mile solutions.
Objective 12-1	To promote an adequate system of bikeways for commuter, school and recreational use.	**Consistent**. See Response to Goal 12.
Objective 12-2	To promote pedestrian - oriented mobility for commuter, school, recreational use, economic activity and access to transit facilities.	**Consistent**. See Response to Goal 12.
Goal 13	A sufficient supply of well-designed and convenient on-street parking and off-street parking facilities throughout the plan area.	**Consistent**. The Proposed Project would require new development to provide sufficient off-street parking in compliance with minimum parking requirements in LAMC Section 12.21 A 4. Select properties containing neighborhood-serving uses within mixed use development would be eligible for a reduction in required parking. In addition, parking reductions would be allowed in the form of shared parking between different uses within a project where owners can demonstrate that the reduced parking can sufficiently meet the peak demand of all uses on the site. These targeted voluntary parking reductions would be complemented by the Proposed Project's strategies to locate jobs and housing in a mixed use environment and increase access to transit and other non-auto modes of transportation, which would encourage residents and employees to walk and bike and, thus, require less parking. Required TDM strategies, especially those required of commercial projects, would also help reduce demand for parking. The Proposed Project's Urban Design Standards would ensure that surface parking and parking structures are well-designed and concealed from the street. The Proposed Project's streetscape plans would generally maintain existing on-street parking. In one location, along Bundy Drive north of Olympic Boulevard, the streetscape plan would incorporate new on-street parking. Along Palms Boulevard, the streetscape plan calls for several curb extensions that would result in the loss of approximately five parking spaces between Exposition Boulevard and Motor Avenue. This minor loss of parking would allow for the enhancement of the pedestrian environment, a key goal of the Proposed Project.
Objective 13-1	To provide parking in appropriate locations in accordance with Citywide standards and community needs.	**Consistent**. See Response to Goal 13 above.
Goal 15	A well maintained, safe, efficient freeway, highway and street network.	**Consistent**. The Proposed Project contains streetscape plans that aim to improve the configuration and condition of public rights-of-way to better promote pedestrian, bicycle, and vehicular circulation. The streetscape plans would maintain vehicular travel lanes while also accommodating pedestrians and bicyclists through wider sidewalks and on-street bicycle facilities on select streets. Streetscape improvements proposed for specific segments would also help achieve this by requiring safety measures at intersections, such as crosswalks and curb extensions. See Section 4.12, Transportation and Traffic for further discussion.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Objective 15-2	Ensure that adequate maintenance of the street system is provided to facilitate the movement of the current and future traffic volumes, as well as emergency services.	**Consistent**. See Response to Goal 15. As discussed in Section 4.11 Public Services and Section 4.12, Transportation and Traffic, the Proposed Project would not result in inadequate emergency vehicle access. The proposed streetscape plans do not propose removal of any vehicle travel lanes and, thus, maintain capacity for vehicles and emergency services on those street segments.
Goal 16	A system of highways, freeways and streets that provides a circulation system which supports existing and planned land uses while maintaining a desired level of service at all intersections.	**Partially Consistent**. See Response to Goal 15. As discussed in Section 4.12, Transportation and Traffic, in 2035 with the Proposed Project, 45 intersections would have levels of service (LOS) E or F during peak hours, as opposed to 33 intersections in 2013 and 2015. The Proposed Project requires future development projects to implement Transportation Demand Management (TDM) strategies and physical mitigation measures. These TDM strategies can include providing bicycle amenities, rideshare programs, and transit pass subsidies. Physical mitigation measures include signalizing intersections and restriping. These strategies and measures could reduce traffic impacts at many intersections, but some of the intersections would still have a reduced LOS.
Objective 16-1	To comply with Citywide performance standards for acceptable Levels of Service (LOS) and ensure that necessary road access and street improvements are provided to accommodate traffic generated by new development.	**Partially Consistent**. See Response to Goal 15 and Goal 16.
Goal 17	Preservation and restoration of cultural resources, neighborhoods, and landmarks, which have historical and/or cultural significance.	**Consistent**. The Proposed Project would comply with all applicable City of Los Angeles requirements and guidelines pertaining to historic resources and landmarks. See Section 4.3, Cultural Resources for further discussion of impacts anticipated to occur under the Proposed Project, and requirements for development that involves potentially historic or culturally significant resources.
Objective 17-1	To ensure that the community's historically significant resources are protected, preserved, and/or enhanced.	**Consistent**. See Response to Goal 17 above.
PALMS - MAR VISTA - DEL REY COMMUNITY PLAN (1997)		
Goal 1	A safe, secure and high quality residential environment for all community residents.	**Consistent**. See Response to Goal 1 (West Los Angeles Community Plan).
Objective 1-1	To provide for the preservation of existing housing and for the development of new housing to meet the diverse economic and physical needs of the existing residents and projected population of the Plan area to the year 2010.	**Consistent**. See Response to Objective 1-1 (West Los Angeles Community Plan).
Objective 1-2	To reduce vehicular trips and congestion by developing new housing in proximity to services and facilities.	**Consistent**. See Response to Objective 1-2 (West Los Angeles Community Plan).
Objective 1-4	To promote the adequacy and affordability of multiple-family housing and increase its accessibility to more segments of the population.	**Consistent**. See Response to Objective 1-4 (Wes Los Angeles Community Plan).
Goal 2	A strong and competitive commercial sector, which promotes economic vitality, serves the needs of the community through well-designed, safe and accessible areas while preserving the historic, commercial, and cultural character of the community.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Objective 2-1	To conserve and strengthen viable commercial development in the community and to provide additional opportunities for new commercial development and services within existing commercial areas.	**Consistent**. See Response to Objective 2-1 (West Los Angeles Community Plan).

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Objective 2-2	To promote distinctive commercial districts and pedestrian-oriented areas.	**Consistent**. See Response to Objective 2-2 (West Los Angeles Community Plan).
Objective 2-3	To enhance the appearance of commercial districts.	**Consistent**. See Response to Objective 2-3 (West Los Angeles Community Plan).
Goal 3	Sufficient land for a variety of industrial uses with maximum employment opportunities which are environmentally sensitive, safe for the work force with minimal adverse impact on adjacent uses.	**Consistent**. See Response to Goal 3 (West Los Angeles Community Plan).
Objective 3-1	To provide a viable industrial base with job opportunities for residents with minimal environmental and visual impacts to the community.	**Consistent**. See Response to Goal 3 (West Los Angeles Community Plan).
Goal 4	Adequate recreation and park facilities which meet the needs of the residents in the plan area.	**Consistent**. Some individual projects requesting increased FARs would provide open space as a part of the Public Benefits requirement.
Objective 4-1	To conserve, maintain and better utilize existing recreation and park facilities which promote the recreational needs of the community.	**Consistent**. The Proposed Project would not remove or rezone existing recreational or open space areas.
Goal 5	Sufficient open space in balance with new development to serve the recreational, environmental, health and safety needs of the community and to protect environmental and aesthetic resources.	**Partially Consistent**. See above discussion of Goal 5 West Los Angeles Community Plan.
Objective 5-1	To preserve existing open space resources and where possible develop new open space.	**Consistent**. The Proposed Project would not remove or rezone existing recreational or open space areas. See Response to Goal 4, above.
Objective 10-2	To increase the work trips and non-work trips made on public transit.	**Consistent**. See Response to Objective 10-2 (West Los Angeles Community Plan).
Goal 11	Encourage alternative modes of transportation over the use of single occupant vehicles (SOV) in order to reduce vehicular trips.	**Consistent**. See Response to Goal 11 (West Los Angeles Community Plan).
Objective 11-1	To pursue transportation management strategies that can maximize vehicle occupancy, minimize average trip length and reduce the number of vehicle trips.	**Consistent**. See Response to Goal 11 (West Los Angeles Community Plan).
Goal 12	A system of safe, efficient, and attractive bicycle and pedestrian routes.	**Consistent**. See Response to Goal 12 (West Los Angeles Community Plan).
Objective 12-1	To promote an adequate system of bikeways for commuter, school and recreational use.	**Consistent**. See Response to Goal 12 (West Los Angeles Community Plan).
Objective 12-2	To promote pedestrian oriented mobility and utilization of the bicycle for commuter, school, recreational use, economic activity and access to transit facilities.	**Consistent**. See Response to Goal 11(West Los Angeles Community Plan).
Goal 13	A sufficient system of well-designed and convenient on-street parking and off-street parking facilities throughout the plan area.	**Consistent**. See Response to Goal 13 (West Los Angeles Community Plan).
Objective 13-1	To provide parking in appropriate locations in accordance with Citywide standards and community needs.	**Consistent**. See Response to Goal 13 (West Los Angeles Community Plan.)
Goal 15	A well maintained safe, efficient freeway, highway and street network.	**Consistent**. See Response to Goal 15 (West Los Angeles Community Plan).
Goal 16	A system of highways, freeways and streets that provide a circulation system which supports existing and planned land uses while maintaining a desired level of service at all intersections.	**Partially Consistent**. See Response to Goal 15 and Goal 16 (West Los Angeles Community Plan).

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Objective 16-1	To comply with Citywide performance standards for acceptable levels of service (LOS) and ensure that necessary road access and street improvements are provided to accommodate traffic generated by all new development.	**Partially Consistent**. See Response to Goal 15 and Goal 16 (West Los Angeles Community Plan).
Objective 16-2	To ensure that the location, intensity and timing of development is consistent with the provision of adequate transportation infrastructure.	**Partially Consistent**. The Proposed Project would guide future development by specifying the type of uses, densities, intensities, and design standards and guidelines that would be permitted. The Proposed Project would encourage new development at transit station areas with the goal of promoting transit ridership and creating an active, mixed use environment in the station areas. Nonetheless, as discussed in Section 4.12, Transportation and Traffic, as a result of the Proposed Project, congestion in the Palms-Mar Vista-Del Rey community would increase as a result of increased development. However, per capita VMT would be less under the Proposed Project than the No Project condition. Using a conservative model that does not fully account for anticipated changes in travel behavior, peak period VMT per capita would be 0.8 percent lower under Future MP 2035 with Project conditions than under Future MP 2035 No Project conditions. It is anticipated that over time, transportation patterns would shift such that a greater number of people would use transit and active transportation modes, and, thus, traffic impacts may not be as great as identified in the conservative traffic analysis presented in this EIR.
Goal 17	Preservation and restoration of cultural resources neighborhoods and landmarks, which have historical and/or cultural significance.	**Consistent**. See Response to Goal 17 (West Los Angeles Community Plan).
Objective 17-1	To ensure that the Community's historically significant resources are protected, preserved, and/or enhanced.	**Consistent**. See Response to Goal 17 (West Los Angeles Community Plan).
WEST ADAMS - BALDWIN HILLS - LEIMERT COMMUNITY PLAN (2016)		
Multi-Family Residential		
Goal LU7	A community that promotes an environment of safe, inviting, secure and high-quality multi-family neighborhoods for all segments of the community.	**Consistent**. See Response to Goal 1 (West Los Angeles Community Plan).
Policy LU7-1	*Address Diverse Resident Needs.* Strive for the conservation/ preservation of existing assisted affordable and non-assisted housing stock and in particular rent-stabilized units, and for the development of new housing, including restricted affordable housing, to address the diverse economic and physical needs of the existing residents and projected population of the Community Plan Area to the year 2030.	**Consistent**. See Response to Goal 1 and Objective 1-4 (West Los Angeles Community Plan).
Goal LU8	A community that preserves, conserves and enhances the varied and distinct residential character, scale and integrity of existing multi-family neighborhoods.	**Consistent**. The Proposed Project includes Urban Design Standards and Guidelines which are intended to create livable neighborhoods with an emphasis on walkability and the making of great streets and neighborhoods. Urban Design Standards are applicable to multifamily, mixed Use, commercial, and industrial development. The focus of the Urban Design Standards and Guidelines is on the relationship of buildings to the street and the public realm to create high quality public spaces and a walkable environment. The Urban Design Standards and Guidelines include requirements for the following: Building Form, Building Orientation, Architectural Treatment, Open Space Design, Vehicle Access and Parking, and Signs.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Policy LU8-3	*Analyze Impacts.* Consider factors such as neighborhood character and identity, compatibility of land uses, impact on livability, impacts on services and public facilities, and impacts on traffic levels when changes in multi-family residential densities are proposed.	**Consistent**. Per CEQA a DEIR has been prepared to analyze proposed changes to multifamily residential areas. Discussion of impacts to aesthetics, land use, public services, and transportation can be found in Sections 4.1, 4.8, 4.11, and 4.12 respectively.
Goal LU9	A community of neighborhoods where social capital is promoted by ensuring the provision of adequate housing for all persons regardless of income, age, racial or ethnic background.	**Consistent**. See Response to Goal 1 (West Los Angeles Community Plan).
Policy LU9-2	*Mixed-income Neighborhoods.* Strive to eliminate residential segregation and concentrations of poverty by promoting affordable housing that is integrated into mixed-income neighborhoods.	**Consistent**. See Response to Goal 1 and Objective 1-4 (West Los Angeles Community Plan).
Goal LU10	A community that supports cohesive neighborhoods and lifecycle housing to promote health, well-being and safety.	**Consistent**. See Response to Goal 1 and Objective 1-4 (West Los Angeles Community Plan).
Policy LU10-1	*Neighborhood Continuity.* Promote neighborhood continuity by targeting new affordable, market-rate and workforce housing for existing residents and tailoring development standards to established neighborhood character.	**Consistent**. See Response to Goal LU8 (West Adams – Baldwin Hills – Leimert Community Plan) Response to Goal 1 and Objective 1-4 (West Los Angeles Community Plan).
Policy LU10-2	*Complete Streets.* Support healthy aging in place and childhood development by promoting safe, "complete" streets with multiple housing types within neighborhoods.	**Consistent**. See Response to Goal 1, Objective 1-4, Goal 11, and Goal 15 (West Los Angeles Community Plan).
Goal LU11	A community where new housing is located in a manner which reduces vehicular trips and makes it accessible to services and facilities.	**Consistent.** See Response Objective 1-2 and Goal 11 (West Los Angeles Community Plan).
Policy LU11-1	*Higher Density Residential Near Transit.* Encourage higher residential densities near commercial centers, light rail transit stations and major bus routes where public service facilities, utilities and topography will accommodate this development.	**Consistent**. See Response to Objective 1-2 (West Los Angeles Community Plan).
Policy LU11-3	*Pedestrian Linkages.* Allow for the provision of pedestrian linkages and amenities to connect to commercial centers, light rail transit stations, and Major Bus Centers.	**Consistent**. See Response to Goal 12 (West Los Angeles Community Plan).
Commercial Areas		
Goal LU14	A community that conserves, enhances and regenerates its distinctive "main street" character by promoting continued pedestrian orientation of commercial areas.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Policy 14-1	*Pedestrian Orientation.* Foster preservation, conservation, maintenance and enhancement of existing pedestrian orientation along commercial and mixed use boulevards.	**Consistent**. See Response to Objective 2-2 and Goal 12 (West Los Angeles Community Plan).
Policy LU14-2	*Activate First Floor Frontages.* Encourage the first floor street frontage of buildings, including parking structures, to incorporate commercial or other active public uses.	**Consistent**. The Proposed Project has Urban Design Standards and Guidelines that require new commercial, industrial, and multifamily residential development to orient towards the street and other public space and include active ground floor uses that help define and activate the street and create visual interest. The design standards also ensure that parking structures contain commercial or other active uses on the ground floor.
Goal LU15	A community that prioritizes mixed use projects within community commercial nodes, centers and transit-oriented development areas.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Policy LU15-1	*Prioritize New Infill Development Close to Transit.* Prioritize new infill development that is in close proximity to mass transit centers, stations and platform portals.	**Consistent**. See Response to Objective 1-2 (West Los Angeles Community Plan).
Policy LU15-2	*Parking Reductions Near Transit Stations*. Strive to reduce parking requirements for developments that locate near major bus centers and mass transit stations and that provide pedestrian, bicycle, and exceptional ADA facilities.	**Partially Consistent**. The Proposed Project would require new development to provide off-street parking in compliance with minimum parking requirements in LAMC Section 12.21 A 4. Projects may utilize the Citywide regulation allowing the provision of bicycle parking spaces in-lieu of vehicular parking spaces. Under the Proposed Plan, select properties containing neighborhood-serving uses within mixed use development would be eligible for a reduction in required parking. In addition, parking reductions would be allowed in the form of shared parking between different uses within a project where owners can demonstrate that the reduced parking can sufficiently meet the peak demand of all uses on the site. Finally, the Plan allows for parking spaces reserved for car sharing services to replace five otherwise required spaces, and exempts change of use projects from having provide additional parking. All of these reductions would be complemented by requirements for streetscape improvements and bicycle and pedestrian facilities as well as design standards that ensure pedestrian-oriented design.
Goal LU17	A community that promotes context sensitive projects that reinforce established neighborhood character.	**Consistent**. See Response to Goal 2 and Objective 1-2 (West Los Angeles Community Plan).
Policy LU17-1	*Contextual New Development*. Promote commercial infill projects that achieve harmony with the best of existing pedestrian oriented environments by enhancing desirable neighborhood character and supporting established connectivity.	**Consistent**. See Response to Goal 2 and Objective 2-2 (West Los Angeles Community Plan).
Policy LU17-2	*Transition Height to Residential.* Seek to mitigate the potential negative impact of the height of new commercial development located directly adjacent to residential properties by tailoring transitional height standards to the unique constraints of commercial parcel depth along the corridor.	**Consistent**. The Proposed Project does not preclude existing transitional height requirements in the LAMC, which apply to commercial and industrial zones. The Proposed Plan additionally institutes a tailored transitional height standard that requires upper stories to be stepped back where new zones are adjacent to one- and two-family residential zones. Varied height limits in the Proposed Plan also address adjacency of new zones to residential areas.
Policy LU17-3	*Mitigate Commercial/Residential Mixed use Conflicts.* Request that mixed use projects be designed to mitigate potential conflicts between the commercial and residential uses (e.g., noise, lighting, security, truck and automobile access, etc.) and provide adequate amenities for residential occupants.	**Consistent**. See Response to Goal LU8 (West Adams – Baldwin Hills – Leimert Community Plan).
Policy LU17-4	*Parking Maximums*. Establish parking maximums in addition to parking minimum requirements in order to encourage pedestrian friendly boulevards.	**Partially Consistent**. See Response to Goal 13 (West Los Angeles Community Plan).
Goal LU20	A Community where residents will be able to access their daily needs by walking, biking or using other sustainable modes of transportation.	**Consistent**. See Response to Goal 12 and Objective 1-2 (West Los Angeles Community Plan).
Policy LU20-1	*Streetscapes.* Encourage enhancement of the public realm by facilitating the planting of street trees and installation of street lighting, street furniture, and public art as well as median plantings within commercial area especially where pedestrian character prevails.	**Consistent**. See Response to Goal 12 (West Los Angeles Community Plan).
Policy LU20-4	*Parking Area Safety and Aesthetics.* Strive to improve safety and aesthetics of parking areas in commercial areas.	**Consistent**. See Response to Goal 13 (West Los Angeles Community Plan).

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Goal LU24	A community that facilitates increasing and improving the economic activity of existing commercial areas through revitalization of the physical environment.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Policy LU24-1	*Promote Commercial Activity.* Promote the reemergence of commercial areas by establishing development standards that distinctively cater to commercial activity especially at the ground floor.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan) and Objective 14-2 (West Adams – Baldwin Hills – Leimert Community Plan).
Goal LU28	A Community where residents will be able to access their daily needs by walking, biking or using other sustainable modes of transportation.	**Consistent**. See Response to Goal 12 and Objective 1-2 (West Los Angeles Community Plan).
Policy LU28-1	*Density/Intensity Minimums*. Adopt sufficient density minimums in addition to density maximums for residential, commercial, and retail development to ensure development that supports transit and walkable environments, as well as reinforces traditional neighborhood development patterns.	**Partially Consistent**. The Proposed Project does not require density minimums; instead the Proposed Project contains other project features which support transit use, walkable environments, and urban development patterns, including Urban Design Standards and zone changes that allow more compact, mixed use development.
Policy LU28-2	*Jobs/Housing Balance*. Balance commercial and residential development (jobs and housing) within community commercial nodes, centers and transit-oriented development areas to reduce the number of people who must commute long distances to work.	**Consistent**. See Response to Goal 2 and Objective 1-2 (West Los Angeles Community Plan).
Policy LU28-3	*Mix of Uses*. Ensure a mix of residential, commercial, office and light industrial, where appropriate, to encourage economic sustainability and encourage walkability.	**Consistent**. See Response to Goal 2 and Objective 2-1 (West Los Angeles Community Plan).
Goal LU37	A community that conserves, enhances and regenerates its distinctive "main street" character by promoting continued pedestrian orientation along commercial and mixed use boulevards.	**Consistent**. See Response to Objective 2-2 (West Los Angeles Community Plan)
Policy LU37-1	*Pedestrian Activity*. Promote developments that enhance existing pedestrian activity within the public realm.	**Consistent**. See Response to Objective 2-2 (West Los Angeles Community Plan).
Policy LU37-2	*Off-street Parking at the Rear.* Recommend that new developments along commercial corridors locate required parking at the rear of the property or facilitate the creation of nearby shared satellite parking facilities in order to strengthen the pedestrian experience by continuing to orient buildings toward the sidewalk thereby enhancing the public realm.	**Consistent**. The Proposed Project's Urban Design Standards require parking to be located at the rear of a property, underground, or otherwise be concealed from the street. Other provisions of the Urban Design Standards also ensure pedestrian-friendly street frontage through requirements for access, transparency, and active uses on the ground floor
Goal LU38	A community that promotes context sensitive projects, including mixed use projects along commercial corridors.	**Consistent**. The Proposed Project would encourage new multi-family residential and mixed use development along commercial corridors and adjacent to transit stations with the goal of promoting transit ridership and creating an active, mixed use, pedestrian-friendly environment in the station areas. Specifically, the Proposed Project would rezone land around transit stations and establish urban design standards in order to promote more intense, compact development – including housing, jobs, and retail and services – while maintaining a safe and comfortable pedestrian environment and buffering between uses. The Proposed Project includes Urban Design Standards and Guidelines that require new commercial, industrial, and multifamily residential development to orient towards the street and other public space and include active ground floor uses that help define and activate the street and create visual interest. Height limits and transitional height requirements in the Proposed Plan also address adjacent of new development to lower density residential areas.

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Policy LU38-1	Prioritize New Development Close to Transit. Prioritize new infill development at locations well served by or in close proximity to major bus centers and mass transit stations.	**Consistent**. See Response to Objective 1-2 (West Los Angeles Community Plan).
Policy LU38-2	Activate First Floor Frontages. Require that the first floor street frontage of structures, including mixed use projects and parking structures, located along commercial corridors incorporate retail or other active public uses.	**Consistent**. See Response to Objective 14-2 (West Adams – Baldwin Hills – Leimert Community Plan).
Goal LU40	A community where the economic vitality of commercial nodes, centers and transit-oriented development areas is increased by encouraging contextual new development that maximizes access to transit, jobs, goods and services, and conserves desirable community character.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Policy LU40-1	*Encourage New Development in Established Commercial Centers*. New commercial uses shall be encouraged to locate in existing, established community commercial nodes, centers and transit-oriented development areas and reuse existing structures that reinforce desirable neighborhood character.	**Consistent**. See Response to Goal 2 and Objective 2-1 (West Los Angeles Community Plan).
Policy LU40-2	*Mix of Uses Compatible with Local Needs*. Encourage a mix of uses in community centers that are compatible with the needs of local residents and accommodate viable existing neighborhood businesses.	**Consistent**. See Response to Goal 2 and Objective 1-2 (West Los Angeles Community Plan).
Goal LU43	A community that promotes economic revitalization within community commercial nodes, centers and transit-oriented development areas by ensuring enhanced pedestrian orientation.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Policy LU43-1	*Structured Off-street Parking.* Recommend that new developments within community commercial nodes, centers and transit-oriented development areas locate required parking within structures, underground or internal to the property.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan) and Objective 37-2 (West Adams – Baldwin Hills – Leimert Community Plan).
Goal LU44	A community that prioritizes mixed use projects within community commercial nodes, centers and transit-oriented development areas.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Policy LU44-1	*Transit Served Business Districts.* Support business districts outside of city centers that are well served by mass transit facilities.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan).
Policy LU44-2	*Prioritize Mixed use at Community Centers*. Identify pedestrian-oriented community commercial nodes, centers and transit-oriented development areas as preferred locations for mixed use projects.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan)
Policy LU44-3	*Prioritize New Development Close to Transit.* Prioritize new infill development that is in close proximity to mass transit centers, stations and platform portals.	**Consistent**. See Response to Goal 12 (West Los Angeles Community Plan).
Policy LU44-4	*Commercial Uses Along Ground Floor Frontages.* Encourage the location of commercial uses along the first floor street frontage of structures, including mixed use projects and parking structures located within community commercial nodes, centers and transit-oriented development areas.	**Consistent**. See Response to Objective 14-2 (West Adams – Baldwin Hills – Leimert Community Plan).

TABLE 4.8-12: CONSISTENCY WITH APPLICABLE CITY OF LOS ANGELES COMMUNITY PLAN GOALS AND OBJECTIVES

Goal/Objective	Goal/Objective Description	Analysis
Goal LU45	A community that enhances the appearance and safety of community commercial nodes, centers and transit-oriented development areas.	**Consistent**. See Response to Objective 2-2 (West Los Angeles Community Plan).
Policy LU45-1	*Parking Area Safety and Aesthetics*. Improve safety and aesthetics of parking areas in community commercial nodes, centers and transit-oriented development areas.	**Consistent**. See Response to Goal 2 (West Los Angeles Community Plan) and Objective 37-2 (West Adams – Baldwin Hills – Leimert Community Plan).
Goal LU65	A community where existing and future industrial uses which contribute job opportunities for residents are provided and which minimize environmental and visual impacts to the community.	**Consistent**. See Response to Goal 3 and Objective 3-2 and Objective 3-3 (West Los Angeles Community Plan).
Goal LU66	A community plan which retains industrial designations that are appropriate in order to maintain and increase the industrial employment for community residents.	**Consistent**. See Response to Goal 3 (West Los Angeles Community Plan).

SOURCE: Metro, CMP, 2010; SCAG, 2012-2035 RTP/SCS, 2012; SCAG, Growth Vision Report, 2004; SCAG, RCP, 2008; *Palms - Mar Vista - Del Rey Community Plan, 1997; West Los Angeles Community Plan, 1999; West Adams - Baldwin Hills - Leimert Community Plan, 2016.*

Although the Proposed Project would result in the repositioning of light industrial zones to proposed Hybrid Industrial zones, which would allow light manufacturing uses, office, and retail, as well as residential uses in limited areas, this change in zoning in and of itself would not result in inconsistencies with land use plans and policies. The changes in land use designations and zones would continue to promote job-generating uses on land planned for jobs and currently zoned as industrial. Therefore, the Proposed Project would not result in the loss of industrial uses as the proposed zone would allow for light industrial uses. Further, introducing residential uses in industrial zones in order to promote a mix of uses would better support transit ridership and activity in the station areas. In addition, the introduction of residential uses to industrial areas would be consistent with previous staff direction in the ILUP for certain areas to contain a mix of industrial and residential uses. The Proposed Project would encourage combining jobs and housing to accommodate anticipated demand for both jobs and housing. Residential use could complement, and co-exist with, newer light industrial uses, such as high tech and clean technology. Therefore, the Proposed Project would not create inconsistencies with land use policies and plans.

The community plan policies that encourage adequate parking are broad community-wide policies that pre-date the construction of light rail transit serving the Project Area. With the introduction of transit, as well as bicycle and pedestrian improvements proposed by the Mobility Plan 2035, Westside Mobility Plan and the ECTNP, there would be increased access to other modes (transit, bicycling, walking), and, thus, the Proposed Project would facilitate reduction in parking demand consistent with current state, regional, and city policies. Nevertheless, the Proposed Project continues to require the minimum amount of off-street parking per current LAMC provisions, with some exceptions for neighborhood-serving uses in select areas. Further, SB 743 indicates that with respect to CEQA documents, "the adequacy of parking shall not support a finding of significance…" Therefore, parking cannot be considered a significant impact.

As described in Section 4.12, Transportation and Traffic, the Proposed Project would include the installation of landscaped bulb-outs on Palms Boulevard between Motor Avenue and National Boulevard, resulting in the removal of approximately five on-street parking spaces. This proposed minimal loss of parking could result in an indirect impact to land uses by reducing the availability of parking for these uses. However, the Proposed Project would balance demand for on-street parking with other transportation and land-use objectives that result in fewer vehicle trips. The Proposed Project would provide greater proximity and access to neighborhood services and provide greater access to a variety of modes of transportation for residents and employees.

Overall, the Proposed Project would be generally consistent with applicable plans and policies related to transportation because of the large number of policies encouraging alternative modes of transportation. The Proposed Project would provide greater proximity and access to neighborhood services and provide greater access to alternative modes for residents, visitors, and employees. In the long run, it is anticipated that a more robust multi-modal network as would occur under the Proposed Project could be increasingly beneficial to the City as mode shift choices continue to evolve (i.e., as more people choose alternative modes to vehicles, greater choice would be provided). Alternative modes (e.g., transit, bicycles, and pedestrian) would have more interconnected networks, potentially accelerating mode shifts to modes other than vehicles.

Since the Proposed Project abuts the cities of Santa Monica and Culver City, **Table 4.8-13** shows consistency with their applicable goals and policies. As shown in this table, the Proposed Project would be consistent with these goals, policies, and objectives.

TABLE 4.8-13: CONSISTENCY WITH APPLICABLE CITY OF SANTA MONICA AND CITY OF CULVER CITY GOALS, POLICY, AND OBJECTIVES

Goal/Policy/Objective	Goal/Policy/Objective Description	Analysis
CITY OF SANTA MONICA		
Goal LU2	Integrate Land Use and Transportation for Greenhouse Gas (GHG) Emission Reduction – Integrate land use and transportation, carefully focusing new development on transit-rich boulevards and in the districts, to create sustainable active pedestrian-friendly centers that decrease reliance on the automobile, increase walking, bicycling and transit use, and improve community quality of life.	**Consistent**. The Proposed Project would encourage new development in transit station areas with the objective of promoting transit ridership and creating an active, mixed use environment in the station areas. Its goal is to improve circulation for all modes on major streets and includes streetscape improvements aimed at improving bicycle and pedestrian circulation. The Proposed Project would also involve new streetscape plans that enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. The Proposed Project would encourage alternatives to automobile travel and improve community quality of life. Under the Proposed Project, individual projects that exceed the base FAR would be required to provide public benefits which could include off-site streetscape improvements, enhancements to freeway underpasses, publicly accessible open space, mobility hubs, enhanced bike amenities, enhanced transit amenities (e.g., bus shelters, transit kiosks, real time transit information), and Transportation Demand Management (TDM) strategies to reduce vehicle trips.
Policy LU2	Transit Villages. Capitalize on the Expo Light Rail stations to create vital new complete sustainable neighborhoods with transit as a focal element, green connections and pathways, a variety of housing types and jobs, enhanced creative arts and institutions, and local-serving retail and services.	**Consistent**. See Response to Goal LU2 above.
Policy LU2.5	Vehicle Trip Reduction. Achieve vehicle trip reduction through comprehensive strategies that designate land uses, establish development and street design standards, implement sidewalk, bicycle and roadway improvements, expand transit service, manage parking, and strengthen Transportation Demand Management programs that support accessibility by transit, bicycle and foot, and discourage vehicle trips at a district-wide level. Monitor progress using tools that integrate land use and transportation factors. Increase bicycle and pedestrian connectivity in transit districts and adjust bus and shuttle services to ensure success of the transit system.	**Consistent**. See Response to Goal LU2 above and Goal 11 (West Los Angeles Community Plan). The Proposed Project includes a vehicle trip reduction requirement for commercial projects that exceed the Base FAR, requiring that such projects utilize a robust TDM program to achieve reductions in peak hour vehicle trips to and from a site. Such projects would be required to submit annual reports to demonstrate attainment of the target reductions.

TABLE 4.8-13: CONSISTENCY WITH APPLICABLE CITY OF SANTA MONICA AND CITY OF CULVER CITY GOALS, POLICY, AND OBJECTIVES

Goal/Policy/Objective	Goal/Policy/Objective Description	Analysis
Goal LU3	Transition from Regional- Serving Commercial Uses to Local-Serving Uses in Areas Served by Transit – Redirect regional-serving commercial and office development potential into new housing opportunities with access to neighborhood serving uses in transit-accessible areas as part of a citywide trip reduction strategy.	**Consistent**. The Proposed Project would guide future development by specifying the type of uses, densities, intensities, and design standards that would be permitted. The Proposed Project would encourage new residential and commercial development at transit station areas with the goal of promoting transit ridership and creating an active, mixed use environment in the station areas.
Goal LU5	Expo Light Rail line – Cluster housing, employment, local-serving retail and services around the Expo Light Rail line to reduce vehicle trips, create complete neighborhoods and support transit.	**Consistent**. See Responses to Goals LU2 and LU3 above.
Goal LU8	Reduction of Vehicle Trips/ Management of Congestion – Establish a complete transportation network that supports integrated land use. Ensure that transportation supports human activity and access to land uses through a diverse multimodal transportation system that incentivizes walking, biking and transit and reduces the need for vehicle trips.	**Consistent**. See Response to Goal LU2 and Policy LU2.5 above and Goal 11 (West Los Angeles Community Plan).
Goal N1	Protect, preserve and enhance the residential neighborhoods.	**Consistent**. The Proposed Project would not divide established residential neighborhoods and would not result in significant land use impacts related to compatibility of new uses with existing residential neighborhoods.
Goal N7	Ensure that walking and bicycling are safe and comfortable on all neighborhood streets at all times of the day.	**Consistent**. The primary objectives of the Proposed Project include improving the pedestrian and bike environment within and between neighborhoods and to transit and improving circulation for all modes.
Goal B15	Develop an integrated pattern of land uses along Olympic Blvd. to establish a new mixed use district with opportunities for affordable and workforce housing to support nearby employment centers, and an emphasis on the boulevard's close proximity to the Expo Light Rail line.	**Consistent**. See Response to Goal N7 above. Proposed land use changes along Olympic Boulevard near the Bundy Station promote a mix of uses that expand on and support nearby employment centers.
Goal B18	Support a mixed use pattern along the entire length of Pico Blvd. to establish a pedestrian-friendly transit corridor with a series of activity nodes.	**Consistent**. Proposed land use changes allow for mixed use (residential and retail) development along Pico Boulevard in the City of Los Angeles, which complement the City of Santa Monica's land use goals for this corridor. Streetscape plans for Pico Boulevard between Centinela Boulevard and Patricia Avenue enhance the pedestrian environment along this corridor.
Goal T8	Provide a beautiful and attractive pedestrian environment throughout the City.	**Consistent**. See Response to Goal B18 above.
Goal T10:	Ensure that the bicycle network is attractive to cyclists of all ages and experience levels.	**Consistent**. See Response to Goal 12 (West Los Angeles Community Plan).
Goal T13	Increase transit ridership for all types of trips.	**Consistent**. See Response to Goal LU2 above and Response to Objective 10-2 (West Los Angeles Community Plan).
Goal T15	Manage local and regional congestion affecting Santa Monica.	**Consistent**. See Response to Goal LU2 above. The Proposed Project's mix of land uses, including jobs and housing, supports transit ridership and aims to reduce the length and amount of vehicle trips generated by new development. Individual projects are also required to incorporate transportation demand management (TDM) strategies, which aim to reduce vehicle trips to and from a site. Commercial projects that exceed the base FAR on a site must demonstrate a reduction in vehicle trips as a result of a TDM plan.
Goal T18	Encourage a more sustainable transportation system.	**Consistent**. See Response to Goal LU2 above and Goal 11 (West Los Angeles Community Plan).

TABLE 4.8-13: CONSISTENCY WITH APPLICABLE CITY OF SANTA MONICA AND CITY OF CULVER CITY GOALS, POLICY, AND OBJECTIVES

Goal/Policy/Objective	Goal/Policy/Objective Description	Analysis
CITY OF CULVER CITY		
LU Objective 2	Encourage the retention and creation of housing throughout the City	**Consistent**. See Response to Goal N1 (City of Santa Monica).
LU Objective 4	Establish and maintain quality living environments throughout the City.	**Consistent**. The Proposed Project includes streetscape plans, which aim to enhance the appearance and functionality of the public right-of-way through elements such as street furniture, shade trees, medians, and unique sidewalk paving. The Proposed Project also includes urban design standards that regulate commercial, industrial, and multi-family residential development to ensure it is pedestrian-oriented, appropriately scaled and sited, and incorporates high-quality materials and details. Public benefits required by certain development projects, including publicly accessible open space, streetscape improvements, and other public amenities, also contribute to creating a quality living environment in the Project Area.
LU Goal	Economic vitality that serves the community and protects the quality of life.	**Consistent**. See Response to LU Objective 4 above.
LU Objective 5	Encourage new business opportunities that expand Culver City's economic base and serve the needs of the City's residential and business community.	**Consistent**. See Response to LU Objective 4 above.
LU Objective 6	Revitalize the physical character and economic well-being of the City's commercial corridors.	**Consistent**. See Response to LU Objective 4 above.
LU Goal	Clear and consistent guidance for balanced growth	**Consistent**. See Response to LU Objective 4 above.
LU Objective 16	Encourage mutually compatible land uses	**Consistent**. See Response to LU Objective 4 above.
Cir Goal	Integrated local and regional transportation systems that serve residential and business needs.	**Consistent**. See Response to Goal LU2 (City of Santa Monica), Objective 10-2 (West Los Angeles Community Plan), and Goal 12 (West Los Angeles Community Plan) above.
Cir Objective 2	Expand public transit service and ridership.	**Consistent**. See Response to Goal LU2 (City of Santa Monica) and Objective 10-2 (West Los Angeles Community Plan above.
Cir Objective 3	Provide a system of safe and enjoyable bikeways and support facilities.	**Consistent**. See Goal 12 (West Los Angeles Community Plan) above.
Cir Objective 4	Provide convenient and pleasant pedestrian access.	**Consistent**. The primary objectives of the Proposed Project include improving the pedestrian and bike environment within and between neighborhoods and to transit and improving circulation for all modes.

HOUSING POLICIES

Future development under the proposed ECTNP would still be subject to all adopted City and regional housing policies designed to protect low-income housing and provide relocation assistance for displaced households, such as the Rent Stabilization Ordinance. Additionally, the proposed ECTNP would be consistent with the General Plan Framework and Housing Elements objectives and policies that aim to minimize the risk of permanent displacement of substantial numbers of existing housing units. These policies include General Plan Framework Element Objectives 3.4, 3.5, 4.2, 4.3, and 4.4, and Housing Element Objective 1.2 (see Table 4.10-1 in Section 4.10, Population, Housing and Employment) which seek to conserve existing stable residential neighborhoods, preserve neighborhood character and scale in balance with facilitating new development, and encourage the location of new multi-family housing and commercial development in designated areas away from existing neighborhoods. The Proposed Project would support these policies by encouraging development in focused areas around transit stations and along commercial boulevards, which would generally keep development away from stable single-family neighborhoods as well as multi-family residential areas with substantial concentrations of rent-stabilized units. The Proposed

Project also respects existing neighborhood scale and character through building height regulations and Urban Design Standards that address the potential adjacency of new development to existing residential areas. Additionally, the Proposed Project would be consistent with the U.S. Department of Housing and Urban Development Comprehensive Housing Affordability Strategy by incorporating a system that would require developers to including affordable housing in exchange for additional allowable floor area.

The Proposed Project would also be consistent with General Plan Framework and Housing Element objectives focused on the need to accommodate population growth and provide an adequate supply of housing of various types to serve all income levels, including General Plan Framework Objectives 3.3 and 4.1 and Housing Element Objectives 1.1, 1.3, and 2.5. The Proposed Project seeks to accommodate population growth projected for the area by SCAG by increasing capacity for housing through a variety of means, including allowing residential uses in areas where it is currently not allowed, encouraging mixed use development along commercial boulevards, and allowing increased density in select residential areas. The Proposed Project would also require that new mixed use development provide affordable housing when seeking additional development rights, which would address the need to create a supply of housing that is affordable to a variety of income levels.

The Proposed Project would be consistent with Housing Element Objectives 2.2 and 2.4, which aim to create sustainable, livable neighborhoods in proximity to transit and with a mix of uses and housing types, and quality design. The Proposed Project would allow a variety of land uses, including residential, as well as retail, office, and industrial, to be located within each station area, creating neighborhoods that are vibrant, accessible to transit, and which encourage walking and bicycling, and contain amenities for residents, workers, and visitors. Urban Design Standards, which would apply to most properties within the Project Area, would ensure new development is pedestrian- and transit-oriented and displays a high level of design quality.

Finally, the Proposed Project would be consistent with General Plan Framework Objective 4.4 and Housing Element Objective 1.4, which aim to reduce regulatory and procedural barriers to increase housing production and capacity. The Proposed Project would include a more streamlined development review procedure in which projects that comply with the ECTNP regulations would be eligible for Administrative Clearance. This would facilitate the development process for new housing and potentially reduce development costs, allowing more housing to be built and in a more timely manner.

Therefore, implementation of the Proposed Project would not result in inconsistencies with local and regional housing policies, and impacts related to policy inconsistencies would be less than significant.

Given the above, the Proposed Project would result in a less than significant impact related to conflicting with applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

ALTERNATIVE COMPLIANCE SCENARIO

As described above, the Alternative Compliance scenario would provide development flexibility by allowing residential use on specified New Industry parcels, where residential use is not allowed by the zone, and increased residential use on specified parcels in the Hybrid Industrial: Jobs Emphasis zone, where residential use is limited. The increase in residential use under the Alternative Compliance scenario is tied to a commensurate reduction in the amount of non-residential square footage allowed in each project, while maintaining the same overall level of growth as in the Proposed Project. Therefore, the Alternative Compliance scenario does not conflict with the industrial, mixed use and commercial goals of the applicable community plans as it continues to accommodate the demand for jobs and housing in the Project Area as a whole. The use of the Alternative Compliance scenario is limited to a set number of dwelling units within the Project Area, and eligible sites would still have the opportunity to accommodate demand for non-

residential uses and jobs, since the use of the Alternative Compliance procedure is voluntary. In addition, Alternative Compliance projects would be required to provide increased public benefits that support the additional residential use allowed, such as publicly accessible open space and community and cultural facilities, consistent with local policies to provide adequate recreational opportunities. Finally, the Alternative Compliance scenario would result in greater mixed use development opportunities, which would result in further reduction in vehicle trip generation of new development as housing is placed within close proximity to jobs, retail, and services. This would be consistent with local policies encouraging the use of alternative modes of transportation and a reduction in vehicle trips. Therefore, with the Alternative Compliance scenario impacts related to consistency with applicable land use policies would be similar to those anticipated to occur under the Proposed Project, and would be less than significant.

NON-CHANGE AREAS

The Proposed Project would not include land use changes that would disrupt or substantially change land use patterns outside the identified change areas. Existing zoning and community plan land use designations in the affected portions of the West Los Angeles, Palms-Mar Vista-Del Rey and West Adams-Baldwin Hills-Leimert community plan areas in the non-change areas would remain unchanged. Implementation of future development projects governed by the affected community plans would continue to be substantially consistent with the regional goals, objectives, and policies.

MITIGATION MEASURES

Impacts related to conflicting with an applicable land use plan, policy, or regulation would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to conflicting with an applicable land use plan, policy, or regulation would be less than significant without mitigation.

IMPACT 4.8-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CONFLICT WITH ANY APPLICABLE HABITAT CONSERVATION PLANS OR NATURAL COMMUNITY CONSERVATION PLANS? NO IMPACT WOULD OCCUR WITH IMPLEMENTATION OF THE PROPOSED PROJECT.

Habitat Conservation Plans (HCPs), designated under Endangered Species Act Section 10(a)(1)(B), are planning documents required when a project will affect a species identified as listed, non-listed or eligible under the act and detail how those impacts will be minimized, or mitigated; and how the HCP is to be funded.

The California Department of Fish and Wildlife's Natural Community Conservation Planning (NCCP) program is a cooperative effort to protect habitats and species. It began under the State's Natural Community Conservation Planning Act of 1991, legislation broader in its orientation and objectives than the California and Federal Endangered Species Acts. The NCCP takes a broad-based ecosystem approach to planning for the protection and perpetuation of biological diversity and identifies and provides for the regional or area wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The primary objective of NCCPs is to conserve natural communities at the ecosystem scale while accommodating compatible land use. There are no HCPs or NCCPs within the ECTNP Area.[10] Therefore, no impact related to consistency with HCPs or NCCPs would occur.

[10]California Department of Fish and Wildlife, *Natural Community Planning Program,* https://www.wildlife.ca.gov/Conservation/Planning/NCCP, accessed March 6, 2017.

NON-CHANGE AREAS

As discussed above, there are no HCPs or NCCPs within the ECTNP Area, including the non-change areas. Therefore, no impact related to consistency with HCPs or NCCPs would occur in the non-change areas.

MITIGATION MEASURES

No impact to consistency with HCPs or NCCPs would occur under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE AFTER MITIGATION

No impact to consistency with HCPs or NCCPs would occur under the Proposed Project without mitigation.

4.9 NOISE

This section provides an overview of noise and vibration and evaluates impacts associated with the Proposed Project. Supporting data and calculations are included in **Appendix E** of this Draft EIR. Topics addressed include short-term construction and long-term operational noise and vibration. The following information provides noise and vibration characteristics and effects.

NOISE CHARACTERISTICS AND EFFECTS

Characteristics of Sound. Sound is technically described in terms of the loudness (amplitude) and frequency (pitch) of the sound. The standard unit of measurement for sound is the decibel (dB). The human ear is not equally sensitive to sound at all frequencies. The "A-weighted scale," abbreviated dBA, reflects the normal hearing sensitivity range of the human ear. On this scale, the range of human hearing extends from approximately 3 to 140 dBA.[1] **Figure 4.9-1** provides examples of A-weighted noise levels from common sounds.

Noise Definitions. This noise analysis discusses sound levels in terms of Community Noise Equivalent Level (CNEL), Day-Night Noise Level (L_{dn}), and Equivalent Noise Level (L_{eq}).

Community Noise Equivalent Level (CNEL). CNEL is an average sound level during a 24-hour period. CNEL is a noise measurement scale, which accounts for noise source, distance, single event duration, single event occurrence, frequency, and time of day. Humans perceive sound between 7:00 p.m. and 10:00 p.m. as if the sound were actually 5 dBA higher than if it occurred from 7:00 a.m. to 7:00 p.m. From 10:00 p.m. to 7:00 a.m., humans perceive sound as if it were 10 dBA higher, due to the lower background level. Hence, the CNEL is obtained by adding an additional 5 dBA to sound levels in the evening from 7:00 p.m. to 10:00 p.m. and 10 dBA to sound levels in the night from 10:00 p.m. to 7:00 a.m. Because CNEL accounts for human sensitivity to sound, the CNEL 24-hour figure is always a higher number than the actual 24-hour average.[2]

Day-Night Noise Level (L_{dn}). L_{dn} is similar to CNEL except that it does not include a 5 dBA penalty from 7:00 p.m. to 10:00 p.m.[3]

Equivalent Noise Level (L_{eq}). L_{eq} is the average noise level on an energy basis for any specific time period. The L_{eq} for one hour is the energy average noise level during the hour. The average noise level is based on the energy content (acoustic energy) of the sound. L_{eq} can be thought of as the level of a continuous noise which has the same energy content as the fluctuating noise level. The equivalent noise level is expressed in units of dBA.[4]

Effects of Noise. Noise is generally defined as unwanted sound. The degree to which noise can impact the human environment ranges from levels that interfere with speech and sleep (annoyance and nuisance) to levels that cause adverse health effects (hearing loss and psychological effects). Human response to noise is subjective and can vary greatly from person to person. Factors that influence individual response include the intensity, frequency, and pattern of noise, the amount of background noise present before the intruding noise, and the nature of work or human activity that is exposed to the noise source.

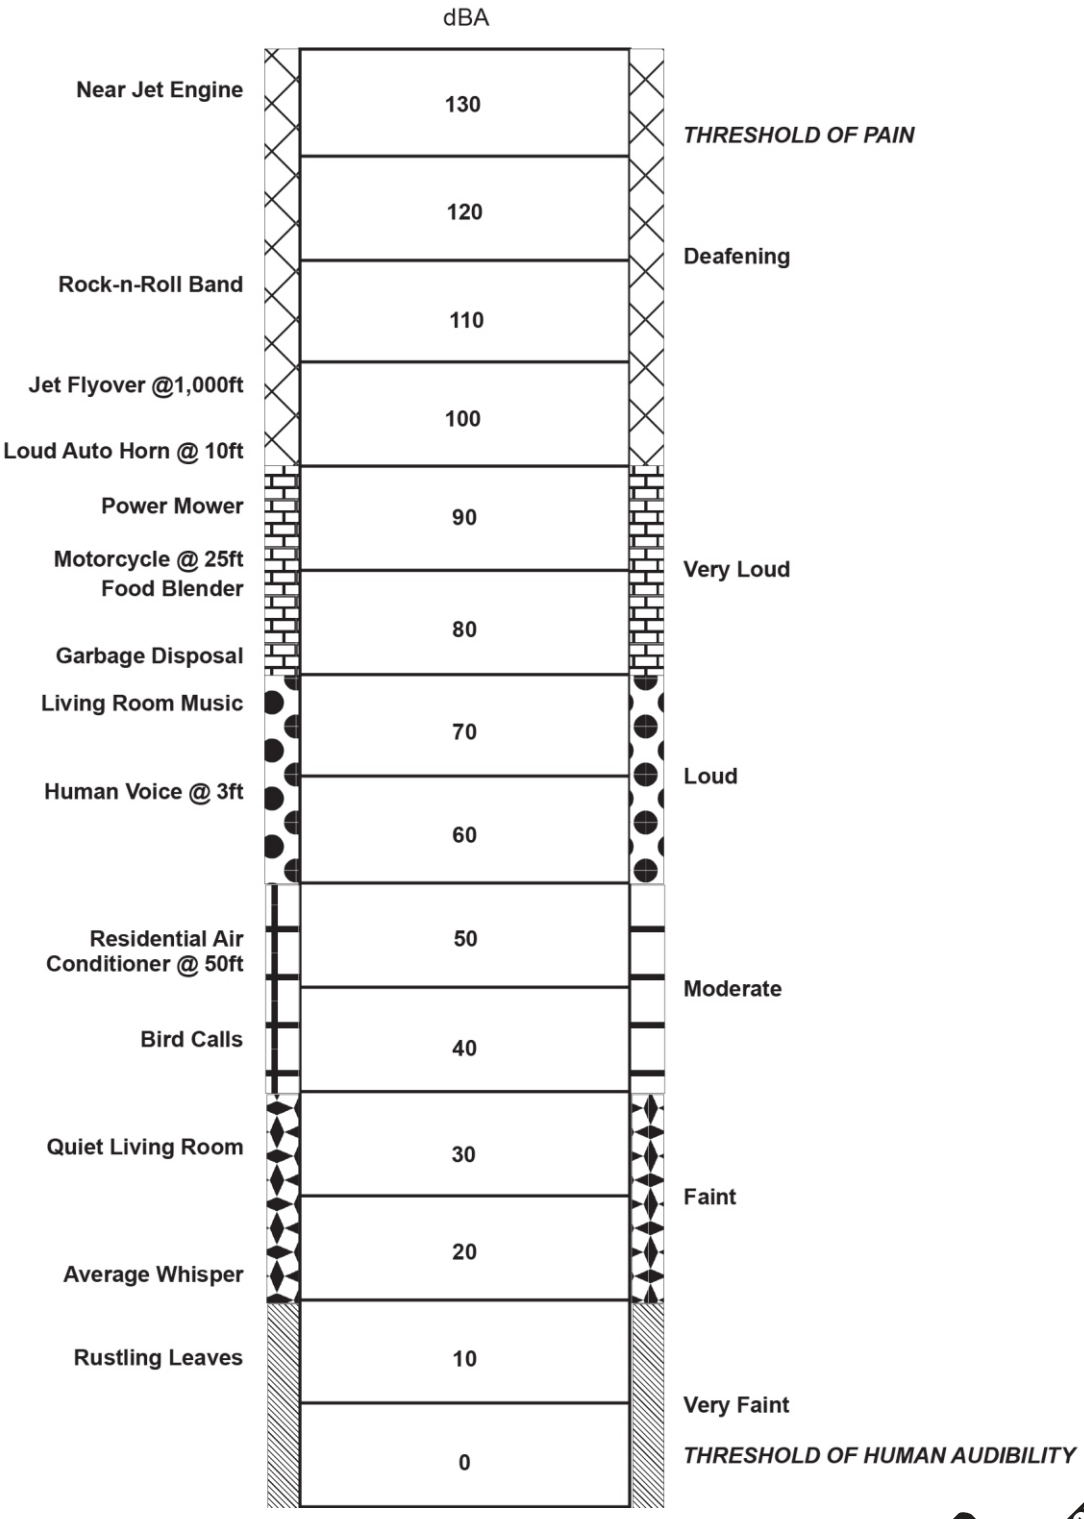
[4]*Ibid*.

Figure 4.9-1 A-Weighted Decibel Scale



SOURCE: City of Los Angeles and TAHA, 2017.

Audible Noise Changes. Studies have shown that the smallest perceptible change in sound level for a person with normal hearing sensitivity is approximately 3 dBA. A change of at least 5 dBA would be noticeable and would likely evoke a community reaction. A 10-dBA increase is subjectively heard as a doubling in loudness.[5]

Noise levels decrease as the distance from the noise source to the receiver increases. Noise generated by a stationary noise source, or "point source," will decrease by approximately 6 dBA over hard surfaces (e.g., reflective surfaces such as parking lots or smooth bodies of water) and 7.5 dBA over soft surfaces (e.g., absorptive surfaces such as soft dirt, grass, or scattered bushes and trees) for each doubling of the distance.[6] For example, if a noise source produces a noise level of 89 dBA at a reference distance of 50 feet, then the noise level would be 83 dBA at a distance of 100 feet from the noise source, 77 dBA at a distance of 200 feet, and so on. Noise generated by a mobile source will decrease by approximately 3 dBA over hard surfaces and 4.8 dBA over soft surfaces for each doubling of the distance.

Noise is most audible where there is a direct line-of-sight.[7] Solid barriers, such as walls, berms or buildings, that break the line-of-sight between the source and the receiver greatly reduce noise levels from the source since sound can only reach the receiver by bending over the top of the barrier. However, if a barrier is not solid or not high or long enough to break the line-of-sight from the source to the receiver, its effectiveness is greatly reduced.

VIBRATION CHARACTERISTICS AND EFFECTS

Characteristics of Vibration. Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration.[8] Vibration can be a serious concern, causing buildings to shake and rumbling sounds to be heard. In contrast to noise, vibration is not a common environmental problem. It is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of vibration are trains, buses on rough roads, and construction activities, such as blasting, pile driving, and heavy earth-moving equipment.

Vibration Definitions. There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is most frequently used to describe vibration impacts to buildings and is usually measured in inches per second. The PPV is defined as the maximum instantaneous peak of the vibration signal. The root mean square (RMS) amplitude is most frequently used to describe the effect of vibration on the human body. The RMS amplitude is defined as the average of the squared amplitude of the signal. Decibel notation (Vdb) is commonly used to measure RMS. The decibel notation acts to compress the range of numbers required to describe vibration.[9]

Effects of Vibration. High levels of vibration may cause physical personal injury or damage to buildings. Ground-borne vibration levels rarely affect human health. Instead, most people consider ground-borne vibration to be an annoyance that can affect concentration or disturb sleep. High levels of ground-borne vibration can damage fragile buildings or interfere with equipment that is highly sensitive to ground-borne vibration (e.g., electron microscopes). Although responses to vibration differ, 65 Vdb is the approximate threshold of perception for many people.[10] The approximate dividing line between barely and distinctly perceptible is 75 Vdb and 85 Vdb is typically only acceptable if there are an infrequent number of events per day.

REGULATORY FRAMEWORK

NOISE

FEDERAL

Federal Aviation Administration (FAA). The FAA sets noise limits for commercial aircrafts (14 Code of Federal Regulations (CFR) Part 36) and establishes procedures for airport noise studies and land use compatibility evaluations (14 CFR Part 150) in the Federal Aviation Regulations. Part 150 prescribes the procedures, standards, and methodology governing the development, submission, and review of airport noise exposure maps and airport noise compatibility programs, including the process for evaluating and approving or disapproving those programs. It prescribes single systems for (a) measuring noise at airports and surrounding areas that generally provides a highly reliable relationship between projected noise exposure and surveyed reaction of people to noise; and (b) determining exposure of individuals to noise that result from the operations of an airport. CFR Part 150 also identifies those land uses which are normally compatible with various levels of exposure to noise by individuals. It provides technical assistance to airport operators, in conjunction with other local, state, and federal authorities, to prepare and execute appropriate noise compatibility planning and implementation programs.

U.S. Department of Housing and Urban Development (HUD). HUD regulations may be found in 24 CFR Part 51, Subpart B and include exterior noise standards for new housing construction assisted or supported by the department. HUD states that an acceptable noise level is 65 dBA L_{dn} or less, a normally unacceptable noise level exceeds 65 dBA L_{dn} but does not exceed 75 dBA L_{dn} (appropriate sound attenuation measures must be provided to achieve an acceptable status), and an unacceptable noise level exceeds 75 dBA L_{dn}. HUD regulations do not contain standards for interior noise levels. The noise environment inside a building is considered acceptable if the noise environment external to the building is acceptable and the building is constructed in a manner common to the area.

STATE

Department of Health Services. The State of California, Department of Health Services, Environmental Health Division, has published the Guidelines for Noise and Land Use Compatibility (the State Guidelines) which recommend guidelines for local governments to use when setting standards for human exposure to noise and preparing noise elements for general plans. The State Guidelines, which are illustrated in **Table 4.9-1** indicate that residential land uses and other noise sensitive receptors generally should be located in areas where outdoor ambient noise levels do not exceed 65 to 70 dBA (CNEL or L_{dn}).

Application of this compatibility matrix to development projects is not mandated by the Department of Health Services; however, each jurisdiction is required to consider the State Guidelines when developing its General Plan Noise Element and when determining acceptable noise levels within its community. According to the State Guidelines, an exterior noise level of 60 dBA CNEL is considered to be a "normally acceptable" noise level for single-family, duplex, and mobile homes involving normal, conventional construction, without any special noise insulation requirements. Exterior noise levels up to 65 dBA CNEL are typically considered "normally acceptable" for multi-family units and transient lodging without any special noise insulation requirements. Between these values and 70 dBA CNEL, exterior noise levels are typically considered "conditionally acceptable," and residential construction should only occur after a detailed analysis of the noise reduction requirements is made and needed noise attenuation features are included in the project design. Exterior noise attenuation features include, but are not limited to, setbacks to place structures outside the conditionally acceptable noise contour and orientation.

TABLE 4.9-1: GUIDELINES FOR NOISE COMPATIBLE LAND USE

Land Use Category	Community Noise Exposure (dBA, CNEL) 55 60 65 70 75 80
Residential - Low Density Single-Family, Duplex, Mobile Homes	
Residential - Multi-Family	
Transient Lodging - Motels Hotels	
Schools, Libraries, Churches, Hospitals, Nursing Homes	
Auditoriums, Concert Halls, Amphitheaters	
Sports Arena, Outdoor Spectator Sports	
Playgrounds, Neighborhood Parks	
Golf Courses, Riding Stables, Water Recreation, Cemeteries	
Office Buildings, Business Commercial and Professional	
Industrial, Manufacturing, Utilities, Agriculture	

Normally Acceptable - Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

Conditionally Acceptable - New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply system or air conditioning will normally suffice.

Normally Unacceptable - New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

Clearly Unacceptable - New construction or development should generally not be undertaken.

SOURCE: California Office of Noise Control, Department of Health Services.

Department of Housing and Community Development. The State Department of Housing and Community Development has required that new residential units should not be exposed to outdoor ambient noise levels in excess of 65 dBA (CNEL or L_{dn}), and, if necessary, sufficient noise insulation must be provided to reduce interior ambient levels to 45 dBA. Within a 65 dBA exterior noise environment, interior noise levels are typically reduced to acceptable levels (to at least 45 dBA CNEL) through conventional construction, but with closed windows and fresh air supply systems or air conditioning.

LOCAL

The Noise Element of the City of Los Angeles General Plan (General Plan) establishes CNEL guidelines for land use compatibility and includes a number of goals, objectives, and policies for land use planning purposes. The City also has regulations to control unnecessary, excessive, and annoying noise, as cited by the Los Angeles Municipal Code (LAMC) Chapter XI Noise Regulation. These regulations are described further below.

City of Los Angeles General Plan Noise Element. The City of Los Angeles General Plan Noise Element identifies potentially significant noise sources, addresses vibration issues, identifies historic and current noise management approaches and guides the development of noise regulations. It addresses noise mitigation regulations, strategies and programs and delineates federal, state and City jurisdiction relative to rail, automotive, aircraft and nuisance noise. **Table 4.9-2** identifies the Noise Element goals, objectives, and policies that are relevant to the Proposed Plan. The City's noise compatibility guidelines mirror the State Guidelines, as illustrated in **Table 4.9-1**, and indicate that residential land uses and other noise sensitive receptors generally should be located in areas where outdoor ambient noise levels do not exceed 65 to 70 dBA (CNEL or L_{dn}).

TABLE 4.9-2: RELEVANT GENERAL PLAN NOISE GOALS, OBJECTIVES, AND POLICIES

Goal/Objective/Policy	Goal/Objective/Policy Description
NON-AIRPORT	
P5	Continue to enforce, as applicable, city, state, and federal regulations intended to abate or eliminate disturbances of the peace and other intrusive noise.
P6	When processing building permits, continue to require appropriate project design and/or insulation measures, in accordance with the California Noise Insulation Standards (Building Code Title 24, Section 3501 et seq.), or any amendments thereto or subsequent related regulations, so as to assure that interior noise levels will not exceed the minimum ambient noise levels, as set forth in the City's noise ordinance (LAMC Section 111 et seq., and any other insulation related requirements) for a particular zone or noise sensitive use, as defined by the California Noise Insulation Standards.
LAND USE DEVELOPMENT	
P11	For a proposed development project that is deemed to have a potentially significant noise impact on noise sensitive uses, require mitigation measures, as appropriate, in accordance with California Environmental Quality Act and City procedures.
P12	When issuing discretionary permits for a proposed noise-sensitive use or subdivision of four or more detached single-family units and which use is determined to be potentially significantly impacted by existing or proposed noise sources, require mitigation measures, as appropriate, in accordance with procedures set forth in the California Environmental Quality Act so as to achieve an interior noise level CNEL of 45 dB, or less, in any habitable room as required by LAMC Section 91.
P13	Continue to plan, design and construct or oversee construction of public projects, and projects on City owned properties, so as to minimize potential noise impacts on noise sensitive uses and to maintain or reduce existing ambient noise levels.
P15	Continue to take into consideration, during updating/revision of the City's general plan community plans, noise impacts from freeways, highways, outdoor theaters and other significant noise sources and to incorporate appropriate policies and programs into the plans that will enhance land use compatibility.
P16	Use, as appropriate, the "Guidelines for Noise Compatible Land Use", or other measures that are acceptable to the City, to guide land use and zoning reclassification, subdivision, conditional use and use variance determinations and environmental assessment considerations, especially relative to sensitive uses within a CNEL of 65 dB airport noise exposure areas and within a line-of-sight of freeways, major highways, railroads or truck haul routes.
P17	Continue to encourage the California Department of Transportation, the Los Angeles County Metropolitan Transportation Authority, or their successors, and other responsible agencies, to plan and construct transportation systems so as to reduce potential noise impacts on adjacent land uses, consistent with the standards and guidelines contained in the noise element.

SOURCE: City of Los Angeles, *Noise Element of the Los Angeles City General Plan*, February 3, 1999.

Los Angeles Municipal Code (LAMC). The City of Los Angeles has established noise ordinances concerning the generation and control of noise that could adversely affect its citizens and noise sensitive land uses. There are numerous specific ordinances, many of which do not relate to the impact analysis presented below. This discussion summarizes the general regulations and focuses on the ordinances most relevant to the Proposed Plan.

Regarding construction, Section 41.40 (Noise Due to Construction, Excavation Work – When Prohibited) in Chapter IV (Public Welfare) of the LAMC indicates that no construction or repair work shall be performed between the hours of 9:00 p.m. and 7:00 a.m., since such activities would generate loud noises and disturb persons occupying sleeping quarters in any adjacent dwelling, hotel, apartment or other place of residence. No person, other than an individual home owner engaged in the repair or construction of his/her single-family dwelling, shall perform any construction or repair work of any kind or perform such work within 500 feet of land so occupied before 8:00 a.m. or after 6:00 p.m. on any Saturday or on a federal holiday, or at any time on Sunday. Under certain conditions, the City may grant a waiver to allow limited construction activities to occur outside of the limits described above.

LAMC Section 91.106.4.8 requires a construction site notice to be provided that includes the following information: job site address, permit number, name and phone number of the contractor and owner or owner's agent, hours of construction allowed by code or any discretionary approval for the sites, and City telephone numbers where violations can be reported. The notice shall be posted and maintained at the construction site prior to the start of construction and displayed in a location that is readily visible to the public and approved by the City's Department of Building and Safety.

Chapter XI (Noise Regulation) of the LAMC addresses sources of noise other than construction activities. Chapter XI is intended to prohibit unnecessary, excessive and annoying noises from all sources within the City. A noise level increase from certain regulated noise sources of 5 dBA over the existing or presumed ambient noise level at an adjacent property line is considered a violation of the Noise Regulations. The 5-dBA increase above ambient is applicable to City-regulated noise sources (e.g., mechanical equipment), and it is applicable any time of the day. The LAMC states that the baseline ambient noise shall be the actual measured ambient noise level of the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise levels averaged over a period of at least 15 minutes. The LAMC indicates that in cases where the actual measured ambient conditions are not known, the City's presumed noise levels should be used. The presumed ambient noise levels are in Section 111.03 (Minimum Ambient Noise Level) of the LAMC.

To account for people's increased tolerance for short-duration noise events, the LAMC provides a 5 dBA allowance for noise sources occurring more than 5 minutes but less than 15 minutes in any 1-hour period (for a total of 10 dBA above the ambient), and an additional 5 dBA allowance (total of 15 dBA above the ambient) for noise sources occurring 5 minutes or less in any 1-hour periods. These additional allowances for short-duration noise sources are applicable to noise sources occurring between the hours of 7:00 a.m. and 10:00 p.m. (daytime hours). Furthermore, LAMC provides a reduction of 5 dBA for steady high-pitched noise or repeated impulsive noise.

LAMC Section 112.02 requires that any heating, ventilation, and air conditioning (HVAC) system within any zone of the City not cause an increase in ambient noise levels on any other occupied property or if a condominium, apartment house, duplex, or attached business, within any adjoining unit to exceed the ambient noise level by more than 5 dBA.

Section 112.05 (Maximum Noise Level of Powered Equipment or Powered Hand Tools) of the LAMC specifies the maximum noise level of powered equipment or powered hand tools. Any powered equipment or hand tool that produces a maximum noise level exceeding 75 dBA at a distance of 50 feet is prohibited. However, this noise limitation does not apply where compliance is technically infeasible. Technically infeasible means the

above noise limitation cannot be met despite the use of mufflers, shields, sound barriers and/or any other noise reduction device or techniques during the operation of equipment.

City of Los Angeles Planning and Zoning Code (LAMC Chapter 1) contains a variety of provisions that directly or indirectly reduce noise impacts on, or impacts that are associated with, different types of land uses and zones. The Planning and Zoning Code contains regulations for each of these different zoning classifications. These regulations guide land use considerations by setting maximum ambient noise levels for specific zones.

The most basic noise management measure is traditional zoning that separates agricultural, residential, commercial and industrial uses. Another is the front yard setback that not only adds attractiveness to a neighborhood but serves to distance homes from adjacent street noise. Side and rear yards also serve as noise buffers. Through zone change and subdivision processes, site or use specific conditions can be imposed to assure compatibility of land use and to protect users of a site from impacts from adjacent uses. The commercial (C zones) and manufacturing (M zones) provisions of the code contain use specific requirements intended to reduce noise, odor and other impacts on adjacent uses. These include prohibiting of certain commercial and industrial uses within so many feet of residential or less restrictive uses or zones, requiring increased setbacks from residential uses, limiting hours of operation, containing uses wholly within an enclosed building, requiring sound walls, prohibiting openings that face residential uses and prohibiting audibility of noise outside a facility.

Conditional use permits and variances (LAMC Sections 12.24, 12.27, 12.28 and 12.29) allow the planning commission, zoning administrators and, on appeal, City Council to assess potential inconsistencies and impose conditions to control noise for certain uses that may need special conditions to ensure compatibility with the surrounding land uses. Conditional use permits are required for various land uses in certain zones including, but not limited to, schools, churches, alcohol sales, parks, mixed use development, and automobile repair facilities. In most cases, the uses are allowed by right in less restrictive zones. Some are prohibited entirely in residential zones. The permitting procedures include site investigations, notice to neighbors and hearings to assist decision makers in determining if the use should be permitted and, if permitted, allow imposition of appropriate conditions of approval. Typical conditions include specific site design, setbacks, use limitations on all or parts of the site, walls and hours of operation so as to minimize noise and other impacts.

Variances are required when a proposed development needs to deviate from the Planning and Zoning Code. The permitting procedures for variances include site investigations, notice to neighbors and hearings to assist decision makers in determining whether a property has special conditions that makes it difficult for a proposed development to adhere to the Planning and Zoning Code. If a variance is granted, the requested variance must not be materially detrimental to the public welfare or injurious to the property in the same zone or vicinity in which the property is located. As with conditional use permits, the zoning administrator may impose conditions on variances to protect the public health, safety or welfare, including conditions to minimize noise.

The City has the authority to revoke, discontinue a use, or impose nuisance abatement conditions on uses that were allowed under the conditional use permit. Conditional use permits may be revoked by the planning commission, zoning administrator, or, on appeal, by the City Council for nuisance (including disturbance of the peace) or noncompliance with the conditions of the conditional use permit. In addition, for existing commercial or industrial development that had previously required discretionary approval, a zoning administrator may discontinue or, on appeal, the City Council may impose operational conditions on the uses that are deemed a nuisance, including for excessive noise or disturbance of the peace. These two procedures can be utilized to encourage owners to operate activities on their properties in a manner that is compatible with adjacent uses, particularly residential uses.

Other Planning and Zoning Code provisions allow a zoning administrator to conditionally permit, without public hearing, particular uses allowed in a zone, provided that the uses meet certain criteria, such as provision of

additional parking or walls. The additional parking requirements for such uses as health clubs, restaurants, trade schools and auditoriums, in part, would prevent spillover parking on adjacent residential neighborhoods, which would minimize noise impacts, especially in the evening and at night on residential neighborhoods.

City of Los Angeles Building Sound Insulation Regulations. With the development of inexpensive insulation materials, air conditioning and improved noise reduction techniques, it became economically feasible to design buildings that provide effective insulation from outside noise as well as from weather conditions. It has been estimated that standard insulation, window sealing efficiency and other energy conservation measures reduce exterior-to-interior noise by approximately 15 decibels. Such a reduction generally is adequate to reduce interior noise from outside sources, including street noise, to an acceptable level. Building setbacks and orientation also reduce noise impacts.

Sound transmission control requirements are included in the International Building Code (IBC), which are the basis for the 2016 California Building Code (CBC). CBC states noise insulation standards (CBC Title 24, Section 1207.4). The standards require that intrusive noise not exceed 45 dB in any habitable room and has been incorporated into the City of Los Angeles Building Code (LAMC Section 91).

The City of Los Angeles Building Code guides building construction. The insulation provisions are intended to mitigate interior noise from outside sources, as well as sound between structural units. The provisions vary according to the intended use of the building, e.g., residential, commercial, industrial. The regulations are intended to achieve a maximum interior sound level equal to or less than the ambient noise level standard for a particular zone, as set forth in the City's Noise Ordinance.

VIBRATION

FEDERAL

Federal Transit Administration (FTA). The FTA regulates vibration levels from proposed transit projects. According to the FTA, vibration impacts associated with human annoyance would be significant if vibration caused by new development exceeds 85 VdB, which is the vibration level that is considered to be acceptable only if there are an infrequent number of events per day. In terms of ground-borne vibration impacts on structures, the FTA vibration damage threshold is approximately 90 VdB for buildings extremely susceptible to building damage (e.g., historic structures) and 98 VdB for engineered concrete and masonry buildings without plaster (e.g., typical urban development).[11]

STATE

There are no adopted state policies or standards for ground-borne vibration. The traditional view has been that common vibrations related to roadway traffic and construction activities pose no threat to buildings or structures. The California Department of Transportation recommends that extreme care be taken when sustained pile driving occurs within 7.5 meters (25 feet) of any building and 15 to 30 meters (50 to 100 feet) of a historic building or a building in poor condition.

LOCAL

There are no adopted City standards for ground-borne vibration.

EXISTING SETTING

Existing Noise Levels. The ECTNP Area includes a wide variety of land uses and localized ambient noise levels. Because the Proposed Project encompasses a large area, the existing noise environment is best characterized using the presumed levels in the LAMC.

[11]Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, May 2006.

Section 111.03 (Minimum Ambient Noise Level) of the LAMC has set forth the presumed ambient noise levels for various land uses (**Table 4.9-3**). The daytime and nighttime ambient noise levels for residential areas are presumed to be 50 and 40 dBA, respectively. However, urban areas typically experience ambient noise levels higher than the conservative levels presented in the table. Areas near freeways, high volume surface streets, and industrial uses also typically experience higher noise levels than land uses located farther from these sources.

TABLE 4.9-3: PRESUMED EXISTING AMBIENT NOISE LEVEL

		dBA	
	Zones	**Daytime (7:00 a.m. to 10:00 p.m.)**	**Nighttime (10:00 p.m. to 7:00 a.m.)**
Residential	A1, A2, RA, RE, RS, RD, RW1, RW2, R1, R2, R3, R4, and R5	50	40
Commercial	P, PB, CR, C1, C1.5, C2, C4, C5, and CM	60	55
Industrial	M1, MR1, and MR2	60	55
	M2 and M3	65	65

SOURCE: LAMC Section 111.03 and City of Los Angeles, *CEQA Thresholds Guide*, 2006.

Existing Vibration Levels. The vibration environment is dominated by vehicular movement. Heavy trucks can generate vibrations that vary depending on vehicle type, weight, and pavement conditions. As trucks typically operate on major streets, existing vibration in the project area is largely related to truck traffic on the surrounding roadway network.

SENSITIVE RECEPTORS

Some land uses are considered more sensitive to changes in noise and vibration levels than others, depending on the population groups and the activities involved. Noise- and vibration-sensitive land uses include locations where people reside or where the presence of unwanted sound could adversely affect the use of the land. Residences, schools, hospitals, guest lodging, libraries, and some passive recreation areas would each be considered noise- and vibration-sensitive and may warrant unique measures for protection from intruding noise.

Figure 4.9-2a and **Figure 4.9-2b** show proposed zoning changes that would result in land uses considered sensitive to high noise levels. The figures also show existing sensitive land uses outside the zone change areas that may be impacted by construction noise, increased mobile source noise on local roadways, and stationary source noise (e.g., mechanical equipment).

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to noise if it would:

- Expose persons to or generate noise in levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Expose people to or generate excessive vibration or ground-borne noise levels;
- Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; and/or
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.
- Expose people working or residing within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport to excessive noise levels.
- Expose people working or residing within the vicinity of a private airstrip to excessive noise levels.

2012-058

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the Proposed Project would have a significant impact on noise levels from construction if:

- Construction activities lasting more than one day would exceed existing ambient noise levels by 10 dBA or more at a noise-sensitive use;
- Construction activities lasting more than ten days in a three-month period would exceed existing ambient noise levels by 5 dBA or more at a noise-sensitive use; and/or
- Construction activities would exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or anytime on Sunday.

Based on the Thresholds Guide, the Proposed Project would have significant impact on noise levels from operations, including mobile noise, if:

- Ambient noise level measured at the property line of affected uses increases by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.9-1**, or any 5 dBA or more increase in noise level.

Section I.4 of the Thresholds Guide includes a significance threshold related to the construction or expansion of an airport or heliport. This significance threshold does not apply to the Proposed Project, and has not been utilized in the analysis.

There are no adopted City standards for vibration. According to the FTA, vibration impacts associated with human annoyance would be significant if vibration caused by implementation of the proposed plans exceeds 85 VdB, which is the vibration level that is considered to be acceptable only if there are an infrequent number of events per day. In terms of ground-borne vibration impacts on structures, the FTA vibration damage threshold is approximately 90 VdB for buildings extremely susceptible to building damage (e.g., historic structures) and 98 VdB for engineered concrete and masonry buildings without plaster (e.g., typical urban development).

METHODOLOGY

The noise and vibration analysis considers construction and operational sources. Construction noise levels were based on example equipment levels provided in the Thresholds Guide. Construction noise levels were also provided for various phases of construction activity based on the same source. Construction vibration levels were based on example equipment levels provided in FTA's Transit Noise and Vibration Impact Assessment guidance document.[12] Mobile source noise levels were estimated using the Federal Highway Administration (FHWA) RD-77-108 methodology. This methodology accounts for traffic volumes, roadway width, and vehicle mix. The analysis also discussed operational mechanical equipment noise (e.g., HVAC), land use/compatibility, and operational vibration.

Regarding the mobile source noise analysis, there are two CEQA cases that address analysis scenarios of long-range planning documents: 1) *Sunnyvale West Neighborhood Assoc. v. City of Sunnyvale City Council (6th Dist. 2010) 190 Cal.App.4th 1351* (Sunnyvale West) and 2) *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority (2013) 57 Cal.4th 439* (Expo II). The first case indicated that project impacts should be compared directly to existing conditions. The second case clarified that comparison to an existing condition may *not* be appropriate if there is, "substantial evidence that an analysis based on existing conditions would tend to be misleading or without informational value to EIR users." For a planning project that would be implemented over time, comparison of full implementation of the plan (with all reasonably

[12]Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, May 2006.

foreseeable development constructed and occupied) to existing conditions would be misleading and of no or little informational value because it is likely infeasible for all development in the plan area to occur immediately. Impacts would not occur in the context of existing conditions but rather in the future context, once the plan has had time to be realized. For a planning project, significance of impacts is appropriately assessed based on a comparison between Future (2035) with Project conditions (at the earliest time full implementation could reasonably be expected) and Future (2035) No Project conditions. The ECTNP is a plan that is anticipated to only be fully realized over time, with all improvements anticipated to be implemented by 2035 or later. Therefore, an analysis of the Proposed Project's future (2035) land use changes and associated mobile noise impacts are compared to future mobile noise impacts in 2035 without the Proposed Project. Although it is only a theoretical scenario, a comparison to what would happen if the Proposed Project (comprised of transit-oriented development) were fully implemented by 2015 (after the Expo LRT Line Phase 2 is operational) is provided (Project in 2015 compared to No Project in 2015) for informational purposes.

As discussed in detail above, the Thresholds Guide provides guidance for the determination of significance of noise related impacts. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. In some cases (see above), the Thresholds Guide includes quantitative thresholds. For purposes of this analysis, CEQA Guidelines Appendix G criteria are used, supplemented by thresholds identified in the Thresholds Guide, where appropriate.

A recent court case found that how existing environmental conditions impact a project's future users or residents, is not required to be analyzed in CEQA documents unless a project exacerbates existing conditions.[13] The Proposed Project would not change noise levels associated with operation of the Santa Monica Airport. Nonetheless, noise levels associated with the Airport are presented for informational purposes. The FAA and the City of Santa Monica plan to maintain airport operations through 2028, after which the City may discontinue its use as an airport.[14]

This discussion of noise addresses impacts for the entire Project Area. No distinction is made between areas of proposed change and areas within the ECTNP Area where zoning controls would not change because noise levels are a direct function of both mobile sources (traffic in the Project Area) and construction activity throughout the ECTNP Area.

IMPACTS

IMPACT 4.9-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXPOSE PERSONS TO OR GENERATE NOISE IN LEVELS IN EXCESS OF STANDARDS ESTABLISHED IN THE LOCAL GENERAL PLAN OR NOISE ORDINANCE, OR APPLICABLE STANDARDS OF OTHER AGENCIES? THIS IMPACT IS CONSIDERED SIGNIFICANT AND UNAVOIDABLE.

Construction

Construction noise levels would fluctuate depending on the construction phase, equipment type and duration of use, distance between the noise source and receptor, and presence or absence of noise attenuation barriers. The primary source of construction noise would be heavy-duty equipment.

[13] *California Building Industry Association v. Bay Area Air Quality Management District (2015) __Cal.4th__* (Case No. S213478)

[14] Federal Aviation Administration, *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

Typical noise levels at 50 feet from various types of equipment that may be used during construction are listed in **Table 4.9-4**. The loudest noise levels are typically generated by impact equipment (e.g., pile drivers) and heavy-duty equipment (e.g., scrapers and graders).

TABLE 4.9-4: MAXIMUM NOISE LEVELS OF COMMON CONSTRUCTION MACHINES

Noise Source	Noise Level at 50 feet (dBA) /a/
Front Loader	73-86
Trucks	82-95

Paver	85-88

/a/ Machinery equipped with noise control devices or other noise-reducing design features generates less noise than shown in the table.
SOURCE: City of Los Angeles, *CEQA Thresholds Guide*, 2006.

The LAMC regulates construction noise levels through the provisions of Section 41.40 and Section 112.05. As described in Regulatory Framework above, Section 41.40 states that construction activities may only occur between the designated hours (7:00 a.m. to 9:00 p.m. Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays). LAMC Section 112.05 establishes performance standards for powered equipment or tools. The maximum allowable noise level for most construction equipment within 500 feet of any residential zone is 75 dBA measured at 50 feet from the noise source. This restriction holds unless compliance is not technically feasible even with the use of noise "mufflers, shields, sound barriers, and/or other noise reduction devices or techniques."

Noise could be experienced by sensitive uses due to construction activities associated with development pursuant to the ECTNP. Sensitive uses are located in and around the ECNTP, and as specific development plans have not yet been determined at individual sites, for the purpose of this analysis it is assumed that sensitive receptors could be as close as 50 feet from where construction would take place. As shown in **Table 4.9-4**, above, sensitive receptors in the ECNTP could experience noise levels from construction equipment ranging from 68 to 107 dBA L_{eq}. Although LAMC regulations discussed above place limits on construction noise levels, there is still a possibility that typical construction noise levels could exceed the LAMC standard of 75 dBA L_{eq} at 50 feet in both areas of proposed change and areas within the ECTNP Project Area where zoning controls would not change. Details about future development projects and their ability to incorporate noise reduction devices or techniques per LAMC Section 112.05 are not known at this time. Therefore, prior to implementation of mitigation, the Proposed Project would result in a significant impact related to construction noise exceeding established standards.

Operation

The greatest potential for operational noise impacts would be related to changing the current zoning adjacent to existing sensitive land uses. These potential incompatibilities between the areas of change and surrounding uses are shown in **Table 4.9-5**. This table assesses the impacts of the proposed zones on the surrounding community (e.g., future industrial adjacent to existing residential). It does not assess the impact of the existing community to a new zone (e.g., existing manufacturing adjacent to future residential). Development could occur anywhere in the Project Area, both inside and outside areas of proposed change/Subareas. Impacts could occur throughout the Plan Area if intensified development is proposed adjacent to sensitive receptors.

TABLE 4.9-5: POTENTIAL NOISE INCOMPATIBILITY ADJACENT TO ZONE CHANGE AREAS

Station Area	Areas of Proposed Change		Adjacent Land Uses Outside of Change Areas	Potential Noise Incompatibility from Zone Changes?
	Existing Zone	Proposed Zone		
BUNDY	Manufacturing (M2)	New Industry; Hybrid Industrial: Jobs Emphasis; Hybrid Industrial: Residential Emphasis	Single-Family Residential Multi-Family Residential Public Facilities Commercial	No
	Single-Family Residential (R1)	Multi-Family Residential (R3, R1.5)	Multi-Family Residential Commercial Manufacturing	No
	Single-Family Residential (R1)	Residential/Accessory Services (RAS4)	Multi-Family Residential Commercial	**Yes**
SEPULVEDA	Manufacturing (M2)	New Industry; Hybrid Industrial: Jobs Emphasis	Single-Family Residential Multi-Family Residential Commercial Manufacturing	No
	Commercial (C2)	Residential/Accessory Services (RAS4)	Single-Family Residential Multi-Family Residential Commercial	No
	Multi-Family Residential (R2)	Multi-Family Residential (R3)	Single-Family Residential	No
WESTWOOD	Commercial (C2)	Residential/Accessory Services (RAS4)	Single-Family Residential Commercial	No
	Multi-Family Residential (R2)	Multi-Family Residential (R3)	Single-Family Residential Multi-Family Residential	No
PALMS	Manufacturing (M1)	New Industry	Multi-Family Residential Commercial	No
	Commercial (C2, CR, P1)	Mixed Use: Commercial/ Residential	Multi-Family Residential Public Facilities	No
	Multi-Family Residential (R3, R4)	Mixed Use: Commercial/ Residential	Multi-Family Residential Public Facilities Commercial	**Yes**
CULVER CITY	Manufacturing (M1, M2)	New Industry and Hybrid Industrial: Jobs Emphasis	Multi-Family Residential Manufacturing	No
	Commercial (C2, C4, P1)	Mixed Use: Commercial/ Residential	Multi-Family Residential Public Facilities Commercial	No
	Multi-Family Residential (RD2, R3)	Mixed Use: Commercial/ Residential	Multi-Family Residential Public Facilities	**Yes**

SOURCE: TAHA, 2017.

As specific development plan have not yet been determined at individual sites, for the purpose of this analysis, assumptions are made based off the compatibility of land uses. The assessment considers the general compatibility between land uses allowed in areas of proposed changed and the type of existing adjacent (i.e., abutting and across the street) land uses. Using the Thresholds Guide criteria, **Table 4.9-5** considers whether the noise level of a new proposed use in the ECTNP would exceed the ambient noise level of an existing adjacent use by at least 3 dBA to or within the "normally unacceptable" or "clearly unacceptable" categories (as indicated in **Table 4.9-1**), or would exceed the noise level by at least 5 dBA.

For example, the Bundy Station Area includes the conversion of some manufacturing zoning to the New Industry zone or either one of two the Hybrid Industrial zones. The New Industry and Hybrid Industrial zones would not allow traditional industrial uses, rather uses tailored toward 21st century industries, such as creative office, research and development, media, and technology. It is not anticipated that New Industry land uses would generate more noise than existing manufacturing facilities, which typically include substantial operations of mechanical equipment. New Industry and Hybrid Industrial land uses would include the operations of some mechanical equipment (e.g. HVAC equipment); however, the noise generated by this equipment would be similar or less than the noise generated by heavier equipment that is typically associated with manufacturing facilities allowed in the existing Manufacturing zones. Therefore, the proposed zoning would have a lesser impact on adjacent sensitive uses compared to the existing zoning, and would not increase the current ambient noise level of adjacent sensitive uses.

Another example is the conversion of a single-family residential zone to the Residential/Accessory Service (RAS4) zone in the Bundy Station Area. The RAS4 zone allows multi-family land use as well as neighborhood-serving commercial land uses such as grocery stores. A new grocery store located next to a single-family or multi-family residence could increase noise levels due a variety of noise sources, including truck deliveries and parking activity and thus would be potentially incompatible. Trucks in loading zones can generate noise levels up to 79 dBA at 50 feet, which would exceed the City's presumed ambient noise levels for residential uses (approximately 50 dBA during the daytime, as shown in **Table 4.9-3**) by more than 5 dBA.[15] This type of noise source would also likely exceed baseline noise levels, if they are already higher than the presumed ambient level, in existing residential areas by more than 5 dBA. In this case, the proposed zoning would potentially have a greater noise impact on adjacent sensitive uses compared to existing zoning.

In the Palms and Culver City Station Areas, some Multi-Family Residential zones (RD2, R3, and R4) would be converted to the Mixed Use Commercial/Residential zone. The Mixed Use zone would mostly be developed with residential uses, but could also be developed entirely as commercial use. Thus, commercial uses could be operational adjacent to residences, schools, or other existing sensitive uses. As discussed above for the proposed RAS4 zone in Bundy Station Area, due to noise sources such as truck delivery, commercial uses would potentially impact adjacent sensitive uses by increasing the ambient noise levels by more than 5 dBA.

As shown in **Table 4.9-5**, the Bundy, Palms, and Culver City Station Areas include zone changes that have the potential to generate a noise impact on an existing adjacent sensitive land use. A "No" in the last column of the table does not necessarily mean that the proposed zone is compatible with the adjacent uses. It may mean that the proposed zone is simply more compatible (less incompatible) than the existing zone. A "Yes" means that zone changes could create new land use incompatibilities. As discussed above, zone changes could increase noise levels at adjacent sensitive uses by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.9-1**, or increase noise by levels at least 5 dBA. This general incompatibility is not related to any specific exceedance of a standard in the LAMC (e.g., HVAC equipment) but land use incompatibility as a whole. Implementation of the ECTNP would result in a substantial permanent increase in ambient noise levels in the Proposed Project vicinity above levels existing without the Proposed Project. Therefore, prior to implementation of mitigation, due to the introduction of new land uses the

[15]California Department of Transportation, *Technical Noise Supplement*, November 2009.

Proposed Project would result in a significant impact related to exposing persons to or generating noise levels in excess of established standards.

