Table 2 shows a summary gleaned from the results of the Synchro analysis (over all six sites). In general, if the mainline volume increased beyond an interpolated value of 1000-1100 vph for these sites (consistent with the other assumption showed above), the conversion from 4-lane to 3-lane sections will typically have a negative impact on the traffic operations in terms of approach delays. Using a K factor of 0.10 for conversion from peak hour to ADT yields an ADT of 10-11,000 veh/day. This is considerably lower than the 20,000 ADT which appears to be a widely used rule of thumb. The results here suggest that an ADT of greater than 10,000 would be a better figure to use as a critical ADT where a road-diet conversion for a particular site requires detailed operational evaluation. For all of the 3-lane study sections, the average mainline volume was 1500 vph (corresponding ADT of 15,000 vpd) at which the approach delay reached the threshold of 55 sec/veh.

A corridor-level operational analysis study using microscopic simulation models (e.g., VISSIM) would provide an even more detailed evaluation of the operational impacts of a proposed road diet. More detained operational analysis can incorporate multiple factors (e.g., varying levels of heavy traffic volumes, turning movements at the intersection).

Table 2. Interpolated mainline volumes (vph) when approach delay ≥ 55 sec/veh (≥LOS D)

Site #	County	City	Intersection	Interpolated Mainline Volume at Threshold Delay (≥ 55 sec/veh)

			M-57 @ Seymour Road	EB	WB	EB	WB
				-	-	1700	1650

The important summary points from the operational analysis include the following:

- The operational analysis of the several sites provide reasonably consistent results and support guidelines that suggest that 4-to-3-lane road diet conversions become problematic for **ADTs greater than 10,000**.
- More importantly, 4-to-3-lane road diet conversions result in increased delay for **peak hour volumes between 1,000 and 1,500**.
- However, it is clear that "local" conditions (e.g., varying geometry, variation in turning movements, and variations in cross-street traffic) can have a significant impact on the viability of any proposed road diet. Thus, while an initial culling for potential road diet sites can be accomplished using the general guidelines above, in all instances a detailed operational analysis of the corridor (including operations at each intersection) for both

4- and 3-lane sections should be undertaken before the proposed road diet conversion is implemented.

A SAFETY-RELATED ANALYSIS FOR SELECTED 4-TO-3 LANE ROAD DIETS

The overarching purpose of the project was to estimate a crash modification factor (CMF or CMFs) that could be used to estimate crash savings that result from the implementation of 4-to-3-lane road diets in Michigan. From the outset it needs to be clear that road diets can have any of the following results (or combinations of results):

- decreases in crashes since, for example, left-turning vehicles are moved out of a through lane and into the reserved turning lane (the TWLTL) at mid-block non-intersection locations;
- increases in crashes since two lanes of through vehicles are moved into a single through lane (e.g., rear-end crashes in the right-hand lane become more likely simply due to higher volumes in the lane);
- decreases in pedestrian and bicyclist crashes because of the provision of better infrastructure for these users; and
- increases in pedestrian and bicyclist crashes since such users/trips are attracted to the improved infrastructure.

In addition, crash increases or decreases can vary substantially given the prevailing ADTs, road usage patterns, adjacent land uses (e.g., are there pedestrian/bicyclist attractors adjacent to the road diet site), turning volumes (especially mid-block), peak hour characteristics, and type of area (e.g., tourist area, university campus, small town) among others. Finally, background variation in crash frequencies (e.g., all crashes are steadily decreasing in a particular city) must be considered when trying to isolate the effect of a road diet.

The point is that there is likely to be significant variation in existing conditions prior to the implementation of a road diet. Crash savings (if there are any) are, likewise, likely to vary substantially with all of these variables.

In this section, the development of a crash modification factor (CMF) for selected 4-to-3 lane road diet sites in Michigan is documented:

- first, site selection is reviewed;
- next, data collection and reduction (e.g., reclassification of crash types) are discussed;
- then, the data analysis is presented including consideration of various methods for controlling for background trends in crash history; and,
- finally, a general CMF for road diets in Michigan is presented.