An additional source of operational noise includes new stationary sources such as HVAC systems. Large HVAC systems could result in noise levels that average between 50 and 65 dBA L_{eq} at 50 feet from the equipment. HVAC units would be mounted on the rooftops and, as required by LAMC Section 112.02, HVAC units would be required to reduce noise such that the noise levels of adjoining units and adjacent properties do not exceed ambient noise levels by 5 dBA. Compliance with Section 112.02 would ensure that noise levels from the introduction of new HVAC units remains below LAMC standards and exposure to persons to noise levels above City's standards would not occur. Therefore, the Proposed Project would result in a less than significant impact related to exceeding established noise standards for operational noise from new HVAC uses. The predominant noise source for the Proposed Project is vehicular traffic. **Table 4.9-6** shows the incremental increase in mobile source noise levels between the 2035 Future with Project and Future No Project conditions.

Table 4.9-7 shows the incremental increase in mobile source noise levels between the Project in 2015 and No Project in 2015. None of the analyzed roadway segments would experience an increase in mobile source noise that exceeds the most conservative noise threshold from the Thresholds Guide of 3-dBA CNEL. Therefore, the Proposed Project would result in a less than significant impact related to exceeding standards for mobile noise levels.

SOURCE: TAHA, 2017.

In conclusion, before mitigation, the Proposed Project would result in potentially significant impacts related to exceeding standards for construction noise, as well as exceeding ambient noise levels of existing uses due to the introduction of new uses. The Proposed Project would result in less than significant impacts relating to exceeding standards for operational noise from new HVAC units, as well as mobile noise levels.

MITIGATION MEASURES

N1 The City, as a condition of any approval for applicable projects within the ECTNP, shall require all contractors to include the following best management practices in contract specifications:

- Construction haul truck and materials delivery traffic shall avoid residential areas whenever feasible. If no alternatives are available, truck traffic shall be routed on streets with the fewest residences.
- The construction contractor shall locate construction staging areas away from sensitive uses.
- When construction activities are located within 500 feet of noise-sensitive land uses, noise barriers (e.g., temporary walls or piles of excavated material) shall be constructed between activities and noise sensitive uses.
- Impact pile drivers shall be avoided where possible in noise-sensitive areas. Drilled piles or the use of a sonic vibratory pile driver are quieter alternatives that shall be utilized where geological conditions permit their use. Noise shrouds shall be used when necessary to reduce noise of pile drilling/driving.
- Construction equipment shall be equipped with mufflers that comply with manufacturers' requirements.
- The construction contractor shall use on-site electrical sources to power equipment rather than diesel generators where feasible.

N2 The following conditions shall apply to future development within New Industry, Hybrid Industrial: Jobs Emphasis, Hybrid Industrial-Residential Emphasis, and Mixed Use: Commercial/Residential zones with direct line-of-site to adjacent residential and other sensitive land uses:

- Industrial activity yards that include the operation of heavy equipment shall be shielded by sound barriers that block line-of-sight to sensitive receptors.
- Mechanical equipment (e.g., HVAC Systems) shall be enclosed with sound buffering materials.
- Truck loading/unloading activity shall be prohibited between the hours of 10:00 p.m. and 7:00 a.m. when located within 200 feet of a residential land use.
- Parking structures located within 200 feet of any residential use shall be constructed with a solid wall abutting the residences and utilize textured surfaces on garage floors and ramps to minimize tire squeal.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Implementation of Mitigation Measure **N1** would reduce construction noise levels at existing and future noise-sensitive receptors during construction activities associated with implementation of the Proposed Project; however, as identified in **Table 4.9-4**, above, noise levels from various mechanized construction equipment would exceed 75 dBA at distances of 50 feet from the equipment which could exceed the limitations established in LAMC Section 112.05. Depending on the location of construction activities, typical construction noise levels could still exceed 75 dBA despite implementation of mitigation. Implementation of Mitigation Measure **N1** would help to reduce this impact, but not necessarily to less than significant, because certain construction activities may still be required in proximity to nearby sensitive receptors and construction-related noise levels could exceed the 75 dBA threshold. Construction activity would be short-term and temporary at each location, although construction is anticipated to occur throughout the time frame of the Proposed Project. Regardless, with mitigation, the Proposed Project would result in a significant and unavoidable impact related to the generation of construction noise in excess of the LAMC standards.

Operational impacts related to HVAC and mobile sources noise were determined to be less than significant. However, impacts related to operational land use incompatibilities were determined to be potentially significant without mitigation. While difficult to quantify noise reduction associated with Mitigation Measure **N2**, implementing these conditions would reduce noise levels. For example, sound barriers between industrial activities and a receptor would reduce noise levels by 5 dBA to 15 dBA, depending on the height of the barrier. However, depending on the specific land uses proposed at a specific location, operational activities could still potentially increase noise levels at adjacent receptors by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.9-1**, or could increase any ambient noise level by 5 dBA or more. Therefore, the Proposed Project is considered to result in a significant and unavoidable impact related to operational noise after mitigation.

IMPACT 4.9-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN A SUBSTANTIAL PERMANENT INCREASE IN AMBIENT NOISE LEVELS IN THE PROPOSED PROJECT VICINITY ABOVE LEVELS EXISTING WITHOUT THE PROJECT? THIS IMPACT IS CONSIDERED SIGNIFICANT AND UNAVOIDABLE.

See Impact 4.9-1 for a discussion of permanent noise. The Proposed Project is a planning document and detailed noise impacts cannot be identified in the absence of specific projects. Impact 4.9-1 includes examples of specific projects that would potentially result in substantial increases in permanent noise. For example, in the Palms and Culver City Station Areas, some Multi-Family Residential zones (RD2, R3, and R4) would be converted to the Mixed Use Commercial/Residential zone. It is anticipated that the Mixed Use zone would mostly be developed with residential uses, but could also be developed entirely as commercial use. Thus commercial uses could be operational adjacent to residences, schools, or other existing sensitive uses. Noise sources such as truck deliveries at commercial uses could impact adjacent sensitive uses by increasing the ambient noise levels at adjacent receptors by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.9-1**, or increase noise by levels at least 5 dBA. This would result in a substantial permanent increase in ambient noise levels in the Proposed Project vicinity above levels existing without the Proposed Project. Therefore, prior to implementation of mitigation, the Proposed Project could result in a significant impact related to operational noise.

MITIGATION MEASURES

Refer to Mitigation Measure **N2** above for mitigation related to permanent noise from operational activity.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to operational noise were determined to be significant without mitigation. While difficult to quantify noise reduction associated with Mitigation Measure **N2**, implementing these conditions would reduce noise levels. For example, sound barriers between industrial activities and a receptor would reduce noise levels by 5 dBA to 15 dBA, depending on the height of the barrier. However, depending on the specific land uses proposed at a specific location, operational activities could still increase noise levels at adjacent receptors by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.9-1**, or could increase any ambient noise level by 5 dBA or more. Therefore, the Proposed Project is considered to result in a significant and unavoidable impact related to operational noise after mitigation.

IMPACT 4.9-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN A SUBSTANTIAL TEMPORARY OR PERIODIC INCREASE IN AMBIENT NOISE LEVELS IN THE PROPOSED PROJECT VICINITY ABOVE LEVELS EXISTING WITHOUT THE PROJECT? THIS IMPACT IS CONSIDERED SIGNIFICANT AND UNAVOIDABLE.

As discussed above in Impact 4.9-1, land uses sensitive to increased noise levels (e.g., residences) are located throughout the ECTNP and surrounding communities. Construction activity typically involves the operation of multiple pieces of equipment at the same time.

Table 4.9-8 shows noise levels by construction phase at 50 feet. The grading/excavation and finishing phases typically generate the loudest noise levels at 89 dBA L_{eq} without equipment mufflers, and 86 dBA L_{eq} with equipment mufflers.

TABLE 4.9-8: OUTDOOR CONSTRUCTION NOISE LEVELS

Construction Phase	Noise Level At 50 Feet (dBA, L_{eq})	Noise Level At 50 Feet With Mufflers (dBA, L_{eq})
Ground Clearing	84	82
Grading/Excavation	89	86
Foundations	78	77
Structural	85	83
Finishing	89	86

SOURCE: City of Los Angeles, *CEQA Thresholds Guide*, 2006.

The existing daytime noise level in residential areas is presumed to be 50 dBA (**Table 4.9-3**). As discussed in Impact 4.9-1, it is anticipated that construction activity within the ECNTP would be located within 50 feet of residences and other sensitive receptors. Based on **Table 4.9-8**, the daytime ambient noise levels would increase between 28 and 39 dBA depending on the construction phase. Construction noise would increase ambient noise levels by more than 10 dBA for activities lasting more than one day, and by more than 5 dBA for construction activities lasting more than ten days in a three month period. This would result in a substantial temporary or periodic increase in ambient noise levels in the Proposed Project vicinity above levels existing without the Proposed Project. Therefore, prior to implementation of mitigation, the Proposed Project would result in a significant impact related to construction noise.

MITIGATION MEASURES

Refer to Mitigation Measure **N1** above for mitigation related to temporary and periodic noise from construction activity.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to temporary and periodic noise from construction activity were determined to be significant without mitigation. While difficult to quantify, the noise reduction associated with each part of Mitigation Measure **N1** would noticeably reduce noise levels. For example, requiring equipment mufflers would reduce engine noise by at least 3 dBA. However, in the absence of detailed noise analyses associated with specific projects, it is anticipated that construction noise levels at various sensitive land uses would exceed the City's thresholds of significance. Therefore, the Proposed Project would result in a significant and unavoidable impact related to temporary and periodic noise after mitigation.

IMPACT 4.9-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXPOSE PEOPLE TO OR GENERATE EXCESSIVE VIBRATION OR GROUND-BORNE NOISE LEVELS? THIS IMPACT IS CONSIDERED SIGNIFICANT AND UNAVOIDABLE.

Construction

Construction activity can result in varying degrees of ground vibration depending on the equipment and methods employed. Operation of construction equipment causes vibrations that spread through ground and diminish in strength with distance. Buildings founded on the soil in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the lowest levels, low rumbling sounds and perceptible vibrations at moderate levels, and slight damage at the highest levels.

Table 4.9-9 shows construction equipment vibration levels based on various reference distances. Construction vibration is a localized event and is typically only perceptible to a receptor that is in close proximity to the vibration source. The type of low- or mid-rise buildings anticipated to be built under the Proposed Project would typically be constructed with loaders and bulldozers. However, it is possible that pile driving would be necessary depending on site-specific geologic conditions. Construction equipment would typically generate vibration levels up to 87 Vdb at 25 feet, although pile driving could generate a vibration level of 112 Vdb at 25 feet. Without detailed project-specific construction plans, it is possible that heavy equipment could operate within 25 feet of, or adjacent to, nearby buildings. The vibration levels associated with this equipment could exceed the 90 VdB for buildings extremely susceptible to building damage (e.g., historic structures) and 98 VdB for engineered concrete and masonry buildings without plaster (e.g., typical urban development). Therefore, prior to mitigation, the Proposed Project would result in a significant impact related to construction vibration.

TABLE 4.9-9: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

	Approximate Vdb			
Equipment	**25 Feet**	**50 Feet**	**75 Feet**	**100 Feet**
Pile Driver (Impact)	112	106	102	100
Large Bulldozer	87	81	77	75
Loaded Trucks	86	80	76	74
Jackhammer	79	73	69	67
Small Bulldozer	58	52	48	46

SOURCE: FTA, *Transit Noise and Vibration Impact Assessment*, May 2006.

Operation

It is not anticipated that the ECTNP would be developed with substantial sources of operational vibration (e.g., blasting activities). Operational ground-borne vibration would be generated by vehicular travel on the local roadways. According to the FTA, *Transit Noise and Vibration Impact Assessment* guidance document, vibration from traffic is rarely perceptible.[16] It is not anticipated that the Proposed Project would result in new mobile or stationary sources of operational vibration. Similar to existing conditions, traffic vibration levels would not be perceptible by sensitive receptors. Therefore, the Proposed Project would result in less than significant impacts related to operational vibration.

[16]Federal Transit Authority, *Transit Noise and Vibration Impact Assessment*, May 2006.

MITIGATION MEASURES

N3 As part of project conditions for new development within the ECTNP Area, the City shall require all contractors to include the following best management practices in contract specifications:

- The construction contractor shall manage construction phasing (scheduling demolition, earthmoving, and ground-impacting operations so as not to occur in the same time period), use low-impact construction technologies, and shall avoid the use of vibrating equipment where possible to avoid construction vibration impacts.

- The construction contractor shall utilize alternatives to impact pile drivers, such as sonic pile drivers or caisson drills. If geotechnical limitations require the use of pile driving, control measures shall be used to reduce vibration levels. These measures may include, but are not limited to:

  - Predrilled holes;
  - Cast-in-place or auger cast piles;
  - Pile cushioning (i.e., a resilient material placed between the driving hammer and the pile);
  - Jetting (i.e., pumping a mixture of air and water through high-pressure nozzles to erode the soil adjacent to the pile); and
  - Non-displacement piles (i.e., piles that achieve capacity from the end bearing rather than the pile shaft).

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to construction vibration were determined to be significant without mitigation. While difficult to quantify the vibration reduction associated with Mitigation Measure **N3**, implementing caisson drilling instead of impact pile driving would reduce vibration levels by approximately 87 Vdb at 25 feet. It is anticipated that mitigation would substantially reduce/control construction vibration. However, in the absence of construction details associated with specific projects and without knowing the proximity of construction activities to specific receptors, it is anticipated that construction vibration levels at adjacent buildings could exceed the thresholds of significance. Therefore, after mitigation the Proposed Project is considered to result in a significant and unavoidable impact related to construction vibration after mitigation.

Impacts related to operational vibration were determined to be less than significant without mitigation.

IMPACT 4.9-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXACERBATE LEVELS OF EXPOSURE FOR PEOPLE WORKING OR RESIDING WITHIN AN AIRPORT LAND USE PLAN OR, WHERE SUCH A PLAN HAS NOT BEEN ADOPTED, WITHIN TWO MILES OF A PUBLIC AIRPORT OR PUBLIC USE AIRPORT TO EXCESSIVE NOISE LEVELS? THE PROJECT WOULD NOT AFFECT EXISTING NOISE RELATED TO OPERATION OF SANTA MONICA AIRPORT AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH AVIATION NOISE.

The City's community noise exposure standards are presented in **Table 4.9-1**, above. This table can be used to determine if a proposed land use is compatible with existing ambient noise levels, including noise levels generated by an airport. The ECTNP Project Area is approximately 1,400 feet north of the Santa Monica Airport. The nearest proposed zone or land use designation change is located approximately 2,800 feet north of the Santa Monica Airport. The Santa Monica Airport has developed noise contours to characterize the Airport's influence on community noise levels.[17] The noise contours indicate that Santa Monica Airport-related noise levels at new development associated with the Proposed Project would be less than 60 dBA CNEL. These airport-related noise levels would be consistent with the City's acceptable community noise exposure standards for all land uses, as presented in **Table 4.9-1**. Therefore, the Proposed Project would result in no significant impact related to exacerbating levels of exposure for people working or residing near

[17]City of Santa Monica, *Calendar Year 2012 CNEL Contours for the Santa Monica Municipal Airport*, September 2013.

the Santa Monica Airport to excessive noise levels. Additionally, the FAA and the City of Santa Monica plan to maintain airport operations through 2028, after which the City may discontinue its use as an airport.[18]

MITIGATION MEASURES

The Proposed Project would not exacerbate existing conditions with respect to aviation noise. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to aviation noise were identified to result from the Proposed Project.

IMPACT 4.9-6 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXACERBATE LEVELS OF EXPOSURE FOR PEOPLE WORKING OR RESIDING WITHIN THE VICINITY OF A PRIVATE AIRSTRIP TO EXCESSIVE NOISE LEVELS? THE PROJECT AREA IS NOT LOCATED WITHIN THE VICINITY OF A PRIVATE AIRSTRIP. THE PROJECT WOULD NOT AFFECT EXISTING NOISE RELATED TO OPERATION OF AN AIRSTRIP AND THEREFORE THERE WOULD BE NO IMPACT ASSOCIATED WITH AVIATION NOISE.

The Project Area is not located within the vicinity of a private airstrip. Development of the Proposed Project would not exacerbate levels of exposure for people residing or working in the project area to excessive noise related to airstrip operations. Therefore, the Proposed Project would have no impact related to airstrip noise, and no further analysis of this issue is required.

MITIGATION MEASURES

The Proposed Project would not exacerbate existing conditions with respect to aviation noise. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

No impacts related to aviation noise were identified to result from the Proposed Project.

[18]Federal Aviation Administration, *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

4.10 POPULATION, HOUSING, AND EMPLOYMENT

This section provides an overview of population, housing, and employment and evaluates the construction and operational impacts associated with the Proposed Project. Topics addressed include local and regional assessments, the amount of population, housing, and employment growth expected, and the potential displacement caused by the Proposed Project. The Draft EIR evaluates the environmental impacts related to population, housing, and employment based upon information from a variety of public agencies including the City of Los Angeles Department of City Planning (DCP), the U.S. Census Bureau (US Census), the Southern California Association of Governments (SCAG), and the California Department of Finance (DOF).

In accordance with California Environmental Quality Act (CEQA) Guidelines Section 15131, the Draft EIR analysis is limited to those socioeconomic issues that could result in a direct change on the physical environment. In light of this, the effect of the Proposed Project on property values and its economic effect on surrounding businesses are not considered environmental issues and, therefore, will not be analyzed.

REGULATORY FRAMEWORK

FEDERAL

Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Relocation Act). The Uniform Relocation Act (Public Law 91-646) provides important protections and assistance for people affected by federally funded projects. This law was enacted by Congress to ensure that people whose real property is acquired, or who move as a result of projects receiving federal funds, will be treated fairly and equitably and will receive assistance in moving from the property they occupy.

Comprehensive Housing Affordability Study (CHAS). CHAS was enacted by the Cranston-Gonzalez National Affordable Housing Act of 1990 and is run by the U.S. Department of Housing and Urban Development (HUD). The primary purpose of the CHAS data is to demonstrate the number of households in need of housing assistance. This is estimated by the number of households that have certain housing problems and have income low enough to qualify for HUD's programs (primarily 30, 50, and 80 percent of median income). It is also important to consider the prevalence of housing problems among different types of households, such as the elderly, disabled, minorities, and different household types. The CHAS data provide counts of the numbers of households that fit these HUD-specified characteristics in HUD-specified geographic areas.

In addition to estimating low-income housing needs, the CHAS data contribute to a more comprehensive market analysis by documenting issues such as lead paint risk, affordability mismatch, and the interaction of affordability with variables such as age of homes, number of bedrooms, and type of building.

STATE

Senate Bill 375 (SB 375). SB 375 focuses on aligning transportation, housing, and other land uses to achieve regional greenhouse gas (GHG) emission reduction targets established under the California Global Warming Solutions Act, also known as Assembly Bill (AB) 32. SB 375 requires Metropolitan Planning Organizations (MPO) to develop a Sustainable Communities Strategy (SCS) as part of the Regional Transportation Plan (RTP), with the purpose of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. In application, the SCS must: (1) identify the general location of land uses, residential densities, and building intensities within the region; (2) identify areas within the region sufficient to house all the population of the region; (3) identify areas within the region sufficient to house an eight-year projection of the regional housing need; (4) identify a transportation network to service the regional transportation needs; gather and consider the best practically available scientific information

regarding resources areas and farmland in the region; (5) consider the state housing goals; (6) set forth a forecasted development pattern for the region; and (7) allow the regional transportation plan to comply with the Federal Clean Air Act (CAA) of 1970 (42 United States Code Section 7401 *et seq.*; Government Code Section 65080, subdivision (b)(F)(2)(B)), which, when integrated with the transportation network and other transportation measures and policies, will reduce the GHG from automobiles and light-duty trucks to achieve, if there is a reasonable way to do so, the GHG emission reduction targets approved by the California Air Resources Board (CARB). If the SCS does not achieve the GHG emission targets set by CARB, an Alternative Planning Strategy (APS) must be developed to demonstrate how the targets could be achieved.

SB 375 also imposes a number of new requirements on the regional housing needs process. Prior to SB 375, the regional transportation plan and regional housing needs processes were not required to be coordinated. SB 375 now synchronizes the schedules of the regional housing needs allocation (RHNA) and RTP processes. The RHNA, which is developed after the regional transportation plan, must also allocate housing units within the region consistent with the development pattern included in the SCS. Previously, the RHNA determination was based on population projections produced by the DOF. SB 375 requires the determination to be based upon population projections by the DOF and regional population forecasts used in preparing the RTP. If the total regional population forecasted and used in the RTP is within a range of three percent of the regional population forecast completed by the DOF for the same planning period, then the population forecast developed by the regional agency and used in the RTP shall be the basis for the determination. If the difference is greater than three percent, then the two agencies shall meet to discuss variances in methodology and seek agreement on a population projection for the region to use as the basis for the RHNA determination. If no agreement is reached, then the basis for the RHNA determination shall be the regional population projection created by the DOF.

Existing law requires local governments to adopt a housing element as part of their general plan. Unlike the rest of the general plan, where updates sometimes occur at intervals of 20 years or longer, under previous law the housing element was required to be updated as frequently as needed and no less than every five years. Under SB 375, this time period has been lengthened to eight years and timed so that the housing element period begins no less than 18 months after adoption of the RTP, to encourage closer coordination between the housing and transportation planning. SB 375 also changes the implementation schedule required in each housing element. Previous law required the housing element to contain a program, which set forth a five-year schedule to implement the goals and objectives of the housing element. The new law instead requires this schedule of actions to occur during the eight-year housing element planning period, and requires each action have a timetable for implementation.

Fair Employment and Housing Act (FEHA). The FEHA of 1959 (Government Code Section 12900 *et seq.*) prohibits housing discrimination on the basis of race, color, religion, sexual orientation, marital status, national origin, ancestry, familial status, disability, or source of income.

The Unruh Civil Rights Act. The Unruh Civil Rights Act of 1959 (Civ. Code Section 51) prohibits discrimination in "all business establishments of every kind whatsoever." The provision has been interpreted to include businesses and persons engaged in the sale or rental of housing accommodations.

California Department of Housing and Community Development (HCD). State Housing Law (Government Code Section 65580) requires local government plans to address the existing and projected housing needs of all economic segments of the community through their housing elements. The housing element is one of seven state-mandated elements that every general plan must contain, and is required to be updated every eight years and determined legally adequate by the state. The purpose of the housing element is to identify the community's housing needs, states the community's goals and objectives with regard to housing production, rehabilitation, and conservation to meet those needs, and define the policies and programs that the community will implement to achieve the stated goals and objectives.

California Relocation Assistance Act. The California Relocation Assistance Act (Government Code Section 7260 *et seq.*) establishes uniform policies to provide for the fair and equitable treatment of people displaced from their homes or businesses as a direct result of state and/or local government projects or programs. This Act requires that comparable replacement housing be made available to displaced persons within a reasonable period of time prior to the displacement. Displaced persons or businesses are assured payment for their acquired property at fair market value. Relocation assistance in the form of advisory assistance and financial benefits would be provided at the local level. This includes aid in finding a new home location, payments to help cover moving costs, and additional payments for certain other costs.

Homeowners and Private Property Protection Act. In 2008, California voters approved Proposition 99, the Homeowners and Private Property Protection Act, which amended the California Constitution so that local governments are prohibited from using eminent domain authority to acquire an owner-occupied residence for the purposes of conveying it to a private recipient, with limited exceptions. Proposition 99 applies only to owner-occupied residences. Cities may still use eminent domain authority to convey multi-family and non-residential property to other private parties.

Density Bonus Law (Government Code Section 65915). The State Density Bonus law (signed into law in 1979) requires jurisdictions to provide applicants with a density bonus and incentives or concessions for the production of housing development in which affordable housing is also provided. Eligible projects include housing developments with 10 percent housing for lower income households, 5 percent of the housing for very low income households, senior citizen housing, and 10 percent of the total dwelling units provided as affordable housing in condominium projects.

Assembly Bill (AB) 2222. On September 27, 2014, Governor Brown signed AB 2222, which amended sections of the State Density Bonus Law (Government Code Section 65915). AB 2222's major provision to the State Density Bonus Law requires that density bonus projects resulting in a loss in existing affordable, and otherwise locally-regulated (i.e., rent-stabilized) housing units, replace those units one-for-one. It also extends the affordability period from 30 to 55 years and expands the use of equity sharing in for-sale units.

REGIONAL

Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS).[1] In 2012, SCAG adopted the 2012-2035 RTP/SCS. The RTP/SCS presents a long-term transportation vision through the year 2035 for the SCAG region. The State of California requires that cities plan for changes in population, housing demand and employment; if growth is anticipated, each city must accommodate a share of the region's projected growth. These projections are developed by SCAG, which serves as the MPO for the six-county region which includes Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties, and then allocated to cities within the region. SCAG is mandated by federal and state governments to prepare the RTP, a 20-year transportation plan for the region that addresses regional growth, air quality and other issues, based on an analysis of past and future regional trends. The 2012-2035 RTP/SCS includes SCAG's projection of growth for the region. The RTP/SCS includes population, housing, and employment forecasts that provide advisory information to local jurisdictions for use in planning activities. The overall land use pattern projected by the RTP/SCS focuses jobs and housing in the region's High Quality Transit Areas (HQTA), areas identified by SCAG that are within a half mile of a well-serviced transit stop. The RTP/SCS assumes that between 2008 and 2035, 51 percent of new housing and 53 percent of new employment growth will occur within HQTAs.

[1]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. The 2016-2040 RTP/SCS is discussed for informational purposes. Please see **Appendix K** for a more detailed discussion.

SCAG's 2016-2040 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and Regional Transportation Improvement Plan (RTIP).[2] The 2016-2040 RTP/SCS, adopted in April 2016, presents the transportation and overall land use vision for the SCAG region. The 2016-2040 RTP/SCS includes SCAG's projection of growth for the region through 2040. The 2016-2040 RTP/SCS includes population, housing, and employment forecasts that provide advisory information to local jurisdictions for use in planning activities. Built upon the success of the 2012-2035 RTP/SCS, the 2016-2040 RTP/SCS includes a set of regional land use strategies that are intended to increase transportation mode choice, guide future land development patterns, and further improve air quality. These proposed land use strategies recognize a higher portion of new households and employment in areas well served by transit, and reduce growth in high value habitat areas along with neighborhoods that are adjacent to highways. Like the 2012-2035 RTP/SCS, the proposed land use strategies included in the 2016-2040 RTP/SCS continue to focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities.

Sustainability Planning Grant Program. The Sustainability Planning Grant Program, previously known as the Compass Blueprint Growth Grant Program, provides direct technical assistance to SCAG member jurisdictions to complete planning and policy efforts that enable implementation of the regional SCS. Since starting in 2005, 133 projects have been completed through the program, with another 69 projects to be completed by the end of 2016. Grants are available to SCAG member jurisdictions in through categories: integrated land use, active transportation, and green region. The Compass Blueprint Growth Vision was replaced by SCAG's RTP/SCS.[3]

SCAG Regional Housing Needs Assessment (RHNA). The RHNA is a key tool for SCAG and its member governments to plan for growth. The 5th cycle Final RHNA Allocation Plan was adopted by the SCAG Regional Council on October 4, 2012 and quantifies the need for housing within each jurisdiction between 2013 and 2021. Communities then plan, consider, and decide how they will address this need through the process of completing the housing elements of their general plans. The RHNA does not necessarily encourage or promote growth, but rather allows communities to anticipate growth, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment. The RHNA is produced periodically by SCAG, as mandated by state law, to coincide with the region's schedule for preparing housing elements. It consists of two measurements of housing need: existing and future.[4]

The existing need for housing is based on data from the most recent US Census to measure ways in which the housing market is not meeting the needs of current residents. These variables include the number of low-income households paying more than 30 percent of their income for housing, as well as severe overcrowding.

The future need for housing is determined primarily by the forecasted growth in households in a community, based on historical growth patterns, job creation, household formation rates, and other factors to estimate how many households will be added to each community over the projection period. The need for new households is then adjusted to account for an ideal level of vacancy needed to promote housing choice, maintain price competition, and encourage acceptable levels of housing upkeep and repair. The RHNA also accounts for units expected to be lost due to demolition, natural disaster, or conversion to non-housing uses.

[2]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. The 2016-2040 RTP/SCS is discussed for informational purposes. Please see **Appendix K** for a more detailed discussion.

[3]SCAG, *Sustainability Planning Grant,* http://sustain.scag.ca.gov/Pages/Grants%20and%20Local%20Assistance/GrantsLocalAssistance.aspx, accessed March 6, 2017.

[4]SCAG, *Regional Housing Needs Assessment (RHNA),* http://www.scag.ca.gov/Documents/scagRHNA2012.pdf, accessed March 6, 2017.

The sum of these factors – household growth, vacancy need and replacement need – form the "construction need" assigned to each community. In addition, the RHNA considers how each jurisdiction might grow in ways that will decrease the concentration of low-income households in certain communities. The need for new housing is distributed among income groups so that each community moves closer to the regional average income distribution. The City of Los Angeles was assigned a RHNA of 82,002 for the 2013 to 2021 planning period.

LOCAL

The Housing Authority City of Los Angeles (HACLA) Year 2016 Agency Plan (Agency Plan). The Agency Plan has a goal to preserve the existing affordable housing supply of 79,379 units, and will spearhead a collaborative effort to increase the supply of affordable housing in the City of Los Angeles over the next 10 years.[5] HACLA will collaborate with residents, as well as public, non-profit, and private entities to create viable, healthy communities, and to empower residents to achieve financial independence.

City of Los Angeles General Plan Framework and Housing Elements. The City of Los Angeles General Plan contains growth and development policies that reflect a comprehensive long-range view of the City as a whole. The General Plan provides a comprehensive strategy for accommodating long-term growth should it occur as projected. Applicable goals and policies that apply to all development within the City of Los Angeles include a balanced distribution of land uses, adequate housing for all income levels, and economic stability. The Citywide General Plan Framework Element, adopted in December 1996 and amended in August 2001, is intended to guide the City's long-range growth and development. Although the Framework Element indicates a horizon year of 2010, the population anticipated for 2010 has still not been reached. The Housing Element of the General Plan identifies the existing and projected housing needs of all economic segments of the City of Los Angeles. The goal of the Housing Element is to encourage the location of housing, jobs, and services in mutual proximity. Policies of the Housing Element include the provision of an adequate and affordable supply of housing. Goals, objectives, and policies from the General Plan Framework Element and Housing Element related to population, housing, and employment are listed in **Table 4.10-1**.

Los Angeles Municipal Code (LAMC). Zoning regulations provide for the types and densities of commercial, institutional, industrial, and residential uses permitted in each of the City's zones. Zoning in the City is generally cumulative; it permits less intense uses to be built within zones that allow greater intensity, and permits residential uses to be developed in commercial zones. For instance, R1 (single-family), R2 (two family), and R3 (medium density multi-family) uses are allowed to be built in an R4 zone, and are also permitted in all commercial zones. No minimum development standards are established in any zone. Zones and height districts dictate the height, setbacks, and number of residential units allowed per lot square-footage.

City of Los Angeles Community Plans (West Adams-Baldwin Hills-Leimert; Palms-Mar Vista-Del Rey; West Los Angeles). The ECTNP contains portions of three Community Plan areas: West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles. The community plans contain various goals, objectives, and policies that are directly and indirectly related to population, housing, and employment, listed in **Table 4.10-2**. These plans generally encourage the provision of an adequate level of housing that meets a range of needs for income, household type, and ability; maintenance and growth of the maximum employment base; and safe, secure, and high quality communities.

[5] U.S. Department of Housing and Urban Development, Office of Public and Indian Housing. *Housing Authority of the City Los Angeles Year 2016 Agency Plan – Final Version*, October 7, 2015.

TABLE 4.10-1: RELEVANT GENERAL PLAN POPULATION, HOUSING, AND EMPLOYMENT OBJECTIVES AND POLICIES	
GENERAL PLAN FRAMEWORK – LAND USE	
Objective 3.1	Accommodate a diversity of uses that support the needs of the City's existing and future residents, businesses, and visitors.
Objective 3.3	Accommodate projected population and employment growth within the City and each community plan area and plan for the provision of adequate supporting transportation and utility infrastructure and public services.
Objective 3.4	Encourage new multi-family residential, retail commercial, and office development in the City's neighborhood districts, community, regional, and downtown centers as well as along primary transit corridor/boulevards, while at the same time conserving existing neighborhoods and related districts.
Policy 3.4.1	Conserve existing stable residential neighborhoods and lower-intensity commercial districts and encourage the majority of new commercial and mixed-use (integrated commercial and residential) development to be located (a) in a network of neighborhood districts, community, regional, and downtown centers, (b) in proximity to rail and bus transit stations and corridors, and (c) along the City's major boulevards, referred to as districts, centers, and mixed-use boulevards, in accordance with the Framework Long-Range Land Use Diagram.
Objective 3.5	Ensure that the character and scale of stable single-family residential neighborhoods is maintained, allowing for infill development provided that it is compatible with and maintains the scale and character of existing development.
GENERAL PLAN FRAMEWORK – HOUSING	
Objective 4.1	Plan the capacity for and develop incentives to encourage production of an adequate supply of housing units of various types within each City sub region to meet the projected housing needs by income level of the future population to the year 2010.
Objective 4.2	Encourage the location of new multi-family housing development to occur in proximity to transit stations, along some transit corridors, and within some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods.
Objective 4.3	Conserve scale and character of residential neighborhoods.
Objective 4.4	Reduce regulatory and procedural barriers to increase housing production and capacity in appropriate locations.
GENERAL PLAN FRAMEWORK – ECONOMIC DEVELOPMENT	
Objective 7.2	Establish a balance of land uses that provides for commercial and industrial development which meets the needs of local residents, sustains economic growth, and assures maximum feasible environmental quality.
Objective 7.3	Maintain and enhance existing businesses in the City
Objective 7.5	Capture a significant share of regional growth in the "targeted" or emerging industries in the City of Los Angeles.
HOUSING ELEMENT	
Objective 1.1	Produce an adequate supply of rental and ownership housing in order to meet current and projected needs.
Objective 1.2	Preserve quality rental and ownership housing for households of all income levels and special needs.
Objective 1.3	Forecast and plan for changing housing needs over time in relation to production and preservation needs.
Objective 1.4	Reduce regulatory and procedural barriers to the production and preservation of housing at all income levels and needs.
Objective 2.2	Promote sustainable neighborhoods that have mixed-income housing, jobs, amenities, services, and transit.
Objective 2.4	Promote livable neighborhoods with a mix of housing types, quality design, and a scale and character that respects unique residential neighborhoods in the City
Objective 2.5	Promote a more equitable distribution of affordable housing opportunities throughout the City.
SOURCES: City of Los Angeles, *The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan*, re-adopted 2001; City of Los Angeles General Plan, *Housing Element 2013-2021,* adopted 2013.	

TABLE 4.10-2: RELEVANT COMMUNITY PLAN POPULATION, HOUSING, AND EMPLOYMENT GOALS, OBJECTIVES, AND POLICIES	
WEST ADAMS–BALDWIN HILLS–LEIMERT	
Goal LU7	A community that promotes an environment of safe, inviting, secure and high-quality multi-family neighborhoods for all segments of the community.
Goal LU9	A community of neighborhoods where social capital is promoted by ensuring the provision of adequate housing for all persons regardless of income, age, racial or ethnic background.
Policy LU9-1	Affordability. Prioritize housing that is affordable to a broad cross-section of income levels and that provides the ability to live near work and achieve homeownership.
Policy LU9-2	Mixed-income Neighborhoods. Strive to eliminate residential segregation and concentrations of poverty by promoting affordable housing that is integrated into mixed-income neighborhoods.
Policy LU10-4	Individual Choice. Promote greater individual choice in type, quality, price and location of housing.
Policy LU10-10	Moderate Income Homeownership. Allow for the creation of townhouse and condominium development through new construction, conversion or adaptive reuse in order to meet the demands of moderate income residents thereby increasing access to affordable, and moderate income homeownership opportunities.
Goal LU23a	A community that maintains and increases the commercial employment base for community residents whenever possible.
Policy LU23a-1	Match Jobs to Resident Skills. Promote efforts to prioritize commercial/economic development strategies that match jobs to existing and desired resident skills.
Goal LU27	A community that trains and develops its human resource potential to take advantage of the job opportunities of the future.
PALMS–MAR VISTA–DEL REY	
Goal 1	A safe, secure and high quality residential environment for all community residents.
Policy 1-1.1	Provide for adequate multi-family residential development.
Objective 1-4	To promote the adequacy and affordability of multiple-family housing and increase its accessibility to more segments of the population.
Policy 1-4.1	Promote greater individual choice in type, quality, price and location of housing.
Policy 1-4.2	Ensure that new housing opportunities minimize displacement of residents.
Goal 3	Sufficient land for a variety of industrial uses with maximum employment opportunities which are environmentally sensitive, safe for the work force with minimal adverse impact on adjacent uses.
Objective 3-1	To provide a viable industrial base with job opportunities for residents with minimal environmental and visual impacts to the community.
Policy 3-1.1	Designate and preserve lands for the continuation of existing industry and development of new industrial parks, research and development uses, light manufacturing and similar uses which provide employment opportunities.
WEST LOS ANGELES	
Goal 1	A safe, secure, and high quality residential environment for all economic, age, and ethnic segments of the community.
Policy 1-1.3	Provide for adequate multi-family residential development.
Objective 1-4	To promote adequate and affordable housing and increase its accessibility to more segments of the population, especially students and senior citizens.
Policy 1-4.1	Promote greater individual choice in type, quality, price and location of housing.
Policy 1-4.2	Ensure that new housing opportunities minimize displacement of residents.
Policy 1-4.3	Encourage multiple residential development in specified commercial zones.
Goal 3	Sufficient land for a variety of industrial uses with maximum employment opportunities that are safe for the environment and the workers, and which have minimal adverse impact on adjacent uses.
Objective 3-1	To retain existing industrial uses and promote future development which contributes to job opportunities and minimizes environmental impacts.
Policy 3-1.1	Designate and preserve lands for the continuation of existing industry and development of new industrial parks, research and development uses, light manufacturing and similar uses.

SOURCES: City of Los Angeles, *West Adams – Baldwin Hills – Leimert Community Plan,* 2016 *Palms -- Mar Vista – Del Rey Community Plan,* 1997; *West Los Angeles Community Plan,* 1999.

City of Los Angeles Density Bonus Ordinance (Ordinance 176,681). The purpose of the City's Density Bonus Ordinance, codified as LAMC Section 12.22 A.25, is to establish procedures for implementing State Density Bonus requirements, as set forth in California Government Code Sections 65915-65918, and to increase the production of affordable housing, consistent with City policies. Subject to the provisions of LAMC Section 12.22 A.25, Housing Development Projects that include an affordable housing component and Senior Citizen Housing Development projects may be granted a density bonus, allowing for a density increase over the otherwise maximum allowable residential density under the applicable zoning ordinance and/or specific plan. The density bonus is determined based on the percentage and type of restricted affordable housing units provided and shall not exceed 35 percent. The amount of parking required for these projects may also be reduced. In addition, a Housing Development Project that qualifies for a Density Bonus may be granted incentives set forth in the ordinance that allow for modification to a City development standard or requirement.

Homelessness Reduction and Prevention, Housing, and Facilities Bond (Proposition HHH). Proposition HHH, approved on November 8, 2016, is a $1.2 billion general obligation bond to finance the construction of supportive and affordable housing for homeless people in the City. The purpose of the bond is to provide safe, clean affordable housing for the homeless and for those in danger of becoming homeless, such as battered women and their children, veterans, seniors, foster youth, and the disabled; and provide facilities to increase access to mental health care, drug and alcohol treatment, and other services.

Los Angeles Affordable Housing and Labor Standards Initiative (Proposition JJJ). Proposition JJJ, approved on November 8, 2016, enacts an initiative to impose minimum affordable housing requirements, training standards, and labor and wage regulations on development projects requiring zoning changes, including provisions to require a certain percentage of labor come from local workers.

City of Los Angeles Affordable Housing Trust Fund. Contained within the LAMC, the City created and administers the Affordable Housing Trust Fund (Fund). The Fund establishes a special fund for the purposes of receiving and disbursing monies to address the affordable housing needs of the City. The Fund requires 25 percent of the received initial and continuing net revenue of the 2001 business tax and payroll expense tax amnesty program and the revenue program of the Revenue and Taxation Code Section 1955.1 (Assembly Bill 63) be allocated to the Fund.

City of Los Angeles Rent Stabilization Ordinance (RSO). The City's RSO was established in response to the shortage of affordable housing in the City of Los Angeles and went into effect May 1, 1979. The RSO's stated purpose is to regulate rents so as to safeguard tenants from excessive rent increases, while at the same time providing landlords with just and reasonable returns from their rental units.[6] The RSO addresses allowable rent increases, the registration of rental units, legal reasons for eviction, and the causes for eviction requiring relocation assistance payment to the tenant. Properties subject to the RSO are those that are within the City limits, contain two or more units, and have a Certificate of Occupancy prior to October 1, 1978, as well as replacement units under LAMC Section 151.28. A complaint can be filed by any tenant who believes that an owner, manager, or agent has committed a violation of the RSO. The Housing and Community Investment Department oversees and enforces the RSO.

[6]Los Angeles Municipal Code, *Chapter XV Rent Stabilization Ordinance*.

EXISTING SETTING

CONTEXT

CEQA Guidelines Section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of a Proposed Project as they exist at the time the Notice of Preparation (NOP) is published. The NOP for this EIR was published on March 14, 2013. Thus, the Draft EIR uses 2013 as the baseline existing conditions.

The City of Los Angeles has grown from its modest initial size of 28 square miles and 50,000 persons to over 469 square miles and a population of approximately 3.8 million persons according to the U.S. Census 2010. The population is anticipated to increase by 14 percent to approximately 4.32 million persons by the year 2035, according to the 2012-2035 RTP/SCS. In order to accommodate this growth, the City of Los Angeles has prepared and adopted a General Plan, which contains a guiding document – the General Plan Framework Element – that provides a strategy for long-range growth and development focused around the following guiding policies: grow strategically in designated centers and areas served by transit; conserve existing stable single and multifamily residential neighborhoods; balance the distribution of land uses; enhance neighborhood character through better development standards; create more small parks, pedestrian districts, and public plazas; improve mobility and access; and identify a hierarchy of commercial districts and centers. The City's 35 Community Plans and 2 Special Purpose Districts (LAX and Port of LA), as well as Specific Plans, implement, at a community level, the citywide goals and policies established in the overarching Framework Element and all the other elements in the General Plan.

Table 4.10-3 below shows the population according to the US Census 2010 for the County of Los Angeles, City of Los Angeles, the West Los Angeles sub-region (coterminous with the West Los Angeles Area Planning Commission Boundaries), and the three Community Plan Areas that are within the boundaries of the Proposed Project. **Table 4.10-3** also shows the projected future population for these areas in 2035 according to the 2012-2035 RTP/SCS. Significant growth is anticipated to occur throughout Los Angeles County by 2035, with the County population increasing by 15.6 percent and the City of Los Angeles population increasing by 13.9 percent. The West Los Angeles sub-region, which comprises 11 percent of the City's current population, is expected to grow at a rate of 11.2 percent, consistent with the overall City's growth rate. The ECTNP Area is located within the West Los Angeles sub-region, and therefore, is expected to accommodate a portion of this growth. Because the ECTNP Area is also located along the Expo LRT Line Corridor, it is consistent with General Plan Framework policies to concentrate growth around transit.

TABLE 4.10-3: EXISTING AND PROJECTED POPULATION GROWTH WITHIN LOS ANGELES COUNTY

	2010		2035 Projected		2010-2035	
	Population /a/	% of City of LA	Population /b/	% of City of LA	Population Growth	% Change

POPULATION

To determine the population of the Project Area in 2013, the existing conditions baseline year, data from the 2010 Census (the most recent Census data available) was adjusted to account for growth that was estimated to have occurred in the Project Area between 2010 and 2013, using the average annual growth rates between 2010 and 2013 for the City of Los Angeles and other surrounding cities, shown in **Table 4.10-4**. According to the U.S. Census, the population for ECTNP Area in 2010 was 49,934 persons. Applying the average annual growth rate of 0.44 percent, the population within the ECTNP Area in 2013 was estimated to be 50,595 persons. This represents 1.3 percent of the population of the City of Los Angeles in 2013.

TABLE 4.10-4: EXISTING POPULATION

Location	2010 Census Data /a/	Existing Conditions (2013) /b/	Net Population Growth (2010-2013)	Percent Change (2010-2013)	Average Annual Growth Rate /c/
County of Los Angeles /d/	9,818,605	9,958,091	139,486	1.42%	0.47%

/d/ County of Los Angeles data is shown for reference only. The County is not included in the average annual growth rate applied to the ECTNP.

Table 4.10-5 compares the existing conditions (2013) to SCAG population projections for 2035 for the County of Los Angeles, City of Los Angeles, surrounding cities, and the ECTNP Area. Based on historic and recent growth trends, SCAG projects the City of Los Angeles to grow 11.82 percent, to 4,320,600 residents, by 2035. Surrounding cities are expected to grow at slower rates, between 2 percent and 5 percent. The ECTNP is projected to grow by 7.61 percent, at a slower rate compared to the City as a whole, but at a greater rate than surrounding cities. The projected population for the ECTNP represents 1.26 percent of the projected population for the City in 2035, which is comparable to the Project's percent of the City's population in 2013.

TABLE 4.10-5: SCAG 2035 POPULATION PROJECTIONS

Planning Area	Existing Conditions (2013)/a/	SCAG Projection (2035) /b/	Projected Increase (Persons)	Projected Increase (%)
County of Los Angeles	9,958,091	11,353,000	1,394,909	14.01%
Beverly Hills	34,494	36,300	1,806	5.24%
Culver City	39,210	40,000	790	2.01%
City of Los Angeles	3,863,839	4,320,600	456,761	11.82%
Santa Monica	91,040	94,700	3,660	4.02%
West Hollywood	34,853	36,100	1,247	3.58%

SOURCES:
/a/ California Department of Finance Table 2: E-4.
/b/ SCAG, 2012-2035 RTP/SCS, accessed 2013.
/c/ Existing conditions (2013) for ECTNP Project Area are derived from the 2010 Census data adjusted to 2013 using the average annual growth rate of the surrounding cities, and the City of Los Angeles.

Under the current Community Plan land use designations and zoning, it is estimated that a total of approximately 52,500 persons can be accommodated within the ECTNP Area. While this represents an additional 1,907 persons more than existing conditions, the area does not contain sufficient capacity to accommodate the population growth projected by SCAG for the ECTNP Area in 2035.

HOUSING

To determine the number of housing units in the Project Area in 2013, the existing conditions baseline year, data from the U.S. Census 2010 (the most recent Census data available) was adjusted using the average annual growth rates in housing units between 2010 and 2013 for the City of Los Angeles and other surrounding cities, shown in **Table 4.10-6**. According to the U.S. Census, the ECTNP Area had 24,906 housing units in 2010. Applying the average annual growth rate of 0.14 percent, the number of housing units within the ECTNP in 2013 was estimated to be 25,018 housing units. This represents 1.8 percent of the number of housing units in the City of Los Angeles in 2013.

TABLE 4.10-6: EXISTING HOUSING UNITS

Location	2010 Census Data /a/	Existing Conditions (2013) /b/	Net Housing Growth (2010-2013)	Percent Change (2010-2013)	Average Annual Growth Rate /c/
County of Los Angeles /d/	3,445,076	3,463,382	18,306	0.53%	0.18%
Beverly Hills	16,394	16,436	42	0.26%	0.09%
Culver City	17,491	17,486	-5	-0.03%	-0.01%
City of Los Angeles	1,413,995	1,425,372	11,377	0.80%	0.27%
Santa Monica	50,912	51,210	298	0.59%	0.20%
West Hollywood	24,588	24,698	110	0.45%	0.15%
Average					**0.14%**
ECTNP Area	**24,906**	**25,018**	**112**	**0.45%**	**0.14%**

SOURCES and NOTES:
/a/U.S. Census Bureau, *2010 Census*, accessed 2013;
/b/ California Department of Finance, Table 2: E-5; accessed 2013
/c/ Average annual growth rate is derived from percentage change in households from 2010 to 2013.
/d/ County of Los Angeles data is shown for reference only. The County is not included in the average annual growth rate applied to the ECTNP.

Table 4.10-7 compares the existing number of housing units (2013) to SCAG housing projections for 2035 for the County of Los Angeles, City of Los Angeles, surrounding cities, and the ECTNP Area. (Note that SCAG makes housing projections in terms of households. In order to compare to existing conditions, the SCAG projections were converted to housing units, assuming a vacancy rate of 1.5 percent for owner occupied units and 4.5 percent for renter occupied units[7]. This vacancy allowance is made to facilitate availability and mobility among housing units).

The number of housing units in the City of Los Angeles is projected to grow to 1,680,766 by 2035, a growth of almost 18 percent compared to existing conditions in 2013. The surrounding cities are anticipated to increase at a much slower rate, as compared to the City of Los Angeles, while the ECTNP is anticipated to increase 13.9 percent, a rate more similar to the City of Los Angeles. According to SCAG, in 2035 the ECTNP is projected to comprise 1.7 percent of the households projected for the City of Los Angeles, which is comparable to the area's share of housing units in 2013.

Under the current Community Plan land use designations and zoning, it is estimated that a total of approximately 26,072 housing units can be accommodated within the ECTNP Area. While this represents an additional 1,054 housing units more than existing conditions, the area does not contain sufficient capacity to accommodate the housing unit growth projected for the ECTNP Area in 2035.

/b/ SCAG, 2012-2035 RTP/SCS, 2012. A household consists of all the people who occupy a housing unit regardless of relationship.
/c/ Existing conditions (2013) for ECTNP Project Area are derived from the 2010 Census data adjusted to 2013 using the average annual growth rate of the surrounding cities, and the City of Los Angeles.
/d/ Housing units projection for 2035 is based on SCAG household projection, applying the vacancy rates for owner-occupied and renter-occupied housing used in the California Department of Housing and Community Development Regional Housing Needs Assessment (RHNA) Determination for 2014-2021.

EMPLOYMENT

The existing number of jobs in the ECTNP Area in 2013, the existing conditions baseline year, was obtained through the U.S. Census "On the Map" application. For the purposes of comparison, **Table 4.10-8** shows the number of jobs in 2010 and 2013 for the ECTNP Area as well as the County of Los Angeles, City of Los Angeles, and the surrounding cities. According to the U.S. Census the number of jobs in the ECTNP Area in 2013 was 33,962 jobs. This represents 2 percent of the employment of the City of Los Angeles in 2013.

TABLE 4.10-8: EXISTING EMPLOYMENT		
Location	**Employment (2010)** /a/	**Employment (2013)** /a/
County of Los Angeles	4,133,335	4,282,812

Culver City	59,823	71,176
City of Los Angeles	1,604,925	1,692,165
Santa Monica	76,276	83,180
West Hollywood	33,419	27,779
ECTNP Area	**32,462**	**33,962**

SOURCES:
/a / U.S. Census Bureau, On the Map Application for 2010 and 2013, accessed January 2016.

Table 4.10-9 compares the existing conditions (2013) to SCAG employment projections for 2035 for the County of Los Angeles, City of Los Angeles, surrounding cities, and the ECTNP Area. According to SCAG, employment in the City of Los Angeles is projected to grow to 1,906,800 jobs by 2035, a growth of 12.7 percent compared to existing conditions in 2013. Meanwhile the surrounding cities of Beverly Hills, Culver City, Santa Monica, and West Hollywood are anticipated to grow at much higher rates – from 23.6 percent to 31.8 percent - indicating that this part of the region is expected to take on a larger share of employment growth in the future. At a rate of almost 27 percent, employment in the ECTNP Area is expected to grow more in line with the surrounding cities, and much faster than in the City of Los Angeles as a whole. According to SCAG, in 2035 the ECTNP is projected to comprise 2.26 percent of the jobs projected for the City of Los Angeles, which is modestly greater than the area's share of jobs in 2013.

TABLE 4.10-9: SCAG 2035 EMPLOYMENT PROJECTIONS				
Planning Area	**Existing Conditions (2013) /a/**	**SCAG Projection (2035) /b/**	**Projected Increase (Jobs)**	**Projected Increase (%)**
County of Los Angeles	4,282,812	4,827,000	544,188	12.7%
Beverly Hills	52,435	64,800	12,365	23.6%
Culver City	71,176	50,400	20,776	29.2%
City of Los Angeles	1,692,165	1,906,800	214,635	12.7%
Santa Monica	83,180	104,200	21,020	25.3%
West Hollywood	27,779	36,600	8,821	31.8%
ECTNP	**33,962**	**43,097**	**9,135**	**26.9%**

SOURCES:
/a/ U.S. Census Bureau, On the Map Application for 2013, accessed January 2016.
/b/ SCAG 212-2035 RTP/SCS, 2012.

Under the current Community Plan land use designations and zoning, it is estimated that a total of approximately 37,775 jobs can be accommodated within the ECTNP Area. While this represents an additional 3,813 jobs more than existing conditions, the area does not contain sufficient capacity to accommodate the jobs growth projected by SCAG for the ECTNP Area.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the State CEQA Guidelines, the Proposed Project would have a significant impact related to population and housing if it would:

- Induce substantial population growth in an area either directly (for example by proposing new homes or businesses) or indirectly (for example through extension of new roads or infrastructure);
- Displace substantial numbers of existing housing units necessitating the construction of replacement housing elsewhere; and/or
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance based upon the Appendix G thresholds set forth above shall be made on a case-by-case basis, considering the following factors.

- The degree to which the Proposed Project would cause growth (i.e., new housing or employment generators) or accelerate development in an undeveloped area that exceeds projected/planned levels for the year of project occupancy/buildout, and that would result in an adverse physical change in the environment;
- Whether the Proposed Project would introduce unplanned infrastructure that was not previously evaluated in the adopted Community Plan or General Plan;
- The extent to which growth would occur without implementation of the Proposed Project;
- The total number of residential units to be demolished, converted to market rate, or removed through other means as a result of the Proposed Project, in terms of net loss of market-rate and affordable units;
- The current and anticipated housing demand and supply of market rate and affordable housing units in the Project Area;
- The land use and demographic characteristics of the Project Area and the appropriateness of housing in the area; and
- Whether the project is consistent with adopted city and regional housing policies such as the Framework and Housing Elements, HUD Consolidated Plan and CHAS policies, redevelopment plan, Rent Stabilization Ordinance, and the Regional Comprehensive Plan and Guide (RCP&G).

METHODOLOGY

This analysis considers population, housing unit, and employment growth that would occur with implementation of the Proposed Project and the Proposed Project with the Alternative Compliance scenario, and whether this anticipated growth is within local or regional forecasts, whether it can be considered substantial with respect to growth projections citywide, and whether it would result in the displacement of housing or people.

The capacity of the Proposed Project, also referred to as reasonable expected development, is based on assumptions about the level of development that can be reasonably expected to occur during the life of the Proposed Project, given the proposed land use designations and zoning. Past building permit data demonstrate that not all sites will be redeveloped in the Project Area within the horizon year of 2035, nor will those sites that do get redeveloped be built to the maximum densities permitted by the Proposed Project for a variety of reasons, including economic conditions; market trends; financial lending practices; construction and land acquisition costs; physical site constraints; and other General Plan policies or regulations. For this reason, 100 percent development to maximum allowable densities and intensities is a theoretical scenario that is not analyzed, but rather a more "realistic" reasonable expected capacity is used both to guide proposed land use changes and analyze the potential environmental impacts of those changes.

Table 4.10-10 demonstrates the reasonably expected population, housing, and employment in the Project Area in 2035 under the Proposed Plan and under the Proposed Plan with Alternative Compliance scenario, and compares this to the following: the capacity of the current Community Plans; SCAG 2035 projections; and estimates from a market demand study that was prepared for the Proposed Project. [8]

TABLE 4.10-10: POPULATION, HOUSING, AND EMPLOYMENT IN THE ECTNP AREA

	Population (Persons)	Housing (Dwelling units)	Employment (Jobs)
Existing (2013) /a/	50,595	25,018	33,962 /b/
Proposed Plan (2035)	59,571 /c/	29,441 /d/	48,296 /e/
Proposed Plan with Alternative Compliance (2035)	62,810	31,060	43,419
Current Community Plans (2035)	52,447	26,072	37,775
SCAG Projection (2035) /f/	54,444	28,497 /g/	43,097
Market Study Estimate (2035) /h/	N/A	28,733 – 31,277	42,078-49,922

SOURCES and NOTES:
/a/ Existing Population and Housing are estimates derived from the US Census (2010), adjusted to 2013 using average annual growth rates from the Calif. Department of Finance. See **Appendix F** of this EIR for detailed methodology.
/b/ Existing employment is obtained from the US Census "On the Map" application (2013).
/c/ Population in Proposed Plan (Reasonable Expected Development) is derived from the estimated number of dwelling units multiplied by the SCAG estimated persons per household (by Community Plan Area) for 2035.
/d/ Estimated number of dwelling units in Proposed Plan (Reasonable Expected Development) is based on a methodology using reasonably anticipated residential densities for each zone. See **Appendix F** for further discussion about this methodology and how population, housing, employment, and non-residential development were determined for the Proposed Project.
/e/ Employment in Proposed Plan (Reasonable Expected Development) is derived from the estimated square footage of non-residential use, using square feet per employee factors that reflect the types of land uses permitted by the proposed zoning
/f/ SCAG 2012-2035 RTP/SCS
/g/ SCAG housing projections are made in terms of number of households (occupied housing units). In order to compare SCAG projections to the Proposed Plan in 2035, the number of households projected by SCAG for the ECTNP Area (27,427) was converted to dwelling units using vacancy rates used by the Calif. Department of Housing and Community Development's in the Regional Housing Needs Assessment for 2014-2021 for the SCAG region.
/h/ Market study estimate for 2035 represents the estimated market demand for housing and jobs in the ECTNP Area added to existing conditions (2013). Market demand for housing was estimated to be 3,715 to 6,259 dwelling units. Demand for office, retail, and industrial space estimated in the market study was converted into number of jobs using the following square foot per employee ratios: 350 (office); 400 (retail); 1,000 (industrial). This resulted in total estimated demand of 8,116 – 15,960 jobs. Note that the market study boundaries included only the half-mile radii around the following stations: Bundy, Sepulveda, Palms, and Culver City.

[8] Pro Forma Advisors, LLC, *Expo and Crenshaw LRT Station Area Plans Market Analysis*, 2013. See **Appendix L** for a more detailed discussion.

Based on proposed changes to General Plan land use designations and zones, implementation of the Proposed Project would increase population, housing, and employment capacity compared to capacity under the current Community Plans. The reasonable expected development under the Proposed Project would accommodate the SCAG projections for population, housing, and employment for 2035. The Proposed Project with the Alternative Compliance scenario would similarly increase housing, population, and employment capacity compared to that under the current Community Plan. Reasonable expected development under the Proposed Project with the Alternative Compliance scenario would also accommodate the SCAG projections for housing, population, and employment for 2035.

SCAG growth projections for the Project Area are intended to be a target that is derived from forecasts made for the entire six-county region and allocated to cities within the region. In consultation with the City of Los Angeles, SCAG refines Citywide projections and distributes population, housing, and employment among Transportation Analysis Zones in response to local conditions and trends, and policies such as the General Plan Framework, which directs growth to designated centers and areas served by transit. The resulting numbers serve as a benchmark or reference point that guides the planning process. Please see **Appendix K** for a more detailed discussion.

To supplement the SCAG growth forecasts, a market study was prepared for the ECTNP Area to determine the market demand for jobs and housing within the Project Area.[9] The market study reviewed demographics and the regional real estate market performance to provide context for the study area, which included four stations along the Expo Line Phase 2: Culver City Station, Palms Station, Expo/Sepulveda Station, and Expo/Bundy Station. The market study was prepared to provide an additional lens for understanding future demand for housing and jobs (i.e. "growth") at a more fine-grained level than is achieved through the SCAG regional methodology. Together, the two sets of numbers inform anticipated growth in 2035 and guide Proposed Plan recommendations.

In particular, the market study assessed the demand for residential and retail developments by estimating population and household growth. Age, income, and employment data further informed the estimated demand for commercial and residential developments. The market study also evaluated expected growth in various industries in the region with a focus on the creative office market in order to understand the number and type of jobs anticipated in the future. The station-specific market analyses looked closely at the real estate market in each of the station areas and included the demand for key land uses within each of the stations' half-mile radii. Using these methods of analysis, the market study provided an estimated demand for housing and office, retail, and industrial space for 2035 within the ECTNP Area. The demand estimates were provided as a range, accounting for potential variability in the amount of the regional growth that might occur in each station area and the ECTNP Area as a whole. Like the SCAG forecasts, the market demand estimates serve as a benchmark that informs proposed changes in the ECTNP. The market study analysis is geographically specific and thus sensitive to the unique conditions within the ECTNP Area, and helps augment the SCAG forecasts.

As seen in **Table 4.10-10**, the reasonable expected development under both the Proposed Project and the Proposed Project with Alternative Compliance scenario falls within the range of housing units and jobs estimated by the market study for the ECTNP Area.

This discussion of population, housing, and employment addresses impacts for the entire Project Area. No distinction is made between Areas of Proposed Change/Subareas and areas within the ECTNP Project Area where zoning would not change, because the Proposed Project aims to accommodate projected growth for the entire Project Area. For this analysis, Appendix G criteria are used, supplemented by the factors identified in the City's Threshold Guide, where appropriate.

[9]Pro Forma Advisors, LLC, *Expo and Crenshaw LRT Station Area Plans Market Analysis*, 2013. See **Appendix L** for a more detailed discussion.

IMPACTS

The Proposed Project would establish a Specific Plan, initiate zone changes and General Plan amendments, and introduce development and urban design standards. A component of the ECTNP is the Alternative Compliance scenario, which allows specific parcels to have a greater amount of housing than allowed by the underlying zoning, while simultaneously reducing the amount of non-residential square footage, maintaining the same anticipated overall levels of growth. The Proposed Project would also involve new streetscape plans and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would only occur within identified "areas of proposed change" in the Plan Area.

IMPACT 4.10-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT INDUCE SUBSTANTIAL POPULATION GROWTH IN AN AREA, EITHER DIRECTLY (FOR EXAMPLE, BY PROPOSING NEW HOMES AND BUSINESSES) OR INDIRECTLY (FOR EXAMPLE, THROUGH EXTENSION OF ROADS OR OTHER INFRASTRUCTURE)? THIS IMPACT IS LESS THAN SIGNIFICANT.

With implementation of the Proposed ECTNP, development capacity in the Project Area would be increased to accommodate regional population, housing, and employment growth projected by the market study and SCAG, consistent with sustainable growth policies of the 2012-2035 RTP/SCS.[10]

As mentioned above and shown in **Table 4.10-10**, the Proposed Project and the Proposed Project with the Alternative Compliance scenario would accommodate SCAG's population, housing, and employment projections for the ECTNP Area for the year 2035. This level of growth is also consistent with Citywide projections and is not considered substantial with respect to anticipated growth in the City as a whole. The Proposed Project does not affect the overall 2035 growth projections for the City. Additionally, the distribution of the City's growth to the ECTNP Area in 2035 is generally comparable to existing levels and would continue to implement the City's adopted growth strategy. As discussed in the Existing Setting section above, the ECTNP is projected to comprise 1.7 percent of the City's housing units in 2035, which is similar to the area's current share of housing (1.8 percent) in 2013. In terms of employment, the ECTNP is projected to have 2.26 percent of the City's jobs in 2035, an increase over the area's existing share of jobs in 2013 (2.0 percent). The ECTNP Area is a growing employment center, and taking on a greater share of the City's employment growth is consistent with General Plan Framework objectives to locate jobs within centers and along transit corridors. With the Proposed Plan, growth would be accommodated within an urbanized area of the City and in a manner that would represent a more sustainable pattern by focusing growth near transit, consistent with City and regional plans. As described above in the Methodology section, SCAG growth projections for this area are intended to be a target, and the City's long-standing policy is to meet or exceed SCAG projections for a plan area in a manner that is consistent with the General Plan Framework and regional policies, while remaining generally within Citywide projections. Therefore, the Proposed Plan is not inducing but rather accommodating anticipated growth.

While the implementation of the proposed ECTNP would increase housing and employment capacity in the Project Area, this increase is needed to accommodate population, housing and employment demand forecast by SCAG for the year 2035 for the City as a whole, while at the same time addressing various policies to focus growth around transit stations. As the proposed ECTNP has been designed to accommodate projected growth in population, employment and housing within its boundaries, its adoption will not induce or cause such growth. While the proposed ECTNP modestly exceeds SCAG 2035 projections for the Project Area, the City has the discretion to distribute the projected citywide growth in a manner that is consistent with adopted policy. The proposed increases are consistent with both the SCAG projections and analysis derived from

[10]Pro Forma Advisors, LLC, *Expo and Crenshaw LRT Station Area Plans Market Analysis*, 2013. See **Appendix L** for a more detailed discussion.

more localized market studies, both of which forecast anticipated demand for jobs and housing and inform plan recommendations. The two sources together provide a range of the anticipated demand for housing units and jobs by 2035 and the plan recommendations seek to accommodate that range, while advancing relevant adopted goals, consistent with state mandates, the 2012-2035 RTP/SCS, and City's General Plan Framework, all of which call for growth to be focused in higher-intensity centers close to transportation and services. In particular, the proposed ECTNP aims to advance adopted General Plan economic development goals that are designed to facilitate job growth by providing sufficient land to support economic development activities and broadening the definition of industrial uses resulting from the changing nature of such uses due to the introduction of information age technology.[11] These include General Plan Framework goals, objectives and policies: 7B, 7.2, 7.2.6, 7.5, 7.5.1 and 7.5.3. As a result, the proposed ECTNP directs growth, and particularly job growth, to select areas around the Expo LRT Line stations, taking advantage of market-linked areas that are and have been attractive to new technology businesses (in parts of West Los Angeles and the other Westside cities such as Santa Monica, Culver City and Beverly Hills) and where Los Angeles could capture a larger share of jobs in those business sectors. Furthermore, the ECTNP Area is located within the HQTA identified by SCAG, as it is within a half mile of a well-serviced transit stop. Therefore, the proposed land use changes are consistent with the 2012-2035 RTP/SCS assumption that the majority of new housing and commercial development in the region will occur within HQTAs.

Additionally, as discussed above, a market study was prepared for the ECTNP Area to determine the market demand for jobs and housing within the Project Area through 2035.[12] As seen in **Table 4.10-10**, both the Proposed Project and the Proposed Project with Alternative Compliance scenario can accommodate a sufficient number of housing units and jobs to meet the future market demand in the Project Area.

The SCAG projections and market study estimates for housing and jobs in 2035 are within a similar range (approximately 28,000 to 31,000 dwelling units and approximately 42,000 to 50,000 jobs). Thus, with adoption of the proposed ECTNP, the Project Area would accommodate housing units and jobs projected by SCAG as well as those estimated by the market study for the year 2035. These housing units and jobs could not otherwise be accommodated under the current community plans. Under the current community plans this growth would still likely occur in the City, or immediately adjacent cities, but potentially in a less sustainable manner (i.e., in a more ad-hoc manner and further from amenities and transit infrastructure). Such ad-hoc growth would also occur without the benefit of urban design standards and public benefit requirements that are found in the Proposed Plan, and has the potential to have more adverse impacts in the area aesthetics (see Chapter 5.0, Alternatives for further discussion of the No Project Alternative). Finally, the Proposed Project is an urban area comprehensively served by urban infrastructure and would not require the construction of new roads or utility infrastructure (see Sections 4.11, Public Services and 4.13, Utilities and Service Systems). Therefore, the Proposed Project would result in less-than-significant impacts related to inducing substantial population growth.

MITIGATION MEASURES

Impacts related to inducing substantial population growth would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to inducing substantial population growth were determined to be less than significant without mitigation.

[11]City of Los Angeles, *The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan*, re-adopted 2001

[12]Pro Forma Advisors, LLC, *Expo and Crenshaw LRT Station Area Plans Market Analysis*, 2013. See **Appendix L** for a more detailed discussion.

IMPACT 4.10-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT DISPLACE SUBSTANTIAL NUMBERS OF EXISTING HOUSING UNITS, NECESSITATING THE CONSTRUCTION OF REPLACEMENT HOUSING ELSEWHERE? THIS IMPACT IS LESS THAN SIGNIFICANT.

The Proposed Project would accommodate growth within a highly-urbanized area that is already developed, and the proposed changes are anticipating the projected growth and market demand for housing and jobs in an area soon to be served by a new LRT line. The proposed land use changes would allow future development within the areas of proposed change to generally include uses similar to those already found in the area but at increased heights and intensities. Through these proposed changes, the Proposed Project aims to add, not displace, housing stock while maintaining capacity for jobs in the same area. No specific residential units are proposed to be demolished, converted from affordable to market rate, or removed through other means as part of the ECTNP. The proposed ECTNP may cause temporary reduction in housing stock as new buildings are built in place of older ones or as existing buildings are renovated, but ultimately would result in a net gain in housing of approximately 4,423 housing units within the Project Area, which is sufficient to meet the forecasts for housing growth in the future. The Proposed Project would not introduce new unplanned infrastructure in the area.

Under the proposed ECTNP, areas currently designated and zoned for residential land uses would, for the most part, remain designated and zoned for residential land uses. For example, in the Palms Station Area, the majority of the multi-family residential properties are not proposed for any land use and zoning changes. This area was not recommended for land use and zoning changes in order to avoid displacement of a concentration of rental housing units, many of which, due to the age of the buildings, have rent levels protected by the RSO. The RSO generally applies to multi-family properties constructed prior to 1978. Over 85 percent of the existing multi-family built parcels in the Project Area constructed prior to 1978 are not included in the areas of proposed change.

CHANGE AREAS

The majority of proposed land use designation changes encompass a relatively small proportion of the Project Area. As described and discussed in Chapter 3.0, Project Description, the areas of proposed change comprise approximately 13 percent of the Project Area and are focused on properties in proximity to Expo LRT Line stations. Overall, there are currently approximately 272 single family units and 785 multi-family units within the areas of proposed change. These represent 5 percent of all the single-family units (5,090) currently in the Project Area and about 4 percent of all the multi-family units (19,928) in the Project Area, respectively.

The Proposed Project aims to accommodate anticipated growth by increasing housing capacity in specified areas. This is accomplished by increasing allowable heights, floor area ratios, and/or dwelling unit densities in select areas around transit stations and along key corridors to allow for more mixed-use and multi-family development. The changes in the Proposed Project are primarily focused on commercial and industrial areas, where there are few existing residences. However, some changes are proposed for residential areas, including the following:

- Within the Culver City Station Area north of I-10, properties currently zoned for RD2 (low-medium density residential land use) and R3 (medium residential land use)are proposed to be rezoned to the Mixed Use: Commercial/Residential zone. The Mixed Use zone would allow both commercial use, as well as higher density residential use.
- Within the Palms Station Area along National Boulevard, several properties currently zoned for R3 (medium-density residential land use) are also proposed to be rezoned to Mixed Use: Commercial/Residential. The Mixed Use zone would allow both commercial use, as well as higher density residential use.

- Within the Sepulveda Station Area, 6 acres along Exposition Boulevard currently zoned as R2 (low-medium density residential land use) are proposed to be rezoned to R3 (medium-density residential land use).
- Within the Bundy Station Area, 24 acres currently zoned R1 for single-family residential (low density residential land use) are proposed to be rezoned to multi-family residential uses with some RAS 4. It is believed that this single-family neighborhood is comprised primarily of homeowners, who have a choice as to whether or not sell their property and, thus, would not be involuntary displaced.

While the above proposed zone changes may affect a small percentage of existing housing stock, this limited loss would be offset by a substantial net increase of approximately 3,450 housing units within the areas of proposed change. When properties are redeveloped, there is a potential for a mismatch between affordability of housing that is removed and the affordability of new housing constructed in its place. However, within the change areas there are very few affordable housing units dedicated to very low- and low-income households; those that exist are located in relatively new developments that are not likely to be removed within the life of the Plan. In addition, in certain zones the ECTNP allows increased FAR in exchange for the provision of affordable housing for low-income households. Projects using this FAR bonus would also be required to replace any existing affordable units on the site with equivalent units of the same type and affordability level, in accordance with the provisions of AB 2222. Thus there is not anticipated to be a net loss of affordable housing units within the areas of proposed change due to the Proposed Project, and instead there is a potential for a net gain. Therefore impacts related to housing displacement in the areas of proposed change would be less than significant under the Proposed Project.

NON-CHANGE AREAS

Projects occurring outside the areas of proposed change would be subject to the existing Community Plan land use designations and zoning. In these areas there is the potential for redevelopment of property currently containing residential uses, including dwelling units in commercial or industrial zones, as well as single- or multi-family residences located in residential zones that allow greater density than what is currently built on the site. Such properties comprise approximately 142 acres or about 7 percent of the Project Area. While it is not expected that every parcel in these circumstances would be redeveloped by 2035 (the horizon year of the Plan), it is estimated that there would be a net increase in housing stock in the non-change areas of approximately 973 dwelling units. As these properties are redeveloped, there could be temporary displacement of housing units due to the separation of time between removal and replacement of housing. However, this potential temporary displacement would occur under the existing zoning and land use designations of the current Community Plans. Therefore impacts related to housing displacement in the non-change areas would be less than significant under the Proposed Project.

ALTERNATIVE COMPLIANCE SCENARIO

The Alternative Compliance scenario allows for select properties within the areas of proposed change (shown in Figures 3-3a and 3-3b) to be developed with a mix of uses that contains more residential, and consequently less non-residential, use than is allowed in the underlying zone. This scenario would create similar development potential as in the Proposed Project, particularly in areas proximate to Expo LRT Line stations. In these circumstances, the limited loss of existing housing stock would be offset by a substantial increase in new housing over existing conditions (approximately 6,042 dwelling units within the Project Area). Similar to the Proposed Project, potential for a loss of any affordable housing units in the Project Area would be offset by the ECTNP requirements for affordable housing described above, which apply to the Alternative Compliance scenario. Therefore the displacement of housing units in the Alternative Compliance scenario would be considered a less than significant impact.

MITIGATION MEASURES

Impacts related to housing displacement would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts relating to housing displacement were determined to be less than significant without mitigation.

IMPACT 4.10-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT DISPLACE SUBSTANTIAL NUMBERS OF PEOPLE NECESSITATING THE CONSTRUCTION OF REPLACEMENT HOUSING ELSEWHERE? THIS IMPACT IS LESS THAN SIGNIFICANT.

The Proposed Project was developed by the DCP as an effort to accommodate projected population growth in the region forecasted by SCAG. These projections are described in **Table 4.10-3** and discussed above. The proposed ECTNP, in part, would accommodate population growth in the City by increasing housing capacity and facilitating mixed use development in areas formerly designated and zoned primarily for industrial and commercial land uses.

CHANGE AREAS

Because the ECTNP Area is a fully developed urban area, development in the Project Area would primarily consist of redevelopment of existing uses in areas of proposed change. As described above, the Proposed Project would rezone properties in these areas, resulting in increased heights, floor area ratios, and/or densities. This could cause temporary displacement of people as new buildings are built in place of old ones, or as existing buildings are renovated and as uses change. However, new development would result in a net increase in the number of housing units within the change areas, which would accommodate more people, thereby minimizing the permanent displacement of people.

While some of the proposed land use changes would result in density increases within areas of proposed change, no residential uses are specifically proposed to be demolished, converted from affordable to market rate, or removed through other means as a result of the Proposed Project. The Proposed Project would rezone both residential areas as well as non-residential areas that may currently be developed with residential uses, thus creating a possibility of displacement of persons residing in these areas. However, these changes are concentrated in select areas, where the current population is approximately 2,084 persons. This represents 4 percent of the total existing population of the Project Area, and therefore the amount of potential displacement is not anticipated to be substantial. Furthermore, the Proposed Project is intended to accommodate population, housing, and employment growth projected by SCAG for the year 2035 by allowing increased development capacity, which would increase housing opportunities in the Project Area. The Proposed Project would result in a net gain of approximately 3,450 dwelling units within the areas of proposed change. Therefore, implementation of the Proposed Project in the areas of proposed change would not displace substantial numbers of people necessitating the construction of replacement housing elsewhere, and impacts to population displacement would be less than significant.

NON-CHANGE AREAS

As noted above, projects occurring outside the areas of proposed change would be subject to existing Community Plan land use designations and zoning. In these areas there is the potential for redevelopment of property currently containing residential uses, including dwelling units in commercial or industrial zones, as well as single- or multi-family residences located in residential zones that allow greater density than what is currently built on the site. Similar to the areas of proposed change, development projects in the non-change areas would also create the potential to temporarily displace existing residents as new buildings are built in place of old ones, though this would occur under the existing zoning and land use designations of the current Community Plans, and thus is not directly a result of the Proposed Plan.

Therefore, implementation of the Proposed Project in the non-change areas would not displace substantial numbers of people necessitating the construction of replacement housing elsewhere, and impacts to population displacement would be less than significant.

ALTERNATIVE COMPLIANCE SCENARIO

The Alternative Compliance scenario allows for select properties within the areas of proposed change (shown in Figures 3-3a and 3-3b) to be developed with a mix of uses that contains more residential, and consequently less non-residential, use than is allowed in the underlying zone. This scenario would likely create development potential similar to the Proposed Project, particularly in areas proximate to Expo LRT Line stations where new zoning would allow increased densities and intensities. In these circumstances, there would likely be a limited loss of existing housing stock and temporary displacement of residents. It is expected that, in the life of the Proposed Project, relocation opportunities would be available due to the overall net increase in housing stock in the Project Area (approximately 6,042 dwelling units). Therefore, implementation of the Alternative Compliance scenario would not displace substantial numbers of people necessitating the construction of replacement housing elsewhere, and impacts to population displacement would be less than significant.

MITIGATION MEASURES

Impacts related to the displacement of people would be less than significant. Mitigation measures are not required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the displacement of people were determined to be less than significant without mitigation.

4.11 PUBLIC SERVICES

This section provides an overview of public services and evaluates potential impacts resulting from the Proposed Project. Topics addressed include fire and emergency services, police protection services, public schools, parks and libraries within and in the vicinity of the Project Area.

The impacts of the Proposed Project on public services are evaluated based on the adequacy of existing and planned facilities and personnel to meet any additional demand generated by the Proposed Project. The Proposed Project with Alternative Compliance scenario is analyzed in this section, as this scenario would add more residents, and thus result in greater impacts in terms of public services.

FIRE PROTECTION AND EMERGENCY SERVICES

REGULATORY FRAMEWORK

FEDERAL

Federal Emergency Management Act (FEMA). FEMA was established in 1979 via executive order and is an independent agency of the federal government. In March 2003, FEMA became part of the US Department of Homeland Security. FEMA's continuing mission is to lead the effort to prepare the nation for all hazards and effectively manage federal response and recovery efforts following any national incident. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.

Disaster Mitigation Act of 2000. Disaster Mitigation Act (42 United States Code [U.S.C.] Section 5121) provides the legal basis for FEMA mitigation planning requirements for state, local, and Indian Tribal governments as a condition of mitigation grant assistance. It amends the Robert T. Stafford Disaster Relief Act of 1988 (42 U.S.C. Section 5121-5207) by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need and creates incentives for state, tribal, and local agencies to closely coordinate mitigation planning and implementation efforts. This Act reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide and the streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of this Act include:

- funding pre-disaster mitigation activities;
- developing experimental multi-hazard maps to better understand risk;
- establishing state and local government infrastructure mitigation planning requirements;
- defining how states can assume more responsibility in managing the Hazard Mitigation Grant Program (HMGP); and
- adjusting ways in which management costs for projects are funded.

The mitigation planning provisions outlined in Section 322 of this Act establish performance-based standards for mitigation plans and require states to have a public assistance program (Advance Infrastructure Mitigation [AIM]) to develop county government plans. The consequence for counties that fail to develop an infrastructure mitigation plan is the chance of a reduced federal share of damage assistance from 75 percent to 25 percent if the damaged facility has been damaged on more than one occasion in the preceding 10-year period by the same type of event.

Federal Fire Safety Act (FFSA). The FFSA of 1992 is different from other laws affecting fire safety as the Law applies to federal operations, and there is no requirement for local action unless a private building owner leases space to the federal government. The FFSA requires federal agencies to provide sprinkler protection in any building, whether owned or leased by the federal government that houses at least 25 federal employees during the course of their employment.

STATE

California Fire Code. Title 24, Part 9 of the California Code of Regulations (CCR), also referred to as the California Fire Code, is part of the California Building Code and provides building standard regulations regarding fire protection and notification systems for residential and commercial buildings. It includes fire safety requirements and regulations, including: the implementation of fire protection devices such as fire extinguishers and smoke alarms; installation of sprinklers in all high-rise buildings; establishment of fire resistance standards for fire doors, buildings materials, and types of construction; clearance of debris and vegetation within a prescribed distance from occupied structures in wildfire hazards areas; and fire suppression training. The California Fire Code is applicable to all occupancies in California except if adopted local regulations are more stringent. Regulations within the California Fire Code have been incorporated by reference with amendments in the Los Angeles Building Code, Fire Safety Regulations.

Title 8 California Code of Regulations (CCR) Sections 1270 and 6773. In accordance with CCR, Title 8 Sections 1270 "Fire Prevention" and 6773 "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration (Cal-OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hosing sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

California Health and Safety Code Section 13100-13135. California Health Safety Code Section 13100-13135 codifies regulations known as the "Regulations of the State Fire Marshal" and constitutes the Basic Building Design and Construction Standards of the State Fire Marshall. The regulations establish minimum standards for the preservation and protection of life and property against fire, explosion, and panic through requirements for fire protection and notification systems, fire protection devices, and fire suppression training.

California Governor's Office of Emergency Services (Cal OES). In 2009, the State of California passed legislation creating the Cal OES and authorized it to prepare a Standard Emergency Management System (SEMS) program (Title 19 CCR Section 2401 et seq.), which sets forth measures by which a jurisdiction should handle emergency disasters. In California, SEMS provides the mechanism by which local government requests assistance. Non-compliance with SEMS could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster. Cal OES coordinates the state's preparation for, prevention of, and response to major disasters, such as fires, floods, earthquakes and terrorist attacks. During an emergency, Cal OES serves as the lead state agency for emergency management in the state. It also serves as the lead agency for mobilizing the state's resources and obtaining federal resources. Cal OES coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with local government. Local jurisdictions first use their own resources and, as they are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system (see discussion of Mutual Aid Agreements (MAA), below). California Emergency Management Agency (Cal-EMA) maintains oversight of the state's mutual aid system.

Mutual Aid Agreements (MAA). Cal OES developed the Emergency Managed Mutual Aid (EMMA) System in response to the 1994 Northridge Earthquake. The EMMA System coordinates emergency response and recovery efforts along the coastal, inland, and southern regions of California. The purpose of EMMA is to provide emergency management personnel and technical specialist to afflicted jurisdictions in

support of disaster operations during emergency events. Objectives of the EMMA Plan is to provide a system to coordinate and mobilize assigned personnel, formal requests, assignment, training and demobilization of assigned personnel; establish structure to maintain the Plan and its procedures; provide the coordination of training for EMMA resources, including SEMS training, coursework, exercises, and disaster response procedures; and to promote professionalism in emergency management and response. The EMMA Plan was updated in November 2012 and supersedes the 1997 EMMA Plan and November 2001 EMMA Guidance.

LOCAL

City of Los Angeles General Plan, Framework and Safety Elements. The City of Los Angeles General Plan Framework, which is an element of the City of Los Angeles General Plan, was originally adopted in December 1996 and re-adopted in August 2001. The General Plan Framework provides guidance for long-term growth in the City and guides the update of community plans and Citywide elements. The General Plan Framework also contains purposes, policies, and programs for City development. Chapter 9 (Infrastructure and Public Services) of the Framework Element addresses fire prevention, fire protection and emergency medical services provided to the City. The Safety Element of the General Plan identifies existing police, fire, and emergency services and the service needs of the City of Los Angeles in the event of a natural disaster. It was adopted in November 1996. The Safety Element provides goals, objectives, and policies related to the City's response to hazards and natural disasters. The Safety Element goals, objectives, policies, and programs are broadly stated to reflect the comprehensive scope of the Emergency Operations Organization (EOO), which is the program that implements the Safety Element. The Framework and Safety Elements include goals, objectives, and policies that are applicable to fire protection and emergency services (**Table 4.11-1**).

TABLE 4.11-1: RELEVANT GENERAL PLAN FIRE PROTECTION GOALS, OBJECTIVES, AND POLICIES

FRAMEWORK ELEMENT – INFRASTRUCTURE AND PUBLIC SERVICES	
Goal 9J	Every neighborhood has the necessary level of fire protection service, emergency medical service (EMS) and infrastructure.
Objective 9.16	Monitor and forecast demand for existing and projected fire facilities and service.
Policy 9.16.1	Collect appropriate fire and population development statistics for the purpose of evaluating fire service needs based on existing and future conditions.
Objective 9.17	Assure that all areas of the City have the highest level of fire protection and EMS, at the lowest possible cost, to meet existing and future demand.
Policy 9.17.2	Identify areas of the City with deficient fire facilities and/or service and prioritize the order in which these areas should be upgraded based on established fire protection standards.
Policy 9.17.4	Consider the Fire Department's concerns and, where feasible adhere to them, regarding the quality of the area's fire protection and emergency medical services when developing General Plan amendments and zone changes, or considering discretionary land use permits.
Objective 9.19	Maintain the Los Angeles Fire Department's ability to assure public safety in emergency situations.
Policy 9.19.1	Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Policy 9.19.3	Maintain the continued involvement of the Fire Department in the preparation of contingency plans for emergencies and disasters.
SAFETY ELEMENT	
Goal 2	A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.
Objective 2.1	Develop and implement comprehensive emergency response plans and programs that are integrated with each other and with the City's comprehensive hazard mitigation and recovery plans and programs.

TABLE 4.11-1: RELEVANT GENERAL PLAN FIRE PROTECTION GOALS, OBJECTIVES, AND POLICIES	
Policy 2.1.5	Response: Develop, implement, and continue to improve the City's ability to respond to emergency events. [All EOO emergency response programs and all hazard mitigation and disaster recovery programs related to protecting and reestablishing communications and other infrastructure, service and governmental operations systems implement this policy.]
Policy 2.1.6	Standards/fire. Continue to maintain, enforce and upgrade requirements, procedures and standards to facilitate more effective fire suppression. [All peak load water and other standards, code requirements (including minimum road widths, access, and clearances around structures) and other requirements or procedures related to fire suppression implement this policy.] The Fire Department and/or appropriate City agencies shall revise regulations or procedures to include the establishment of minimum standards for location and expansion of fire facilities, based upon fire flow requirements, intensity and type of land use, life hazard, occupancy and degree of hazard so as to provide adequate fire and emergency medical event response. At a minimum, site selection criteria should include the following standards which were contained in the 1979 General Plan Fire Protection and Prevention Plan: • Fire stations should be located along improved major or secondary highways. If, in a given service area, the only available site is on a local street, the site must be on a street which leads directly to an improved major or secondary highway. • Fire station properties should be situated so as to provide drive-thru capability for heavy fire apparatus. • If a fire station site is on the side of a street or highway where the flow of traffic is toward a signalized intersection, the site should be at least 200 feet from that intersection in order to avoid blockage during ingress and egress. • The total number of companies which would be available for dispatch to first alarms would vary with the required fire flow and distance as follows: (a) less than 2,000 gpm would require not less than 2 engine companies and 1 truck company; (b) 2,000 but less than 4,500 gpm, not less than 2 or 3 engine companies and 1 or 2 truck companies; and (c) 4,500 or more gpm, not less than 3 engine companies and 2 truck companies. These provisions of the 1979 Plan were modified by the Fire Department for purposes of clarification.
Goal 3	A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.
Objective 3.1	Develop and implement comprehensive disaster recovery plans which are integrated with each other and with the City's comprehensive hazard mitigation and emergency response plans and programs.
Policy 3.1.1	Coordination: Coordinate with each other, with other jurisdictions and with appropriate private and public entities prior to a disaster and to the greatest extent feasible within the resources available, to plan and establish disaster recovery programs and procedures which will enable cooperative ventures, reduce potential conflicts, minimize duplication and maximize the available funds and resources to the greatest mutual benefit following a disaster. [All EOO recovery programs involving cooperative efforts between entities implement this policy.]

Los Angeles Fire Department (LAFD) Strategic Plan 2015-2017. The LAFD Strategic Plan 2015-2017 focuses on goals and strategic actions to guide the LAFD in the following areas: improving service delivery, implementing advanced technologies, employing sound budgeting practices and enhancing leadership. The plan also addresses the development of an even more professional workforce, promoting a positive work environment, and working to strengthen community relationships to improve preparedness and enhance resiliency during emergency events.

Los Angeles Municipal Code (LAMC) and Charter. The Los Angeles Fire Code is contained within Chapter V, Article 7, Fire Protection and Prevention of the LAMC. As required by the Fire Code, the LAFD Bureau of Fire Prevention and Public Safety is required to administer and enforce basic building regulations as set forth by the state fire marshal. The Los Angeles Fire Code, last updated in 2014, is a combination of the California Fire Code and Los Angeles amendments. The Los Angeles Fire Code provides regulations for the safeguarding of life and property from fire, explosion, panic, or other hazardous conditions which may arise in the use or occupancy of buildings, structures, or premises.

LAMC Section 57.503 requires any facility, structure, group of structures, or premises to provide and maintain LAFD access and requires that any structure located more than 150 feet from an approved street provide an approved fire lane.

LAMC Section 57.507.3 contains the fire flow requirements characterized by the type of development. As discussed therein and per Table 57.507.3.1 of LAMC, fire flow requirements require 2,000 gallons per minute (gpm) from three adjacent fire hydrants for low-density residential developments; 4,000gpm from four adjacent fire hydrants for high density residential and neighborhood commercial developments; 6,000 to 9,000 gpm from four to six fire hydrants for industrial and commercial developments; and to 12,000 gpm available to any block for high-density industrial and commercial developments. As provided in LAMC Section 57.507.3.2 and described in Table 57.507.3.2, each fire hydrant serving industrial and commercial land developments serve 80,000 square feet of land area, be spaced 300 feet from the next fire hydrant on roads and fire lands, and be a 2.5-inch-by-4-inch double fire hydrant, or 4-inch-by-4-inch double fire hydrant.

LAMC Section 57.507.3.3 requires land uses to include the installation of an automatic fire-sprinkler system should the type of land use exceed the maximum response distances per Table 57.507.3.3 of LAMC Section 57.507.3.3.

City of Los Angeles Proposition F, Q, and J – Facilities Bond. Proposition F, also known as the Fire Facilities Bond, was approved in November 2000 and authorized the issuance of $532.6 million to finance the construction and rehabilitation of fire stations and animal shelters in the City of Los Angeles. Further, $378.6 million was allocated for the construction of 18 new or replacement neighborhood fire/paramedic stations, one regional fire station and training facility, and an emergency air operations/helicopter maintenance facility, for a total of 20 Proposition F projects.

Proposition Q, known as the Citywide Public Safety Bond Measure was approved in March 2002 and allocated $600 million to renovate, improve, expand, and construct police, fire, 911, and paramedic facilities. Proposition Q also includes renovations to existing LAFD facilities, totaling 80 LAFD facility renovation projects.

In 2006, Measure J amended Proposition F, providing flexibility in the design of new facilities and setting standards for such facilities. Specifically, Measure J allows the following: the development of new regional fire stations to be designed and built on one or more properties that are less than two acres; components to be built on two or more sites within proximity; or facilities to be designed to fit on a single site of less than two acres.

EXISTING SETTING

Fire prevention, protection, and emergency medical services within the Project Area are provided by the LAFD. The Project Area is located within City Council Districts 5, 10, and 11, and comprises portions of the West Los Angeles, Palms-Mar Vista-Del Rey, and West Adams-Baldwin Hills-Leimert Community Plan areas. The Project Area is located entirely within the incorporated City of Los Angeles and abuts the City of Culver City and the City of Santa Monica.

The LAFD is currently organized into groups of fire stations clustered into battalions within larger geographic groups known as bureaus.[1] Each bureau is commanded by a Deputy Chief who oversees and coordinates daily field operations within each bureau's respective service area. The Project Area lies within the service areas of the South and West Bureaus (**Table 4.11-2**). These divisions coordinate and oversee the eight fire stations that provide service to the Project Area (**Figure 4.11-1** and **Table 4.11-2**).

SERVICE PERFORMANCE MEASURES

LAFD's services continue to be based on the community's needs, as determined by on-going evaluations, taking into consideration calls for service. These evaluations are used to determine the need for the reallocation of equipment or personnel, or if required, the acquisition of equipment, personnel, and/or new stations. As development occurs, the LAFD reviews EIRs and subdivisions applications for needed facilities. Where appropriate, construction of new facilities is required as a condition of development for individual projects.[2]

In March 2014, a Third-Party Deployment of Fire Resources Study was prepared for the LAFD to provide for an independent review and analysis of its current deployment of fire and EMS resources and determine the most efficient and cost-effective model that could be implemented by the LAFD.[3] This study focused on three key areas, including the following:

- Deployment of Resources. The study reviewed the organization and the performance of the LAFD's current resource deployment, including platoon duty and administrative staffing levels, deployment model, task force configuration, and the use of sworn firefighters to fill non-emergency administrative positions and the feasibility of utilizing non-sworn personnel to staff these positions.

- Response Times of Fire and EMS. The study analyzed current LAFD and EMS response times benchmarked against industry goals and comparable agencies.

- EMS Comparative Analysis. The study reviewed and analyzed best practices of the LAFD and EMS, including dispatching models and protocols.

Based on the assessment of these key areas, the study made numerous recommendations, including the development of a strategic plan and Standards of Cover.

LOS ANGELES TRANSIT NEIGHBORHOOD PLAN

SOURCE: City of Los Angeles and TAHA, 2017.

As a result of this study, the LAFD prepared *A Safer City: Strategic Plan 2015-2017*, the LAFD's first strategic plan, as discussed above.[4] The LAFD has also initiated a Standards of Response Coverage analysis to assist in the evaluation of specific geographic response areas, specific community risks, deployment methods, response time standards, and the allocation of resources for LAFD.[5]

Fire Flow and Response Distance. The adequacy of fire protection for a given area is based on required fire flow, response distance from existing fire stations, and the LAFD's judgment of needs in the area. Personnel and equipment needs for individual fire stations are determined based on the LAFD's review of the number of incidents within a station's service area. As the number of incidents increases, the LAFD assigns new staff and equipment as necessary to maintain acceptable service ratios and response times.[6]

The fire flow (measured in gallons per minute from the local water system) necessary to contain a fire depends on the existing land use or combination of land uses and the density of the area being served. Consequently, the amount of water necessary for fire protection depends on various factors, including the type of development, risk of life, occupancy, and the level or intensity of a fire hazard. Response distance relates directly to the linear travel distance (i.e., miles between a station and a site) and the LAFD's ability to successfully navigate through an area's circulation system. The Fire Code specifies maximum response distances allowed between specific locations and engine/truck companies based upon land use and fire flow requirements, as shown in **Table 4.11-3**. When response distances exceed these requirements, plans for all new commercial and residential structures must be reviewed and various fire suppression equipment (e.g., automatic fire sprinkler systems, fire signaling systems, fire extinguishers, smoke removal systems, and any other fire protection devices) as deemed necessary by the Fire Chief are required to be incorporated in the plans prior to the approval of an occupancy permit. In addition to fire flow requirements, the LAFD requires different types of fire hydrants within a specified distance to deliver the required fire flow, which are shown in **Table 4.11-4**.

TABLE 4.11-3: REQUIRED FIRE FLOW AND MAXIMUM RESPONSE DISTANCES

Land Use	Required Fire Flow	Maximum Response Distance to LAFD Fire Station/a/	
		Engine Company/b/	Truck Company/b/
RESIDENTIAL			
Low Density Residential	2,000 gpm from three adjacent hydrants flowing simultaneously	1.5 miles	1.5 miles
High Density Residential and Commercial Neighborhood	4,000 gpm from four adjacent hydrants flowing simultaneously	1.5 miles	1.5 miles
COMMERCIAL			
Industrial and Commercial	6,000 to 9,000 gpm from four hydrants flowing simultaneously	1 mile	1.5 miles
High Density Industrial and Commercial or Industrial (Principal Business Districts or Centers)	12,000 gpm available to any block (where local conditions indicate that consideration must be given to simultaneous fires, an additional 2,000 to 8,000 gpm will be required)	0.75 mile	1 mile

/a/ The maximum response distance to LAFD fire stations pertains to areas outside the boundaries covered by the Hillside Ordinance (Ordinance Number 168,159). When a portion of any subdivision, as that term is defined in Section 17.02 of the Los Angeles Municipal Code, falls outside of the one and one-half mile distance requirement, automatic fire sprinklers will not be required in that portion whenever a review by the Chief has determined that no unacceptable increase in hazard to the public will result.
/b/ The maximum response distances for both LAFD fire suppression companies (engine and truck) must be satisfied.
gpm = gallons per minute

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to fire protection and emergency services if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered fire or emergency service facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for fire protection and emergency services.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors:

For impacts related to fire protection and emergency medical services:

- If a project would require the addition of a new fire station or the expansion, consolidation or relocation of an existing facility to maintain service.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of impacts to fire and emergency services. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. In some cases, the Thresholds Guide includes quantitative thresholds. For purposes of this analysis, the CEQA Guidelines Appendix G criteria are used supplemented by the City's Guidelines, as necessary, since the thresholds identified in the City's Thresholds Guide are more development project-specific.

Fire service needs are dependent on the size of the service population and the geographic area served, the number and types of calls for service, and the characteristics of a project and its surrounding community.

This discussion of impacts to fire protection and emergency services addresses impacts for the entire Project Area. As discussed below, an increase in population, by itself, would not increase demand for fire protection services. Therefore, no distinction is made between areas of change and areas within the Project Area where

zoning controls would not change since the service area for each of the LAFD battalions and fire stations covers both the change and non-change areas.

IMPACTS

IMPACT 4.11-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT FORESEEABLY REQUIRE THE ADDITION OF A NEW FIRE STATION OR THE EXPANSION, CONSOLIDATION, OR RELOCATION OF AN EXISTING FACILITY, THE CONSTRUCTION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL IMPACTS, IN ORDER TO MAINTAIN ACCEPTABLE SERVICE RATIOS, RESPONSE TIMES, OR OTHER PERFORMANCE OBJECTIVES FOR FIRE PROTECTION AND EMERGENCY RESPONSE? COMPLIANCE WITH EXISTING REGULATIONS WOULD ENSURE THIS IMPACT REMAINS LESS THAN SIGNIFICANT.

The Proposed Project would establish a Specific Plan, initiate zone changes and General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would not occur on every parcel within the Project Area; these changes are anticipated in specific "areas of proposed change."

Fire protection and emergency service impacts are addressed for the Project Area within the context of the local policies and codes identified above that apply to existing and future development. The ECTNP does not contain any specific regulations that would affect fire protection and emergency services.

Construction

While the Proposed Project would allow for increased development capacity, it would not constitute a commitment to any project-specific construction. Construction related to future capacity within the Project Area, particularly within the change areas, could result in the effects described below.

Construction activities would have the potential to temporarily increase the existing demand on fire protection and emergency medical services. Construction activities could potentially expose combustible materials (e.g., wood, plastics, sawdust, coverings, and coatings) to fire risks from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings and lighted cigarettes. However, in compliance with Occupational Safety and Health Administration (OSHA) requirements, construction managers and personnel would be trained in emergency response and fire safety operations. Additionally, fire suppression equipment (e.g., fire extinguishers) specific to construction would be maintained onsite. Project construction would also comply with requirements and policies relating to fire safety practices.

Road and lane closures due to construction activities related to individual projects could affect response times of fire and emergency services vehicles. Traffic delays caused by potential closures could impede the ability of emergency vehicles to efficiently move along roadways to their destination. Additionally, road closure may result in detours that adversely impact response time. However, as discussed in Section 4.12, Traffic and Transportation, individual projects would be required to develop a construction staging and traffic management plan, as necessary to ensure emergency access is maintained, consistent with LAFD requirements. Therefore, the Proposed Project would result in a less-than-significant construction impact related to fire protection services and emergency medical services.

Operation

Implementation of the Proposed Project with Alternative Compliance scenario would create increased development capacity, increasing the overall housing, population, and employment in the Project Area. Based on proposed land use changes and reasonable expected development for the year 2035, the Project Area could accommodate approximately 12,200 residents and 9,500 jobs more than existing conditions. Compared to future conditions under the current plan, the Project Area could accommodate approximately 10,350 additional residents and 5,650 additional jobs. Land uses are not expected to greatly change, but the intensity of some land uses is expected to increase. However, an increase in population, by itself, would not increase demand for fire protection services. The need for new fire stations is based on the geographic distribution of physical structures; access to trucks, ambulances, and other equipment; and the location of the Proposed Project rather than only on population increases. Regardless, this increase in population, employment and development has been generally anticipated citywide by the DCP through other long-range General Plan Elements, such as the Housing Element and the Framework Element. Based on the reasonably expected development with the ECTNP in 2035, implementation of the Proposed Project would result in growth that is consistent with SCAG 2035 population forecasts for the ECTNP Area. [7] As discussed in Section 4.10 Population, Housing, and Employment, this level of growth is not considered substantial with respect to anticipated growth in the City as a whole, and the distribution of the City's growth to the ECTNP Area in 2035 is generally comparable to existing levels and would continue to implement the City's adopted and directed growth strategy in the General Plan Framework. These projections are the same that public service providers, City departments, and other government agencies rely on for long-range planning. Therefore, on a program level, implementation of the Proposed Project would not cause the construction of a new fire station since growth in the ECTNP Area has been accounted for by the LAFD.

In addition, the zone changes proposed by the ECTNP would not allow heavy manufacturing or other activities that may involve the use of large quantities of toxic combustible substances. Moreover, future development projects within the Project Area would adhere to current fire codes, which require new construction to incorporate more dynamic and advanced fire and life safety technologies and fire prevention measures than older construction in order to reduce the risk of fires.

As discussed in Section 4.12, Transportation and Traffic, the 2035 With Project scenario assumes land use intensification and an organized and coordinated development pattern that increase accessibility of destinations while minimizing the related growth in vehicle trips and VMT per capita. Additionally, designated emergency evacuation and disaster routes within the Project Area would be maintained.[8] While the Project could impact segment-level LOS, there is not a direct relationship between predicted travel delay and emergency response times as California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Generally, multi-lane arterial roadways allow the emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. The Project Area is not within a hillside area or located where there are increased hazards due to a design feature or incompatible use; the Project Area is in an urbanized environment where there is sufficient street access for emergency response.

The LAFD in collaboration with Los Angeles Department of Transportation (LADOT) has developed a Fire Preemption System (FPS), a system that automatically turns traffic lights to green for emergency vehicles traveling on designated streets in the City. The City of Los Angeles has over 205 miles of routes equipped

[7]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. Please see **Appendix K** for a more detailed discussion.

[8]City of Los Angeles, General Plan, *Safety Element*, Exhibit H, 1996.

with FPS.[9] LAFD has a mandate to protect public safety and must respond to changing circumstances and, therefore, would act to maintain response times. Accordingly, the Project would have a less-than-significant impact on fire protection and emergency medical services.

MITIGATION MEASURES

Impacts related to fire protection services and emergency services would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to fire protection and emergency services would be less than significant without mitigation.

POLICE PROTECTION SERVICES

REGULATORY FRAMEWORK

FEDERAL

There are no federal police protection services regulations applicable to the Proposed Project.

STATE

California Penal Code. All law enforcement agencies within the State of California are organized and operated in accordance with the applicable provisions of the California Penal Code. This code sets forth the authority, rules of conduct, and training for peace officers. Under state law, all sworn municipal and county officers are state peace officers.

Title 13 California Code Regulations (CCR) Division 2. Division 2 of Title 13 of the CCR governs the operations of the California Highway Patrol.

LOCAL

City of Los Angeles General Plan, Framework Elements. The City of Los Angeles General Plan Framework, which is an element of the City of Los Angeles General Plan, was originally adopted in December 1996 and re-adopted in August 2001. The General Plan Framework provides guidance for long-term growth in the City and guides the update of community plans and Citywide elements. The General Plan Framework also contains purposes, policies, and programs for City development. Chapter 9 (Infrastructure and Public Services) of the Framework Element includes goals, objectives, and policies applicable to police protection services (**Table 4.11-5**).

City of Los Angeles Charter and Administrative and Municipal Codes. The law enforcement regulations, as well as the powers and duties of the LAPD, are outlined in the City of Los Angeles' Charter, Administrative Code, and the LAMC. Article V, Section 570 of the City of Los Angeles Charter gives power and duty to the LAPD to enforce the penal provisions of the Charter, city ordinances, and state and federal law. The Charter gives responsibility to LAPD officers to act as peace officers and to protect lives and property in case of disaster or public calamity. Chapter 11, Section 22.240 of the Los Angeles Administrative Code requires the LAPD to adhere to the State of California standards described in Section 13522 of the California Penal Code.

[9]Training Bulletin: Traffic Signal Preemption System for Emergency Vehicles, Los Angeles Fire Department, Bulletin No. 133, October, 2008.

TABLE 4.11-5: RELEVANT GENERAL PLAN POLICE PROTECTION GOALS, OBJECTIVES, AND POLICIES	
FRAMEWORK ELEMENT – CHAPTER 9 INFRASTRUCTURE AND PUBLIC SERVICES	
Goal 9I	Every neighborhood in the City has the necessary police services, facilities, equipment, and manpower required to provide for the public safety needs of that neighborhood.
Objective 9.13	Monitor and forecast demand for existing and projected police service and facilities.
Policy 9.13.1	Monitor and report police statistics, as appropriate, and population projections for the purpose of evaluating police service based on existing and future needs.
Objective 9.14	Protect the public and provide adequate police services, facilities, equipment and personnel to meet existing and future needs.
Policy 9.14.1	Work with the Police Department to maintain standards for the appropriate number of sworn police officers to serve the needs of residents, businesses, and industries.
Policy 9.14.5	Identify neighborhoods in Los Angeles where facilities are needed to provide adequate police protection.
Policy 9.14.7	Participate fully in the planning of activities that assist in defensible space design and utilize the most current law enforcement technology affecting physical development.
Objective 9.15	Provide for adequate public safety in emergency situations.
Policy 9.15.1	Maintain mutual assistance agreements with local law enforcement agencies, State law enforcement agencies, and the National Guard to provide for public safety in the event of emergency situations.
SOURCE: City of Los Angeles, *The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan*, re-adopted 2001.	

Section 13522 charges the LAPD with the responsibility of enforcing all LAMC Chapter 5 regulations related to fire arms, illegal hazardous waste disposal, and nuisances (e.g., excessive noise), and with providing support to the Department of Building and Safety Code Enforcement inspectors and the LAFD in the enforcement of the City's Fire, Building, and Health Codes. The LAPD is also given the power and the duty to protect residents and property and to review and enforce specific security-related mitigation measures in regards to new development.

Los Angeles Police Department (LAPD) Computer Statistics Unit (COMPSTAT) Program. The LAPD COMPSTAT was created in 1994 and implements the General Plan Framework goal of assembling statistical population and crime data to determine necessary crime prevention actions. This system implements a multi-layer approach to police protection services through statistical and geographical information system (GIS) analysis of growing trends in crime through its specialized crime control model. COMPSTAT has effectively and significantly reduced the occurrence of crime in Los Angeles communities through accurate and timely intelligence regarding emerging crime trends or patterns.[10]

Design Out Crime/Crime Prevention through Environmental Design. The Design Out Crime initiative implements the techniques of Crime Prevention Through Environmental Design (CPTED), which introduces ways to deter crime by changing the design of buildings and public spaces. Design Out Crime guidelines were developed and adopted for distribution to developers, architects, urban planners, and others involved in the design of building projects to improve safety and reduce crime by providing visual connection/natural surveillance and discouraging criminal activity. Examples of recommended CPTED practices include the use of paths, lighting, entryways, and security features (locks/gates/signs) to enhance site safety.[11]

[11]Los Angeles Police Department, *Design Out Crime*, http://www.lapdonline.org/crime_prevention/content_basic_view/8852#1, accessed March 6, 2017.

EXISTING SETTING

The LAPD provides police protection services to the Project Area. The West Bureau serves the Project Area with two divisions: the West Los Angeles Division and the Pacific Division. The LAPD West Los Angeles Division encompasses approximately 65.14 square miles and serves a population of approximately 230,288 people. The West Los Angeles Community Police Station is staffed by 238 sworn officers, 20 reserve officers, 18 civilians, and 25 volunteers.

The LAPD Pacific Division encompasses approximately 25.74 square miles and serves a population of approximately 203,664 people. The Pacific Community Police Station is staffed by 284 sworn officers, 16 reserve officers, 15 civilians, and 19 volunteers.

The LAPD police stations that serve the Project Area are shown in **Table 4.11-6** and illustrated in **Figure 4.11-1**, above. Crime statistics for the LAPD stations that serve the Project Area are shown in **Table 4.11-7**. Typical crimes include homicide, rape, robbery, aggravated assault, burglary, larceny, motor vehicle theft, and arson.

TABLE 4.11-6: LAPD STATIONS SERVING THE PROJECT AREA

Bureau	Station	Address	Number of Officers /a/	Officer to Resident Ratio Per 1,000 Residents
West	West LA Community	1663 Butler Ave.	238	1.03
West	Pacific Community	12312 Culver Blvd.	284	1.39

SOURCE: Los Angeles Police Department, 2013.

TABLE 4.11-7: CRIME STATISTICS OF LAPD STATIONS SERVING THE PROJECT AREA

Station	Part I Crimes Offenses /a,b/	Part I Crime Offense Rate per 1,000 Persons
West LA Community Police Station	879	0.88
Pacific Community Police Station	1,038	1.04

/a/ Part I Crime Offenses recorded in the year 2016.
/b/ Part I Crime Offenses include violent and property crimes such as homicide, rape, robbery, aggravated assaults, burglary, motor vehicle theft, burglary/theft from motor vehicle, and personal/other theft.
SOURCE: Los Angeles Police Department, *COMPSTAT Community Area Profile,* www.lapd.org; TAHA, 2017.

The crime rate, which represents the number of crimes reported, affects the "needs" projection for staff and equipment for the LAPD. To some extent, it is logical to anticipate that the crime rate in a given area would increase as the level of activity or population, along with the opportunities for crime, increases. However, because a number of other factors also contribute to the resultant crime rate, such as police presence, crime prevention measures, and ongoing legislation/funding, the potential for increased crime rates is not necessarily directly proportional to increase in population or land use activity.

In addition to crime rates, the LAPD's operational statistics are also analyzed in terms of response time. Response time is the amount of time from when a call requesting assistance is made until the time that a police unit arrives at the scene. Calls for police assistance are prioritized based on the nature of the call. Unlike fire protection services, police units are often in a mobile state; hence, actual distance between a headquarters facility and the project site is often of little relevance. Instead, the number of officers on the street is more directly related to the realized response time.

To plan for personnel needs at individual stations, the LAPD uses a field deployment software model called "Patrol Plan" that takes into account 25 separate factors, including crime data, population density, and traffic speeds. The model is run on a quarterly basis, but station captains can request the assignment of additional

personnel at any time in response to increased demand. The LAPD seeks to maintain a maximum response time of seven minutes and will increase staffing at stations as necessary to ensure that this goal is met.[12]

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to police protection services if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered police protection service facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for police protection.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors related to police protection services:

- The population increase resulting from the Proposed Project, based on the net increase of residential units or square footage of non-residential floor area;
- The demand for police services anticipated at the time of project buildout compared to the expected level of service available. Consider, as applicable, scheduled improvements to LAPD services (facilities, equipment, and officers) and the project's proportional contribution to the demand; and
- Whether the project includes security and/or design features that would reduce the demand for police services.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of impacts to police protection services. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. In some cases, the Thresholds Guide includes quantitative thresholds. For purposes of this analysis, the CEQA Guidelines Appendix G criteria are used supplemented by the City's Guidelines, as necessary, since the thresholds identified in the City's Thresholds Guide are more development project-specific.

Potential impacts on law enforcement services are evaluated based on the ability of existing and planned LAPD staffing, equipment, and facilities to meet the additional demand for law enforcement services potentially associated with implementation of the Proposed Project. Police protection service impacts are also evaluated for the Proposed Project within the context of applicable local policies and codes mentioned above.

This discussion of impacts to police protection services addresses impacts for the entire Project Area. No distinction is made between areas of change and areas within the Project Area where zoning controls would not change since the service area for each of the two LAPD divisions and two police stations covers both the change and non-change areas.

[12]Los Angeles Police Department, Community Relations Section, Sergeant Leonid Tsap, telephone correspondence, September 15, 2014.

IMPACTS

IMPACT 4.11-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF NEW OR PHYSICALLY ALTERED POLICE FACILITIES, THE CONSTRUCTION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL IMPACTS, IN ORDER TO MAINTAIN ACCEPTABLE SERVICE RATIOS, RESPONSE TIMES, AND OTHER PERFORMANCE OBJECTIVES? THIS IS A LESS-THAN-SIGNIFICANT IMPACT.

The Proposed Project would establish a Specific Plan, initiate zone changes and General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would not occur on every parcel within the Project Area; these changes are anticipated within specific "areas of proposed change."

The Project Area could accommodate an additional 12,216 residents and 9,457 jobs under the Proposed Project with Alternative Compliance scenario when compared to existing conditions and an additional 10,364 residents and 5,644 jobs when compared to the current plan. Although there is no direct proportional relationship between increases in land use activity and increases in demand for police protection services, the number of calls for police response to home and retail burglaries, vehicle burglaries, damage to vehicles, traffic-related incidents, and crimes against persons would be anticipated to increase with the increase in people, commercial and retail land uses, and dwelling units in the ECTNP Area. Such calls are typical of problems experienced in existing developed areas of the City and do not represent unique law enforcement issues that would be created specifically by implementation of the proposed ECTNP.

An increase in the number of residents and employees, and amount of development within the Project Area would create increased demand for LAPD services. However, due to the mobile nature of police services, it is unlikely that the need for additional officers created by the increase in demand for police services would result in the need for the construction of new or physically altered police protection facilities. Additional police service demands can be accommodated through a variety of methods, including overtime or provision of substations in existing structures, which would increase police protection without the need for construction of new stations.

As discussed in Section 4.12, Transportation and Traffic, the 2035 With Project scenario assumes land use intensification and an organized and coordinated development pattern that increase accessibility of destinations while minimizing the related growth in vehicle trips and VMT per capita. While the Project could impact segment-level LOS, there is not a direct relationship between predicted travel delay and emergency response times as California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Designated emergency and disaster routes within the Project Area would be maintained.[13] In conformance with existing policies, procedures and practices, as development occurs, the LAPD will maintain acceptable service levels through the provision of additional personnel and equipment as needed. Impacts to police services are addressed through standard city policies, procedures, and practices. Therefore, the Proposed Project would result in a less-than-significant impact related to police protection services.

MITIGATION MEASURES

Impacts related to substantial adverse physical impacts associated with the provision of new or physically altered police facilities would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to police protection services were determined to be less than significant without mitigation.

[13]City of Los Angeles, General Plan, *Safety Element*, Exhibit H, 1996.

PUBLIC SCHOOLS

This analysis below presents an evaluation of the environmental impacts on public schools that could result from the implementation of the Proposed Project; this analysis does not consider impacts on private or charter schools.

REGULATORY FRAMEWORK

FEDERAL

There are no federal public school regulations applicable to the Proposed Project.

STATE

California Government Code Section 65995. California Government Code Section 65995 is found in Title 7, Chapter 4.9 of the California Government Code. California Government Code Section 65995 authorizes school districts to collect impact fees from developers of new residential and commercial/industrial building space. Leroy F. Greene School Facilities Act of 1998 (Senate Bill 50 [SB 50]) amended Government Code Section 65995 in 1998, which allows schools to collect fees to offset costs associated with increasing school capacity as a result of development. The maximum fees authorized under SB 50 apply to zone changes, general plan amendments, zoning permits and subdivisions. The provisions of SB 50 are deemed to provide full and complete mitigation of school facilities impacts, notwithstanding any contrary provisions in CEQA or other state or local laws The Los Angeles Unified School District (LAUSD) determines the fees in accordance with California Government Code Section 65995, annually, and publishes them in their school fee justification study.

California Education Code. School facilities and services are subject to the rules and regulations of the California Education Code and governance of the State Board of Education (SBE). The SBE is the 11-member governing and policymaking body of the California Department of Education (CDE) that sets Kindergarten through 12th Grade (K–12) education policy in the areas of standards, instructional materials, assessment, and accountability.

California Department of Education (CDE). The CDE is the government agency responsible for public education throughout the state. With the State Superintendent of Public Instruction, the CDE is responsible for enforcing education law and regulations and for continuing to reform and improve public elementary school, secondary school, childcare programs, adult education, and preschool programs. The department oversees funding, and student testing and achievement levels for all state schools. A sector of the CDE, the SBE is the governing and policy making sector responsible for education policies regarding standards, instructional materials, assessment, and accountability. The CDE's mission is to provide leadership, assistance, oversight, and resources so that every Californian has access to an education that meets world-class standards. The core purpose of the CDE is to lead and support the continuous improvement of student achievement, with a specific focus on closing achievement gaps.

Assembly Bill 149 and 2071 – Open Enrollment Policy. The open enrollment policy is a state-mandated policy that enables students located in the LAUSD to apply to any regular, grade-appropriate LAUSD school with designated "open enrollment" seats. Open enrollment seats are granted through an application process that is completed before the school year begins. Under the Open Enrollment Policy, students living in a particular school's attendance area are not displaced by a student requesting an open enrollment transfer to that school.

Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of 1998. Proposition 1A, the Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of

1998 (Ed. Code, Section 100400–100405) is a school construction funding measure that was approved by the voters on the November 3, 1998 ballot. This Act created the School Facility Program where eligible school districts may obtain state bond funds.

LOCAL

Los Angeles Unified School District (LAUSD). Although the California public school system is under the policy direction of the Legislature, the CDE relies on local control for the management of school districts. In allocating resources among the schools of the district, school district governing boards and district administrators must not only follow the law but also set the educational priorities for their schools.

LAUSD 2012-2015 Strategic Plan. The 2012-2015 Strategic Plan was created to guide LAUSD schools in providing high-quality instruction and a rigorous curriculum to facilitate student learning and achievement. The Strategic Plan provides 17 initiatives that would guide the LAUSD in reaching its goals in preparing students and ensuring they are college-prepared and career-ready upon graduation.[14]

LAUSD Choices Program. LAUSD provides education choices including magnet and permits with transportation (PWT) programs to students residing within the LAUSD boundaries. Students interested in enrolling in LAUSD magnet and PWT programs are required to apply through LAUSD eChoices. Magnet schools under the Choice Program include business, communication arts, center for enriched studies, gifted/highly gifted/high ability, liberal arts, magnet schools assistance program, public service, science/technology/engineering/math, and visual and performing arts.[15]

City of Los Angeles General Plan Framework (Framework Element). The City of Los Angeles General Plan Framework, which is an element of the City of Los Angeles General Plan, was originally adopted in December 1996 and re-adopted in August 2001. The General Plan Framework provides guidance for long-term growth in the City and guides the update of community plans and Citywide elements. The General Plan Framework also contains purposes, policies, and programs for City development. Chapter 9 Infrastructure and Public Services of the Framework Element includes goals, objectives, and policies applicable to public schools (**Table 4.11-8**).

TABLE 4.11-8: RELEVANT GENERAL PLAN SCHOOL GOALS, OBJECTIVES, AND POLICIES

FRAMEWORK ELEMENT – CHAPTER 9 INFRASTRUCTURE AND PUBLIC SERVICES	
Goal 9N	Public schools that provide a quality education for all of the City's children, including those with special needs, and adequate school facilities to serve every neighborhood in the City so that students have an opportunity to attend school in their neighborhoods.
Objective 9.31	Work constructively with the Los Angeles Unified School District to monitor and forecast school service demand based upon actual and predicted growth.
Policy 9.31.1	Participate in the development of, and share demographic information about, population estimates.
Objective 9.32	Work constructively with Los Angeles Unified School District to promote the siting and construction of adequate school facilities phased with growth.
Policy 9.32.1	Work with the Los Angeles Unified School District to ensure that school facilities and programs are expanded commensurate with the City's population growth and development.
Policy 9.32.2	Explore creative alternatives for providing new school sites in the City, where appropriate.
Policy 9.32.3	Work with LAUSD to explore incentives and funding mechanisms to provide school facilities in areas where there is a deficiency in classroom seats.
Objective 9.33	Maximize the use of local schools for community use and local open space and parks for school use.
Policy 9.33.1	Encourage a program of decision-making at the local school level to provide access to school facilities by neighborhood organizations.
Policy 9.33.2	Develop a strategy to site community facilities (libraries, parks, schools, and auditoriums) together.

[15]Los Angeles Unified School District, *e-Choices LAUSD Choices Program,* http://echoices.lausd.net//GeneralInformation.aspx, accessed March 6, 2017.

EXISTING SETTING

The LAUSD covers an area totaling 710 square miles, including most of the City of Los Angeles, along with all or portions of 26 cities and unincorporated areas of Los Angeles County. As the nation's second largest school district, LAUSD serves more than 664,774 K-12 students, with an additional 69,867 students enrolled in adult education schools, totaling approximately 734,641 students enrolled through LAUSD..[16] In total, LAUSD provides education services to an area of 710 square miles with a total of 1,302 educational schools and centers, including 451 elementary schools, 83 middle schools, 96 senior high schools, and 279 charter schools.[17,18] Further, through LAUSD's eChoice program, there are 198 Magnet Programs located throughout LAUSD.

LAUSD currently operates 15 schools serving the Project Area. Of these schools, nine are elementary schools, three are middle schools, and three are high schools.[19] **Figure 4.11-2** shows the location of these public schools. **Table 4.11-9** identifies the location, current capacity, and current enrollment of LAUSD schools serving the Project Area. All schools except for Webster Middle School are currently operating under enrollment capacity. LAUSD does not currently have any plans to open new schools to relieve current overcrowding at Webster Middle School. However, Webster Middle School currently has plans for expansion to accommodate existing and future student enrollment with a projected capacity of 1,115 students, eliminating any deficits in capacity.[20]

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to public schools if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered public school facilities, need for new or physically altered public school facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable capacities or other performance objectives for public schools.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors related to public schools:

- The population increase resulting from the Proposed Project, based on the increase in residential units or square footage of non-residential floor area;
- The demand for school services anticipated at the time of project buildout compared to the expected level of service available. Consider, as applicable, scheduled improvements to LAUSD services (facilities, equipment and personnel) and the project's proportional contribution to the demand;
- Whether (and the degree to which) accommodation of the increased demand would require construction of new facilities, a major reorganization of students or classrooms, major revisions to the school calendar (such as year-round sessions), or other actions which would create a temporary or permanent impact on the school(s); and
- Whether the project includes features that would reduce the demand for school services (e.g., on-site school facilities or direct support to LAUSD).

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of impacts to public schools. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. In some cases, the Thresholds Guide includes quantitative thresholds. For purposes of this analysis, Thresholds Guide criteria are used supplemented by the City's Guidelines, as necessary, since the thresholds identified in the City's Thresholds Guide are more development project-specific.

This discussion of impacts to public schools addresses impacts for the entire Project Area. No distinction is made between areas of change and areas within the ECTNP Area where zoning controls would not change since the potential impacts on public schools are evaluated based on the amount of development occurring within the attendance boundaries of existing schools and the ability of these schools to accommodate additional demand for enrollment created as a result of the implementation of the Proposed Project. This analysis estimates the number of students that would be generated by reasonably expected development with the ECTNP using LAUSD student generation rates and assesses whether existing and planned LAUSD school facilities expected to serve the Project Area would have sufficient available capacity to accommodate the students.[21] The Proposed Project with Alternative Compliance scenario is analyzed here, as it would add more residents and, therefore, would generate the greatest amount of students and result in the greatest amount of impacts to schools.

[21]Los Angeles Unified School District, *Student Generation Rate Calculation*, February 2008; Los Angeles Unified School District, *Commercial/Industrial Development School Fee Justification Study*, February 2008.

IMPACTS

IMPACT 4.11-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE ADDITIONAL DEMAND FOR PUBLIC SCHOOL ENROLLMENT THAT COULD NOT BE ADEQUATELY ACCOMMODATED BY EXISTING SCHOOLS SERVING THE PROJECT AREA, RESULTING IN THE NEED FOR NEW OR PHYSICALLY ALTERED SCHOOL FACILITIES? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

The Proposed Project would establish a Specific Plan, initiate zone changes and General Plan amendments, and introduce development and urban design standards. The Proposed Project would also involve new streetscape plans and parking strategies that together would enhance the pedestrian experience, promote transit ridership, and encourage a variety of mobility options. Zone changes and General Plan amendments would not occur on every parcel within the Project Area; these changes are anticipated within specific "areas of proposed change." School impacts within the Project Area are evaluated within the context of local policies and codes mentioned above. The ECTNP does not contain any specific regulations that would affect public schools.

As previously described, based on reasonably expected development levels for 2035, the Proposed Project with Alternative Compliance scenario could accommodate an additional 6,042 dwelling units and 3,887,018 square feet of non-residential uses when compared to existing conditions. Compared to future conditions under the current plan, the Project Area could accommodate an additional 4,988 dwelling units and 1,584,148 square feet of non-residential uses with the Proposed Project with Alternative Compliance scenario.

Based on the anticipated increase in residential and non-residential development resulting from the proposed land use changes, student enrollment in elementary, middle, and high schools serving the Project Area could be expected to increase by approximately 2,221 students by 2035. **Table 4.11-10** shows the estimated generation of elementary, middle, and high school students that could be anticipated within the Project Area.

TABLE 4.11-10: ANTICIPATED STUDENT GENERATION

Use	Dwelling Units/Buildable Square Feet 2013	2035	Net	Student Generation Rate	Students Generated
ELEMENTARY SCHOOL STUDENTS					
Residential /a/	25,018	31,060	*6,042*	0.1496 per dwelling unit	904
Retail	2,810,959	3,917,646	*1,106,687*	0.0238 per 1,000 sq. ft.	26
Office	3,383,329	8,150,877	*4,767,548*	0.0373 per 1,000 sq. ft.	178
Other Non-Residential /c/	5,230,197	3,242,981	*(1,987,216)*	0.0287 per 1,000 sq. ft.	(57)
				Total Elementary School Students Generated	***1,051***
MIDDLE SCHOOL STUDENTS					
Residential /a/	25,018	31,060	*6,042*	0.0763 per dwelling unit	461
Retail	2,810,959	3,917,646	*1,106,687*	0.0123 per 1,000 sq. ft.	14
Office	3,383,329	8,150,877	*4,767,548*	0.0194 per 1,000 sq. ft.	92
Other Non-Residential /c/	5,230,197	3,242,981	*(1,987,216)*	0.0150 per 1,000 sq. ft.	(30)
				Total Middle School Students Generated	***537***
HIGH SCHOOL STUDENTS					
Residential /a/	25,018	31,060	*6,042*	0.0921 per dwelling unit	556
Retail	2,810,959	3,917,646	*1,106,687*	0.0123 per 1,000 sq. ft.	14
Office	3,383,329	8,150,877	*4,767,548*	0.0192 per 1,000 sq. ft.	92
Other Non-Residential /c/	5,230,197	3,242,981	*(1,987,216)*	0.0148 per 1,000 sq. ft	(29)
				Total High School Students Generated	***632***
				Total Students Generated by Proposed Project	**2,221**

sq. ft. = square feet
/a/ The student generation rate for multi-family units was used to determine the students generated by the residential component of the Proposed Project, as all new residential use resulting from the Proposed Project is expected to be multi-family
/b / Other Non-Residential use includes both industrial and institutional use. The student generation rate for industrial use was applied to this category, as the net loss of square footage here is assumed to be the result of a decrease in industrial use in the future.
SOURCES: City of Los Angeles, Department of City Planning, 2014 and LAUSD, *Student Generation Rate Calculation*, February 2008 and LAUSD, *Commercial/Industrial Development School Fee Justification Study*, February 2008.

The Proposed Project would generate moderate student population and could increase enrollment at non-charter public schools by 1,051 elementary school students, 537 middle school students, and 632 high school students, totaling 2,221 students. As shown in **Table 4.11-9**, existing public (non-charter) elementary and middle schools serving the Project Area currently have the capacity to accommodate an additional 734 elementary and 1,158 middle school students. Based on remaining capacity at high schools serving the Project Area, an additional 3,789 students can currently be accommodated.

LAUSD enrollment forecasts are limited to five-year increments and do not extend out to 2035, and, thus, a comparison to LAUSD forecasts for the plan horizon year is not possible. While the increase in student enrollment resulting from the Proposed Project could be accommodated by the current capacity for the middle schools and high schools serving the Project Area, the current capacity at elementary schools serving the Project Area would not accommodate the number of new students that could be generated by the Proposed Project. However, student population may change during the intervening years, and LAUSD may need to expand existing schools and/or provide new facilities in order to accommodate the additional students generated by the Proposed Project. In the event that LAUSD constructs a new school or physically alter an existing facility, a project-specific environmental analysis would be required to address site-specific environmental concerns.

All development in California is subject to California Government Code Section 65995, which allows LAUSD to collect impact fees from developers of new residential and commercial/industrial space. Per current state law, developer impact fees are the exclusive method for mitigating impacts on school facilities. These fees collected on residential and commercial development may be used to pay for all of the following: land (purchased or leased) for school facilities, design of school facilities, permit and plan checking fees, construction or reconstruction of school facilities, testing and inspection of school sites and school buildings, furniture for use in new school facilities, and interim school facilities (purchased or leased) to house students generated by new development while permanent facilities are constructed. Such development would assist in funding efforts necessary to alleviate school overcrowding and would ensure that new development under the Proposed Project would bear its fair share of the cost of accommodating additional students generated. With payment of appropriate fees, impacts would be less than significant.

MITIGATION MEASURES

Impacts related to creating additional demand for public school enrollment are addressed by current law, and thus are less than significant before mitigation. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to creating additional demand for public school enrollment were determined to be less than significant without mitigation.

PARKS AND OTHER PUBLIC SERVICES

REGULATORY FRAMEWORK

FEDERAL

PUBLIC PARKS

U.S. Department of Transportation Act of 1966 (USDOT Act). Section 4(f) of the USDOT Act was enacted as a means of protecting publicly owned public parks, recreation areas, and wildlife/waterfowl refuges as well as historic sites of local, state or national significance, from conversion to transportation uses.

PUBLIC LIBRARIES

There are no federal regulations pertaining to libraries that are applicable to the Proposed Project.

STATE

PUBLIC PARKS

Quimby Act. The Quimby Act was established by the California State Legislature in 1965 and codified as California Government Code Section 66477. The Quimby Act allows the legislative body of a city or county to require, by ordinance, the dedication of land, payment of fees in lieu thereof, or a combination of both for park or recreational purposes as a condition to the approval of a tentative tract map or parcel map. LAMC Sections 12.33 and 17.12 are codified city ordinances that were enacted as a way to implement the Quimby Act. LAMC Sections 12.33 and 17.12 are colloquially referred to as the City's "Quimby Code."[22]

State Public Park Preservation Act of 1971. The primary instrument for protecting and preserving parkland is this Act (PRC Section 5400–5409). Under this Act, cities and counties may not acquire any real property that is in use as a public park for any non-park use unless compensation or land, or both, are provided to replace the parkland acquired. This provides no net loss of parkland and facilities.

California Mitigation Fee Act. This California Mitigation Fee Act, Government Code Sections 66000, *et seq.*, allows cities to establish fees to be imposed on development projects for the purpose of mitigating the impact of development on a city's ability to provide specified public facilities. In order to comply with this Act a city must follow the following primary requirements: (1) Make certain determinations regarding the purpose and use of a fee and establish a nexus or connection between a development project or class of project and the public improvement being financed with the fee; (2) Segregate fee revenue from the General Fund in order to avoid commingling of capital facilities fees and general funds; (3) For fees that have been in the possession of a city for five years or more and for which the dollars have not been spent or committed to a project, the city must make findings each fiscal year.

PUBLIC LIBRAIRES

There are no state regulations pertaining to libraries that are applicable to the Proposed Project.

LOCAL

PUBLIC PARKS

Los Angeles Countywide Comprehensive Parks & Recreation Needs Assessment. The Parks & Recreation Needs Assessment, adopted May 2016, documents existing parks and recreation facilities in cities and unincorporated communities and to use the data to determine the scope, scale, and location of park needs in Los Angeles County. The Parks & Recreation Needs Assessment also establishes new ways of understanding about parks, recreation, and open space by: considering parks as key infrastructure; using a new series of metrics to determine park needs; supporting a need-based allocation of funding for parks and recreation; and emphasizing community priorities and deferred maintenance projects. As part of the assessment, the Los Angeles County Department of Parks and Recreation collaborated with 86 cities.[23]

County of Los Angeles General Plan, Conservation and Open Space Element. The Conservation and Open Space Element of the County General Plan intends to guide the County's long-range preservation of its natural resources and open space and sets policy direction for the open space, natural, and energy-related resources within unincorporated Los Angeles County.[24] The Conservation and Open Space Element

[22]City of Los Angeles Department of Recreation and Parks, *Quimby/Park Fees*, https://laparks.org/planning/quimby-park-fees, accessed March 6, 2017

[23]County of Los Angeles Department of Parks and Recreation, *Los Angeles Countywide Comprehensive Parks & Recreation Needs Assessment*, May 2016.

[24]County of Los Angeles Department of Region Planning, *Draft General Plan Conservation and Open Space Element*, 2008.

establishes a standard of four acres of parkland per 1,000 residents and six acres of parkland per 1,000 County residents to plan for local and regional parkland, respectively.

City of Los Angeles General Plan, Service Systems Element-Public Recreation Plan. The City of Los Angeles General Plan is a comprehensive, long range declaration of purposes, policies and programs for the development of the City. The Public Recreation Plan of the Service Systems Element of the General Plan identifies existing recreational facilities and parks in the City of Los Angeles. The Public Recreation Plan categorizes parks into three types: neighborhood, community, and regional. Ideally, neighborhood parks have a service radius of approximately 0.5 mile and are pedestrian-accessible without crossing a major arterial street or highway/freeway. Community parks have a service radius of 2 miles and are easily accessible to the area served. Regional parks in the City provide specialized recreational facilities and/or attractions and have a service radius encompassing the entire Los Angeles region.

The Public Recreation Plan also provides the City's standard long-range ratios for parks to population. The City's standard ratio of parks to population is 2 acres per 1,000 residents for neighborhood parks and 2 acres per 1,000 residents for community parks, or 4 acres per 1,000 residents of combined neighborhood and community parks.[25] In addition to the park acreage standards, the Public Recreation Plan also states that the types of amenities (e.g., recreation center, gym, basketball courts, etc.) that are offered on public parks and recreation land should also be considered when determining the adequacy of park space.

City of Los Angeles General Plan Framework (Framework Element). The City of Los Angeles General Plan Framework, which is an element of the City of Los Angeles General Plan, was originally adopted in December 1996 and re-adopted in August 2001. The General Plan Framework provides guidance for long-term growth in the City and guides the update of community plans and Citywide elements. The General Plan Framework also contains purposes, policies, and programs for City development. Chapter 9 Infrastructure and Public Services of the Framework Element includes goals, objectives, and policies applicable to parks and recreation (**Table 4.11-11**).

2009 Citywide Community Needs Assessment. The Department of Recreation and Parks conducted the Citywide Community Needs Assessment as the first step in the preparation of a Citywide Recreation and Parks Master/Strategic Plan and a Five-year Capital Improvement Plan. The Needs Assessment identifies, quantifies, and preliminarily prioritizes the tremendous need for recreation and open space in the City. A high-level review was also performed of the Department's facilities in an attempt to address the various facilities needing improvements to meet current and future needs, prevent future maintenance problems, and offer positive alternatives to an increasingly dense and urbanized population.

LAMC Section 12.21(G). LAMC Section 12.21(G) contains open space requirements for multiple-residential dwelling units. This section requires new construction of a building, or a group of buildings, to provide a minimum amount of open space, based upon the number of dwelling units of the new construction of more than six dwelling units. LAMC Section 12.21(G) requires 100 square feet of open space for dwelling units with less than three habitable rooms, 125 square feet of open space per dwelling unit with three habitable rooms, and 175 feet of open space per dwelling unit with more than three habitable rooms. In addition, LAMC Section 12.21(G) indicates specific provisions with respect to the design and intended use of required open space for new construction.

LAMC Section 12.33. LAMC Section 12.33 is part of the City's implementation of the Quimby Act. This section was established by the City in 1985, and is a park impact fee, separate from the fees established in LAMC Section 17.12. This section applies to the finalization of zone changes for multi-unit residential projects, including rental projects.[26] The amount of land to be dedicated, or fees paid in lieu, must be done in the manner that is provided in LAMC Section 17.12.

[25]City of Los Angeles, *General Plan Public Recreation Plan*, 1980.
[26]County of Los Angeles Department of Regional Planning, *Draft General Plan Conservation and Open Space Element*, 2008.

LAMC Section 17.12. LAMC Section 17.12 is part of the City's implementation of the Quimby Act. LAMC Section 17.12 was established by the City in 1971. Section 17.12 requires that the residential developments requesting a subdivision or zone change are required, as a condition of approval, to either dedicate land for park and recreation purposes or pay a fee in lieu. The amount of land to be dedicated is based upon the table found in LAMC Section 17.12(B). Fees in-lieu are determined annually on March 1st by the City Planning Department.

LAMC Section 17.58. LAMC Section 17.58 requires land to be dedicated, or a fee paid in lieu, or in some other manner set forth in Section 17.12, prior to the final parcel map being approved by the City Council and/or its filing with the Los Angeles County Recorder.

LAMC Section 21.10.3(a)(1). Under LAMC Section 21.10.3(a)(1)(Dwelling Unit Construction Tax), the City imposes a tax of $200 per dwelling unit on all construction of new and modification of existing dwelling units to be paid to the Department of Building and Safety. These Parkland fees are placed into a "Park and Recreational Sites and Facilities Fund" to be used exclusively for the acquisition and development of park and recreational sites. If a developer has already paid Quimby fees, as described under Section 17.12, or has dedicated in lieu parkland or recreational facilities, the Parkland fees required may be reduced accordingly.

PUBLIC LIBRARIES

Los Angeles Public Library (LAPL) Branch Facilities Plan. To guide the construction, maintenance, and operation of libraries within the City, the LAPL Board of Commissioners adopted the Branch Facilities Plan in 1988. The Branch Facilities Plan is comprised of two components. One component sets the size and features of a local branch based upon the population and location it would serve, and the other component is a status list of existing branches and identification of communities that do not have library services. To facilitate and finance the implementation of the Branch Facilities Plan, bond measures were approved in 1989 and 1998. With the anticipated completion of the projects listed in the Branch Facilities Plan of 1988, the LAPL Board of Commissioners approved a revision to the plan in 2007.

The Branch Facilities Plan sets the following site selection criteria:

- Branches serving a population above 45,000 persons must have a facility of at least 14,500 square feet on a 40,000-square-foot property. Branches serving a population below 45,000 persons must have a facility of at least 12,500 square feet on a property of at least 32,500 square feet The size of regional branch facilities must not exceed 20,000 square feet upon a 52,000-square-foot property. When a community reaches a population of 90,000, an additional branch should be considered for the area;
- One-story library buildings with interior layouts must be designed to accommodate the disabled, and to have electronic technology, substantial shelving and seating capacities, and have a community meeting room;
- Good visibility and street access;
- Easily accessible by car, by bus and on foot;
- Take into consideration the relative locations of all schools served by the branch; and
- Take into consideration the relative locations of all neighboring branch libraries.

Los Angeles Public Library Strategic Plan 2015-2020. The LAPL Strategic Plan 2015-2020 provides goals, objectives, and key activities highlighting the next steps LAPL will take to provide better access to services, information, and resources to LAPL patrons. The goals and objectives of the Strategic Plan will guide the LAPL in providing services, opportunities, and increase existing collections that will cultivate and inspire young readers; nurture student success; champion literacy and lifelong learning; contribute to the city's economic growth; stimulate the imagination; and strengthen community connections and celebrate the City.[27] The LAPL Strategic Plan 2015-2020 is a update to LAPL Strategic Plan 2007-2010.

[27]City of Los Angeles Public Library, *Strategic Plan 2015-2020: Creating Opportunity, Building Community, Inspiring Innovation*, June 2015.

City of Los Angeles General Plan Framework Element. The City of Los Angeles General Plan Framework, which is an element of the City of Los Angeles General Plan, was originally adopted in December 1996 and re-adopted in August 2001. The General Plan Framework provides guidance for long-term growth in the City and guides the update of community plans and Citywide elements. The General Plan Framework also contains purposes, policies, and programs for City development. Chapter 9 (Infrastructure and Public Services) of the Framework Element includes objective, and policies applicable to library services (**Table 4.11-11)**.

TABLE 4.11-11: RELEVANT GENERAL PLAN PARKS AND LIBRARY GOALS, OBJECTIVES, AND POLICIES

Goal/Objective/Policy	Goal/Objective/Policy Description
FRAMEWORK ELEMENT – CHAPTER 9 INFRASTRUCTURE AND PUBLIC SERVICES	
Policy 9.23.2	Prioritize the implementation of recreation and park project in areas of the City with the greatest existing deficiencies.
Policy 9.23.5	Re-evaluate the current park standards and develop modified standards which recognize urban parks, including multi-level facilities, smaller sites, more intense use of land, public/private partnerships and so on.
Policy 9.23.7	Establish guidelines for developing non-traditional public park spaces like community gardens, farmer's markets, and public plazas.
Policy 9.24.1	Phase the development of new programs and facilities to accommodate projected growth.
Objective 9.20	Adopt a citywide library service standard by the year 2000.
Objective 9.21	Ensure library services for current and future residents and businesses.

SOURCE: City of Los Angeles, The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan, re-adopted 2001.

EXISTING SETTING

PUBLIC PARKS

The City of Los Angeles Department of Recreation and Parks (DRP) manages and provides parks and recreational services throughout the City. City park and recreation facilities include over 16,000 acres of parkland with over 444 park sites, including athletic fields, 422 playgrounds, 321 tennis courts, 184 recreation centers, 72 fitness areas, 62 swimming pools and aquatic centers, 30 senior centers, 26 skate parks, 13 gold courses, 12 museums, and 9 dog parks. In addition, the DRP also maintain 13 lakes, 92 miles of hiking trails, and operates 187 summer youth camps, and gang reduction and community intervention programs[28]

According to the City of Los Angeles Public Recreation Plan, parks can be classified as neighborhood, community, or regional. A neighborhood park should be a minimum of five acres in size (ideally 10 acres), with a service radius of a one-half-mile. A community park should be a minimum of 15 acres in size (ideally 20 acres), with a service radius of two miles. Regional parks are generally over 50 acres in size and serve the city region.[29] The Los Angeles County Department of Parks and Recreation manages regional parks, community parks, and golf courses that are available for all county residents to use.

There are currently 23 parks and/or recreational facilities providing service to the Project Area, including two regional parks, seven community parks, eight neighborhood parks, and six pocket parks. As a response to the need for additional park and recreational facilities, the DRP has implemented the 50 Parks Initiative which aims to better meet the park and recreational needs of the City's diverse communities by substantially increasing the number of citywide facilities, with a specific focus on densely-populated neighborhoods and communities lacking sufficient park space and recreational facilities.[30] In total, one site has been secured

Laces Recreation Center	5931 West 18th St.	Community Park	7.4

SOURCE: City of Los Angeles Department of Recreation and Parks, 2013; TAHA, 2017.

As indicated previously, the City's Public Recreation Plan states that in order to meet long-range local recreational standards, a project must have a minimum of two acres of neighborhood facilities and two acres of community recreational facilities for every 1,000 persons.[31] **Table 4.11-13** shows the existing demand for neighborhood parks and community parks located in the Project Area. Currently, there is an insufficient amount of available neighborhood parks. Based on the City's recreational standards, deficits exist of 78.5 acres of neighborhood parks. The Project Area is sufficiently meeting the current demand for community parks.

TABLE 4.11-13: EXISTING DEMAND FOR RECREATIONAL FACILITIES

Recreational Facility Type	Population (2013)	Demand per 1,000 residents	Demand for Recreational Facilities /a/	Acres of Recreational Space Available	Acres of Deficit	Demand Met
Pocket Parks	**50,595**	--	--	2.51	--	--
Neighborhood Parks		2 acres	101.2	22.74	78.5	No
Community Parks		2 acres	101.2	128.53	(27.3)	Yes
TOTAL		**4 acres**	**202.4**	**153.78**	**48.6**	**No**

/a/ Existing demand is based on open space provisions as provided for each facility type by the City of Los Angeles Public Recreation Plan (i.e., 2 acres for every 1,000 residents for neighborhood facilities; 2 acres for every 1,000 residents for community facilities; 6 acres for every 1,000 residents for regional parks).

PUBLIC LIBRARIES

The LAPL System provides library services for the City of Los Angeles. The LAPL System includes the Central Library, 8 regional branch libraries, 67 community branches, and 4 bookmobiles. There are approximately six million books and other materials within the LAPL collection.

All branch libraries also provide free access to computer workstations, which allow patrons to fully access the Internet and the LAPL's electronic resources, including the online catalog, subscription databases, word processing, language learning, and collections of historic documents and photographs. The LAPL website is also specially designed to allow accessibility for children, teens, and Spanish-speakers.

The LAPL operates seven libraries that serve the Project Area. **Figure 4.11-3** shows the location of these libraries. **Table 4.11-14** lists the locations, service area boundaries, number of residents served, total staff, total volume of materials, and total public computers at each branch. Combined, these seven libraries serve a population of approximately 429,127 residents and provide approximately 346,337 total volumes of materials.

TABLE 4.11-14: LIBRARIES SERVING THE PROJECT AREA

Library	Residents Served	Service Area Boundaries	Total Staff	Total Volumes of Materials	Building Size (Square Feet)

SOURCE: City of Los Angeles Public Library written correspondence, 2013. City of Los Angeles Public Library, *Strategic Plan 2007-2010*.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to parks and other public services if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios or other performance objectives for parks and/or other public services.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors:

For impacts related to public parks:

- The net population increase resulting from the Proposed Project;
- The demand for recreation and park services anticipated at the time of project buildout compared to the expected level of service available. Consider, as applicable, scheduled improvements to recreation and park services (renovation, expansion, or addition) and the project's proportional contribution to the demand; and
- Whether the project includes features that would reduce the demand for recreation and park services (e.g., on-site recreation facilities, land dedication or direct financial support to the Department of Recreation and Parks).

For impacts related to library services:

- The net population increase resulting from the Proposed Project;
- The demand for library services anticipated at the time of project buildout compared to the expected level of service available. Consider, as applicable, scheduled improvements to library services (renovation, expansion, addition or relocation) and the project's proportional contribution to the demand; and
- Whether the project includes features that would reduce the demand for library services (e.g., on-site library facilities or direct support to the LAPL).

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of impacts to public parks and library services. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. For purposes of this analysis, the CEQA Guidelines Appendix G criteria are used, supplemented by the City's Guidelines, as necessary, since the thresholds identified in the City's Thresholds Guide are more development project-specific.

Potential impacts on public parks and libraries are evaluated based on the ability of existing and planned facilities to accommodate additional demand for their use caused by population growth due to the Proposed Project. Using facility information obtained from the DRP and from the LAPL, this analysis estimates the number of residents that would be generated by implementation of the ECTNP and assesses whether existing and planned public parks and libraries expected to serve the Project Area would have sufficient available capacity to accommodate additional users.

The Proposed Project with Alternative Compliance scenario is analyzed as it would add more residents, and thus result in greater impacts in terms of public services.

IMPACTS

IMPACT 4.11-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE ADDITIONAL DEMAND FOR PARKS AND RECREATION FACILITIES THAT COULD NOT BE ADEQUATELY ACCOMMODATED BY EXISTING FACILITIES SERVING THE PROJECT AREA AND LIKELY RESULT IN THE NEED FOR NEW OR PHYSICALLY ALTERED PARKS AND RECREATION FACILITIES? THIS IMPACT IS POTENTIALLY SIGNIFICANT AND UNAVOIDABLE.

As previously described, based on reasonable expected development levels for 2035, the Proposed Project with Alternative Compliance scenario is anticipated to result in approximately 62,810 residents in the Project Area, which represents an increase of 12,215 residents compared to the estimated 2013 population, or an increase of 10,363 residents compared to future conditions (2035) under the current plan.

The Proposed Project would rezone approximately 2.2 acres of land north and south of the Expo LRT Line between Westwood Boulevard and Overland Avenue to Open Space. The Proposed Project would allow individual projects to increase their allowable floor area ratio in exchange for providing public benefits, which could include public open space and recreational facilities. In addition, the Proposed Project includes a new requirement for individual projects to provide open space based non-residential square footage (in addition to the open space currently required in the LAMC for residential use).

Increased development in the Project Area would increase the demand for parks and recreational facilities. This increased demand would be met in part through compliance with City requirements and through the public benefits required by the ECTNP of commercial and mixed use projects, as well as the new open space around Westwood Station. However, it is anticipated that these requirements would be insufficient to meet the demand from new development and that the increased demand would exacerbate the existing park deficit in the Project Area.

Based on the Public Recreation Plan standards, with the reasonable anticipated development for the year 2035, the existing deficit of parks and recreational facilities serving the Project Area could grow to 102.88 acres of neighborhood parks for a total deficit of 97.46 acres of parks and recreational facilities, as shown in **Table 4.11-15**. Population growth associated with the proposed increase in capacity would create demand for 251.24 acres of recreational facilities, 48.86 acres of which would result from the Proposed Project. Of the anticipated deficit of 97.46 acres of open space in 2035, 48.86 of this is attributed to the Proposed Project.

TABLE 4.11-15: FUTURE (2035) DEMAND FOR RECREATIONAL FACILITIES

Recreational Facility Type	Population /a/	Demand per 1,000 residents	Demand for Recreational Facilities /b/	Acres of Recreational Space Available	Acres of Deficit /c/	Project-Generated Deficit /d/	Demand Met
EXISTING CONDITIONS (2013)							
Neighborhood Parks	50,595	2 acres	101.19	22.74	78.45	--	No
Community Parks	50,595	2 acres	101.19	128.53	(27.34)	--	Yes
TOTAL		**4 acres**	**202.38**	**153.78**	**48.60**	**--**	**No**
ALTERNATIVE COMPLIANCE SCENARIO (2035)							
Neighborhood Parks	62,810	2 acres	125.62	22.74	102.88	24.43	No
Community Parks	62,810	2 acres	125.62	128.53	(2.91)	24.43	Yes
TOTAL		**4 acres**	**251.24**	**153.78**	**97.46**	**48.86**	**No**

/a/ Existing and reasonable expected population based on capacity of the proposed ECTNP.
/b/ Recommended standard per the City of Los Angeles Public Recreation Plan.
/c/ Acres needed to meet Public Recreation Plan standards.
/d/ Project-generated deficit calculated by subtracting existing deficit from future (2035) deficit.
SOURCE: TAHA, 2017.

Future development under the Proposed Project would be subject to LAMC Sections 12.33 and 17.12, which are part of the City's implementation of the Quimby Act. These ordinances require developers of residential projects to dedicate land for park and recreation purposes, or pay a fee in lieu thereof, prior to obtaining a building permit. The dedication of land for park and recreation purposes or payment of fees and implementation of Proposed Project policies, programs, and development standards would slightly offset the demand created by future development under the Proposed Project. However, population growth associated with the proposed increase in housing capacity would create additional demand for parklands that cannot be accommodated in the Project Area. The following issues were identified as barriers to the provision of new parks: (1) existing citywide open space ratios are suburban in nature and do not reflect the constraints of a dense, urban environment; (2) acquisition of new public land for parks and open space is extremely expensive in the Project Area; and (3) vacant or underused land in the Project Area is scarce and purchasing land for the provision of open space would compete with other identified community priorities such as providing housing and non-residential, job-generating uses. Therefore, there are no feasible mitigation measures and the Proposed Project would result in a significant impact related to public parks.

MITIGATION MEASURES

Impacts related to public parks would be significant under the Proposed Project. No feasible mitigation measures exist.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

While payment of applicable fees, the potential provision of publicly accessible open space as part of the Proposed Project's public benefit requirements, and the rezoning of some residential land to open space would all help address demand for recreational facilities, it would not lower demand sufficiently to reduce impacts to a less than significant level. No feasible mitigation measures were identified to reduce the significant operational impact related to public parks to less than significant. Therefore, the Proposed Project would result in a significant and unavoidable impact related to public parks.

IMPACT 4.11-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CREATE ADDITIONAL DEMAND FOR LIBRARY SERVICES THAT COULD NOT BE ADEQUATELY ACCOMMODATED BY EXISTING FACILITIES SERVING THE PROJECT AREA AND LIKELY RESULT IN THE NEED FOR NEW OR PHYSICALLY ALTERED LIBRARY FACILITIES? THIS IMPACT IS CONSIDERED LESS THAN SIGNIFICANT.

The Branch Facilities Plan developed for LAPLs establishes guidelines related to service. Branches serving a population above 45,000 people must have at least 14,500 square feet on a 40,000 square foot property. Branches serving a population below 45,000 people must have a facility of at least 12,500 square feet upon a property of at least 32,500 square feet. Branch expansions or special situations have special sizes. The size of regional branch facilities must not exceed 20,000 square feet upon a 52,000 square foot property. When a community reaches a population of 90,000 an additional branch should be considered for the area.

Implementation of the Proposed Project with Alternative Compliance scenario would guide development through 2035 and is anticipated to result in an additional 12,215 residents compared to existing conditions. The increased population is anticipated to increase the demand for library services and resources of the LAPL System. As addressed previously, the Branch Facilities Plan establishes criteria for the size and features of libraries in order to accommodate their corresponding populations served. Currently, the Westwood Branch and West Los Angeles Branch are the only libraries serving the Project Area that meet the minimum criteria established by the Branch Facilities Plan. However, the Branch Facilities Plan does identify the expansion of the West Los Angeles Branch from 14,000 square feet to 20,000 square feet. The Branch Facilities Plan will continue to forecast future demand for library facilities and ensure that adequate facilities and related improvements are available to serve the population of the Project Area. In addition, library requirements are changing with the advent of increasing resources being available on-line. While the

increase in population as a result of the Proposed Project may create a demand for library services, residential units within new buildings would have internet access to alleviate some of the need for library services and resources. Accordingly, the Proposed Project would not create substantial capacity or service level problems that would require the provision of new or physically altered library facilities in order to maintain an acceptable level of service for libraries. Impacts would be less than significant.

MITIGATION MEASURES

Impacts to libraries would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts to libraries would be less than significant without mitigation.

4.12 TRANSPORTATION AND TRAFFIC

This section provides an overview of transportation and traffic, and evaluates the construction and operational impacts associated with the Proposed Project. Topics addressed in this section include the circulation system; the congestion management plan; emergency access; and public transit, bicycle, and pedestrian facilities.

REGULATORY FRAMEWORK

FEDERAL

Americans with Disabilities (ADA) Act of 1990. Titles I, II, III, and V of the ADA have been codified in Title 42 of the United States Code, beginning at Section 12101. Title III prohibits discrimination based on disability in "places of public accommodation" (businesses and non-profit agencies that serve the public) and "commercial facilities" (other businesses). The regulation includes Appendix A through Part 36 (Standards for Accessible Design), establishing minimum standards for ensuring accessibility when designing and constructing a new facility or altering an existing facility. Examples of key guidelines include detectable warnings for pedestrians entering traffic where there is no curb, a clear zone of 48 inches for the pedestrian travelway, and a vibration-free zone for pedestrians.

STATE

Complete Streets Act. Assembly Bill 1358, the Complete Streets Act (Government Code Sections 65040.2 and 65302), was signed into law by Governor Arnold Schwarzenegger in September 2008. As of January 1, 2011, the law requires cities and counties, when updating the part of a local general plan that addresses roadways and traffic flows, to ensure that those plans account for the needs of all roadway users. Specifically, the legislation requires cities and counties to ensure that local roads and streets adequately accommodate the needs of bicyclists, pedestrians and transit riders, as well as motorists.

Complete Streets Directive. Caltrans enacted Complete Streets: Integrating the Transportation System (Complete Streets Directive; Deputy Directive 64) in October 2008, which required cities to plan for a "balanced, multimodal transportation network that meets the needs of all users of streets."[1] The directive also covers all phases of state highway projects, from planning to construction to maintenance and repair. A complete street is a transportation facility that is planned, designed, operated, and maintained to provide safe mobility for all users, including bicyclists, pedestrians, transit vehicles, truckers, and motorists, appropriate to the function and context of the facility. Every complete street looks different, according to its context, community preferences, the types of road users, and their needs.

Statewide Transportation Improvement Program (STIP). Caltrans administers transportation programming for the state. Transportation programming is the public decision-making process that sets priorities and funds projects envisioned in long-range transportation plans. It commits expected revenues over a multi-year period to transportation projects. The STIP is a multi-year capital improvement program of transportation projects on and off the State Highway System, funded with revenues from the State Highway Account and other funding sources.

[1]Caltrans, *Implementation Policy of Complete Streets: Integrating the Transportation System*, 2008, http://www.dot.ca.gov/hq/tpp/offices/ocp/complete_streets.html, accessed on March 8, 2017.

Congestion Management Program (CMP). To address the increasing public concern that traffic congestion is impacting the quality of life and economic vitality of the state, the CMP was enacted by Proposition 111, passed by voters in 1990. The intent of the CMP is to provide the analytical basis for transportation decisions through the STIP process.

Senate Bill 743 (SB 743). SB 743 directs the Office of Planning and Research (OPR) to develop revisions to the CEQA Guidelines to establish new criteria for determining the significance of transportation impacts and define alternative metrics for traffic level of service (LOS). On September 27, 2013, Governor Jerry Brown signed SB 743 into law and started a process that could fundamentally change transportation impact analysis as part of CEQA compliance. The new methodologies to evaluate transportation impacts under CEQA would promote the State's goals of reducing GHG emissions and traffic-related air pollution, incentivize an appropriate mix of land uses, and facilitate the development of a multimodal transportation system. These changes will include elimination of auto delay, LOS, and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts in many parts of California (if not statewide). Further, parking impacts will not be considered significant impacts on the environment for select development projects within infill areas with nearby frequent transit service. According to the legislative intent contained in SB 743, these changes to current practice were necessary to "…more appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions."

On January 20, 2016, the Governor's OPR released the *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA.* Of particular relevance to this project is the text of the proposed new Section 15064.3 that relates to the determination of the significance of transportations impacts, alternatives and mitigation measures. The following key text concerning the analysis of transportation impacts is taken directly from the document:

> *(b) Criteria for Analyzing Transportation Impacts.*
>
> *Lead agencies may use thresholds of significance for vehicle miles traveled recommended by other public agencies or experts provided the threshold is supported by substantial evidence.*
>
> *(1) Vehicle Miles Traveled and Land Use Projects. A development project that results in vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, development projects that locate within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor may be presumed to cause a less than significant transportation impact. Similarly, development projects that decrease vehicle miles traveled in the project area compared to existing conditions may be considered to have a less than significant transportation impact.*
>
> *(2) Induced Vehicle Travel and Transportation Projects. Additional lane miles may induce automobile travel, and vehicle miles traveled, compared to existing conditions. Transportation projects that reduce, or have no impact on, vehicle miles traveled may be presumed to cause a less than significant transportation impact. To the extent that the potential for induced travel has already been adequately analyzed at a programmatic level, a lead agency may incorporate that analysis by reference.*

Assembly Bill 32 (AB 32) and **Senate Bill 375 (SB 375)**. With the passage of AB 32, the Global Warming Solutions Act of 2006, the State of California committed itself to reducing statewide greenhouse gas (GHG) emissions to 1990 levels by 2020. The California Air Resources Board (CARB) is coordinating the response to comply with AB 32.

On December 11, 2008, CARB adopted its Proposed Scoping Plan for AB 32. This scoping plan included the approval of SB 375 as the means for achieving regional transportation-related GHG targets. SB 375 provides guidance on how curbing emissions from cars and light trucks can help the state comply with AB 32. The five major components to SB 375 are as follows:

(1) Regional GHG emissions targets. CARB's Regional Targets Advisory Committee guides the adoption of targets to be met by 2020 and 2035 for each Metropolitan Planning Organization (MPO) in the state. These targets, which MPOs may propose themselves, are updated every eight years in conjunction with the revision schedule of housing and transportation elements.

(2) MPOs are required to prepare a Sustainable Communities Strategy (SCS) that provides a plan for meeting regional targets. The SCS and the Regional Transportation Plan (RTP) must be consistent with each other, including action items and financing decisions. If the SCS does not meet the regional target, the MPO must produce an Alternative Planning Strategy that details an alternative plan to meet the target.

(3) SB 375 requires that regional housing elements and transportation plans be synchronized on 8-year schedules. In addition, Regional Housing Needs Assessment (RHNA) allocation numbers must conform to the SCS. If local jurisdictions are required to rezone land as a result of changes in the housing element, rezoning must take place within three years.

(4) SB 375 provides California Environmental Quality Act (CEQA) streamlining incentives for preferred development types. Certain residential or mixed-use projects qualify if they conform to the SCS. Transit-oriented developments (TODs) also qualify if they (1) are at least 50% residential, (2) meet density requirements, and (3) are within 0.5 mile of a transit stop. The degree of CEQA streamlining is based on the degree of compliance with these development preferences.

(5) MPOs must use transportation and air emissions modeling techniques consistent with guidelines prepared by the California Transportation Commission (CTC). Regional Transportation Planning Agencies, cities, and counties are encouraged, but not required, to use travel demand models consistent with the CTC guidelines.

REGIONAL

A number of regional improvement plans affect transportation in the City of Los Angeles. They include the Southern California Association of Governments' (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), Regional Transportation Improvement Plan (RTIP), and Sustainability Planning Grant Program; Los Angeles County Metropolitan Transportation Authority's (Metro) CMP, Long-Range Transportation Plan (LRTP), Short-Range Transportation Plan (SRTP), and Complete Streets Policy; City of Los Angeles' Bicycle Plan, Mobility Plan 2035 (MP 2035), General Plan, and Muncipal Code; Los Angeles Department of Transportation's (LADOT) Great Streets for Los Angeles Strategic Plan; and the Los Angeles Fire Department (LAFD) Strategic Plan.

SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Regional Transportation Improvement Plan (RTIP). [2] SCAG adopted the 2012-2035 RTP/SCS in April 2012. The 2012-2035 RTP/SCS is a planning document required under state and federal statute that encompasses the SCAG region, including six counties: Los Angeles, Orange, San Bernardino, Riverside,

[2]During the preparation of this Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. The 2016-2040 RTP/SCS is provided for informational purposes. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. The 2016-2040 RTP/SCS is discussed for informational purposes.Please see **Appendix K** for a more detailed discussion.

Ventura, and Imperial. The 2012-2035 RTP/SCS forecasts long-term transportation demands and identifies policies, actions, and funding sources to accommodate these demands. The 2012-2035 RTP/SCS consists of the construction of new transportation facilities, transportation systems management strategies, transportation demand management and land use strategies. The RTIP, also prepared by SCAG based on the 2012-2035 RTP/SCS, lists all of the regional funded/programmed improvements over a six-year period.

2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[3] The 2016-2040 RTP/SCS, adopted in April 2016, presents the transportation and overall land use vision for Los Angeles, Orange, San Bernardino, Imperial, Riverside, and Ventura Counties. The RTP portion of the 2016-2040 RTP/SCS identifies priorities for transportation planning within the Southern California region, sets goals and policies, and identifies performance measures for transportation improvements to ensure that future projects are consistent with other planning goals for the area. Transportation projects being constructed within the SCAG region must be listed in the 2016-2040 RTP/SCS. The SCS portion of the 2016-2040 RTP/SCS presents an overall land use concept for the region with increasing focus on long-term emission reduction strategies for rail and trucks; expanding the region's high-speed and commuter rail systems; expanding active transportation; leveraging technological advances for transportation; addressing further regional reductions in GHG emissions; and making the region more resilient to climate change. The RTP/SCS is intended to aid local jurisdictions in developing local plans and addressing local issues of regional significance.

Sustainability Planning Grant Program. The Sustainability Planning Grant Program, previously known as the Compass Blueprint Growth Grant Program, provides direct technical assistance to SCAG member jurisdictions to complete planning and policy efforts that enable implementation of the regional SCS. Since starting in 2005, 133 projects have been completed through the program, with another 69 projects to be completed by the end of 2016. Grants are available to SCAG member jurisdictions in through categories: integrated land use, active transportation, and green region. The Compass Blueprint Growth Vision was replaced by the RTP/SCS.[4]

Metro Congestion Management Plan (CMP). Metro, the local CMP agency, has established an approach to implement the statutory requirements of the CMP. The Metro Board adopted the 2010 CMP in October 2010. The approach includes designating a highway network that includes all State highways and principal arterials within the County and monitoring the network's congestion. The CMP identifies a system of highways and roadways, with minimum levels of service performance measurements designated at LOS E (unless exceeded in base year conditions) for highway segments and key roadway intersections on this system. For all CMP facilities within the Project Area, a traffic impact analysis (TIA) is required, though mixed-use developments that meet minimum density requirements and that are located within ¼ mile of a fixed rail station are exempt from CMP analysis. The analysis must investigate measures that will mitigate the significant CMP system impacts; develop cost estimates, including the fair share costs to mitigate impacts of the Proposed Project; and indicate the responsible agency. Selection of final mitigation measures is left at the discretion of the local jurisdiction. Once a mitigation program is selected, the jurisdiction self-monitors implementation through the existing mitigation monitoring requirements of CEQA.

[3]During the preparation of this Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. The 2016-2040 RTP/SCS is provided for informational purposes. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. The 2016-2040 RTP/SCS is discussed for informational purposes.Please see **Appendix K** for a more detailed discussion.

[4]SCAG, *Sustainability Planning Grant*, http://sustain.scag.ca.gov/Pages/Grants%20and%20Local%20Assistance/GrantsLocalAssistance.aspx, accessed March 6, 2017.

Metro 2009 Long Range Transportation Plan (LRTP). The 2009 LRTP includes funding for general categories of improvements, such as Arterial Improvements, Non-motorized Transportation, Rideshare and Other Incentive Programs, Park-and-Ride Lot Expansion, and Intelligent Transportation System (ITS) improvements for which Call for Project Applications can be submitted for projects in Los Angeles County. Metro also has a Short Range Transportation Plan to define the near-term (through year 2024) transportation priorities in Los Angeles County. In addition to the regional transportation plans, Metro has recently adopted a Complete Streets Policy and a First Last Mile Strategic Plan.

Metro Short Range Transportation Plan (SRTP). The 2014 Metro SRTP is a 10-year action plan that guides future Metro programs and projects through 2024 and advances Metro towards the long-term goals identified in the 2009 Metro LRTP. The SRTP identifies the short-term challenges, provides an analysis of financial resources, proposes action plans for the public transportation and highway modes, and includes other project and program initiatives. In addition, it addresses sustainability, future funding strategies, and lastly, measures the Plan's performance.[5]

Metro Complete Streets Policy. Metro's recently adopted Complete Streets Policy reinforces the California Complete Streets Act (AB 1358). Effective January 1, 2017, Metro requires all local jurisdictions within Los Angeles County to adopt a Complete Streets Policy, an adopted city council resolution supporting Complete Streets, or an adopted general plan consistent with the California Complete Streets Act of 2008 in order to be eligible for Metro capital grant funding programs, starting with the 2017 grant cycles.

LOCAL

City of Los Angeles 2010 Bicycle Plan (incorporated into the Mobility Plan (MP) 2035, see below). The City of Los Angeles adopted the 2010 Bicycle Plan on March 1, 2011, as a component of the Transportation Element of the City's General Plan. The purpose of the Bicycle Plan is to increase, improve, and enhance bicycling in the City as a safe, healthy, and enjoyable means of transportation and recreation. It establishes policies and programs to increase the number and type of bicyclists in the City and to make every street in the City a safe place to ride a bicycle.

The City is implementing the bicycle plan in a series of Five-Year Implementation Strategies, monitored, advised, and assisted by the Bicycle Advisory Council and the Bicycle Plan Implementation Team. The First Five-Year Implementation Strategy, started in 2011, prioritizes the first 253 miles of new bikeways for implementation. As the City updates each of its 35 community plans, it can include localized recommendations that address community-specific conditions and are consistent with and complementary to the 2010 Bicycle Plan. As each community plan is updated, future bicycle lanes in that planning area will be analyzed for potential environmental impacts.

The 2010 Bicycle Plan has been incorporated into the MP 2035, in several sections through the document, , reflecting the City's commitment to a holistic and balanced complete street approach that acknowledges the role of multiple modes (pedestrians, bicycles, transit, and vehicles). The former Technical Design Handbook in the Bicycle Plan has been incorporated into the Mobility Plan's Complete Streets Design Guide, including sections on design needs, bicycle paths, bicycle lanes, bicycle routes and neighborhood friendly streets, network gaps, signalized intersections, bicycle parking, bikeway signage, non-standard treatments, and street sections.

City of Los Angeles Mobility Plan (MP 2035). MP 2035 (formerly the Transportation Element of the City of Los Angeles General Plan) is the transportation blueprint for the City of Los Angeles. Adopted in 2015 and amended in 2016, the MP 2035 has been updated to reflect the policies and programs that will give Angelenos a full range of options to meet their mobility needs, including bicycling, carpooling, driving, transit, and walking. MP 2035 lays the policy foundation for safe, accessible and enjoyable streets for pedestrians, bicyclists, transit users, and vehicles alike.

[5]Los Angeles Metropolitan Transportation Authority, *2014 Short Range Transportation Plan, 2014.*

Relevant goals identified in the plan include:

1. Safety First
2. World Class Infrastructure
3. Access for all Angelenos
4. Collaboration, Communication, and Informed Choices
5. Clean Environments for a Healthy Community
6. Smart Investments

MP 2035 was prepared in compliance with the Complete Streets Act (AB 1358), which mandates that the circulation element of the General Plan be modified to plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways, defined to include motorists, pedestrians, bicyclists, children, persons with disabilities, seniors, movers of commercial goods, and users of public transportation, in a manner that is suitable to the rural, suburban, or urban context of the City's General Plan. Compliance with the Complete Streets Act is expected to result in increased options for mobility; less GHG emissions; more walkable communities; and fewer travel barriers for active transportation and those who cannot drive such as children or people with disabilities. Complete Streets play an important role for those who would choose not to drive if they had an alternative, as well as for those who do not have the option of driving.

City of Los Angeles General Plan Framework and Safety Elements. The Citywide General Plan Framework (Framework), an element of the City of Los Angeles General Plan, is a guide for Community Plans to implement growth and development policies by providing a comprehensive long-range view of the City as a whole. It provides a comprehensive strategy for accommodating long-term growth should it occur as predicted. Chapter 9 Infrastructure and Public Services of the Framework Element addresses fire prevention, fire protection and emergency medical services provided to the City. The Safety Element of the General Plan identifies existing police, fire, and emergency services and the service needs of the City of Los Angeles in the event of a natural disaster. The Safety Element goals, objectives, policies, and programs are broadly stated to reflect the comprehensive scope of the Emergency Operations Organization (EOO), which is the program that implements the Safety Element. The Framework and Safety Elements include goals, objectives, and policies that are applicable to emergency services, as identified in Table 4.11-1 in Section 4.11, Public Services.

Los Angeles City Municipal Code (LAMC). LAMC Section 12.26 contains required Transportation Demand Management (TDM) and Trip Reduction measures as described in the following paragraphs. TDM is defined as the alteration of travel behavior through programs of incentives, services, and policies, including encouraging the use of alternatives to single-occupant vehicles such as public transit, cycling, walking, carpooling/vanpooling and changes in work schedule that move trips out of the peak period or eliminate them altogether (as in the case in telecommuting or compressed work weeks). Trip Reduction is defined as reduction in the number of work-related trips made by single-occupant vehicles. Specific requirements for developments of various sizes are summarized from the code below:

Development in excess of 25,000 square feet (sf) of gross floor area is required to provide a bulletin board, display case, or kiosk (displaying transportation information) where the greatest number of employees are likely to see it. The transportation information displayed includes, but is not limited to: (1) current routes and schedules for public transit serving the site; telephone numbers for referrals on transportation information including numbers for the regional ridesharing agency and local transit operations; (2) ridesharing promotion material supplied by commuter-oriented organizations; (3) regional/local bicycle route and facility information; a listing of on-site services or facilities that are available for carpoolers, vanpoolers, bicyclists, and transit riders.

- Development in excess of 50,000 sf of gross floor area is required to provide the above, plus: (1) a designated parking area for employee carpools and vanpools as close as practical to the main pedestrian

entrance(s) of the building(s); (2) one permanent, clearly identified (signed and striped) carpool/vanpool parking space for the first 50,000 to 100,000 sf of gross floor area and one additional permanent, clearly identified (signed and striped) carpool/vanpool parking space for any development over 100,000 sf of gross floor area; (3) parking spaces clearly identified (signed and striped) shall be provided in the designated carpool/vanpool parking area at any time during the building's occupancy sufficient to meet employee demand for such spaces; (4) no signed and striped parking spaces for carpool/vanpool parking shall displace any handicapped parking; (5) a statement that preferential carpool/vanpool spaces are available on-site and a description of the method for obtaining permission to use such spaces shall be included on the required transportation information board; (6) a minimum vertical clearance of 7 feet 2 inches shall be provided for all parking spaces and accessways used by vanpool vehicles when located within a parking structure; and (7) bicycle parking shall be provided in conformance with Section 12.21A16 of this Code. Absent such demand, parking spaces within the designated carpool/vanpool parking area may be used by other vehicles and other amenities.

- Development in excess of 100,000 sf of gross floor area is required to provide the above, plus (1) a safe and convenient area in which carpool/vanpool vehicles may load and unload passengers other than in their assigned parking area; (2) sidewalks or other designated pathways following direct and safe routes from the external pedestrian circulation system to each building in the development; (3) possible bus stop improvements; and (4) safe and convenient access from the external circulation system to bicycle parking facilities on site.

Great Streets for Los Angeles/Los Angeles Department of Transportation (LADOT) Strategic Plan. In September 2014, the Mayor's Office and LADOT released Great Streets for Los Angeles, LADOT's first strategic plan to turn the City's essential infrastructure -- its streets and sidewalks -- into safer, more livable 21st century public spaces that accommodate everyone who uses them. The plan builds upon Mayor Eric Garcetti's Great Streets Initiative, which looks at Los Angeles's streets as valuable assets that can help revitalize neighborhoods across the City and make it easier for Angelenos to get around whether they walk, bike, drive, or take transit. The plan also stresses the importance of working closely with other City and regional agencies, such as the Bureau of Street Services and Metro, to improve safe, accessible transportation services and infrastructure.

Los Angeles Department of Transportation (LADOT) Review. As part of project review, LADOT evaluates project site plans to ensure that they follow standard engineering practice and City guidelines for vehicular access design. The department's *Traffic Study Policies and Procedures Manual* (2013) includes the requirements related to elements such as driveway design, use of off-street parking, and loading facilities. These design-related requirements are often imposed through zone changes, conditional uses, or the traffic review process. In many cases it in necessary to clear these traffic requirements (i.e., certify that they have been carried out). This is done by LADOT's representative on the Subdivision Committee, who must approve any plans affected by such requirements.

Los Angeles Fire Department (LAFD) Strategic Plan. The Strategic Plan focuses on nine goals and corresponding strategic actions that would guide the LAFD for the next three years. The primary goals that are applicable to the Proposed Project include providing exceptional public safety and emergency service and implementing and capitalizing on advanced technologies. Some of the key priorities associated with these goals include the following:

- Improving response times by utilizing data and metrics to identify gaps in LAFD's response strategies and exploring response time improvements through dialogue, cognitive inquiry, innovation, and follow-up;
- Delivery of emergency medical services by expanding LAFD Emergency Medical Service (EMS) response capabilities for special events and addressing period of high vehicle traffic; and
- Implementing advanced technologies by developing performance metrics, tracking standards, data collection, analysis and reporting procedures (FireStatLA).

The Strategic Plan also focuses on the development of an even more professional workforce and promotion of a positive work environment to address risk management issues and strengthening community relationships to improve preparedness and enhance resiliency during emergency events.

EXISTING SETTING

A comprehensive data collection effort was undertaken to develop a detailed evaluation of existing transportation conditions surrounding the five Expo Line Phase 2 light rail transit (LRT) stations located in the City of Los Angeles that together comprise the ECTNP. The ECTNP Area includes 86 study intersections within West Los Angeles, eastern Santa Monica, and Downtown Culver City, as illustrated in **Figure 4.12-1**.

These study intersections were selected to characterize the flow of traffic through the Project Area and to analyze the Proposed Project's potential impacts. The assessment of existing conditions relevant to this study includes a description of the immediate station and neighborhood area, an inventory of the local street and highway system in the vicinity of the stations, an evaluation of traffic volumes on these facilities, an assessment of operating conditions at selected intersections and current public transit services, bicycle network, and pedestrian facilities.

SPECIFIC PLAN STUDY AREAS

Bundy Station. The Bundy Station is located at the Bundy Drive/Exposition Boulevard intersection in the City of Los Angeles, south of Olympic Boulevard and approximately ¼-mile east of the boundary with the City of Santa Monica, and is served by the second phase of the Expo LRT. The majority of properties within a ½-mile radius of the Bundy Station are largely within the West Los Angeles Community Plan. Some of the properties located to the southeast are within the Palms-Mar Vista-Del Rey Community Plan.

Current land uses adjacent to the Bundy Station are commercial, including a car dealership and several big box retail stores. There is also a strong cluster of creative office uses, such as the Westside Media Center. North of Olympic Boulevard, there are some single- and multi-family residential uses. Directly south of the station is a concentration of single-family homes and limited multi-family and manufacturing zoned parcels. Neighborhood-oriented uses, such as retail and restaurants, are primarily located on Pico Boulevard. Streets in the Bundy Station Area east of Centinela Avenue are under the jurisdiction of the City of Los Angeles, while streets west of Centinela Avenue are under the jurisdiction of the City of Santa Monica. The Santa Monica Freeway (I-10), which runs through the station area, is under the jurisdiction of Caltrans.

Sepulveda Station. The Sepulveda Station is located at the Sepulveda Boulevard/Exposition Boulevard intersection in the City of Los Angeles and is served by Expo LRT. The station study area is bounded by Santa Monica Boulevard to the north, National Boulevard to the south, Overland Avenue to the east, and Bundy Drive to the west. The properties within a ½-mile radius of the station are within the West Los Angeles Community Plan.

Current land uses adjacent to the Sepulveda Station are manufacturing and light industrial uses. There are some single- and multi-family residential uses north of Pico Boulevard, as well as east and west of Sepulveda Boulevard directly south of the station. Neighborhood-oriented uses, such as retail stores and restaurants, are primarily located along Pico Boulevard east of Sepulveda Boulevard. The streets in the Project Area are under the jurisdiction of the City of Los Angeles, while the nearby San Diego Freeway (I-405) and I-10 are under Caltrans' jurisdiction.