SITE SELECTION

Site selection for this project was developed through a general solicitation of sites from various MDOT personnel (e.g., TSC and/or regional traffic engineers) and local agencies. MDOT personnel had developed a tentative contact list which was supplemented with suggestions from others. A survey (see Appendix F) was sent to the list with the purpose of identifying potential sites, locations of the road diets, basic information about the site (e.g., type of road diet such as 4-to-3 lane reductions), the reasons for implementing the road diet, start and end dates for the actual implementation, and other basic data. Some 43 initial sites were eventually identified via the survey. Although it had originally been envisioned that different types of road diets might be included in the study, review (with MDOT) of the set of sites that emerged from the survey led to the conclusion that the study be limited to the "standard" 4-to-3 lane road diet conversions.

Some sites were eliminated because they were too recent to have adequate (three years) "after-implementation" data. Other sites were too old to have crash data that were consistent with data for all other sites. Other reasons for eliminating sites included: length too short, other recent site changes, inconsistent or no ADT data, and on-street parking allowed. For the final analysis, a total of 24 sites were generally used. For some of the analysis (e.g., on-site visits to observe pedestrian/bicyclist operations) some older sites were used while for other parts of the analysis, some of the 24 were not used. The latter is discussed in more detail below. Locations of all of the sites (including some that were only visited) were shown earlier in Figure 1. A copy of the spreadsheet for each of the 24 sites used in the crash analysis is in Appendix D.

DATA COLLECTION AND REDUCTION

Once the sites had been identified and agreed-upon, crash data were retrieved for each site (both for the mainline and cross streets near the intersections) as were ADT and other traffic data (e.g., turning data for some sites for the operational analysis). In addition to the electronic crash records, the "hard copies" of all of the relevant UD-10s were retrieved so that the actual crash diagram and narrative could be examined for each crash. This allowed, for example, for a determination of whether cross-street crashes were correctly assigned to the intersection or the cross street itself (and back from the intersection)—i.e., were these crashes at all associated with the road diet.

In addition, crashes were "reclassified" using a more-detailed assignment so that the effects of the road diets could be more accurately assessed. An example of this "reclassification" is assigning a rear-end/straight crash to the right or left lane during the "before" period. Further, crash categories were classified as whether they were expected to be: 1) "correctable" by a road diet (e.g., a rear-end left-turn crash in the left lane which should be corrected with a road diet since the turning vehicle would be out of the regular travel lane as a result of the road diet); or 2) affected by the road diet (e.g., rear-end crashes in the curb lane might increase). Note that while "correctable" crashes are a benefit, the affected crashes might either increase or decrease. Details of the reclassification scheme can be seen in Appendix G.

During the review of the crash data, some crashes were eliminated from consideration in the subsequent analysis. For example, if the crash didn't have anything to do with the roadway or its geometry, it was eliminated. Examples of such an elimination include a crash where a driverless vehicle rolled out of a driveway and crossed the entire roadway before crashing; and another where a police traffic stop resulted in the admission by the (inebriated) driver that she had been involved in a crash "somewhere" within the preceding hour or so, and the crash was coded to the street where the stop occurred. Other crashes that were eliminated included those with animals, those that occurred during (any) construction, and those that occurred on (or were otherwise attributable to) the side streets.

DATA ANALYSIS

Once all of the data had been prepared and reconciled, the analysis was relatively straightforward except for the control for background trends. The data used for any site is illustrated in the spreadsheet on the next page (site 11). Copies of the spreadsheets for all 24 sites are in Appendix D.

With reference to the information shown on the next page, the top section contains a summary of the basic **site characteristics** for site 11 (e.g., county, city, road name). The next section contains the **descriptive statistics** which include the basic crash frequencies by before and after period (and further broken down by year) as well as all of the crash information for background trends (e.g., crashes for the city and county over the same time period). The third section shows a **naïve before/after crash analysis** (no correction for trends) including a graphical representation of the crash frequency by year for the site. The fourth section shows the **before/after crash analysis with a simple adjustment for various background trends**. The final section (only available for some sites) shows the **before/after crash analysis adjusted for trends of an untreated comparison group**. Each of these sections is discussed in more detail in the following paragraphs.

Site characteristics, in addition to simple identification of the site, are also used for grouping similar types of sites when the CMF is developed—for example, the number of driveways, intersections, and average daily traffic (ADT).

Descriptive statistics include all of the basic crash information for the site. For each site, three-year before and after windows are shown. While, in most, if not all, instances the construction duration was short-lived, the crash data for the entire year during which the construction/implementation of the road diet occurred are eliminated from the analysis. Thus, each year in the before-after window for every site is a full calendar year and all before-after comparisons are based on three full years before and after the construction year. This eliminates any issues with one site being completed in the spring while another is completed in the fall. In addition to the overall crash frequencies, crash data are also broken down by

whether they are intersection- or driveway-related and whether they are correctable or affected. Background data for assessing citywide and countywide trends are also shown. Finally, citywide-trunkline and countywide-trunkline trends are also shown. These can be used to "adjust" the basic before-after comparisons for background trends/variation (addressed below).