Westwood Station. The Westwood Station is located at the Westwood Boulevard/Exposition Boulevard intersection in the City of Los Angeles and is served by Expo LRT. The station area is bounded by Tennessee Avenue to the north, National Boulevard to the south, Prosser Avenue to the east, and Sepulveda Boulevard to the west. The land uses within a ½-mile radius of the station are within the West Los Angeles Community Plan.

The current land uses adjacent to the Westwood Station are predominantly low-density residential. Community-oriented uses, such as a shopping mall and other retail stores, a cineplex, and restaurants, are primarily located along Pico Boulevard. Light industrial land uses are located in the western portion of the study area along Sepulveda Boulevard. There are also three schools in the station area, including a public elementary school, a private elementary, and a private senior high school. The streets in the station area are under the jurisdiction of the City of Los Angeles, while freeways are under the jurisdiction of Caltrans.

Palms Station. The Palms Station is located at the National Boulevard/Palms Boulevard intersection in the City of Los Angeles and is served by Expo LRT. The station study area covers the area bounded by National Boulevard to the north, Palms Boulevard to the south and the east, and Overland Boulevard to the west. The land uses within a ½-mile radius of the station are within the West Los Angeles Community Plan or the Palms-Mar Vista Del Rey Community Plan.

The current land uses that are adjacent to the Palms Station are predominantly residential uses, with Palms Station having the largest residential population of the five Project Area stations. The northern half of the study area is comprised of single-family homes and limited multi-family residences, while the area south of the station is a large multi-family residential neighborhood with commercial and light industrial businesses along National Boulevard. Along Motor Avenue, there are retail and office uses, as well as a large concentration of neighborhood-serving public facilities, such as Palms Elementary School and the U.S. Post Office. Streets in the station area are under the jurisdiction of the City of Los Angeles, while freeways are under the jurisdiction of Caltrans.

Culver City Station. The Culver City Station is served by Expo LRT. The station area is located on the edge of the City of Culver City and is directly adjacent to the city limits of Los Angeles, where a number of the neighborhoods surrounding the station fall. The City of Los Angeles land uses within a ½-mile radius of the station area are located in the Palms-Mar Vista-Del Rey Community Plan or the West Adams-Baldwin Hills-Leimert Community Plan.

Current land uses adjacent to the Culver City Station, particularly along the north and south sides of Venice Boulevard, are commercial and light industrial. The majority of commercial facilities, such as a shopping center located north of the station anchored by an grocery store, and the mixture of restaurants and creative office spaces in Downtown Culver City to the west of the station, are primarily oriented to serve the local population, as well as nearby film industry and office workers. East of the station is the historic Helms Bakery District, which also includes restaurants, offices, and home furnishing stores. Directly southeast of the station along Washington and La Cienega Boulevards is the Culver City Arts District, which is home to dozens of art galleries. Station Area neighborhoods also include multi-family homes between Washington Place and Venice Boulevard and along other major arterials, as well as single-family homes, which are largely concentrated north of I-10. Streets in the Station Area are under either the jurisdiction of the City of Los Angeles or the City of Culver City, while freeways are under the jurisdiction of Caltrans.

EXISTING HIGHWAY AND STREET SYSTEM

The street pattern in much of the ECTNP is a grid. In the Cheviot Hills neighborhood, located between the Westwood and Palms Station sites, the street pattern is curvilinear in nature due to area topography. The study area also includes portions of the street network in Culver City and Santa Monica that are proximate to the stations.

Roadway Descriptions. Below is a brief description of the types of facilities available in the ECTNP according to definitions included within planning documents for each of the three cities.

City of Los Angeles (MP 2035, Complete Streets Design Guide Manual)[6]

- Boulevard I (Major Highway Class I) – Class I Boulevards are generally defined as having three to four lanes in each direction along with a median turn lane. The width of a Class I Boulevard is usually 100 feet, with a typical sidewalk width of 18 feet and a target operating speed of 35 miles per hour (mph).
- Boulevard II (Major Highway Class II) – Class II Boulevards are generally defined as having two to three lanes in each direction along with a median turn lane. The width of a Class II Boulevard is usually 80 feet, with a typical sidewalk width of 15 feet and a target operating speed of 35 mph.
- Avenue I (Secondary Highway) – Class I Avenues typically have one to two lanes in each direction, a roadway width of 70 feet, and a typical sidewalk width of 15 feet and a target operating speed of 35 mph. An Avenue I typically includes streets with a high amount of retail uses and local destinations.
- Avenue II (Secondary Highway) – Avenue II streets usually have one to two lanes in each direction, with a typical roadway width of 56 feet, a typical sidewalk width of 15 feet and a target operating speed of 30 mph. Such streets are typically located in parts of the City with dense active uses, and a busy pedestrian environment.
- Avenue III (Secondary Highway) – Avenue III streets are defined to have one to two lanes in each direction, with a roadway width of 46 feet, a typical sidewalk width of 15 feet, and a target operating speed of 25 mph. This classification was developed to maintain roadway width in older, more historic parts of the City.
- Collector Street – Collector Streets generally have one travel lane in each direction, with a roadway width of 40 feet and a sidewalk width of 13 feet. The target operating speed for Collector Streets is 25 mph. Such streets are typically intended for vehicle trips that start or end in the immediate vicinity of the street.
- Industrial Collector Street – Industrial Collector Streets vary from normal collector streets in that larger curb returns are incorporated to allow for the wider turning radii of trucks.
- Local Street Standard – Local Street Standard roadways typically have one lane in each direction, a roadway width of 36 feet, sidewalk width of 12 feet, and a target operating speed of 20 mph. Such streets are not designed for through traffic; rather, their focus is to allow access to and from destination points. Unrestricted parking is typically available on both sides of the street.
- Local Street Limited – Local Street Limited roadways typically have one lane in each direction, a roadway width of 30 feet, sidewalk width of 10 feet, and a target operating speed of 15 mph.
- Industrial Local Street – Although similar to normal local streets, Industrial Local Streets differ primarily in width for the purpose of providing adequate space for trucks to maneuver. The typical roadway width for an Industrial Local Street is 44 feet, with 10-foot sidewalks and a target operating speed of 20 mph.

City of Santa Monica (Santa Monica's Land Use and Circulation Element [LUCE])[7]

- Boulevard – Boulevards are regional transportation corridors with continuous mixed uses and commercial land uses. Boulevards in the study area include Wilshire Boulevard, Santa Monica Boulevard and Pico Boulevard.

[6]Complete Streets Design Guide, https://losangeles2b.files.wordpress.com/2015/05/2015_csdg_web-4-22.pdf, adopted August 11, 2015.

[7]City of Santa Monica, *Santa Monica Land Use & Circulation Element*, adopted July 2010, revised July 2015, Page 4.0-18.

- Avenue: Major – These streets serve regional automobile trips and provide access for all modes of transportation. They are designed to discourage regional auto traffic from using Secondary or Minor Avenues. Examples of these Major Avenues include Centinela Avenue (south of Olympic Boulevard), Cloverfield Boulevard (between Santa Monica Boulevard and Pico Boulevard) and 26th Street (between Broadway and Cloverfield Boulevard).
- Avenue: Secondary – These streets distribute auto trips onto Minor Avenues and Neighborhood Streets, often serving regional bicycle trips. Examples of Secondary Avenues in the Project Area include Centinela Avenue (between Wilshire Boulevard and Olympic Boulevard) and 20th Street (between Wilshire Boulevard and Pico Boulevard).
- Avenue: Minor – These streets connect Neighborhood Streets with other avenues. Examples of Minor Avenues include Nebraska Avenue and Stewart Street/28th Street (north of Ocean Park Boulevard).
- Neighborhood Street – These streets primarily serve abutting buildings. An example a Neighborhood Streets is Pennsylvania Avenue (east of Stewart Street).
- Parkway – These streets serve as a linear park incorporating continuous landscaping, recreational bikeways and pedestrian paths. The Parkway in the study area is Olympic Boulevard (Lincoln Boulevard to eastern city limit).

City of Culver City (Culver City's General Plan Circulation Element)[8]

- Freeway – Freeways are specialized arterials with limited access and grade-separated intersections from the city's street system.
- Primary Artery – Primary arteries serve as major cross-town thoroughfares and it is desirable that they have right-of-way widths of 95 feet or more. Ideally, direct access onto primary arteries from private driveways should be limited or prohibited. The number of lanes on primary arteries varies between four and six lanes plus left-turn lanes, and may have raised median islands. Designated primary arteries within the study area include Culver Boulevard, Robertson Boulevard, Venice Boulevard, and Washington Boulevard.
- Secondary Artery – Secondary arteries serve as links between collector streets and primary arteries. They have between two and four travel lanes. Desirable right-of-way widths range from 80 to 94 feet. Designated secondary arteries within the study area include Duquesne Avenue, Higuera Street, and National Boulevard.
- Neighborhood Feeder – Neighborhood feeder streets are generally in residential neighborhoods and provide the commonly used direct route between local residential streets and the adjacent arteries.
- Local Street – Local streets are the bridge by which vehicles travel between private parking and driveways to the larger, non-local streets. Generally, local streets do not exceed 60 feet in right-of-way width and are found mostly in residential neighborhoods.

ROADWAY ACCESS IN ECTNP PROJECT AREA

Freeways. Regional north/south access to and from the ECTNP is provided by the I-405. Regional east/west access is provided by the I-10, which intersects the I-405 adjacent to the Sepulveda Station.

- The San Diego Freeway (I-405) is a major freeway that runs in a north/south direction and extends from the north San Fernando Valley to Orange County. The I-405 provides four to five lanes in each direction plus a High Occupancy Vehicle (HOV) lane in each direction in the vicinity of the ECTNP. The freeway ramps closest to the ECTNP are:
    - National Boulevard (northbound off-ramp, southbound on-ramp)

[8]City of Culver City, *Culver City General Plan: Circulation Element*, July 1996, Page C-10.

  - Cotner Avenue at Tennessee Avenue (northbound on-ramp)
  - Sawtelle Boulevard at Tennessee Avenue (southbound off-ramp)
  - Santa Monica Boulevard (northbound on-/off-ramps and southbound on-/off-ramps)

- The Santa Monica Freeway (I-10) is a major freeway that runs in an east/west direction and extends from the Pacific Ocean eastward through Downtown Los Angeles and beyond. In the vicinity of the ECTNP, the freeway provides three to five lanes in each direction plus parallel auxiliary lanes and/or collector distributor roadways at several sections usually near interchanges. The freeway ramps closest to the specific plan area are:

  - Bundy Drive (eastbound on-ramp and westbound off-ramp)
  - Centinela Avenue (westbound on-/off-ramps)
  - Manning Avenue (eastbound on-ramp)
  - National Boulevard (eastbound on-ramp)
  - National Boulevard (eastbound off-ramp)
  - Overland Avenue (eastbound on-ramp and westbound on-/off-ramps)
  - Pico Boulevard (eastbound off-ramp)
  - Robertson Boulevard (eastbound off-ramp and westbound on-/off-ramps)

Arterials. Key arterials serving the specific plan area include:

- Barrington Avenue is a north/south-oriented Avenue II roadway and is part of the Bicycle Enhanced Network in the MP 2035. Barrington Avenue is located west of the I-405 and provides service between Sunset Boulevard and Federal Avenue, where it becomes McLaughlin Avenue. In the study area, Barrington Avenue provides one travel lane per direction plus left-turn channelization at some intersections and widens to two travel lanes per direction south of Olympic Boulevard. In addition, south of Navy Street, the roadway is re-designated as a Collector Street and is reduced to one travel lane in each direction. On-street parking is generally permitted on both sides of the street. The posted speed limit is 35 mph. Barrington Avenue was a designated Secondary Highway in the previous version of the Transportation Element.

- Bundy Drive is a north/south-oriented Avenue I roadway and is part of the Bicycle Lane Network and the Transit Enhanced Network. The roadway is located directly east of the station and runs between San Vicente Boulevard and National Boulevard, where it becomes Centinela Avenue. Within the Project Area, the roadway generally provides two travel lanes in each direction plus left-turn channelization at key intersections. On-street parking is generally prohibited along the roadway; however, there are a few areas that do allow on-street parking during off-peak periods. The posted speed limit is 35 mph. Bundy Drive was a designated a Secondary Highway between Wilshire Boulevard and Pico Boulevard and a Major Highway South of Pico Boulevard in the previous version of the Transportation Element.

- Motor Avenue is a north/south-oriented Modified Avenue II roadway between Manning Avenue and National Boulevard and is part of the Bicycle Lane Network in the City of Los Angeles that was restriped in 2012. Between National Boulevard and Venice Boulevard, there is one travel lane in each direction, a center turn lane, and a bicycle lane in each direction. On-street parking is permitted on both sides of the street. The posted speed limit is 35 mph. Motor Avenue was a designated Secondary Highway in the previous version of the Transportation Element.

- Overland Avenue is a north/south-oriented roadway between the Westwood and Palms Station areas. The roadway provides connection between Santa Monica Boulevard in the City of Los Angeles and Jefferson Boulevard in the City of Culver City. Within the Project Area, there are typically two travel lanes in each direction and left-turn channelization at most key intersections. Throughout most of its length, Overland Avenue is designated a Boulevard II and is part of the Bicycle Lane Network, the Transit Enhanced Network, and the Bicycle Enhanced Network in the City of Los Angeles but is reduced to Modified Collector Street status between Santa Monica Boulevard and Pico Boulevard, where it has one lane of travel in each direction. In Culver City, Overland Avenue is designated as a Primary

Arterial. On-street parking is permitted on both sides of the street in most areas, except along segments near the I-10, which is accessible via eastbound and westbound on-/off-ramps at Overland Avenue and National Place. The posted speed limit is 35 mph, with a 25 mph school zone near Overland Elementary School. Overland Avenue was a designated Major Highway and Secondary Highway in the previous version of the Transportation Element.

- Robertson Boulevard is a north/south-oriented Modified Avenue II roadway in Los Angeles and a Collector Street in Culver City with two travel lanes in each direction. On-street parking is permitted on both sides of the street in most segments in the Project Area; however, portions of the segment between National Boulevard and Washington Boulevard have posted no-stopping-anytime restrictions. Robertson Boulevard provides westbound on-/off-ramps to the I-10. The posted speed limit is 35 mph except in the designated school zone for Alexander Hamilton High School and Everest College, between National Boulevard and Cattaraugus Avenue, where the posted limit drops to 25 mph. Robertson Boulevard was a designated a Secondary Highway in the previous version of the Transportation Element.

- Sawtelle Boulevard is a north/south-oriented Avenue I roadway located west of the Sepulveda Station between Olympic Boulevard and Overland Avenue. The roadway provides two travel lanes in each direction. The Culver City portion is designated a Collector Street. North of Olympic Boulevard, the roadway becomes a Collector Street and provides just one travel lane in each direction. A portion of the roadway is part of the Neighborhood Enhanced Network. In the Project Area, time-limited parking is available on both sides of the roadway between Tennessee Avenue and Olympic Boulevard, while no-stopping-anytime restrictions are posted on both sides of the roadway between Pico Boulevard and Tennessee Avenue. There is access to the roadway from the southbound I-405 via an off-ramp at Tennessee Avenue. The posted speed limit is 35 mph, except in the designated school zone near Daniel Webster Middle School, where the posted speed drops to a 25 mph. Sawtelle Boulevard was a designated a Secondary Highway in the previous version of the Transportation Element.

- Sepulveda Boulevard is a north/south-oriented Boulevard II located directly east of the Sepulveda Station and is part of the Transit Enhanced Network and the Bicycle Lane Network. The roadway runs parallel to the I-405 and serves as an important freeway alternative between Roscoe Boulevard in northern Los Angeles to the Terminal Island State Route 103 in Long Beach. In the Project Area, the facility typically provides two travel lanes in each direction with left-turn channelization at most intersections. On-street parking is generally permitted on both sides of the street except in the southbound direction between Santa Monica Boulevard and Exposition Boulevard. The posted speed limit is 35 mph. Sepulveda Boulevard was designated a Class II Major Highway in the previous version of the Transportation Element.

- Westwood Boulevard is a north/south-oriented roadway located east of the Westwood Station. The roadway begins in the north at Le Conte Avenue in Westwood Village and terminates at National Boulevard, where it becomes National Place. Through most of the Project Area, the roadway is designated a Boulevard II with one to two through travel lanes in each direction, left-turn channelization at most locations, and right-turn only lanes at major intersections. North of Santa Monica Boulevard, the roadway's designation changes to an Avenue II roadway. Portions of the roadway are part of the Transit Enhanced Network and the Bicycle Lane Network. On-street parking is generally permitted on both sides of the street. The posted speed limit is 30 mph. Westwood Boulevard was designated a Class II Secondary Highway and a Class II Major Highway in the previous version of the Transportation Element.

- Culver Boulevard is an east/west-oriented Primary Arterial in Culver City that provides two travel lanes in each direction with left-turn channelization at key intersections and a raised center median bicycle path. In the City of Los Angeles, between the Marina Freeway (State Route 90) and Lincoln Boulevard, Culver Boulevard is designated an Avenue I roadway and widens to provide three eastbound travel lanes and is part of the Bicycle Enhanced Network. On-street parking is generally prohibited west of Braddock Drive and permitted east of it, except adjacent to the I-405. Access to the I-405 is provided via

northbound and southbound ramps located along the roadway in the study area. The posted speed limit is 40 mph. Culver Boulevard was designated a Major Class Highway II in the previous version of the Transportation Element.

- Gateway Boulevard is an east/west-oriented Boulevard II roadway with two lanes in each direction, a raised median, and permitted on-street parking on both sides of the street. The posted speed limit is 35 mph and it is part of the Bicycle Lane Network and the Neighborhood Enhanced Network.

- National Boulevard is an east/west-oriented Avenue I and Avenue II roadway, which roughly parallels the I-10 and is part of the Bicycle Enhanced Network. Within the Project Area, except as noted below, National Boulevard provides two travel lanes per direction with left-turn channelization at key intersections and right-of-way widths ranging from 70 to 95 feet. Portions of the roadway between Overland Avenue and Palms Boulevard and between Castle Heights Avenue and Robertson Boulevard provide just one travel lane in each direction. On-street parking is permitted on both sides of the street between Overland Avenue and Robertson Boulevard, except along small neighborhood segments, such as the segment between the I-10 eastbound off-ramp and Overland Avenue. No parking is allowed along most sections of National Boulevard, except between Robertson Boulevard and Jefferson Boulevard where there are posted no-stopping-anytime restrictions. Freeway access is provided by eastbound and westbound on-/off-ramps at Overland Avenue and a westbound off-ramp at Manning Avenue. The posted speed limit ranges from 35 to 40 mph. National Boulevard was designated a Secondary Highway in the previous version of the Transportation Element.

- Ocean Park Boulevard is an east/west-oriented roadway that provides access between the City of Santa Monica and West Los Angeles. In the City of Santa Monica, Ocean Park Boulevard is designed as a Secondary Avenue in some portion and a Neighborhood Commercial roadway in others. East of Centinela Avenue in West Los Angeles, Ocean Park Boulevard is a Boulevard II roadway. Within the Project Area, the roadway provides two travel lanes and left-turn channelization at most intersections. On-street parking is generally permitted along the roadway, except within the Project Area, where parking is prohibited on the westbound side of the road. The posted speed limit is 35 mph.

- Olympic Boulevard is an east/west-oriented roadway located north of the stations. The roadway provides access between Santa Monica, West Los Angeles, Century City, and eventually downtown Los Angeles and beyond. The designation of the roadway varies from an Arterial Street in Santa Monica with two travel lanes in each direction and a raised median west of Centinela Avenue to a Boulevard II in Los Angeles with typically three travel lanes in each direction east of Centinela Avenue. In Los Angeles, Olympic Boulevard is part of the Vehicle Enhanced Network as well. Left-turn channelization is provided at most Olympic Boulevard intersections. In the Project Area, the roadway has three travel lanes in each direction with the exception of the segment between Cloverfield Boulevard and Centinela Avenue (west), where there are only two lanes in each direction. The segment between Cloverfield Boulevard and Sawtelle Boulevard has various areas that offer time-limited and metered parking, with the exception of the area between Cloverfield Boulevard and Centinela Avenue (east), where parking is prohibited. The posted speed limit is 35 mph. Olympic Boulevard was designated a Major Highway Class II Highway in the previous version of the Transportation Element.

- Palms Boulevard is an east/west-oriented Avenue II and Collector Street roadway with two travel lanes in each direction and is part of the Neighborhood Enhanced Network and the Bicycle Lane Network. On-street parking is permitted on both sides of the street. The posted speed limit is 35 mph. Palms Boulevard was designated a Secondary Highway in the previous version of the Transportation Element.

- Pico Boulevard is an east/west-oriented roadway that runs roughly parallel to the I-10, providing an alternate connection between Santa Monica and Downtown Los Angeles. Pico Boulevard is a designated Avenue I in Los Angeles and is part of the Transit Enhanced Network and the Bicycle Lane Network. The roadway is also an Arterial Street in Santa Monica with two travel lanes in each direction. Morning and evening peak hour parking restrictions provide a third eastbound travel lane between Gateway Boulevard and Sawtelle Boulevard and a third travel lane in each direction between Sawtelle Boulevard

and Sepulveda Boulevard. Left-turn channelization is provided at most intersections. Time-limited and metered parking is available on both sides of the street within the Project Area, except as noted. The posted speed limit is 35 mph. Pico Boulevard was designated a Major Highway Class II Highway in the previous version of the Transportation Element.

- Santa Monica Boulevard is an east/west-oriented Boulevard II roadway, which provides connectivity between Santa Monica, the West Los Angeles area, Beverly Hills, West Hollywood, and Hollywood. Portions of the roadway are part of the Transit Enhanced Network and the Bicycle Lane Network. West of the I-405, the roadway typically has two travel lanes in each direction with left-turn channelization at key intersections. On-street parking is permitted along both sides of the street during unrestricted periods. During critical commute periods, parking is prohibited in order to provide an additional travel lane. From the I-405 east to Beverly Hills, this roadway facility is configured with a raised median dividing three travel lanes in each direction with left-turn and/or right-turn channelization at key intersections. Santa Monica Boulevard was designated a Major Highway Class I Highway in the previous version of the Transportation Element.

- Venice Boulevard is an east/west-oriented Boulevard II roadway with portions designated as Modified and/or Scenic. The roadway is also known as State Route 187, with three travel lanes in each direction and is part of the Bicycle Enhanced Network and the Transit Enhanced Network. Within the Project Area, the roadway provides westbound and eastbound access to the I-405; rights-of-way range from 108 feet to 170 feet. A median of varying widths restricts left-turn access at many minor intersections. Restricted and unrestricted parking is available on both sides of the street. The posted speed limit is 35 mph. Venice Boulevard was designated a Scenic Major Highway Class II Highway in the previous version of the Transportation Element.

- Washington Boulevard is an east/west-oriented Boulevard I with two lanes in each direction, except for the approximately 1,000-foot segment where Washington Boulevard and Culver Boulevard overlap, where there are three travel lanes in each direction. Many Downtown Culver City segments of Washington Boulevard feature landscaped medians of variable widths. Time-limited and/or metered on-street parking is permitted on both sides of the street, except between Overland Avenue and Hughes Avenue on the south side of the street. The posted speed limit is 35 mph. A small portion of Washington Boulevard in the City of Los Angeles is designated a Bicycle Lane Network. Washington Boulevard was designated a Major Highway in the previous version of the Transportation Element.

Collector and Local Streets. The following streets are key collector and local streets serving the Project Area:

- 26th Street is a north/south-oriented roadway located west of the Bundy Station. It provides access between the City of Santa Monica, San Vicente Boulevard, and Cloverfield Boulevard. In the study area, the roadway is designated as a Major Avenue and a Secondary Avenue. The roadway typically provides two travel lanes in each direction and permitted on-street parking, except for the one-way northbound segment between Cloverfield Boulevard and Olympic Boulevard. The posted speed limit is 30 mph.

- Beloit Avenue is a short north/south-oriented Collector Street paralleling the I-405 to the west between Ohio Avenue and Olympic Boulevard. Although the street provides access to adjacent residential and commercial uses, it primarily serves as a frontage street with southbound ramp access to the I-405. Beloit Avenue provides one travel lane southbound, and on-street parking is prohibited adjacent to the I-405 ramps and permitted elsewhere along Beloit Avenue.

- Centinela Avenue is a north/south-oriented Collector Street roadway located west of the Bundy Station. It forms the boundary between the City of Santa Monica and the City of Los Angeles. South of Wilshire Boulevard, the roadway is designated as a local street in Santa Monica and as a collector street in Los Angeles. At the intersection with Olympic Boulevard, the north and south legs of Centinela Avenue are offset by about 500 feet. South of Olympic Boulevard, Centinela Avenue provides one travel lane in each direction, left-turn channelization at major intersections, and limited on-street parking. North of

Olympic Boulevard, Centinela Avenue widens to provide two travel lanes per direction, left-turn channelization, and permitted on-street parking. In the study area, Centinela Avenue provides one to two travel lanes, and parking is limited with time-limited and no-stopping-anytime restrictions posted. The posted speed limit is 30 mph.

- Cotner Avenue is a short north/south-oriented Collector Street paralleling the I-405 to the east between Ohio Avenue and Pico Boulevard. Although the street provides access to adjacent residential and commercial uses, it primarily serves as a frontage street with ramp access to the northbound I-405. North of Nebraska Avenue, Cotner Avenue is one-way and provides a northbound travel lane. Between Nebraska Avenue and Olympic Boulevard, there is one travel lane in each direction and permitted on-street parking. Between Olympic Boulevard and Pico Boulevard, a shared center left-turn lane is provided. Adjacent to the freeway ramp, left- and right-turn channelization is provided, and on-street parking is prohibited.
- Exposition Boulevard is an east/west-oriented Collector Street roadway directly south of the Sepulveda, Westwood,and Bundy stations. The roadway is designated as a Local Street from its western terminus at Stewart Street in Santa Monica to Sepulveda Boulevard, where it transitions to a Collector Street for most of its route in the study area. In the Project Area, the roadway runs parallel to the Union Pacific Rail Road right-of-way with one lane in each direction and permitted on-street parking.
- Ohio Avenue is an east/west-oriented Local Street roadway located north of the Bundy Station. It connects Centinela Avenue on the west with Thayer Street near Century City on the east. In the Project Area, Ohio Avenue is designated as a Local Street between Centinela Avenue and Barrington Avenue and as a Collector Street between Barrington Avenue and Manning Avenue. Typically, Ohio Avenue provides one travel lane in each direction with many intersections providing left- and/or right-turn channelization and permitted on-street parking.

EMERGENCY ACCESS

California state law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Generally, multi-lane arterial roadways allow the emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. Within the Project Area, arterial roadways running north/south include Barrington Avenue, Bundy Drive, Motor Avenue, Overland Avenue, Robertson Boulevard, Sawtelle Boulevard, Sepulveda Boulevard, and Westwood Boulevard. Arterial roadways running east/west include Culver Boulevard, Gateway Boulevard, National Boulevard, Ocean Park Boulevard, Olympic Boulevard, Pico Boulevard, Santa Monica Boulevard, Palms Boulevard, Venice Boulevard, and Washington Boulevard. Additionally, the I-10 provides rapid emergency access to and from locations within the Project Area.

The LAFD in collaboration with LADOT has developed a Fire Preemption System (FPS), a system that automatically turns traffic lights to green for emergency vehicles travelling on designated streets in the City. Within the Project Area, portions of Sepulveda Boulevard, Santa Monica Boulevard, Olympic Boulevard, and Pico Boulevard currently have FPS.

The City requires that development plans be submitted to the City for review and approval to ensure that new development has adequate access, including driveway access and turning radius in compliance with existing City regulations. The adequacy of emergency service may be influenced by factors such as staffing levels, emergency response times, and technology improvements, management strategies, and mutual aid agreements. On a yearly basis, LAFD assesses its resources and reallocates them based demand and need citywide. The provision of new fire stations varies as a function of not only the geographic distribution of physical structures but access to trucks, ambulances, and other equipment as well as the location of the Project Area and access to reciprocal agreements with neighboring jurisdictions.

EXISTING PUBLIC TRANSIT SERVICE

Public transit service within the Project Area consists primarily of local bus services linking riders to localized businesses and destinations. However, some regional transit opportunities are available via transfers to and from other lines. Services are provided by multiple transit operators, including Metro, Santa Monica Big Blue Bus (BBB), Culver City Bus, and LADOT Commuter Express Bus; services headways can be as frequent as 15 minutes or less. **Figure 4.12-2** shows transit lines in the ECTNP Area at the time of preparation of the Draft EIR. With the opening of the Expo Rail Line, Metro and BBB are expected to modify service to and from the stations. Below are brief descriptions of the various transit operators and the fixed transit lines providing service within the study area.

Los Angeles County Metropolitan Transportation Authority (Metro). Metro is the primary transit operator in Los Angeles County, providing bus, light rail, and subway services. There are two Metro heavy rail lines (Red and Purple), four Metro light rail lines (Blue, Green, Gold, Expo Phase 1) and two bus rapid transit (BRT) lines (i.e., Orange and Silver) operating in exclusive rights-of-way. Bicycles are allowed in designated areas on Metro trains at no extra charge at all times. Metro also operates approximately 180 bus routes in mixed traffic. These bus services vary considerably in speed, frequency and capacity. Most buses are equipped with two bicycle racks at the front of the bus, and bicyclists are allowed to load their bicycles on the rack when there is space available at no extra charge. If the rack is full, bicyclists are asked to wait for the next bus. The following Metro lines currently provide transit service in the study area:

- Metro Line 33 – Line 33 provides local service from Santa Monica via Venice Boulevard to Downtown Los Angeles. This line operates with headways of approximately 15 minutes on weekday peak periods. Off-peak headways are about 20 minutes. The stops along Venice Boulevard at Robertson Boulevard and at National Boulevard are close to the Culver City Station. Connection to the Rapid 733 Line is available at most stops in the study area.
- Metro Line 220 – Line 220 provides local service from the Beverly Center to Culver City via Robertson Boulevard. This line operates with headways of 60 minutes on weekdays only.
- Metro Line 534 – Line 534 provides express service that runs from Malibu through Downtown Santa Monica to the West Los Angeles Transit Center via the Pacific Coast Highway and the I-10. In the study area, this line operates primarily on Venice and Robertson Boulevards. This line operates with headways of approximately 20 minutes during the AM peak hour and 30 minutes during the PM peak hour.
- Metro Line 733 – Line 733 offers rapid service on Venice Boulevard between Santa Monica and Downtown Los Angeles. This line operates with headways of 10 to 15 minutes on weekdays.
- Metro Exposition Line – The Expo Line connects the Westside by rail to Downtown Los Angeles and other rail lines in the Metro system. The Expo Line operates with headways of 6 minutes during weekday peak periods.

Santa Monica Big Blue Bus (BBB). BBB is the primary transit operator within the Project Area. BBB operates 14 local bus routes, five rapid routes, and two circulator routes. These bus services vary considerably in speed, frequency and capacity. Most buses are equipped with two bicycle racks at the front of the bus, and bicyclists are allowed to load their bicycles on the rack when there is space available at no extra charge. If the rack is full, bicyclists are asked to wait for the next bus. The following BBB lines provided transit service in the study area at the time of preparation of the Draft EIR:

- BBB Line 2 – Line 2 runs from 4th Street in Downtown Santa Monica to Westwood and the UCLA campus via Wilshire Boulevard. Headways are approximately 15 minutes during the weekday peak periods and about 20 minutes during the weekday off-peak periods and on weekends.

2012-058

- BBB Line 4 – Line 4 runs from Downtown Santa Monica to Brentwood via 4th Street and San Vicente Boulevard via Sawtelle Boulevard, Olympic and Pico Boulevards. Line 4 provides service on Pico Boulevard in the study area with headways of 30 minutes during weekday peak hours and 60 minutes on weekends.
- BBB Line 5 – Line 5 runs from Downtown Santa Monica to Century City and the Culver City Station. Service headways of about 20 minutes are provided during weekday peak periods and about 30 minutes during weekday off-peak periods and on weekends.
- BBB Line 6 – Line 6 provides limited service and runs from the Santa Monica College (SMC) main campus to the SMC Bundy Campus to Palms and loops around National Boulevard and Venice Boulevard to travel back to the SMC campuses. Line 6 services are only available Monday through Thursday only.
- BBB Line 7 – Line 7 provides localized service between Downtown Santa Monica to Rimpau Transit Center and the Mid-City area of Los Angeles via Pico Boulevard. In the study area, Line 7 provides service with 10-minute headways during weekday peak hours and 15-minute headways on weekends.
- BBB Line Rapid 7 – During weekdays, the Rapid 7 line offers limited-stop, express service between Downtown Santa Monica and the Rimpau Transit Center and the Mid-City area of Los Angeles via Pico Boulevard. This line operates with headways of approximately 10 minutes during the peak hours. No service for this line is available on weekends.
- BBB Line 8 – Line 8 provides local service between Downtown Santa Monica in the west and UCLA in the east via Main Street, Ocean Park Boulevard, Barrington Avenue, National Boulevard, and Westwood Boulevard. This line travels through and stops in the Westwood Station area at a number of intersections along Westwood Boulevard. Service hours are from 6:00 a.m. to 11:30 p.m. seven days per week. Peak period headways range from 11 to 25 minutes in the morning and 15 to 20 minutes in the afternoon.
- BBB Line Rapid 10 – Line 10 is a freeway express line that provides service through Downtown Santa Monica via Santa Monica Boulevard west of Bundy Drive and on Bundy Drive between Santa Monica Boulevard and the I-10. This line eventually travels along the I-10 to Downtown Los Angeles and Union Station. Service headways of about 15 to 20 minutes are provided during weekday peak periods and about 30 minutes during weekday off-peak periods and on weekends.
- BBB Line 12 – Line 12 travels from UCLA Hilgard Terminal or UCLA Ackerman Terminal to the Westside Pavilion to the Culver City Station. This line serves the Palms, Culver City, and Westwood areas. Service headways of about 15 minutes are provided during the weekday peak periods and about 30 minutes during weekends. This line travels along National Boulevard, Palms Boulevard, and Venice Boulevard in the study area.
- BBB Line 13 – Line 13 provides weekday peak-hour commuter service between the Rimpau Transit Center (Rimpau) in the east and the Westside Pavilion in the west. Within the study area, this line travels along Pico Boulevard, Overland Avenue, Ashby Avenue, Manning Avenue, Motor Avenue, and Beverly Drive. The line's western terminus is the intersection of Westwood Boulevard and Pico Boulevard in the Westwood Station Area. Morning service from Rimpau to the Westside Pavilion begins at 7:00 a.m., with the last pick-up leaving at 8:30a.m. Headways are 30 to 35 minutes. Afternoon service hours from the Westside Pavilion to Rimpau begin at 2:30 p.m. and end with the last pick-up leaving at 6:00 p.m. Headways are 65 minutes.
- BBB Line Rapid 12 – Rapid 12 line travels from UCLA Hilgard Terminal or UCLA Ackerman Terminal to the Westside Pavilion to the Culver City Station. This line provides faster service to the Palms Station in addition to serving the Palms, Culver City, and Westwood areas. This line travels along National Boulevard, Palms Boulevard, Overland Avenue, and Venice Boulevard in the study area.

- BBB Line 14 – Line 14 provides service to Brentwood Village, Olympic-Bundy Commercial Area, Santa Monica Airport, and Marina del Rey Middle School via Bundy Drive and Centinela Avenue. Service headways of about 13 to 15 minutes are provided during weekday peak periods and about 20 to 30 minutes during weekday off-peak periods and on weekends. This line travels along Bundy Drive in the study area.
- BBB Line 20 – Line 20 provides express service from Downtown Santa Monica to the western terminus of the Expo Line in Culver City. Between Downtown Santa Monica and Culver City Station, the line travels along the I-10 and makes no stops. Weekday eastbound service hours are from 5:30 a.m. to 7:30 a.m., and again from noon to 4:30 p.m.; westbound service hours are from noon to 2:30 p.m. and again from 5:30 p.m. to 9:00 p.m. Eastbound morning peak hour headways range from seven to 33 minutes. Westbound afternoon peak hour headways range from 25 to 35 minutes.

Los Angeles Department of Transportation (LADOT). LADOT provides local and commuter express bus services in the City of Los Angeles. The Downtown Area Short Hop (DASH) operates 32 local routes covering Downtown Los Angeles and many outlying communities within the City. The Commuter Express operates 14 routes, making a limited number of stops and transporting passengers between downtown Los Angeles and other major centers within the City. All Commuter Express routes, except for one, operate during the peak hours only in the peak direction. Most buses are equipped with two bicycle racks at the front of the bus, and bicyclists are allowed to load their bicycles on the rack when there is space available at no extra charge. If the rack is full, bicyclists are asked to wait for the next bus. The following LADOT Commuter Express Lines currently provide transit service in the study area:

- LADOT Commuter Express Line 431 – Line 431 is a north/south commuter express line that travels from Downtown Los Angeles to Westwood. This line also serves Rancho Park and Palms. This line travels on the I-10 in the study area. Line 431 operates on weekdays only.
- LADOT Commuter Express Line 437 – Line 437 is a north/south commuter express line that travels from Downtown Los Angeles to Venice. This line also serves Culver City and Marina del Rey. This line travels along Robertson Boulevard and Culver Boulevard in the study area. Line 437 operates on weekdays only.

Culver City Bus. Culver City Bus operates seven local and one rapid bus service in the City of Culver City and the City of Los Angeles. Most buses are equipped with two bicycle racks at the front of the bus, and bicyclists are allowed to load their bicycles on the rack when there is space available at no extra charge. If the rack is full, bicyclists are asked to wait for the next bus. The following Culver City Bus lines currently provide transit service in the study area:

- Culver City Bus Line 1 – Line 1 is a local east/west line that runs along Washington Boulevard from Venice Beach in the west to Washington Boulevard and Fairfax Avenue in the east. Service headways of about 12 minutes are provided during the weekday peak periods. This line travels along Washington Boulevard in the study area.
- Culver City Bus Line 3 – Line 3 is a local north/south line that runs from Century City in the north to the Culver City Transit Center in the south. In the study area, the line travels along Westwood Boulevard, National Boulevard, and Motor Avenue. Service hours begin at 5:30 a.m. and end at 11:00 p.m. Weekday headways are 20 minutes all day until 8:00 p.m. After 8:00 p.m. and on weekends, headways are 30 minutes.
- Culver City Bus Line 5 – Line 5 is a local east/west line that runs from Blair Hills in the east to Washington and Inglewood Boulevards in the west. This line travels along Washington Boulevard, Culver Boulevard, and Higuera Street within the study area. Line service is available on school days only. In addition to limited service days, Line 5 operates only once in the morning westbound and once in the afternoon.

- Culver City Bus Line 6 – Line 6 provides localized service on Sepulveda Boulevard and Westwood Boulevard between the Metro Green Line Station in Inglewood and UCLA in Westwood. Buses run at 10- to 15-minute headways during the peak weekday hours and approximately 30-minute headways during off-peak periods and weekends.
- Culver City Bus Line Rapid 6 – Line 6 offers limited-stop, express service on Sepulveda Boulevard and Westwood Boulevard between the Metro Green Line Station in Inglewood and UCLA in Westwood. Buses run at 20- to 25-minute headways during the peak weekday hours.
- Culver City Bus Line 7 – Line 7 is a local east/west line that runs from Venice Boulevard and Culver Boulevard in the east to Marina del Rey in the west. Line 7 only operates during weekdays with 30-minute headways. This line travels primarily along Culver Boulevard in the study area.

EXISTING BICYCLE AND PEDESTRIAN FACILITES

Bicycle Facilities. Existing bicycle facilities in the ECTNP are classified based on the following standard typology:

- Bike Paths Class I Bikeways provide a completely separate right-of-way and are designated for the exclusive use of bicycles and pedestrians. Vehicle and pedestrian cross-flow is minimized.
- Bike Lanes Class II Bikeways provide a restricted right-of-way and are designated for bicyclist use through a striped lane on a street or highway. Bicycle lanes are generally five-foot wide, one-way facilities that carry bicyclist traffic in the same direction as the adjacent roadway traffic. Vehicle parking and vehicle/pedestrian cross-flow are permitted.
- Bike Routes Class III Bikeways provide for a right-of-way designated by signs or pavement markings for shared use with pedestrians or motor vehicles. Bike routes provide continuity to other bicycle facilities (usually Class II Bikeways) or designate preferred routes through high demand corridors.
- Separated Class IV Bikeways provide on-street facilities reserved for use by bicyclists, with physical separation between the bikeway and travel lanes.

Figure 4.12-3 shows existing and planned bicycle facilities in the Project Area. As illustrated, there are existing bicycle lanes on Venice Boulevard and on portions of Sepulveda Boulevard, Motor Avenue, Ohio Avenue, Gateway Boulevard, National Place, and La Cienega Boulevard. There are existing bicycle routes on Barrington Avenue, Westwood Boulevard, and National Place.

Pedestrian Facilities. A pedestrian network provides safe and convenient access for all users with all abilities. The pedestrian network includes sidewalks, crosswalks, and curb ramps, as well as pedestrian amenities, such as street trees, benches, and buffer zones separating sidewalks from traffic and buildings. The ECTNP Area has an aging network of pedestrian facilities, including sidewalks of varying widths and wide crosswalks at most major intersections. Many areas have pedestrian-friendly features, such as curbside parking and traffic signal modifications, to ensure longer pedestrian crossing times, where warranted. Conditions surrounding each station vary widely in terms of sidewalk condition, pavement marking visibility, and obstructions in the sidewalk realm.

PLANNED TRANSPORTATION NETWORK IMPROVEMENTS

Several key improvements in the study area are funded and assumed to be part of the future baseline. These improvements, the result either of local or regional Capital Improvement Programs or as mitigation for ongoing or entitled projects, would result in capacity changes and/or traffic shifts at various locations throughout the study area. The improvements are reflected in the Future No Project and Future With Project traffic forecasts. Although some of these projects are now complete, they were not included in the existing operating conditions as they were under construction at the time of this analysis.

Following are key planned capital improvements in the study area (as of 2013):

- Extension of the Expo LRT from Culver City to Santa Monica via the Expo rail right-of-way, which includes several aerial grade separations. According to the Expo Corridor Transit Project Phase 2 Final EIR, this line is estimated to generate approximately 15,060 total daily passenger trips among the following four stations in the Project Area by 2030:
    - National/Palms – 1,860 daily passengers[9]
    - Expo/Westwood – 5,240 daily passengers[10]
    - Expo/Sepulveda – 5,100 daily passengers[11]
    - Expo/Bundy – 2,860 daily passengers[12]
- Construction of a Class I and Class II bikeway (3.85 miles) along the Expo Corridor between Venice/Robertson Boulevards and Santa Monica city limits at Centinela Avenue.
- Widen the I-405 between the I-10 and the US-101 in order to add a northbound carpool lane.
- Wilshire Bus Rapid Transit Project extends from Valencia Street to the Santa Monica city limit line and include peak period curbside bus lanes.

Future Bicycle Network (MP 2035). Implementation of future bicycle facilities along key arterials is anticipated to be part of a network providing access to major employment centers, transit stops, and retail, entertainment, and recreational resources. As discussed above in Regulatory Framework, the City of Los Angeles 2010 Bicycle Plan has been incorporated into the recently adopted MP 2035. The programs in the Bicycle Plan are integrated into the MP 2035 Bicycle Enhanced Network and Bicycle Lane Network, which together create a network of arterial streets and other rights-of-way prioritized for bicycle movement. The Bicycle Enhanced Network consists of bicycle paths, protected bicycle lanes, and bicycle facilities on neighborhood-serving streets that provide connections within the protected bicycle lane system. The Bicycle Lane Network consists of bicycle facilities on arterial roadways with striped separation. **Figure 4.12-3** illustrates the facilities that are on either the Bicycle Enhanced Network or the Bicycle Lane Network within the Project Area.

EXISTING TRAFFIC VOLUMES AND OPERATING CONDITIONS

This section presents existing base peak hour traffic volumes, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each, indicating volume-to-capacity (V/C) ratios and LOS. See **Appendix H** for detailed existing traffic volume data.

It should be noted that since traffic volumes are a result of the aggregate travel choices of thousands of individual drivers, variation in the daily and peak period volumes on a ny given facility is both expected and observed. The Federal Highway Administration (FHWA) guidelines recommend traffic models are

[9]Exposition Line Construction Authority. *Exposition Corridor Transit Project Phase 2 FEIR*, December 2009, page 3.2-52.

[11]*Ibid*, p. 3.2-66.
[12]*Ibid*, p. 3.2-66.

calibrated to within 7 to 15 percent for freeway and arterial volumes to account for this regular variation.[13] This range is based on studies that show that this range represents the average daily fluctuation in traffic for major roadways.[14] Accordingly, while specific and detailed LOS calculations are provided throughout this document, these estimates of both existing and operating conditions are subject to regular variation due to fluctuations in travel demand.

Existing Traffic Volumes

Weekday AM and PM peak hour turning movement counts were collected at the study intersections listed below. For all analysis locations, AM (7:00 to 10:00 a.m.) and PM (3:00 to 6:00 p.m.) period traffic volumes were counted in 15-minute intervals in May 2013:

1. Cloverfield Boulevard & Olympic Boulevard
2. 26th Street & Olympic Boulevard
3. Stewart Street & Olympic Boulevard
4. Centinela Avenue (West) & Olympic Boulevard

86. Sawtelle Boulevard & I-405 Southbound On- and Off-Ramp

Two studied intersections located in the City of Los Angeles are currently unsignalized: Barrington Avenue & Missouri Avenue and Westwood Boulevard & Exposition Boulevard (South). These intersections have been analyzed to determine whether volumes warrant the installation of a traffic signal.

At the time when traffic counts were conducted for this study, the following six study intersections were under construction as part of the Expo LRT Line Phase 2 (Culver City to Santa Monica):

1. National Boulevard & Venice Boulevard
2. Robertson Boulevard & Venice Boulevard
3. National Boulevard / Exposition Boulevard & Palms Boulevard
4. Sepulveda Boulevard & Exposition Boulevard
5. Gateway Boulevard & Pico Boulevard
6. Cloverfield Boulevard & Olympic Boulevard

Manual peak period turning movement counts for the aforementioned study intersections are provided in **Appendix H**.

Existing Levels of Service. The existing year traffic volumes and lane configurations presented in **Appendix H** were analyzed using the required intersection capacity analysis methodology to realistically determine the existing operating conditions at the study intersections. **Table 4.12-1** summarizes the V/C and corresponding LOS results for the aforementioned analyzed periods during a weekday. As indicated, 53 (62 percent) of the 86 analyzed intersections are currently operating at an acceptable level of service (LOS D or better) during one or more analysis periods. The remaining 33 intersections are currently operating at or near capacity (LOS E or F) during one or more analysis periods.

CMA/ICU methodology uses a V/C ratio, while Highway Capacity Manual methodology uses seconds of delay. The City of Santa Monica uses Highway Capacity Manual Methodology. City of Los Angeles uses CMA methodology. Culver City uses ICU methodology. Unsignalized intersections use Highway Capacity Manual methodology.
/a/ Intersection geometry altered due to construction.
/b/ Unsignalized intersection; City of Santa Monica uses Highway Capacity Manual methodology. (City of Los Angeles does not require impact analysis of unsignalized intersections.)
SOURCE: Fehr & Peers, 2015.

Existing Transit Ridership. This section presents the available data for bus transit boardings and alightings in the study area. In 2013, there were more than 28,000 average daily transit boardings and alightings on Metro and BBB routes within ½ mile of each of the five station areas. Data on Metro and BBB existing average daily transit boardings and alightings near each station site are presented in **Table 4.12-2**. Because the ½-mile buffers around some stations overlap, some boardings and alightings are counted in two station areas.

TABLE 4.12-2: AVERAGE DAILY BUS BOARDINGS AND ALIGHTINGS WITHIN ½ MILE OF THE EXPO STATIONS

Station Area	Boardings	Alightings	Total

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to transportation/traffic if it would:

- Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit;
- Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways;
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- Result in inadequate emergency access; and/or
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

The above thresholds are general in nature and address a broad range of projects and are supplemented by the more specific thresholds adopted by each of the jurisdictions in which the study intersections are located. For purposes of this analysis, adopted LOS thresholds are used to determine the significance of impacts. As noted above, the Governor's OPR has circulated suggested (preliminary discussion draft) changes to these thresholds to remove automobile delay as a significant impact under CEQA and to focus on VMT and the potential to induce more traffic into an area. These changes are currently being circulated for comment and are, therefore, not used in this document as a threshold of significance. However, evaluation of VMT and other metrics is included in this chapter for informational purposes but VMT analysis is not relied upon for the purposes of determining impact.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

The 2006 Los Angeles CEQA Threshold Guidelines (Threshold Guidelines) provides thresholds of significance for intersection capacity, street segment capacity, freeway capacity, neighborhood intrusion, project access, transit system capacity, parking, and in-street construction impacts.

CITY OF LOS ANGELES CEQA THRESHOLDS AS APPLIED TO THE PROPOSED PROJECT

The Thresholds Guidelines were applied to specifically address the ECTNP as follows:

- The methodology and thresholds for intersection capacity are incorporated in the Circulation System threshold used in this EIR as described below.
- Thresholds for street segments are not used because the intersection capacity analysis incorporated in the Circulation System threshold is more refined than street segment analysis, and thus can characterize the flow of traffic and to analyze potential impacts in the Project Area.
- The methodology and thresholds for freeway capacity are incorporated in the Congestion Management Program – Freeway Segment Analysis threshold used in this EIR as described below.
- The methodology and thresholds for neighborhood intrusion impacts are included in the Neighborhood Intrusion Impacts threshold used in this EIR as described below.
- The methodology and thresholds for project access are incorporated in the Safety, Emergency Access, and Consistency with Plans thresholds used in this EIR as described below.
- The methodology and thresholds for transit system capacity are incorporated in the Congestion Management Program – Transit Impact Review threshold used in this EIR as described below.
- Parking has been removed as a threshold under CEQA as described below.
- This EIR evaluates the thresholds for in-street construction impacts qualitatively because the study represents a specific plan area relating to the build out of multiple parcels. There is currently no specific project or detailed information regarding a particular site.

CIRCULATION SYSTEM

The Proposed Project would have a significant impact to the circulation system if it would exceed the applicable thresholds established by each jurisdiction as identified below.

LADOT Threshold Guidelines for Intersections. Based on the criteria set forth in the City of Los Angeles Department of Transportation *Traffic Study Policies and Procedures*, June 2013, the Critical Movement Analysis (CMA) method is used to determine the LOS grade for signalized intersections within the City of Los Angeles. Changes in V/C are assessed by comparing conditions with and without the addition of the Proposed Project. Near term and future year analysis horizons are defined by LADOT staff in the Proposed Project scoping process.

The transportation analysis used the thresholds described below to determine the significance of the Proposed Project impacts.

***Signalized Intersections*.** In accordance with LADOT criteria defined in their *Traffic Study Policy and Procedures*, an impact is considered to be significant if one of the following V/C thresholds is exceeded:

- The LOS is C, its final V/C ratio is 0.701 to 0.80, and the Project-related increase in V/C is 0.040 or greater, or
- The LOS is D, its final V/C ratio is 0.801 to 0.90, and the Project-related increase in V/C is 0.020 or greater, or
- The LOS is E or F, its final V/C ratio is 0.901 or greater, and the Project-related increase in V/C is 0.010 or greater.

Intersections operating at LOS A or B after the addition of the Proposed Project traffic are not considered significantly impacted regardless of the increase in V/C ratio.

***Unsignalized Intersections*.** The City of Los Angeles traffic analysis methodology and significance criteria are for signalized intersections only. The City does not provide impact thresholds for unsignalized intersections. The LADOT *Traffic Study Policies and Procedures* states, "unsignalized intersections should

be evaluated solely to determine the need for the installation of a traffic signal or other traffic control device."

Traffic volumes and lane configurations, as presented in **Appendices H** were used to prepare signal warrant analyses at the unsignalized intersections under 2015 No Project, 2015 With Project, 2035 No Project, and 2035 With Project conditions. The warrant analyses were conducted in accordance with the procedures described in Chapter 4C of the *California Manual on Uniform Traffic Control Devices 2012* (MUTCD 2012). The warrant for a traffic signal is met if a plotted point representing the vehicles per hour on the major street (for both approaches) and the corresponding vehicles per hour on the higher-volume minor-street approach (one direction only) for one hour lies above the applicable curve in Figure 4C-3 in the MUTCD 2012 for the combination of approach lanes. If the combined volume of the major approaches and the corresponding conflicting volumes are greater than the threshold determined by the intersection configuration, then a traffic signal could be warranted.

City of Santa Monica Significance Criteria for Intersections. The City of Santa Monica has established criteria for assessing whether project-related traffic increases result in significant impacts on intersection operating conditions. The adopted significance criteria, summarized below, depend on the classification of the streets at the intersection and the operating conditions of the intersection. The potential significance of a project's impact is measured either by the change in average vehicular delay or by a change in the intersection operating conditions to unacceptable conditions. If the projected LOS is F, however, significance is defined in terms of a change in V/C ratio (as calculated by the Highway Capacity Manual's Operational Analysis method), since the average vehicular delay cannot be calculated using the Highway Capacity Manual operational method if the intersection exhibits oversaturated traffic conditions.

In accordance with Santa Monica criteria, an impact is considered to be significant if one of the following thresholds is exceeded with the addition of the Proposed Project:

- If LOS equals A, B or C and is a collector street intersection and the average vehicle delay increase is greater than or equal to 15 seconds or LOS becomes D, E or F
- If LOS equals A, B or C and is an arterial street intersection and the average vehicle delay increase is greater than or equal to 15 seconds or LOS becomes E or F
- If LOS equals D and is a collector street intersection and there is any net increase in average seconds of delay per vehicle
- If LOS equals D and is an arterial street intersection and the average vehicle delay increase is greater than or equal to 15 seconds or LOS becomes E or F
- If LOS equals E and is a collector or arterial intersection and there is any net increase in average seconds of delay per vehicle
- If LOS equals F and is a collector or arterial intersection and the Highway Capacity Manual V/C ratio net increase is greater than or equal to 0.005

City of Culver City Significance Criteria for Intersections. The City of Culver City has established threshold criteria used to determine if a project has a significant traffic impact at a signalized intersection under the City of Culver City jurisdiction. According to the City of Culver City criteria, a Project impact would be considered significant if the following conditions are met:

Intersection Conditions with Project Traffic		Project-related Increase in V/C Ratio
LOS	V/C Ratio	
C	0.701 to 0.800	Equal to or greater than 0.050
D	0.801 to 0.900	Equal to or greater than 0.040
E, F	0.901 or more	Equal to or greater than 0.020

CONGESTION MANAGEMENT PROGRAM (CMP)

Freeway Segment Analysis. The Proposed Project would have a significant impact related to the CMP if it would exceed the established threshold. CMP mainline freeway monitoring locations where the Proposed Project could add 150 or more trips in either direction during either the AM or PM weekday peak hours are subject to CMP analysis. The CMP traffic impact analysis guidelines indicate that a significant Project impact occurs when the following threshold is exceeded:

- The Proposed Project increases traffic demand on a CMP facility by two percent of capacity (V/C ≥0.02), causing LOS F (V/C > 1.00)

If the facility is already at LOS F, a significant impact occurs when the Proposed Project increases traffic demand on a CMP facility by two percent of capacity (V/C ≥ 0.02).

The required CMP methodology compares the typical lane capacity for a freeway mainline segment to the number of vehicles traveling on the segment during the peak hour. Due to bottlenecks in the freeway network, vehicle demand can often exceed vehicle throughput resulting in significant reductions in travel speeds and extensive vehicle queuing. When this situation occurs, the number of vehicles passing a CMP monitoring location may be substantially lower than the actual vehicle demand for that location. This results in an artificially low traffic count at the CMP monitoring station, that when compared to the typical lane capacity, can show better operations (i.e., a lower V/C) than experienced by drivers.

Arterial Intersection Analysis. CMP arterial monitoring intersections, including monitored freeway on-ramps or off-ramps, where the Proposed Project will add 50 or more trips during either the AM or PM weekday peak hours are subject to CMP analysis. The CMP exempts from analysis residential and mixed use projects within ¼ mile of fixed rail passenger stations. Although some portions of the Project and study intersections would qualify for this exemption, all CMP intersections in the study area were evaluated.

The Proposed Project would have a significant impact related to the CMP if it would exceed the established threshold. The *Congestion Management Program for Los Angeles County* traffic impact analysis guidelines indicate that a significant Project impact occurs when the following threshold is exceeded:

- The Proposed Project increases traffic demand on a CMP facility by 2 percent of capacity (V/C ≥0.02), causing LOS F (V/C > 1.00)

If the facility is already at LOS F, a significant impact occurs when the Proposed Project increases traffic demand on a CMP facility by 2 percent of capacity (V/C ≥ 0.02).

Transit Impact Review. The Proposed Project would have a significant impact related to the CMP Transit system if it would substantially impact transit service.

NEIGHBORHOOD INTRUSION

The Proposed Project would have a significant impact related to neighborhood intrusion if it increase the average daily traffic (ADT) volume on a local residential street in an amount equal to or greater than the following:

- ADT increase ≥ 16% if final ADT < 1,000
- ADT increase ≥ 12% if final ADT ≥ 1,000 and < 2,000
- ADT increase ≥ 10% if final ADT ≥ 2,000 and < 3,000
- ADT increase ≥ 8% if final ADT ≥ 3,000

Final ADT is defined as total projected future daily volume including Proposed Project, ambient, and related project growth.

Because the routing of traffic to local residential streets depends on the locations of site access points for each development site and those access points cannot be known at this time, the Proposed Project is assessed qualitatively against these thresholds for purposes of this EIR.

SAFETY

The Proposed Project would have a significant impact if it would substantially change transportation safety. No specific methodologies or quantitative thresholds for safety have been defined by the three jurisdictions in the Study Area. CEQA Guidelines broadly define a safety impact threshold as "substantially increase hazards due to a design feature (sharp curves or dangerous intersections) or incompatible land uses (farm equipment)." The Threshold Guidelines include significance thresholds for Bicycle, Pedestrian, and Vehicular Safety. According to those guidelines, the determination of significance shall consider the following factors:

- The amount of pedestrian activity at project access points.
- Design features/physical configurations that affect visibility of cars to pedestrians and bicyclists.
- The type of bicycle facility that the project driveway(s) crosses and level of utilization.
- The physical conditions of the site and the surrounding area, such as curves, slopes, walls, landscaping or other barriers, that could result in vehicle/pedestrian, vehicle/bicycle, or vehicle/vehicle impacts.

The Proposed Project does not include specific design features at this time that would be known to increase hazards, so the Proposed Project is assessed qualitatively against these thresholds for purposes of this EIR.

EMERGENCY ACCESS

The CEQA Guidelines and the Thresholds Guide both state that the Proposed Project would have a significant impact if it would result in inadequate emergency access.[15,16] The Thresholds Guide provides screening criteria and thresholds of significance for evaluating emergency access in terms of two impacts: impacts to project access and impacts to emergency services.

The City's guidelines for analyzing project access impacts are best suited for evaluating *local* project access where design details are available and are not directly applicable to the evaluation of a Specific Plan. The City guidelines provide the following screening criteria for determining whether project access impacts, including emergency access, need to be studied in an EIR:

> *Would the Proposed Project generate 500 or more daily trips or 43 or more vehicle trips during either the a.m. or p.m. peak hours? If yes, would any of the following occur?*
>
> > *Is a project driveway proposed on a major or secondary highway within 150 feet of an intersection with another major or secondary highway? Would a project driveway intersect an on-street bicycle lane or cross a sidewalk in an area of high pedestrian activity? Can it be readily perceived that there are access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to adequate lines of site?*
>
> *A "no" response to the first question and all of the following questions indicates that there would normally be no significant Project Access impacts from the proposed project.*

Since the Proposed Project does not include design-level details (such as driveway design and location) this criterion for evaluating project access is not used to evaluate emergency access of the ECTNP. As noted above the required City review of site plans addresses adequacy of access.

[15]CEQA Guidelines, Appendix G.
[16]City of L.A. Thresholds Guide, 2006, page 28.

The more suitable analysis for determining the emergency access impacts of the Proposed Project is provided in the *Threshold Guide's* discussion of impacts to fire and emergency medical services. The relevant CEQA threshold for significance for public services is as follows:

> *Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the above public services: i) Fire protection? ii) Police protection?*[17]

The City's screening criteria for whether fire service impacts need to be studied more, including whether there will be an increased number of intersections with LOS E or F (other screening criteria include: project distance to fire station, brush fire hazards, fire hydrant services, storage of combustible materials).[18] It is important to note that this is not the threshold of significance. This criteria simply informs whether further study is required, including possibly an EIR. The adopted threshold of significance in the City's threshold guidelines is that a project would normally have a significant impact on fire protection if it requires the addition of a new fire station or the expansion, consolidation or relocation of an existing facility to maintain service.

This is the threshold used in this EIR for determining the Proposed Project's emergency access impact.[19]

PUBLIC TRANSIT, BICYCLE, OR PEDESTRIAN FACILITIES

The Proposed Project would have a significant impact if it would disrupt existing public transit, bicycle, or pedestrian facilities or interfere with planned facilities, or create conflicts or inconsistencies with adopted public transit, bicycle, or pedestrian system plans, guidelines, policies, or standards. No other specific LOS methodologies or quantitative thresholds for performance have been defined by the three jurisdictions in the Study Area.

CONSISTENCY WITH PUBLIC TRANSIT/BICYCLE/PEDESTRIAN POLICIES OR PLANS

The Proposed Project would have a significant impact related to transportation if it would conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

PARKING

Parking deficits are considered to be socioeconomic effects, rather than impacts on the physical environment as defined by CEQA, but there may be secondary physical environmental impacts, such as increased traffic congestion at intersections, neighborhood intrusion, air quality impacts, safety impacts, noise impacts caused by congestion, or land use impacts. According to SB 743, parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area is not considered a significant impact. A transit priority area is defined as an area within ½ mile of a major transit stop that is existing or planned; the majority of the Project Area is within a transit priority area for the respective Expo Line stations. The Proposed Project would have a significant impact if secondary effects related to parking

[17] City of L.A. Thresholds Guide, 2006, page 26.

[18] *Ibid*, K.2-2.

[19] The City rejects the use of a threshold of significance for fire and emergency response services in this EIR that is directly tied to response times based on LOS as has been advocated by commentators on other City EIRs. The City is rejecting this threshold on the basis that, as discussed further in Impact 4.12-5, it is not supported by substantial evidence. There is no evidence, including substantial evidence, that has been provided to the City or that the City (including its traffic and environmental consultants) is aware of, or has found with reasonable diligence and inquiry, including searching the relevant academic and trade literature and other agency's EIRs prepared across the State, that can demonstrate to the City's satisfaction that there is a correlation between decreased LOS and decreased response times of fire and emergency response services, or that there is any method to connect LOS and response times for purposes of analyzing a plan adoption or update that covers an area the size of the Project Area.

contribute to impacts described by the other significance thresholds. These other significance thresholds are addressed in the relevant sections (noise, air quality, etc.).

CONSTRUCTION

The Proposed Project would have a significant impact if it would require construction activities to take place within a major or secondary highway right-of-way that would necessitate temporary lane, alley, or street closures for more than one day; require construction activities to take place within a collector or local street right-of-way that would necessitate temporary lane, alley, or street closures for more than seven days; result in the loss of regular vehicular or pedestrian access to an existing land use for more than one day; or result in the temporary loss for more than one day of an existing bus stop or rerouting of a bus route that serves the Proposed Project site.

OTHER METRICS FOR CUMULATIVE ANALYSIS

In addition to vehicular LOS and the other CEQA significance thresholds described above, the per-capita VMT, vehicle trips, and peak period mode split are also evaluated for informational purposes. Significance thresholds for these metrics have not been established by the City of Los Angeles so only the direction (i.e., increase or decrease) and magnitude of change is reported.

METHODOLOGY

INTERSECTION AND FREEWAY MAINLINE LEVEL OF SERVICE METHODOLOGY

A variety of standard methodologies are available to analyze LOS, and a lead agency retains discretion to decide how the existing physical conditions without the Proposed Project can most realistically be measured. As required by the *Traffic Study Policies and Procedures*, the CMA method is used to determine the LOS grade for signalized intersections within the City of Los Angeles (Transportation Research Board, 1980). The CMA methodology determines the intersection V/C ratio. The V/C ratio is then used to determine the corresponding LOS grade. The City of Culver City utilizes a similar but different method of intersection capacity calculation: Intersection Capacity Utilization (ICU). Under both the CMA and ICU methodology, a V/C ratio is generated for each study intersection based on factors such as the volume of traffic and the number of lanes providing for such vehicle movement and an LOS grade. The City of Santa Monica utilizes the Highway Capacity Manual's Operational Analysis delay-based method of intersection capacity calculation. **Table 4.12-3** provides LOS definitions for signalized intersections and freeway mainline segments according to jurisdictions in the area.

In consultation with LADOT and in accordance with precedent, the governing methodologies for each jurisdiction were utilized for the study of impacts in each separate jurisdiction. LOS worksheets are included in **Appendix H**.

Under the CMA methodology, a V/C ratio is generated for each study intersection based on factors, such as the volume of traffic and the number of travel lanes and theoretical lane capacity available to the traffic on each approach. Because the CMA methodology uses V/C as the means to determine LOS, the results of CMA methodology tend to inaccurately reflect the effects of congestion in areas with acute traffic congestion. During periods of acute congestion, fewer vehicles may travel through an intersection because of gridlock. Lower vehicle throughput translates into lower V/C, resulting in artificially better LOS measurements. For instance, the V/C may show a LOS of B, C, or D when there are instead gridlock conditions that should be categorized as LOS E or F. As a result, LOS results may not accurately reflect true, on-the-ground traffic conditions for intersections experiencing heavy congestion.

TABLE 4.12-3: LEVEL OF SERVICE DEFINITIONS SUMMARY TABLE

LOS ANGELES AND CULVER CITY SIGNALIZED INTERSECTIONS

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	EXCELLENT. No Vehicle waits longer than one red light and no approach phase is fully used.
B	>0.600 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat what restricted within groups of vehicles.
C	>0.700 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	>0.800 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	>0.900 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

F(1)	>1.25-1.35
F(2)	>1.35-1.45
F(3)	>1.45

SOURCE: *Congestion Management Program*, Metro, 2010.

During field observations, intersections in the study area were observed to experience acute traffic congestion during the afternoon peak traffic period on certain approaches of the intersection, resulting in a reduced number of vehicles traveling through the intersection. This reduction in vehicle throughput was determined to inaccurately reflect the existing LOS experienced by motorists. The congestion was determined to be worsened by the temporary impacts of construction of the I-405 Sepulveda Pass Improvements Project and the construction of the Expo LRT Line Phase 2, resulting in uncharacteristically oversaturated conditions unreflective of generally existing conditions and longer than normal queuing and delays. In consultation with LADOT and in accordance with LADOT's traffic study guidelines, adjusted capacities were used to calculate V/C ratios to reflect conditions where congestion has led to suppressed volumes. The adjusted capacities were calculated based on field observations of saturation flow (traffic conditions during acute congestion) at the intersections listed below. LADOT allows for the adjustment (substitution of lower observed capacity for theoretical capacity) of intersection capacities at heavily congested locations to better reflect the operating conditions that are observed in the field and subsequently experienced by motorists.

The LOS worksheets included in **Appendix H** reflect the adjusted capacity values for these intersections as described in **Appendix H**. The following intersections were adjusted to reflect traffic bottlenecks and spillbacks, and the resulting LOS:

1. Barrington Avenue & Santa Monica Boulevard
2. Barrington Avenue & Pico Boulevard
3. Gateway Boulevard & Pico Boulevard
4. Beloit/I-405 SB Off-Ramp & Santa Monica Boulevard
5. Sawtelle Boulevard & Olympic Boulevard
6. Sawtelle Boulevard & Pico Boulevard

8. Sepulveda Boulevard & Santa Monica Boulevard
9. Sepulveda Boulevard & Olympic Boulevard
10. Sepulveda Boulevard & Pico Boulevard
11. Culver Boulevard & Venice Boulevard
12. Robertson Boulevard & Venice Boulevard
13. Robertson Boulevard & National Boulevard
14. National Boulevard & I-10 EB On-Ramp
15. National Boulevard & Venice Boulevard

The City of Los Angeles' Automated Traffic Surveillance and Control (ATSAC) system is a computer-based traffic signal control system that monitors traffic conditions and system performance to allow ATSAC operations to manage signal timing to improve traffic flow conditions. The Adaptive Traffic Control System (ATCS) is an enhancement to ATSAC and provides fully responsive traffic-adaptive signal control based on real-time traffic conditions. All of the signalized study intersections in the City of Los Angeles are currently operating under the City's ATSAC system and ATCS control. ATSAC and ATCS provide improved operating conditions. Therefore, in accordance with City of Los Angeles procedures, a credit of 0.07 V/C reduction was applied at all intersections where ATSAC is implemented, and an additional 0.03 V/C reduction was applied at the same intersections where ATCS is implemented.

Trip Generation and Vehicle Miles Traveled (VMT) Methodology. In order to analyze the effects of the Proposed Project on the transportation network, it was necessary to calculate vehicle trip generation for the change areas within each of the five light rail station areas. These estimates are based on a quantitative model that attempts to capture the vehicle traffic reduction effects of mixed-use developments and improve on current trip generation methods that rely on conventional travel demand models or rates and adjustments from the Institute of Transportation Engineers (ITE). ITE trip generation rates have been developed from data collected mainly at single land use sites that do not account for mixed-use (including accounting for reduced trip generation as a result of trips occurring internal to the Proposed Project between on-site uses) or transit-oriented development (where an increased shift from vehicles to transit can be expected), thus resulting in trip

characteristics that would not be applicable to this type of project. Further information on ITE guidance and recommended practice for analysis of mixed-use and transit-oriented developments (TODs) can be found in the American Planning Association (APA) Planning Advisory Service (PAS) report *Getting Trip Generation Right: Eliminating the Bias against Mixed-Use Development*, May 2013 (See **Appendix H**).

Due to the mix of land uses proposed in the Plan area and the state of the practice guidance noted above, a Mixed-Use Development Trip Generation (MXD) model was used to estimate the probabilities for a trip that would be captured internally among complementary uses, that would be a walking trip from/to employment within one mile of the site, or that would be a transit trip from/to employment within a 30-minute transit ride of the site. These trips would no longer be accounted for as vehicle trips that would leave the site, but would instead shift to walking, biking, transit, or trips by other modes that would remain internal or very close to the Project Area. Additional trip generation adjustments related to transportation demand management (TDM) measures were not included in this analysis. TDM requirements that exceed the current municipal code, such as transit system improvements, parking pricing, and commute trip reduction programs have been shown to further reduce both trip generation and VMT. The ECTNP requires most new development to implement several TDM strategies, such as unbundled parking, parking cash out programs, and subsidized transit passes. Additionally, in exchange for additional development rights, commercial projects are required to achieve a vehicle trip reduction using further TDM strategies. These elements are not explicitly analyzed within the ECTNP and, therefore, are not included in the MXD trip generation.

Table 4.12-4 and **Table 4.12-5** provide the future trip generation for the segments around each of the five Expo LRT stations. **Table 4.12-6** shows the trip generation attributable to the Proposed Project. The Gross Trips represent trip generation based on the traditional ITE rates, while the Net External Trips (MXD) represent the gross trips net of the internally captured trips described above. Also described in the tables are the vehicle trip adjustments that represent the share of gross trips that are captured internally or shifted to non-auto modes (e.g., walk, bike and transit). In general, the trip generation shows an increase in automobile trips due to the Proposed Project at all station areas. (See the "Cumulative Analysis and Other Metrics" discussion later in this section, which shows that despite an increase in trips due to the Project, an even greater increase in the growth of the service population due to the Project results in reduced Vehicle Miles Traveled per capita.)

These changes in land use result in mode split estimates that are considered conservative since they are based on experience with vehicular trip generation in mixed-use and transit-oriented developments. If recent changes in demographics, vehicle ownership patterns, and energy prices persist or increase in magnitude, this could lead to further increases in mode shift to lower-energy and lower-cost transportation modes.

The trip generation estimated by the MXD model was categorized according to the origin and destination of each trip. Internal-to-internal (II) trips remain within each station area. Internal-to-external (IX) trips originate within each station area and terminate at an outside destination. External-to-internal (XI) trips originate outside each station area and terminate within it. The VMT calculation accounts for 100 percent of internal-to-internal (II) trips and 50 percent of both internal-to-external (IX) and external-to-internal (XI) trips; trips that pass through a station area but both originate and terminate outside of it ("through trips") are excluded. Trips were further categorized by trip purpose, including home-based work, home-based other, and non-home based trips. Average trip lengths by purpose and origin-destination type (II, IX, or XI) were then applied to the trip generation estimates to calculate the VMT attributable to land uses in the five station areas.

Travel Demand Model Development. The potential impacts associated with implementation of the ECTNP are evaluated using the City of Los Angeles' Travel Demand Model. The model developed for the ECTNP utilizes the TransCAD Version 4.8 Build 500 modeling software and has been calibrated and validated for current conditions. The model has a future horizon year of 2035 and was designed to produce AM and PM peak period vehicle and transit flows on roadways within the study area based on comprehensive land use and socioeconomic data (SED) and uses a conventional 4-step process of trip generation, trip distribution, modal split and assignment. For modeling purposes, the City of Los Angeles is divided into 1,411 Transportation Analysis Zones (TAZs), each with corresponding SED and connections to the roadway and transit networks. The SED reflects a combination of the City of Los Angeles SED data and the SCAG 2012-2035 RTP/SCS Model data for existing and future conditions.

Changing Travel Behavior and VMT Trends. As discussed throughout this EIR, federal, state, regional and local regulations and policies are increasingly addressing reduction of GHG emissions. SB 375 requires Metropolitan Planning Organizations (SCAG in the Los Angeles area) to identify land use strategies to achieve specified GHG emission reductions from automobiles and light trucks. The 2012-2035 RTP/SCS contains the regional-scale Sustainable Communities Strategy to achieve per capita GHG reduction targets specified by the California Air Resources Board (CARB). However, the RTP presents only a regional strategy that local jurisdictions are required to interpret at the local level to ensure consistency with the 2012-2035 RTP/SCS and required reductions in VMT and therefore GHGs. At its heart, the regional strategy calls for increasing density around transit stations and increasing mixed-use land uses. Regional and City planning is based on total forecast growth, so if growth increases in areas adjacent to transit stations, it would decrease in areas further from transit. With more development closer to transit in the region and in the City, average VMT by car per capita would decrease.

The ECTNP is the City of Los Angeles response to the 2012-2035 RTP/SCS for the Exposition Corridor in the critical West Los Angeles area. West Los Angeles is already substantially congested and is, therefore, the focus of extensive transit and active transportation planning efforts on the part of Metro and other transit agencies. The City of Los Angeles aims to complement these transit planning efforts with land use planning in the ECTNP that encourages not only transit use but also active transportation (bicycling and walking).

However, the ECTNP does not stand alone; it is part of the synergistic group of plans, policies and regulations that are anticipated to foster a community that is less dominated by personal vehicles and more supportive of alternative modes of transportation. This shift in focus and changed behaviors, together with anticipated changes in energy pricing, would not occur overnight, and it may be several years before the results of this societal change are fully reflected in what we see on our streets and what the traffic models reflect.

As noted, traffic models are substantially based on past precedent. The model-estimated changes in circulation system conditions are conservative, vehicle-centric estimates based on historical travel behavior patterns and do not account for additional changes in demographics, vehicle ownership patterns, energy prices, and migration to walkable and transit-served locations that would lead to decreasing vehicular volumes. Transportation demand models are largely dependent on historical travel patterns and mode choices when forecasting future traffic projections. Recent research in this area suggests that factors correlated with annual VMT over the last 60 years include the economy, demographics, technology, and the urban form of the built environment. Specifically, this research shows both cyclical recession effects and a structural leveling of the economy and travel. Recent research shows significantly higher than expected transit ridership and lower than expected trip rates than typical ITE rates.[20]

The traffic model used for the ECTNP is primarily validated and calibrated to conservatively forecast vehicular travel. While it also includes forecasts of transit ridership and short trips that are likely to be walking or bicycling trips, the sensitivity of the model to shifts in demographics, vehicle ownership, walkability, and active transportation networks at a citywide scale is limited. Accordingly, expected increases in bicycling and pedestrian activity anticipated to result from changing land use policies, as well as increasing regulations and fuel pricing, have not been directly quantified and incorporated in to the traffic model. It is possible that current traffic studies (including the study in this EIR) that rely on the traffic model for vehicle trip generation may overstate future traffic congestion, possibly by a substantial amount.

In response to increased focus on reducing GHG emissions, the State is shifting the approach to the assessment of traffic impacts – away from the traditional metrics such as Level of Service (LOS) that measure levels of traffic congestion and towards metrics that address GHG emissions such as per capita VMT.[21] Also as noted above, it is anticipated the Governor's OPR will provide additional guidance on CEQA review of transportation impacts.

Analysis Scenarios. Two CEQA cases address analysis scenarios: 1) *Sunnyvale West Neighborhood Assoc. v. City of Sunnyvale City Council (6th Dist. 2010) 190 Cal.App.4th 1351* (Sunnyvale West) and 2) *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority (2013) 57 Cal.4th 439* (Expo II). The first case indicated that Project impacts should be compared directly to existing conditions. However, this is not always an appropriate comparison, particularly for planning projects.

For a planning project that would be implemented over time, comparison of the Project to existing conditions would be misleading because the plan cannot be built out immediately. Impacts would not occur in the context of existing conditions, but rather in the future context once the plan has had time to be realized.

[20]Boarnet, Marlon J., Andy Hong, Jeongwoo Lee, Xize Wang, Weijie Wang. 2013. The Exposition Light Rail Line Study A Before-and-After Study of the Impact of New Light Rail Transit Service. *USC Sol Price School of Public Policy.* 59-61.

[21]Governor's OPR, *Updating Transportation Impacts Analysis in the CEQA Guidelines*, August 6, 2014.

The *Neighbors for Smart Rail* case clarified that comparison to an existing condition may *not* be appropriate if there is, "substantial evidence that an analysis based on existing conditions would tend to be misleading or without informational value to EIR users."

Thus for a planning project, significance of impacts is more appropriately assessed based on a comparison between Future (at the earliest time buildout could reasonably be expected) Project conditions and Future No Project conditions. The ECTNP is a plan that is anticipated to be fully realized only over time with all improvements anticipated to happen in 2035 or later. Therefore, an analysis of potential land use changes and associated traffic impacts compared to existing traffic conditions could be misleading since the land uses changes would not occur immediately.

Nonetheless, even though the Project could not be built out immediately, an analysis of the Proposed Project compared to existing conditions (2015 No Project compared to 2015 with Project) is provided for informational purposes. In this case, 2015, the anticipated opening year of the Expo LRT Phase 2, is used to represent existing conditions.[22] (Although in this EIR the year 2013 is considered the base year for analysis, 2015 is instead used as the base year for the transportation analysis since the Project assumes the Expo LRT Phase 2 to be operational.)

Finally, the City of Los Angeles has recently adopted MP 2035, formerly the Transportation Element of the City's General Plan, as the transportation blueprint for the City of Los Angeles. The City is also in the process of making amendments to the Coastal Transportation Corridor Specific Plan (CTCSP) and West LA Transportation Improvement and Mitigation Specific Plan (WLA TIMP), which will include an updated list of transportation improvements to be funded by impact fees on new development and an update to the Transportation Impact Assessment (TIA) fee program. Together these projects (MP 2035, CTCSP, and WLA TIMP) represent the future cumulative condition. An analysis of the cumulative scenario both with and without the Project is provided.

The following scenarios are analyzed:

1. Existing Conditions (2013)
2. 2015 No Project
3. 2015 with Project
4. Future No Project (2035)
5. Future with Project (2035)
6. Future Cumulative without Project (2035)
7. Future Cumulative with Project (2035)

The following comparisons between scenarios are described herein:

1. 2015 No Project vs. 2015 with Project
2. Future No Project (2035) vs. Future with Project (2035)
3. Future Cumulative without Project vs. Future Cumulative with Project (a comparison of data such as vehicle trips, vehicle miles traveled and mode share for the West Los Angeles Area Planning Commission geography)

Alternative Compliance Scenario. As discussed in Chapter 3.0, Project Description, the ECTNP includes an alternative compliance procedure that would allow designated sites (within the areas of change) to have a different mix of residential and non-residential uses than required per the zoning of the property. Projects utilizing this path would still be subject to the maximum floor area ratio (FAR) and other zoning and development standards, but would also be required to provide increased public benefits and affordable housing (within Chapter 3.0, Project Description, Table 3-13 compares the population, housing, and employment of the

[22]At the time of this study, the opening year for EXPO LRT Phase 2 was anticipated to be 2015. It instead opened in 2016. This does not have a measurable effect on the analysis.

Proposed Project incorporating the Alternative Compliance scenario to the results of the Proposed Project not accounting for the Alternative Compliance scenario; Figure 3-8 shows the parcels where the Alternative Compliance scenario would be permitted). Projects reviewed under the Alternative Compliance procedure of the Specific Plan would be required to obtain a "Director's Determination for an Alternative Compliance." Alternative Compliance scenario would result in increased residential land use on a given parcel but not increased FAR. Trip generation from increased residential development (but not increased total development) on any given site would result in fewer trips than assumed for the Project without Alternative Compliance, therefore a separate Alternative Compliance scenario is not analyzed herein.

IMPACTS

IMPACT 4.12-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT DISRUPT EXISTING PUBLIC TRANSIT, BICYCLE, OR PEDESTRIAN FACILITIES OR INTERFERE WITH PLANNED FACILITIES, OR CREATE CONFLICTS OR INCONSISTENCIES WITH ADOPTED PUBLIC TRANSIT, BICYCLE, OR PEDESTRIAN SYSTEM PLANS, GUIDELINES, POLICIES, OR STANDARDS OR OTHERWISE DECREASE THE PERFORMANCE OR SAFETY OF SUCH FACILITIES? THIS IS A LESS THAN SIGNIFICANT IMPACT.

The Proposed Project seeks to enhance access to transit stations and creates new zoning regulations to encourage appropriate mixes and scales of uses as well as site design supportive of transit use. These objectives are consistent with the SCAG 2012-2035 RTP/SCS and the MP 2035 goals and policies. The Proposed Project would not disrupt any existing or planned transit facilities or create conflicts or inconsistencies with adopted transit plans, guidelines, policies, or standards, but rather helps to implement them by encouraging development patterns that would foster transit ridership. Therefore, impacts related to the transit system would be less than significant.

The Proposed Project seeks to improve the configuration and condition of streets to better promote bicycle circulation. It anticipates the bicycle networks identified in the MP 2035 and allows these networks to be accommodated in the future. The Proposed Project would not disrupt any existing or planned bicycle facilities, or create conflicts or inconsistencies with adopted bicycle system plans, guidelines, policies, or standards. Therefore, impacts related to the bicycle circulation system would be less than significant.

The Proposed Project aims to support vibrant neighborhoods around transit stations, where people can live, work, shop and dine, all within a safe and pleasant walk to transit stations. The Proposed Project requires the design of new buildings to be pedestrian-oriented and seeks to improve the configuration and condition of streets to better promote pedestrian circulation. The Proposed Project would not disrupt existing pedestrian facilities or interfere with planned pedestrian facilities, or create conflicts or inconsistencies with adopted pedestrian system plans, guidelines, policies, or standards. Instead, the Project attempts to enhance pedestrian facilities through site planning requirements, public benefits requirements, streetscape improvements, etc. Therefore, impacts related to the pedestrian circulation system would be less than significant. See also the more detailed discussion of plans and policies in Section 4.8, Land Use and Planning.

MITIGATION MEASURES

Impacts related to public transit, bicycle or pedestrian facilities would be less than significant under the Proposed Project. No mitigation measures are necessary.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Impacts related to public transit, bicycle or pedestrian facilities under the Proposed Project would be less than significant without mitigation.

IMPACT 4.12-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT IMPACT THE CIRCULATION SYSTEM BY EXCEEDING THE APPLICABLE THRESHOLDS ESTABLISHED BY EACH JURISDICTION? THIS IMPACT IS SIGNIFICANT AND UNAVOIDABLE.

Consistent with existing requirements of each affected jurisdiction in the Study Area, V/C ratios and LOS calculations were prepared for the 86 study intersections under (1) 2015 No Project, (2) 2015 With Project, (3) Future (2035) No Project, and (4) Future (2035) With Project conditions. Each intersection was analyzed using the methodology of the jurisdiction in which the intersection is located. In addition, Signal Warrant Analysis was performed for the two unsignalized study intersections.

2015 and 2035 No Project. 2015 No Project traffic volumes were analyzed to determine V/C ratios or seconds of delay and a corresponding LOS for each of the study intersections. As indicated in **Table 4.12-7A**, 31 intersections are projected to operate at LOS E or F in either the AM or PM peak hour under 2015 conditions without the Project. 2035 No Project traffic volumes were also analyzed. Under 2035 conditions, 38 intersections are projected to operate at LOS E or F in either the AM or PM peak hour without the Proposed Project. The number of intersections operating at E or F in 2015 without the project is anticipated to be slightly less than in 2013 (31 in 2015 compared to 33 in 2013) because of the immediate benefits of the Expo LRT, which would be operational in 2015.

CMA/ICU methodology uses a V/C ratio, while Highway Capacity Manual methodology uses seconds of delay. The City of Santa Monica uses Highway Capacity Manual Methodology. City of LA uses CMA methodology. Culver City uses ICU methodology. Unsignalized intersections use Highway Capacity Manual unsignalized methodology.
*Intersection operates at LOS D or better in both AM and PM peak hour
/a/ Intersection geometry altered due to construction.
/b/ Unsignalized intersection. City of Santa Monica uses Highway Capacity Manual unsignalized methodology. (City of Los Angeles does not require impact analysis for unsignalized intersections.)
SOURCE: Fehr & Peers, 2015.

2015 and 2035 With Project. As indicated in **Table 4.12-7B**, there would be 34 and 45 intersections in 2015 and 2035, respectively, operating at LOS E or F in either the AM or PM peak hour with the Proposed Project. In 2015 the Project would increase the number of intersections operating at LOS E or F to 34, as compared to 33 (in the pre-light rail 2013 conditions) and 31 (in 2015 with light rail but without the Project). In 2035 the Project would increase the number of intersections operating at LOS E of F from 38 (in 2035 without Project) to 45 (in 2035 With Project).

*Intersection operates at LOS D or better in both AM and PM peak hour
/a/ Intersection geometry altered due to construction.
/b/ Unsignalized intersection. City of Santa Monica uses Highway Capacity Manual unsignalized methodology. (City of Los Angeles does not require impact analysis for unsignalized intersections.)
SOURCE: Fehr & Peers, 2015.

Table 4.12-8 identifies Proposed Project impacts by comparing what would happen if the Proposed Project were fully completed by 2015 to 2015 Without Project conditions (as discussed above, the Proposed Project is a long-term planning project that is anticipated to build out over time and could not be completed by 2015, so this is a theoretical scenario only). The table also compares 2035 With Project conditions to 2035 No Project conditions. Without mitigation, 47 of the 86 intersections would be significantly impacted by the Project during one or more peak hours under 2015 conditions, and 56 of the 86 intersections would be significantly impacted during one or more peak hours under 2035 conditions. Therefore, without mitigation, the Proposed Project would result in a significant impact related to the circulation system.

CMA/ICU methodology uses a V/C ratio, while Highway Capacity Manual methodology uses seconds of delay. The City of Santa Monica uses Highway Capacity Manual Methodology. City of Los Angeles uses CMA methodology. Culver City uses ICU methodology. Unsignalized intersections use Highway Capacity Manual unsignalized methodology.
/a/ Intersection geometry altered due to construction.
/b/ Unsignalized intersection. City of Santa Monica uses Highway Capacity Manual unsignalized methodology. (City of Los Angeles does not require impact analysis for unsignalized intersections.)
SOURCE: Fehr & Peers, 2015.

As shown in **Table 4.12-7A** and **Table 4.12-7B**, even without the Proposed Project, traffic congestion and intersection delays for motorists in the project area are expected to increase considerably compared to today. This increase in traffic is related to development occurring in downtown Los Angeles and in Santa Monica and the Westside (as well as elsewhere in the region) and trips both passing through and generated in the Project Area. As shown in **Table 4.12-8**, the Proposed Project is expected to further increase intersection delays for motorists in the vicinity of the change areas.

As discussed in the subsection "Changing Travel Behavior and VMT Trends," this traffic analysis includes conservative assumptions with respect to trip generation and expected delays for people driving.

Traffic patterns in the future on the Westside are expected to be more heavily influenced by demographics shifts (for example changing patterns of car ownership and use in younger people), expansion of transit service and the characteristics of development (both new and redeveloped land) than roadway expansion and vehicular capacity increases. Since few widening projects are currently programmed and since these would likely induce additional demand on the system, the majority of programmed Westside transportation projects and the policies of the MP 2035 are focused on increasing mobility via transit, active transportation modes, and increasing accessibility through land use intensification.

Under these conditions, intensification of land use in locations that are well served by transit and have characteristics that support shorter trip lengths and active modes is likely to result in lower VMT per capita and relatively less severe congestion and vehicular delay related outcomes than uncoordinated development patterns.

The 2035 With Project scenario includes land use intensification and an organized and coordinated development pattern to increase accessibility of destinations while minimizing the related growth in vehicle trips and VMT per capita. While not part of the CEQA analysis, it should be noted that future conditions without the Project could be worse than with Project conditions. While the 2035 No Project scenario evaluated in this traffic section considers a reasonably foreseeable and less intense amount of development with less vehicle trip generation and fewer delay related impacts, as discussed in Chapter 5.0, Alternatives, it is reasonable to expect continued market demand for housing and jobs in the area, which could result in unpredictable, uncoordinated and more intense development patterns on individual parcels that could produce much greater congestion impacts at specific locations within the study area.

Unsignalized Intersections (City of Los Angeles) - Signal Warrant Analysis.[23] Details of the of the signal warrant analysis are presented in **Appendix H**. As shown on **Table 4.12-9**, both unsignalized study intersections meet the signal warrant thresholds under the PM peak hour. The results of the signal warrant analysis do not result in any impacts but are provided for informational purposes.

[23]This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. It estimates future development-generated traffic compared against a sub-set of the standard traffic signal warrants recommended in the Federal Highway Administration *Manual on Uniform Traffic Control Devices* and associated State guidelines. This analysis should not serve as the only basis for deciding whether and when to install a signal. To reach such a decision, the full set of warrants should be investigated based on field-measured, rather than forecast, traffic data and a thorough study of traffic and roadway conditions by an experienced engineer. Furthermore, the decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible state or local agency should undertake regular monitoring of actual traffic conditions and accident data, and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

STATE HIGHWAYS

This section summarizes the intersection operations analysis for study intersections along State Route 187 (SR 187), Venice Boulevard, in the vicinity of the Proposed Project. Within the Project Area, the roadway provides westbound and eastbound access to the I-405 and adjacent land uses in the study area.

Specific intersections studied along SR 187 include:

- Intersection 58: Overland Avenue & Venice Boulevard
- Intersection 62: Motor Avenue & Venice Boulevard
- Intersection 64: Hughes Avenue & Venice Boulevard
- Intersection 68: Culver Boulevard & Venice Boulevard
- Intersection 69: Robertson Boulevard & Venice Boulevard
- Intersection 72: National Boulevard & Venice Boulevard
- Intersection 76: La Cienega Boulevard & Venice Boulevard
- Intersection 84: Sepulveda Boulevard & Venice Boulevard

2015 and 2035 No Project. 2015 No Project traffic volumes were analyzed to determine V/C ratios or seconds of delay and a corresponding LOS for each of the study intersections. As indicated in **Table 4.12-7A**, one intersection (National Boulevard) along SR 187 is projected to operate at LOS E or F under 2015 conditions without the Project. 2035 No Project traffic volumes were also analyzed. Under 2035 conditions, four intersections on SR 187 are projected to operate at LOS E or F in either the AM or PM peak hour without the Project. These include Robertson Boulevard, National Boulevard, La Cienega Boulevard, and Sepulveda Boulevard.

2015 and 2035 with Project. As indicated in **Table 4.12-7B**, there are two intersections (National Boulevard and Sepulveda Boulevard) in 2015 and five intersections in 2035 operating at LOS E or F in either the AM or PM peak hour with the Project. The five intersections operating at LOS E of F in 2035 with Project include Overland Boulevard, Robertson Boulevard, National Boulevard, La Cienega Boulevard, and Sepulveda Boulevard.

As shown in **Table 4.12-7A** and **Table 4.12-7B**, even without the Proposed Project, traffic congestion and intersection delays for motorists in the Project Area are expected to increase considerably compared to today. This increase in traffic is related to development occurring in Downtown Los Angeles and in Santa Monica and the Westside (as well as elsewhere in the region) and trips both passing through and generated in the Project area. As shown in **Table 4.12-8**, the Proposed Project is expected to further increase intersection delays for motorists in the vicinity of the change areas. However, as discussed in the subsection "Changing Travel Behavior and VMT Trends," this traffic analysis includes conservative assumptions with respect to trip generation and expected delays for people driving.

FREEWAYS

The following section details the freeway off-ramp queue analysis that was performed at 13 intersections within the ECTNP AREA, the methodology that was used to perform the analysis and summarizes the estimated queue lengths for both the 50th and 95th percentile volumes in the Existing (2013), Future (2035) without Project, and Future (2035) with Project scenarios.

Methodology. Queue lengths were estimated for both the 50th and 95th percentile volumes using the Synchro traffic analysis software and the Highway Capacity Manual methodology. The Highway Capacity Manual methodology uses a static approach to predicting traffic performance at signalized intersections, estimating the average vehicular delay and queue lengths for a typical signal cycle during the peak hour. The Highway Capacity Manual methodology uses the V/C ratio to determine queues. When V/C is greater than 1 for a specific movement, the queue would theoretically not dissipate until the volume decreases. As such, Highway Capacity Manual methodology does not provide the average queue length and instead reports the estimated queue length after two cycles. The following subset of intersections was studied:

- Intersection 7: Centinela Avenue & I-10 W B ramps
- Intersection 8: Pico Boulevard & 34th Street (I-10 EB off-ramps)
- Intersection 31: Santa Monica Boulevard & I-405 SB ramps
- Intersection 33 Tennessee Avenue & Sawtelle Boulevard (I-405 SB off-ramp)
- Intersection 38: Santa Monica Boulevard & I-405 NB ramps
- Intersection 44: National Boulevard & I-405 NB off-ramp
- Intersection 53: National Boulevard & Overland Avenue (I-10 WB off-ramp)
- Intersection 56: National Boulevard & I-10 EB off-ramp
- Intersection 66: National Boulevard & Manning Avenue (I-10 WB off-ramp)
- Intersection 69: Venice Boulevard & Robertson Boulevard (I-10 EB off-ramp)
- Intersection 74: Kincardine Avenue & Robertson Boulevard (I-10 WB off-ramp)
- Intersection 85: Sepulveda Boulevard & I-405 NB ramps
- Intersection 86: Sawtelle Boulevard & I-405 SB ramps

Each intersection is configured according to its existing conditions, including signal timing and physical geometry. Under the Future Year (2035) with Project scenario, the eastbound shared through/left-turn lane at Intersection 53 is restriped to a shared left/through/right lane. Existing signal timing charts were acquired from the City of Los Angeles, except for Intersection 8 (City of Santa Monica) and Intersections 85 and 86 (City of Culver City).

In addition to queue analysis in Synchro, data from Caltrans' Performance Measurement System (PeMS) were obtained in order to compare the speeds of mainline freeway lanes and auxiliary lanes near the analyzed off-ramps. Data were collected from Vehicle Detector Stations (VDS) along the I-10 and I-405 within the study area. The data include speeds by lane, which can be used to compare the speed differential between freeway auxiliary lanes and mainline lanes near off-ramps. However, only three of the 13 study off-ramps had VDSs in close enough proximity to provide useful data on the difference in lane speeds caused by queueing on the off-ramps. PeMS data were collected for the month of May 2013 for these off-ramps, but was inconsistent with field observations and did not provide a useful comparison between the travel lanes and so is not shown in the analysis results.

Queue Results. Ramp queues for the 50th percentile volumes are shown in **Table 4.12-10** and ramp queues for the 95th percentile volumes are shown in **Table 4.12-11**. Each table shows the ramp storage length from the intersection to the gore point between the off-ramp and the mainline. The estimated ramp queues do not exceed the storage capacity at any of the study intersections for either the 50th or 95th percentile volumes for any of scenarios analyzed. In most cases, the difference in queue length does not change by more than +/- 75 feet, which would equate to approximately three vehicles. See also the discussion of impacts to CMP facilities for further discussion of impacts to freeways.

MITIGATION MEASURES

The following mitigation measures identify physical improvements and procedures that are designed to reduce project impacts and are feasible. Physical intersection improvements that would conflict with Project objectives were considered to be infeasible. Feasible mitigation measures are also limited due to the constraints of the existing conditions. Beyond conflicting with Project Objectives, mitigation measures involving street widening were deemed infeasible since it was not considered practical or desirable to widen streets at the expense of reduced sidewalk widths or lost on-street parking spaces.

TR1 A trip generation analysis, as well as an access and circulation study per LADOT guidelines, will be required as part of the development application for projects within the Specific Plan boundary that result in net new square footage, for purposes of determining consistency of the project with the transportation assumptions in the EIR. The Specific Plan area is divided into five ECTNP station segments, as shown in Figure 3-2 in the Project Description. To be consistent, a project cannot cause the total estimated 2035 trip forecasts (for the station segment in which it is located) to exceed the number of either AM or PM peak hour net new external trips analyzed in the EIR (see **Table 4.12-5**). If a project is determined to be consistent, no further traffic analysis will be required. However, if a project causes the number of either AM or PM peak hour net external trips to exceed the cumulative total number of trips in the corresponding station segment analyzed in the EIR, then a project-specific traffic analysis per current LADOT Guidelines will be required.

The City will revise this traffic impact consistency determination methodology, if appropriate, to reflect new traffic impact guidance mandated by the State of California, Office of Planning and Research in response to SB 743.

Potential intersection improvements were identified and evaluated for all intersections identified as being significantly impacted in either 2015 or 2035. However, the focus of the Proposed Project is establishing new development regulations that better support transit ridership, with particular emphasis on vibrant neighborhoods around transit stations, where people can live, work, and shop or eat out, all in a safe and pleasant walk to transit stations. Physical intersection improvement mitigations that require widening travel lanes, adding turn lanes, and increasing pedestrian crossing distances would be in conflict with multiple Project Objectives such as: improving circulation, increasing mobility choices, promoting alternative transit modes (Primary Project Objective 6); ensuring new development is pedestrian oriented (Secondary Objective 1); and stimulating vibrancy and activity and creating a unique sense of place through the design of buildings, streets, and the public realm(Secondary Objective 2). Physical intersection improvement mitigations that would conflict with Proposed Project Objectives were considered to be infeasible. See **Appendix H-9** for detailed evaluation of the feasibility of mitigation measures identified for each significantly impacted intersection.

The feasible intersection mitigations include improvements, such as restriping, signalization, and traffic signal modifications, that would be consistent with Proposed Project goals. The following discussions identify study intersections with no feasible mitigations and propose mitigation measures that would either partially or fully mitigate the remaining significant impacts identified in the impacts analysis above.

2015 Intersection Improvement Mitigation Measures. The following mitigation measures would partially or fully mitigate the significant impacts for 10 of the intersections identified in the 2015 impact analysis above:

TR2 **Centinela Avenue & Exposition Boulevard (Intersection 6)**. Signalize the intersection.

TR3 **Bundy Drive & Olympic Boulevard (Intersection 16)**. Restripe the northbound and southbound approaches. The northbound restriping would add one northbound left-turn lane. This would result in a northbound approach of one right-turn lane, two through lanes, and two left-turn lanes. The southbound restriping would add one southbound left-turn lane and change one through lane

and the right-turn lane into a shared through/right lane. This would result in a southbound approach of one shared through/right lane, one through lane, and two left-turn lanes.

TR4 **Barrington Avenue & Pico Boulevard (Intersection 27)**. Restripe the existing northbound curb lane to provide one through lane and one right-turn lane. This improvement would require the removal of one on-street parking space.

TR5 **Barrington Avenue & Gateway Boulevard (Intersection 28)**. Restripe the existing northbound shared through/right-turn lane to provide one through lane and one right-turn lane. This improvement would require the removal of four on-street parking spaces.

TR6 **Sepulveda Boulevard & Exposition Boulevard (Intersection 43)**. Restripe the existing eastbound shared left/through/right lane to provide one shared through/left-turn lane and one right-turn lane.

TR7 **Sepulveda Boulevard & Palms Boulevard (Intersection 46)**. Restripe one existing northbound shared through/right-turn lane to provide one through lane and one right-turn lane. This improvement would require the removal of two on-street parking spaces.

TR8 **Military Avenue & National Boulevard (Intersection 47)**. Restripe one existing southbound shared through/right-turn lane to provide one shared through/left-turn lane and one right-turn lane. This improvement would require the removal of four on-street parking spaces.

TR9 **Overland Avenue & National Boulevard / I-10 Westbound On- and Off-Ramp (Intersection 53)**. Restripe the existing eastbound shared through/left-turn lane to a shared left-/through/right-turn lane.

TR10 **La Cienega Boulevard & Venice Boulevard (Intersection 76)**. Remove the median to provide a second westbound left-turn lane.

TR11 **Sepulveda Boulevard & Venice Boulevard (Intersection 84)**. Remove the medians on Venice Boulevard and restripe both the eastbound and westbound approaches to add one left-turn lane to each approach.

2035 Intersection Improvement Mitigation Measures. The following mitigation measures would partially or fully mitigate the significant impacts for 12 of the intersections identified in the 2035 impact analysis above:

TR12 **Stewart Street & Olympic Boulevard (Intersection 3)**. Modify the existing signal phasing to change eastbound left-turn signal phasing from permitted to protected and change westbound left-turn signal phasing from protected/permitted to protected.

Centinela Avenue & Exposition Boulevard (Intersection 6). Mitigation Measure **TR2** would also mitigate impacts in 2035.

Bundy Drive & Olympic Boulevard (Intersection 16). Mitigation Measure **TR3** would also mitigate impacts in 2035.

TR13 **Barrington Avenue & Mississippi Avenue (Intersection 25)**. Restripe the existing eastbound shared left/through/right lane to provide one shared through/left-turn lane and one right-turn lane. This improvement would require the removal of two on-street parking spaces.

Barrington Avenue & Pico Boulevard (Intersection 27). Mitigation Measure **TR4** would also mitigate impacts in 2035.

Barrington Avenue & Gateway Boulevard (Intersection 28). Mitigation Measure **TR5** would also mitigate impacts in 2035.

Sepulveda Boulevard & Exposition Boulevard (Intersection 43). Mitigation Measure **TR6** would also mitigate impacts in 2035.

Sepulveda Boulevard & Palms Boulevard (Intersection 46). Mitigation Measure **TR7** would also mitigate impacts in 2035.

Military Avenue & National Boulevard (Intersection 47). Mitigation Measure **TR8** would also mitigate impacts in 2035.

Overland Avenue & National Boulevard/I-10 Westbound On- and Off-Ramp (Intersection 53). Mitigation Measure **TR9** would also mitigate impacts in 2035.

La Cienega Boulevard & Venice Boulevard (Intersection 76). Mitigation Measure **TR10** would also mitigate impacts in 2035.

Sepulveda Boulevard & Venice Boulevard (Intersection 84). Mitigation Measure **TR11** would also mitigate impacts in 2035.

The above mitigation measures may be constructed either by development projects, as a condition of project approval, or by the City through a capital improvement program.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Table 4.12-12 presents the significance of impacts after mitigation under both 2015 and 2035 conditions.Without mitigation, the Proposed Project would result in a significant impact related to the circulation system at 47 of the 86 intersections during one or more peak hours under 2015 With Project conditions; 37 impacted study intersections mitigation measures were found to be infeasible. Feasible mitigation measures that fully mitigate the significant impact are identified for eight impacted study intersections and feasible mitigation measures that partially mitigate the significant impact are identified for two impacted study intersections.

Without mitigation, the Proposed Project would result in a significant impact related to the circulation system at 56 of the 86 intersections during one or more peak hours under 2035 With Project conditions; 44 impacted study intersections mitigation measures were found infeasible. Feasible mitigation measures that fully mitigate the significant impact are identified for nine impacted study intersections and feasible mitigation measures that partially mitigate the significant impacts are identified for three impacted study intersections.

No Feasible Mitigation. Mitigation measures that would result in physical intersection improvements would conflict with Proposed Project goals and were considered to be infeasible. Under both 2015 and 2035 conditions, no feasible mitigation measures were identified for the following 37 study intersections:

7. Centinela Avenue & I-10 Westbound On-/Off-Ramps
17. Bundy Drive & Pico Boulevard
18. Bundy Drive & I-10 Eastbound On-Ramp
19. Bundy Drive & Ocean Park Boulevard
20. Bundy Drive & National Boulevard
21. Barrington Avenue & Santa Monica Boulevard
24. Barrington Avenue & La Grange Avenue
26. Barrington Avenue & Olympic Boulevard
30. Sawtelle Boulevard & Santa Monica Boulevard
31. Beloit Avenue / I-405 Southbound On- and Off-Ramp & Santa Monica Boulevard
32. Sawtelle Boulevard & Olympic Boulevard
33. Sawtelle Boulevard & I-405 Southbound Off-Ramp
34. Sawtelle Boulevard & Pico Boulevard
35. Sawtelle Boulevard & National Boulevard
37. Sawtelle Boulevard & Palms Boulevard
38. Cotner Avenue / I-405 Northbound On- and Off-Ramp & Santa Monica Boulevard
40. Sepulveda Boulevard & Olympic Boulevard
41. Sepulveda Boulevard & Pico Boulevard

73. National Boulevard & Washington Boulevard
77. La Cienega Boulevard & Washington Boulevard
82. Washington Boulevard / Irving Place / Watseka Avenue & Culver Boulevard
86. Sawtelle Boulevard & I-405 Northbound On- and Off- Ramp

In addition, under 2035 conditions, no feasible mitigation measures were identified for the following seven study intersections:

9. Centinela Avenue & Pico Boulevard
11. Bundy Drive & Wilshire Boulevard
29. Gateway Boulevard & Pico Boulevard
36. I-405 Southbound On-Ramp & National Boulevard
44. I-405 Northbound Off-Ramp & National Boulevard
63. Exposition Boulevard / National Boulevard & Palms Boulevard
75. Robertson Boulevard & Cattaraugus Avenue

Partial Mitigation. There is one intersection where the identified mitigation measure does not fully mitigate the identified impact under both 2015 and 2035 conditions:

27. Barrington Avenue & Pico Boulevard – Mitigation Measure **TR4** would partially mitigate the identified Project impact in the AM peak period and would not mitigate the identified Project impact in the PM peak period. No other feasible mitigations were identified. Therefore, this impact would remain significant and unavoidable.

Under 2015 conditions only, there is one intersection where the identified mitigation measure does not fully mitigate the identified impact:

46. Sepulveda Boulevard & Palms Boulevard – Mitigation Measure **TR7** would fully mitigate the identified Project impact in the AM peak period but would only partially mitigate the identified Project impact in the PM peak period. No other feasible mitigations were identified. Therefore, this impact would remain significant and unavoidable.

Under 2035 conditions only, there are two intersections where mitigation measures do not fully mitigate the identified impacts:

43. Sepulveda Boulevard & Exposition Boulevard – Mitigation Measure **TR6** would fully mitigate the identified Project impact in the PM peak period but would not mitigate the identified Project impact in the AM peak period. No other feasible mitigations were identified. Therefore, this impact would remain significant and unavoidable.

76. La Cienega Boulevard & Venice Boulevard – Mitigation Measure **TR10** would fully mitigate the identified Project impact in the PM peak period but would not mitigate the identified Project impact in the AM peak period. No other feasible mitigations were identified. Therefore, this impact would remain significant and unavoidable.

Intersections with Dual Jurisdiction. There are two intersections where the City of Los Angeles does not have full control of the intersection to implement the identified feasible mitigations for impacts under both 2015 and 2035 conditions:

6. Centinela Avenue & Exposition Boulevard – Mitigation Measure **TR2** would fully mitigate the identified Project impact. However, because this intersection is under dual control by the City of Los Angeles and the City of Santa Monica, the City of Los Angeles does not have full control over modifications to the intersection. Therefore, this impact would remain significant and unavoidable.

84. Sepulveda Boulevard & Venice Boulevard – Mitigation Measure **TR11** would fully mitigate the identified Project impact. However, because this intersection is under dual control by the City of Los Angeles and Culver City, the City of Los Angeles does not have full control over modifications to the intersection. Therefore, this impact would remain significant and unavoidable.

Under 2015 conditions only, there is one intersection where the City of Los Angeles does not have full control of the intersection to implement the identified mitigation:

76. La Cienega Boulevard & Venice Boulevard – Mitigation Measure **TR10** would fully mitigate the identified Project impact. However, because this intersection is under dual control by the City of Los Angeles and Caltrans, the City of Los Angeles does not have full control over modifications to the intersection. Therefore, this impact would remain significant and unavoidable.

Under 2035 conditions only, there is one intersection where the City of Los Angeles does not have full control of the intersection to implement the identified mitigation:

3. Stewart Street & Olympic Boulevard – Mitigation Measure **TR12** would fully mitigate the identified Project impact. However, because this intersection is under dual control by the City of Los Angeles and the City of Santa Monica, the City of Los Angeles does not have full control over modifications to the intersection. Therefore, this impact would remain significant and unavoidable.

Therefore, of the 47 total study intersections identified with potential impacts under 2015 conditions without mitigation, significant impacts would remain at 42 study intersections with mitigation. Of the 56 total study intersections identified with potential impacts under 2035 conditions without mitigation, significant impacts would remain at 50 study intersections after mitigation.

Fully Mitigated. The identified mitigation measures would fully mitigate significant impacts under both 2015 and 2035 conditions at the following four study intersections within the City of Los Angeles:

16. Bundy Drive & Olympic Boulevard
28. Barrington Avenue & Gateway Boulevard
47. Military Avenue & National Boulevard
53. Overland Avenue & National Boulevard

Under 2015 conditions, the identified mitigation measure would fully mitigate the significant impact at the following intersection:

43. Sepulveda Boulevard & Exposition Boulevard

Under 2035 conditions, the identified mitigation measures would fully mitigate the significant impacts at the following two study intersections:

25. Barrington Avenue & Mississippi Avenue
46. Sepulveda Boulevard & Palms Boulevard

A summary of the total number of significantly impacted intersections before and after feasible mitigation measures for 2015 and 2035 is provided below in **Table 4.12-13**. As noted, since the City of Los Angeles has no ability to implement mitigation measures in other jurisdictions, all intersections that are not fully controlled by the City of Los Angeles are considered significantly impacted after mitigation for purposes of this EIR.

TABLE 4.12-13: SUMMARY OF NUMBER OF INTERSECTIONS SIGNIFICANTLY IMPACTED

Future Year	Number of Significantly Impacted Intersections Before Mitigation	Number of Significantly Impacted Intersections With No Feasible Mitigation	Number of Significantly Impacted Intersections With Partial Mitigation	Intersections with Dual Jurisdiction (No Feasible Mitigation)	Number of Significantly Impacted Intersections Fully Mitigated	Number of Significantly Impacted Intersections After Mitigations
2015	47	37	2	3	5	42
2035	56	44	3	3	6	50

Note: Table includes intersections that are shared with and outside of the City of Los Angeles.

Transportation Demand Management (TDM) strategies, which are requirements of the Proposed Specific Plan, could mitigate some of the intersection-level impacts identified above. However, at this time it is not possible to estimate the effectiveness of these TDMs without additional detail on the selected TDM strategies and their application to individual development projects. Therefore, the impacts identified in this section would remain significant and unavoidable.

These impacts result from a conservative analysis, based on past experience with vehicular trip generation in mixed-use and transit-oriented developments. If recent changes in demographics, vehicle ownership patterns, and energy prices persist or increase in magnitude, this could lead to further increases in mode shift to lower-energy and lower-cost transportation modes that would reduce the volume of vehicular travel and potentially reduce the number of impacted intersections.

IMPACT 4.12-3 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT HAVE A SIGNIFICANT IMPACT RELATED TO NEIGHBORHOOD INTRUSION BY EXCEEDING THE ESTABLISHED THRESHOLDS? THIS IMPACT IS SIGNIFICANT AND UNAVOIDABLE.

The EIR modeling analysis accounts for potential redistribution of vehicular traffic from highly congested links to links that have more available capacity. While not every local street is included in the model, the cumulative effect of cut-through traffic is accounted for on the modeled links. Along roadways where the Proposed Project would cause significant traffic congestion, diversion of trips could occur onto adjacent parallel routes. It is anticipated that diversion would not occur on streets that operate at LOS D or better during peak periods because the average delay is not substantial. However, for the street segments where the LOS would degrade from D to E or F, some trips could divert to adjacent streets to avoid longer travel times through congested locations. Travel route changes on the City's arterial and collector roadways have been captured through the travel model's peak hour forecasts and LOS results. The extent to which trips would divert to adjacent local residential roadways is not reasonably foreseeable given the broad scope of the Project and the uncertainty around the specific location of individual development project driveways, and, therefore, impacts cannot be precisely determined. However, it is anticipated that increased traffic could

occur on these roadways. Therefore, the Proposed Project would result in a significant impact related to neighborhood intrusion.

MITIGATION MEASURE

TR14 In areas where implementation of the Proposed Project could result in diversion of traffic to adjacent residential streets, LADOT shall monitor traffic on identified residential streets, upon request submitted through the Council Office, to determine if traffic diversion occurs. If traffic on residential streets is found to be significantly impacted in accordance with current LADOT guidelines, LADOT will work with the project applicant and neighborhood residents to survey and monitor the residential street segment/s before and after project occupancy to assess the need for appropriate traffic calming measures. These measures could include the following (but are not limited to):

- Traffic circles
- Speed humps
- Roadway narrowing effects (e.g. raised medians, traffic chokers etc.)
- Landscaping features
- Roadway striping changes
- Stop signs

In addition to the aforementioned traffic calming measures, neighborhood improvements can offset the effect of adding traffic. These could include (but are not limited to) measures such as street trees, sidewalks, landscaping, neighborhood identification features, and pedestrian amenities. It would be the project applicant's responsibility to implement any of the approved measures through the Bureau of Engineering's permit process.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

The implementation of Mitigation Measure **TR14** would reduce the level of impact related to neighborhood intrusion but impacts would remain significant and unavoidable.

IMPACT 4.12-4 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT HAVE A SIGNIFICANT IMPACT RELATED TO THE CMP FREEWAY ANALYSIS BY EXCEEDING THE ESTABLISHED THRESHOLD? THIS IMPACT IS LESS THAN SIGNIFICANT.

The CMP is a state-mandated program administered by Metro (*2010 Congestion Management Program for Los Angeles County*, Metro, 2010) that provides a mechanism for coordinating land use and development decisions. CMP requires establishment of LOS standards to measure congestion at specific monitoring locations on the freeway and arterial systems. LOS ranges from LOS A to LOS F, with LOS A representing free-flow conditions and LOS F representing a high level of congestion.

Freeway segment volumes based on model data were used to compare Future with Project (2035) to Future No Project (2035) conditions and 2015 with Project to 2015 No Project conditions for six mainline CMP freeway monitoring locations identified within the sphere of influence of the Project along the I-10 and I-405. These six mainline locations are identified as CMP Freeway Monitoring Stations in the 2010 CMP:

- Route 10, at postmile R2.17, Lincoln Boulevard
- Route 10, at postmile R6.75, east of Overland Avenue
- Route 10, at postmile R10.71, east of La Brea Avenue
- Route 405, at postmile 24.27, north of La Tijera Boulevard
- Route 405, at postmile 28.30, north of Venice Boulevard
- Route 405, at postmile 35.81, south of Mulholland Drive

In accordance with the CMP guidelines, freeway (mainline) operating conditions during peak periods were evaluated using the general procedures established by the CMP. Freeway mainline LOS is estimated with calculation of the V/C ratio. Calculation of LOS based on V/C ratios is a surrogate for the speed-based LOS used by Caltrans for traffic operational analysis. The LOS criteria for freeway segments using V/C ratios as the performance measure can be found in the *2010 Congestion Management Program for Los Angeles County* and **Table 4.12-4**. Capacity was determined based on the existing capacities reported in the *2010 Congestion Management Program for Los Angeles County* and modified for future 2035 conditions to account for the addition of lanes on the I-405 freeway. Highways and roadways designated in the CMP network are required to operate at LOS E, except where Future No Project LOS is worse than LOS E. In such cases, the Future No Project LOS is the standard.

Freeway segment volumes based on the most recently reported CMP data were used to establish the CMP LOS conditions during the AM and PM peak hours for 2015 No Project conditions. Although PeMS data on existing freeway volumes was also collected, these volumes were not deemed to be representative of local conditions due to the heavily congested conditions on the I-405 and I-10. The use of PeMS data would have resulted in an underestimate of current and future vehicle throughput for these freeway facilities.

The analysis was then performed to evaluate 2015 With Project, 2035 No Project, and 2035 With Project conditions for the six CMP Freeway Monitoring Stations identified above based on AM and PM peak hour traffic volume per direction data from the City of Los Angeles' Travel Demand Model:

- 2015 With Project volumes were calculated by adding the difference between model 2035 with Project volumes and model 2035 No Project volumes to 2015 No Project volumes.
- 2035 No Project volumes were calculated as the difference between the model 2035 No Project volumes and the model 2015 volumes added to the 2015 freeway segment volumes.
- 2035 With Project volumes were calculated as the difference between the model 2035 with Project volumes and the model 2035 No Project volumes added to the 2035 No Project volumes calculated above.

The required CMP methodology compares the typical lane capacity for a freeway mainline segment to the number of vehicles traveling on the segment during the peak hour. Due to bottlenecks in the freeway network, vehicle demand can often exceed vehicle throughput resulting in significant reductions in travel speeds and extensive vehicle queuing. When this situation occurs, the number of vehicles passing a CMP monitoring location may be substantially lower than the actual vehicle demand for that location. This results in an artificially low traffic count at the CMP monitoring station, that when compared to the typical lane capacity, can show better operations (i.e., a lower V/C) than experienced by drivers.

As defined by the CMP, a significant impact occurs when a project increases traffic demand on a CMP facility by two percent of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$); if the facility is already at LOS F, a significant impact occurs when a project increases traffic demand on a CMP facility by two percent of capacity ($V/C \geq 0.02$). Since bottlenecks in the freeway network are resulting in artificially low vehicle counts at some CMP monitoring stations and vehicle LOS experienced by drivers is worse than reported based on the CMP methodology, increases in $V/C \geq 0.02$ for facilities shown to be operating at LOS E or better may also experience a significant impact resulting from the proposed project.

Freeway CMP Impact Analysis

Table 4.12-14 presents the freeway segment LOS for each of the six identified CMP Freeway Monitoring Stations for AM and PM peak hours under 2015 No Project, 2015 With Project, 2035 No Project, and 2035 With Project conditions.

Multiple CMP freeway monitoring locations during both the AM and PM peak hours are operating at LOS F under 2015 conditions or are projected to operate at LOS F in the future. The incremental change in the V/C ratio between Project conditions and No Project conditions for both 2015 and 2035 scenarios is less than 0.02 in each case. Other CMP freeway monitoring locations are expected to operate at LOS E or better based on the CMP methodology. Therefore, no impact related to the freeway system would occur.

TABLE 4.12-14: CMP FREEWAY ANALYSIS

CMP Station		Dir.	2015 Capacity	2015 No Project			2015 With Project			2015 Change in V/C	2035 Capacity	2035 No Project			2035 With Project			2035 Change in V/C

MITIGATION MEASURES

Impacts related to the freeway CMP analysis would be less than significant under the Proposed Project. No mitigation measures are necessary.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Impacts related to the freeway CMP analysis under the Proposed Project would be less than significant without mitigation.

IMPACT 4.12-5 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT HAVE A SIGNIFICANT IMPACT RELATED TO THE CMP ARTERIAL INTERSECTION ANALYSIS BY EXCEEDING THE ESTABLISHED THRESHOLD? THIS IMPACT IS SIGNIFICANT AND UNAVOIDABLE.

The CMP Guidelines require analysis of all CMP arterial monitoring intersections where the proposed Project will add 50 or more peak hour trips (total of both directions). The CMP exempts from analysis residential and mixed use projects within ¼ mile of fixed rail passenger stations. While some portion of the project and study intersections would be exempt under the criteria, all CMP intersections in the study area were evaluated, including the following seven CMP arterial monitoring stations (i.e., intersections). The CMP arterial monitoring stations identified for analysis were analyzed using the CMA/Circular 212 method to estimate LOS (see **Table 4.12-4**).

- Venice Boulevard and Overland Avenue (CMP Arterial Monitoring Station #15)
- La Cienega Boulevard and Jefferson Boulevard (CMP Arterial Monitoring Station #46)
- Santa Monica Boulevard and Bundy Drive (CMP Arterial Monitoring Station #59)
- Santa Monica Boulevard and Westwood Boulevard (CMP Arterial Monitoring Station #62)
- Venice Boulevard and Centinela Avenue (CMP Arterial Monitoring Station #70)
- Venice Boulevard and La Cienega Boulevard (CMP Arterial Monitoring Station #71)
- Wilshire Boulevard and Sepulveda Boulevard (CMP Arterial Monitoring Station #88)

Table 4.12-15 presents the arterial intersection LOS for each of the seven identified CMP Arterial Monitoring Stations for AM and PM peak hours under 2015 No Project, 2015 With Project, 2035 No Project, and 2035 With Project conditions.

This analysis concluded that the identified CMP arterial intersections are expected to operate at LOS E or better during the AM and PM peak hours at six of the seven analyzed locations under 2015 No Project and 2015 With Project conditions. One location would not operate at LOS E or better:

- CMP Arterial Monitoring Station #46 – La Cienega Boulevard at Jefferson Boulevard, where the LOS would be F during both peak hours under 2015 With Project conditions and during the AM peak hour under 2015 No Project conditions.

The Proposed Project does not result in a V/C ratio increase greater than 0.02 with LOS F at any of the analyzed CMP Arterial Monitoring Stations under 2015 conditions. Therefore, there would be no significant impact related to the arterial circulation system under 2015 conditions.

SOURCE: Fehr & Peers, 2015.

The identified CMP arterial intersections are expected to operate at LOS E or better during the AM and PM peak hours at four of the seven analyzed locations under both 2035 No Project and 2035 With Project conditions. Three locations would not operate at LOS E or better:

- CMP Arterial Monitoring Station #46 – La Cienega Boulevard at Jefferson Boulevard, where the LOS would be F during both peak hours under both 2035 No Project and 2035 With Project conditions.
- CMP Arterial Monitoring Station #62 – Santa Monica Boulevard at Westwood Boulevard, where the LOS would be F during both peak hours under both 2035 No Project and 2035 With Project conditions.
- CMP Arterial Monitoring Station #70 – Venice Boulevard at Centinela Avenue, where the LOS would be F during the AM peak hour under both 2035 No Project and 2035 With Project conditions.

The Proposed Project results in a V/C ratio increase greater than 0.02 with LOS F at CMP Arterial Monitoring Stations #62 Santa Monica Boulevard at Westwood Boulevard and #70 Venice Boulevard and Centinela Avenue. Therefore, without mitigation, the Proposed Project would result in a significant impact related to the arterial circulation system under 2035 conditions.

MITIGATION MEASURE

Under 2015 conditions, no intersections were identified as having a significant Project impact. Potential intersection improvements were identified and evaluated for all intersections presented in **Table 4.12-15** as being significantly impacted under 2035 conditions.

Two locations were identified to have Project impacts under the 2035 with Project conditions, CMP Arterial Monitoring Station #62 (Santa Monica Boulevard and Westwood Boulevard) and CMP Arterial Monitoring Station #70 (Venice Boulevard and Centinela Avenue). At CMP Arterial Monitoring Station #62, the only mitigation measures involve physical intersection improvements which would conflict with Project goals.

TR15 **Arterial Monitoring Station #70 (Venice Boulevard and Centinela Avenue)**. Restripe one existing northbound shared through/right-turn lane to provide one through lane and one right-turn lane and restripe one existing shared through/right-turn lane to provide one through lane and one right-turn lane. This improvement would require the removal of four on-street parking spaces on Venice Boulevard and the relocation of the bus stop on Centinela Avenue from the south side to the north side of the intersection.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

At Arterial Monitoring Station #62 (Santa Monica Boulevard at Westwood Boulevard), the only mitigation measures involve physical intersection improvements (such as widening the intersection) which would conflict with Project goals and are considered to be infeasible, and, therefore, this impact would remain significant and unavoidable.

Because Arterial Monitoring Station #70 (Venice Boulevard and Centinela Avenue) is under dual control by the City of Los Angeles and Caltrans, the City of Los Angeles does not have full control over modifications to the intersection. Therefore, impacts related to CMP arterial intersection analysis would remain significant and unavoidable.

IMPACT 4.12-6 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT HAVE A SIGNIFICANT IMPACT RELATED TO THE CMP TRANSIT IMPACT REVIEW BY SUBSTANTIALLY IMPACTING TRANSIT SERVICE? THIS IMPACT IS LESS THAN SIGNIFICANT.

Potential increases in transit person trips generated by the Proposed Project were estimated. Appendix D of the 2010 CMP provides guidelines on a methodology for estimating the number of transit trips expected to result from a proposed project based on the projected number of vehicle trips. This methodology assumes an average vehicle ridership (AVR) factor of 1.4 to estimate the number of person trips to and from the

Proposed Project and then provides guidance on the percentage of person trips assigned to public transit depending on the type of use (commercial/other versus residential) and the proximity to transit services. The CMP Guidelines suggest that 3.5 percent of total person trips generated should be assigned to transit in most cases. In the case of portions of the Project Area, primarily commercial development within ¼ mile of a CMP transit center, 15 percent of total person trips generated are assigned to transit. As a conservative assumption, this transit analysis uses vehicle trip estimates derived from ITE trip rates (shown as "Gross Trips" in **Tables 4.12-4** and **4.12-5**) as opposed to the number of Net External Trips, which account for reductions in the number of vehicle trips anticipated in a mixed-use development proximate to high-frequency transit service and would result in a smaller number of person trips assigned to transit.

This analysis estimates the capacity of future transit services in the Project Area by identifying the bus and rail services with stops within the Project Area, described under the "Existing Public Transit Service" section, above. In addition to the capacity of the Expo LRT, the analysis assumes that, although existing bus services would likely be reconfigured, the overall bus capacity serving the Project Area in the future would be similar to the existing capacity. Although precise reconfiguration plans are not presently known, it is assumed that buses that are redirected from routes that would duplicate Expo service could be used to create better connections to Expo stations and provide additional connectivity to destinations not directly served by Expo. For reference, forecast boardings for the Expo LRT for the year 2030 by station are shown in **Table 4.12-16**.

TABLE 4.12-16: EXPO LRT 2030 STATION BOARDINGS

Station Area	Boardings
Bundy	2,811
Sepulveda	5,097
Westwood	5,213
Palms	1,856
Culver City	4,196

SOURCE: Expo FEIR, 2009.

The Proposed Project would have an estimated increase in vehicle trip generation of approximately 8,475 vehicle trips during the AM peak hour, 8,791 net vehicle trips during the PM peak hour, and 75,101 daily net vehicle trips. Applying the AVR factor of 1.4 to the estimated net vehicle trips would result in an estimated increase of approximately 11,865 AM net person trips, 12,307 PM net person trips and 105,141 daily net person trips. Following the CMP guidelines for assigning trips to transit described above, the Proposed Project would generate an estimated increase of approximately 1,220 AM peak hour transit trips, 1,123 PM peak hour transit trips, and 12,306 daily transit trips.

The bus and rail transit services in the Project Area are estimated to have a combined capacity of approximately 18,700 AM peak hour passenger trips, 18,600 PM peak hour passenger trips, and 287,000 daily passenger trips. The project would use seven percent of total AM peak hour capacity, six percent of total PM peak hour capacity, and four percent of total daily capacity. No significant impacts to the transit system would be anticipated.

MITIGATION MEASURES

Impacts related to the CMP transit analysis would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Impacts related to the CMP transit analysis under the Proposed Project would be less than significant without mitigation.

IMPACT 4.12-7 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN INADEQUATE EMERGENCY VEHICLE ACCESS SUCH THAT THERE WOULD BE NEED FOR CONSTRUCTION OF NEW OR PHYSICALLY ALTERED EMERGENCY SERVICE FACILITIES (POLICE AND/OR FIRE)? THIS IMPACT IS LESS THAN SIGNIFICANT.

Where segment-level LOS would be significantly impacted, emergency vehicles may also be significantly impacted due to the project's location in a congested area of West Los Angeles. Since the Proposed Project could contribute to increased delay for drivers, it would have a potentially significant impact related to inadequate emergency vehicle access resulting in the potential need for construction of new or physically altered emergency service facilities.

In the case of this Proposed Project, if roadway capacity were added (as a mitigation measure), it would be counter to the goals and objectives set forth in the ECTNP designed to encourage mobility using a variety of modes, including vehicles, transit, bicycle, and walking. The addition of significant roadway capacity in this area could also result in induced travel and, thus, not provide mitigation for decreasing emergency response times. However, increasing congestion could impede emergency access. While the Proposed Project could impact segment-level LOS, there is not a direct relationship between predicted travel delay and response times as California State law does require drivers to yield the right-of-way to emergency vehicles and even permits emergency vehicles to use opposing lane of travel, the center turn lanes, or bus-only lanes. People traveling by bicycle are also required to pull to the side of the road to yield access to emergency providers. Emergency responders also routinely use the center left-turn lanes, or even travel in opposing travel lanes if needed. Generally, multi-lane roadways allow the emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle.

Parallel with the ECTNP effort (see cumulative discussion below), the City is evaluating and proposing to implement the Citywide Mobility Plan, Coastal Transportation Corridor Specific Plan (CTCSP), and the West Los Angeles Transportation Improvement and Mitigation Specific Plan (WLA TIMP) Amendments. These projects, together with proposed project mitigation, could alter roadway configurations in the study area. These revised roadway configurations could improve emergency access. For example, a roadway reconfiguration could improve emergency access where a bus-only lane or a contiguous center left-turn lane is introduced where it previously did not exist. Emergency vehicles are permitted to use bus only lanes for local access to emergency destinations, though it is more likely that when in route to an emergency incident, general traffic would merge into a bus only lane permitting the emergency vehicle to pass in the through lane to the left.

Knowing exactly how fire and emergency service response times will be affected calls for a great deal of speculation.

The interrelationship between emergency access and traffic is complex and involves factors such as the following:

- Los Angeles Fire Department (LAFD) in collaboration with LADOT has developed a FPS, a system that automatically turns traffic lights to green for emergency vehicles traveling on designated streets in the City. The City of Los Angeles has over 205 miles of routes equipped with FPS.[24]
- The proximity of LAFD (and other) facilities to those they serve.
- The opportunity for LAFD and emergency responders to use alternative routes in an area.
- LAFD, in cooperation with LADOT and the City's Department of City Planning, actively participates in the design of specific roadway changes in order to ensure adequate fire/emergency access is maintained.

[24]Training Bulletin: Traffic Signal Preemption System for Emergency Vehicles, Los Angeles Fire Department, Bulletin No. 133, October 2008.

LAFD, in reviewing street and right-of-way projects, comments on particular street configuration designs, and will raise concerns if roadways present particular access challenges, and can recommend no changes be done at all or alternative changes be undertaken if fire and emergency access are particularly impacted.

- LAFD is responsible for identifying and implementing capital improvements (such as new Fire Stations) as may be needed to respond to anticipated increased demand. LAFD does not have a capital improvement plan that identifies construction of new fire stations in specific locations, and, therefore, it is not possible to forecast or identify any specific impacts associated with any potential new or expanded fire stations. Any impacts from building or expanding fire stations and facilities would be speculative at this point in time.
- As identified in the Thresholds Guide, on any given project review, LAFD can implement project specific mitigation requirements, such as requiring fire retardant landscaping, prohibiting construction in fire hazard areas, requiring design features that reduce fire potential and developing emergency response plans.
- The changing demand for service is complex. For example, with increasing populations, there may be more density and more construction, though new buildings are constructed in accordance with increasingly stringent building and fire codes making them safer and more resistant to fires, such as requiring fire sprinklers. The population is aging, which may increase demand for service. However, the population may be becoming healthier with increased and improved healthcare.
- Future factors that could increase efficiencies in response, including improvements in technology and management, such as changes in deployment of equipment and staff and mutual aid agreements.

LAFD is responsible for maintaining adequate response times. LAFD published a Strategic Plan in April 2015. The LAFD Strategic Plan[25] focuses on nine goals and corresponding strategic actions that would guide the LAFD for the next three years. The primary goals that are applicable to the Project include providing exceptional public safety and emergency service and implementing and capitalizing on advanced technologies. Some of the key priorities associated with these goals include the following:

- Improving response times by utilizing data and metrics to identify gaps in LAFD's response strategies and exploring response time improvements through dialogue, cognitive inquiry, innovation, and follow-up;
- Delivery of emergency medical services by expanding LAFD EMS response capabilities for special events and addressing periods of high vehicle traffic; and
- Identifying and implementing advanced technologies to support and improve performance metrics, tracking standards, data collection, analysis and reporting procedures (FireStatLA).

The LAFD Strategic Plan also focuses on the development of an even more professional workforce and promotion of a positive work environment to address risk management issues and strengthening community relationships to improve preparedness and enhance resiliency during emergency events.

Planning Department Staff have discussed the LAFD Strategic Plan and its relationship to growth and traffic with LAFD Staff in order to understand how LAFD responds to growth and changes in traffic. LAFD advised that while increasing congestion is a factor in how they address emergency response, their ongoing planning efforts, including the LAFD Strategic Plan take in to account such increases in congestion and LAFD continues to plan for and maintain public safety and emergency service as required. LAFD will continue to monitor any impact on-the-ground implementation of the the Proposed Project may have on response times and make adjustments as necessary. These adjustments may or may not include redeploying resources, adding staff or building new fire stations.

[25]Los Angeles Fire Department, *LAFD Strategic Plan 2015-2017*, May 2015.

It is not reasonably foreseeable that the Proposed Project would cause the addition of a new fire station or police facilities or the expansion, consolidation or relocation of an existing facility to maintain service. LAFD has a mandate to protect public safety and must respond to changing circumstances and therefore would act to maintain response times. The steps that LAFD would have to take to maintain public safety are not reasonably foreseeable at this time. Options available to LAFD include expanding the FPS, increasing staffing levels and adding new fire stations(s) to underserved areas. The potential for new fire station construction is speculative at the present time and is, therefore, not analyzed in this document. Depending on the location of new fire protection facilities, operational impacts (primarily noise) could occur; however, such impacts are unforeseeable at this time. Therefore, the Proposed Project would have a less-than-significant impact on emergency access.

MITIGATION MEASURE

Impacts on emergency vehicle access that would trigger the need for new emergency service facilities were found to be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

The Proposed Project would increase congestion, which could impede emergency access; however, it is not anticipated that congestion would result in the need for construction of new or physically altered emergency service facilities (police and/or fire). LAFD has a mandate to protect public safety and must respond to changing circumstances and therefore would act to maintain response times. The steps that LAFD would have to take to maintain public safety are not reasonably foreseeable at this time. Options available to LAFD include increased staffing levels and new fire stations(s) in underserved areas. Any construction impacts associated with new fire protection facilities would be within the impacts discussed in this document. Depending on the location of new fire protection facilities, operational impacts (primarily noise) could occur; however, such impacts are unforeseeable at this time. Therefore, the Proposed Project was found to have less-than-significant impacts on emergency vehicle access without mitigation.

IMPACT 4.12-8 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT INCREASE HAZARDS DUE TO A DESIGN FEATURE OR INCOMPATIBLE USES? THIS IMPACT IS LESS THAN SIGNIFICANT.

None of the transportation system improvements proposed in the Proposed Project would introduce new safety hazards or incompatible uses at intersections or along roadway segments, as most would be designed to improve safe circulation and access to the transit stations for all users. No new roadways are introduced or removed; streetscape plans are designed to help minimize conflicts between pedestrians and vehicles, and design standards in the Proposed Project are designed to limit the number, width, and location of new driveways along major streets and in areas of high pedestrian activity. Therefore, from a programmatic perspective, impacts related to safety would be less than significant.

MITIGATION MEASURES

Impacts related to design features or incompatible uses would be less than significant under the Proposed Project. No mitigation measures are necessary.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Impacts related to design features or incompatible uses under the Proposed Project would be less than significant without mitigation.

IMPACT 4.12-9 WOULD THE IMPLEMENTATION OF THE PROPOSED PROJECT REQUIRE CONSTRUCTION ACTIVITIES TO TAKE PLACE WITHIN A MAJOR OR SECONDARY HIGHWAY ROW WHICH WOULD NECESSITATE TEMPORARY LANE, ALLEY, OR STREET CLOSURES FOR MORE THAN ONE DAY; REQUIRE CONSTRUCTION ACTIVITIES TO TAKE PLACE WITHIN A COLLECTOR OR LOCAL STREET ROW WHICH WOULD NECESSITATE TEMPORARY LANE, ALLEY, OR STREET CLOSURES FOR MORE THAN SEVEN DAYS; RESULT IN THE LOSS OF REGULAR VEHICULAR OR PEDESTRIAN ACCESS TO AN EXISTING LAND USE FOR MORE THAN ONE DAY; OR RESULT IN THE TEMPORARY LOSS FOR MORE THAN ONE DAY OF AN EXISTING BUS STOP OR REROUTING OF A BUS ROUTE THAT SERVES THE PROJECT SITE? THIS IMPACT IS LESS THEN SIGNIFICANT WITH MITIGATION.

Construction-related impacts would generally be temporary. Because the study area represents a specific plan area relating to the build out of multiple parcels, construction-related impacts would depend on the approach to development of each parcel or development site. Although specific impacts related to construction cannot be known at this time, it is likely that construction activities could necessitate temporary lane, alley, or street closures or result in bus stop relocation or bus rerouting. Therefore, without mitigation, the Proposed Project would result in a significant impact related to construction.

MITIGATION MEASURE

TR16 Projects that require a worksite traffic control plan per current LADOT guidelines shall submit to LADOT for review and approval a plan that mitigates the impact of traffic disruption and ensures the safety of all users of the affected roadway. The plan shall address construction duration and activities and include measures, such as operating a temporary traffic signal, using flagmen adjacent to construction activities, or providing a dedicated pedestrian walkway, as appropriate.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

The implementation of Mitigation Measure **TR16** would reduce the level of impact related to construction to a less-than-significant level.

PARKING

The Proposed Project includes the addition of landscaped bulb-outs that would result in some minor reductions in on-street parking. On Palms Boulevard between Motor Avenue and National Boulevard, the installation of landscaped bulb-outs would result in the removal of approximately five on-street parking spaces.

The reduction in parking spaces related to the Proposed Project could increase VMT if people drive farther to find parking or seek an alternate destination with more convenient parking. However, this increased VMT could typically be offset by a reduction in vehicle trips from others who are aware of constrained parking conditions in a given area. In addition, the Project's strategies to increase proximity to neighborhood services and increase alternative transportation use including transit, bicycling and walking would reduce VMT. As discussed above under Thresholds of Significance, loss of parking is not considered an impact, but can trigger secondary impacts (such as noise, air emissions etc.). In the case of the ECTNP, the loss of parking in the Project Area is not anticipated to result in secondary impacts because the reduction is relatively small and the anticipated number of vehicle trips to the area may decrease as result of parking constraints. Therefore, the Proposed Project would result in less-than-significant impacts related to parking.

CUMULATIVE ANALYSIS AND OTHER METRICS

The analysis of future conditions with and without the project above takes into account forecast population for the year 2035 prepared by SCAG and found in the 2012-2035 RTP/SCS. The RTP also includes a SCS that provides guidance on land use planning and transportation to ensure that the region meets CARBs region-specific GHG reduction goals (see Section 4.5, Greenhouse Gas Emissions). The SCAG population projections are provided at TAZ levels of detail for purposes of analysis in the RTP. However, in order to provide individual jurisdictions flexibility in distribution of populations within their jurisdiction, the population assumptions are only adopted at the jurisdictional level. Individual jurisdictions have the flexibility to distribute population as long as they continue to comply with SCS policies and do not affect regional compliance with CARB GHG targets. The RTP also includes large-scale transportation improvements (such as the Expo Line Phase 2 LRT) to show how linking transportation and land use planning can reduce automobile trips and GHG emissions. The 2012-2035 RTP/SCS identifies transportation corridors and transit routes, High Quality Transit Areas (HQTAs), and a variety of strategies to be employed across the region; to the extent information is available about these strategies/improvements they are included in the analysis of project impacts above.

CEQA requires an analysis of cumulative impacts resulting from the implementation of the Proposed Project along with other related projects anticipated to occur in the same geography and timeframe. In addition to the RTP there are two (City of Los Angeles) plans that could have overlapping impacts with the Proposed Project: the recently adopted MP 2035 and the proposed CTCSP/WLA TIMP. (These plans are discussed in more detail below.) Roadway network changes that could result from MP 2035 and CTCSP/WLA TIMP have not been designed, and, therefore, detailed evaluation of potential traffic impacts at the intersection level of detail was not possible and was not included in the intersection analysis of project impacts above.

The purpose of this cumulative/other metrics analysis is to document potential transportation impacts of the Proposed Project with related transportation projects and roadway network improvement projects that are not designed to the level of detail that they can be included in the intersection-level Project analysis above. Since some of the projects considered are outside of the ECTNP Area boundaries, the cumulative transportation analysis focused on the area defined as the West Los Angeles APC. In addition to the 2012-2035 RTP/SCS included in the analysis of project impacts above, the following projects are included in the cumulative analysis:

- MP 2035: In August 2015, the City of Los Angeles adopted MP 2035. MP 2035 (formerly the Transportation Element of the City's General Plan) is the transportation blueprint for the City of Los Angeles, subsequent amendments have been made to the Mobility Plan. MP 2035 includes a number of changes to the City's circulation system, including policies, an Enhanced Complete Street System, an Action Plan, a Complete Streets Design Guide, and a revised Bicycle Plan, all of which will influence the network conditions in the study area and adjacent areas in the City of Los Angeles.

  MP 2035 provides the framework for future community plans and specific plans, which take a closer look at the transportation system in specific areas of the City and recommend more detailed implementation strategies to realize MP 2035. MP 2035 was prepared in compliance with the 2008 Complete Streets Act, which mandates that the circulation element of a city's General Plan be modified to plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways, defined to include motorists, pedestrians, bicyclists, children, persons with disabilities, seniors, movers of commercial goods, and users of public transportation, in a manner that is suitable to the rural, suburban, or urban context of the general plan.

  For purposes of analysis in this cumulative/other metrics evaluation, the multi-modal improvements included in the MP 2035 enhanced networks (Transit, Bicycle, Neighborhood, Pedestrian and Vehicle) were assumed to be implemented citywide (both within the ECTNP boundaries and in the rest of the City of Los Angeles). While MP 2035 was recently adopted, the timing of implementation and funding sources have not yet been identified, nor have detailed design plans been developed. Therefore the

specific multi-modal improvements could not be included in the detailed 2035 Project analysis. Individual transportation improvements will be designed and implemented as part of subsequent City projects.

- CTCSP and WLA TIMP Amendments: These amendments include an update to the list of transportation improvements to be funded, in part, by the impact fees collected from new development; an update to the Transportation Impact Assessment (TIA) fee program, including revisions to the fees, trip generation rates, exemptions, in-lieu credits, and affordable housing credits; and a new TOD credit. The updated project lists reflect the vision of MP 2035; however, they do not reflect full buildout of MP 2035. Many of the projects contained in the updated project lists provide a first-step in implementing MP 2035 within the specific plan areas. These amendments are currently under review by the City, and therefore, full implementation was not included in the 2035 Project analysis. In addition, project design at the intersection level of detail is not yet available. Individual transportation improvements will be designed and implemented as part of subsequent City projects.

Over the course of the development of the EIR, new methods for evaluating transportation impacts have emerged that are appropriate for evaluating both project and cumulative impacts. The City recently adopted MP 2035, which includes new VMT-related metrics in response to new technical guidance for transportation metrics under SB743 developed by OPR . Although the new draft CEQA guidance from OPR focuses on per-capita VMT, other potential metrics that could be considered include total VMT, vehicle trips (VT), and peak period mode split. This section addresses VT, VMT, VMT per capita, and mode split metrics in the context of cumulative conditions (including the regionally adopted RTP, MP 2035 and CTCSP/WLA TIMP) with and without the ECTNP. Note that these metrics are not adopted thresholds, and are presented below for informational purposes only.

Modeling of cumulative conditions was completed utilizing the City's MP 2035 TDF Model. As part of the MP 2035, the socioeconomic data for the City's TDF Model were updated to reflect the most recent growth forecasts in 2012-2035 RTP/SCS. In addition, the roadway and transit networks have been updated to reflect the assumptions contained in the 2012-2035 RTP/SCS.

Table 4.12-17 presents the number of vehicle trips with an origin and/or destination in the West Los Angeles APC. The number of vehicle trips are reported for both the AM and PM peak periods as well as the two peak periods combined. As shown, with the addition of the Project vehicle trips would increase by 1.1 percent during the AM peak period and 1.3 percent during the PM peak period.

TABLE 4.12-17: VEHICLE TRIPS WITH ORIGINS AND/OR DESTINATIONS WITHIN THE WEST LOS ANGELES APC AREA – COMPARISON OF FUTURE CUMULATIVE CONDITIONS WITH AND WITHOUT PROJECT

West Los Angeles APC	Future Cumulative Vehicle Trips Without ECTNP	Future Cumulative Vehicle Trips With ECTNP	Vehicle Trip Difference	Percent Difference
AM Peak Period (3-hour)	305,303	308,808	+3,506	+1.1%
PM Peak Period (4-hour)	466,448	472,573	+6,126	+1.3%
Peak Period (7-hour)	771,750	781,382	+9,632	+1.2%

SOURCE: Fehr & Peers, 2014.

Table 4.12-18 presents the amount of VMT on roadways contained within the West Los Angeles APC. VMT results are reported for the AM and PM peak periods as well as the two peak periods combined. In comparison to future conditions with implementation of the Proposed Project, VMT would increase by 0.6 percent during both the AM and PM peak periods. Although peak period vehicle trips increase by 1.2 percent, peak period VMT would increase by only 0.6 percent, indicating that, although more trips are made when the the Proposed Project is included, those trips tend to be shorter distances.

TABLE 4.12-18: VEHICLE MILES TRAVELED – ORIGINS AND/OR DESTINATIONS WITHIN THE WEST LOS ANGELES APC AREA – COMPARISON OF FUTURE CUMULATIVE CONDITIONS WITH AND WITHOUT PROJECT

West Los Angeles APC	Future Cumulative VMT Without ECTNP	Future Cumulative VMT With ECTNP	VMT Difference	Percent Difference
AM Peak Period (3-hour)	2,643,475	2,658,975	+15,500	+0.6%
PM Peak Period (4-hour)	3,991,705	4,017,069	+25,364	+0.6%
Total Peak Period (7-hour)	6,635,180	6,676,043	+40,864	+0.6%

SOURCE: Fehr & Peers, 2014.

Table 4.12-19 presents the VMT per capita results for the West Los Angeles APC. In order to capture the effect of increased travel due to additional jobs and housing with the Proposed Project, per-capita VMT is calculated on a service population basis. Service population is defined as the total number of jobs plus the total population of a given area. Although peak period VMT increases approximately 0.6 percent with the addition of the Proposed Project, service population increases by 1.4 percent. As a result, peak period VMT per capita is 0.8 percent lower with the addition of the Proposed Project when compared to future cumulative conditions without the Project.

TABLE 4.12-19: PEAK PERIOD VMT PER CAPITA COMPARISON – WEST LOS ANGELES AREA PLANNING COMMISSION AREA – FUTURE CUMULATIVE CONDITIONS WITH AND WITHOUT PROJECT

West Los Angeles APC	Population	Employment	Service Population (Population + Employment)	Peak Period VMT	VMT per Capita
Future Cumulative Conditions without ECTNP	459,500	362,900	822,400	6,635,180	8.1
Future Cumulative Conditions with ECTNP	466,900	366,900	833,800	6,676,043	8.0
Difference	+7,400	+4,000	+11,400	+40,864	-0.1
Percent Difference	+1.6%	+1.1%	+1.4%	+0.6%	-0.8%

SOURCE: Fehr & Peers, 2014.

Table 4.12-20 presents the types of trips made (i.e., mode split) within the West Los Angeles APC. In comparison to future conditions without the Proposed Project, auto mode share would be approximately 1.1 percent lower, while transit, bike, and walk mode shares would increase by 0.7 percent, 0.3 percent, and 0.2 percent, respectively, with the addition of the Proposed Project. The increase in transit mode share represents a 16.7 percent increase over future cumulative conditions without the Proposed Project, suggesting that proximity of new development to transit services would result in an increase in transit ridership.

TABLE 4.12-20: PEAK PERIOD MODE SPLIT COMPARISON – WEST LOS ANGELES AREA PLANNING COMMISSION AREA - FUTURE CUMULATIVE CONDITIONS WITH AND WITHOUT PROJECT

West Los Angeles APC	Auto	Transit	Bike	Walk
Future Cumulative Conditions Without ECTNP	74.6%	4.2%	2.8%	18.4%
Future Cumulative Conditions with ECTNP	73.5%	4.9%	3.1%	18.6%
Difference	-1.1%	+0.7%	+0.3%	+0.2%
Percent Difference	-1.5%	+16.7%	+10.7%	+1.1%

SOURCE: Fehr & Peers, 2014.

Overview. The cumulative projects considered in the transportation analysis, in combination with the Proposed Project, would improve access to transit and concentrate more growth in compact, mixed-use developments in close proximity to transit services. This would result in a similar number of VMT compared to cumulative conditions without the Project. However, each additional resident and job resulting

fro the Project is expected to contribute fewer VMT than current residents and employees, thereby decreasing the VMT per capita ratio and increasing the mode share for transit, biking and walking.

Cumulative Summary

The cumulative impact analysis below considers related projects that are currently not approved or do not have full funding. For the purposes of this analysis, the cumulative scenario considers the 2012-2035 RTP/SCS and both the MP 2035 and the CTCSP/WLA TIMP Amendments.

Circulation System. As described, potential impacts to the circulation system were evaluated. V/C ratios and LOS calculations were prepared for Existing conditions (2015), Existing conditions With Project (2015), Future Without Project (2035), and Future With Project (2035) conditions. The addition of the Proposed Project would result in significant impacts at 47 intersections in 2015, of which 42 would remain significant after mitigation, and 56 intersections in 2035, of which 50 would remain significant after mitigation measures are applied. Under current CEQA Guidelines and City thresholds, this is considered a significant adverse impact. Roadway network changes that could result from MP 2035 and CTCSP/WLA TIMP have not been designed, and, therefore, detailed evaluation of potential traffic impacts with these projects at the intersection level of detail is not possible. As explained in the respective EIRs for these two projects, each would individually result in traffic impacts at the areawide level. The combination of the Proposed Project together with MP 2035 and CTCSP/WLA TIMP would result in traffic impacts worse than those identified for the year 2035 With Project in the intersection analysis above. All three projects together would result in significant traffic impacts. The Proposed Project would result in a cumulatively considerable contribution to circulation system impacts in the Project Area.

Neighborhood Intrusion. The EIR modeling analysis accounts for potential redistribution of vehicular traffic from highly congested roadway segments to roadway segments that have more available capacity. Along roadways where the Proposed Project would cause significant traffic congestion, diversion of trips could occur onto adjacent parallel routes. While the TDM plans required by LADOT can alleviate neighborhood traffic intrusion from individual developments within the ECTNP Area, regional growth and associated increases in activity levels may still result in vehicles diverting to residential roadways. As noted, while both the MP 2035 and CTCSP/WLA TIMP include proposed roadway network changes, they do not provide detailed intersection level designs in the study area. Therefore, as noted above, detailed evaluation of traffic and associated impacts from these projects is not possible. On a regional level, traffic in the study area is anticipated to increase in conjunction with regional population, housing, and employment growth projected to occur in the future by SCAG. This growth would occur with or without implementation of the Proposed Project. The background growth influences the transportation analysis by accounting for the increased activity levels under Future With Project conditions, although those increases would occur with or without the project. The combination of the Proposed Project together with the anticipated roadway network changes in MP 2035 and the CTCSP/WLA TIMP would further increase traffic and associated impacts, such as neighborhood intrusion, as compared to the 2035 With Project scenario analyzed for the Proposed Project in Impact 4-12-3. Therefore, there is a significant impact to neighborhood intrusion from cumulative projects. The Proposed Project would result in a cumulatively considerable contribution to neighborhood intrusion impacts.

Congestion Management Plan (CMP). As defined by the CMP, a significant impact occurs when a project increases traffic demand on a CMP facility by two percent of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$); if the facility is already at LOS F, a significant impact occurs when a project increases traffic demand on a CMP facility by two percent of capacity ($V/C \geq 0.02$). On a regional level, traffic in the Project Area is anticipated to increase in conjunction with regional population, housing, and employment growth projected to occur in the future by SCAG. This growth would occur with or without implementation of the Proposed Project. The background growth influences the transportation analysis by accounting for the increased activity levels under Future With Project conditions, although those increases would occur with or without the project. Consequently, when comparing traffic operations on the CMP network under Future With

Project conditions to Future No Project conditions, peak period congestion continues to increase as a result of background and project growth. The combination of the Proposed Project together with the anticipated roadway network changes in MP 2035 and the CTCSP/WLA TIMP would further increase traffic and associated roadway impacts, such as impacts on CMP arterial facilities, as compared to the 2035 With Project scenario analyzed for the Proposed Project in Impact 4.12-5. The Proposed Project would result in a cumulatively considerable contribution to CMP arterial impacts. The Proposed Project would not meet CMP criteria for a significant impact to freeways or transit service (Impacts 4.12-4 and 4.12-6). The thresholds used to determine significant project-level impacts to freeways and transit service are also used to determine the potential for cumulatively considerable contributions to these impacts. Therefore, the Propsed Project would not make a cumulatively considerable contribution to freeway or transit service impacts using CMP criteria.

Emergency Access. As discussed above, the Proposed Project would increase traffic in the area resulting in potential delays for emergency vehicles. As noted above, while both the MP 2035 and CTCSP/WLA TIMP include proposed roadway network changes, they do not provide detail ed intersection level concepts in the study area. It is possible that some of these roadway improvements would provide a benefit to emergency access. As discussed above, Department of City Planning Staff have discussed the LAFD Strategic Plan and its relationship to growth and traffic with LAFD Staff in order to understand how LAFD responds to growth and changes in traffic from cululative development and changes to the roadway network. LAFD advised that while increasing congestion is a factor in how they address emergency response, their ongoing planning efforts, including the LAFD Strategic Plan, take in to account such increases in congestion and LAFD continues to plan for and maintain public safety and emergency service as required. LAFD will continue to monitor any impact of growth and changes to the roadway network may have on response times and make adjustments as necessary. These adjustments may or may not include redeploying resources, adding staff or building new fire stations. Based on conversations with LAFD regarding this project and the two other related plans in the area, cumulative impacts are considered less than significant.

Construction of new emergency service facilities as a result of increased traffic delays is not reasonably foreseeable at the present time given the number of factors that affect emergency response. Even if new facilities were needed and constructed impacts would generally fall within those discussed in this document, except for potential operational noise impacts associated with new emergency response facilities. However, it is too speculative to determine even if new facilities would be needed, let alone where noise impacts could occur.

4.13 UTILITIES AND SERVICE SYSTEMS

This section provides an overview of the utilities and service systems and evaluates the construction and operational impacts associated with the Proposed Project. Topics addressed include water, wastewater, solid waste, and energy.

The Proposed Project is evaluated with respect to the demand that could be placed on water, wastewater, solid waste, and energy service providers, whether this demand can be met without the need for additional infrastructure, and whether the Proposed Project would be in compliance with regulations governing the provision of this utility. Assessment of impacts on water, wastewater, solid waste, and energy conveyance infrastructure and supply includes the comparison of estimated project-generated demand against existing and anticipated resource supplies and/or conveyance/treatment capacity.

For the purposes of this evaluation, data for both the Proposed Project and Proposed Project with the Alternative Compliance scenario was used to generate demand estimates. With the Alternative Compliance scenario, there would be a greater residential population and fewer employees when compared to the Proposed Project without Alternative Compliance scenario.

WATER SUPPLY

REGULATORY FRAMEWORK

FEDERAL

The Clean Water Act (CWA) is discussed below under wastewater.

Safe Drinking Water Act (SDWA). The SDWA ensures the quality of Americans' drinking water. The law requires actions to protect drinking water and its sources (e.g., rivers, lakes, reservoirs, springs and groundwater wells) and applies to public water systems serving 25 or more people. It authorizes the U.S. Environmental Protection Agency (USEPA) to set national health-based standards for drinking water to protect against both naturally occurring and manmade contaminants. In addition, it oversees the states, municipalities and water suppliers that implement the standards. USEPA standards are developed as a Maximum Contaminant Level (MCL) for each chemical or microbe. The MCL is the concentration that is not anticipated to produce adverse health effects after a lifetime of exposure, based upon toxicity data and risk assessment principles. USEPA's goal in setting MCLs is to assure that even small violations for a period of time do not pose significant risk to the public's health over the long run. National Primary Drinking Water Regulations (NPDWRs) are legally enforceable standards that limit the levels of contaminants in drinking water supplied by public water systems. Secondary standards are non-enforceable guidelines regulating contaminants that may cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water. USEPA recommends secondary standards to water systems but does not require systems to comply. However, states may choose to adopt them as enforceable standards.

STATE

Governor's Declaration of a State of Emergency. On January 17, 2014, California Governor Jerry Brown proclaimed a state of emergency due to drought conditions. This proclamation directs all local urban water suppliers and municipalities immediately implement their local water shortage contingency plans. In response to

the proclamation, the City and the Los Angeles Department of Water and Power (LADWP) activated Water Conservation Response Unit to implement the Emergency Water Conservation Plan (EWCP).

On May 9, 2016, Governor Jerry Brown signed Executive Order B-37-16 that established a new water use efficiency framework for California. The order bolstered the state's drought resilience and preparedness by establishing longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating clearly wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans. Based on monthly water use reporting, the majority of urban water suppliers reported sufficient supplies to meet demand in three additional dry years and are not subject to state conservation mandates. On February 8, 2017, the State Water Resources Control Board (SWRCB) adopted an emergency water conservation regulation to amend and extend the May 2016 regulation. The amended regulation allows certain suppliers the opportunity to submit or resubmit their water supply reliability assessments by March 15, 2017 and does not require mandatory conservation unless water suppliers determine that they have a shortfall. Prohibitions against homeowner's associations penalizing homeowners for certain outdoor conservation practices during a declared drought remain and similar requirements are extended to cities and counties. The extension maintains urban water supplier monthly reporting and basic water conservation measures. Accordingly, the SWRCB will separately take action to make reporting and wasteful water practices permanent.[1]

Urban Water Management Planning Act. In 1983, the California Legislature enacted the Urban Water Management Planning Act (Water Code Section 10610 *et seq*.), which requires urban water suppliers to develop water management plans to actively pursue the efficient use of available supplies. Every five years, water suppliers are required to develop Urban Water Management Plans (UWMPs) to identify short-term and long-term water demand management measures to meet growing water demands. The LADWP, as a water supplier, has prepared and adopted an UWMP, the latest of which was completed in the year 2015.

In addition to the UWMP, there are several state regulations which govern water consumption within the City:

- Title 20, California Code of Regulations (CCR) Section 1605.1 - Mandates water conservation by establishing efficiency standards that give the maximum flow rate of all new shower heads, lavatory, sink faucets, and tub spout diverters.
- Health and Safety Code Section 17921.3 - Requires all buildings to have low-flush toilets and urinals.
- Health and Safety Code Section 116785 - Prohibits the installation of residential water softening or conditioning appliances unless certain conditions are met, and requires the installation of water conservation devices on fixtures using softened or conditioned water.
- Water Code Section 10910 - Requires the identification of any public water system that may supply water for proposed projects that are subject to CEQA and provides guidelines to include in a water supply assessment, as further described below.

Water Conservation Act. In 2009, the Water Conservation Act was enacted by the California Legislature, which required water agencies to reduce per capita water use by 20 percent by 2020 (known as 20x2020). This includes increasing recycled water use to offset potable water use. Water suppliers are required to set a water use target for 2020 and an interim target for 2015 using one of four methods stipulated in the Act. Failure to meet adopted targets will result in the ineligibility of a water supplier to receive water grants or loans administered by the State. In compliance with this Act, LADWP has calculated its baseline per capita water use, its urban use target for 2020, and its interim water use target for 2015. **Table 4.13-1** details the results of LADWP's calculations.

[1]State Water Resources Control Board, *Water Conservation Portal – Emergency Conservation Regulation*, http://www.waterboards.ca.gov/water_issues/programs/conservation_portal/emergency_regulation.shtml, accessed March 7, 2017.

TABLE 4.13-1: 20X2020 BASE AND TARGET DATA	
20x2020 Required Data	**Gallons Per Capita per Day (gpcd)**
BASE PER CAPITA DAILY WATER USE	
10-Year Average /a/	154
5-Year Average /b/	152
2020 TARGET USING METHOD 3 /c/	
95% of Hydrologic Region Target (149 gpcd)	142
95% of Base Daily Capita Water Use 5-Year Average (152 gpcd)	144
Actual 2020 Target	142
2015 Interim Target	**148**
2015 Actual Use	**114**

/a/ Ten-year average based on fiscal year 1995/96 to 2004/05.
/b/ Five-year average based on fiscal year 2003/04 to 2007/08.
/c/ Methodology requires smaller of two results to be actual water use target to satisfy minimum water use target.
SOURCE: Los Angeles Department of Water and Power, *2015 Urban Water Management Plan, Executive Summary, Exhibit ES-L*, page ES-15.

Water Supply Assessments (WSA). In 2001, the California State Legislature approved SB 610, which amended Public Resources Code Section 21151.9 and Water Code Sections 10910 *et seq.* requiring the preparation of a "water supply assessment" for large developments. A WSA would be required under the following circumstances:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space;
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A proposed hotel or motel, or both, having more than 500 rooms;
- A mixed-use project that includes one or more of the projects specified in this subdivision; and/or
- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project.

These assessments, prepared by "public water systems" responsible for service, address whether adequate existing or projected water supplies are available to serve future development occurring under Proposed Project. State regulations do not specifically require the preparation of a WSA for a general plan. Section 10910(c)(2) states that if the projected water demand associated with a proposed plan was accounted for in the most recently adopted UWMP, the public water system may incorporate the requested information from the UWMP into the analysis.

Water Conservation in Landscaping Act. In 2006, this Act was enacted by the California Legislature to resolve outdoor water waste through improvements in irrigation efficiency and selection of plants requiring less water. This Act required an update to the existing local Model Water Efficiency Landscape Ordinance.

2010 California Green Building Standard Code. The California Green Building Standards Code is Part 11 of twelve parts of the official compilation and publication of the adoption, amendment and repeal of building regulations to the CCR Title 24, also referred to as the California Building Standards Code. The purpose of this code is to improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices. The provisions of this code shall apply to the planning, design, operation, construction, use and occupancy of every newly constructed building or structure, unless otherwise indicated in this code, throughout the State of California.

LOCAL

City of Los Angeles General Plan (Framework). The Framework was adopted in 1996 and amended in August 2001. The Framework is a general, long-term, programmatic document that has goals and policies that are implemented by the various individual elements of the City of Los Angeles General Plan. The goals, objectives, and policies of the Framework that are related to water supply, storage, and delivery infrastructure are listed in **Table 4.13-2**.

TABLE 4.13-2: RELEVANT GENERAL PLAN WATER SUPPLY GOALS, OBJECTIVES, AND POLICIES

Goal/Objective/Policy	Goal/Objective/Policy Descriptions
Goal 9C	Adequate water supply, storage facilities, and delivery system to serve the needs of existing and future residents and businesses.
Objective 9.8	Monitor and forecast water demand based upon actual and predicted growth.
Policy 9.8.1	Monitor water usage and population and job forecast to project future water needs.
Objective 9.9	Manage and expand the City's water resources, storage facilities, and water lines to accommodate projected population increases and new or expanded industries and businesses.
Policy 9.9.1	Pursue all economically efficient water conservation measures at the local and statewide level.
Policy 9.9.2	Develop reliable and cost-effective sources of alternative water supplies, including water reclamation and exchanges and transfers.
Policy 9.9.3	Protect existing water supplies from contamination, and clean up groundwater supplies so those resources can be more fully utilized.
Policy 9.9.4	Work to improve water quality and reliability of supply from the State Water Project and other sources.
Policy 9.9.5	Maintain existing rights to groundwater and ensure continued groundwater pumping availability.
Policy 9.9.6	Identify the needs for land and facilities necessary to provide an adequate and reliable water supply and develop those facilities in an environmentally and socially sensitive way.
Policy 9.9.7	Incorporate water conservation practices in the design of new projects so as not to impede the City's ability to supply water to its other users or overdraft its groundwater basins.
Policy 9.9.9	Clean or replace where necessary, deficient water distribution lines in the City.
Objective 9.10	Ensure that water supply, storage, and delivery systems are adequate to support planned development.
Policy 9.10.1	Evaluate the water system's capability to meet water demand resulting from the Framework Element's land use patterns.
Policy 9.10.2	Solicit public involvement, when appropriate, in evaluating options for the construction of new and/or expansion of existing water facilities.
Objective 9.11	Ensure, to the extent possible, the continued provision of water capacity, quality and delivery after an earthquake or other emergency.
Policy 9.11.1	Provide for the prompt resumption of water service with adequate quantity and quality of water after an emergency.

SOURCE: City of Los Angeles, *The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan*, re-adopted 2001.

Emergency Water Conservation Plan (EWCP). The EWCP is found in Los Angeles Municipal Code (LAMC) Chapter XII, Article I. The purpose of the EWCP is to provide a mandatory water conservation plan to minimize the effect of a water shortage to City water users. The provisions outlined within the EWCP are intended to significantly reduce the consumption of water over an extended period of time, thereby extending the available water required for the City water users while reducing the hardship of the City and the general public to the greatest extent possible. The EWCP contains five water conservation phases, which correspond with the severity of water shortage. Each increase in phase corresponds with more stringent water conservation measures.[2] Phase I of the EWCP requires a number of water-saving measures, including prohibiting hose watering of driveways and associated walkways; requiring decorative fountains to use recycled water, and repairing water leaks in a timely manner. The City imposes additional mandatory

[2]City of Los Angeles Department of Water and Power, *Fact Sheet: Revised Water Conservation Ordinance*, 2010.

water use restrictions as a result of drought conditions. As of April 2016, Mayor Eric Garcetti approved an amendment to the EWCP that would increase fines for water wasters during periods of severe drought and will encourage conservation by the City's largest residential users.[3]

Model Water Efficient Landscape Ordinance. In 2009, the City adopted the Model Water Efficient Landscape Ordinance in compliance with the State Water Conservation in Landscaping Act. This Ordinance requires development of water budgets for landscaping, reduction of erosion and irrigation related runoff, utilization of recycled water if available, irrigation audits, development of requirements for landscape and irrigation design, and scheduling of irrigation based on localized climate for new construction and redevelopment projects. The City requires automatic sprinkler systems to be installed to irrigate landscaping during morning hours or during the evening to reduce water losses from evaporation. Sprinklers are required to water less often in cooler months and during the rainfall season, so that water is not wasted in excessive landscape irrigation.

Landscape Ordinance No. 170,978. In 1996, the City's Landscape Ordinance became effective with an overarching goal to improve the efficient use of outdoor water. This Ordinance was amended in 2009 to comply with the Water Conservation in Landscaping Act of 2006 and the Model Water Efficient Landscape Ordinance.

Water Efficiency Requirements Ordinance. In 2009, the City further increased its water efficiency mandates with the adoption of the Water Efficiency Requirements Ordinance. This Ordinance establishes water efficiency requirements for new developments and renovations of existing buildings by requiring installation of high efficiency plumbing fixtures in all residential and commercial buildings.

Retrofit on Resale Ordinance. In 1988, the City adopted a plumbing retrofit ordinance to mandate the installation of conservation devices in all properties and to require water-efficient landscaping in all new construction. This Ordinance requires the installation of ultra-low-flush toilets and water saving showerheads in single- and multi-family residences prior to resale. LADWP has explored the expansion of the City's Retrofit on Resale Ordinance to include non-residential properties.

Ordinance No. 165,004. Adopted in 1989, this Ordinance effectively reduces Citywide water consumption by requiring new buildings to install water conservation fixtures, such as ultra-low-flush toilets, urinals, taps, and showerheads, and plumbing fixtures which reduce water loss from leakage in order to obtain building permits in the City of Los Angeles. In addition, there are provisions requiring xeriscaping – the use of low-maintenance, drought-resistant plants.

Ordinance No. 166,080. Adopted in 1991, this Ordinance prohibits the use of hoses to wash sidewalks, walkways, driveways, or paved parking areas.

Low Impact Development (LID) Ordinance. On January 15, 2010, the City of Los Angeles approved the LID Ordinance requiring a variety of best management practices (BMPs) to manage stormwater and urban runoff and reduce runoff pollution. The LID Ordinance builds on the City's Standard Urban Stormwater Mitigation Plan process incorporating environmental practices including infiltration, capture and use, groundwater recharge, and biofiltration.

[3] Los Angeles Department of Water and Power, *LADWP Newsroom Mayor Garcetti Signs New Water Saving Measures*, April 27, 2016, http://www.ladwpnews.com/go/doc/1475/2814194/Mayor-Garcetti-Signs-New-Water-Saving-Measures, accessed March 7, 2017.

2014 Los Angeles Amendment Green Building Code, No. 182849. The purpose of the Green Building Program is to reduce the use of natural resources, create healthier living environments and minimize the negative impacts of development on local, regional, and global ecosystems. The program consists of a Standard of Sustainability and Standard of Sustainable Excellence. The program addresses five key areas: (1) Site: location, site planning, landscaping, storm water management, construction and demolition recycling; (2) Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation; (3) Energy & Atmosphere: energy efficiency, and clean/renewable energy; (4) Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and (5) Indoor Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control. As of April 2016, Mayor Eric Garcetti approved an amendment to the Green Building Code will require that water conservation measures be incorporated into the construction and design of new buildings, additions, and alterations valued at over $200,000.[4]

Los Angeles Department of Water and Power (LADWP) Policies. The City requires that each applicant coordinate with the LADWP in order to ensure that existing and/or planned water conveyance facilities are capable of meeting water demand/pressure requirements. In coordination with the LADWP, each applicant/contractor shall identify specific on- and off-site improvements needed to ensure that impacts related to water supply and conveyance demand/pressure requirements are addressed at the time that a water connection permit application is submitted. Water supply and conveyance demand/pressure clearance from LADWP shall be required during this time as well.

Los Angeles Fire Department (LAFD) and Building and Safety Department Policies. The City requires each applicant to coordinate with the LAFD and Building and Safety Department in order to ensure that existing and/or planned fire hydrants are capable of meeting fire flow demand/pressure requirements. The issuance of building permits shall be dependent upon submission, review, approval, and testing of fire flow demand and pressure requirements, as established by the LAFD and Building and Safety Department prior to occupancy. In addition, prior to issuance of building permits, applicants are required to pay any appropriate fees imposed by the Building and Safety Department. A percentage of building permit fees is contributed to the fire hydrant fund, which provides for Citywide fire protection improvements.

Los Angeles Department of Water and Power (LADWP) 2015 Urban Water Management Plan (UWMP). The 2015 UWMP, the water supply planning document for the City prepared by LADWP, presents the basic policy principles that guide LADWP's decision-making process to secure a sustainable water supply for Los Angeles. The 2015 UWMP forecasts future water demands and water supplies under average and dry year conditions; identifies future water supply projects such as recycled water; provides a summary of water conservation BMPs; and provides a single and multi-dry year management strategy. The 2015 UWMP serves as a master plan for water supply and resources management consistent with the City's goals and policy objectives; and (2) provides full compliance with the requirements of the Urban Water Management Planning Act. Faced with increasing demands for additional water supplies and drought conditions, several sustainability initiatives continue to be implemented to decrease water use by up to 25 percent per capita over the next 20 years, reduce dependence on imported water supplies, and accelerate the development of local supplies.[5]

[4]Los Angeles Department of Water and Power, *LADWP Newsroom Mayor Garcetti Signs New Water Saving Measures*, April 27, 2016, http://www.ladwpnews.com/go/doc/1475/2814194/Mayor-Garcetti-Signs-New-Water-Saving-Measures, accessed March 7, 2017.

[5]Los Angeles Department of Water and Power, *2015 Urban Water Management Plan*, 2015, adopted April 2016.

EXISTING SETTING

WATER SUPPLY

LADWP manages the water supply for the City of Los Angeles. The LADWP provides about 168 billion gallons of water to 3.9 million residents and businesses and 675,000 customers each year. Primary sources of water for the LADWP service area include the Los Angeles Aqueduct (LAA) (29 percent of the City's water supply), local groundwater (12 percent of the City's water supply), State Water Project (SWP), and the Colorado River Aqueduct (supplied by Metropolitan Water District of Southern California (MWD) and makes up 57 percent of the City's water supply), and recycled water (2 percent of the City's water supply). Recycled water is beginning to become a larger part of the overall supply portfolio. Water supplies from the LAA, SWP, and Colorado River Aqueduct are considered imported sources because they are obtained outside of LADWP's service area. **Table 4.13-3** shows the LADWP water supplies.[6] In 2015, LADWP supplied approximately 513,540 acre-feet (af) of water to the City.[7]

TABLE 4.13-3: LADWP WATER SUPPLY SERVING THE CITY OF LOS ANGELES (IN ACRE FEET)

Fiscal Year	LAA	Local Groundwater	MWD	Recycled Water	Transfer, Spread, Sills, and Storage /a/	Total
2003	251,340	56,341	317,015	1,759	2,528	653,928
2004	203,190	75,696	391,678	1,774	-2,958	675,296
2005	376,394	57,623	184,605	1,401	3,140	616,883
2006	380,235	67,299	188,598	3,893	-1,336	641,361
2007	127,392	88,041	435,278	3,595	1,044	653,261
2008	148,407	64,604	429,170	7,048	1,664	647,565
2009	137,261	66,998	350,918	7,570	3,052	559,695
2010	199,739	76,982	260,774	6,703	-58	544,256
2011	307,692	49,354	166,452	7,894	-1,082	532,473
2012	266,634	61,060	210,437	6,850	751	544,230
2013	113,411	58,811	388,460	7,513	-1,743	569,938
2014	61,024	79,403	441,986	10,054	871	591,594
2015	53,546	87,046	362,606	10,437	96	513,540

/a/ A negative number does not represent a loss. Rather, the negative number indicates the amount of water that has been taken or stored into the reservoir system. A positive number indicates spills from the reservoir system. For example, in 2003, approximately 2,528 acre-feet of water were spilled from the reservoir system, while in 2004, approximately -2,958 acre-feet of water were taken or stored into the reservoir system.

SOURCE: Los Angeles Department of Water and Power, *2010 Urban Water Management Plan, 2011 (for years 2003 through 2009); 2015 Urban Water Management Plan, Exhibit 12P: LADWP Water System Energy Intensity for FYs 2010-2015, 2016.*

Local Groundwater. The LADWP traditionally extracts groundwater from nine well fields on City-owned property in Owens Valley, and three local groundwater basins: San Fernando, Sylmar, and Central. Groundwater pumped from Owens Valley is used in Owens Valley and in the City. **Table 4.13-4** lists the quantities of water that LADWP extracted from the Owens Valley, San Fernando, Sylmar, and Central groundwater basins. A remediation of an environmental condition occurred in the Owens Valley River and Mono Lake as a result of water diversion for the LAA, in which 182,000 acre feet (af) was used to raise the lake water level and mitigate dust issues. The water supply was reduced from 2003 to 2015 for

[6]Los Angeles Department of Water and Power, *LADWP Newsroom Mayor Garcetti Signs New Water Saving Measures*, April 27, 2016, http://www.ladwpnews.com/go/doc/1475/2814194/Mayor-Garcetti-Signs-New-Water-Saving-Measures, accessed March 7, 2017.

[7]An acre-foot of water is equivalent to 325,851 gallons of water.

environmental mitigation for the court ordered program.[8] A detailed discussion of these groundwater basins is found in Section 4.7, Hydrology and Water Quality, of this Draft EIR.

As detailed in **Table 4.13-4**, over the course of the 2014-2015 water year, LADWP pumped 87,097 af of water from the San Fernando Groundwater Basin, 16,546 af of water from the Central Basin, 3,570 af of water from the Sylmar Groundwater Basin, 1,503 af of water from the West Coast Basin and 500 af of water from the Eagle Rock Groundwater Basin. In accordance with the City's long range water management plan, LADWP plans to continue production from its groundwater basins in the coming years to offset reductions in imported supplies. However, extraction from groundwater basins is limited by the water quality and overdraft protection. Both the LADWP and the California Department of Water Resources have programs in place to monitor wells to prevent overdraft. LADWP's groundwater pumping practice is based on a "safe-yield" operation. The objective of which is to extract an amount of groundwater equal to the native and imported water that recharges the groundwater basins.

TABLE 4.13-4: LADWP GROUNDWATER EXTRACTIONS (IN ACRE FEET)

Water Year (October-September)	Groundwater Basin				Total
	Owens Valley	San Fernando	Sylmar	Central	
2004-2005	85,820	49,085	1,110	13,401	149,416
2005-2006	57,412	38,042	2,175	13,725	111,354

SOURCE: Los Angeles Department of Water and Power, *2010 Urban Water Management Plan,* 2011; *2015 Urban Water Management Plan*, 2016.

Los Angeles Aqueduct (LAA). Snowmelt runoff from the Eastern Sierra Nevada Mountains and groundwater from the Owens Valley Groundwater Basin are collected and conveyed to the City via the LAA. LAA supplies can fluctuate yearly due to varying hydrologic conditions. In recent years, the LAA supplies have been less than the historical average because of LADWP's obligations to perform environmental restoration in Mono and Inyo Counties. The Runoff Forecast Model and the Los Angeles Aqueduct Simulation Model (LAASM) was used jointly to predict water available from the LAA. Average long-term LAA delivery over the next 25 years is expected to be 278,000 acre-feet per year (afy) with a decline to 267,000 due to climate change impacts. However, by 2024, with the completion of the Master Project, LAA delivery will increase to 286,000 due to conserved water at Owens Lake.[9]

Metropolitan Water District of Southern California (MWD). The MWD is a consortium of 26 member agencies, which includes LADWP. The MWD service area encompasses the service areas of its 26 member agencies, approximately 5,200 square miles, and includes portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties. LADWP purchases water from MWD to supplement its water

[8]An acre-foot of water is equivalent to 325,851 gallons of water.
[9]Los Angeles Department of Water and Power, *2015 Urban Water Management Plan*, adopted April 2016.

supplies from the LAA and local groundwater basins. MWD is the largest water wholesaler for domestic and municipal uses in Southern California. MWD imports its water supplies from Northern California through the SWP via the California Aqueduct, and the Colorado River through the MWD-owned Colorado River Aqueduct. Per MWD Act Section 135, each of MWD's 26 member agencies has a preferential right to purchase water from the MWD.[10] Between 2010/2011 to 2014/2015, the City purchased a five-year average of 57 percent of its water from MWD.