The **naïve before/after crash analysis** is a simple comparison of the three-year before and after crash frequencies. (Again, note that percentage reductions [in crashes] are discussed here—the percentage reductions in crashes can be converted to CMFs using the formula where the CMF = 1 – [percent reduction].) A percentage change (based on the before period) is also shown. In addition, similar numbers are shown using recoded crashes and then limiting the crash types to those that are presumed to be affected or correctable by the road diet. A graphical comparison of before and after frequencies is also shown (for total crashes, recoded crashes, affected crashes, and correctable crashes). It should be noted that the results shown for site 11 are fairly typical:

- Considerable year-to-year variation in crash frequencies are noted during both the before and after periods.
- In general, the crash frequencies are lower in the after period than during the before period. If there was no background variation, this would suggest that road diets result in significant crash reductions, regardless of which general group of crashes is examined.
- Crash reductions for "correctable" (by a road diet) crashes are the most substantial—a not-unexpected outcome.

The **before/after crash analysis with a simple adjustment for various background trends** is a consideration of the proposition that some of the observed reduction in crash frequencies is not because of the road diet but rather due to other causes (which may not be known). Background trends are shown for the county in which the road diet is located, for the city, and considering trends in only trunkline crashes for both the county and city. The trunkline trends were added since most of the road diets to be analyzed were on trunklines.

Various arguments can be made for which background trend "best" represents the overall environment for the road diet. After considering all of the sites, it was decided that the citywide trend is the most reasonable and realistic to use as the indicator of what else is occurring in the background of the implementation of the various road diets. The county level includes many roads that are quite different (in design and use) from those being "dieted" and, in some instances, may even include other larger urban areas. For this reason, the countywide data are not considered as representative as the citywide data. In addition, for some sites (in smaller cities), the trunkline category may primarily consist of the road diet site. Thus, the following analysis is based on using the "city trend" as indicative of the environment in which the road diet is undertaken. In each instance, the adjusted percentage change is also shown. That is, what is the effect of the road diet after considering (subtracting out) the background trend. Again, what is shown for site 11 is fairly typical of other results (see Appendix D for all sites):

- There is some year-to-year variation in background trends (i.e., the trend lines shown are not flat or monotonically increasing or decreasing).
- Notwithstanding year-to-year variations, the overarching background trends are that crash frequencies are decreasing.
- The simple (naïve) before-after trends associated with road diet implementation need to be adjusted for the general downward trend in crash frequency being experienced in the various cities where road diets were implemented.
- A considerable portion of the reduction in crash frequency that would be attributed to the road diet under a naïve scenario is accounted for by the background trend. For example (considering site 11 as shown), the average number of crashes per year is reduced from 48.3 to 37.7 or ~22% for the road diet site; but citywide crashes decreased from 153 to 130 or ~15%. Thus, much of the reduction on the road diet site is presumably attributable to the background trend—the modified crash reduction due to the road diet is reduced to ~7% (which corresponds to an adjusted CMF of 0.93).

The **before/after crash analysis adjusted for trends of an untreated comparison group** (last section in the example shown) is another attempt at controlling crash reduction for background trends. In the narrative here, the term CMF is used. As noted earlier, a CMF is used to estimate the number of crashes expected at a site following the implementation of a countermeasure or treatment. In addition to the naïve before/after analysis and comparison with background crash trends, the CMFs for each of the 24 project sites were computed. FHWA's 'A Guide to Developing Quality Crash Modification Factors' (Gross et al., 2010) provides several methods to compute crash modification factors and functions including before/after with comparison sites, empirical Bayes, and full-Bayes studies. While these (and other) methods differ primarily in statistical approach to modeling the crash data, a fundamental requirement for most methods is the availability of data for a group of "comparison sites" which are very similar to the "treatment sites" in physical and operational aspects.