Due to effects from dry weather conditions and environmental restrictions on water pumping operations within San Francisco Bay/Sacramento-San Joaquin River Delta (Delta), the MWD service area may not meet the future water demand of its member agencies. To address the possibility that MWD water supplies may not meet member water demand, the MWD and its 26 member agencies have prepared a Water Supply Allocation Plan (WSAP). If the MWD cannot meet member water demand for any given year, it uses a formula within the WSAP to allocate water to member agencies in a fair and efficient manner.

MWD has undertaken efforts to provide additional supply reliability for the entire southern California region. MWD has worked closely with LADWP to ensure the implementation of water resource development plans. To meet member agencies' growing supply and reliability needs, MWD is planning improvements to the WSAP. To date, the MWD Board of Directors voted to not implement a WSAP for 2016/2017 as water supply conditions have improved and storage levels in SWP reservoirs have increased.[11]

Recycled Water. Recycled water is produced by the Hyperion Treatment Plant (HTP), Terminal Island Water Reclamation Plant (TIWRP), Donald C. Tillman Water Reclamation Plant (DCTWRP), and the Los Angeles-Glendale Water Reclamation Plant (LAGWRP). Currently, recycled water is provided for landscape irrigation and commercial uses. **Table 4.13-5** provides details on these treatment plants services, capacity, and average daily flows. There is no recycled water infrastructure within the Project Area.

TABLE 4.13-5: WASTEWATER TREATMENT PLANTS SUMMARY

Wastewater Treatment Plants	Treatment Level	Capacity (mgd)	Average Flows (mgd)
Donald C. Tillman	Tertiary to Title 22 Standards with Nitrification/Dentrification	80	34
Los Angeles-Glendale	Tertiary to Title 22 Standards with Nitrification/Dentrification	20	14
Terminal Island	Tertiary; Advanced treatment (MF/RO) of 5 mgd	30	16
Hyperion	Full secondary	450	263

Note: mgd = million gallons per day
SOURCE: Los Angeles Department of Water and Power, *2015 Urban Water Management Plan; Exhibit 4C: Sources of Recycled Water Summary*, 2016.

WATER CONSERVATION

Los Angeles consistently ranks among the lowest in per person water consumption when compared to California's largest cities.[12] This is accomplished through water metering, water rationing, public awareness and incentives, industrial process water use efficiency, and other policies, programs and ordinances. As a result of water conservation measures, the City has reduced its water usage by 31 percent during Fiscal Year (FY) 2014/2015 compared to FY 2006/2007.[13] Furthermore, state legislation, which postdates several City water conservation ordinances, has only strengthened the City's commitment to water conservation and provides added assurance that the City will continue its leadership role in managing demand for water in the near and distant future.

[10]The MWD Act was passed in 1928 to form the MWD and governs how the MWD operates within the state.
[11]Metropolitan Water District of Southern California, *5/10/2016 Board Meeting, Board of Directors Water Planning and Stewardship Committee*, March 10, 2016.
[12]Los Angeles Department of Water and Power, *2015 Urban Water Management Plan, Chapter Three: Water Conservation*, adopted April 2016.
[13]*Ibid*.

WATER SUPPLY TREATMENT PROCESS

LADWP supplies water that meets or exceeds all health-related State and federal standards.[14] LADWP accomplishes such standards by: (1) filtration of the LAA supply; (2) security measures safeguarding access to water supply and storage areas; (3) control of algae growth in groundwater and reservoirs; (4) continuous disinfection of water entering mains; and (5) regular water quality testing, inspection, and cross-control prevention.

All water coming from the LAA, the California Aqueduct, and the Colorado River Aqueduct is filtered and treated at the LAA Filtration Plant to ensure a safe drinking water supply. Once at the filtration plant, all water travels through screens that remove environmental debris such as twigs and dead leaves. Bacteria and other impurities that can affect taste, odor, and color are eliminated by ozone injections, a super-charged oxygen molecule with powerful disinfecting properties. Treatment chemicals are then quickly dispersed into the water to make fine particles called "floc", which are subsequently removed via a 6-foot-deep coal filter. The final step is the addition of chlorine and fluoride, which ensure lasting disinfection and strengthen tooth enamel. The LAA Filtration Plant has a water treatment capacity of up to 600 million gallons per day (mgd). In the mid-2000's, LADWP began a comprehensive modernization of the filtration plant to upgrade and replace equipment. The upgrade program is on-going process and will continue to deliver dependable supply of safe, quality water to its customers in an efficient and responsible manner. Furthermore, LADWP continues to invest in improving drinking water quality through its Capital Improvement Program, in which water quality capital expenditures are approximately $1.4 billion, and 40 percent of the total capital budget.[15]

The City's groundwater supply in the San Fernando and Central Basins is generally clean. LADWP pumps from the clean parts of the basins and disinfects this groundwater with chlorine as a safeguard against microorganisms. Additionally, LADWP continuously monitors and ensures that all water meets water quality standards and results are far below the maximum contaminant levels permitted by federal or state regulations.

Existing Water Demand. The estimated water usage of existing uses within the entire Project Area is shown in **Table 4.13-6**. Each type of use demands water at a different rate. For example, single-family dwelling units demand approximately 180-230 gallons per day (gpd), whereas multi-family dwelling units demand approximately 80-200 gpd (depending on number of bedrooms). The total water usage within the Project Area is estimated to be approximately 10 million gpd or 11,226 afy.[16] Water usage within the Project Area represents approximately 2 percent of water supplied by LADWP to the City in 2012 (552,660 afy).

TABLE 4.13-6: ESTIMATED EXISTING WATER USAGE WITHIN THE PROJECT AREA

	Water Usage (gpd)	Water Usage (afy)
Change Areas /a/	**1,313,968**	**1,472**
Non-Change Areas /b/	**8,710,645**	**9,754**
Single Family Residential	987,690	1,106
Multi-Family Residential	2,852,307	3,194
Non-Residential	654,361	733
Landscaping /c/	2,482,451	2,780
Cooling Tower /d/	1,733,836	1,942
Total Existing Water Usage of the Entire Project Area	**10,024,613**	**11,226**

/a/ Water usage for the change areas is based on the estimates in the WSA prepared by LADWP for the change areas, and incorporates residential use, non-residential use, landscaping, and cooling towers.
/b/ Water usage for the non-change areas is based on factors identified in the WSA and weighted to establish the usage presented above.
/c/Quantity of landscaping for the non-change areas was derived using parcel data for the non-change areas.
/d/Water usage for cooling towers is based on factors identified in the WSA prepared by LADWP for the change areas and excludes single-family residential units (see **Appendix J**).

[16]One acre-foot is equivalent to 325,851 gallons; therefore, the annual usage in acre-feet (afy) was derived by multiplying the daily usage by 365 days and dividing by 325,851 gallons.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to water demand and/or conveyance infrastructure if it would:

- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects; and/or
- Have insufficient water supplies available to serve the project from existing entitlements and resources, or result in new or expanded entitlements needed.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the (2006) Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors:

- The total estimated water demand for the project as compared to existing water demand;
- Whether sufficient capacity exists in the water infrastructure that would serve the project, taking into account the anticipated conditions at project buildout; and
- The degree to which scheduled water infrastructure improvements or project design features would reduce or offset service impacts.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance for impacts on water supply. This guidance is generally based on Appendix G of the CEQA Guidelines, and provides specific criteria to be considered when making a significance determination. For this analysis, Appendix G criteria are used, supplemented by the thresholds identified in the City's Thresholds Guide, where appropriate.

In order to evaluate the effects of the Proposed Project on water supplies, it is necessary to evaluate the expected demand for water supplies as a result of the reasonably foreseeable implementation of the Proposed Project and the Proposed Project with Alternative Compliance scenario. The primary factors affecting demand for water supplies are: total population, housing unit growth, total employment, and landscaping. By considering these factors, water demand forecasts were made by land use water usage factors and a corresponding unit base (i.e., total number of units for residential uses, and total square footage for non-residential uses and landscaping).[17] **Tables 4.13-7** and **4.13-8** show the estimated water usage for the entire ECTNP Area, in both the change and non-change areas, with the Proposed Project and the Proposed Project with the Alternative Compliance scenario.

A WSA was prepared for the Proposed Project and approved on February 6, 2014.[18] The requirements for a WSA include the identification of existing water supply entitlements, water rights, or water service contracts held by LADWP's public water system, and prior years' water deliveries received by LADWP's public water system. LADWP determined that the future development in the change areas with the Proposed Project would result in a maximum increase in water demand of 2,793 acre-feet per year over existing conditions, as shown in **Table 4.13-7**, and that this additional demand can be met.

Cooling Tower /e/	3,359,620	3,762
Estimated Total Water Usage of the Non-Change Areas	**9,961,966**	**11,156**
Less Existing Water Usage of the Non-Change Areas	*8,710,645*	*9,754*
Net Water Usage of the Non-Change Areas	**1,251,321**	**1,401**
Total Net Water Usage of the Entire Project Area	**3,543,989**	**3,972**

/a/ Water usage for the change areas is based on the estimates in the WSA prepared by LADWP for the change areas, and assumes conservation measures are implemented for new development.
/b/ Estimated future water usage in the change areas represents the sum of the existing water usage and the net water usage, both of which are identified in the WSA.
/c/ Water usage for the non-change areas is based on factors identified in the WSA and weighted to establish the usage presented above.
/d/ Quantity of landscaping for the non-change areas were derived using parcel data for the non-change areas (see **Appendix J**).
/e/ Water usage for cooling towers is based on factors identified in the WSA prepared by LADWP for the change areas and excludes single-family residential units (see **Appendix J**).
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

This estimate assumes the implementation of conservation measures, which would be required of all new development in the change areas. Since the preparation of the WSA, minor refinements to the ECTNP have been made that resulted in slight changes to the land use assumptions[19]; however, these refinements are not anticipated to measurably affect the results of the WSA. For planning purposes, the increase in water usage identified in the WSA is considered the reasonably anticipated increase in water demand for the change areas. Outside the change areas water demand would continue to increase as anticipated in the UWMP.

IMPACTS

IMPACT 4.13-1 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT CAUSE THE CONSTRUCTION OF NEW WATER TREATMENT FACILITIES OR EXPANSION OF EXISTING TREATMENT FACILITIES, THE CONSTRUCTION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS? COMPLIANCE WITH EXISTING WATER CONSERVATION REGULATIONS WOULD ENSURE THAT THIS IMPACT REMAINS LESS THAN SIGNIFICANT.

CHANGE AREAS

Implementation of the Proposed Project would increase the amount of water supplied by LADWP to the change areas. As shown in **Table 4.13-7**, the Proposed Project would increase water demand *in the change areas* by approximately 2.5 mgd or approximately 2,793 afy over existing uses, as estimated in the WSA.

Water conservation measures would apply to new development, but existing uses are also increasingly implementing water conservation measures (in response to increased regulations, community pressure and pricing controls). Any water usage increases resulting from the Proposed Project are anticipated to occur incrementally through the year 2035.

As described below in Impact 4.13-3, sufficient water supply exists to accommodate the full implementation of the Proposed Project (with all reasonably foreseeable development constructed and occupied). As such, it is not anticipated that the Proposed Project would require additional water treatment facilities. Therefore, the Proposed Project would result in a less than significant impact related to water treatment infrastructure.

ALTERNATIVE COMPLIANCE SCENARIO

Table 4.13-8 shows that the Alternative Compliance scenario would increase water demand *in the change areas* by approximately 2.3 mgd or approximately 2,570 afy over existing uses, as estimated in the WSA. As described below in Impact 4.13-3, sufficient water supply exists to accommodate full implementation of the Proposed Project under the Alternative Compliance scenario. As such, it is not anticipated that the Proposed Project would require additional water treatment facilities. Therefore, the Proposed Project under the Alternative Compliance scenario would not result in a potentially significant impact related to water treatment infrastructure.

NON-CHANGE AREAS

Tables 4.13-7 and **4.13-8** show the estimated future water demand in the non-change areas. This demand would occur regardless of the Proposed Project, as no changes in zoning or land use designation are proposed in these areas, and thus has already been accounted for in the City's UWMP. In addition, water demand in these areas may not be as high as estimated, as water conservation in both existing and new development is anticipated to increase in the future in response to new regulations, community pressure, and pricing controls. Therefore, impacts to water treatment facilities resulting from any development in the non-change areas that is consistent with the current plan would be less than significant.

[19]Compared to the land use assumptions used in the WSA, the revised land use assumptions had an increase of 113 dwelling units and a decrease of 107,537 square feet of non-residential use.

MITIGATION MEASURES

Impacts related to the construction of new water treatment facilities would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the construction of new water treatment facilities were determined to be less than significant without mitigation.

IMPACT 4.13-2 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN THE CONSTRUCTION OF NEW WATER LINES? COMPLIANCE WITH EXISTING CITY OF LOS ANGELES POLICIES WOULD ENSURE THAT THIS IMPACT WOULD REMAIN LESS THAN SIGNIFICANT.

CHANGE AREAS

Implementation of the Proposed Project would increase the amount of water supplied by LADWP to the change areas. As shown in **Table 4.13-7**, the Proposed Project would increase water demand *in the change areas* by approximately 2.5 mgd or approximately 2,793 afy over existing uses, as estimated in the WSA. Local water delivery lines may need to be augmented in certain locations within the change areas depending on specific uses, locations, and the capacity and conditions of the existing infrastructure. Consequently, this impact is found to be potentially significant due to the likelihood of construction of new water lines in the change areas. However, each applicant would be required to coordinate with LADWP in order to ensure that existing and/or planned water conveyance facilities are capable of meeting water demand/pressure requirements. In coordination with the LADWP, each Applicant/Contractor would be required to identify specific on- and off-site improvements needed to ensure that impacts related to water conveyance and demand/pressure requirements are addressed prior to issuance of a certificate of occupancy. Therefore, the Proposed Project would result in a less than significant impact related to water conveyance.

ALTERNATIVE COMPLIANCE SCENARIO

Table 4.13-8 shows that the Alternative Compliance scenario would increase water demand *in the change areas* by approximately 2.3 mgd or approximately 2,570 afy over existing uses, as estimated in the WSA. Similar to the Proposed Project, under the Alternative Compliance scenario, local water delivery lines may need to be augmented in certain locations within the change areas depending on specific uses, locations, and the capacity and conditions of the existing infrastructure. Therefore, this impact is found to be potentially significant due to the likelihood of construction of new water lines in the change areas. However, each applicant would be required to coordinate with LADWP in order to ensure that existing and/or planned water conveyance facilities are capable of meeting water demand/pressure requirements. In coordination with the LADWP, each Applicant/Contractor would be required to identify specific on- and off-site improvements needed to ensure that impacts related to water conveyance and demand/pressure requirements are addressed prior to issuance of a certificate of occupancy. Therefore, the Project under the Alternative Compliance scenario would result in a less than significant impact related to water conveyance.

NON-CHANGE AREAS

Tables 4.13-7 and **4.13-8** show the water demand in the non-change areas. This demand would occur regardless of the Proposed Project as no changes in zoning or land use designation are proposed in these areas. Similar to development in the change areas, each applicant for projects in the non-change areas will be required to coordinate with LADWP in order to ensure that existing and/or planned water conveyance facilities are capable of meeting water demand/pressure requirements. In coordination with the LADWP, each Applicant/Contractor would be required to identify specific on- and off-site improvements needed to ensure that impacts related to water conveyance and demand/pressure requirements are addressed prior to

issuance of a certificate of occupancy. Therefore, the projects in the non-change areas would result in a less than significant impact related to water conveyance.

MITIGATION MEASURES

Impacts related to the construction of new water conveyance systems would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the construction of new water conveyance systems were determined to be less than significant without mitigation.

IMPACT 4.13-3 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN LADWP MAKING A DETERMINATION THAT THEY HAVE INSUFFICIENT WATER SUPPLIES AVAILABLE TO SERVE THE PROPOSED PROJECT FROM EXISTING ENTITLEMENTS AND RESOURCES, OR WOULD THE PROPOSED PROJECT RESULT IN LADWP NEEDING NEW OR EXPANDED ENTITLEMENTS? THIS IMPACT IS LESS THAN SIGNIFICANT.

Construction

Implementation of the proposed plan would not occur immediately, but instead would occur over time. Temporary increases in water use associated with construction activities (such as dust suppression) would occur. Such use would not be substantial in relation to overall water use in the area. In addition, the increase in water use associated with construction activities in the Project Area relative to the operation of the individual project would be temporary and nominal. Therefore, construction activities associated with the Proposed Project would have a less-than-significant impact on water supply.

Operation

The Proposed Project (which, as illustrated above, generates greater water demand than the Alternative Compliance scenario) could potentially allow for an approximately 18 percent increase in the population, 18 percent increase in the number of housing units, and a 42 percent increase in the number of jobs in the Project Area by year 2035 when compared to existing 2013 conditions. The Proposed Project's expected population, housing, and employment growth would be 1.95 percent, 1.73 percent, and 6.7 percent, respectively, of SCAG's projected growth for the City as a whole by the year 2035.[20]

CHANGE AREAS

Table 4.13-7 details the estimated water use within the Project Area when built out to reasonably expected levels under the Proposed Project. Implementation of the Proposed Project in the change areas in year 2035 would result in an increase of water usage of approximately 2.5 mgd or approximately 2,793 afy over existing conditions. This increase in demand for water would occur incrementally over the lifespan of the Proposed Project. The LADWP forecasts that Citywide water demand with passive water conservation efforts would be 710,760 af in 2035.[21] Based on the estimated amount of water demanded by the Proposed Project in the

[20]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. Please see **Appendix K** for a more detailed discussion.

[21]LADWP, *2010 Urban Water Management Plan, Exhibit 2J (Water Demand Forecast and Conservation Savings Under Average Weather Fiscal Year Ending June 30 [Acres Feet])*, January 2011.

change areas (2,793 afy), the Proposed Project would represent less than one percent (0.40 percent) of Citywide water demand in 2035.

Given the long lifespan of the Proposed Project, it is important to consider the City's commitment to water conservation in conjunction with supply and demand forecasts to fully evaluate the impacts of the Proposed Project on water supply resources. Water use in FY 2009/2010 was nearly 20 percent lower than water use in FY 2006/2007 with single-family residential water use 25 percent lower, multi-family water use 11 percent lower, commercial water use 15 percent lower and governmental water use 33 percent lower.[22] State legislation, which postdates several City water conservation ordinances, has only strengthened the City's commitment to water conservation and provides added assurance that the City will continue its leadership role in managing demand for water in the near and distant future. **Table 4.13-9** details LADWP's projected future water conservation savings by major customer classification through 2035. Total anticipated water savings from conservation is projected to be 64,367 af in FY 2034/2035, which is 20.9 billion gallons of water.

TABLE 4.13-9: ACTIVE CONSERVATION PROJECTIONS BY SECTOR

	Acre-feet per Fiscal Year				
Sector	**2014/2015**	**2019/2020**	**2024/2025**	**2029/2030**	**2034/2035**
Single-Family Residential	3,416	5,882	8,349	10,815	12,249
Multi-Family Residential	871	1,504	2,137	2,770	3,150
Commercial/Government	7,969	16,000	24,030	32,061	39,629
Industrial	1,924	3,847	5,824	7,774	9,339
Total Active Conservation Projections	**14,180**	**27,233**	**40,340**	**53,420**	**64,367**

SOURCE: Los Angeles Department of Water and Power, *2010 Urban Water Management Plan*, Chapter 3: Water Conservation, Exhibit 3I, page 76.

The City of Los Angeles' policy is that future water needs shall be met by expanding water recycling and conservation. The Proposed Project would require implementation of the following water conservation measures for all new development within the change areas in the ECTNP:

- Installation of high-efficiency toilets with flush volume of 1.0 gallons of water per flush
- Indoor faucet (other than City Ordinance No. 181480 requirements) flow rate of 1.5 gallons per minute or less
- Waterless urinals
- No more than one showerhead per stall
- Public restroom faucet flow rate of 0.5 gallons per minute or less
- Showerhead flow rate of 2.0 gallons per minute or less
- High efficiency clothes washers (commercial/residential)
- Individual metering and billing for water use
- Domestic water heating system located in close proximity to point(s) of use, as feasible; use of tankless and on-demand water heaters as feasible
- Cooling tower conductivity controllers or cooling tower pH conductivity controllers
- Water-saving pool filter system
- Leak detection system for swimming pools and jacuzzis
- Use of recycled water (if available) for appropriate end uses (irrigation, cooling towers, sanitary)
- Single pass cooling shall be prohibited (e.g., any vacuum pumps or ice machines)
- Drought tolerant plants to comprise 100 percent of total landscaping in the public-right-of-way and 70 percent of landscaping on private property
- Rainwater harvesting

[22]LADWP, *2010 Urban Water Management Plan, Exhibit 2J (Water Demand Forecast and Conservation Savings Under Average Weather Fiscal Year Ending June 30 [Acres Feet])*, January 2011.

- Irrigation shall include:
  - Weather-based irrigation controller with rain shutoff
  - Rotating sprinkler nozzles with a flow rate of 0.5 gallons per minute or less
  - Flow sensor and master valve shutoff (for large landscaped areas)
  - Matched precipitation (flow) rates for sprinkler heads
  - Drip/microspray/subsurface irrigation where appropriate
  - Minimum irrigation system distribution uniformity of 75 percent
  - Proper hydro-zoning, turf minimization and use of native/drought tolerant plant materials
  - Water conserving turf
  - Use of landscape contouring to minimize precipitation runoff

Note that any existing development within the ECTNP Area that is not redeveloped would not be required to conform to these measures although community pressure and pricing controls are anticipated to continue to reduce water demand from existing uses. New development within the Project Area would also be required to comply with the Water Efficiency Requirements Ordinance - City Ordinance No. 180822, Los Angeles Green Building Code Ordinance - City Ordinance No. 181480, and the 2010 California Green Building Standard Code.

The ECTNP would require that applicants for new development projects within the change areas that meet the SB 610 criteria (California Water Code Sections 10910 to 10915) coordinate with LADWP to determine if the net increase in water demand (not including demand for recycled water) from the individual project falls within the calculated demand as established in the WSA for the ECTNP. If an individual project is determined not to be within the water demand as identified in the WSA, then a project-specific WSA shall be required.

Water conservation efforts, a cornerstone of the City's water policy agenda, can be relied on to effectively attenuate some of the added demand for water resources as the Proposed Project is implemented. Moreover, the impacts to water demand for future water resources are minimized as implementation of the Proposed Project would occur incrementally over the lifespan of the ECTNP. In addition, the Proposed Project responds to regional growth policies to concentrate growth around transit, resulting in more efficient water use in the region (as a result of more multi-family dwellings being developed as compared to single-family dwellings). Therefore, the impacts of the Proposed Project related to available water supplies and resources would be less than significant.

ALTERNATIVE COMPLIANCE SCENARIO

Table 4.13-7 details the estimated water use within the Project Area by land use when built out to reasonably expected levels under the Alternative Compliance scenario. Implementation of the Proposed Project under the Alternative Compliance scenario in the change areas in year 2035 would result in an increase of water usage of approximately 2.3 mgd or 2,570 afy over existing conditions. According to LADWP, this anticipated water demand can be met, as it falls within the maximum water demand from the Project noted in the WSA for the change areas.

The LADWP forecasts that Citywide water demand with passive water conservation efforts would be 710,760 acre feet in 2035.[23] Based on the estimated amount of water demanded by the Project Area under the Alternative Compliance scenario in the change areas (2,570 afy), the ECTNP Area would represent less than one percent (0.36 percent) of Citywide water demand in 2035. Water conservation measures listed above for the change areas would also be applicable in the Alternative Compliance scenario.

Therefore, the impacts of the Proposed Project under the Alternative Compliance scenario related to available water supplies and resources would be less than significant.

[23]Los Angeles Department of Water and Power, *2010 Urban Water Management Plan, Exhibit 2J (Water Demand Forecast and Conservation Savings Under Average Weather Fiscal Year Ending June 30 [Acres Feet])*, January 2011.

NON-CHANGE AREAS

Tables 4.13-7 and **4.13-8** show the estimated future water demand in the non-change areas. This demand would occur regardless of the Proposed Project as no changes in zoning or land use designation are proposed in these areas, and thus has already been accounted for in the City's UWMP. In addition, water demand in these areas may not be as high as estimated, as water conservation in both existing and new development is anticipated to increase in the future in response to new regulations, community pressure, and pricing controls. Therefore, impacts to water supply resulting from any development in the non-change areas that is consistent with the current plan would be less than significant.

MITIGATION MEASURES

Impacts to water supply would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to water supply were determined to be less than significant without mitigation.

WASTEWATER

REGULATORY FRAMEWORK

FEDERAL

Federal Water Pollution Control Act (Clean Water Act [CWA]). In 1972, the CWA was amended to provide that the discharge of pollutants to waters of the United States from any point (such as discharge from an industrial facility) or non-point (surface and farmland water runoff) source is unlawful unless the discharge is in compliance with a National Pollution Discharge Elimination System (NPDES) permit.

The CWA was enacted with the primary purpose of restoring and maintaining the chemical, physical, and biological integrity of the Nation's waters. The CWA also directs states to establish water quality standards for all "waters of the United States" and to review and update such standards on a triennial basis. Section 319 of the CWA mandates specific actions for the control of pollution from non-point sources. The USEPA has delegated responsibility for implementation of portions of the CWA to the State Water Resources Control Board (SWRCB) and the Regional Water Quality Control Board (RWQCB) and water quality control planning and control programs, such as the NPDES Program. Section 303(c)(2)(b) of the CWA requires states to adopt water quality standards for all surface waters of the United States based on the water body's designated beneficial use. Where multiple uses exist, water quality standards must protect the most sensitive use. Water quality standards are typically numeric, although narrative criteria based upon biomonitoring methods may be employed where numerical standards cannot be established or where they are needed to supplement numerical standards. Water quality standards applicable to the Proposed Project are listed in the California RWQCB's Basin Plan.

National Pollutant Discharge Elimination System (NPDES). The NPDES permit system was established in the CWA to regulate point source discharges into waters within the United States. Point sources are discrete conveyances such as pipes or manmade ditches. Individual homes connected to a municipal system are not required to obtain a permit under the NPDES, however, industrial, municipal, and other facilities must obtain permits if their discharges go directly to surface waters.

REGIONAL

Los Angeles Regional Water Quality Control Board (LARWQCB). The LARWQCB is one of the nine State RWQCBs that are under the purview of the SWRCB. The SWRCB sets statewide policy and, together with the nine State RWQCBs, implements State and federal laws and regulations that pertain to water quality. The LARWQCB implements State and federal laws and regulations within its jurisdiction and continuously maintains its Water Quality Control Plan (WQCP).

The LARWQCB enforces the CFR Part 40, Section 122.41(m), which prohibits the bypassing of treatment facilities and sanitary sewer overflows. In addition to the CFR, the sewer conveyance system is subject to regulation by the South Coast Air Quality Management District (SCAQMD), which responds to complaints regarding nuisance odors. The 10-year Los Angeles Sewers Program also regulates maintenance and construction project schedules and is currently managing approximately 150 sewer infrastructure improvement projects.

The 10-year Los Angeles Sewers Program was put into place in order to carry out the mandates of the Collection System Settlement Agreement (CSSA), which has a compliance term of 10 years. The CSSA is a settlement agreement that was reached in 2004 to resolve a lawsuit brought against the City by the Santa Monica Baykeeper and other community organizations after a number of sanitary sewer overflows occurred in the City in February 1998. The CSSA requires the City to enhance, repair, and update the sewer system and sets specific timelines for the City to complete the upgrades. It also mandates that the City spend $8.5 million in supplemental environmental enhancement projects. Pursuant to the CSSA, the City prepares annual progress reports detailing its success at meeting the terms of the agreement. The sixth progress report, published in August 2010, indicates that the City is currently in full compliance with the CSSA and that the number of sanitary sewer overflows is declining.

LOCAL

City of Los Angeles General Plan Framework. The General Plan Framework was adopted in 1996 and amended in August 2001. The Framework is a general, long-term, programmatic document that has goals and policies that are implemented by the various individual elements of the General Plan. The goals, policies, and objectives of the Framework that are related to the City wastewater collection infrastructure and treatment capacity are listed on **Table 4.13-10**.

City of Los Angeles Integrated Resources Plan (IRP). The City's IRP incorporates a future vision of water, wastewater, and runoff management in the City, recognizing the relationships among all of the City's water resources activities and functions. The IRP addresses and integrates the water, wastewater, and runoff need of the City to the year 2020 and utilized comprehensive basin-wide water resources planning. The IRP consists of a Facilities Plan, a Financial Plan, and an EIR for the program. Objectives of the IRP include, but are not limited to, meeting the projected wastewater system needs of the City; complying with all regulations protecting public health and the environment; conforming to the sustainability guidelines of the City; providing for safe use of recycled water; and providing cost-effective services. In developing the alternatives, the City also allowed for application of various criteria to accommodate changes and unanticipated conditions that could be encountered during implementation of the selected alternative.

Wastewater Capital Improvement Program. Every 10 years, the Bureau of Sanitation updates the City's 10-Year Capital Improvement Program, which identifies the wastewater system upgrades, equipment, and modifications to be funded by the City within a 10-year period. Many of these improvements are necessary in order to comply with state and CWA regulations. The most recent update, the Wastewater Capital Improvement Program FY 2013/2014 through FY 2022/2023, identifies improvements scheduled through 2016 for the four treatment plants, collection system, pumping plants, and system-wide operations.

TABLE 4.13-10: RELEVANT GENERAL PLAN WASTEWATER TREATMENT AND CONVEYANCE GOALS, OBJECTIVES, AND POLICIES

Goal/Policy/Objective	Goal/Policy/Objective Description
Goal 9A	Adequate wastewater collection and treatment capacity for the City and in basins tributary to City-owned wastewater treatment facilities.
Objective 9.1	Monitor and forecast demand based upon actual and predicted growth.
Policy 9.1.1	Monitor wastewater generation.
Policy 9.1.2	Monitor wastewater flow quantities in the collection system and conveyed to the treatment plants.
Policy 9.1.3	Monitor wastewater effluent discharged into the Los Angeles River, Santa Monica Bay, and San Pedro Harbor to ensure compliance with water quality requirements.
Objective 9.2	Maintain the wastewater collection and treatment system, upgrade it to mitigate current deficiencies, and improve it to keep pace with growth as measured by the City's monitoring and forecasting efforts.
Policy 9.2.1	Collect and treat wastewater as required by law and Federal, State, and regional regulatory agencies.
Policy 9.2.2	Maintain wastewater treatment capacity commensurate with population and industrial needs.
Policy 9.2.3	Provide for additional wastewater treatment capacity in the Hyperion Service Area, as it becomes necessary.
Policy 9.2.4	Continue to implement programs to upgrade the wastewater collection system to mitigate existing deficiencies and accommodate the needs of growth and development.
Policy 9.2.5	Review other means of expanding the wastewater system's capacity.
Objective 9.3	Increase the utilization of Demand Side Management (DSM) strategies to reduce system demand and increase recycling and reclamation.
Policy 9.3.1	Reduce the amount of hazardous substances and the total amount of flow entering the wastewater system.
Policy 9.3.2	Consider the use of treated wastewater for irrigation, groundwater recharge, and other beneficial purposes.
Objective 9.4	Ensure continued provision of wastewater collection and treatment after an earthquake or other emergency.
Policy 9.4.1	Restore minimal operations as soon as possible after an emergency, and full operations as soon as feasible.
Policy 9.4.2	Establish joint cooperation agreements with other jurisdictions for mutual assistance during emergencies.

SOURCE: City of Los Angeles, *The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan*, re-adopted 2001.

Los Angeles Municipal Code (LAMC). LAMC Chapter V (Public Safety and Protection) describes different categories of wastewater discharge and peak flow (the maximum 5-minute rate of wastewater flow). In addition, the LAMC identifies permitted regulations related to industrial wastewater. LAMC Chapter XII (The Water Conservation Plan of the City of Los Angeles) also defines recycled water as treated wastewater suitable for direct beneficial use, or controlled use, as approved by the California Department of Public Health.

LAMC Sections 64.11 and 64.12 require approval of a sewer permit, also called an "S" Permit, prior to connection to the wastewater system. Each new connection is assessed a Sewerage Facilities Charge, which is deposited in the City's Sewer Construction and Maintenance Fund for wastewater-related purposes, including but not limited to industrial waste control and water reclamation purposes. LAMC Section 64.15 requires that a Sewer Capacity Availability Request (SCAR) be performed by the Department of Building and Safety when a sewer permit is sought for a new connection to the City's wastewater system, or in the event that a proposed increase in discharge to a public wastewater line or proposed future development is anticipated to generate 10,000 gallons or more of wastewater per day. A SCAR evaluates the existing wastewater collection system to determine whether adequate capacity exists to convey project-related wastewater to the appropriate treatment plant. If capacity is available, the Department of Building and Safety accepts project plans and specifications for plan check; otherwise, projects are placed on a waiting list to receive an allocation of forthcoming capacity, or applicants are required to construct a connection to the

nearest wastewater line with available capacity. The Department of Building and Safety accepts project plans and specification for plan check if the project is on the waiting list, although the project may not connect to the City's wastewater system until capacity is available and a sewer permit is available.

EXISTING SETTING

Wastewater generated within the ECTNP Area is collected and treated by the City Los Angeles Department of Public Works, Bureau of Sanitation (LASAN) wastewater conveyance and treatment infrastructure, which operates and maintains the wastewater collection and treatment for the City and 29 contract cities and agencies. The City's sewage system is comprised of the HTP Service Area, the TIWRP Service Area. The City's public sewers are managed within 26 primary sewer basins and 220 secondary basins, or sewer sheds. The City operates and maintains the largest sewer network within the nation, with more than 6,700 miles of sewer lines and conveys about 400 mgd.[24] The City's primary sewer basin boundaries are based solely on sewer drainage and configuration and are independent of political boundaries. The Project Area is within the following five secondary sewer basins: U04, U09, U14, U16, and U23.[25]

WASTEWATER TREATMENT

City wastewater is treated at the following wastewater treatment facilities: the HTP, located in Playa del Rey; the TIWRP, located in San Pedro; the DCTWRP, located in Van Nuys; and the LAGWRP, located in Los Angeles, adjacent to the City of Glendale. Each of these treatment plants can treat a maximum of approximately 450, 30, 80, and 20 mgd of wastewater, respectively, but experience average daily flows of 362, 17.5, 67, and 20 mgd, respectively.[26] With the exception of the Harbor area, the majority of the City's wastewater conveyance and treatment, including the Project Area is served by the Hyperion Sanitary Sewer System. Wastewater in the Hyperion Sanitary Sewer System is treated at the HTP.

As stated previously, the HTP is located in the community of Playa del Rey, which is approximately 10 miles southwest of the Project Area. The HTP has a treatment capacity of 450 mgd and its solids handling facilities can process approximately 468 dry tons of solids per day.[27] The HTP performs primary treatment of wastewater (i.e., the removal of large objects) and secondary treatment of wastewater (i.e., degradation of biological content).[28,29]

Treated wastewater from the HTP, also known as effluent, is discharged into the Santa Monica Bay through a five-mile outfall. All effluent discharges into the Santa Monica Bay are regulated by the NPDES Permit Number CA0109991. The HTP outfall discharges primary and secondary treated effluent at a depth of 187 feet. The HTP also has a one-mile outfall which is in standby condition in case of an emergency. A small remaining portion of effluent is reused to recharge barrier walls. Treated sewer sludge, or biosolids are not discharged into the Santa Monica Bay. Biosolids are either reused in agriculture or used by landfills for daily cover.[30]

WASTEWATER CONVEYANCE INFRASTRUCTURE

The City owns, operates, and maintains an extensive collection and conveyance system that collects sewage over a 470-square-mile area from over four million residential customers, as well as commercial, institutional, and industrial enterprises. The City conveys the sewage to one of the four treatment facilities.[31] The collection system pipelines range in diameter from 6 inches to 150 inches and consist of approximately 6,700 miles of primary and secondary sewers. To assess and maintain the condition of this expansive system, the City actively conducts an ongoing dry- and wet-weather flow monitoring program. There are 30 automatic "real time" flow monitors and 74 additional "near time" monitors located in the primary sewer system. The monitors use either telephone lines to send data to a central location or staff will download data in the field. Additionally, flow gauging is performed at over 600 strategic locations throughout the City's secondary sewer system on either a quarterly, semi-annual, or annual cycle to monitor flow depth.

The sewer system consists of primary sewers (16-inches and larger in diameter) and secondary sewers (less than 16-inches in diameter). The secondary sewers provide service to property laterals and feed into the primary sewer lines. Primary sewers discharge into trunk, interceptor, and outfall pipes. All sewer lines in the Project Area convey wastewater to the HTP.

The sewer infrastructure in the vicinity of the Project Area includes mostly existing 8-inch, 10-inch, 12-inch, and 15-inch lines. These lines feed into larger outfall primary lines (18-inch and 24-inch) along Pico Boulevard, Granville Avenue, Exposition Boulevard, Manning Avenue, and Venice Boulevard.[32] Based on current gauging and monitoring, the existing sewer infrastructure has no conveyance capacity constraints and is in good to very good structural condition.[33]

Sewer capacity planning is prioritized based on two ratios of sewer flow to sewer capacity (d/D): a Trigger ratio and a Relief ratio. Trigger flow is the quantity of flow, that once reached, would initiate planning for a relief or a replacement sewer. Trigger flow is determined by subtracting a buffer capacity from the capacity of the existing sewer at the flow depth when additional capacity is needed. The buffer capacity is defined as the product of the estimated years to complete the new sewer project and the rate of recent flow increases in the sewer being evaluated. The Relief d/D is currently 0.75 across the City (i.e. when a sewer is at 75 percent of capacity) for all existing sewers, the Trigger d/D varies on a project by project basis because each project's tributary area has its own unique characteristics such as population growth projection, commercial and industrial discharge forecast, and other contributing factors that determine how quickly flows are projected to increase over time. The Sewer Design Manual requires all new sewers to meet a d/D of 0.5 for the projected design year (i.e. that they be at no more than 50 percent of capacity in their design year).[34] **Table 4.13-11** lists the sewer structural condition ranking used by LASAN.

New and rehabilitated sewers and pump stations are planned, designed, and constructed to meet the highest performance standards in the industry in accordance with the City's Sewer Design Manual. The Sewer Design Manual is a comprehensive set of criteria for planning and designing of new sewers, pump stations, force mains, and appurtenances, and for the rehabilitation of existing sewers. In conjunction with the Sewer Design Manual, the City also maintains Standard Plans, which are used to provide consistency and quality in design. All system components are designed to meet permit requirements of the various federal, State, and local agencies thereby ensuring that projects benefit from the input of all affected and interested parties, including the communities.

TABLE 4.13-11: SEWER CONDITION RANKS

Ranking	Description	Action
A	Very Good • Condition is almost like-new sewer reach.	No Repairs Future routine inspection
B	Good • Light Cracks localized • Light Corrosion localized • Light Roots localized	No Immediate Repairs Routine Maintenance Program. Schedule next inspection in the order of sewer system priority.
C	Fair • Moderate Cracks/Fractures • Moderate Corrosion continuous • Moderate Infiltration continuous • Moderate Roots continuous	Routine Repairs as Needed Includes planning, environmental documentation, technical investigations, design, reviews, bid and award following established priorities.
D	Poor • Severe Cracks/Fractures • Broken Reach with Holes • Severe Corrosion • Severe Infiltration/Roots	Repairs Includes regular bid and award, fast track construction, accelerate planning/design, and monitoring.
E	Emergency • Collapsed Pipe (PX) • Dirt Pipe (CPD) • Crown of Pipe Gone (CPC, CG) • Void in Backfill around pipe • Full Flow Obstruction/Blockage	Emergency Repair Initiate Special Order Procedure " Urgent Necessity"

SOURCE: Los Angeles Department of Public Works, Bureau of Sanitation, W*astewater Collection System Rehabilitation and Replacement Report and Plan*, June 2006.

The Sewer Design Manual and Standard Plans are updated, maintained, and administered by LASAN. For all projects, LASAN is responsible for determining the sewer capacity availability for new sewer connections for residential, commercial, and industrial developments. This function is part of an overall sewer connection permitting process that involves a combined effort by LASAN and Bureau of Engineering (BOE) personnel. In issuing a sewer connection permit, the BOE Development Services Division determines if further investigation is needed to evaluate the capacity of an existing sewer line to handle the additional flow from the proposed development or project and take appropriate preemptive action to attenuate potential emergency sewer overflow incidences in the future.

In addition to preemptive sewer monitoring and permitting activities, the LASAN Wastewater Collection Systems Division also maintains up-to-date Sanitary Sewer Overflow Response and Reporting Procedures. The procedures outline the necessary actions to provide immediate response to sewage overflows. It is City policy that, "[e]very reported sewage spill affecting public or private property within the City of Los Angeles shall be acted upon by the Division." Crew leaders are immediately notified upon receipt of a reported potential sewer overflow and are instructed to respond immediately.[35]

The effect of stringent monitoring practices and sewer design standards are apparent in that the City has not experienced any wet-weather overflows since major relief sewers were completed in 2006. However, some dry-weather overflows still occur occasionally due to tree roots, grease blockages, landslides, and vandalism. Despite these irregular overflow occurrences, the system currently has sufficient capacity to handle peak dry-weather flows.[36]

[36]Los Angeles Department of Public Works, *Sewer System Management Plan: Hyperion Sanitary Sewer System,* 2011.

WATER QUALITY MONITORING

Los Angeles is constantly monitoring the infrastructure to ensure reliable service. The Flow Monitoring Expansion Program helps operations and maintenance to manage the conveyance system. Flow data is gathered to support resource allocation. There are 120 permanent monitors and 50 temporary monitors which continually measure flow quantities at major sewers.[37]

EXISTING WASTEWATER GENERATION

The estimated wastewater generation of existing uses within the entire ECTNP Area is shown in **Table 4.13-12**. The total wastewater generation within the Project Area is approximately 6.0 mgd. Wastewater generated by the Project Area represents approximately 1.3 percent of the HTP's current wastewater treatment capacity of 450 mgd.

TABLE 4.13-12: ESTIMATED EXISTING WASTEWATER GENERATION WITHIN THE PROJECT AREA

Use	Wastewater Generation (gpd) /a/
Change Areas /a/,/b/,/c/	1,149,934
Non-Change Areas	4,884,471
Single-Family Residential	987,690
Multi-Family Residential	2,852,307
Non-Residential	654,361
Landscaping /b/	0
Cooling Tower /c/	390,113
Total Existing Wastewater Generation of the Change Areas	**1,149,934**
Total Existing Wastewater Generation of the Non-Change Areas	**4,884,471**
Total Existing Wastewater Generation of the Entire Project Area	**6,034,405**

/a/ Based on the water usage rates used in the WSA and the sewage generation factors for residential and commercial categories established by the City of Los Angeles Bureau of Sanitation (April 6, 2012) (see **Appendix J**), residential and non-residential uses generate the same amount of wastewater as their water usage/ consumption.
/b/ Landscaping assumes that all water usage either percolates into the ground or enters the storm drain system.
/c/ Wastewater generation by cooling towers were assumed to be 22.5 percent of total water usage by the cooling towers based on a case example calculation developed by the Global Environmental Management Initiative (http://waterplanner.gemi.org/module1.htm).
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to wastewater if it would:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board;
- Require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects;
- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects; and/or
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

[37]Los Angeles Department of Public Works, Bureau of Sanitation, *Sewer System Management Plan,* February 2015.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors:

- Cause a measurable increase in wastewater flows to a point where, and a time when, a sewer's capacity is already constrained or that would cause a sewer's capacity to become constrained; or;
- The additional wastewater flows would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the Wastewater Facilities Plan or General Plan and its elements.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of wastewater impacts. This guidance is generally based on Appendix G of the CEQA Guidelines and provides specific criteria to be considered when making a significance determination. For this analysis, Appendix G criteria are used, supplemented by the thresholds identified in the City's Thresholds Guide, where appropriate.

The analysis of project impacts on wastewater conveyance and treatment capacity is based on the analysis of the existing sewer conveyance system in the Project Area and calculation of the anticipated wastewater flows to be generated by the Project Area using wastewater generation factors provided by the Bureau of Sanitation (BOS). The evaluation of impacts is based on a constraints analysis that assesses how much project-generated wastewater could be accommodated by the existing sewer lines. The analysis also evaluates whether adequate treatment capacity within the HTP would be available to accommodate the Project Area based on data from the BOS.

IMPACTS

IMPACT 4.13-4 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT EXCEED WASTEWATER TREATMENT REQUIREMENTS OF LARWQCB? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

As described in the discussion of Impact 4.13-5 below, the Proposed Project would increase wastewater generation by approximately 2.1 mgd over existing conditions. However, all wastewater from the project will be treated according to requirements of the NPDES permit authorized by the LARWQCB. Therefore, the proposed project would result in a less-than-significant impact related to wastewater treatment requirements of LARWQCB.

MITIGATION MEASURES

Impacts related to the Proposed Project exceeding wastewater treatment requirements of LARWQCB would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to Proposed Project exceeding wastewater treatment requirements of LARWQCB were determined to be less than significant without mitigation.

IMPACT 4.13-5 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN THE CONSTRUCTION OF NEW WASTEWATER TREATMENT FACILITIES OR EXPANSION OF EXISTING WASTEWATER TREATMENT FACILITIES? THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

The Proposed Project would result in approximately 29,441 dwelling units and 16,957,415 square feet of non-residential land-uses within the entire Project Area. Currently, the HTP has a maximum capacity of 450 mgd. The average daily wastewater flow that the HTP handles is 362 mgd, which leaves an additional capacity of approximately 20 percent or 88 mgd.[38]

It is important to consider the existing and anticipated wastewater generation of the Project Area in relation to current average daily flows experienced at HTP, and the remaining capacity of the system. As shown in **Table 4.13-12**, the ECTNP Area currently generates approximately 6.0 mgd of wastewater. As noted above, the HTP experiences an average daily flow of 362 mgd. As a proportion of total average daily flow experienced by the HTP, the existing wastewater generation of the Project Area accounts for approximately 1.7 percent of average daily wastewater flow. When compared to the maximum capacity of the plant, existing wastewater generation of the Project Area represents approximately 1.3 percent of HTP's total wastewater capacity.

CHANGE AREAS

As shown in **Table 4.13-13**, implementation of the Proposed Project and its associated land use changes would increase the amount of wastewater generated within the change areas by approximately 2.05 mgd over existing conditions.

TABLE 4.13-13: ESTIMATED WASTEWATER GENERATION OF THE PROJECT AREA WITH PROPOSED PROJECT (2035)

Use	Wastewater Generation (gpd) /a/
Net Wastewater Generation of the Change Areas /b/,/c/,/d/	**2,047,198**
Non-Change Areas	4,942,774
Single-Family Residential	987,690
Multi-Family Residential	2,574,848
Non-Residential	624,322
Landscaping /c/	0
Cooling Towers /d/	755,914
Estimated Total Wastewater Generation of the Non-Change Areas	**4,942,774**
Less Existing Wastewater Generation of the Non-Change Areas	*4,884,471*
Net Wastewater Generation of the Non-Change Areas	**58,303**
Total Net Wastewater Generation of Entire Project Area	**2,105,501**

/a/ Based on the water usage rates used in the WSA and the sewage generation factors for residential and commercial categories established by the City of Los Angeles Bureau of Sanitation (April 6, 2012) (see **Appendix J**), residential and non-residential uses generate the same amount of wastewater as their water usage/ consumption.
/b/ Represents net additional wastewater generation (i.e., minus the wastewater demand from existing to be redeveloped and additional water conservation).
/c /Landscaping assumes that all water usage either percolates into the ground or enters the storm drain system.
/d/ Wastewater generation by cooling towers were assumed to be 22.5 percent of total water usage by the cooling towers based on a case example calculation developed by the Global Environmental Management Initiative (http://waterplanner.gemi.org/module1.htm).
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

[38]Los Angeles Department of Public Works, Bureau of Sanitation, *City of Los Angeles Integrated Resources Plan,* December 2006, Table 2-5, page 2-9.

As discussed above, under Water Supply, it is anticipated that water conservation would reduce anticipated water demand. With the exception of water conservation related to landscape irrigation, water conservation would also decrease wastewater flows. The Project Area would use approximately 2.1 mgd of the remaining capacity of the 88 mgd at the HTP and would account for 2.4 percent.

The anticipated wastewater generation within the Project Area would represent a minimal proportion of total average daily flows, and would be well within the planned capacity of the HTP. Therefore, the increased wastewater generation due to the Proposed Project would be less than significant.

ALTERNATIVE COMPLIANCE SCENARIO

As shown in **Table 4.13-14**, implementation of the Proposed Project with the Alternative Compliance scenario would increase wastewater generation by approximately 1.88 mgd in the change areas over existing conditions. The Project Area would use approximately 1.94 mgd of the remaining capacity of the 88 mgd at the HTP, which would account for 2.2 percent. Thus, the BOS would have sufficient capacity to serve the Proposed Project in addition to their existing commitments. Therefore, the Proposed Project would result in a less-than-significant impact related to requiring or resulting in the construction of new wastewater treatment facilities or expansion of existing facilities.

TABLE 4.13-14: ESTIMATED WASTEWATER GENERATION OF THE PROJECT AREA WITH PROPOSED PROJECT – ALTERNATIVE COMPLIANCE (2035)

Use	Wastewater Generation (gpd) /a/
Net Wastewater Generation of the Change Areas /b/,/c/,/d/	**1,881,742**
Non-Change Areas	**4,942,774**
Single-Family Residential	987,690
Multi-Family Residential	2,574,848
Non-Residential	624,322
Landscaping /c/	0
Cooling Towers /d/	755,914
Estimated Total Wastewater Generation of the Non-Change Areas	**4,942,774**
Less Existing Wastewater Generation of the Non-Change Areas	*4,884,471*
Net Wastewater Generation of the Non-Change Areas	**58,303**
Total Net Wastewater Generation of Entire Project Area	**1,940,045**

/a/ Based on the water usage rates used in the WSA and the sewage generation factors for residential and commercial categories established by the City of Los Angeles Bureau of Sanitation (April 6, 2012) (see **Appendix J**), residential and non-residential uses generate the same amount of wastewater as their water usage/ consumption.
/b/ Represents net additional wastewater generation (i.e., minus the wastewater demand from existing to be redeveloped and additional water conservation).
/c/ Landscaping assumes that all water usage either percolates into the ground or enters the storm drain system.
/d/ Wastewater generation by cooling towers were assumed to be 22.5 percent of total water usage by the cooling towers based on a case example calculation developed by the Global Environmental Management Initiative (http://waterplanner.gemi.org/module1.htm).
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

NON-CHANGE AREAS

Tables 4.13-13 and **4.13-14** show the wastewater generation in the non-change areas. The generation of wastewater in these areas would occur regardless of the Proposed Project as no changes in zoning or land use designation are proposed in these areas. This wastewater generation has already been accounted for in the City's IRP. Therefore, impacts to wastewater treatment resulting from any development in the non-change areas that is consistent with the current plan would be less than significant.

MITIGATION MEASURES

Impacts related to wastewater treatment facilities would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to wastewater treatment facilities were determined to be less than significant without mitigation.

IMPACT 4.13-6 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN THE CONSTRUCTION OF NEW WASTEWATER CONVEYANCE SYSTEMS OR EXPANSION OF EXISTING CONVEYANCE SYSTEMS? COMPLIANCE WITH CITY POLICIES WOULD ENSURE THAT THIS IMPACT WOULD REMAIN LESS THAN SIGNIFICANT.

CHANGE AREAS

The City's existing infrastructure does not have an infinite lifespan and needs continuing renewal in order to provide reliable service. This means rehabilitating old sewer mains, maintenance holes, and replacing aging equipment and structures at treatment and pumping plants. To do so, the City maintains the Wastewater Capital Improvement Program (WCIP) that contains the capital projects and estimated costs for the renewal of the City's infrastructure for the next ten years. The WCIP was originally adopted in 2006 and most recently updated in 2013. The WCIP was developed and evaluated according to projections and preferences contained in the City of Los Angeles Integrated Resources Plan (IRP), which anticipates that average daily wastewater flows in year 2020 will increase to 531.4 mgd. To meet anticipated increased wastewater flows, the IRP evaluates five alternatives and identifies a preferred alternative that addresses the need for increased treatment capacity from the system but does not identify the need to build new treatment plants to meet the anticipated increase in wastewater generation. Instead, the chosen alternative favors adding capacity to existing facilities.[39] The existing maximum capacity of the HTP can accommodate the anticipated wastewater flows identified in the IRP. However, the 2013/2014 WCIP recognizes necessary projects to maintain, bolster, and expand the existing system allocating over $179.3 million to do so during FY 2013-2014. Multiple projects identified in the WCIP are upgrades for the HTP. These projects are necessary to ensure that the HTP complies with RWQCB permit requirements and will refurbish various plant facilities in order to meet future operating requirements. Many of these upgrades are already funded and under construction and all upgrades are scheduled to be completed by 2020.[40]

The BOS Wastewater Engineering Services Division is responsible for determining sewer capacity availability for new sewer connections for residential, commercial, and industrial developments. Thus, all development activities that require sewer connection permits are evaluated under the purview of existing capacity of sewer lines in the development site's vicinity at the time of development. By doing so, each new development must adhere to the most current Sewer Design Manual specifications as well as appropriate Standard Plan requirements. The Sewer Design Manual and Standard Plan are continuously updated to incorporate the most recent industry practices and materials ensuring appropriate measures are taken to accommodate any potential project. All existing sewer laterals within the Project Area, except three, meet the Sewer Design Manual and Standard Plan of having a d/D of 0.5 or better.[41] The three laterals that do not meet the d/D of 0.5 or better are: Westgate Avenue, Pico Boulevard, and Mississippi Avenue. However, according to the BOS, the sewers within the Project Area have no current conveyance capacity constraints.[42]

[39]Los Angeles Department of Public Works, Bureau of Sanitation, *City of Los Angeles Integrated Resources Plan,* December 2006, Table 2-5, page 2-9.

[40]Los Angeles Department of Public Works, Bureau of Sanitation, *Wastewater Capital Improvement Program: Fiscal Year 2013/2014-2022/2023,* August 2013.

[41]Los Angeles Department of Public Works, Bureau of Sanitation, Ali Poosti, Written Correspondence, September 30, 2013.

[42]*Ibid.*

Once individual projects are designed, the associated developer would be required to identify specific sewer connection points. At that time, a sewer assessment would be performed to determine the capacity of the sewer system and final approval and a connection permit would be issued upon the determination that sufficient capacity exists.[43]

The City also has immediate response and reporting procedures in place to attend to any unexpected sewer overflows. The procedures are maintained in the Wastewater Collection Systems Division's up-to-date Sanitary Sewer Overflow Response and Reporting Procedures. Moreover, the City proactively monitors the sewer system to preemptively identify and resolve deficiencies before they can become problematic. System deficiencies in need of rehabilitation are then included in the WCIP, which are attended to according to their associated priority ranking.

The cumulative result of requiring new developments to meet rigorous design and performance standards in conjunction with a ready overflow response plan and proactive monitoring practices has resulted in the absence of wet-weather overflows since 2006. However, although the existing sewer infrastructure within the Project Area has no conveyance capacity constraints and the sewer infrastructure is in good to very good structural condition, the Proposed Project would exceed 20,000 gpd, which is the BOS criterion for necessitating detailed gauging to determine whether the sewer conveyance system is capable of safely accommodating the total flow generated by the Proposed Project.[44] Nevertheless, each future development project in the change areas would be required to coordinate with the LASAN to ensure that existing and/or planned sewer conveyance and treatment facilities are capable of meeting wastewater flow capacity requirements. Therefore, compliance with this regulatory requirement would ensure that this impact related to wastewater conveyance would remain less than significant.

ALTERNATIVE COMPLIANCE SCENARIO

Similar to the Proposed Project, development under the Alternative Compliance scenario would exceed 20,000 gpd, which is the LASAN criterion for necessitating detailed gauging to determine whether the sewer conveyance system is capable of safely accommodating the total flow generated by the Proposed Project. However, as discussed above, each future development project in under the Alternative Compliance scenario would be required to coordinate with the LASAN to ensure that existing and/or planned sewer conveyance and treatment facilities are capable of meeting wastewater flow capacity requirements. Therefore, compliance with this regulatory requirement would ensure that this impact related to wastewater conveyance would remain less than significant.

NON-CHANGE AREAS

Tables 4.13-13 and **4.13-14** show the wastewater generation in the non-change areas. Similar to development in the change areas, future development projects in the non-change areas would exceed 20,000 gpd, which is the BOS criterion for necessitating detailed gauging to determine whether the sewer conveyance system is capable of safely accommodating the total flow generated by development projects. However, as discussed above, each future development project in under the Alternative Compliance scenario would be required to coordinate with the LASAN to ensure that existing and/or planned sewer conveyance and treatment facilities are capable of meeting wastewater flow capacity requirements. Therefore, compliance with this regulatory requirement would ensure that any development in the non-change areas would have a less-than-significant impact related to wastewater conveyance infrastructure.

MITIGATION MEASURES

Impacts related to wastewater conveyance facilities would be less than significant. No mitigation measures are required.

[43]Los Angeles Department of Public Works, Bureau of Sanitation, Ali Poosti, Written Correspondence, September 30, 2013.
[44]*Ibid.*

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to wastewater conveyance infrastructure were determined to be less than significant without mitigation.

IMPACT 4.13-7 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT REQUIRE THE CONSTRUCTION OF NEW STORMWATER DRAINAGE FACILITIES OR EXPANSION OF EXISTING FACILITIES? THIS IMPACT IS LESS THAN SIGNIFICANT.

As discussed in Section 4.7, Hydrology and Water Quality, the Proposed Project would not result in a substantial increase in impervious surfaces. Accordingly, the Proposed Project would not cause a substantial increase in the peak flow rates or volumes that would exceed the drainage capacity of existing stormwater drainage facilities. Compliance with City's LID ordinance would further ensure that any future development resulting from the Proposed Project would not require construction of new stormwater drainage facilities and or expansion of existing facilities. Therefore, the Proposed Project would result in a less-than-significant impact.

MITIGATION MEASURES

Impacts related to requiring construction of new stormwater drainage facilities and or expanding existing facilities would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to requiring construction of new stormwater drainage facilities and or expanding existing facilities were determined to be less than significant without mitigation.

IMPACT 4.13-8 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN A DETERMINATION BY THE BOS THAT IT DOES NOT HAVE ADEQUATE CAPACITY TO SERVE THE PROPOSED PROJECT IN ADDITION TO THEIR EXISTING COMMITMENTS? THIS IMPACT IS LESS THAN SIGNIFICANT.

According to the BOS, the sewers within the Project Area have no current conveyance capacity constraints.[45] Additionally, according to the LASAN, the HTP has sufficient capacity for current and future development and based on structural conditions, most of the existing sewer laterals that serve the Project Area are in good to very good condition.[46] Thus, the LASAN would be able to adequately serve the Proposed Project in addition to their existing commitments. Therefore, the Proposed Project would result in a less-than-significant impact related to a determination by the LASAN that it does not have adequate capacity to serve the Proposed Project in addition to their existing commitments.

MITIGATION MEASURES

Impacts related to the LASAN's capacity to serve the Proposed Project in addition to their existing commitments would not occur under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Impacts related to the LASAN's capacity to serve the Proposed Project in addition to their existing commitments were determined to be less than significant without mitigation.

[45]Los Angeles Department of Public Works, Bureau of Sanitation, Ali Poosti, Written Correspondence, September 30, 2013.
[46]*Ibid.*

SOLID WASTE

REGULATORY FRAMEWORK

FEDERAL

Federal Agencies and Regulations. Title 40 CFR, Part 258 Subtitle D of the Resource Conservation and Recovery Act (RCRA) establishes minimum location standards for siting municipal solid waste landfills. Because California laws and regulations governing the approval of solid waste landfills meet the requirements of Subtitle D, the USEPA delegated the enforcement responsibility to the State of California.

STATE

California Integrated Waste Management Act of 1989 (AB 939). The California Integrated Waste Management Act of 1989, which is commonly known as AB 939, was the first recycling legislation in the country to mandate recycling diversion goals. The Act, codified into the PRC, emphasized a reduction of waste disposed in California landfills by requiring cities and counties to reduce the production, recycle, and reuse solid waste. To achieve a reduction of waste in California landfills, AB 939 required all city and county plans to include a waste diversion schedule with the goals to divert 25 percent of solid waste from landfills by 1995 and divert 50 percent of solid waste from landfills by the year 2000. Recently, a number of changes to the municipal solid waste diversion requirements under the Integrated Waste Management Act were adopted, including a revision to the statutory requirement or 50 percent diversion of solid waste. Under these provisions, local governments are required to continue to divert 50 percent of all solid waste after January 1, 2000.

Senate Bill 63 (SB 63). On July 28, 2009, SB 63 was approved and filed, allowing the abolishment of the California Integrated Waste Management Board and transfer of its duties and responsibilities to a new department called the Department of Resources Recycling and Recovery (CalRecycle). This legislation was passed in order to combine the State's solid waste and recycling programs which went into effect on January 1, 2010.

LOCAL

City of Los Angeles General Plan Framework. The General Plan Framework was adopted in 1996 and recently amended in August 2001. The Framework is a general, long-term, programmatic document that has goals and policies that are implemented by the various individual elements of the General Plan. The goals of the Framework that are related to the solid waste disposal and landfills are listed in **Table 4.13-15**.

TABLE 4.13-15: RELEVANT GENERAL PLAN SOLID WASTE GOALS, OBJECTIVES, AND POLICIES

Goal	Goal Description
Goal 9D	An integrated solid waste management system that maximizes source reduction and materials recovery and minimizes the amount of waste requiring disposal.
Goal 9E	Adequate Recycling Facility Development - expanded siting of facilities that enhance the City's reduction, recycling and composting efforts using methods and strategies that are economically, socially, and politically acceptable.
Goal 9F	Adequate collection, transfer and disposal of mixed solid waste - the City shall seek to ensure that all mixed solid waste that cannot be reduced, recycled or composted is collected, transferred and disposed of in a manner that minimizes adverse environmental impacts.
Goal 9G	An environmentally sound solid waste management system that protects public health, safety, and natural resources and minimizes adverse environmental impacts.
Goal 9H	A cost-effective solid waste management system that emphasizes source reduction, recycling, reuse, and market development and is adequately financed to meet operational and maintenance needs.

SOURCE: City of Los Angeles, *The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan*, re-adopted 2001.

Recovering Energy, Natural Resources and Economic Benefit from Waste for Los Angeles (RENEW LA). A resource management blueprint called RENEW LA was adopted by the City Council in February 2006. This 20-year plan is the blueprint that will guide the City in reducing the use of landfills by maximizing recycling and reuse, and converting much of the solid waste that currently would go to landfills into clean energy and/or valuable raw materials. Many of the plan components have been, and continue to be implemented. RENEW LA calls for the following actions:

- Establish RENEW LA Oversight Committee
- Adopt RENEW LA Blueprint and Zero Waste Policy
- Modify Zoning Code to allow Alternative Technology by right in M2 (light industrial) and M3 (heavy industrial) zones with conditions
- Establish site areas for Alternative Technology in each of the Collection Districts
- Site and develop the first and second Alternative Technology facility
- Establish a fund from Sunshine Canyon host fees for development of facilities that reduce landfilling
- Implement recycling in 50 percent of the commercial sector
- Mandate a time-certain reduction in City MSW disposed at Sunshine Canyon
- Expand Multi-Family Recycling to 50 percent of the City
- Establish City tax breaks for Zero Waste and new re-manufacturing companies
- Establish a green energy producer bonus from the Department of Water and Power
- Add residential food waste to the green bin program

Solid Waste Integrated Resources Plan (SWIRP) – A Zero Waste Master Plan. The SWIRP, most commonly known as the City's Zero Waste Plan, was released in October 2013 and adopted by the City in April 2015. The SWIRP is a long-range master plan for the City's solid waste programs, policies and environmental infrastructure through the year 2030. As discussed more in detail above, the RENEW LA Plan provided a blueprint for Zero Waste identified through the above plan components. The SWIRP proposes an approach for the City to achieve a goal of 90 percent diversion by 2025 through the implementation of existing and new policies and programs, and the development of future facilities to meet the City's recycling and solid waste infrastructure needs.

Citywide Construction and Demolition (C&D) Waste Recycling Ordinance (Ordinance 181519). On March 5, 2010, the City Council approved the Citywide C&D Waste Recycling Ordinance (Ordinance 181519) that requires all mixed C&D waste generated within City limits be taken to City certified C&D waste processors. The Bureau of Sanitation (BOS) is responsible for this new C&D waste recycling policy that is effective January 1, 2011. All haulers and contractors responsible for handling C&D waste must obtain a Private Solid Waste Hauler Permit from the BOS prior to collecting, hauling and transporting C&D waste and C&D waste can only be taken to City certified C&D Processing Facilities. Effective January 1, 2011, noncompliance penalties of up to $5,000 will be assessed for every load of C&D waste not taken to City certified processors. Among the various purposes of this program is the goal of maintaining an open and competitive market for all companies providing solid waste and disposal services in the City, and to mandate the recycling of construction and demolition waste.

Citywide Recycling Chute Ordinance (Ordinance 181227). On July 7, 2010, the City Council approved the Citywide Recycling Chute Ordinance that requires all new development projects, all existing multiple-family residential development projects of four or more units where the addition of floor area is 25 percent or more, and all other existing development projects where the addition of floor area is 30 percent or more, to provide an adequate recycling area or room for the collection and loading of recyclable materials. When a new development project provides a trash chute or an existing development project adds a trash chute, a recycling chute shall also be provided in both cases. Recycling chutes shall be clearly marked "recycling only" at every point of entry.

Zero Waste LA Franchise System. Zero Waste LA Franchise System is a public-private partnership to address 3-million tons of waste disposed yearly by City of LA businesses, consumers, and residents. [47] The Zero Waste LA Franchise System was approved by City Council in April 2014 and expected to go into full effect by July 2017. As part of the program, the City is divided in to 11 zones that are served by a single trash hauler that would allow for the efficient collection and sustainable management of solid waste resources and recyclables. LASAN solid waste collection services will continue to be provided to current City customers, including the collection of bulky items from all residents. Zero Waste LA goals include the following:

- Reduction of landfill disposal by 1,000,000 tons per year by 2025;
- Transparent and predictable solid waste and recycling service rates for the next 10-20 years;
- Quality customer service standards with LASAN monitoring and enforcement;
- Franchise hauler accountability for program outcomes and customer satisfaction through a series of measures implemented by LASAN, up to and including liquidated damages;
- Compliance with environmental regulations, including mandatory commercial and organics recycling;
- Investment of over $200 million in new and improved solid resources infrastructure;
- Clean fuel vehicles; and
- Decrease and recycling of food waste, and increase in food rescue.

EXISTING SETTING

SOLID WASTE CONVEYANCE INFRASTRUCTURE

LASAN and private waste management companies are responsible for the collection of solid waste, disposal, and recycling of solid waste for the City. LASAN collects an average of 6,652 tons per day of refuse, recyclables, yard trimmings, horse manure and bulky items from more than 750,000 homes. Remaining multi-family and all commercial and industrial areas of the city contract with private waste haulers to collect, dispose, and recycle solid waste.

Table 4.13-16 lists the location, permitted capacity, remaining capacity, permitted daily intake capacity, the average daily volume of solid waste disposed of at the landfills serving the City of Los Angeles, and the approximate tons per day of solid waste that the City of Los Angeles disposed of at each landfill. "Commerce Refuse to Energy and the Southeast Resource Recovery" are alternate solid waste disposal methods that help extend the landfill capacity by converting solid waste to energy that is sold to local utility companies. While they do not encounter capacity maximum issues, they are restricted in regards to the daily amount and type of solid waste that they can accept and process. Another alternate solid waste disposal method includes recycling businesses, with the most notable location being the Azusa Reclamation facility. Approximately 65 percent of the City's solid waste in 2015 was disposed of at the Chiquita Canyon and Sunshine Canyon Landfills (both the City and County portions). The Class III landfill facilities accepting waste from the City have a total daily intake capacity of 39,540 tons per day and a remaining capacity of approximately 164 million tons.

EXISTING SOLID WASTE GENERATION

In 2015, approximately 5.29 million tons of solid waste was disposed of at the local landfills and other solid waste facilities, as shown in **Table 4.13-16**.[48] The estimated solid waste generation of existing uses within the Project Area is shown in **Table 4.13-17**. The existing total solid waste generation within the ECTNP Area is approximately 130,615 pounds per day, which is equivalent to approximately 65 tons per day.[49] Solid waste from existing uses within the Project Area represents approximately 0.2 percent of the permitted daily intake capacity of the landfills serving the Project Area.

TABLE 4.13-17: ESTIMATED EXISTING SOLID WASTE GENERATION WITHIN THE PROJECT AREA

Use	Quantity	Solid Waste Disposal (ppd)
Residential	25,018 units	61,664
Change Area	1,057units	2,590
Non-Change Area	23,961units	59,074
Non-Residential	11,424,485 sf	68,951
Change Area	5,104,547 sf	30,152
Non-Change Area	6,319,938 sf	38,799
Total Existing Solid Waste Generation of the Change Areas		**32,742**
Total Existing Solid Waste Generation of the Non-Change Areas		**97.873**
Total Existing Solid Waste Generation of the Entire Project Area		**130,615**

/a/ Solid waste disposal rates were derived from the CalRecycle's, *Solid Waste Disposal Rates* website, http://www.calrecycle.ca.gov/wastechar/wastegenrates/default.htm, and CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.

[48]County of Los Angeles Department of Public Works, S*olid Waste Information Management System, Detailed Solid Waste Disposal Activity Report by Jurisdiction of Origin*, http://dpw.lacounty.gov/epd/swims/OnlineServices/reports.aspx, October 13, 2015.

[49]The conversion rate used was 2000 pounds = 1 ton. By contrast, a metric ton has a conversion rate of 2,204.62 pounds per ton.

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact related to solid waste if it would:

- Not be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs.
- Not comply with federal, state, and local statutes and regulations related to solid waste.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

- In addition, based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors: amount of projected waste generation, diversion, and disposal during demolition, construction, and operation of the project, considering proposed design and operational features that could reduce typical waste generation rates;
- Need for an additional solid waste collection route, or recycling or disposal facility to adequately handle project-generated waste; and/or
- Whether the project conflicts with solid waste policies and objectives in the Source Reduction and Recycling Element (SRRE) or its updates, City of Los Angeles Solid Waste Management Policy Plan (CiSWMPP), Framework Element, or the Curbside Recycling Program, including consideration of the land use-specific waste diversion goals contained in Volume 4 of the SRRE.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of solid waste impacts. This guidance is based on CEQA Guidelines Appendix G and provides specific criteria to be considered when making a significance determination. In some cases, the Thresholds Guide includes quantitative thresholds. For purposes of this analysis, the thresholds identified in Appendix G are used; related thresholds are discussed jointly.

The Proposed Project's solid waste impacts are based on an analysis of the estimated net amount of solid waste generated during implementation of the Proposed Project. Solid waste disposal rates were derived from the CalRecycle's "Solid Waste Disposal Rates" website. The estimated net solid waste generated by the Proposed Project is then compared to the remaining capacity at landfills that serve the Project Area.

IMPACTS

IMPACT 4.13-9 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT COMPLY WITH FEDERAL, STATE, AND LOCAL STATUTES AND REGULATIONS RELATED TO SOLID WASTE AND BE SERVED BY A LANDFILL WITH SUFFICIENT PERMITTED CAPACITY TO ACCOMMODATE THE PROJECT'S SOLID WASTE DISPOSAL NEEDS? NO IMPACT WOULD OCCUR RELATED TO COMPLIANCE WITH APPLICABLE REGULATIONS. THE IMPACT RELATED TO LANDFILL CAPACITY WOULD BE LESS THAN SIGNIFICANT.

Future development occurring under the Proposed Project would be required to comply with LAMC Section 66.32 regarding demolition activities. Compliance with LAMC Section 66.32 would ensure that at least 50 percent of the demolition and construction waste generated by the future development would be diverted from landfills serving the City of Los Angeles. Solid waste generated in the City, including the Project Area, is disposed of at a number of landfills in the County of Los Angeles. As of December 2015, the landfills

serving the City had a combined remaining capacity of approximately 164 million tons of solid waste. In 2015, approximately 5.29 million tons of solid waste was disposed of at the local landfills and other solid waste facilities, as shown in **Table 4.13-16**, above.

Future development occurring under the Proposed Plan is required to comply with LAMC Section 66.32 during demolition. Compliance with LAMC Section 66.32 would ensure that at least 50 percent of the demolition and construction waste generated by the future development would be diverted from landfills serving the City of Los Angeles. Therefore, at least 50 percent of the demolition and construction waste generated by the future development resulting from the Proposed Plan would be diverted from landfills serving the City of Los Angeles.

According to Los Angeles County Department of Public Works' 2015 Annual Report, landfills serving the City of Los Angeles have various closure dates depending on maximum capacity. Expansion of existing landfills has extended adequate capacity to accommodate anticipated growth to lessen the impact of eventual closures. Therefore, anticipated construction in accordance with the Proposed Plan could be accommodated. The Proposed Plan could result in development and redevelopment of land uses that would generate solid waste. All solid waste-generating activities within the City of Los Angeles are subject to the requirements set forth in AB 939 and other local ordinances. Future development permitted under the Proposed Plan would comply with the applicable solid waste policies and objectives, and therefore, would be no impacts related to compliance with federal, state, and local statutes and regulations related to solid waste.

CHANGE AREAS

As shown in **Table 4.13-18**, implementation of the Proposed Project could increase solid waste generation in the change areas by 35,328 pounds per day (ppd) or approximately 17.7 tons per day and in the entire ECTNP Project Area by 37,071 ppd or approximately 18.5 tons per day. This amounts to an approximate 28 percent increase over existing solid waste generation in the Project Area.

TABLE 4.13-18: ESTIMATED SOLID WASTE GENERATION OF THE PROJECT AREA WITH PROPOSED PROJECT (2035)

Use	Quantity	Solid Waste Disposal (ppd)
Residential	29,441 units	72,851
Change Areas	4,507 units	11,323
Non-Change Areas	24,934 units	61,528
Non-Residential	16,957,415 sf	94,835
Change Areas	10,705,463 sf	56,747
Non-Change Areas	6,251,952 sf	
Total Solid Waste Generation of the Change Areas		**68,070**
Total Existing Solid Waste Generation of the Change Areas		*32,742*
Net Solid Waste Generation of the Change Areas		**35,328**
Total Solid Waste Generation of the Non-Change Areas		**99,616**
Total Existing Solid Waste Generation of the Non-Change Areas		*97,873*
Net Solid Waste Generation of the Non-Change Areas		**1,743**
Total Solid Waste Generation of the Entire Project Area		**167,686**
Total Existing Solid Waste Generation of the Entire Project Area		*130,615*
Net Solid Waste Generation of the Entire Project Area		**37,071**

/a/ Solid waste disposal rates were derived from the CalRecycle's, Solid Waste Disposal Rates, http://www.calrecycle.ca.gov/wastechar/wastegenrates/default.htm, accessed March 7, 2017 and CalEEMod, *Calculation Details for CalEEMod – Appendix D*, July, 2013.
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

The calculation of the Project's estimated solid waste generation is a worst-case-scenario and does not take into consideration the City's successful efforts to divert disposal of solid waste by 50 percent. The increase in solid waste resulting from implementation of the Proposed Project would increase the average daily disposal rate at landfills serving the City of Los Angeles by 0.09 percent to 20,298 tons per day. As the combined daily intake capacity of these landfills is 29,800 tons per day, the increase in solid waste generation resulting from the implementation of the Proposed Project would represent 0.06 percent of daily capacity.

Implementation of the ECTNP would not result in the need for additional solid waste collection routes as new development would be infill development in an already urbanized area and would not develop areas beyond its current service boundaries or result in the construction of additional single-family residences.

Furthermore, implementation of the Proposed Plan would be consistent with all waste reduction goals set forth by the SWIRP, RENEW LA Plan, and the Framework Element, which are discussed in the Regulatory Framework section. The Proposed Plan does not conflict with solid waste policies and objectives in the SWIRP, or Framework Element, or the Zero Waste LA goals. These policy documents govern the solid waste management practices within the Project Area. As discussed above, the Proposed Project could increase solid waste generation by 35,328 ppd or approximately 17.7 tons in the change areas, or 37,071 ppd or 18.5 tons in the Project Area over existing solid waste generation. This level of increase would not disrupt successfully meeting the goals, objectives, and policies contained in any of the solid waste management policy documents of the City as it is a negligible fraction of daily solid waste. Therefore, the Proposed Project would result in less-than-significant impact related to being served by a landfill with insufficient permitted capacity.

ALTERNATIVE COMPLIANCE SCENARIO

Table 4.13-19 shows that implementation of the Proposed Project with the Alternative Compliance scenario could increase solid waste generation in the Project Area by 32,427 ppd or approximately 16.2 tons per day. The Alternative Compliance scenario would create less of an impact in terms of solid waste generated due to higher disposal rates for non-residential uses.

TABLE 4.13-19: ESTIMATED SOLID WASTE GENERATION OF THE PROJECT AREA WITH PROPOSED PROJECT – ALTERNATIVE COMPLIANCE (2035)

Use	Quantity	Solid Waste Disposal (ppd)
Residential	31,060 units	76,931
Change Areas	4,954 units	15,404
Non-Change Areas	26,106 units	61,527
Non-Residential	15,311,503 sf	86,111
Change Areas	9,059,551 sf	48,022
Non-Change Areas	6,251,952 sf	99,616
Total Solid Waste Generation of the Change Areas		**63,426**
Total Existing Solid Waste Generation of the Change Areas		*32,742*
Net Solid Waste Generation of the Change Areas		**30,684**
Total Solid Waste Generation of the Non-Change Areas		**99,616**
Total Existing Solid Waste Generation of the Non-Change Areas		*97,873*
Net Solid Waste Generation of the Non-Change Areas		**1,743**
Total Solid Waste Generation of the Entire Project Area		**163,042**
Total Existing Solid Waste Generation of the Entire Project Area		*130,615*
Net Solid Waste Generation of the Entire Project Area		**32,427**

/a/ Solid waste disposal rates were derived from the CalRecycle's, Solid Waste Disposal Rates website, http://www.calrecycle.ca.gov/wastechar/wastegenrates/default.htm, accessed February 10, 2014 and CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

Similar to the Proposed Project, implementation of the ECTNP under the Alternative Compliance scenario would not result in the need for additional solid waste collection routes as it would be infill development in an already urbanized area and would not develop areas beyond its current service boundaries or result in the construction of additional single-family residences. The Proposed Project under the Alternative Compliance scenario could increase solid waste generation by 30,684 ppd or approximately 15 tons in the change areas, or 32,427 ppd or approximately 16 tons in the Project Area over existing solid waste generation. This level of increase would not disrupt successfully meeting the goals, objectives, and policies contained in any of the solid waste management policy documents of the City as it is a negligible fraction of daily solid waste. Therefore, the Proposed Project under the Alternative Compliance scenario would result in less-than-significant impact related to being served by a landfill with insufficient permitted capacity.

NON-CHANGE AREAS

Tables 4.13-18 and **4.13-19** show the solid waste generation in the non-change areas. The generation of solid waste in these areas would occur regardless of the Proposed Project as no changes in zoning or land use designation are proposed in these areas. Therefore, impacts to solid waste disposal resulting from any development in the non-change areas that is consistent with the current plan would be less than significant.

MITIGATION MEASURES

There would be no impact related to compliance with federal, state, and local statutes and regulations related to solid waste. Impacts related to the Proposed Project being served by a landfill with insufficient permitted capacity would be less than significant. No mitigation measures are required.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

There would be no impact related to compliance with federal, state, and local statutes and regulations related to solid waste. Impacts related to the Proposed Project being served by a landfill with insufficient permitted capacity would be less than significant.

ENERGY

REGULATORY FRAMEWORK

FEDERAL

Public Utility Regulatory Policies Act of 1978 (PURPA) (Public Law 95-617). PURPA was passed in response to the unstable energy climate of the late 1970s. PURPA sought to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators, small power producers, from which, along with qualified cogenerators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from qualifying facilities (Qfs) at avoided cost (avoided costs are the incremental savings associated with not having to produce additional units of electricity) PURPA expanded participation of nonutility generators in the electricity market, and demonstrated that electricity from nonutility generators could successfully be integrated with a utility's own supply. PURPA requires utilities to buy whatever power is produced by Qfs (usually cogeneration or renewable energy). Utilities want these provisions repealed; critics argue that it will decrease competition and impede development of the renewable energy industry. The Fuel Use Ace (FUA) of 1978 (repealed in 1987) also helped Qfs become established. Under FUA, utilities were not allowed to use natural gas to fuel new generating technologies but Qfs were by definition not utilities, were able to take

advantage of abundant natural gas and abundant new technologies (such as combined-cycle). The technologies lowered the financial threshold for entrance into the electricity generation business as well as shortened the lead time for constructing new plants.

Energy Policy Act of 2005. On August 8, 2005, President George W. Bush signed the National Energy Policy Act of 2005 into law. This comprehensive energy legislation contains several electricity related provisions that aim to:

- Help ensure that consumers receive electricity over a dependable, modern infrastructure;
- Remove outdated obstacles to investment in electricity transmission lines;
- Make electric reliability standards mandatory instead of optional; and
- Give federal officials the authority to site new power lines in DOE designated national corridors in certain circumstances.

Federal Clean Air Act (CAA). Section 211(o) of the CAA, as amended by the Energy Policy Act of 2005, requires the Administrator of the USEPA to annually determine a renewable fuel standard (RFS) which is applicable to refines, importers and certain blenders of gasoline, and public the standard in the Federal Register by November 30 each year. On the basis of this standard, each obligated party determines the volume of renewable fuel that it must ensure is consumed as motor vehicle fuel. This standard is calculated as a percentage, by dividing the amount of renewable fuel that the CAA requires to be blended into gasoline for a given year by the amount of gasoline expected to be used during that year, including certain adjustments specified by the CAA. The notice published on November 21, 2008, included an RFS of 10.21 percent for 2009.

STATE

The California Energy Commission and California Public Utilities Commission have jurisdiction over Investor Owned Utilities (IOUs) in California. The California Energy Commission (CEC) also collects information for the LADWP.

California Building Energy Efficiency Standards: Title 24. California established statewide building energy standards following legislative action. The legislation required the standards to:

- Be cost effective;
- Be based on the building life cycle; and
- Include both prescriptive and performance-based approaches.

California's building efficiency standards (along with those of energy efficient appliances) have saved more than $56 billion in electricity and natural gas costs since 1978. It is estimated the standards will save an additional $23 billion by 2013.[50] As technology and design have evolved the standards have been periodically updated, generally, every three years.

Title 24 of the CCR comprises the State Building Standards Code. Part 6 of Title 24 is the California Energy Code that includes the building energy efficiency standards. The standards include provisions applicable to all buildings, residential and non-residential, which describe requirements for documentation and certificates that the building meets the standards. These provisions include mandatory requirements for efficiency and design of the following types of systems, equipment and appliances:

- Air conditioning systems
- Heat pumps
- Water chillers
- Gas and oil-fired boilers
- Cooling equipment
- Water heaters and equipment

[50]California Code of Regulations. Title 24, Part 6.

- Pool and spa heaters and equipment
- Gas fired equipment including furnaces and stoves/ovens
- Windows and exterior doors
- Joints and other building structures openings
- Insulation and cool roofs
- Lighting control devices

The standards include additional mandatory requirements for space conditioning (cooling and heating), water heating, indoor and outdoor lighting systems, and equipment in non-residential, high-rise residential and hotel or motel buildings. Mandatory requirements for low-rise residential buildings cover indoor and outdoor lighting, fireplaces, space cooling and heating equipment (including ducts and fans), and insulation of the structure, foundation and water piping. In addition to the mandatory requirements, the standards call for further energy efficiency measures that can be provided through a choice between performance and prescriptive compliance approaches. The 2016 update to the Building Energy Efficiency Standards focuses on several key areas to improve the energy efficiency of newly constructed buildings and additions and alterations to existing buildings, such as improvements to the residential Standards including improvements for attics, walls, water heating, and lighting. The most significant efficiency improvements to the nonresidential Standards include alignment with the ASHRAE 90.1 2013 national standards. New efficiency requirements for elevators and direct digital controls are included in the nonresidential Standards.

The CEC has estimated that the 2016 Building Energy Efficiency Standards may reduce statewide annual electricity consumption by approximately 281 gigawatt-hours per year, electrical peak demand by 195 megawatts, and natural gas consumption by 16 million therms per year. The potential effect of these energy savings to air quality may be a net reduction in the emission of nitric oxide by approximately 508 tons per year, sulfur oxides by 13 tons per year, carbon monoxide by 41 tons per year and particulate matter less than 2.5 microns in diameter by 13.57 tons per year. Additionally, the CEC staff has estimated that the implementation of the 2016 Standards may reduce statewide greenhouse gas emissions by 160 thousand metric tons CO2e per year.

Bio-energy Action Plan (Executive Order S-06-06). Executive Order S-06-06 establishes targets for the use and production of bio-fuels and bio-power and directs state agencies to work together to advance biomass programs in California while providing environmental protection and mitigation. The executive order establishes the following target to increase the production and use of bio-energy, including ethanol and biodiesel fuels made from renewable resources: produce a minimum of 20 percent of its bio-fuels within California by 2010, 40 percent by 2020, and 75 percent by 2050. The executive order also calls for the state to meet a target for use of biomass electricity.

State of California 2015 Integrated Energy Policy Report. On April 29, 2015, Governor Edmund G. Brown Jr. signed Executive Order B-30-15, establishing a new statewide goal to reduce greenhouse gas emissions 40 percent below 1990 levels by 2030. Senate Bill 1389 (Bowen, Chapter 568, Statutes of 2002) requires the California Energy Commission to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the state's economy; and protect public health and safety. The 2015 Integrated Energy Policy Report, adopted by the CEC in February 2016, provides the results of the CEC's assessments of a variety of energy issues facing California, including the following:

- Energy efficiency
- Benchmarking under the AB 758 Action Plan
- Strategies related to data for improved decisions in the Existing Buildings Energy Efficiency Action Plan
- Building energy efficiency standards, the impact of drought on California's energy system, achieving 50 percent renewables by 2030
- Renewable Action Plan status, the California Energy Demand Forecast

- Natural Gas Outlook
- AB 1257 Report
- Methane emissions
- Transportation Energy Demand Forecast
- Alternative and Renewable Fuel and Vehicle Technology Program benefits updates
- Landscape-scale planning efforts, transmission projects
- California Independent System Operator energy imbalance market
- Desert Renewable Energy Conservation Plan
- Climate change vulnerability and adaptation options
- Electricity infrastructure in Southern California
- Trends in California's sources of crude oil
- California's nuclear plants[51]

Greenhouse Gas (GHG)

A number of regulations aimed primarily at GHG reductions would affect energy consumption as the consumption of energy generates most greenhouse gases. Please refer to Section 4.5, Greenhouse Gas Emissions, of this Draft EIR for a complete regulatory framework discussion.

Senate Bill 97 (SB 97), CEQA Guidelines for Greenhouse Gas Emissions. SB 97 required the Governor's Office of Planning and Research (OPR) to prepare CEQA Guidelines for the mitigation of GHG emissions, including, but not limited to, effects associated with transportation or energy consumption. OPR and the Resources Agency are required to periodically review the guidelines to incorporate new information or criteria adopted by CARB pursuant to the Global Warming Solutions Act.

Renewable Energy

Renewables Portfolio Standard (RPS) (SB 2). Established in 2002 under SB 1078, accelerated in 2006 under SB 107, and expanded in 2011 under SB 2, RPS is one of the most ambitious renewable energy standards in the country. This law requires investor-owned utilities such as Pacific Gas and Electric, SCE and San Diego Gas and Electric, to have 33 percent of their electricity come from renewable sources by 2020. All of these entities had to adopt the new RPS goals of 20 percent of retails sales from renewables by the end of 2013, 25 percent by the end of 2016, and the 33 percent requirement being met by the end of 2020.

Clean Energy and Pollution Reduction Act of 2015 (SB 350). SB 350, signed in October 2015 by Governor Edmund G. Brown, requires retail sellers and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030. SB 350 also makes additional revisions to the RPS Program and to certain other requirements on public utilities and publicly owned electric utilities.

California Solar Initiative (CSI). On January 12, 2006, the CPUC approved the CSI (R.04-03-017), a solar incentive program for California consumers of the investor-owned utilities - PG&E, SCE, SDG&E. Together with the rebate program for New Solar Homes and rebate programs offered through the dozens of publicly owned utilities in the state the CSI program is a key component of the Go Solar California campaign for California. The CSI program has a total budget of $2.167 billion between 2007 and 2016 and a goal to install approximately 1,940 MW of new solar generation capacity. The CSI-Thermal portion of the program has a total budget of $250 million between 2010 and 2017, and a goal to install 200,000 new solar hot water systems. The CSI program is funded by electric ratepayers and the CSI-Thermal portion of the program is funded by gas ratepayers. The CSI program is overseen by the California Public Utilities Commission and rebates are offered through the Program Administrators.[52]

[51]California Energy Commission, *2015 Integrated Energy Policy Report*, July 2015, adopted February 2016.
[52]California Energy Commission, California Solar Initiative, *About the California Solar Initiative (CSI)*, http://www.gosolarcalifornia.ca.gov/, accessed March 7, 2017.