To conduct a before/after analysis with a comparison group, comparison sites were identified using various characteristics such as length of road diet, area type (residential, commercial, or mixed), driveway and intersection density, number of lanes in the before period (including similar bike/pedestrian facilities), treatment year, and ADT. Given the practical difficulties in achieving ideal pairs of comparison and treatment sites, this exercise resulted in the identification of 17 potential comparison sites for 9 of the 24 treatment sites (multiple comparison sites were identified for six treatment sites). Crash data for comparison sites in the before period were then extracted to ascertain suitable matches with specific treatment sites.

In order to determine the suitability of the treatment-comparison pairs, sample odds ratios were computed using the crash data in the before period. The mean, standard error, and 95% confidence intervals of the sample odds ratios were computed to determine if crash frequencies at the comparison site were statistically similar to the treatment site in the before period. This crash data comparison further reduced the number of suitable comparison sites to five to match with the following treatment sites: 1, 3, 8, 11 (shown above), and 13.

For the five treatment sites for which the sample odds ratios resulted in viable comparison sites, the expected number of crashes that would have occurred in the after period

without treatment (N-expected,T,A) was computed. The CMF was then computed based on the observed number of crashes in the after period for treatment sites (N-observed,T,A) N-expected,T,A, and the variance of N-expected,T,A (Gross et al., 2010). The variance, standard error, and 95% confidence interval of the CMF were also computed.

The CMF for site 11 (see above) was computed to be 0.93 with a 95% confidence interval of 0.60-1.26. Since the confidence interval includes the value of 1.0, it cannot be stated with 95% confidence that the true value of the CMF is not 1.0. In other words, the treatment did not have a statistically significant effect in reducing the crashes at this site. By way of comparison, the naïve before/after analysis shows a decrease of ~22%, and comparison with background crashes shows a range from a **~7% reduction** when adjusted for citywide crashes to an **increase of ~7%** when adjusted for citywide trunk line crashes. A graphical illustration of the crash trends for site 11 and the comparison site is also shown.

For site 1 (see Appendix D), the CMF was computed as 0.98 with a 95% confidence interval of 0.62 and 1.35. Again, since the confidence interval contains the value of 1.0, it cannot be stated with 95% confidence that the true value of the CMF is not 1.0. In other words, the treatment did not have a statistically significant effect in reducing the crashes at this site. While the naïve before/after analysis shows a decrease of 15.6%, the uncertainly of the treatment effect is somewhat evident from the comparison with background crashes where the effect of treatment yields a reduction of 6.11% when adjusted for countywide crashes, and shows an increase of 6.07% when adjusted for citywide crashes.

For site 3 (see Appendix D), the CMF was computed to be 0.83 with a 95% confidence interval of 0.58 and 1.07. The results relative to the confidence interval are the same as above. The naïve before/after analysis shows a decrease of 34.03%, and comparison with background crashes shows a wide range from 20.58% reduction when adjusted for countywide crashes, and a reduction of only 2.34% when adjusted for citywide trunk line crashes.

The CMF for site 8 (see Appendix D) was computed to be 0.97 with a 95% confidence interval of 0.61 and 1.33. Again, these results are similar to those noted above. The CMF for site 13 (see Appendix D) was computed to be 0.80 with a 95% confidence interval of 0.48 and

1.12, so the results are similar. Overall, the CMFs computed using the before/after analysis with comparison groups were not found to be significant for any site.

The outcome of the exercise using comparison sites to adjust the percentage of crash reductions and/or the CMFs was somewhat disheartening. While it seems intuitively clear that there is some reduction in crashes due to road diets, the results of the most-detailed analysis indicated that it was not statistically significant. However, that analysis is highly dependent on the comparison sites that were selected. It was impossible to find sites that were an exact match for the road diets studied, notwithstanding some measure of statistical fit. Roadway segments upstream and downstream from the road diets were considered as were parallel routes; all to no avail. Sites in different locations were considered and those chosen were the "best possible," but far from perfect. The dilemma was whether to go forward with developing recommended CMFs which may not be statistically defensible. The decision was to go forward and, to the extent possible, develop CMFs based on citywide trends in crashes during the before and after periods. The caveat regarding the suitability of comparison groups being noted.

ESTIMATION OF CMFs AND DISCUSSION

As noted, the site-by-site results (as discussed above) for all 24 sites are presented in Appendix D. These results were synthesized to get a general result that could be used by MDOT as a guideline for what might be expected to result from a road diet implementation. Further work was also done to examine trends in crash severity.

The tasks below were completed to develop CMFs; the results are shown in the summary spreadsheets in the appendix. An abbreviated version of that spreadsheet (showing CMFs) is shown on the next page (Table 3). These spreadsheets contain the results from the following tasks:

- Site-by-site calculations were done as described above.
- A summary of selected site characteristics was prepared for each site and included:
    - site number,

- crashes,
- length of road diet,
- approximate average annual crash frequency (over all years—used later to divide sites into high and low accident frequencies), and
- type of site (residential, mixed and commercial—used later to divide sites).

- Percentage changes for the county trends, city trends, and trunklines were calculated for each site (as above) and transferred to the summary spreadsheet—these are used as alternative corrections for considering background variation.
- The percentage reductions (or increases) between the before and after period were calculated for all, recoded, affected, and correctable crashes and transferred to the summary sheet.
- Each of the basic reductions was then "adjusted" using the various corrections for city, county, and other trends (the abbreviated summary below shows only the corrections for city trends; the sheet in Appendix D shows all of the corrections).
- Once the above information was all transferred to the summary sheet, averages (and other statistics) were calculated over all sites with usable data. Confidence intervals for the relevant average CMFs were also calculated.
- All of the percent changes were converted to CMFs (a separate worksheet in the appendix which is shown in abbreviated form below).
- The sites were sorted by relatively high and low "before" crash frequencies (>19 crashes/year vs. 10 or fewer crashes/year), type of adjacent land use (residential, mixed residential and commercial, and commercial), number of driveways (>32 and <32), and number of intersections (8 or less, 9 or more).

The important CMFs in Table 3 are those in bold red. These are: the basic (unadjusted) CMF referred to earlier as the "naïve" CMF and based solely on the overall change in crash frequency between the before and after periods; the basic CMF adjusted for the citywide trend;

and the CMFs for recoded crashes, affected crashes, and correctable crashes. Similar CMFs were calculated considering different stratifications of the sites (e.g., by high and low frequencies of before crashes). (Details on these variations are not shown in the abbreviated version of the spreadsheet but are provided in Appendix D.)

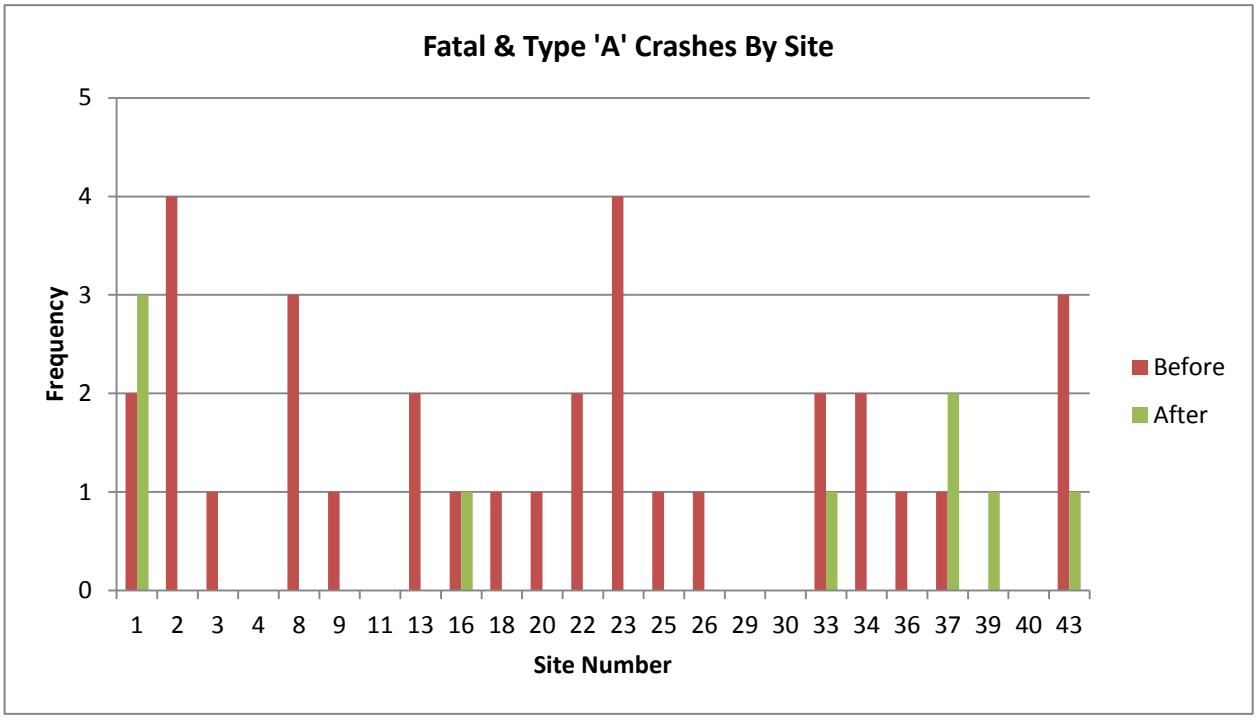
The 95% confidence intervals for the mean values of the CMFs are also shown in the following spreadsheet. Note that in every instance (save for the "correctable" crashes) the confidence interval for the trend-corrected CMF contains the value of 1.0—therefore, the average CMFs are not statistically different from zero. This result is actually similar to that obtained from the more detailed analysis involving comparison sites discussed in the last section.