CEQA Guidelines Appendix F: Energy Conservation. CEQA Guidelines Appendix F provides a goal of conserving energy in the state of California. The appendix indicates the following methods to achieve this goal: (1) decreasing overall per capita energy consumption, (2) decreasing reliance on natural gas and oil, and (3) increasing reliance on renewable energy sources.

LOCAL

The City of Los Angeles GREEN LA Plan. On May 15, 2007, Los Angeles Mayor Antonio Villaraigosa released the "GREEN LA – An Action Plan to Lead the Nation in Fighting Global Warming" (GREEN LA Plan) that has an overall goal of reducing the City of Los Angeles' greenhouse gas emissions by 35 percent below 1990 levels by 2030. This goal exceeds the targets set by both California and the Kyoto Protocol, and is the greatest reduction target of any large United States City. The cornerstone of the GREEN LA Plan is increasing the City's use of renewable energy to 35 percent by 2020. The Plan discusses City goals for each focus area, as follows:

Energy
- Increase the generation of renewable energy;
- Encourage the use of mass transit;
- Develop sustainable construction guidelines;
- Increase City-wide energy efficiency; and
- Promote energy conservation.

Water
- Decrease per capita water use to reduce electricity demand associated with water pumping and treatment.

Transportation
- Power the City vehicle fleet with alternative fuels; and
- Promote alternative transportation (e.g., mass transit and rideshare).

Other Goals
- Create a more livable City through land use regulations;
- Increase recycling, reducing emissions generated by activity associated with the Port of Los Angeles and regional airports;
- Create more City parks, promoting the environmental economic sector; and
- Adapt planning and building policies to incorporate climate change policy.

Sustainable City Plan (pLAn). On April 8, 2015, Mayor Eric Garcetti released the pLAn, a roadmap to achieve back to basics short-term results while setting the path to strengthen and transform the City. The pLAn is made up of short-term (by 2017) and longer-term (by 2025 and 2035) targets in 14 categories to advance the City's environment, economy and equity. The pLAn provides strategies to create a more sustainable and livable city by: improving land use planning to promote neighborhood quality of life; conserving energy and water; mitigating and adapting to climate change; building transit options for an accessible future; promoting affordability and environmental justice; and restoring and reinventing the Los Angeles River.

EXISTING SETTING

ELECTRICITY

LADWP provides electricity to residents and business within the City of Los Angeles. LADWP supplies more than 24 million megawatt-hours (MWh) of electricity a year to approximately 1.4 million residential and

business customers.[53] LADWP owns and operates the majority of its generation, transmission, and distribution infrastructure, which include natural gas-fueled generation stations, coal-fired generation stations, nuclear-fueled generation stations, large hydroelectric generation stations, renewable resources, and distributed generation. 7,640 Megawatts (MW) with a record peak in instantaneous demand of 6,396 MW in 2014.[54] LADWP's Power Infrastructure includes 22 Generation Plants, 6,752 miles of overhead distribution lines, 3,626 miles of underground distribution cables and 160 distribution stations.[55] The LADWP is constantly striving for energy efficiency and is procedurally always moving forward, embracing renewable energy and to cut back on emissions. As a result of the shutdown of the Mohave Coal Power Plant in 2005, efficient energy solutions, ongoing repowering programs, and increase development of renewable resources, LADWP CO_2 emissions levels were 12.0 million metric tons (MMT), 23 percent below its 1990 level (17.9 MMT). GHG emissions are expected to be 55 percent below 1990 levels by 2025.[56]

With the advent of energy efficiency, LADWP has developed Smart Grid L.A. in order to upgrade its power grid with communications technologies that will give customers empowerment of control of their energy uses and costs in real-time. There will be continuous communication and feedback from the power grid which will provide a balance of customer electricity demand and power production. Since 2013, the LADWP has already outfitted 52,000 residential and commercial customers with Smart Meters. The use of Smart Meters will enable the LADWP to gather information to better implement the Smart Grid LA plan.

Table 4.13-20 shows the source of LADWP's power resources. Approximately 21 percent of power generation is from renewable sources, including biomass and biowaste, geothermal, small hydroelectric, solar, and wind energy. Specifically, wind energy provides the majority of renewable energy accounting for 11 percent of renewable energy. LADWP's eligible renewable "small hydro" resources include the Owens Gorge, the Owens Valley and LAA hydroelectric plants.

TABLE 4.13-20: LADWP POWER RESOURCES (2015)

Energy Source	Percent Contributed to LADWP Power
Renewable Energy	21%
Wind	11%
Biomass & Biowaste	4%
Geothermal	2%
Small hydroelectric	1%
Solar	3%
Coal	37%
Natural Gas	25%
Nuclear	10%
Large Hydroelectric	3%
Other/Unspecified	4%

[55]*Ibid*.

[56]Los Angeles Department of Water and Power, *2016 Briefing Book*, June 2016.

Electricity from coal-fired power sources represents approximately 37 percent of LADWP's power supply. The Navajo and the Intermountain Generating Stations, located in Arizona and Utah, respectively, supply the LADWP coal-generated electricity.[57] These stations provide low-cost base load generation to Los Angeles; however, these stations also emit twice the amount of CO_2 compared to Natural Gas. Thus, the LADWP will continue to seek replacement options to lower the LADWP's power generation CO_2 emission levels.

Electricity from natural gas-fueled power sources represents approximately 25 percent of LADWP's power supply. The coal generating stations, owned by the LADWP and located throughout the Los Angeles Basin, include the Harbor, Haynes, Scattergood, and Valley generating stations supply the LADWP with natural gas-fueled electricity. Electricity from nuclear-fueled power sources represents approximately 10 percent of LADWP's power supply. The Palo Verde Nuclear Generation Station, located in Arizona, supplies the LADWP with nuclear-generated electricity. Electricity from large hydroelectric and other unspecified power sources represents a total of approximately seven percent of the LADWP's power supply. The Castaic Pumped Storage Power Plant and the Hoover Power Plant supply LADWP with hydroelectric-generated electricity, and are located in Castaic, California and Arizona, respectively.[58]

In 2015, LADWP's electricity generation and distribution infrastructure delivered 24.0 million MWh of electricity to its customers. Commercial users consumed the most electricity supplied by the LADWP in 2015 with approximately 12.8 million MWh, or 53 percent of the total electricity provided by the LADWP. Residential customers consumed approximately 8.4 million MWh, or 35 percent, of electricity supplied by the LADWP in 2015. Industrial users consumed approximately 2.7 million MWh, or 10 percent, while other LADWP customers consumed approximately 0.4 million MWh, or approximately 0.02 percent.[59]

The estimated electricity usage of existing uses within the ECTNP Area is shown in **Table 4.13-21**. The total electricity usage within the ECTNP Area is approximately 168,403,097 kilowatt-hours (kWh) per year or approximately 168,403 MWh per year. Electricity usage of the ECTNP Area represents less than one percent of the 23.5 million MWh of total electricity delivered by the LADWP in 2013.[60]

TABLE 4.13-21: ESTIMATED EXISTING ELECTRICITY USAGE WITHIN THE PROJECT AREA

Use	Quantity	Electricity Usage Generation (kWh/year)
Residential	25,018 units	49,157,215
Change Areas	1,057 units	2,156,875
Non-Change Areas	23,961 units	47,000,340

NATURAL GAS

The City of Los Angeles, including the Project Area, is served by the investor-owned Southern California Gas Company (SoCalGas), a unit of Sempra Energy. SoCalGas serves approximately 21.6 million customers through 5.9 million meters of gas lines within a 20,000-square-mile service area that includes over 500

[57]Los Angeles Department of Water and Power, *2016 Integrated Resource Plan*, January 2017.
[58]*Ibid*.
[59]California Energy Commission, *Electricity by Entity*, http://www.ecdms.energy.ca.gov/elecbyutil.aspx, accessed March 7, 2017.
[60]City of Los Angeles, Department of City Planning, February 2014.

communities in Central and Southern California.[61] In 2015, a total of approximately 4,947 million therms of natural gas were consumed by SoCalGas' customers. Of this total, residential, industrial, commercial and miscellaneous other customers consumed 2,038 million, 1,614 million, 979 million, and 315 million therms of natural gas, respectively.[62,63] California natural gas anticipates a gas demand to decline at an annual rate of 1.4 percent between 2016 and 2035 as a result of modest growth in the Natural Gas Vehicle (NGV) market, economic growth, energy efficiency standards, other sources of renewable energy, metering infrastructure and the decline in demand of commercial and industrial sectors.[64] More specifically, from 2016 to 2035, SoCalGas residential demand is expected to decline from 239 billion cubic feet (Bcf) to 218 Bcf, reflecting an annual decline rate of 0.5 percent, non-residential markets are expected to decline from 113 Bcf in 2016 to 105 Bcf by 2035, reflecting an annual decline rate of 0.24 percent.[65]

SoCalGas natural gas supplies originate from sedimentary basins located in California, New Mexico (San Juan Basin), west Texas (Permian Basin), the Rocky Mountains, western Canada, and local California supplies. Interstate pipelines used by SoCalGas and San Diego Gas and Electric (SDG&E) have a natural gas upstream capacity of 6,725 million cubic feet per day (MMcf/d).[66] Additionally, SoCalGas and SDG&E currently have firm receipt capacity (i.e. access to supply from interstate pipelines for core customers) of 3,875 MMcf/d of natural gas. Locally, SoCalGas distributes natural gas through an extensive network of approximately 41,500 miles of underground gas mains.

Underground storage of natural gas plays a vital role in balancing the region's energy supply and demand. SoCalGas owns and operates four underground storage facilities located in Aliso Canyon, Honor Rancho, Goleta, and Playa Del Rey. These facilities have a total storage capacity of 137.1 Bcf. Stored gas is appropriated as follows: 83 Bcf is allocated to core residential, small industrial and commercial customers; 4.2 Bcf is used for system balancing; and the remainder is available to other customers. In October 2015 the storage facility in Aliso Canyon had a natural gas leak resulting in DOGGR imposing a moratorium on the storage facility with a safety review for all 114 wells within the facility. The safety review requires the wells to be thoroughly tested for safe operation or removed from operation and isolated from the underground reservoir. As a result of the incident the Aliso Canyon facility is not currently supplying natural gas to the greater Los Angeles area.

The estimated natural gas usage of existing uses within the Project Area is shown in **Table 4.13-22**. The total natural gas usage within the Project Area is approximately 459 MMcf per year (MMcf/y). Natural gas usage of the Project Area represents approximately 0.08 percent of the 532 Bcf of natural gas was consumed within the SoCalGas service area in 2013.

[63]One therm is equal to 96.7 cubic feet of natural gas.

[64]California Gas and Electric Utilities, 2016 *California Gas Report*, 2016.

[65]*Ibid.*

[66]Beginning in April 2008, gas supplies to serve both SoCalGas' and SDG&E's retail core gas demand are procured with a combined portfolio. SoCalGas and SDG&E plan and design their systems to provide continuous service to their core customers under an extreme peak day event. The extreme peak day design criteria is defined as a 1-in 35 likelihood event for each utility's service area.

TABLE 4.13-22: ESTIMATED EXISTING NATURAL GAS USAGE WITHIN THE PROJECT AREA

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix F of the State CEQA Guidelines, the Proposed Project would have a significant impact related to energy if it would:

- Result in the wasteful or inefficient use of energy as a result of project implementation.

CITY OF LOS ANGELES CEQA THRESHOLDS GUIDELINES

Based on the criteria set forth in the 2006 Los Angeles CEQA Thresholds Guide (Thresholds Guide), the determination of significance shall be made on a case-by-case basis, considering the following factors.

For impacts related to energy and/or distribution infrastructure:

- The extent to which the project would require new (off-site) energy supply facilities and distribution infrastructure, or capacity enhancing alterations to existing facilities;
- Whether and when the needed infrastructure was anticipated by adopted plans; or
- The degree to which the project design and/or operations incorporate energy conservation measures, particularly those that go beyond City requirements.

METHODOLOGY

The Thresholds Guide sets forth guidance for the determination of significance of energy impacts. In some cases, the Thresholds Guide includes quantitative thresholds. For purposes of this analysis, Thresholds Guide criteria are used, supplemented by the thresholds identified in Appendix G, where appropriate.

Electricity and natural gas use was estimated using the same methodology utilized by CalEEMod.[67] The program uses the California Commercial End Use Survey (CEUS) database to develop energy intensity values (electricity or natural gas usage per square feet per year) for non-residential buildings. The energy use from residential land uses is calculated based on the Residential Appliance Saturation Survey (RASS). Similar to CEUS, this is a comprehensive energy use assessment that includes the end use for various climate zones in California. The CalEEMod support files include detailed discussions of processing the RASS data to obtain the lookup tables and additional calculation methodologies. Applying the use factors to the proposed building square footages by land use type, an estimate was made as to the net future electricity and natural gas consumption of the reasonably expected development under the Proposed Project. This estimate is

[67]CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.

compared to the existing available energy supplies from LADWP and SoCalGas, to determine if these utilities would be able to accommodate the net Proposed Project's energy demands.

IMPACTS

IMPACT 4.13-10 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN THE INEFFICIENT USE OF ELECTRICITY? THIS IMPACT IS LESS THAN SIGNIFICANT WITH COMPLIANCE WITH TITLE 24, PART 6 OF THE CALIFORNIA ADMINISTRATIVE CODE, THE ENERGY EFFICIENCY STANDARDS FOR RESIDENTIAL AND NONRESIDENTIAL BUILDING AND THE CITY OF LOS ANGELES' GREEN BUILDING CODE ENERGY EFFICIENCY REQUIREMENTS.

CHANGE AREAS

As detailed in **Table 4.13-23**, implementation of the Proposed Project could result in demand for electricity in the change areas to increase by approximately 88,656,829 kWh per year or 88,657 MWh and demand in the entire Project Area to increase by approximately 89,551,839 kWh per year, or 89,552 MWh per year. This increase would be a 53 percent increase over existing electricity usage within the Project Area.

TABLE 4.13-23: ESTIMATED ELECTRICITY USE INTHE PROJECT AREA WITH PROPOSED PROJECT (2035)

Use	Quantity	Electricity Usage Generation (kWh/year)
Residential	29,441 units	54,187,817
Change Areas	4,507 units	7,365,012
Non-Change Areas	24,934 units	46,822,805
Non-Residential	16,957,415 sf	203,767,119
Change Areas	10,705,463 sf	138,807,341
Non-Change Areas	6,251,952 sf	64,959,778
Total Electricity Usage of the Change Areas		**146,172,353**
Total Existing Electricity Usage of the Change Areas		*57,515,524*
Net Electricity Usage of the Change Areas		**88,656,829**
Total Electricity Usage of the Non-Change Areas		**111,782,583**
Total Existing Electricity Usage of the Non-Change Areas		*110,887,573*
Net Electricity Usage of the Non-Change Areas		**895,010**
Total Electricity Usage of the Entire Project Area		**257,954,936**

Net Electricity Usage of the Entire Project Area		**89,551,839**

/a/ CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

The estimated increase in demand for electricity resulting from reasonably expected implementation of the Proposed Project in the change areas represents approximately 0.4 percent of 23.5 million MWh of total electricity delivered by LADWP in 2013. The dependable plant capability of LADWP is 7,639 MWh[68] with a maximum production of 66.9 million MWh per year by LADWP.[69] LADWP experienced an average Peak Demand of 6,341 MW in 2013. If the average Peak Demand occurred continuously, 24 hours per day, for an entire year, LADWP would have produced 55.5 million MWh.[70] This theoretical maximum capacity scenario would leave LADWP with an additional 11.4 million MWh of potential electricity production in 2013. Thus, the expected increase in electricity demand from the Proposed Project would be less than 0.01 percent of the total remaining potential electricity production.

LADWP projects that in 2035 annual peak demand will grow by approximately 20 percent to 7,715 MW.[71] LADWP's estimated 2035 peak demand considers potential and likely changes that would increase the amount of electricity people will consume such as purchasing more air conditioners and driving electric vehicles to combat more frequent extreme weather conditions as a result of climate change, and the increased use of electric vehicles.[72] Development in the change areas could increase city-wide demand for electricity by 0.4 percent compared to existing conditions, which would be within LADWP's projected increase in peak demand for electricity. LADWP estimates they will produce 11,277 MW in 2035 which would be 3,562 MW or 46 percent more than the projected peak demand in 2035. Therefore, LADWP would generate adequate electrical supply at existing and planned facilities to provide electricity to the Proposed Project.

New development occurring from anticipated development under the Proposed Project in the change areas would be subject to Title 24, Part 6 of the California Administrative Code, the Energy Efficiency Standards for Residential and Nonresidential Buildings, which requires local jurisdictions to use energy efficient appliances, weatherization techniques, and efficient cooling and heating systems to reduce energy demand stemming from new development. In addition, development occurring from the implementation of the Proposed Project in the change areas would be required to comply with the City of Los Angeles' Green Building Code Energy Efficiency requirements. Consequently, as projects are built in the change areas, they will be in compliance with all applicable energy conservation plans and policies of the City. Therefore, the Proposed Project would result in less-than-significant impacts related to electricity.

ALTERNATIVE COMPLIANCE SCENARIO

As shown in **Table 4.13-24**, the Proposed Project with the Alternative Compliance scenario would result in demand for electricity in the change areas to increase by 69,888,521 kWh per year or 69,889 MWh per year or in the Project Area to increase by 70,783,530 kWh per year or 70,784 MWh per year. This increase would be a 42 percent increase over existing electricity usage within the Project Area. The Proposed Project with the Alternative Compliance scenario would result in less demand due to a lower amount of non-residential square footage than would the Proposed Project.

[68]Los Angeles Department of Water and Power, *2014 Integrated Resource Plan*, December 19, 2014.

[69]This is a theoretical maximum capacity figure that assumes LADWP being able to utilize all 7,639 MW capacity of their system uninterrupted 24 hours per day for an entire year. This figure was arrived at by multiplying total capacity (7,639 MW) by total hours in year (8,760 hours/year). The following conversions were also used: 1MW = 1,000 KW; 1MWh = 1,000 kwh.

[70]Los Angeles Department of Water and Power, *2014 Integrated Resource Plan*, December 19, 2014.

[71]*Ibid*.

[72]LADWP expects the use of Plug-in Hybrid Electric Vehicles to exceed 500,000 vehicles to be used within their service area by 2030. (LADWP, *2013 Power Integrated Resources Plan*, 2013).

TABLE 4.13-24: ESTIMATED ELECTRICITY USE IN THE PROJECT AREA WITH PROPOSED PROJECT – ALTERNATIVE COMPLIANCE (2035)

Use	Quantity	Electricity Usage Generation (kWh/year)
Residential	31,060 units	56,760,440
Change Areas	4,954 units	9,937,635
Non-Change Areas	26,106 units	46,822,805
Non-Residential	15,311,503 sf	182,426,187
Change Areas	9,059,551 sf	117,466,410
Non-Change Areas	6,251,952 sf	64,959,777
Total Electricity Usage of the Change Areas		**127,404,045**

Net Electricity Usage for the Entire Project Area		**70,783,530**

/a/ CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

Similar to the Proposed Project, new development occurring from anticipated development under the Alternative Compliance scenario in the change areas would be subject to Title 24, Part 6 of the California Administrative Code, the Energy Efficiency Standards for Residential and Nonresidential Buildings, which requires local jurisdictions to use energy efficient appliances, weatherization techniques, and efficient cooling and heating systems to reduce energy demand stemming from new development. In addition, development occurring from the implementation of the Alternative Compliance scenario in the change areas would be required to comply with the City of Los Angeles' Green Building Code Energy Efficiency requirements. Consequently, as projects are built in the change areas, they will be in compliance with all applicable energy conservation plans and policies of the City. Therefore, the Alternative Compliance scenario would result in less-than-significant impacts related to electricity.

NON-CHANGE AREAS

Tables 4.13-23 and **4.13-24** show the electricity use in the non-change areas. The use of electricity in these areas would occur regardless of the Proposed Project as no changes in zoning or land use designation are proposed in these areas. Similar to new development in the change areas, new development occurring in the non-change areas would also be subject to Title 24, Part 6 of the California Administrative Code, the Energy Efficiency Standards for Residential and Nonresidential Buildings and would be required to comply with the City of Los Angeles' Green Building Code Energy Efficiency requirements. Therefore, impacts to electricity resulting from any development in the non-change areas that is consistent with the current plan would be less than significant.

MITIGATION MEASURES

Impacts related to the inefficient use of electricity would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF AFTER MITIGATION.

Impacts related to the inefficient use of electricity were determined to be less than significant without mitigation.

IMPACT 4.13-11 WOULD IMPLEMENTATION OF THE PROPOSED PROJECT RESULT IN THE INEFFICIENT USE OF NATURAL GAS? THIS IMPACT IS LESS THAN SIGNIFICANT.

Over the course of implementation of the Proposed Project, several changes (such as increased outdoor temperatures due to climate change, and the increased use of natural gas vehicles) are expected to affect the demand for natural gas. SoCalGas projects that as a result of increased temperatures, overall demand for natural gas will decrease at an annual rate of 0.33 percent between 2013 and 2035.[73] In addition, energy use per meter for residential customers is projected to decline due to expected energy savings from improved building construction and insulation, appliance standards, and utility energy efficiency programs. In addition, the NGV market is projected to grow due to federal, State, and local incentives and regulations related to the purchase and operation of alternate fuel vehicles and due to the rising costs of petroleum. At the end of 2013, there were 289 compressed natural gas (CNG) fueling stations delivering 11.4 Bcf of natural gas during the year in California. SoCalGas projects the NGV market will grow in demand from 11.4 Bcf in 2013 to 23.3 Bcf in 2035.

CHANGE AREAS

Implementation of the Proposed Project could result in demand for natural gas in the change areas to increase by approximately 77 MMcf/y or in the Project Area to increase by approximately 83 MMcf/y, as detailed in **Table 4.13-25**. The estimated increase in demand for natural gas resulting from implementation of the change areas more than doubles the existing natural gas usage in the change areas. When compared to total consumption by the entire SoCalGas service territory in 2013 (532 Bcf), the estimated increase in natural gas usage due to future development in the change areas is 0.014 percent.

TABLE 4.13-25: ESTIMATED NATURAL GAS USAGE OF THE PROJECT AREA WITH PROPOSED PROJECT (2035)

Use	Quantity	Natural Gas Usage (cf/year)
Residential	29,441 units	391,301,663
Change Areas	4,507 units	52,452,966
Non-Change Areas	24,934 units	338,848,697
Non-Residential	16,957,415 sf	150,903,802
Change Areas	10,705,463 sf	91,757,350
Non-Change Areas	6,251,952 sf	59,146,452
Total Natural Gas Usage of the Change Areas		**144,210,316**
Total Existing Natural Gas Usage of the Change Areas		*66,797,373*
Net Natural Gas Usage of the Change Areas		**77,412,943**
Total Natural Gas Usage of the Non-Change Areas		**397,995,149**
Total Existing Natural Gas Usage of the Non-Change Areas		*392,450,832*
Net Natural Gas Usage of the Non-Change Areas		**5,544,317**
Total Natural Gas Usage of the Entire Project Area		**542,205,465**
Total Existing Natural Gas Usage of the Entire Project Area		*459,248,205*
Net Natural Gas Usage of the Entire Project Area		**82,957,260**

/a/ CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

Furthermore, SoCalGas' total supply capacity is nearly 2.7 trillion cubic feet per year. Of the total supply capacity by SoCalGas, 532 Bcf was consumed in 2013 in the SoCalGas service territory, or 20 percent of total supply capacity. Thus, the total remaining supply capacity of SoCalGas is approximately 2.2 trillion cubic feet per year. The total expected increase in natural gas usage in the change areas under the Proposed

[73]California Gas and Electric Utilities, 2104 *California Gas Report*, 2014.

Project is approximately 77 MMcf/y and, therefore, would consume much less than 0.01 percent of SoCalGas' remaining supply capacity.

The 2014 California Gas Report provides estimates of projected supply and demand within the SoCalGas service area over the 2010 to 2035 planning horizon.[74] In 2035, SoCalGas projects gas demand to be 2,647 MMcf/d and to have an available supply of 3,875 MMcf/d or 1.4 quadrillion cf/year. The Proposed Project would consume 0.02 percent of SoCalGas' 2035 projected available supply. Therefore, development of the Proposed Project in the change areas would result in less-than-significant impacts related to the inefficient use of natural gas.

ALTERNATIVE COMPLIANCE SCENARIO

The Proposed Project with the Alternative Compliance Scenario could result in demand for natural gas in change areas to increase by 81 MMcf/y and in the Project Area to increase by approximately 87 MMcf/y, as detailed in **Table 4.13-26**. Similar to the Proposed Project, the estimated increase in demand for natural gas resulting from development in the change areas under the Alternative Compliance scenario more than doubles the existing natural gas usage in the change areas. When compared to total consumption by the entire SoCalGas service territory in 2013 (532 Bcf), the estimated increase in natural gas usage due to development of the change areas is 0.15 percent.

TABLE 4.13-26: ESTIMATED NATURAL GAS USAGE OF THE PROJECT AREA WITH PROPOSED PROJECT – ALTERNATIVE COMPLIANCE (2035)

Use	Quantity	Natural Gas Usage (cf/year)
Residential	31,060 units	409,559,000
Change Areas	6,126 units	70,710,303
Non-Change Areas	24,934 units	338,848,697
Non-Residential	15,311,503 sf	136,796,573
Change Areas	9,059,551 sf	77,650,122
Non-Change Areas	6,251,952 sf	59,146,451
Total Natural Gas Usage of the Change Areas		**148,360,425**
Total Existing Natural Gas Usage of the Change Areas		*66,797,373*
Net Natural Gas Usage of the Change Areas		**81,563,052**
Total Natural Gas Usage of the Non-Change Areas		**397,995.148**
Total Existing Natural Gas Usage of the Non-Change Areas		*392,450,832*
Net Natural Gas Usage of the Non-Change Areas		**5,544,316**
Total Natural Gas Usage of the Entire Project Area		**546,355,573**
Total Existing Natural Gas Usage of the Entire Project Area		*459,248,205*
Net Natural Gas Usage of the Entire Project Area		**87,107,368**

/a/ CalEEMod, *Calculation Details for CalEEMod - Appendix D*, July, 2013.
SOURCE: City of Los Angeles, Department of City Planning, February 2014; TAHA, 2017.

Similar to the Proposed Project, the Alternative Compliance scenario would consume less than 0.02 percent of SoCalGas' 2035 projected available supply. Therefore, the Alternative Compliance scenario would result in less-than-significant impacts related to the inefficient use of natural gas.

[74]California Gas and Electric Utilities, 2104 *California Gas Report*, 2014.

NON-CHANGE AREAS

Tables 4.13-25 and **4.13-26** show the natural gas use in the non-change areas. The use of natural gas in these areas would occur regardless of the Proposed Project as no changes in zoning or land use designation are proposed in these areas. Therefore, impacts to natural gas resulting from any development in the non-change areas that is consistent with the current plan would be less than significant.

MITIGATION MEASURES

Impacts related to use of natural gas would be less than significant under the Proposed Project. No mitigation measures are required.

SIGNIFICANCE OF LEVEL AFTER MITIGATION

Impacts related to the use of natural gas were determined to be less than significant without mitigation.

4.14 CUMULATIVE IMPACTS

California Environmental Quality Act (CEQA) defines cumulative impacts as two or more individual actions that, when considered together, are considerable or will compound other environmental impacts. Cumulative impacts are the changes in the environment that result from the incremental impact of development of the Proposed Project and other projects with related impacts. For example, traffic impacts of two nearby projects may be insignificant when analyzed separately but could have a significant impact when analyzed together. Cumulative impact analysis allows the Environmental Impact Report (EIR) to provide a reasonable forecast of future environmental conditions and can more accurately gauge the effects of a series of projects.

CEQA Guidelines Section 15130 allows for the cumulative assessment to address adopted growth forecasts representing growth effects that may occur in the same time frame as the Proposed Project. The following impact analysis considers different geographies as appropriate to each impact. Many cumulative impacts (such as aesthetics and noise) occur within the immediate vicinity of a project (adjacent to or within ½ mile); some impacts (such as impact on local utility lines) affect infrastructure further away (one to two miles); some impacts are at the City level (such as the impact to the City's sewer treatment facilities); some impacts are regional (such as air quality criteria pollutants) and one impact is global (greenhouse gas (GHG) emissions). For transportation impacts, cumulative projects include related transportation projects within the West Area Planning Commission (APC) geography.

In order to provide context for anticipated changes within the ECTNP, **Table 4.14-1** presents projections for population, housing, and employment in the areas adjacent to, but outside of, the Project Area, including portions of the cities of Santa Monica and Culver City. Within two miles of the Project Area (but not including the Project Area itself), approximately 44,000 people, 31,000 dwelling units, and 29,000 employees are forecast to be added by 2035 according the Southern California Associations of Government (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[1] This growth combined with the growth in the Proposed Project Area would broadly represent anticipated cumulative changes.

Anticipated growth is also the foundation for planning initiatives taken by the City of Los Angeles, Department of City Planning. As part of the City's response to 2012-2035 RTP/SCS, the City initiated the Transit Neighborhood Plans (TNP) program to encourage compact, mixed-use development patterns near transit stations as a means of accommodating projected growth. The TNP program, which includes the ECTNP, is intended to provide station area-level planning to areas surrounding new and existing transit stations.

The potential for the ECTNP to result in a cumulatively considerable contribution to impacts in the City is addressed in detail below.

[1]During the preparation of the ECTNP Draft EIR, the 2012-2035 RTP/SCS was the most recent adopted RTP/SCS available. The 2016-2040 RTP/SCS was adopted April 7, 2016, after the analysis in the ECTNP Draft EIR was completed. The 2016-2040 RTP/SCS has been reviewed to determine if there are any substantial differences in policy and/or growth trends associated with the socioeconomic data as compared to the 2012-2035 RTP/SCS. Based on this review it has been determined that the minor refinements in policy and associated updated socioeconomic data in the 2016-2040 RTP/SCS would not substantially affect the analyses or conclusions of this ECTNP EIR. While the SCAG transportation model itself is still not available, SCAG staff indicates that changes to the network and associated calculations are minor. Please see **Appendix K** for a more detailed discussion.

TABLE 4.14-1: ADOPTED GROWTH PROJECTIONS FOR PROPOSED PROJECT ADJACENT AREAS				
	2008/2013 /a/	**2035**	**Change**	**Percent Change**
ONE HALF MILE FROM PROJECT AREA				
Population	73,314	82,651	9,337	13%
Housing	33,035	39,792	6,757	20%
Employment	52,232	56,951	4,719	9%
ONE MILE FROM PROJECT AREA				
Population	153,689	172,540	18,851	12%
Housing	70,032	83,781	13,749	20%
Employment	137,314	149,591	12,277	9%
TWO MILES FROM PROJECT AREA				
Population	362,614	406,412	43,798	12%
Housing	159,928	190,469	30,541	19%
Employment	317,265	345,834	28,569	9%

/a/ Data shown is for 2008; data for 2013 for these boundaries is not available. However, based on economic trends in the region 2008 and 2013 levels are assumed to be equivalent.

AESTHETICS

The added land use capacity in the Proposed Project would be focused in specific areas of proposed change, where new permitted use, design standards, and higher densities/intensities are proposed. In addition, new growth and development would occur outside the areas of proposed change where development would continue to be subject to existing zoning regulations that would not be changed by the Proposed Project. Development occurring either consistent with the Proposed Project or with applicable community plans will be subject to codes and policies intended to reduce visual impacts, and thus would likely have minor or negligible effects on scenic highways, scenic vistas, and other visual resources, including landforms. In addition, the Proposed Project establishes urban design standards and includes eight streetscape plans that require additional landscaping to support a safe and comfortable pedestrian environment and add to the visual quality of the Project Area, particularly along Bundy Drive, Olympic Boulevard, Sepulveda Boulevard, National Boulevard, Palms Boulevard, Pico Boulevard, and Motor Avenue.

As shown in **Table 4.14-1**, substantial future growth is anticipated in areas adjacent to the Proposed Project. In these circumstances, the built environment – i.e. building heights, density and massing – necessary to accommodate projected growth in the Project Area and adjacent areas would likely cumulatively change the visual character of primarily commercially and multi-family zoned areas, as well as increase the potential for adverse shade/shadow affects in areas where low scale uses may be adjacent to taller buildings (residential or commercial). Therefore, there would be cumulative impacts to visual character and shade/shadow impacts, and the Proposed Project's contribution would be cumulatively considerable.

AIR QUALITY

The SCAQMD approach for assessing cumulative air quality impacts is based on the AQMP forecasts of attainment of ambient air quality standards in accordance with the requirements of the federal and state Clean Air Acts. The SCAQMD has set forth significance thresholds designed to assist in the attainment of ambient air quality standards. As shown in Table 4.2-7 in Section 4.2, Air Quality, the 2035 With Project conditions compared to Existing conditions (2013) would not generate regional operational emissions that exceed the SCAQMD significance thresholds, as decreased mobile source emissions associated with a more fuel-efficient vehicle fleet in 2035 would offset increases in consumer product emissions. It is also likely that increasingly stringent controls on consumer products that are not accounted for in the CalEEMod model will reduce emissions from consumer products in the future. (Although VOC emissions would exceed the SCAQMD threshold when comparing Existing (2013) to 2015 With Project conditions, this is a hypothetical and extremely conservative scenario – because it assumes the ECTNP will be fully implemented and all anticipated development constructed and occupied by 2015, however this would not occur.) Development anticipated to

occur beyond the Project Area consistent with the 2012-2035 RTP/SCS and other planning documents is similarly expected to result in lower mobile source emissions in the future. Therefore, cumulative impacts from the operation of the Proposed Project in combination with cumulative projects would be less than significant.

Regarding construction emissions, as shown in Table 4.2-6, it is anticipated that Project-related construction emissions would exceed the regional significance thresholds. Anticipated development that would occur consistent with the 2012-2035 RTP/SCS and other planning documents is anticipated to include the development of hundreds of thousands of square feet of commercial and residential uses, a number that is many times greater than the Proposed Project, and therefore the cumulative impact of this development in combination with development resulting from the Proposed Project would be significant. As the Proposed Project results in a regionally significant impact during construction, the Proposed Project would result in a cumulatively considerable contribution to regional emissions of criteria pollutants as a result of construction activities.

CULTURAL RESOURCES

The analysis of Cultural Resources in Section 4.3 identifies a potentially significant impact to historic resources as a result of the Proposed Project. In addition, development of the Proposed Project in combination with other projects located in the adjacent area would increase the potential for impacts to archaeological, and paleontological resources and could contribute to the loss of such resources in the City. The potential that development consistent with local plans would impact cultural resources during development is determined by a variety of factors, including the type of development that is proposed. All projects would be required to follow City of Los Angeles and CEQA regulations and policies, though projects that do not require discretionary review may not be subject to the same level of evaluation and thus result in impacts to cultural resources. Therefore cumulative impacts from the Proposed Project along with surrounding development would be significant. However, development within the Project Area would be subject to mitigation measures (see Mitigation Measures **CR1** through **CR4** in Section 4.3, Cultural Resources), which would reduce the Project's potential impacts on archaeological and paleontological resources to less than significant. Consequently, the incremental effects of the Proposed Project, after mitigation, would not be cumulatively considerable with respect to archaeological and paleontological resources. The project's potentially significant impacts on historic resources would be a cumulatively significant contribution to such impacts citywide.

GEOLOGY AND SOILS

Development in all areas of the City of Los Angeles, including the Project Area, is required to be reviewed for seismic safety and soil stability and would be required to comply with all applicable regulations, codes, and requirements, including the California Building Code and City of Los Angeles Building Code. Therefore, there would not be a cumulative impact related to geology and soils.

GREENHOUSE GAS (GHG) EMISSIONS

In order to reduce vehicle miles traveled (VMT) and therefore GHG emissions (consistent with Assembly Bill (AB) 32, Senate Bill 375, the 2012-2035 RTP/SCS, and the 2016-2040 RTP/SCS), the ECTNP concentrates growth around transit; promotes compact, mixed-use development; and improves streets to accommodate a variety of transportation modes.

The City is undertaking a number of complementary and parallel planning efforts that are anticipated to reduce total and per capita VMT and therefore GHG emissions. The Proposed Project is not occurring in isolation, it is part of a regional strategy (contained in both the 2012-2035 RTP/SCS and the 2016-2040 RTP/SCS) to direct growth to urban areas served by transit in order to achieve the following:

- Develop areas in close proximity to transit in order to reduce vehicular trips.
- Create a mix of uses that encourages pedestrian and bicycle activity reducing vehicle trips; and

- Undertake modern, efficient construction techniques and compact development patterns, both of which result in using less energy and less water as compared to lower intensity, dispersed development patterns.

The City of Los Angeles recently adopted the Mobility Plan (MP 2035). MP 2035 was prepared in compliance with the 2008 Complete Streets Act (AB 1358), which mandates that the circulation element of the General Plan be modified to plan for a balanced, multimodal transportation network. The MP 2035 reflects current state and regional policies and programs aimed at balancing land use and transportation planning and reducing VMT and associated GHG emissions.

Analysis prepared for this Draft EIR that assumed MP 2035 to be in place (see Section 4.12, Transportation and Traffic) showed that the ECTNP would result in shorter and fewer trips as compared to more traditional development and therefore would be consistent with the policies and goals in both the 2012-2035 RTP/SCS and the 2016-2040 RTP/SCS, and would contribute to reducing cumulative GHG emissions in the City and region.

Because the City is undertaking parallel planning efforts, these efforts cannot be fully reflective of each other. The transportation planning efforts being undertaken in MP 2035 and the Coastal Transportation Corridor Specific Plan and West Los Angeles Traffic Improvement and Mitigation Specific Plan (CTCSP/WLA TIMP) amendments would complement the ECTNP, likely reducing per capita GHG emissions and climate change impacts as compared to those analyzed in this EIR. In addition, City regulations, such as the Green Building Code, would reduce the carbon footprints of general development. Development would be entirely consistent with state, regional, and local goals to place new development in areas with transportation options. Therefore, cumulative impacts to GHG emissions would not be significant.

HAZARDS AND HAZARDOUS MATERIALS

Development of the Proposed Project, in combination with development in adjacent areas consistent with local plans, has the potential to increase the risks associated with the use and potential accidental release of hazardous materials. However, as discussed in Section 4.6, Hazards and Hazardous Materials, the use, storage, transport and disposal of hazardous materials are well regulated and compliance with existing regulations both within the Project Area and in adjacent areas would ensure this cumulative impact remains less than significant.

With respect to future development both within the Project Area and surrounding areas, the potential presence of hazardous substances on a development site would require evaluation on a case-by-case basis, in conjunction with the development proposals for each of these properties. Local municipalities are required to follow local, state, and federal laws regarding hazardous materials, which would further ensure that potential contamination or exposure to hazardous materials is avoided or controlled to minimize the risk to the public as future development projects are implemented. However, the cumulative impact from developing on hazardous sites would still be potentially significant. Development under the Proposed Project would be subject to Mitigation Measure **HM1**, which requires that future development located on or near an identified hazardous materials site be subject to a Phase I Environmental Site Assessment to ensure that any potential hazards are evaluated and mitigated as recommended as appropriate. Therefore, the Proposed Project would not result in a cumulatively considerable impact with respect to hazardous materials.

HYDROLOGY AND WATER QUALITY

Cumulative impacts on hydrology and water quality would result from incremental changes that degrade water quality or contribute to drainage issues and flooding within and adjacent to the Project Area. While existing poor drainage and flooding may exist in the Project Area, impacts resulting from new development are generally localized and are addressed by Building and Safety as part of the review of individual projects. Groundwater can be affected by increasing impervious surfaces or contamination from hazardous wastes of individual uses; these issues are addressed project-by-project and as a result of regulatory oversight are generally not of concern for new development in the highly urbanized Project Area.

Significant impacts to water quality are addressed at the regional level. As of March 2012, the USEPA has approved 22 Total Maximum Daily Loads (TMDL) throughout the region that list the City of Los Angeles as a responsible jurisdiction. These include waterbodies within the Los Angeles River, Ballona Creek, Santa Monica Bay, and Dominguez Channel Watersheds. Santa Monica Bay's beaches and other waterbodies within the Watershed are impaired by pollutants (i.e., debris, bacteria, and toxics) mainly because portions of the Watershed have large, dense populations and significant amounts of impervious ground surface that prevents large quantities of runoff from infiltrating into the soils. Currently there are several TMDLs for waterbodies in the City's portion of the Watershed, including:

- Santa Monica Bay Nearshore Debris TMDL
- Santa Monica Bay DDTs and PCBs TMDL
- Santa Monica Bay Beaches Wet Weather Bacteria TMDL
- Santa Monica Bay Beaches Dry Weather Bacteria TMDL
- Marina del Rey TMDLs (Toxics and Bacteria)

The City with other agencies in the Santa Monica Bay watershed is currently developing an Enhanced Watershed Management Program (EWMP). The EWMP identifies measures for compliance with all Santa Monica Bay TMDLs and other water quality mandates, while maximizing potential benefits of stormwater for local water supply.

As discussed in Section 4.7, Hydrology and Water Quality, with compliance with existing federal, state, and local policies and regulations, development of future individual projects in the areas of proposed change would not result in any significant impacts on water quality, groundwater, or stormwater drainage. Future development that could be implemented within and adjacent to the Project Area consistent with local plans would continue to be subject to applicable City codes and community plan policies that address the effects of erosion and pollutant discharges on hydrology and water quality. Therefore, the Proposed Project's hydrology and water quality impacts would not be considered cumulatively considerable.

LAND USE AND PLANNING

The Proposed Project would guide future development in the areas around five light rail stations along the Expo Light Rail Transit (LRT) Line within the City of Los Angeles in order to promote transit ridership, reduce automobile dependence, and create vibrant neighborhoods around the stations. The Proposed Project is intended to accommodate anticipated growth in compliance with City and regional policies. The Proposed Project has tailored proposed land use changes to accommodate anticipated growth per SCAG projections and economic and market considerations. The added land use capacity would be focused on specific areas of proposed change, where new permitted uses, design standards and guidelines, and higher densities are proposed. Development of the areas of proposed change under the ECTNP would increase the residential and commercial retail/office uses located along the Expo LRT corridor and station areas. In addition, growth and development would continue to occur outside the areas of proposed change consistent with existing zoning regulations that would not be changed by the Proposed Project. Development both within the Project Area and surrounding areas would take place within an already urbanized context and would not result in land use changes that would create land use conflicts and/or divide communities. All development projects would be required to comply with applicable regulations and Citywide planning standards and would be subject to the City planning process and environmental review as applicable. Therefore, cumulative land use impacts would be less than significant.

NOISE

The noise analysis assessed construction and operational noise and vibration levels. During construction of future development under the Proposed Project, sensitive receptors would be exposed to noise levels in excess of the established significance thresholds. Construction noise levels decrease substantially with distance. Consequently, in order to achieve a substantial cumulative increase in construction noise levels, more than one source emitting high levels of construction noise would need to be in close proximity to a noise receptor. The potential exists for overlapping construction activity between individual projects. The possibility exists that a

substantial cumulative increase in construction noise levels could result from construction associated with multiple projects both within and adjacent to the Project Area. Therefore, the Proposed Project would result in a cumulatively considerable impact related to construction noise. Vibration impacts are highly localized and a cumulatively considerable contribution to vibration impacts is not anticipated.

Noise from street traffic is addressed in Section 4.9, Noise of this Draft EIR. The traffic analysis presented in the Draft EIR took into account the combined effect of project-generated traffic, existing traffic volumes and future through traffic from areas both within and adjacent to the Project Area. **Table 4.14-2** presents the cumulative increase in future traffic noise levels at intersections surrounding each station. None of the analyzed intersections would experience an increase in noise levels that exceed 3 dBA CNEL (Community Noise Equivalent Level). The significance threshold for operational noise states that an impact would occur if the ambient noise level measured at the property line of affected uses increases by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in Table 4.9-1 in Section 4.9, Noise, or any 5 dBA or more increase in noise level. Cumulative mobile source noise levels would not exceed the significance thresholds. Therefore, there would not be a cumulative impact related to operational noise from mobile sources.

TABLE 4.14-2: ESTIMATED MOBILE SOURCE NOISE LEVELS – CUMULATIVE

Roadway	CNEL

SOURCE: TAHA, 2017.

An additional source of operational noise includes new stationary sources such as heating ventilation, and air conditioning (HVAC) systems. Large HVAC systems could result in noise levels that average between 50 and 65 dBA Leq at 50 feet from the equipment. HVAC units would be mounted on the rooftops and, as required by Los Angeles Municipal Code (LAMC) Section 112.02, HVAC units would be required to reduce noise such that the noise levels of adjoining units and adjacent properties do not exceed ambient noise levels by 5 dBA. Compliance with LAMC Section 112.02 would ensure that noise levels from the introduction of new HVAC units remains below LAMC standards. These types of mechanical equipment are typical to urban infill developments and are common throughout the City, and compliance with the LAMC would ensure that the cumulative impact of the Proposed Project with projects in the surrounding area remains less than significant.

Existing vibration levels are typically not perceptible in the Project Area. It is not anticipated that the Proposed Project would include substantial sources of operational vibration (e.g., turbines). The Proposed Project would not contribute to a cumulatively considerable vibration impact during operation.

POPULATION, HOUSING, AND EMPLOYMENT

SCAG projects an increase in population, employment, and housing in the Los Angeles area. To achieve the objective of concentrating growth near transit and transit stations, the Proposed Project accommodates slightly more employment than in the SCAG projection for the area. The Proposed Project seeks to accommodate this forecast growth in an efficient and sustainable manner. While other specific plans and community plans, as well as regional plans, also seek to accommodate forecasted growth and generally do not induce growth, some of these other plans could have the potential to result in significant impacts to population, employment, and/or housing. **Table 4.14-1** illustrates the adopted growth projections for areas adjacent to the Project Area. **Table 4.14-3** provides additional context with respect to the combined effect of the growth from the Proposed Project with the growth for a two-mile area surrounding the Project Area. It is anticipated that, compared to existing conditions, the combined 2035 population (Proposed Project and the surrounding two-mile area together) would increase by approximately 53,000 persons, housing by approximately 35,000 units, and employment by approximately 43,000 jobs. The Proposed Project Area's proportion of the combined dwelling units and population growth would be 13 and 17 percent, respectively, while the Project Area's proportion of combined employment growth would be approximately 33 percent. As discussed in Section 4.10, Population, Housing, and Employment, the growth anticipated from the Proposed Project is consistent with SCAG projections for the area, as it directs growth – and in particular, employment growth – to areas around transit. The Proposed Project's growth is also consistent with the market study prepared for the project, which forecasts an increase in demand for jobs and housing in this area. Although there is a potential cumulative impact on population, housing, and employment, the Proposed Project's contribution is not cumulatively considerable.

TABLE 4.14-3: INCREASE IN POPULATION, HOUSING, EMPLOYMENT (2013-2035) – CUMULATIVE

	Proposed Project Area	Two Miles from Project Area	Total Increase	Project Percentage of Total Increase
Population	8,976	43,798	52,774	17%
Housing	4,423	30,541	34,964	13%
Employment	14,334	28,569	42,903	33%

SOURCE: TAHA, 2017.

As presented in Chapter 3.0, Project Description, the Proposed Project would increase the land use intensity for several areas that are currently zoned for residential use. Also, there may be existing circumstances within the Project Area, as well as adjacent to the Project Area, where residences may occupy land either zoned for commercial or industrial use and/or a higher density residential use. These existing circumstances represent a potential for redevelopment and displacement. However, this potential displacement would be temporary, and it is ultimately anticipated that there would be a net increase in housing stock as properties

are redeveloped. Consequently, the redevelopment of existing residences to either higher density residential use or non-residential use would not be a cumulative impact.

PUBLIC SERVICES

Fire Protection and Emergency Services. The implementation of the Proposed Project would result in increased intensity of development in the Project Area, particularly in the areas of proposed change. Additional development would also occur in the areas surrounding the Project Area, consistent with the SCAG RTP/SCS projections. This cumulative growth could contribute to an increased demand for fire protection services in the Los Angeles area. However, the growth that would occur both in the Project Area and in surrounding areas would be consistent with 2035 SCAG projections, and therefore is anticipated by LAFD. As discussed in Section 4.12, Transportation and Traffic, the Proposed Project would increase traffic in the area resulting in potential delays for emergency vehicles. While both the MP 2035 and CTCSP/WLA TIMP – the projects considered in the cumulative transportation analysis - include proposed roadway network changes, they do not provide detailed intersection level designs in the Project Area. It is possible that some of these roadway improvements would provide a benefit to emergency access. Planning Department Staff have discussed the Los Angeles Fire Department (LAFD) Strategic Plan and its relationship to growth and traffic with LAFD Staff in order to understand how LAFD responds to growth and changes in traffic from cumulative development and changes to the roadway network. LAFD advised that while increasing congestion is a factor in how they address emergency response, their ongoing planning efforts, including the LAFD Strategic Plan, take in to account such increases in congestion and LAFD continues to plan for and maintain public safety and emergency service as required. LAFD will continue to monitor any impact of growth and changes to the roadway network may have on response times and make adjustments as necessary. These adjustments may or may not include redeploying resources, adding staff or building new fire stations. Construction of new emergency service facilities as a result of increased traffic delays is not reasonably foreseeable at the present time given the number of factors that affect emergency response. Even if new facilities were needed and constructed impacts would generally fall within those discussed in this document, except for potential operational noise impacts associated with new emergency response facilities. However, it is too speculative to determine even if new facilities would be needed, let alone where noise impacts could occur.

Based on conversations with LAFD regarding growth and roadway changes including the ECTNP and the two other related plans in the area, cumulative impacts are considered less than significant.

Police Protection Services. Similar to Fire Protection Services, above, the implementation of the Proposed Project, along with general growth that would occur in surrounding areas, would likely contribute to the citywide need for greater and expanded police services. However, because police services are mobile in nature, the increased demand would not necessarily result in the need to construct new or expanded police facilities. Like the LAFD, in conformance with existing policies, procedures, and practices, Los Angeles Police Department (LAPD) would continue to maintain acceptable service levels through the provision of additional personnel and equipment as needed. Therefore, cumulative impacts related to police protection services would be less than significant.

Public Schools. The anticipated student population generated by the Proposed Project would contribute to the demand for public school services in the Los Angeles Unified School District (LAUSD). The implementation of the Proposed Project would result in an increase in the student population in the Project Area (approximately 2,100 students). In general, LAUSD currently focuses on sending students to local schools near their place of residence, therefore an evaluation of student generation within one mile of the Project Area is useful to understand the impact on local schools. The adopted 2035 growth forecast for adjacent areas within one mile of the Project Area suggest that there would be an additional approximately 4,600 students, as shown in **Table 4.14-4**.

TABLE 4.14-4: 2035 CUMULATIVE STUDENT INCREASE

Level	Project Area	Adjacent Area within One Mile /a/	Total Increase	Project Percentage of Total Increase
Elementary	996	2,161	3,157	31.5%
High School	605	1,320	1,925	31.4%
Middle	509	1,103	1,612	31.6%
TOTAL	**2,110**	**4,585**	**6,695**	**31.5%**

/a/ Adjacent area assumes the adopted growth forecast for 1-mile area adjacent to the Project Area. See **Table 4.14-1**. Student generation rates were assumed to be the same for adjacent areas as for the Project Area as shown on Table 4.11-10.

Thus, the Project Area would likely account for approximately 31 percent of the cumulative increase in the number of students for the Project Area and surrounding one-mile area combined. It should be noted that in general, existing public, non-charter student enrollments have been below operating capacities in existing LAUSD schools in West Los Angeles. Projects are required to pay state mandated fees in order to mitigate potential impacts to schools. It is anticipated that with payment of the applicable fees and the operation of the LAUSD New School Construction Program and Facilities Services Division Strategic Execution Plan, as well as provisions of state regulations to increase funding to schools, school facilities would have the potential to accommodate the anticipated increase in the student population. Therefore, cumulative impacts related to public schools would not be significant.

Public Parks and Libraries. As discussed in Section 4.11, Public Services, the existing overall parkland acreage, particularly neighborhood parks, in the Project Area is not adequate to accommodate the anticipated increase in population because there is currently an acute shortage of parkland and recreational facilities in the Project Area and surrounding communities. Implementation of the Proposed Project would further exacerbate this shortage in the Project Area and surrounding community plan areas. Specifically, as shown on Table 4.11-15, the Proposed Project would result in a demand for over 250 acres of neighborhood and community parkland. The projected population growth within a mile of the Project Area would increase this demand by an additional 690 acres.[2] Therefore, the Proposed Project would result in a project specific impact related to public parks which would contribute to a significant cumulative impact.

Some public libraries located within the Project Area are presently inadequate to serve their residents in terms of the required library space and materials collection. At present, five of the seven public libraries servicing the Project Area do not meet the newly adopted library facilities standards in terms of building size for the population served. However, the Branch Facilities Plan does identify the expansion of the West Los Angeles Branch from 14,000 square feet to 20,000 square feet. The Branch Facilities Plan will continue to forecast future demand for library facilities and ensure that adequate facilities and related improvements are available to serve the population of the Project Area. In addition, library requirements are changing with the advent of increasing resources being available on-line. While the increase in population as a result of the Proposed Project and cumulative development may create a demand for library services, residential units within new buildings are likely to have Internet access to alleviate some of the need for library services and resources. Therefore, the Proposed Project would not result in a cumulatively considerable impact related to public libraries.

[2]Table 4.14-1, one mile adjacent area population (172,540) times 4 acres per 1,000 persons.

TRANSPORTATION AND TRAFFIC

Two City of Los Angeles plans have been identified as potentially having overlapping impacts with the Proposed Project: the recently adopted City of Los Angeles MP 2035 and the proposed CTCSP/WLA TIMP. The impacts of these plans in combination with the Proposed Project are discussed for each transportation impact area below.

Circulation System. As described, potential impacts to the circulation system were evaluated. V/C ratios and LOS calculations were prepared for Existing conditions (2015), Existing conditions With Project (2015), Future Without Project (2035), and Future With Project (2035) conditions. The addition of the Proposed Project would result in significant impacts at 47 intersections in 2015, of which 42 would remain significant after mitigation, and 56 intersections in 2035, of which 50 would remain significant after mitigation measures are applied. Under current CEQA Guidelines and City thresholds, this is considered a significant adverse impact. Roadway network changes that could result from MP 2035 and CTCSP/WLA TIMP have not been designed, and, therefore, detailed evaluation of potential traffic impacts with these projects at the intersection level of detail is not possible. As explained in the respective EIRs for these two projects, each would individually result in traffic impacts at the areawide level. The combination of the Proposed Project together with MP 2035 and CTCSP/WLA TIMP would result in traffic impacts worse than those identified for the year 2035 with Project in the intersection analysis above. All three projects together would result in significant traffic impacts. The Proposed Project would result in a cumulatively considerable contribution to circulation system impacts in the Project Area.

Neighborhood Intrusion. The EIR modeling analysis accounts for potential redistribution of vehicular traffic from highly congested roadway segments to roadway segments that have more available capacity. Along roadways where the Proposed Project would cause significant traffic congestion, diversion of trips could occur onto adjacent parallel routes. While the TDM plans required by LADOT can alleviate neighborhood traffic intrusion from individual developments within the ECTNP Area, regional growth and associated increases in activity levels may still result in vehicles diverting to residential roadways. As noted, while both the MP 2035 and CTCSP/WLA TIMP include proposed roadway network changes, they do not provide detailed intersection level designs in the study area. Therefore, as noted above, detailed evaluation of traffic and associated impacts from these projects is not possible. On a regional level, traffic in the study area is anticipated to increase in conjunction with regional population, housing, and employment growth projected to occur in the future by SCAG. This growth would occur with or without implementation of the Proposed Project. The background growth influences the transportation analysis by accounting for the increased activity levels under Future with Project conditions, although those increases would occur with or without the project. The combination of the Proposed Project together with the anticipated roadway network changes in MP 2035 and the CTCSP/WLA TIMP would further increase traffic and associated impacts, such as neighborhood intrusion, as compared to the 2035 with Project scenario analyzed for the Project in Impact 4.12-3. Therefore, there is a significant impact to neighborhood intrusion from cumulative projects. The Proposed Project would result in a cumulatively considerable contribution to neighborhood intrusion impacts.

Congestion Management Plan (CMP). As defined by the CMP, a significant impact occurs when a project increases traffic demand on a CMP facility by two percent of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$); if the facility is already at LOS F, a significant impact occurs when a project increases traffic demand on a CMP facility by two percent of capacity ($V/C \geq 0.02$). On a regional level, traffic in the Project Area is anticipated to increase in conjunction with regional population, housing, and employment growth projected to occur in the future by SCAG. This growth would occur with or without implementation of the Proposed Project. The background growth influences the transportation analysis by accounting for the increased activity levels under Future With Project conditions, although those increases would occur with or without the Project. Consequently, when comparing traffic operations on the CMP network under Future With Project conditions to Future No Project conditions, peak period congestion continues to increase as a result of background and project growth. The combination of the Proposed Project together with the anticipated roadway network changes in MP 2035 and the CTCSP/WLA TIMP would further increase traffic and

associated roadway impacts, such as impacts on CMP arterial facilities, as compared to the 2035 with Project scenario analyzed for the project in Impact 4.12-5. The Proposed Project would result in a cumulatively considerable contribution to CMP arterial impacts. The Proposed Project would not meet CMP criteria for a significant impact to freeways or transit service (Impacts 4.12-4 and 4.12-6). The thresholds used to determine significant project-level impacts to freeways and transit service are also used to determine the potential for cumulatively considerable contributions to these impacts. Therefore, the Proposed Project would not make a cumulatively considerable contribution to freeway or transit service impacts using CMP criteria.

Emergency Access. As discussed above, the Proposed Project would increase traffic in the area resulting in potential delays for emergency vehicles. As noted above, while both the MP 2035 and CTCSP/WLA TIMP include proposed roadway network changes, they do not provide detailed intersection level concepts in the study area. It is possible that some of these roadway improvements would provide a benefit to emergency access. As discussed above, Department of City Planning Staff have discussed the LAFD Strategic Plan and its relationship to growth and traffic with LAFD Staff in order to understand how LAFD responds to growth and changes in traffic from cumulative development and changes to the roadway network. LAFD advised that while increasing congestion is a factor in how they address emergency response, their ongoing planning efforts, including the LAFD Strategic Plan, take in to account such increases in congestion and LAFD continues to plan for and maintain public safety and emergency service as required. LAFD will continue to monitor any impact of growth and changes to the roadway network may have on response times and make adjustments as necessary. These adjustments may or may not include redeploying resources, adding staff or building new fire stations. Based on conversations with LAFD regarding this project and the two other related plans in the area, cumulative impacts are considered less than significant.

Construction of new emergency service facilities as a result of increased traffic delays is not reasonably foreseeable at the present time given the number of factors that affect emergency response. Even if new facilities were needed and constructed impacts would generally fall within those discussed in this document, except for potential operational noise impacts associated with new emergency response facilities. However, it is too speculative to determine even if new facilities would be needed, let alone where noise impacts could occur.

UTILITIES AND SERVICE SYSTEMS

Water Supply. The issues of water demand and supply are region-wide in the southern California area and transcend the boundaries of individual specific plans and community plan areas or even the City. As discussed in Section 4.13, Utilities and Service Systems, implementation of the Proposed Project would result in a net increase in water usage of over 3.7 million gallons per day or 4,169 acre feet per year by year 2035 as compared to existing water usage within the Project Area. However, when placed in a regional context, the increase in water usage as a result of the Proposed Project is equivalent to less than a one percent increase of the total water supplied by the Los Angeles Department of Water and Power (LADWP) in 2012. Every five years, water suppliers are required to develop Urban Water Management Plans (UWMPs) to identify short-term and long-term water demand management measures to meet growing water demands. The LADWP, as a water supplier, has prepared and adopted an UWMP, the latest of which was completed in the year 2015. The 2015 UWMP addresses growth citywide consistent with SCAG forecasted growth for the City. The 2015 UWMP serves as a master plan for water supply and resources management consistent with the City's goals and policy objectives; and provides full compliance with the requirements of the Urban Water Management Planning Act. Faced with increasing demands for additional water supplies and drought conditions, several sustainability initiatives continue to be implemented to decrease water use by up to 25 percent per capita over the next 20 years, reduce dependence on imported water supplies, and accelerate the development of local supplies.[3] Since the Proposed Project would be consistent with growth analyzed in the UWMP, the Proposed Project would not result in a cumulatively considerable contribution related to city-wide water use.

[3]LADWP, *2015 Urban Water Management Plan*.

Wastewater. The issue of wastewater flow is a citywide concern and transcends the boundaries of individual specific plans and community plan areas. The existing citywide wastewater flow is approximately 466.5 million gallons per day (gpd), whereas the existing wastewater generation within the Project Area is less than 6.7 million gpd. The net increase in wastewater flows resulting from the Proposed Project in year 2035 would be less than 1.5 million gpd. Implementation of the Proposed Project would contribute to an anticipated Citywide increase in wastewater flow, as well as placing added demands on the wastewater conveyance system as future projects are undertaken in pursuit of the goals, policies, and objectives of the Proposed Project. However, the cumulative result of requiring new developments to meet rigorous design and performance standards in conjunction with a ready overflow response plan and proactive monitoring practices has resulted in the absence of wet-weather overflows since 2006. Furthermore, as stated in Section 4.13 Utilities and Service Systems, the existing sewer infrastructure has no conveyance capacity constraints and is in good to very good structural condition. Therefore, the Proposed Project would not result in a cumulatively considerable impact related to wastewater.

Solid Waste. Solid waste management is another citywide concern with growing solid waste disposal needs. The Bureau of Sanitation (LASAN) is responsible for solid waste disposal in the City of Los Angeles. LASAN addresses solid waste disposal through a variety of means, including maximizing recycling and reuse and minimizing use of landfills. The RENEW LA Plan provides a 20-year blueprint to guide the City in reducing use of landfills. The project would be consistent with growth forecasts for the City and would be required to implement aggressive recycling consistent with RENEW LA. The existing solid waste capacity and collection system would be able to accommodate the anticipated increase in solid waste generated from the Proposed Project and planned growth consistent with Bureau of Sanitation plans. Neither the Los Angeles County Department of Public Works as part of the Countywide Integrated Waste Management Plan (2014) nor LASAN have identified any long-term issues in providing solid waste disposal; therefore, the Proposed Project would not result in a cumulatively considerable impact related to solid waste.

Energy. Implementation of the Proposed Project would cause an increase in the citywide consumption of non-renewable energy resources, including electricity and natural gas. As discussed in Section 4.13, Utilities and Service Systems, while implementation of the Proposed Project would increase demand for electricity and natural gas, the impact to the City's energy resources would be less than significant. LADWP is responsible for provision of electricity to the City; Southern California Edison and Sempra Energy provide natural gas. Both LADWP and the natural gas providers undertake long-term planning for the provision of energy based on SCAG forecasts. No long-term supply issue has been identified by these entities. Therefore, the Proposed Project would not result in a cumulatively considerable impact related to energy.

SUMMARY

In summary, while CEQA recognizes that the analysis of cumulative impacts need not be as detailed as the analysis of project level impacts, the analysis of cumulative impacts should "be guided by the standards of practicality and reasonableness" (CEQA Guidelines Section 15130(b)). The analysis presented above concluded that the Proposed Project would result in cumulatively considerable impacts related to aesthetics (visual character and shade/shadow), air quality (construction), cultural resources (historic resources), noise (construction), public services (parks), and traffic (circulation, neighborhood intrusion, and CMP arterial facilities).

5.0 ALTERNATIVES

California Environmental Quality Act (CEQA) requires that an Environmental Impact Report (EIR) describe a range of reasonable alternatives to the project or to the location of the project that could feasibly avoid or substantially lessen significant environmental impacts while attaining most of the basic objectives of the project.[1] An EIR should also evaluate the comparative merits of the alternatives. This chapter sets forth potential alternatives to the Exposition Corridor Transit Neighborhood Plan (ECTNP or Proposed Project) and provides a qualitative analysis of each alternative and a comparison of each alternative to the Proposed Project. Key provisions of the CEQA Guidelines pertaining to the alternatives analysis are summarized below.[2]

- The discussion of alternatives shall focus on alternatives to the project including alternative locations that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.
- The No Project Alternative shall be evaluated along with its potential impacts. The No Project Alternative analysis shall discuss the existing conditions at the time the notice of preparation is published, as well as what would reasonably be expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services.
- The range of alternatives required in an EIR is governed by a "rule of reason." Therefore, the EIR must evaluate only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the Proposed Project.
- For alternative locations, only locations that are available to the applicant and would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR.
- An EIR need not consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative.

The range of potentially feasible alternatives is selected and discussed in a manner intended to foster meaningful public participation and informed decision making. Among the factors that may be taken into account when addressing the potential feasibility of alternatives (as described in CEQA Guidelines Section 15126.6[f][1]) are environmental impacts, site suitability, economic viability, availability of infrastructure, general plan consistency, regulatory limitations, jurisdictional boundaries, and whether the proponent could reasonably acquire, control, or otherwise have access to the alternative site.

An EIR must briefly describe the rationale for selection and rejection of alternatives. The lead agency may make an initial determination as to which alternatives are potentially feasible, and, therefore, merit in-depth consideration.[3] Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet project objectives, are infeasible, or do not avoid any significant environmental effects.[4]

The decision of whether to adopt an alternative identified in this EIR as the project will be made by the City Council after it certifies this EIR. In making that decision, the City Council will make findings in which it will find which alternatives, if any, are in fact feasible, pursuant Public Resources Code Section 21081 and CEQA Guidelines Section 15091.

5.1 PROJECT-LEVEL IMPACTS

As discussed in Chapter 3.0, Project Description, the Proposed Project includes an Alternative Compliance procedure that would allow designated sites (within the areas of proposed change) to have a different mix of residential and non-residential uses than required per the proposed zoning of the property (Figures 3-3a and 3-3b in Chapter 3.0, Project Description). Projects utilizing this path would still be subject to the maximum FAR and other zoning and development standards and would also be required to provide increased public benefits and affordable housing.

As addressed in this EIR, the Proposed Project would create significant and unavoidable impacts associated with:

- **Aesthetics (Visual Character and Shade & Shadow)**. SB 743 states that the aesthetic impacts of a residential, mixed use residential, or employment center project on an infill site within a Transit Priority Area (TPA) shall not be considered significant impacts on the environment. Such projects are typical of the kinds of projects anticipated by the Proposed Project. Although a majority of the Project Area is located in a TPA, a portion of the Project Area is not. Therefore, a discussion of aesthetic impacts is provided below. The proposed land use and zoning changes that allow increases in height, scale, and density in the Project Area could substantially degrade the existing visual character or quality in various portions of the Project Area. Therefore, the Proposed Project over time would result in a significant and unavoidable impact related to visual character. In addition, future development could cast shadows on shadow-sensitive land uses for a potentially significant period of time. Therefore, the Proposed Project would result in a significant and unavoidable impact related to shade and shadow.

- **Air Quality (construction)**. During construction of development projects that are consistent with the ECTNP, regional and localized emissions would exceed the SCAQMD significance thresholds. Therefore, the Proposed Project would result in a significant and unavoidable impact related to violating regional and localized air quality standards, or contributing substantially to existing violations, for construction emissions. Also during construction, sensitive receptors could be exposed to substantial pollutant concentrations. Therefore, despite compliance with standards established by a federal, state, and regional regulations, and mitigation measures, the Proposed Project could result in a significant and unavoidable impact related to exposing sensitive receptors to substantial pollutant concentrations during construction.

- **Cultural Resources (Historical Resources).** It is possible that demolition and /or significant alteration to some of the historical resources identified in this EIR may occur. Beyond the existing regulatory framework and the Proposed Plan standards that will assist in protecting both designated and eligible historical resources, no feasible mitigation measures have been identified to reduce the significant impact to less than significant. Therefore, the Proposed Project could result in a significant and unavoidable impact related to historical resources.

- **Noise (Construction Noise and Vibration, Operational Noise)**. Noise levels from various mechanized construction equipment would exceed 75 dBA at distances of 50 feet from the equipment which could exceed the limitations established in LAMC Section 112.05. Therefore, despite the implementation of mitigations to reduce construction noise and vibration levels, the Proposed Project would result in a significant and unavoidable impact related to construction noise and vibration (including excessive vibration or ground-borne noise levels, substantial temporary or period increases in ambient noise levels, and exceeding established standards). Additionally, new ambient noise sources, such as truck deliveries, at new commercial uses in mixed use developments and developments adjacent to sensitive uses may result in a substantial permanent increase in ambient noise levels in the proposed project vicinity above levels existing without the project. Therefore, despite implementation of mitigation to reduce noise

levels, the proposed project would result in a significant and unavoidable impact related to a permanent increase in ambient noise.

- **Public Services (Public Parks)**. There is an existing deficit in park spaces in the Project Area. Increased development in the Project Area would increase the demand for parks and recreational facilities. This increased demand would be met in part through compliance with City requirements and through the public benefits required by the ECTNP of commercial and mixed use projects, as well as new open space around Westwood Station. However, it is anticipated that these requirements would be insufficient to meet the demand from new development and that the increased demand would exacerbate the existing park deficit in the Project Area. No feasible mitigation measures were identified to reduce the significant impact to less than significant. Therefore, the Proposed Project would result in a significant and unavoidable impact related to public parks.

- **Transportation and Traffic**. Due to the increase in development capacity, significant impacts would occur to the circulation system and at individual study intersections as a result of the Proposed Project. Specifically, the addition of the Proposed Project would result in significant impacts at 47 intersections in 2015, of which 42 intersections would remain significant after mitigation, and 56 intersections in 2035, of which 50 would remain significant after mitigation measures are applied. Furthermore, increased development may cause some trips to divert to adjacent streets to avoid congested intersections, resulting in neighborhood intrusion impacts. Therefore, the Proposed Project would result in a significant and unavoidable impact related to transportation and traffic.

Other potentially significant impacts have been identified; however, all of these impacts would be reduced to less than significant levels with implementation of mitigation measures identified in the respective impact analysis sections of this EIR.

- **Aesthetics**. The Proposed Project would have created a new source of substantial light or glare that would have adversely affected day- or nighttime public views in the Project Area. However, with mitigation measures requiring non-reflective building and construction materials, this impact would be reduced to a less than significant level.

- **Cultural Resources**. The Proposed Project would have caused a substantial adverse change in the significance of an archeological resource. However, mitigation measures will require that a qualified archaeologist monitor excavation and grading activities in soils that have not been previously disturbed and, if necessary, assess and process any archeological resources in consultation with the City's Office of Historic Resources. Additionally, the Proposed Project could have directly or indirectly destroyed a unique paleontological resource or site or unique geologic feature. However, mitigation measures will require that a qualified paleontologist monitor excavation and grading activities in soils that have not been previously disturbed and, if necessary, assess and process any archeological resources in consultation with the City's Office of Historic Resources. Therefore, these impacts would be reduced to a less than significant level.

- **Hazards and Hazardous Materials**. The Proposed Project would have allowed development that would be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. However, mitigation measures will require future development that involves new construction and soil disturbance document that the project is not on or near any site that is on any government list of sites containing hazardous waste or hazardous materials. Development that is found to be on such a list or within a quarter mile of a site on such a list shall complete a Phase 1 Environmental Site Assessment and any required remediation to the satisfaction of the lead agency. Therefore, this impact would be reduced to a less than significant level.

- **Hydrology and Water Quality**. The Proposed Project would have placed housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map. However, the mitigation measure will require buildings within a 100-year floodplain to be designed and constructed a minimum of one foot above the 100-year flood water surface elevation to ensure the protection of structures from all flooding events. Therefore, this impact would be reduced to a less than significant level.

- **Transportation and Traffic**. The Proposed Project would have required construction activities to take place within arterial rights-of-way (ROW) which would have necessitated temporary lane, alley, or street closures for more than one day; required construction activities to take place within a collector or local street ROW which would have necessitated temporary lane, alley, or street closures for more than seven days; resulted in the loss of regular vehicular or pedestrian access to an existing land use for more than one day; or resulted in the temporary loss for more than one day of an existing bus stop or rerouting of a bus route that serves the project site. However, the mitigation measure will require developments to submit a worksite traffic control plan to mitigate the impact of traffic disruption and to ensure the safety of all users of the affected roadway. Therefore, this impact would be reduced to a less than significant level.

As required by the CEQA Guidelines, the achievement of project objectives must be balanced by the ability of an alternative to reduce the significant impacts of the project. The Proposed Project's objectives from Chapter 3.0 are restated below.

PROPOSED PROJECT OBJECTIVES

Primary Objective 1: Implement the policies of the City of Los Angeles General Plan Framework, the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and the West Adams-Baldwin Hills-Leimert, Palms-Mar Vista-Del Rey, and West Los Angeles Community Plans that encourage growth to be directed to transit-oriented areas and foster more sustainable, mixed use development patterns that improve mobility options and reduce auto dependence.

Primary Objective 2: Accommodate employment, housing, and population growth projections forecasted through the planning horizon year of 2035 by focusing residential development and new job-generating uses around transit stations.

Primary Objective 3: Maintain and expand the City's jobs base and increase opportunities for economic development in the Expo Corridor in order to increase the generation of tax revenue in the City that will help pay for the provision of City services.

Primary Objective 4: Implement the General Plan Framework goal to capture a significant share of regional growth in emerging environmentally oriented and clean industries such as technology industry jobs, which are clustered on the Westside and comprise a growing industry sector, and institute zoning that accommodates and creates incentives for the location and continued clustering of these technology industry jobs in the Expo Corridor where they will benefit from the proximity to transit and mixed use environments.

Primary Objective 5: Create incentives for the provision of affordable housing in new residential development near the Expo LRT Line to enhance accessibility and housing options for core transit riders and increase transit ridership.

Primary Objective 6: Improve circulation within the station areas; increase mobility choices; promote transit ridership and use of other alternative transit modes; and reduce vehicle miles traveled per capita for those who live and/or work within the Expo Corridor.

The ECTNP also includes secondary objectives that aim to promote well-designed, cohesive, and sustainable neighborhoods around the Expo Corridor transit stations.

Secondary Objective 1: Ensure new development is pedestrian-oriented, acknowledges the transit stations, and is compatible with surrounding neighborhoods through the design of buildings, streets, and the public realm.

Secondary Objective 2: Stimulate vibrancy and activity and create a unique sense of place within each station area through the design of buildings, streets, and the public realm.

To be potentially feasible, Proposed Project alternatives must meet most of these project objectives. In addition, while not specifically required under CEQA, other parameters may be used to select alternatives, such as adjustments to project design features, streetscapes, and/or proposed zoning and height districts, and other "fine-tuning" that would shape potentially feasible alternatives in a manner that may result in reducing identified environmental impacts. In some instances, when the project results in environmental impacts that are reduced to less than significant levels with mitigation, an alternative may reduce these less than significant impacts even further.

5.2 ALTERNATIVES CONSIDERED BUT REJECTED FROM FURTHER CONSIDERATION

No Development Alternative. The ECTNP Area is subject to existing community plans and zoning. These land use controls allow redevelopment and growth within specific use, density, and height restrictions (see discussion of the No Project Alternatives below). Because of these factors, a No Development Alternative is not a realistic or foreseeable option, and the City has no current mechanisms to halt all change within the Project Area. Furthermore, the West Los Angeles area has historically and continues to be a desirable area, with high demand for both jobs and housing.

Increased Intensity Alternative. The purpose of this alternative would be to reduce regional VMT and decrease regional GHG emissions through a substantial increase in mixed use development (height, floor-area-ratios, etc.) in close proximity to Expo LRT transit stations. This Increased Intensity Alternative would represent a significant increase in development as compared to reasonable expected growth under the Proposed Project. While theoretically there could be region-wide benefits, this alternative would likely greatly exacerbate localized impacts (air quality, noise, public services, traffic, etc. within and adjacent to the Project Area) and would provide no impact reduction benefits when compared to the Proposed Project. As a result of these factors, this alternative was not considered further.

Alternatives Suggested During NOP Comment Period. In response to the notice of preparation, the following comments on alternatives to be addressed in the Draft EIR were made:

- The study must include alternatives with no commercial office space.
- The study must include alternatives that keep any buildings to a scale in keeping with the rest of the neighborhood, not significantly higher.
- The study must include alternatives that show any projects limited to a size that all significant impacts can be mitigated.
- The study should show alternatives that include easy pedestrian access and bicycle access from surrounding areas to get to and from the station.

These comments were considered as the Proposed Project alternatives were identified. Some aspects of the suggested alternatives were not considered further due to infeasibility and/or inconsistency with most of the Project objectives, particularly objectives relating to accommodating jobs and housing. In other cases some

aspects of the suggested alternatives were incorporated either into the Proposed Project or one of the alternatives studied in this EIR.

The comment suggesting an alternative that excludes all commercial office is infeasible. Per the City's Zoning Code, existing commercial and industrial zones expressly permit office and other commercial uses. Moreover, the General Plan Framework and the adopted Community Plans that govern the ECTNP Area have policies that encourage commercial and office uses as a way to provide for the retail and service needs of the surrounding residential population and to accommodate future demand for jobs. As noted in Chapter 3.0, Project Description, the Proposed Project includes recommended changes to select areas (areas of proposed change) surrounding the Expo LRT stations (about 13 percent of the total Project Area); the remainder of the Proposed Project Area retains the existing community plan/general plan land uses and zoning requirements, but becomes subject to new design standards and guidelines. The proposed new Hybrid Industrial and Mixed Use: Commercial/Residential zones similarly allow office and commercial uses, consistent with adopted policy. The elimination of commercial office space is not consistent with the objectives of the Proposed Project to preserve and expand jobs in the West Los Angeles area alongside growth in housing. In addition, the portion of the Proposed Project Area that would continue to be governed by existing general plan land uses designations and zoning would continue to allow commercial development, including commercial offices, in Commercial and Manufacturing zones under existing zoning regulations. These governing land use regulations are not affected by the Proposed Project, with the exception of added urban design standards to ensure compatibility with surrounding land uses. Studying an alternative that changes the allowable land uses in these areas to exclude commercial use would therefore not be reasonable or feasible.

A component of the Proposed Project is an Alternative Compliance process, allowing projects in certain areas to be developed with a greater proportion of residential use, within the same levels of development as the Proposed Project, with the provision of increased public benefits. Although this process would not eliminate commercial growth, it would reduce it compared to the Proposed Project and would accommodate a greater amount of new housing. In addition, the EIR evaluates an Increased Residential/Reduced Employment Alternative (Alternative 3), which further reduces the commercial growth potential and further provides for increased housing opportunities. As such, the alternatives evaluated substantially address reduced commercial growth compared to the Proposed Project, and no additional alternative to totally eliminate commercial growth was considered potentially feasible.

In the Proposed Project the proposed density, height and land use changes in select areas near transit are accompanied by design standards and guidelines and other project features intended to ensure the compatibility of new development with surrounding residential land uses. This is intended to address concerns about scale and effects on neighborhood character. The Proposed Project also includes requirements to improve streetscape, provide public amenities, facilitate pedestrian access, and encourage the use of alternative (non-auto) modes of transportation. In this context, the comment regarding bicycle and pedestrian access is substantially addressed by the Proposed Project and was not considered further in a standalone alternative.

Finally, the discussion of alternatives below includes consideration of a No Project Alternative, which would continue the existing general plan and zoning designations within the Project Area. Due to the remaining unbuilt capacity in the Project Area, even this alternative would entail some increased growth and would likely cause corresponding significant impacts. Defining an alternative to reduce growth to levels below that which is currently allowed to eliminate all potential impacts is both inconsistent with the project objectives and infeasible.

5.3 ALTERNATIVES TO THE PROPOSED PROJECT

The CEQA statute, the CEQA Guidelines, and related recent court cases do not specify a precise number of alternatives to be evaluated in an EIR. Rather, "the range of alternatives required in an EIR is governed by the rule of reason that sets forth only those alternatives necessary to permit a reasoned choice."[5] At the same time, Section 15126.6(b) of the CEQA Guidelines requires that "...the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project" and Section 15126.6(f) requires, "The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project." Accordingly, alternatives that would not address potentially significant effects are not considered herein. However, the CEQA Guidelines require that a "No Project" alternative must be included and, if appropriate, an alternative site location should be analyzed.[6] Other project alternatives may involve a modification of the proposed land uses, density, or other project elements at the same project location.

Alternatives should be selected on the basis of their ability to attain all or most of the basic objectives of the project while reducing the project's significant environmental effects. The CEQA Guidelines state that "...[t]he EIR should briefly describe the rationale for selecting alternatives to be discussed [and]...shall include sufficient information to allow meaningful evaluation, analysis and comparison with the proposed project."[7] The feasibility of the alternatives is another consideration in the selection of alternatives. The CEQA Guidelines state that "[a]mong the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations [and] jurisdictional boundaries..."[8] and "The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision making."[9] Alternatives that are considered remote or speculative, or whose effects cannot be reasonably predicted do not require consideration. Therefore, potential feasibility, the potential to mitigate significant project-related impacts, and reasonably informing the decision-maker are the primary considerations in the selection and evaluation of alternatives.

Table 5-1 and **Figures 5-1a** and **5-1b** compare the existing population, dwelling units, employment, and non-residential square footage to the reasonable expected development for the Proposed Project, Proposed Project with Alternative Compliance scenario, and the three alternatives analyzed in this Draft EIR.

Alternative 1 – No Project Alternative. The No Project Alternative is required by Section 15126.6 (e)(2) of the CEQA Guidelines and assumes that the Proposed Project would not be implemented. It assumes reasonably foreseeable development under the current community plans including existing zoning, General Plan designations, and land use regulations, and assumes no discretionary actions such as site-specific zone changes. However, it is reasonable to expect continued market demand for housing and jobs in the area which could result in requests for General Plan Amendments and zone changes; thus development could occur in an uncoordinated fashion. Details about such potential requests for land use and zoning changes are not known, and therefore they are not incorporated into the population, housing, and employment estimates for the No Project Alternative.

[9] Section 15126.6(f).

TABLE 5-1: ALTERNATIVES POPULATION, DWELLING UNITS, AND EMPLOYMENT CAPACITIES COMPARISON

	Existing Conditions (2013)	Proposed Project	Proposed Project: Alternative Compliance Scenario	Alternative 1: No Project	Alternative 2: Reduced Project	Alternative 3: Increased Residential/ Reduced Employment
Housing (dwelling units)	25,018	29,441/a/	31,060/a/	26,072	28,336	32,578
Population (persons)	50,595/b/	59,571/c/	62,810/c/	52,447	57,326	65,835
Employment (jobs)	33,962/d/	48,296/e/	43,419/e/	37,775	44,712	39,693
Non-Residential Square Footage	11,424,485/f/	16,957,415	15,311,503	13,727,355	15,574,182	13,489,759

SOURCES and NOTES:
/a/Estimated number of dwelling units in Proposed Plan Reasonable Expected Development is based on a methodology using reasonably anticipated residential densities for each zone. See **Appendix F** for further discussion about the methodology and how population, housing, employment, and nonresidential development were determined for the Proposed Project.
/b/Existing Population and Housing are estimates derived from the US Census (2010), adjusted to 2013 using average growth rates from the California Department of Finance. See Section 4.10 Population, Housing, and Employment and **Appendix F** of this EIR for detailed methodology.
/c/Population in Proposed Plan Reasonable Expected Development is derived from the estimated number of dwelling units multiplied by the SCAG estimated persons per household (by Community Plan Area) for 2035. DCP has considered SCAG 2012 RTP base year estimates and 2040 growth projections contained in the 2016 RTP/SCS and has concluded that the estimates in this table remain reasonable and consistent with the 2016 RTP/SCS estimates and projections. See **Appendix K** of this EIR for details.
/d/U.S. Census "On The Map" application, 2013.
/e/Employment in Proposed Plan Reasonable Expected Development is derived from the estimated square footage of non-residential use, using square foot per employee factors that reflect the types of land uses permitted by the proposed zoning.
/f/Existing non-residential square footage is derived from the existing number of jobs in each station segment, multiplied by an average square foot per employee factor that reflects the types of land uses in each area.

LEGEND:

Existing Conditions

SOURCE: TAHA, 2017.

Consideration of the No Project Alternative allows decision-makers to compare the impacts of approving the Proposed Project with the impacts of not approving the Proposed Project. However, "no project" does not mean that development would not occur in the Project Area. The No Project Alternative includes "what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services" (CEQA Section 15126.6 [e][2]).

Under Alternative 1, existing zoning and General Plan land use designations would remain in place for the Project Area, consistent with the existing West Los Angeles, Palms-Mar Vista-Del Rey, and West Adams-Baldwin Hills-Leimert Community Plans. It is reasonably foreseeable that these existing land use regulations would allow for an increase of 1,054 dwelling units, 1,852 residents, 3,813 jobs, and approximately 2.30 million square feet of non-residential building area within the ECTNP Area compared to existing conditions by the year 2035. As shown in **Table 5-2**, the No Project Alternative would result in a total population of 52,447 persons, 26,072 dwelling units, 37,755 jobs, and approximately 13.73 million square feet of non-residential building area by 2035.

TABLE 5-2: ALTERNATIVE 1 - NO PROJECT ALTERNATIVE COMPARISON

	Alternative 1 (2035)	Alternative 1 (2035) to Existing Conditions (2013)	Alternative 1 (2035) to Current Community Plans (2035)	Alternative 1 (2035) to Proposed Plan (2035)	Alternative 1 (2035) to Alternative Compliance Scenario (2035)
Housing (dwelling units)	26,072	1,054	0	-3,369	-4,988
Population (persons)	52,447	1,852	0	-7,124	-10,363
Employment (jobs)	37,775	3,813	0	-10,521	-5,644
Non- Residential Square Feet	13,727,355	2,302,870	0	-3,230,060	-1,584,148

SOURCE: City of Los Angeles and TAHA, 2017.

In comparison to the Proposed Project, Alternative 1 would allow for 3,369 fewer dwelling units, 7,124 fewer residents, 10,521 fewer jobs, and approximately 3.23 million square feet less of non-residential building area than the Proposed Project by the year 2035. In comparison to the Alternative Compliance Scenario, Alternative 1 would allow for 4,988 fewer dwelling units, 10,363 fewer residents, 5,644 fewer jobs, and approximately 1.58 million square feet less of non-residential building area by the year 2035.

Alternative 2 – Reduced Project Alternative. Alternative 2 would increase development capacity of the ECTNP Area over the current community plans, similar to the Proposed Project but to a lesser extent. This alternative would encourage infill development along transit corridors. Alternative 2 would partially achieve Proposed Project objectives related to encouraging development near transit, increasing transit-ridership, improving circulation for all modes, and improving the pedestrian and bike environment. Proposed design standards and height regulations would be similar to those proposed under the Proposed Project. Alternative 2 would include the same mix of land uses as included under the Proposed Project; however the increase in development that would be reasonably expected to occur under this alternative, compared to the growth anticipated under the Proposed Project (2035) over Existing Conditions (2013), would represent 25 percent less dwelling units, population, employment, and non-residential space. Overall, as shown in **Table 5-3**, Alternative 2 would result in 2035 Project Area totals of 28,336 dwelling units, 57,326 persons, 44,712 jobs, and approximately 15.57 million square feet of non-residential space. This would represent residential and non-residential growth by 2035 over existing conditions of approximately 3,300 dwelling units and 4.15 million square of non-residential space. The reduced number of dwelling units would also result in a reduced number of affordable units that would potentially be generated through the public benefit requirements of the Proposed Plan.

TABLE 5-3: ALTERNATIVE 2 - REDUCED PROJECT ALTERNATIVE COMPARISON

	Alternative 2 (2035)	Alternative 2 (2035) to Existing Conditions (2013)	Alternative 2 (2035) to Current Community Plans (2035)	Alternative 2 (2035) to Proposed Plan (2035)	Alternative 2 (2035) to Alternative Compliance Scenario (2035)
Dwelling Units	28,336	3,318	2,264	-1,105	-2,724
Population	57,326	6,731	4,879	-2,245	-5,484
Employment	44,712	10,750	6,937	-3,584	1,293
Non- Residential Square Feet	15,574,182	4,149,697	1,846,827	-1,383,233	262,679

SOURCE: City of Los Angeles and TAHA, 2017.

Alternative 3 – Increased Residential/Reduced Employment Alternative. Similar to the Proposed Project, Alternative 3 would increase development capacity of the ECTNP Area over the current community plans and would encourage infill development along transit corridors. Alternative 3 was chosen to respond to a citywide demand for additional housing and local residents' concerns about increased traffic congestion from commercial uses, as well as the potential for this Alternative to reduce impacts related to utilities and services systems. Alternative 3 would partially achieve the Proposed Project objectives related to encouraging development near transit, increasing transit-ridership, improving circulation for all modes, and improving the pedestrian and bike environment. Due to decreased capacity for jobs, Alternative 3 is less likely to meet project objectives relating to economic development and job growth. The key component of this alternative would be to encourage increased residential development over non-residential development within the Project Area. In this context, Alternative 3 would be similar to the Proposed Project Alternative Compliance scenario, but Alternative 3 represents a greater shift from non-residential to residential uses. Alternative 3 (2035), when compared to the growth proposed in the Proposed Plan (2035), represents an approximately 70 percent increase in dwelling units and population and an approximately 62 percent decrease in employment and non-residential square footage. Alternative 3 (2035), when compared to the growth proposed under the Alternative Compliance scenario of the Proposed Plan (2035), represents an approximately 25 percent increase in dwelling units and population, an approximately 39 percent decrease in employment, and an approximately 47 percent decrease in non-residential square footage. As shown in **Table 5-4**, Alternative 3 would result in a total of 32,578 dwelling units, 65,835 persons, 39,693 jobs, and approximately 13.49 million square feet of non-residential space by 2035. Compared to the Alternative Compliance scenario, Alternative 3 by 2035 would provide an additional 1,518 units of housing, equating to approximately 3,025 persons, but would reduce the non-residential square footage by approximately 1.82 million, which would accommodate 3,726 fewer jobs.

TABLE 5-4: ALTERNATIVE 3 - INCREASED RESIDENTIAL REDUCED EMPLOYMENT ALTERNATIVE COMPARISON

	Alternative 3 (2035)	Alternative 3 (2035) to Existing Conditions (2013)	Alternative 3 (2035) to Current Community Plans (2035)	Alternative 3 (2035) to Proposed Plan (2035)	Alternative 3 (2035) to Alternative Compliance Scenario (2035)
Dwelling Units	32,578	7,560	6,506	3,137	1,518
Population	65,835	15,240	13,388	6,264	3,025
Employment	39,693	5,731	1,918	-8,603	-3,726
Non- Residential Square Feet	13,489,759	2,065,274	-237,596	-3,467,656	-1,821,744

COMPARISON OF ALTERNATIVES

This section describes the potential environmental impacts associated with each alternative as compared to the impacts of the Proposed Project. The summary comparison of impacts of the project alternatives and the Proposed Project is included in **Table 5-5**, with the supporting analysis provided in the subsections that follow. Where the net impact of the alternative would be less adverse or more beneficial than the impact of the Proposed Project, the comparative impact is said to be "less." Where the net impact of the alternative would be more adverse or less beneficial than the Proposed Project, the comparative impact is said to be "greater." Where the net impacts of the alternative and Proposed Project would be roughly equivalent, the comparative impact is said to be "similar."

ANALYSIS OF ALTERNATIVE 1 – NO PROJECT ALTERNATIVE

Aesthetics

Under Alternative 1, proposed changes to existing zoning and General Plan land use designations in portions of the Project Area would not occur. As shown in **Table 5-2,** growth is anticipated under Alternative 1 (1,054 dwelling units and approximately 2.30 million square feet of non-residential space). Future development would be subject to existing West Los Angeles, Palms-Mar Vista-Del Rey, and West Adams-Baldwin Hills-Leimert community plan land use designations and policies, as well as by building height and density limitations, which allow for buildings to be developed at heights and/or densities greater than what currently exist in a number of locations within the Project Area (see Figures 3-6, 3-8, 3-10, and 3-12, in Chapter 3.0 Project Description). Unlike the Proposed Project, no new development standards, design standards, or policies intended to preserve and enhance the visual character and quality of transit-oriented development and ensure compatibility between land uses would be established. The City review of proposed residential, commercial, and industrial developments would continue to be guided by Citywide Design Guidelines. SB 743 states that aesthetic impacts shall not be considered significant for the purposes of environmental analysis for residential, mixed use residential, or employment center projects on infill sites within a Transit Priority Area. Such projects are typical of the kinds of projects anticipated under Alternative 1. Although a majority of the Project Area is located in a Transit Priority Area, a portion of the Project Area is not. Therefore, a discussion of aesthetic impacts is provided below.

Scenic Resources within a State Highway. There are no State-designated scenic highways located within the Project Area. While not designated a scenic highway by the State, Venice Boulevard (State Route 187) is a City of Los Angeles-designated scenic highway.[10] The status of Venice Boulevard is recognized in the existing community plans. Similar to the Proposed Project, Alternative 1 would not include elements or allow developments that would adversely affect the visual character of the street right-of-way, and impacts to scenic highways would remain less than significant.

Scenic Vistas. A number of scenic resources, including a City-designated Historic-Cultural Monument (HCM), individual historic structures, and Heritage and Ordinance Protected Trees are located within the Project Area. However, there are no publicly available scenic vista points within the Project Area, and views of the Project Area are not considered panoramic. Therefore, similar to the Proposed Project, Alternative 1 would result in less than significant impacts related to scenic vistas.

[10]City of Los Angeles, *Mobility Plan 2035: An Element of the General Plan*, adopted 2015, as subsequently amended.

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
AESTHETICS				
Impact 4.1-1: Would implementation of the Proposed Project have a substantial adverse effect on a scenic vista/obstruction of views?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.1-2: Would implementation of the Proposed Project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.1-3: Would implementation of the Proposed Project substantially degrade the existing visual character or quality of the site and its surroundings?	Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.1-4: Would implementation of the Proposed Project create a new source of substantial light or glare that could adversely affect day- or nighttime views in the project area?	Less Than Significant with Mitigation	Similar (Less Than Significant)	Similar (Less Than Significant with Mitigation)	Similar (Less Than Significant with Mitigation)
Impact 4.1-5: Would implementation of the Proposed Project result in development of structures that would shade shadow-sensitive uses for more than three hours between the hours of 9:00 a.m. and 3:00 p.m. Pacific Standard Time (between late October and early April), or for more than four hours between the hours of 9:00 a.m. and 5:00 p.m. Pacific Daylight Time (between early April and late October)?	Significant and Unavoidable	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.1-6: Would implementation of the Proposed Project destroy, permanently cover or materially and adversely modify one or more distinct and prominent geologic or topographic features such as hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds and wetlands?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
AIR QUALITY				
Impact 4.2-1: Would implementation of the Proposed Project conflict with or obstruct implementation of the applicable air quality plan?	Less than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Greater (Less Than Significant)
Impact 4.2-2: Would implementation of the Proposed Project violate an air quality standard or contribute substantially to an existing or projected air quality violation?	*Construction*: Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Similar (Significant and Unavoidable)
	Operation: Less than Significant	Less (Less than Significant)	Less (Less than Significant)	Similar (Less than Significant)
Impact 4.2-3: Would implementation of the Proposed Project expose sensitive receptors to substantial pollutant concentrations?	*Construction*: Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Similar (Significant and Unavoidable)
	Operation: Less than Significant	Similar (Less than Significant)	Similar (Less than Significant)	Similar (Less than Significant)
Impact 4.2-4: Would implementation of the Proposed Project create objectionable odors affecting a substantial number of people?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
CULTURAL RESOURCES				
Impact 4.3-1: Would implementation of the Proposed Project cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5?	Significant and Unavoidable	Greater (Significant and Unavoidable)	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.3-2: Would implementation of the Proposed Project cause a substantial adverse change in the significance of an archaeological resource?	Less Than Significant With Mitigation	Greater (Significant and Unavoidable)	Similar (Less Than Significant With Mitigation)	Similar (Less Than Significant With Mitigation)
Impact 4.3-3: Would implementation of the Proposed Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Less Than Significant With Mitigation	Greater (Significant and Unavoidable)	Similar (Less Than Significant With Mitigation)	Similar (Less Than Significant With Mitigation)
Impact 4.3-4: Would implementation of the Proposed Project could disturb human remains, including those interred outside of formal cemeteries?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
GEOLOGY AND SOILS				
Impact 4.4-1: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving the rupture of a known earthquake fault?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.4-2: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from strong seismic ground shaking?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.4-3: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from seismic-related ground failure, including liquefaction?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.4-4: Would implementation of the Proposed Project cause or accelerate geologic hazards that would expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from seismic-related ground failure, including landslides?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.4-5: Would implementation of the Proposed Project be located on geologic unit that is unstable, or that would become unstable as a result of the Proposed Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.4-6: Would implementation of the Proposed Project lead to construction on existing expansive soils, as defined in Table 18-1-B of the Uniform Building Code (1994), Creating substantial risks to life or property?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
Impact 4.4-7: Would implementation of the Proposed Project result in substantial soil erosion or the loss of topsoil?	Less Than Significant	Similar (Less than Significant)	Similar (Less than Significant)	Similar (Less than Significant)
Impact 4.4-8: Would implementation of the Proposed Project involve the use of septic tanks or alternative waste water disposal system and, therefore, result in hazards related to construction on soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
GREENHOUSE GAS EMISSIONS				
Impact 4.5-1: Would implementation of the Proposed Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?	Less Than Significant	Less (Less than Significant)	Less (Less than Significant)	Less (Less than Significant)
Impact 4.5-2: Would implementation of the Proposed Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions?	Less Than Significant	Greater (Significant and Unavoidable)	Similar (Less Than Significant)	Less (Less Than Significant)
HAZARDS AND HAZARDOUS MATERIALS				
Impact 4.6-1: Would implementation of the Proposed Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	Less than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.6-2: Would implementation of the Proposed Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.6-3: Would implementation of the Proposed Project result in hazardous emissions or the handling of acutely hazardous materials, substances, or waste within a quarter mile of an existing or proposed school, creating a risk to human health from such activities?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.6-4: Would development under the Proposed Project be located on a site that is included on a list of hazardous materials sites compiled pursuant to government code section 65962.5 and, as a result, could development create a significant hazard to the public or the environment?	Less Than Significant with Mitigation	Greater (Significant and Unavoidable)	Similar (Less Than Significant with Mitigation)	Similar (Less Than Significant with Mitigation)
Impact 4.6-5: Would Implementation of the Proposed Project result in a safety hazard for people residing or working in the project area near a public airport?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.6-6: Would implementation of the Proposed Project result in a safety hazard for people residing or working in the project area near a private airstrip?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.6-7: Would implementation of the Proposed Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
Impact 4.6-8: Would implementation of the Proposed Project expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
HYDROLOGY AND WATER QUALITY				
Impact 4.7-1: Would implementation of the Proposed Project violate any water quality standards or waste discharge requirements?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.7-2: Would implementation of the Proposed Project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.7-3: Would implementation of the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.7-4: Would implementation of the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.7-5: Would implementation of the Proposed Project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.7-6: Would implementation of the Proposed Project otherwise substantially degrade water quality?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.7-7: Would implementation of the Proposed Project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	Less Than Significant With Mitigation	Greater (Significant and Unavoidable)	Similar (Less Than Significant With Mitigation)	Similar (Less Than Significant With Mitigation)
Impact 4.7-8: Would implementation of the Proposed Project place structures which would impede or redirect flood flows within a 100-year flood hazard area?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
Impact 4.7-9: Would implementation of the Proposed Project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
Impact 4.7-10: Would implementation of the Proposed Project expose people or structures to risk from seiche, tsunami, or mudflow/mudslides?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
LAND USE				
Impact 4.8-1: Would implementation of the Proposed Project physically divide an established community?	Less Than Significant	Greater (Significant and Unavoidable)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.8-2: Would implementation of the Proposed Project be consistent with applicable adopted regional, state and local goals, policies and regulations and therefore, would not conflict with applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	Less Than Significant	Greater (Significant and Unavoidable)	Greater (Less Than Significant)	Greater (Significant and Unavoidable)
Impact 4.8-3: Would implementation of the Proposed Project conflict with any applicable habitat conservation plans or natural community conservation plans?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
NOISE				
Impact 4.9-1: Would implementation of the Proposed Project pursuant to the ECTNP expose persons to or generate noise in levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? This impact is considered significant and unavoidable.	Significant and Unavoidable	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.9-2: Would implementation of the Proposed Project result in a substantial permanent increase in ambient noise levels in the proposed project vicinity above levels existing without the project?	Significant and Unavoidable	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.9-3: Would implementation of the Proposed Project result in a substantial temporary or periodic increase in ambient noise levels in the proposed project vicinity above levels existing without the project?	Significant and Unavoidable	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.9-4: Would implementation of the Proposed Project expose people to or generate excessive vibration or ground-borne noise levels?	*Construction:* Significant and Unavoidable	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)	Similar (Significant and Unavoidable)
	Operation: Less than Significant	Similar (Less than Significant)	Similar (Less than Significant)	Similar (Less than Significant)
Impact 4.9-5: Would implementation of the Proposed Project exacerbate levels of exposure for people working or residing within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport to excessive noise levels?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
Impact 4.9-6: Would implementation of the Proposed Project exacerbate levels of exposure for people working or residing within the vicinity of a private airstrip to excessive noise levels?	No Impact	Similar (No Impact)	Similar (No Impact)	Similar (No Impact)
POPULATION, HOUSING, AND EMPLOYMENT				
Impact 4.10-1: Would implementation of the Proposed Project induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	Less Than Significant	Similar (Less Than Significant)	Similar (Less Than Significant)	Similar (Less than Significant)
Impact 4.10-2: Would implementation of the Proposed Project displace substantial numbers of existing housing units, necessitating the construction of replacement housing elsewhere?	Less than Significant	Less (Less than Significant)	Similar (Less than Significant)	Similar (Less than Significant)
Impact 4.10-3: Would implementation of the Proposed Project displace substantial numbers of people necessitating the construction of replacement housing elsewhere?	Less than Significant	Less (Less than Significant)	Similar (Less than Significant)	Similar (Less than Significant)
PUBLIC SERVICES				
Impact 4.11-1: Would implementation of the Proposed Project foreseeably require the addition of a new fire station or the expansion, consolidation, or relocation of an existing facility, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection and emergency response?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.11-2: Would implementation of the Proposed Project result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, and other performance objectives?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.11-3: Would implementation of the Proposed Project create additional demand for public school enrollment that could not be adequately accommodated by existing schools serving the project area, resulting in the need for new or physically altered school facilities?	Less Than Significant	Less (Less than Significant)	Less (Less than Significant)	Greater (Less than Significant)
Impact 4.11-4: Would implementation of the Proposed Project create additional demand for parks and recreation facilities that could not be adequately accommodated by existing facilities serving the Project Area and likely result in the need for new or physically altered parks and recreation facilities?	Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Greater (Significant and Unavoidable)
Impact 4.11-5: Would implementation of the Proposed Project create additional demand for library services that could not be adequately accommodated by existing facilities serving the project area and likely result in the need for new or physically altered library facilities?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
TRANSPORTATION AND TRAFFIC				
Impact 4.12-1: Would implementation of the Proposed Project disrupt existing public transit, bicycle, or pedestrian facilities or interfere with planned facilities, or create conflicts or inconsistencies with adopted public transit, bicycle, or pedestrian system plans, guidelines, policies, or standards or otherwise decrease the performance or safety of such facilities?	Less Than Significant	Greater (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.12-2: Would implementation of the Proposed Project impact the circulation system by exceeding the applicable thresholds established by each jurisdiction?	Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.12-3: Would implementation of the Proposed Project have a significant impact related to neighborhood intrusion by exceeding the established thresholds?	Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.12-4: Would implementation of the Proposed Project have a significant impact related to the CMP Freeway Analysis by exceeding the established threshold?	Less Than Significant	Less (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.12-5: Would implementation of the Proposed Project have a significant impact related to the CMP Arterial Intersection Analysis by exceeding the established threshold?	Significant and Unavoidable	Less (Significant and Unavoidable)	Less (Significant and Unavoidable)	Similar (Significant and Unavoidable)
Impact 4.12-6: Would implementation of the Proposed Project have a significant impact related to the CMP Transit Impact Review by substantially impacting transit service?	Less Than Significant	Less (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.12-7: Would implementation of the Proposed Project result in inadequate emergency vehicle access such that there would be need for construction of new or physically altered emergency service facilities (police and/or fire)?	Less Than Significant	Less (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.12-8: Would implementation of the Proposed Project increase hazards due to a design feature or incompatible uses?	Less Than Significant	Less (Less Than Significant)	Similar (Less Than Significant)	Similar (Less Than Significant)
Impact 4.12-9: Would implementation of the Proposed Project require construction activities to take place within a major or secondary highway ROW which would necessitate temporary lane, alley, or street closures for more than one day; require construction activities to take place within a collector or local street ROW which would necessitate temporary lane, alley, or street closures for more than seven days; result in the loss of regular vehicular or pedestrian access to an existing land use for more than one day; or result in the temporary loss for more than one day of an existing bus stop or rerouting of a bus route that serves the project site?	Less Than Significant With Mitigation	Less (Less Than Significant)	Similar (Less Than Significant With Mitigation)	Similar (Less Than Significant With Mitigation)
UTILITIES AND SERVICE SYSTEMS				
Impact 4.13-1: Would implementation of the Proposed Project cause the construction of new water treatment facilities or expansion of existing treatment facilities, the construction of which could cause significant environmental effects?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)

TABLE 5-5: COMPARISON OF IMPACTS BETWEEN THE PROPOSED PROJECT AND ALTERNATIVES

Impact	Proposed Project Impact	Alternative 1 Impact	Alternative 2 Impact	Alternative 3 Impact
Impact 4.13-2: Would implementation of the Proposed Project result in the construction of new water lines?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-3: Would implementation of the Proposed Project result in LADWP making a determination that they have insufficient water supplies available to serve the Proposed Project from existing entitlements and resources, or would the Proposed Project result in LADWP needing new or expanded entitlements?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-4: Would implementation of the Proposed Project exceed wastewater treatment requirements of LARWQCB?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-5: Would implementation of the Proposed Project result in the construction of new wastewater treatment facilities or expansion of existing wastewater treatment facilities?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-6: Would implementation of the Proposed Project result in the construction of new wastewater conveyance systems or expansion of existing conveyance systems?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-7: Would implementation of the Proposed Project require the construction of new stormwater drainage facilities or expansion of existing facilities?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-8: Would implementation of the Proposed Project result in a determination by the BOS that it does not have adequate capacity to serve the Proposed Project in addition to their existing commitments?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-9: Would implementation of the Proposed Project comply with federal, state, and local statutes and regulations related to solid waste and be served by a landfill with sufficient permitted capacity to accommodate the Project's solid waste disposal needs?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-10: Would implementation of the Proposed Project result in the inefficient use of electricity?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)
Impact 4.13-11: Would implementation of the Proposed Project result in the inefficient use of natural gas?	Less Than Significant	Less (Less Than Significant)	Less (Less Than Significant)	Greater (Less Than Significant)

SOURCE: TAHA, 2017.

Changes to Landforms and Other Topographic Features. There are no ridges, canyons, ravines, or other topographic features within the Project Area; however, the Project Area contains the edge of the Cheviot Hills north of the Palms Station Area. Under current conditions, large development projects are governed by the Site Plan Review process, as well as by applicable ordinances and Department of Building and Safety foundation and grading requirements. With continued implementation of these measures, it is unlikely that Alternative 1 would destroy, permanently cover, or materially and adversely modify one or more distinct and prominent geologic or topographic features, such as hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds, and wetlands. Therefore, similar to the Proposed Project, Alternative 1 would result in a less than significant impact related to landforms and topographic features.

Visual Character. Future development under Alternative 1 would be subject to Citywide Design Guidelines, provisions of the LAMC, and General Plan policies. Individual projects requiring discretionary approval would be subject to project-level CEQA review under Alternative 1, which would serve to reduce aesthetic-related impacts to the maximum extent feasible. Even under the existing plan, the zoning could result in new buildings with heights, density, and other features that would differ significantly from existing buildings. Additionally, projects under Alternative 1 would not benefit from the tailored and contextual regulations for height and building design found in the Proposed Project, which could minimize the visual character impacts of commercial and industrial use adjacent to residential. Therefore, as with the Proposed Project, development constructed under Alternative 1 would result in significant and unavoidable impacts related to visual character. However, impacts under Alternative 1 would be less than the Proposed Project because the maximum allowable heights and FARs (building intensity) would be less than the Proposed Project in certain portions of the change areas (such as around the Sepulveda, Bundy, and Culver City Stations).

Shade and Shadow. Building heights allowed under Alternative 1 would in some cases be less than the heights permitted under the Proposed Project. Regardless, some future development under Alternative 1 would exceed the height of existing development, creating new shadows on surrounding shade-sensitive uses. Details about where potential future development could exceed existing height, and its proximity to shade-sensitive uses, is not known. Therefore, similar to the Proposed Project, shade and shadow impacts under Alternative 1 would be significant and unavoidable.

Light and Glare. Similar to the Proposed Project, future development under Alternative 1 has the potential to create new sources of light and glare. Site plan review and the accompanying environmental analysis, of development within the Project Area would address these effects. Similar to the Proposed Project, impacts are anticipated to be less than significant.

Air Quality

Air Quality Plans. Future growth under Alternative 1 was accounted for in the SCAG land use assumptions provided to SCAQMD for incorporation into the 2012 Air Quality Management Plan (AQMP). In addition, the growth assumptions in Alternative 1 are consistent with the City assumptions used by SCAG to prepare the 2012-2035 RTP/SCS. Alternative 1 would result in less development than the Proposed Project and would not conflict with air quality plans or regional land use plans. Therefore, similar to the Proposed Project, Alternative 1 would result in less than significant impacts related to conflicting with or obstructing the implementation of applicable air quality plans.

Air Quality Standards. Alternative 1 would result in less capacity for growth and new development, resulting in less construction emissions. Therefore, air quality impacts due to construction emissions under Alternative 1 would be less than the Proposed Project. However, it is anticipated that the construction emissions under Alternative 1 would exceed the SCAQMD significance thresholds. Implementation of mitigation measures on individual projects could reduce significant impacts to a less than significant level but cannot be relied upon in the absence of a specific construction project to assess. Therefore, as with the Proposed Project, construction impacts would remain significant and unavoidable. However, due to

decreased capacity for growth under Alternative 1, construction impacts related to air quality standards would be less than the Proposed Project.

Air quality impacts due to operations under Alternative 1 would be similar to the Proposed Project. The lower capacity for growth associated with Alternative 1 would result in fewer air quality emissions from stationary sources, such as electricity generation. New regulations and improved engine technology would substantially reduce vehicle emissions between 2013 and 2035 despite the absence of intensified development around proposed transit stations and associated reduced per capita VMT that would result from the Proposed Project. Therefore, as with the Proposed Project, operational impacts related to air quality would be less than significant under Alternative 1. However, due to decreased capacity for growth under Alternative 1, operational impacts related to air quality standards would be less than the Proposed Project.

Sensitive Receptors. Construction activity would generate diesel particulate emissions associated with heavy-duty equipment operations and truck traffic. Diesel exhaust causes health effects from both short-term or acute exposures, and long-term chronic exposures. Depending on the specifics of the project being developed (i.e., diesel particulate emissions and sensitive receptor locations), it is anticipated that emissions from construction activities would exceed the health risk significance thresholds established by the SCAQMD. Alternative 1 would result in less capacity for growth and new development, resulting in less total toxic air contaminant construction emissions. Therefore, as with the Proposed Project, construction toxic air contaminant impacts would remain significant and unavoidable under Alternative 1. However, due to decreased capacity for growth under Alternative 1, construction impacts related to toxic air contaminants would be less than the Proposed Project.

Regarding operational toxic air contaminant emissions, similar to the Proposed Project, operational activity associated with Alternative 1 would not generate significant toxic air contaminant emissions. Although current land use designations and zoning allow for manufacturing uses to be developed in the Project Area, any potential toxic air contaminants resulting from such uses would be strictly regulated by SCAQMD. Therefore, operational toxic air contaminant impacts would be less than significant, similar to the Proposed Project.

Odors. Future development under Alternative 1 has the potential to generate construction and operational odors. Potential sources that could emit odors during construction activities include equipment exhaust and paving and painting activities. Such odors are localized, generally confined to the immediate area surrounding a construction site and transitory in nature. According to the SCAQMD *CEQA Air Quality Handbook*, land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies and fiberglass molding. Alternative 1 does not include land uses that are typically associated with odor complaints. Therefore, impacts related to odors would be less than significant, similar to the Proposed Project.

Cultural Resources

Historical Resources. While Alternative 1 would result in less growth due to lower overall development capacity of the existing community plans, development in the Project Area carries with it the potential for impacts to historic resources and could contribute to the loss of such resources in the City. Under this alternative, projects requiring discretionary approval would be subject to project-specific CEQA review, at which point, requirements that are similar to the Plan standards identified in the Proposed Project could be included, if necessary. However, future projects that include demolition, destruction, relocation or alteration of a historical resource such that its significance is materially affected generally result in significant impacts that cannot be mitigated to a less than significant level. Furthermore, development projects not requiring discretionary approval could, adversely affect cultural resources. Alternative 1 provides no consistent protection to cultural resources for projects that require no discretionary action. This is a key distinction between Alternative 1 and the Proposed Project. Thus, impacts to historical resources under this alternative

are anticipated to be significant and unavoidable, as is expected with the Proposed Project. However, it is anticipated that the impacts associated with historical resources under Alternative 1 would be greater than those from the Proposed Project because Alternative 1 does not include the Proposed Project's plan standards which institute a more stringent level of review.

Archaeological and Paleontological Resources. Under the Proposed Project, all development within the Project Area would be subject to a combination of mitigation measures (see Section 4.3 Cultural Resources) and plan standards and procedures that are intended to trigger review of archaeological and paleontological resources. Alternative 1 provides no consistent protection to cultural resources when no City discretionary action is required. Impacts to archaeological and paleontological resources under this alternative are anticipated to potentially be significant and unavoidable. Thus, it is anticipated that the impacts associated with the implementation of Alternative 1 would be greater than those from implementation of the Proposed Project.

Human Remains. Compliance with the California Health and Safety Code and other state laws would ensure that any human remains encountered on a development site are appropriately managed. Impacts related to human remains are anticipated to be less than significant under Alternative 1, similar to the Proposed Project.

Geology and Soils

Similar to the Proposed Project, in order to obtain grading and building permits, all future development is required to comply with the California Building Code (CBC) and the City of Los Angeles Building Code (LABC), which would minimize the effects of seismic and geologic hazards to the maximum extent feasible. Alternative 1, similar to the Proposed Project, would not exacerbate existing conditions related to earthquake faults, ground shaking, or ground failure (including cause of liquefaction, landslides, lateral spreading, subsidence, expansive soils, or collapse). Therefore, no impact would occur.

Soil Erosion. Compliance with the City's codes, regulatory requirements, standard grading and building permit requirements, and the application of best management practices would ensure that potential impacts from erosion or loss of top soils under Alternative 1 would be less than significant, similar to the Proposed Project.

Septic. Neither the Proposed Project nor this alternative would have an effect on septic systems. The Project Area, including the areas of proposed change, is currently served by City-owned wastewater treatment and disposal facilities and does not utilize a septic system. Therefore, similar to the Proposed Project, no impact would occur.

Greenhouse Gas Emissions

GHG Emission Generation. Both the Proposed Project and Alternative 1 would result in GHG emissions associated with the construction and operation of new development projects. GHG emissions would specifically arise from construction and from sources associated with operation, including direct sources, such as motor vehicles, natural gas consumption, solid waste handling/treatment, and indirect sources, such as electricity generation. GHG emissions from stationary sources, when compared to existing conditions, are expected to increase due to new development under Alternative 1, though to a lesser extent than the Proposed Project. Nevertheless, like the Proposed Project, overall emissions (stationary and mobile sources) under Alternative 1 would be lower than existing conditions due to lower vehicle exhaust emissions anticipated in the future. Since Alternative 1 accommodates less development than the Proposed Project, it would result in lower overall emissions. Therefore, as with the Proposed Project, impacts related to generating GHG emissions under Alternative 1 would be less than significant. However, since Alternative 1 accommodates less development than the Proposed Project, it would result in less impacts related to GHG emissions than the Proposed Project.

Consistency with Plans, Policies, and Regulations. With regard to applicable GHG plans, policies, and regulations, Alternative 1 would not be consistent with GHG reduction plans because it does not conform to state and regional policies, including the SCAG 2012-2035 RTP/SCS, SB375, and AB32, that encourage density around transit and promote mixed use development in order to decrease GHG emissions from passenger vehicles. The absence of intensified development around the transit stations in the Project Area would further contribute to increased regional VMT. A recent USC study demonstrated that households located within a half mile of transit have reduced VMT and associated vehicle emissions when compared to households further away.[11] Alternative 1 does not concentrate development near Expo Line stations and, therefore, would not achieve such reductions. Finally, Alternative 1 does not include TDM strategies and vehicle trip reduction requirements found in the Proposed Project, and thus would not benefit from the reduction in vehicle trips and related emissions anticipated from these project features. Therefore, the Alternative 1 would result in significant and unavoidable impacts related to GHG emissions, whereas the Proposed Project results in a less than significant impact.

Hazards and Hazardous Materials

Alternative 1 and the Proposed Project would result in similar impacts related to the transportation, use, disposal, reasonably foreseeable accidental release, or emissions proximate to schools of hazardous materials as well as interference with emergency management plans. Future development is likely to occur on sites where known or unknown soil or groundwater contamination has previously occurred, or on sites that are developed with structures that have asbestos-containing materials, polychlorinated biphenyls (PCBs), and/or lead based paint. The temporary use of potentially hazardous materials, including paints, adhesives, surface coatings, cleaning agents, fuels, and oils, is also anticipated during construction of future development. Accordingly, similar to the Proposed Project, future development has the potential to result in the transport, use, disposal, or release of hazardous materials during construction. In order to obtain permits required to commence construction, including demolition and grading, compliance with all applicable local, state, and federal regulations must be demonstrated. Various regulations identify safety standards and procedures related to the removal, handling, storage, transport, use, and disposal of hazardous materials and require testing, abatement, and remediation when deemed necessary. Therefore, similar to the Proposed Project, compliance with all applicable regulations would ensure that future development under Alternative 1 would result in less than significant impacts related to the transportation, use, disposal, reasonably foreseeable upset and accidental release, or emission or the handling of acutely hazardous materials, substances, or waste proximate to schools of hazardous materials as well as interference with emergency management plans.

Development on Hazardous Materials Sites. Under Alternative 1, future development involving discretionary approvals on sites containing hazardous materials, site plan review and accompanying environmental impact review would address potential impacts through project-specific conditions and/or mitigation. However, Alternative 1 provides no consistent protection to prevent development on sites that may contain hazardous materials as the proposed mitigation measure under the Proposed Project would. The Proposed Project includes a mitigation measure, which has been incorporated as a plan standard, which reduces potentially significant impacts to less than significant, under Alternative 1 this mitigation would not be applied. Therefore, impacts related to hazards and hazardous materials under Alternative 1 would potentially be significant and unavoidable, greater than the Proposed Project.

Airport and Airstrip Hazards. The Proposed Project is located within two miles of the public Santa Monica Airport, which is beyond the planning boundaries of the airport. Existing regulations would ensure that any future development does not result in safety hazards related to the operation of the airport. Additionally, the Airport has been allowed to close after 2028.[12] Therefore, similar to the Proposed Project, Alternative 1

[11]Boarnet M. and Houston D., University of Southern California, Sol Price School of Public Policy, *The Exposition Light Rail Line Study: A Before-and-After Study of the Impact of New Light Rail Transit Service*, December 15 2013.

[12]Federal Aviation Administration (FAA), *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

would result in less than significant impacts related to public airport safety hazards. Additionally, there are no private airstrips within the vicinity of the Proposed Project. Therefore, similar to the Proposed Project, Alternative 1 would result in no impact related to private airstrip safety hazards.

Wildland Fires. The Project Area does not include and is not adjacent to a designated wildland fire hazard area. Thus, similar to the Proposed Project, Alternative 1 would result in no impact related to wildland fire risk.

Hydrology and Water Quality

Similar to the Proposed Project, in order to obtain grading and building permits, all future development is required to comply with the City Ordinances and National Pollutant Discharge Elimination System (NPDES) permit requirements. Therefore, as with the Proposed Project, compliance with these codes would ensure that future development occurring under Alternative 1 would result in less than significant impacts related to water quality standards or waste discharge requirements; groundwater supplies and recharge; drainage patterns resulting in erosion, siltation, or flooding; runoff and storm water; water quality levels; and, risks involving flooding.

Housing in a 100-year Flood Hazard Area. A small portion in the central part of the Project Area is located within a 100-floodplain. Redevelopment of these parcels could place housing within a 100-year flood hazard area. The Proposed Plan contains a mitigation measure that requires housing to be built one foot above 100-year flood water surface elevation to protect structures from flooding events. Such mitigation would not be instituted under Alternative 1. While site plan review and accompanying environmental impact review would address potential impacts through project-specific conditions and/or mitigation when discretionary actions are required, there would be no consistent assurance that ministerial projects under Alternative 1 would not be built in a 100-year flood hazard area. Therefore, Alternative 1 would result in significant and unavoidable impacts related to placing housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary, Flood Insurance Rate Map, or other flood hazard delineation map, greater than the Proposed Project.

Impede or Redirect Flood Flows. It is not anticipated that Alternative 1 would place structures that would impede or redirect flood flows within a 100-year flood hazard area. Therefore, no impact would occur, similar to the Proposed Project.

Seiche, Tsunami, or Mudflows. The Project Area is not located within areas that have the potential for inundation by seiche, tsunami, or mudflow/mudslides. Therefore, similar to the Proposed Project, Alternative 1 would have no impact related to seiche, tsunami, or mudflow/mudslides.

Land Use and Planning

Divide an established community. Under Alternative 1, it is anticipated that there would be requests for General Plan Amendments and zone changes in addition to normal permit application activity utilizing existing zoning. The discretionary requests would likely occur on an ad-hoc basis for areas proximate to the transit stations and include proposed changes to use, subdivision, density, height, building massing, parking, etc. Citywide design standards, site plan review, conditional use, and CEQA-related mitigation requirements for these discretionary projects would be the only tools available to ensure compatibility of new proposed uses with surrounding existing uses. No new development standards or underlying policies intended to ensure compatibility between land uses would be established. Unlike the Proposed Project, which would implement uniform design standards specific to the Project Area, Alternative 1 could result in an inconsistent application of various code requirements, resulting development patterns, site plans, building orientation, landscaping and pedestrian amenities that may neither be entirely consistent with a transit-oriented area nor compatible with existing land uses and neighborhoods. Some of the station areas are surrounded by large, industrially zoned parcels which, if developed with heavy industry (as permitted by the current zoning), could result in uses and development patterns that could create barriers between the residential areas and the

transit stations and are not supportive of a walkable, transit-oriented communities. As a result, Alternative 1, compared to the Proposed Project, would create a greater risk for land use conflicts; thus, impacts related to community division and barriers are anticipated to be significant and unavoidable.

Consistency with Adopted Plans, Policies, and Regulations. The Proposed Project is intended to implement the policies of the City's General Plan Framework Element, the SCAG RTP/SCS, and the respective Community Plans, all of which call for growth to be directed towards transit in order to foster more sustainable, mixed use development patterns that improve mobility options and reduce auto dependence. Additionally, the General Plan's economic development goals are aimed at facilitating job growth by providing sufficient land to support economic development activities and broadening the definition of industrial uses in order to capture a larger share of jobs in emerging business sectors in the City of Los Angeles (see General Plan Framework goals, objectives and policies: 7B, 7.2, 7.2.6, 7.5, 7.5.1 and 7.5.3).[13] The SCAG RTP/SCS contains policies related to land use decisions that are supportive of transit investments, encourage transit-oriented development, promote a variety of travel choices, focus development in infill locations, and efficiently accommodate growth (see Table 4.8-1). Under Alternative 1, the Proposed Project would not be implemented, and no land use changes directing development toward transit would occur. Therefore, Alternative 1 would conflict with the policies of several local and regional land use plans, including General Plan policies related to directing growth of housing and jobs to areas around transit. The current land uses and zoning (that would exist under Alternative 1) were developed prior to the introduction of light rail; with the recent introduction of light rail to the Project Area there is an opportunity to better align land use regulations and zoning with General plan goals in order to create greater consistency with adopted Plans and policies. Furthermore, Alternative 1 would conflict with housing and economic development goals of the General Plan both to accommodate housing demand and to capture a significant share of job and industry growth. Consequently, land use and planning impacts under Alternative 1 would be greater than those identified for the Proposed Project, and are anticipated to be significant and unavoidable.

With regard to housing policies, Alternative 1 would not be consistent with adopted city and regional housing policies, including the General Plan Framework and Housing Element, the HUD Consolidated Plan, and the Comprehensive Affordable Housing Study. Alternative 1 does not involve land use and zone changes that would allow increased housing capacity near transit and does not accommodate the population growth projected by the SCAG 2012-2035 RTP/SCS for the Project Area. Further, Alternative 1 does not concentrate new housing around transit and along commercial boulevards, and does not encourage mixed use development, walking, and bicycling. It also does not facilitate the development process for new housing, and does not include urban design standards that would ensure high-quality, pedestrian-oriented design. Therefore, Alternative 1 would have significant and unavoidable impacts related to consistency with adopted housing policies, greater than the Proposed Project.

Habitat Conservation Plans. Similar to the Proposed Project, Alternative 1 would not conflict with any applicable habitat conservation plans or natural community conservation plans as there are no HCPs or NCCPs within the ECTNP Area.[14] Therefore, no impact would occur under Alternative 1, similar to the Proposed Project.

Noise

Noise Standards and Permanent Ambient Noise. Similar to the Proposed Project, significant changes to ambient noise levels from stationary or mobile sources related to the operation of new residential, commercial, and light industrial development are anticipated under Alternative 1. Depending on specific land uses, it is possible that operational activities would increase permanent noise levels at adjacent land uses

[13]City of Los Angeles, *The Citywide General Plan Framework: An Element of the City of Los Angeles General Plan,* August 2001.

[14]California Department of Fish and Wildlife, *Natural Community Planning Program,* https://www.wildlife.ca.gov/Conservation/Planning/NCCP, accessed March 6, 2017.

above acceptable levels. Therefore, Alternative 1 would result in significant and unavoidable impacts related to exceeding noise standards, similar to the Proposed Project.

Noise Standards and Temporary Ambient Noise. Construction noise from new developments is typically location-specific. The primary source of construction noise would be heavy-duty equipment. Development associated with Alternative 1 would expose persons in the community to new noise and vibration levels at various development sites throughout the Project Area, similar to the Proposed Project. As noted above, over 1,000 new dwelling units and approximately 2.30 million square feet of new non-residential space are anticipated under Alternative 1. However, it is not possible to accurately predict whether the lower level of foreseeable development under Alternative 1, compared to the Proposed Project, would result in fewer construction sites. It is more likely that construction sites under Alternative 1 would be more widely dispersed because there would be no new land use incentives to concentrate development near transit. Therefore, it is anticipated that temporary and periodic construction noise would exceed the City construction standards for both Alternative 1 and the Proposed Project and significant and unavoidable impacts are anticipated.

Vibration. Regarding vibration, it is not anticipated that Alternative 1 would include substantial sources of operational vibration (e.g., blasting activities). Therefore, similar to the Proposed Project, Alternative 1 would result in less than significant impacts related to operational vibration. Construction vibration is a localized event and is typically only perceptible to a receptor that is in close proximity to the vibration source. The type of low- or mid-rise buildings anticipated to be built under Alternative 1 would typically be constructed with loaders and bulldozers. However, it is possible that pile driving would be necessary depending on site-specific geologic conditions. It is also possible that heavy equipment could operate within 25 feet of, or adjacent to, nearby buildings. Although Alternative 1 includes less total development than the Proposed Project, the vibration levels associated with construction equipment operated under this alternative could cause building damage or substantial human annoyance. Therefore, Alternative 1 would result in significant and unavoidable impacts related to vibration standards, similar to the Proposed Project.

Airport and Airstrip Noise. The Project Area is located approximately 1,400 feet north of the Santa Monica Airport, at the closest point. Additionally, the Airport has been allowed to close after 2028.[15] However, airport-related noise levels at potential development sites associated with Alternative 1 would not exceed the City's community noise exposure standards. Therefore, impacts related to noise from a public airport or public use airport under Alternative 1 would result in no impact, similar to the Proposed Project. Development associated with Alternative 1 would not be located within the vicinity of a private airstrip. Therefore, no impacts related to noise from a private air strip would occur, similar to the Proposed Project.

Population, Housing, and Employment

Growth Inducement. The year 2035 forecast for the Project Area is derived from the adopted SCAG 2012-2035 RTP/SCS and is shown in **Table 5-6**. While forecasts are adopted at a citywide level, forecasts for smaller areas derived from regionally defined transportation analysis zones (TAZ) serve as targets or benchmarks that guide the planning process. Alternative 1 results in housing, population, and employment levels less than the SCAG forecast for the area. Furthermore. it does not include new roads or other infrastructure, and thus does not induce substantial population growth. Therefore, impacts related to inducing growth under Alternative 1 would be less than significant, similar to the Proposed Project.

[15]Federal Aviation Administration (FAA), *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

TABLE 5-6: ALTERNATIVE 1 COMPARED TO SCAG FORECAST

	Alternative 1: No Project /a/	SCAG Projection /b/	Alternative 1 Percent of SCAG Forecast
Housing (dwelling units)	26,072	28,497 /c/	91%
Population (persons)	52,447	54,444	96%
Employment (jobs)	37,775	43,097	88%

/c/SCAG projection for number of households was converted to dwelling units by applying average vacancy rates. See Section 4.10 for details.

Housing and Population Displacement. Within the Project Area, there are sites that are not built out to their full development potential based on current zoning and General Plan land use designations. In some instances, residential uses currently occupy sites in commercial or industrial zones, and in other instances lower density residential uses occupy sites that allow for higher densities. There is a potential for displacement of housing units and population as some of these sites are redeveloped, though to a lesser extent than the Proposed Project. Such displacement would be temporary, and ultimately Alternative 1 would result in a net gain in housing units within the Project Area, but less of a gain than the Proposed Project. Therefore, as with the Proposed Project, Alternative 1 would have less than significant impacts related to housing and population displacement. However, due to the lower capacity for development, Alternative 1 would have less impacts related to housing and population displacement than the Proposed Project.

Public Services

Parks and Recreation Facilities. While Alternative 1 would result in less capacity for growth and new development, reasonably foreseeable population growth would still result in a greater demand for the existing available parks and recreation facilities. Existing shortages in community and neighborhood parks, in particular, would be exacerbated by any growth. Therefore, as with the Proposed Project, impacts related to parks and open space under Alternative 1 would be significant and unavoidable. However, due to lower foreseeable population growth, impacts related to parks and open space would be less under Alternative 1 when compared to the Proposed Project.

Police and Fire Services. Alternative 1 would result in a population growth level that is less than the SCAG 2035 forecast for the ECTNP Area (see **Table 5-6** above). As such, this level of growth is not considered substantial with respect to anticipated growth in the City as a whole, and the distribution of the City's growth to the ECTNP Area in 2035 is generally comparable to existing levels. LAFD's services will continue to be based on the community's needs, as determined by on-going evaluations, taking into consideration calls for service and other metrics, including population. Therefore, on a programmatic level, Alternative 1 is not anticipated to result in the construction of new fire stations, since growth in the ECTNP Area has been accounted for by LAFD. Furthermore, the Project Area is not within a hillside area or located where there are increased hazards due to a design feature or incompatible use; the Project Area is in an urbanized environment where there is sufficient street access for emergency response. With regard to police protection, such services are mobile in nature and thus additional service and personnel can be provided to address increased demand without having to construct or expand existing facilities. Thus, as with the Proposed Project, impacts related to the need to provide new or physically altered fire or police facilities under Alternative 1 would be less than significant. However, due to lower foreseeable population growth, impacts related to fire or police facilities would be less under Alternative 1 when compared to the Proposed Project.

Public Schools. In regards to potential impacts to schools, Alternative 1 would result in some population growth, which would generate additional students, although to a lesser extent than the Proposed Project. However, developer impact fees would ensure that new development would bear its fair share of the cost of

accommodating additional students generated. Therefore, as with the Proposed Project, impacts related to the need for new or physically altered school facilities would be less than significant. However, due to lower foreseeable population growth, impacts related to public school facilities would be less under Alternative 1 when compared to the Proposed Project.

Library Services. Likewise, while the increase in population in Alternative 1 may create additional demand for library services, residential units within new buildings would have internet access to alleviate some of the need for library services and resources. Additionally, the LAPL Branch Facilities Plan will ensure adequate facilities are available to serve the growing population. Accordingly, as with the Proposed Project, Alternative 1 would not create substantial capacity or service level problems that would require the provision of new or physically altered library facilities in order to maintain an acceptable level of service for libraries, and would have a less than significant impact. However, due to lower foreseeable population growth, impacts related to library facilities would be less under Alternative 1 when compared to the Proposed Project.

Transportation and Traffic

Circulation System. Alternative 1 would generate fewer daily vehicle trips than the Proposed Project (see Tables 4.12-5 and 4.12-6). Due to less new development, there would be fewer intersections operating at LOS E or F in 2035 under Alternative 1 (38 intersections) than under the Proposed Project (45 intersections). Therefore, as with the Proposed Project, Alternative 1 would result in impacts related to the circulation system that are significant and unavoidable. However, due to lower foreseeable population growth, impacts related to the circulation system would be less under Alternative 1 when compared to the Proposed Project. Additionally, unlike the Proposed Project, Alternative 1 would neither direct new housing and jobs towards areas served by transit nor increase active transportation in the area; thus, Alternative 1 would likely result in slightly greater VMT per capita than the Proposed Project.

Neighborhood Intrusion. For the street segments within and adjacent to the Project Area, where the LOS would degrade from D to E or F, some trips could divert to adjacent streets to avoid longer travel times through congested locations, resulting in neighborhood intrusion impacts. Since Alternative 1 would result in fewer trips, Alternative 1 would result in fewer trips through adjacent neighborhoods than the Proposed Project, thus resulting in fewer neighborhood intrusion impacts. Given the above, as with the Proposed Project, Alternative 1 would result in a significant and unavoidable impact related to neighborhood intrusion. However, due to fewer intersections operating at LOS D, E, or F, impacts related to neighborhood intrusion would be less under Alternative 1 when compared to the Proposed Project.

Existing and Planned Public Transportation, Bicycle, and Pedestrian Facilities. Alternative 1 would not disrupt existing or planned public transportation, bicycle, and pedestrian facilities. However, it would not be consistent with local and regional policies – namely the 2012-2035 RTP/SCS and the Mobility Plan 2035 – that call for development patterns that enhance access to transit and promote bicycle and pedestrian circulation. In addition, this alternative would not have the public transportation amenities and bicycle and pedestrian improvements that would result under the Proposed Project through urban design standards, streetscape plans, and public benefit requirements. Therefore, as with the Proposed Project, impacts related to adopted policies or plans for public transportation, bicycle, and pedestrian facilities would be less than significant. However, due to the lack of project features promoting public transportation, bicycling, and walking, impacts related to public transportation, bicycling, and walking would be greater under Alternative 1 when compared to the Proposed Project.

Freeway, Arterial, and Transit CMP Thresholds. As discussed in Section 4.12, Transportation and Traffic, the Proposed Project would have a less than significant impact on freeway monitoring locations within the Congestion Management Plan (CMP) for locations within and adjacent to the Project Area. With overall less trip generation than the Proposed Project, Alternative 1 would also be expected to have less than significant impacts to freeway monitoring locations. However, impacts to freeway monitoring locations would be less under Alternative 1 than under the Proposed Project. In both Alternative 1 and the Proposed Project, there

would be three CMP arterial intersections operating at LOS F in 2035. Therefore, as with the Proposed Project, Alternative 1 would result in a significant impact related to a CMP arterial intersections, though to a lesser extent than the Proposed Project. Additionally, the increased population under both the Proposed Project and Alternative 1 would increase transit passenger trips. However, this increase is still well below transit capacity and would result in a less than significant impact. Since Alternative 1 involves lower population levels than the Proposed Project, impacts related to CMP transit impact review would be less under Alternative 1 when compared to the Proposed Project.

Emergency Vehicle Access. Emergency vehicle access may also be significantly impacted due to the ECTNP's location within a congested area of West Los Angeles. While Alternative 1 could also impact segment-level LOS, there is not a direct relationship between predicted travel delay and response times as California State law does require drivers to yield the right-of-way to emergency vehicles and even permits emergency vehicles to use opposing lane of travel, the center lanes, or bus-only lanes. In addition, the LAFD has a mandate to protect public safety and must respond to changing circumstances. The steps that LAFD would have to take to maintain public safety are not reasonably foreseeable at this time. Options available to LAFD include expanding the Fire Preemption System (FPS), increasing staffing levels and adding new fire stations(s) to underserved areas. Therefore, as with the Proposed Project, Alternative 1 would have a less than significant impact on emergency access. However, impacts related to emergency vehicle access would be less under Alternative 1 when compared to the Proposed Project.

Hazards due to Design or Uses. Alternative 1 would not include any transportation system improvements. Therefore, from a programmatic perspective, impacts related to safety would be less than significant under Alternative 1, and less when compared to the Proposed Project.

Interruption of Access or Service. Under Alternative 1, development could necessitate temporary lane, alley, or street closures or result in bus stop relocation or bus rerouting. Such projects would be subject to LADOT standards requiring a Worksite Traffic Control Plan. However, Alternative 1 accommodates lower levels of development than the Proposed Plan and is therefore anticipated to have fewer construction related interruptions to transportation access or service. Therefore, as with the Proposed Project, Alternative 1 would have a less than significant impact related to interruption of access or service. However, due to lower levels of expected development, Alternative 1 would have less impacts related to interruption of access of service when compared to the Proposed Project.

Utilities and Services Systems

Impacts under Alternative 1 related to all utilities and service systems impacts would be less than the Proposed Project because Alternative 1 would result in less capacity for growth and new development. The decreased population and employment capacity under Alternative 1 would result in less demand for utilities and service systems. In addition, since Alternative 1 would involve development of projects that are consistent with current plans, demand for utilities has already been accounted for in the respective service plans for providing water supply, wastewater disposal and treatment, solid waste disposal, and energy to the Project Area. Therefore, as with the Proposed Plan, all impacts related to utilities and service systems would be less than significant. However, due to the decreased population and employment capacity, impacts related to utilities and services systems under Alternative 1 would be less when compared to the Proposed Project.

ANALYSIS OF ALTERNATIVE 2 – REDUCED PROJECT ALTERNATIVE

Aesthetics

Under Alternative 2, there would be proposed changes to existing zoning and General Plan land use designations in portions of the Project Area. As shown in **Table 5-3,** growth is anticipated under Alternative 2 (3,318 dwelling units and approximately 4.15 million square feet of non-residential space more than existing conditions (2013)). Future development in the Project Area would be subject to a new Specific

Plan. Similar to the Proposed Project, there would be new development standards, design standards, or policies intended to preserve and enhance the visual character and quality of transit-oriented development and ensure compatibility between land uses would be established. Allowable heights and FARs would be reduced compared to the Proposed Project. SB 743 states that aesthetic impacts shall not be considered significant for the purposes of environmental analysis for residential, mixed use residential, or employment center projects on infill sites within a Transit Priority Area. Such projects are typical of the kinds of projects anticipated under Alternative 2. Although a majority of the Project Area is located in a Transit Priority Area, a portion of the Project Area is not. Therefore, a discussion of aesthetic impacts is provided below.

*Scenic Resources within a State Highway***.** There are no State-designated scenic highways located within the Project Area. While not designated a scenic highway by the State, Venice Boulevard (State Route 187) is a City of Los Angeles-designated scenic highway.[16] The status of Venice Boulevard is recognized in the existing community plans. Therefore, similar to the Proposed Project, Alternative 2 would not include elements or allow developments that would adversely affect the visual character of the street right-of-way, and impacts to scenic highways would remain less than significant.

Scenic Vistas. A number of scenic resources, including a City-designated HCM, individual historic structures, and Heritage and Ordinance Protected Trees are located within the Project Area. However, there are no publicly available scenic vista points within the Project Area, and views of the Project Area are not considered panoramic. Therefore, similar to the Proposed Project, less than significant impacts to scenic vistas are anticipated under Alternative 2.

Changes to Landforms and Other Topographic Features. As described above, there are no ridges, canyons, ravines, or other topographic features within the Project Area; however, the Project Area contains the edge of the Cheviot Hills north of the Palms Station Area. Under current conditions, large development projects are governed by the Site Plan Review process, as well as by applicable ordinances and Department of Building and Safety foundation and grading requirements. With continued implementation of these measures, in combination with new design standards, it is unlikely that Alternative 2 would destroy, permanently cover, or materially and adversely modify one or more distinct and prominent geologic or topographic features, such as hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds and wetlands. Similar to the Proposed Project, this impact would be less than significant.

Visual Character. Existing building heights, density, and other requirements vary throughout the Project Area. Impacts to visual character under Alternative 2 could occur where proposed building heights and FAR (building intensity) exceed existing conditions, though impacts would be less than the Proposed Project because the maximum allowable heights and FARs would be generally less than the Proposed Project in areas of proposed change. Projects under Alternative 2 would benefit from proposed urban design standards that regulate height and building design, which would minimize the visual character impacts of commercial and industrial uses adjacent to residential, as well as improve the visual quality and consistency of development in these areas. Nevertheless, new development constructed under this alternative would constitute a substantial change in visual character of select residential neighborhoods where proposed zoning would allow building heights and intensity that exceeds existing conditions. Therefore, as with the Proposed Project, impacts related to visual character would be significant and unavoidable under Alternative 2. However, due to Alternative 2's reduced maximum allowable heights and FARs in the areas of proposed change, impacts related to visual character would be less under Alternative 2 compared to the Proposed Project.

Shade and Shadow. Compared to the Proposed Project, the height of new development in Alternative 2 would be incrementally lower. However, some building heights under Alternative 2 would likely be taller than existing adjacent low scale residential development. Future development under Alternative 2 would,

[16]City of Los Angeles, *City of Los Angeles Transportation Element of the General Plan*, adopted in 1999.

thus, potentially create new shadows on surrounding shade-sensitive uses. This alternative would include transitional height requirements and requirements for shade/shadow studies to reduce adverse effects. However, given the close proximity of commercial corridors and proposed higher density mixed use areas to low scale developments, shade and shadow impacts under Alternative 2 would continue to be significant and unavoidable, similar to the Proposed Project.

Light and Glare. Similar to the Proposed Project, future development under Alternative 2 has the potential to create new sources of light and glare. Development and design standards associated with this alternative, in addition to implementation of the mitigation measure identified for the Proposed Project, which would be applicable to Alternative 2, would address these effects. Therefore, similar to the Proposed Project, impacts related to light and glare are anticipated to be less than significant with mitigation.

Air Quality

Air Quality Plans. Alternative 2 would increase population, housing, and employment in the Project Area, although to a lesser extent than the Proposed Project. On a citywide basis, this increased population and employment is within the assumptions of the 2012-2035 RTP/SCS provided to SCAQMD for the 2012 AQMP. As discussed below under "Population, Housing and Employment," Alternative 2 is considered consistent with the goals and policies of the 2012-2035 RTP/SCS and AQMP and with the citywide growth assumptions for the City of Los Angeles as it directs new development to areas served by transit and creates a development pattern that encourages the use of non-motorized transportation, such as bicycling and walking. Therefore, Alternative 2 would not conflict with or obstruct implementation of applicable air quality plans. The City will continue to coordinate with SCAG and SCAQMD to ensure that the most recent neighborhood level population, housing, and employment assumptions (including the Proposed Project) are utilized to prepare future AQMP and the RTP/SCS plans. Therefore, similar to the Proposed Project, Alternative 2 would result in less than significant impacts related to conflicting with or obstructing the implementation of applicable air quality plans.

Air Quality Standards. Similar to the Proposed Project, during construction of future development, regional and localized emissions would exceed the SCAQMD daily significance thresholds. However, because the reasonably expected development would be reduced by approximately 1,100 dwelling units and 1.38 million square feet of non-residential space under Alternative 2 compared to the Proposed Project, emissions associated with construction of future development under Alternative 2 would be less than the Proposed Project. Nonetheless, as with the Proposed Project, Alternative 2 would result in significant and unavoidable impacts related to construction emissions.

For this same reason, operational emissions generated by mobile sources and area sources in Alternative 2 would be less than the Proposed Project. Although when compared to existing conditions, area source VOC emissions in 2035 under Alternative 2 would increase as a result of architectural coating emissions and use of consumer products (e.g., cleaning supplies, cosmetics, and toiletries) associated with new residential land uses, decreases in mobile source emissions as a result of a more fuel-efficient vehicle fleet would result in an overall reduction in VOC emissions in 2035. Therefore, as with the Proposed Project, impacts related to operational emissions would be less than significant.

Sensitive Receptors. Construction activity would generate diesel particulate emissions associated with heavy-duty equipment operations and truck traffic. Diesel exhaust causes health effects from both short-term or acute exposures, and long-term chronic exposures. Depending on the specifics of the projects being developed (i.e., diesel particulate emissions and sensitive receptor locations), it is anticipated that emissions from construction activities in Alternative 2 would exceed the health risk significance thresholds established by the SCAQMD. Alternative 2 would result in less new development than the Proposed Project, resulting in less total toxic air contaminant construction emissions. Nonetheless, as with the Proposed Project, under Alternative 2 impacts related to exposing sensitive receptors to substantial pollutant concentrations due to construction activity would remain significant and unavoidable.

Regarding operational toxic air contaminant emissions, similar to the Proposed Project, operational activity associated with Alternative 2 would generate less than significant toxic air contaminant (TAC) emissions. New land uses, including employment-related uses such as creative office and light manufacturing, proposed as part of Alternative 2 are not typically associated with TAC emissions. Any use of toxic compounds would be strictly regulated through SCAQMD. Therefore, operational toxic air contaminant impacts related to exposing sensitive receptors to substantial pollutant concentrations would be less than significant, similar to the Proposed Project.

Odors. Future development under Alternative 2 has the potential to generate construction and operational odors. Potential sources that could emit odors during construction activities include equipment exhaust and paving and painting activities. Such odors are localized, generally confined to the immediate area surrounding a construction site, temporary, and transitory in nature. According to the SCAQMD *CEQA Air Quality Handbook*, land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies and fiberglass molding. Alternative 2 does not include land uses that are typically associated with odor complaints. Therefore, impacts related to odors would be less than significant, similar to the Proposed Project.

Cultural Resources

Alternative 2 would result in similar impacts related to cultural resources as the Proposed Project.

Historical Resources. Similar to the Proposed Project, future development in the ECTNP Area has the potential to significantly impact historical resources either through direct physical effects or through indirect affects to the area surrounding a historical resource. Implementation of Plan Standards and Procedures identified in the Proposed Project which are designed to reduce impacts to historical resources, would be applicable to Alternative 2. However, there is a reasonable possibility that during Alternative 2's development horizon a development project would necessitate the demolition, destruction, alteration or relocation of a historical resource such that the significance of that resource would be materially impaired. For this reason, despite best efforts to avoid significant impacts to historical resources, impacts related to historical resources from the implementation of Alternative 2 would be significant and unavoidable, similar to the Proposed Project.

Archeological and Paleontological Resources. Construction-related ground disturbing activities associated with future development under Alternative 2 could lead to the discovery and potential adverse change or damage to previously unidentified archeological or paleontological resources, similar to the Proposed Project. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, would reduce potentially significant impacts to a less than significant level. Therefore, similar to the Proposed Project, impacts related to archeological or paleontological resources are reduced to less than significant with mitigation.

Human Remains. Compliance with the California Health and Safety Code and other state laws would ensure that any human remains encountered on a development site are appropriately managed. Impacts related to human remains are anticipated to be less than significant under Alternative 2, similar to the Proposed Project.

Geology and Soils

Similar to the Proposed Project, in order to obtain grading and building permits, all future development is required to comply with the California Building Code and the Los Angeles Building Code, which would minimize the effects of seismic and geologic hazards to the maximum extent feasible. Alternative 2, similar to the Proposed Project would not exacerbate existing conditions related to earthquake faults, ground shaking, or ground failure (including liquefaction, landslides, lateral spreading, subsidence, expansive soils, or collapse), therefore, no impact would occur.

Soil Erosion. Compliance with the City's codes, regulatory requirements, standard grading and building permit requirements, and the application of best management practices would ensure that potential impacts from erosion or loss of top soils would be less than significant. Therefore, impacts related to substantial soil erosion or the loss of top soil under Alternative 2 would be less than significant, similar to the Proposed Project.

Septic. Neither the Proposed Project nor this alternative would have an effect on septic systems. The Project Area, including the areas of proposed change, is currently served by City-owned wastewater treatment and disposal facilities and does not utilize a septic system. Therefore, similar to the Proposed Project, no impact would occur.

Greenhouse Gas Emissions

GHG Emissions. Alternative 2 would result in GHG emissions associated with the construction and operation of new land uses. GHG emissions would specifically arise from construction and from sources associated with operation, including direct sources such as motor vehicles, natural gas consumption, solid waste handling/treatment, and indirect sources such as electricity generation. Similar to the Proposed Project, Alternative 2 would result in increased emissions from stationary sources compared to 2013 as a result of new development. However, overall emissions in the immediate plan area compared to 2013 would decrease due to lower vehicle exhaust emissions rates anticipated in the future. Therefore, as with the Proposed Project, impacts related to generating GHG emissions under Alternative 2 would be less than significant. However, due to lower levels of accommodated development, Alternative 2 would result in less impacts related to GHG emissions compared to the Proposed Project.

Consistency with Plans, Policies, and Regulations. Alternative 2 would be consistent with applicable GHG reduction plans, as it accommodates growth while providing transportation options, contributes to regional SB 375 requirements for reducing GHG emissions from cars and light trucks by reducing per capita VMT, concentrates development around transit, comprises a wide mix of uses, and better accommodates pedestrians and bicyclists. These characteristics, as well as the TDM strategies that would be incorporated into Alternative 2, are anticipated to reduce per capita GHG emissions associated with cars and light trucks. In addition, a recent USC study demonstrated that households located within a half mile of transit have reduced VMT and associated vehicle emissions when compared to households further away.[17] The decrease in VMT corresponded to a decrease in mobile source emissions with households within a half mile of a station having 30 percent less vehicle emissions than households further away after transit was introduced. Since Alternative 2 would concentrate jobs and housing within a half-mile of the Metro Expo Line Phase 2, similar to the Proposed Project, Alternative 2 is anticipated to achieve these types of reductions in VMT and CO_2 emissions. Therefore, Alternative 2 would result in a less than significant impact related to GHG emissions and consistency with GHG reduction plans, similar to the Proposed Project.

Hazards and Hazardous Materials

Alternative 2 would result in similar impacts related to hazards and hazardous materials as the Proposed Project.

Transport, Use, or Disposal of Hazardous Materials. Alternative 2 may result in an increase of industrial land uses. This could increase the risk of hazardous material accidents during use, transport, and disposal. However, individual facilities that use or store large quantities of hazardous materials on-site are required to comply with numerous federal, state, and local regulations that address hazardous materials use, transport, storage and disposal. In addition, a majority of the industrial land use located within the Project Area would likely be light industrial and light manufacturing uses, which do not involve the use of hazardous materials.

[17]Boarnet M. and Houston D., University of Southern California, Sol Price School of Public Policy, *The Exposition Light Rail Line Study: A Before-and-After Study of the Impact of New Light Rail Transit Service*, December 15 2013.

The temporary use of potentially hazardous materials, including paints, adhesives, surface coatings, cleaning agents, fuels, and oils, is also anticipated during construction of future development. Accordingly, similar to the Proposed Project, future development under Alternative 2 has the potential to result in the transport, use, disposal, or release of hazardous materials during construction. In order to obtain permits required to commence construction, including demolition and grading, compliance with all applicable local, state, and federal regulations must be demonstrated. These regulations identify safety standards and procedures related to the removal, handling, storage, transport, use, and disposal of hazardous materials and require testing, abatement, and remediation when deemed necessary. Future development may occur on sites where known or unknown soil or groundwater contamination has previously occurred, or that are developed with structures containing asbestos containing materials, lead based paint, and or PCB. Mandatory compliance with Title 40 of the CFR and Title 22 of the CCR would ensure that proper procedures are followed to minimize potential exposure to significant health hazards associated with PCBs. Therefore, Alternative 2 would have less than significant impacts related to the transport, use, or disposal of hazardous materials, similar to the Proposed Project.

Accidental Release of Hazardous Materials. Alternative 2 would allow for the construction of new buildings that would replace older structures that may have been built prior to the most recent building codes and regulations. Therefore, the proposed zone changes would reduce the risk of exposure to hazardous materials for those occupying buildings in the area as a result of accidents that can occur as current building codes and regulations require development projects to adhere to the seismic design requirements of the CBC and LABC to ensure new buildings are designed to withstand seismic events through modern construction techniques and minimize damage to structures or infrastructure that could result in the accidental release of hazardous materials into the environment. Therefore, compliance with all applicable local, state, and federal laws and regulations would ensure that impacts related to the accidental release of hazardous materials would be less than significant under Alternative 2, similar to the Proposed Project.

Proximity to Schools. Alternative 2 would allow for construction of future development within a quarter mile of schools. Construction activities would involve the utilization of diesel powered trucks and equipment, which result in diesel emissions that have been determined to be a health hazard. However, similar to the Proposed Project, individual projects developed as part of the ECTNP under Alternative 2 would be required to comply with federal, state, and local hazardous materials regulations. Compliance with all applicable local, state, and federal laws and regulations would regulate, control, or respond to hazardous waste, transport, storage, disposal, and clean-up in order to ensure that hazardous materials do not pose a significant risk to nearby receptors. Therefore, compliance with all applicable regulations would ensure that impacts related to the public, schools, or the environment through the transport, use, disposal, or release of hazardous materials under Alternative 2 would be less than significant, similar to the Proposed Project.

Government Hazards Materials Site List. Future development on a site identified as previously occupied by a hazardous materials generating facility would have the potential to create a significant hazard to the public or the environment unless an environmental site assessment is conducted to determine potential risks and to ensure appropriate remediation is implemented. Therefore, Alternative 2 could result in a significant impact related to hazardous materials sites. However, a mitigation measure, similar to the one identified for the Proposed Project, would identify sites known to the Government to contain hazardous waste or hazardous materials, allowing the proper remediation to be implemented. Therefore, with mitigation Alternative 2 would have less than significant impacts related to development on sites contained in Government lists of hazardous materials sites, similar to the Proposed Project.

Airport and Airstrip Hazards. The Proposed Project is located within two miles of the public Santa Monica Airport, beyond the planning boundaries of the airport. Additionally, the Airport has been allowed to close

after 2028.[18] Existing regulations would ensure that any future development does not result in safety hazards related to the operation of the airport. Therefore, similar to the Proposed Project, Alternative 2 would result in less than significant impacts related to public airport safety hazards. Additionally, there are no private airstrips within the vicinity of the Proposed Project. Therefore, similar to the Proposed Project, Alternative 2 would result in no impact related to private airstrip safety hazards.

Emergency Plans. Alternative 2 would not impair implementation of, or physically interfere with emergency response plans, as Alternative 2 would not eliminate or reconfigure major access routes into or out of the Project Area. Therefore, impacts related to interference with adopted emergency management plans under Alternative 2 would be less than significant, similar to the Proposed Project.

Wildlands. The Project Area does not include, nor is it adjacent to, a designated wildland fire hazard area, and, thus, no wildland fire hazard impacts are anticipated for Alternative 2 similar to the Proposed Project.

Hydrology and Water Quality

Alternative 2 would result in similar impacts related to hydrology and water quality compared to the Proposed Project. In order to obtain grading and building permits, all future development is required to comply with City Ordinances and NPDES permit requirements. Compliance with these codes would ensure that future development occurring under Alternative 2 would result in less than significant impacts related to hydrology and water quality. Moreover, future development within the Project Area would be subject to proposed design guidelines which would result in an increase in permeable surfaces, an increase in water infiltration and a reduction in the amount of runoff entering the City's storm drain system which would serve to further reduce hydrology and water quality impacts. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, would reduce potentially significant impacts related to developing housing in a 100-year flood hazard area to a less than significant level. Therefore, impacts related to hydrology and water quality would be less than significant, similar to the Proposed Project.

Impede or Redirect Flood Flows. It is not anticipated that Alternative 2 would place structures that would impede or redirect flood flows within a 100-year flood hazard area. Therefore, no impact would occur, similar to the Proposed Project.

Seiche, Tsunami, or Mudflows. The Project Area is not located within areas that have the potential for inundation by seiche, tsunami, or mudflow/mudslides. Therefore, similar to the Proposed Project, Alternative 2 would have no impact related to seiche, tsunami, or mudflow/mudslides.

Land Use and Planning

Alternative 2 would result in increased impacts related to land use and planning compared to the Proposed Project by not meeting the goals of the General Plan Framework and SCAG RTP/SCS to direct sufficient growth towards transit areas. The reasonably expected development capacity for the Project Area would be reduced by approximately 1,100 dwelling units and 1.38 million square feet of non-residential space under Alternative 2 compared to the Proposed Project.

Divide an established community. Similar to the Proposed Project, The types of land uses proposed by the ECTNP would be compatible in character with the surrounding community. Similar to the Proposed Project, Alternative 2 would not disrupt, divide, or isolate any existing neighborhoods or communities as it generally allows similar uses as those that currently exist although with a slightly greater mix of uses and building intensity than currently exists. Alternative 2 would not include new major infrastructure or roadways and, therefore, would not physically divide an existing established community or isolate an existing land use.

[18]Federal Aviation Administration (FAA), *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

Therefore, similar to the Proposed Project, Alternative 2 would result in a less than significant impact related to land use compatibility and division of an established community.

Consistency with adopted Plans, Policies, and Regulations. Alternative 2 would partially implement the policies of the City's General Plan Framework Element, the SCAG RTP/SCS, and respective Community Plans, which call for growth to be directed towards regional and commercial centers, along major corridors, and in close proximity to transit, particularly fixed rail transit. Similar to the Proposed Project, future development within the ECTNP Area under Alternative 2 would be subject to the same new development standards and policies. These standards and policies are also aimed at protecting the character and scale of select residential neighborhoods. However, the City's Housing Element has a goal of producing an adequate supply of housing (including affordable housing), which Alternative 2 does to a lesser degree than the Proposed Plan. Specifically, the reduced scale of development under Alternative 2 would result in reduced development overall, and consequently in a reduction in Public Benefits, including affordable housing, than would otherwise be provided by the Proposed Plan.

Additionally, the City's General Plan Framework Element economic development goals are designed to both facilitate job growth by providing sufficient land to support economic development activities and to broaden the definition of industrial uses due to the introduction of technology industry jobs in order to capture a larger share of jobs in those business sectors in the City of Los Angeles (see, General Plan Framework goals, objectives and policies: 7B, 7.2, 7.2.6, 7.5, 7.5.1 and 7.5.3).[19] Alternative 2 would partially implement these goals, but to a lesser extent than the Proposed Project. Because Alternative 2 is the reduced project alternative, when compared to the Proposed Project, it does not capture as many jobs overall, specifically it does not, to the same degree as the Proposed Project, capture a regional share of the clean, technology industry jobs that are clustered in the Exposition Corridor and which are targeted by General Plan policies.

Alternative 2 would be partially consistent with adopted city and regional housing policies, including the General Plan Framework and Housing Elements, the HUD Consolidated Plan, and the Comprehensive Affordable Housing Study. As discussed above, Alternative 2 generally, but not wholly, accommodates the population growth projected by the SCAG 2012-2035 RTP/SCS for the Project Area. Although to a lesser extent than the Proposed Project, Alternative 2 also concentrates new housing around transit and encourages mixed use development resulting in patterns of development that encourage walking and bicycling. Therefore, Alternative 2 would have a less than significant impact related to consistency with adopted housing policies, but greater than those anticipated by the Proposed Project which is expected to result in more compact, sustainable development patterns.

Similar to the Proposed Project, which would implement uniform design standards, Alternative 2 would implement development and design standards consistently throughout the Project Area. Use of these standards addressing site plans, building orientation, landscaping and pedestrian amenities would ensure that permitted new development would be consistent with a transit-oriented area and ensure compatibility with existing land uses and neighborhoods. In addition, although Alternative 2 includes increased residential capacity within proximity of the I-10 and I-405 freeways, which could result in potential land use conflicts due to toxic air contaminants emitted from freeways, the combination of existing regulatory measures as well as plan standards that apply to Alternative 2 would ensure that this impact is remains less than significant. Like the Proposed Project, Alternative 2 would have a less than significant impact related to adopted plans and polices. However, Alternative 2 would have greater impacts related to adopted plans and policies than the Proposed Project because it does not sufficiently accommodate projected growth.

Habitat Conservation Plans. Similar to the Proposed Project, Alternative 2 would not conflict with any applicable habitat conservation plans or natural community conservation plans, as there are no HCPs or

[19]City of Los Angeles, *The Citywide General Plan Framework: An Element of the City of Los Angeles General Plan,* August 2001.

NCCPs within the ECTNP Area.[20] Therefore, no impact would occur under Alternative 2, similar to the Proposed Project.

Noise

Noise Standards and Permanent Ambient Noise. Similar to the Proposed Project, significant changes to ambient noise levels from stationary or mobile sources related to the operation of new residential, commercial and light industrial development are anticipated. Depending on specific land uses, it is possible that operational activities would increase permanent noise levels at adjacent land uses above acceptable levels. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, would reduce noise levels, but cannot be relied upon to decrease impacts to a less than significant level. Therefore, Alternative 2 would result in significant and unavoidable impacts related to noise standards, similar to the Proposed Project.

Noise Standards and Temporary Ambient Noise. Construction noise from new developments is typically location-specific. The primary source of construction noise would be heavy-duty equipment. Development associated with Alternative 2 would expose persons in the community to new noise and vibration levels similar to the Proposed Project at various development sites throughout the Project Area. As noted above, over 3,300 new dwelling units and approximately 4.15 million square feet of new non-residential space are anticipated. However, it is not possible to accurately predict whether the lesser level of foreseeable development under this alternative, compared to the Proposed Project, would result in fewer construction sites. It is likely that construction sites under Alternative 2 would be concentrated near transit stations similar to the Proposed Project. At these locations, it is anticipated that temporary and periodic construction noise would exceed the City construction standards for both Alternative 2 and the Proposed Project. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, would potentially reduce significant impacts to a less than significant level, but cannot be relied upon in the absence of a specific construction project to assess. Therefore, under Alternative 2 significant and unavoidable impacts are anticipated, similar to the Proposed Project.

Vibration. Regarding vibration, it is not anticipated that Alternative 2 would include substantial sources of operational vibration (e.g., blasting activities). Construction vibration is a localized event and is typically only perceptible to a receptor that is in close proximity to the vibration source. The type of low- or mid-rise buildings anticipated to be built under Alternative 2 would typically be constructed with loaders and bulldozers. However, it is possible that pile driving would be necessary depending on site-specific geologic conditions. It is also possible that heavy equipment could operate within 25 feet of, or adjacent to, nearby buildings. Although Alternative 2 includes less total development than the Proposed Project, the vibration levels associated with equipment operated under Alternative 2 could cause building damage or substantial human annoyance. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, would potentially reduce significant impacts to a less than significant level, but cannot be relied upon in the absence of a specific construction project to assess. Therefore, Alternative 2 would result in significant and unavoidable impacts related to vibration standards, similar to the Proposed Project.

Airport and Airstrip Noise. The ECTNP Project Area is approximately 1,400 feet north of the Santa Monica Airport, at the closest point. The nearest proposed zone or land use designation change is located approximately 2,800 feet north of the Santa Monica Airport. The Santa Monica Airport has developed noise contours to characterize the Airport's influence on community noise levels.[21] Similar to the Proposed Project, the noise contours indicate that Santa Monica Airport-related noise levels at new development associated with Alternative 2 would be less than 60 dBA CNEL. These airport-related noise levels would be consistent

[20]California Department of Fish and Wildlife, *Natural Community Planning Program,* https://www.wildlife.ca.gov/Conservation/Planning/NCCP, accessed March 6, 2017.

[21]City of Santa Monica, *Calendar Year 2012 CNEL Contours for the Santa Monica Municipal Airport*, September 2013.

with the City's acceptable community noise exposure standards for all land uses. Additionally, the Airport has been allowed to close after 2028.[22] Development of the Alternative 2 would not exacerbate levels of exposure for people residing or working in the project area to excessive noise related to airport operations. Therefore, Alternative 2 would result in no impact related to exposing people working or residing near the Santa Monica Airport to excessive noise levels, similar to the Proposed Project. Development associated with Alternative 2 would not be located within the vicinity of a private airstrip. Therefore, no impacts related to airstrip noise would occur, similar to the Proposed Project.

Population, Housing, and Employment

Growth Inducement. The year 2035 forecast for the Project Area is derived from the adopted SCAG 2012-2035 RTP/SCS and is shown in **Table 5-7**. While forecasts are adopted at a citywide level, forecasts for smaller areas derived from regional defined TAZs serve as targets or benchmarks that guide the planning process. Alternative 2 results in housing, population, and employment levels that are consistent with the SCAG forecast for the area, but fall slightly short of the forecasted housing unit growth. Furthermore it does not include new roads or other infrastructure, and thus does not induce substantial population growth. Therefore, impacts related to inducing growth under Alternative 2 would be less than significant, similar to the Proposed Project. In short, Alternative 2 would accommodate some of the growth projected for the area but would not induce new growth.

TABLE 5-7: ALTERNATIVE 2 COMPARED TO SCAG FORECAST

	Alternative 2: Reduced Project /a/	SCAG Forecast /b/	Alternative 2 Percent of SCAG Forecast
Housing (dwelling units)	28,336	28,497 /c/	99%
Population (persons)	57,326	54,444	105%
Employment (jobs)	44,712	43,097	104%

/c/SCAG projection for number of households was converted to dwelling units by applying average vacancy rates. See Section 4.10 for details.

Housing and Population Displacement. Alternative 2 would involve land use changes that increase heights and intensities in select areas, though not to the extent of the Proposed Project, with the aim of adding housing stock. No specific units are proposed to be demolished, converted to market rate, or removed through other means. Although there may be temporary reductions in housing stock and displacement of people as properties are redeveloped, ultimately there would be a net gain in housing of 3,318 units within the Project Area, which would meet growth forecasts for 2035. In addition, the affordable housing provisions in the Proposed Project, which requires the inclusion of low-income dwelling units in market rate projects in exchange for additional development rights on certain properties, also apply to Alternative 2. Although this is voluntary, it is anticipated that some projects will take advantage of this provision, likely resulting in a net gain in affordable housing units within the Project Area. Therefore, similar to the Proposed Project, impacts related to housing and population displacement would be less than significant.

Public Services

Parks and Recreation Facilities. Under Alternative 2, increased development capacity compared to existing conditions would increase the number of residents and jobs in the ECTNP Area, increasing demand for parks and recreation facilities. However, demand for these services under Alternative 2 would be less than the Proposed Project as there would be 25 percent fewer additional residences and employees in the ECTNP

[22]Federal Aviation Administration (FAA), *Press Release – FAA Reaches Settlement Agreement with City of Santa Monica*, January 28, 2017, https://www.faa.gov/news/press_releases/news_story.cfm?newsId=21394, accessed February 28, 2017.

Area compared to the Proposed Project. Accordingly, Alternative 2 would result in impacts related to public services that are less than the Proposed Project. Regardless, as with the proposed Project, any increase in population would exacerbate the existing deficit in parks and open space in the ECTNP Area, creating a significant and unavoidable impact related to demand for parks and recreation facilities.

Fire and Police Services. Alternative 2 would result in a population growth level that is generally consistent with the SCAG 2035 forecast for the ECTNP Area (see **Table 5-7** above). As such, this level of growth is not considered substantial with respect to anticipated growth in the City as a whole, and the distribution of the City's growth to the ECTNP Area in 2035 is generally comparable to existing levels and would continue to implement the City's adopted and directed growth strategy. LAFD's services will continue to be based on the community's needs, as determined by on-going evaluations, taking into consideration calls for service and other metrics, including population. Therefore, on a programmatic level, Alternative 2 is not anticipated to result in the construction of new fire stations since growth in the ECTNP Area has been accounted for by LAFD. Furthermore, the Project Area is not within a hillside area or located where there are increased hazards due to a design feature or incompatible use; the Project Area is in an urbanized environment where there is sufficient street access for emergency response. With regard to police protection, such services are mobile in nature and thus additional service and personnel can be provided to address increased demand without having to construct or expand existing facilities. Therefore, as with the Proposed Project, impacts related to the need to provide new or physically altered fire or police facilities under Alternative 2 would be less than significant. However, due to decreased population and employment capacity, impacts related to fire and police services under Alternative 2 would be less than the Proposed Project.

Public Schools. In regards to potential impacts to schools, Alternative 2 would result in some population growth, which would generate additional students, although to a lesser extent than the Proposed Project. However, required developer impact fees would ensure that new development would bear its fair share of the cost of accommodating additional students generated. Therefore, as with the Proposed Project, impacts related to the need for new or physically altered school facilities would be less than significant under Alternative 2. However, due to decreased population and employment capacity, impacts related to public schools under Alternative 2 would be less than the Proposed Project.

Library Services. Likewise, while the increase in population in Alternative 2 may create additional demand for library services, residential units within new buildings would have internet access to alleviate some of the need for library services and resources. Additionally, the LAPL Branch Facilities Plan will ensure adequate facilities are available to serve the growing population. Accordingly, as with the Proposed Project, Alternative 2 would not create substantial capacity or service level problems that would require the provision of new or physically altered library facilities in order to maintain an acceptable level of service for libraries, and would have a less than significant impact. However, due to decreased population and employment capacity, impacts related to library services under Alternative 2 would be less than the Proposed Project.

Transportation and Traffic

Circulation System. Based on the relative reduction in foreseeable development levels from the Proposed Project, Alternative 2 would likely generate fewer daily vehicle trips than the Proposed Project. Due to less new development that would be accommodated, there would be fewer intersections operating at Level of Service (LOS) E or F in 2035 under Alternative 2 compared to the Proposed Project. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, cannot reduce impacts below a significant level. Therefore, as with the Proposed Project, Alternative 2 would result in significant and unavoidable impacts to the circulation system. However, due to less new development, impacts related to the circulation system would be less under Alternative 2 than the Proposed Project. Alternative 2 would also direct new housing and jobs towards areas served by transit and increase active transportation in the area, which may reduce VMT per capita.

Neighborhood Intrusion. For the street segments within and adjacent to the Project Area, where the LOS would degrade from D to E or F, some trips could divert to adjacent streets to avoid longer travel times through congested locations, resulting in neighborhood intrusion impacts. Since Alternative 2 would likely result in fewer trips, Alternative 2 would result in fewer trips through adjacent neighborhoods than the Proposed Project, thus resulting in fewer neighborhood intrusion impacts. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, cannot reduce impacts below a significant level. Given the above, as with the Proposed Project, Alternative 2 would result in a significant and unavoidable impact related to neighborhood intrusion.

Existing and Planned Public Transportation, Bicycle, and Pedestrian Facilities. Similar to the Proposed Project, Alternative 2 would not disrupt existing or planned transit, bicycle, and pedestrian facilities, nor would it conflict with adopted policies or plans for public transportation, bicycle, and pedestrian facilities. This alternative would promote a compact, mixed use development pattern that enhances access to transit and encourages bicycle and pedestrian circulation, which is consistent with SCAG 2012-2035 RTP/SCS and Mobility Plan policies. Alternative 2 would also have mobility amenities and pedestrian improvements associated with new urban design standards, streetscape plans, and public benefits, similar to the Proposed Project. Although Alternative 2 would result in less development than the Proposed Project, and thus would result in less streetscape improvements and other mobility-enhancing public benefits, the alternative would have a less than significant impact with regard to conflicts with adopted policies or plans for public transportation, bicycle, and pedestrian facilities, similar to the Proposed Project.

Freeway, Arterial, and Transit CMP Thresholds. As discussed in Section 4.12, the Proposed Project would have a less than significant impact on freeway monitoring locations within the CMP for locations within and adjacent to the Project Area. Similarly, lower trip generation under Alternative 2 would also be expected to have less than significant impacts to freeway monitoring locations. However, Alternative 2 would result in a significant impact related to a CMP arterial intersections, similar to, but to a lesser extent than, the Proposed Project due to slightly lower trip generation under Alternative 2. Additionally, the increased population under both the Proposed Project and Alternative 2 would increase transit person trips. However, similar to the Proposed Project, this increase is still well below transit capacity and would result in a less than significant impact.

Emergency Vehicle Access. Emergency vehicle access may be significantly impacted under Alternative 2 due to the ECTNP's location within a congested area of West Los Angeles. However, similar to the Proposed Project, while Alternative 2 could also impact segment-level LOS, there is not a direct relationship between predicted travel delay and response times as California State law requires drivers to yield the right-of-way to emergency vehicles and even permits emergency vehicles to use opposing lane of travel, the center lanes, or bus-only lanes. In addition, the LAFD has a mandate to protect public safety and must respond to changing circumstances and therefore would act to maintain response times. The steps that LAFD would have to take to maintain public safety are not reasonably foreseeable at this time. Options available to LAFD include expanding the Fire Preemption System (FPS), increasing staffing levels and adding new fire stations(s) to underserved areas. The potential for new fire station construction is speculative at the present time and is, therefore, not analyzed for this alternative. Depending on the location of new fire protection facilities, operational impacts (primarily noise) could occur; however, such impacts are unforeseeable at this time. Alternative 2 would result in a less than significant impact related to inadequate emergency vehicle access, similar to the Proposed Project.

Hazards due to Design or Uses. None of the transportation system improvements proposed in the Alternative 2 would introduce new safety hazards or incompatible uses at intersections or along roadway segments, as most would be designed to improve circulation and access to the transit stations for all users. No new roadways are planned to be introduced or removed; however, individual projects on large sites may incorporate additional roadways or pedestrian paseos, but these facilities would improve circulation and increase pedestrian access. Furthermore, streetscape plans are designed to help minimize conflicts between

pedestrians and vehicles, and design standards that would also be applicable to Alternative 2 would limit the number, width, and location of new driveways along major streets and in areas of high pedestrian activity. Therefore, similar to the Proposed Project, impacts related to hazards due to design or use under Alternative 2 would be less than significant.

Interruption of Access or Service. Under Alternative 2, development could necessitate temporary lane, alley, or street closures or result in bus stop relocation or bus rerouting. Construction-related closures would generally be temporary. Because the study area represents a specific plan area relating to the build out of multiple parcels, construction-related impacts would depend on the approach to development of each parcel or development site. Although specific impacts related to construction cannot be known at this time, it is likely that construction activities could necessitate temporary lane, alley, or street closures or result in bus stop relocation or bus rerouting. Implementation of mitigation measures identified for the Proposed Project, which would be applicable to Alternative 2, requires the provision of a worksite traffic control plan. Therefore, similar to the Proposed Project, impacts related to interruption of access or service under Alternative 2 would be less than significant with mitigation.

Utilities and Services Systems

Alternative 2 would result in less impacts related to utilities and services systems as compared to the Proposed Project. Under Alternative 2, new development would include housing and non-residential development, increasing the number of residents and jobs in the ECTNP Area and, thus, increasing demand for utilities and service systems, similar to the Proposed Project. However, demand for these services under Alternative 2 would increase by approximately 25 percent less than anticipated under the Proposed Project. Therefore, under Alternative 2, impacts related to utilities and service systems would be less than significant.

ANALYSIS OF ALTERNATIVE 3 – INCREASED RESIDENTIAL REDUCED EMPLOYMENT ALTERNATIVE

Aesthetics

Under Alternative 3, there would be proposed changes to existing zoning and General Plan land use designations in portions of the Project Area. As shown in **Table 5-4**, growth is anticipated under Alternative 3 (7,560 dwelling units and approximately 2.07 million square feet of non-residential space). Compared to the Proposed Project, the overall increase in development would be similar. The key difference is that this Alternative would likely entail the development of more multi-family stand-alone and mixed use residential buildings and fewer commercial buildings. Future development in the Project Area would be subject to a new Specific Plan. As with the Proposed Project, there would be new development standards, design standards, or policies intended to preserve and enhance the visual character and quality of transit-oriented development and ensure compatibility between land uses. Allowable heights and FARs would be similar to the Proposed Project. SB 743 states that aesthetic impacts shall not be considered significant for the purposes of environmental analysis for residential, mixed use residential, or employment center projects on infill sites within a Transit Priority Area. Such projects are typical of the kinds of projects anticipated under Alternative 3. Although a majority of the Project Area is located in a Transit Priority Area, a portion of the Project Area is not. Therefore, a discussion of aesthetic impacts is provided below.

Scenic Resources within a State Highway. There are no State-designated scenic highways located within the Project Area. While not designated a scenic highway by the State, Venice Boulevard (State Route 187) is a City of Los Angeles-designated scenic highway.[23] The status of Venice Boulevard is recognized in the existing community plans. Similar to the Proposed Project, Alternative 3 would not include elements or allow developments that would adversely affect the visual character of the street right-of-way, and impacts to scenic highways would remain less than significant.

[23]City of Los Angeles, *City of Los Angeles Transportation Element of the General Plan*, adopted in 1999.

Scenic Vistas. A number of scenic resources, including a City-designated HCM, individual historic structures, and Heritage and Ordinance Protected Trees are located within the Project Area. However, there are no publicly available scenic vista points within the Project Area, and views of the Project Area are not considered panoramic. Therefore, similar to the Proposed Project, Alternative 3 would result in less-than-significant impacts related to scenic vistas.

Changes to Landforms and Other Topographic Features. As described above, there are no ridges, canyons, ravines, or other topographic features within the Project Area; however, the Project Area contains the edge of the Cheviot Hills north of the Palms Station Area. Under current conditions, large development projects are governed by the Site Plan Review process, as well as by applicable ordinances and Department of Building and Safety foundation and grading requirements. With continued implementation of these measures, in combination with new design standards, it is unlikely that Alternative 3 would destroy, permanently cover or materially and adversely modify one or more distinct and prominent geologic or topographic features. This impact would be less than significant, similar to the Proposed Project.

Visual Character. Existing building heights, density, and other requirements vary throughout the Project Area. Impacts under Alternative 3 would be similar to the Proposed Project because building massing, as well as maximum allowable heights and FARs (building intensity), would be the same as the Proposed Project in areas of proposed change. Projects under Alternative 3 would benefit from proposed urban design standards that regulate height and building design, which would minimize the visual character impacts of commercial and industrial uses adjacent to residential, as well as improve the visual quality and consistency of development in these areas. Nevertheless, similar to the Proposed Project, development constructed under this alternative would result in significant and unavoidable impacts related to visual character of residential neighborhoods where proposed zoning would allow building heights and intensities that exceed existing conditions.

Shade and Shadow. Compared to the Proposed Project, the height of new development in Alternative 3 would be similar. Some building heights under Alternative 3 would likely be taller than existing adjacent low scale residential development. Future development under Alternative 3 would, thus, potentially create new shadows on surrounding shade-sensitive uses. This alternative would include transitional height requirements and requirements for shade/shadow studies to reduce adverse effects. However, given the close proximity of commercial corridors and proposed higher density residential areas to low scale developments, shade and shadow impacts under Alternative 3 would continue to be significant and unavoidable, similar to the Proposed Project.