The relevant CMFs are further summarized in Table 4 below. The naïve CMF is 0.63—that is, if all of the reduction in crashes was attributed to the implementation of the road diets the "after" crashes would be 63% of the "before" crashes. However, it was argued above that the naïve CMFs needed to be adjusted for the background citywide trend in crash frequency. In all instances (see detailed results), the citywide trend over the seven-year period (3 years before, 1 year for construction, and 3 years after) studied was toward decreasing crashes. Thus, the "uncorrected CMF" is adjusted for that (average) trend with the result that the basic CMF (shown in bold green in the table) is estimated as 0.91. That is to say that after the adjustment for the background trend, the "after" crashes on road diet sites would be 91% of the "before" crashes (only a 9% reduction after adjustment). Looking at the recoded crashes and only affected crashes, it is seen that the CMF varies by only a few points. For the crashes expected to be "corrected" by a road diet, the CMF is 0.59—that is, for those crashes expected to be reduced by road diets the "after" crashes would be only 59% of the "before" crashes.

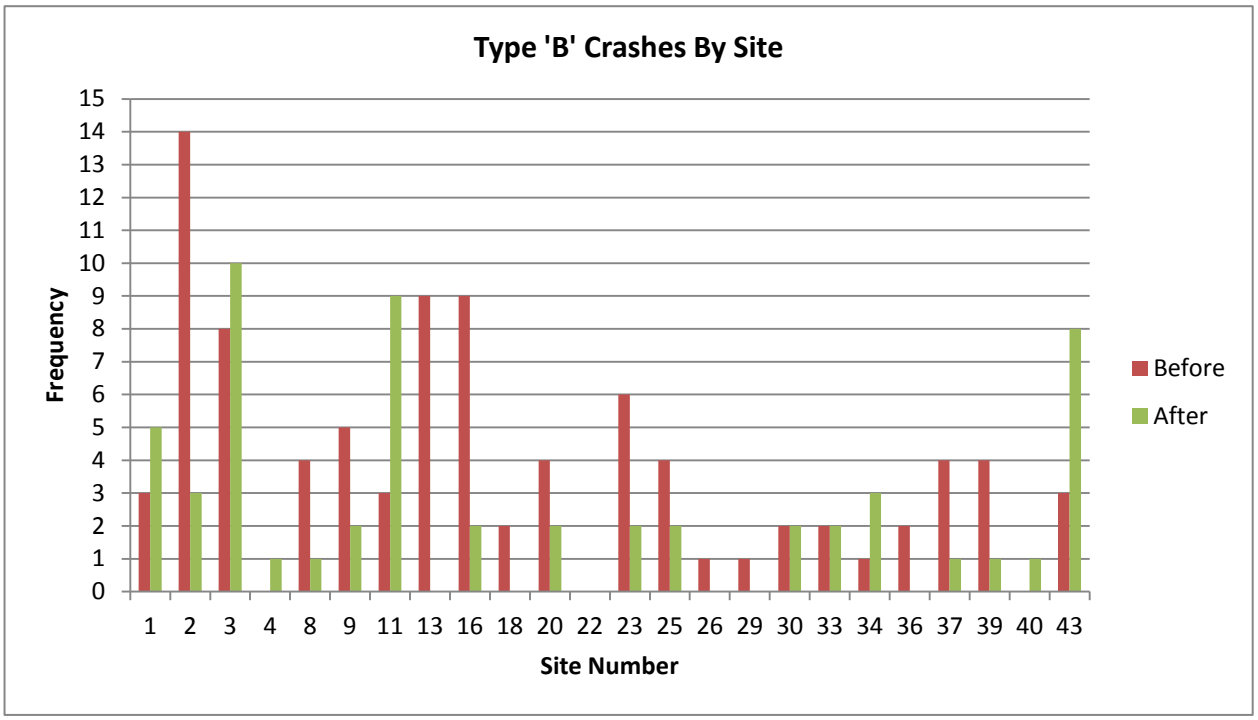
The basic CMF is the one that is suggested for general estimates for proposed road diet projects. This is with the strong caveat that there is significant variation among sites. For example, the results in Table 3 show that the (citywide-trend-adjusted) CMFs for the 24 sites studied varied from 0.53 to 1.69 although most sites had CMFs less than 1.0. It should be noted that the site with the highest CMF had a low number of crashes so that a large percentage

Table 4. Comparison of mean values of CMFs

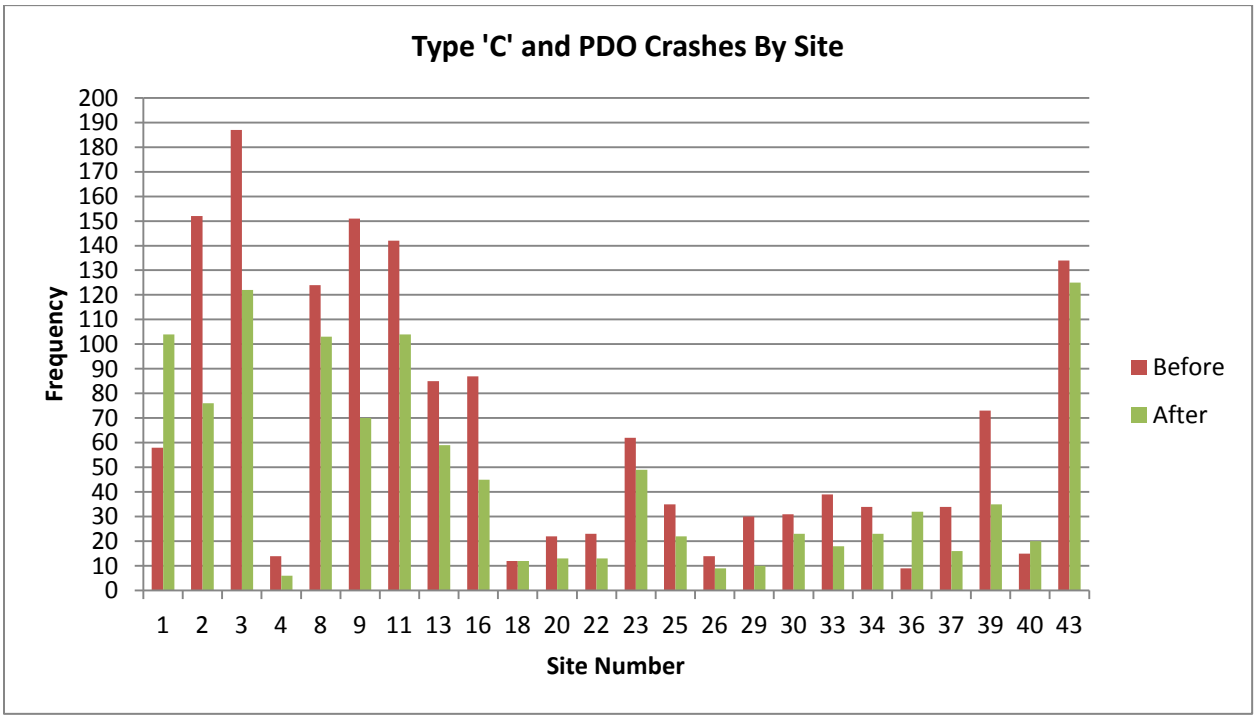
type of CMF	un-corrected CMF	CMFs corrected for city trend			
		basic CMF	CMF for recoded crashes	CMF for affected crashes	CMF for corrected crashes
average over all sites	**0.63**	**0.91**	**0.95**	**0.90**	**0.59**
potential adjustments for different characteristics					
high crash	0.65	0.92	0.91	0.92	0.54
low crash	0.61	0.90	0.98	0.88	0.63
res	0.55	0.78	0.77	0.91	0.51
mix	0.68	0.94	1.06	0.90	0.52
com	0.67	0.99	1.05	0.88	0.72
low driveway density (<32)	0.63	0.93	1.07	0.87	0.66
high driveway density (>32)	0.63	0.88	0.81	0.92	0.51
low number of intersections (8 or less)	0.61	0.90	0.95	0.83	0.61
high number of intersection (9 or more)	0.67	0.93	0.93	1.05	0.55



change was relatively easy to achieve. For such reasons, the sites were disaggregated by crash frequency (and other factors) as seen in Table 4—this was to illustrate how the CMF might vary from one grouping to another. For example, the basic (adjusted) CMF is seen to be 0.92 for "high" crash sites and 0.90 for "low" frequency sites. Looking at the "basic CMF" column, it is noted that most of the groupings don't make much difference—with only a couple of points of difference from one grouping to another. The most notable exception is the grouping by type of adjacent land use. The results here suggest that the CMF for "residential" sites might result in more crash savings (CMF = 0.78) than for commercial or mixed-use sites (CMFs = 0.99 and 0.94, respectively). The way the "potential adjustments" should be interpreted is, for example: while the overarching CMF for all sites is expected to be around 0.91, a residential site might result in a lower CMF than would be achieved at a mixed-use or primarily commercial site.



The exception to the above is the collection of those crash types that are expected to be "corrected" by a road diet. The overall CMF is estimated at 0.59 and (as shown in the detailed results) is statistically different from zero. So, while there is more confidence in this result, it should be noted that there are some offsetting changes in the frequencies of other crash types.



So, used only for selected crash types, this CMF has utility but it is not necessarily good for estimating overall changes.

CRASH SEVERITY

Changes in crash severity might also be expected as a result of the implementation of road diets. Changes in severity must be handled with care as there are many factors in play—e.g., changes in speed limits and/or operating speeds can shift severity distributions regardless of whether road diets are being implemented. The overarching trends in Michigan are that the total number of crashes and all types of severity are decreasing over time (from 1996 through 2010) although not without some year-to-year fluctuation. The three graphs below show the before and after frequency of three severity classifications (fatal + A crashes, B crashes, and C +

PDO crashes) by site. As can be seen, and has been repeatedly noted, there is considerable variation by site although the trend is for an overall reduction (which was noted earlier for all

crashes over all sites). Perhaps the best indication for severity effects is the shift in the distribution of severity for the sites studied. This overall trend (all sites combined) is shown in Table 5.

Table 5. Shift in crash severity for all sites

crash type	before	after
fatal + A	33 (2%)	9 (1%)
B	91 (5.4%)	57 (4.9%)
C + PDO	1567 (92.7%)	1109 (94.4%)

It would appear that there is a slight trend toward less severe crashes on the road diet sites. For rough comparison purposes, an examination of overall statewide trends in severity (using the same severity groupings as for Table 5) is shown below from 2001 to 2010.

Table 6. Shift in statewide crash severity between 2001 and 2010

crash type	2001	2004	2007	2010
fatal + A	2.4%	2.4%	2.3%	2.0%
B	5.2%	4.8%	4.7%	4.8%
C + PDO	92.4%	92.8%	93.1%	93.2%

One issue in comparing the severity shift for the sites is that the actual time periods for the before and after windows varies by site (for example, before-after for site 1 compares 1997-1999 with 2001-2003 while the before-after for site 2 compares 2004-2006 with 2008-2010). That notwithstanding, there are distributional shifts in overall statewide severity over the 10-year period of: a 0.4 percentage point decrease in fatal+A crashes, a 0.4 percentage point decrease in B crashes, and a 0.8 percentage point increase in C+PDO crashes. This compares to a 1 point decrease in fatal+A, a 0.5 point decrease in B, and a 1.7 point increase in C+PDO for the road diet sites. This suggests that the road diet shifts are slightly larger and more positive (from a safety perspective) than overall statewide trends would suggest over the last 10 years or so. Such small differences do not seem operationally significant and could easily be attributable to things like changes in operating speeds, changes in enforcement, or just random variation.

SUMMARY AND DISCUSSION

The development of a crash modification factor (or factors) for road diets in Michigan was the primary objective of this study. In all, 24 separate sites were studied with this goal in mind. Overall changes in crash experience before and after the implementation of the 4-to-3 lane road diets were evaluated and then controlled for background variation. The latter was done through examining citywide and countywide trends (trends on trunklines were also examined) and through consideration of comparison sites (i.e., untreated "control" sites). Changes in crash severity were also examined. The following is a summary of the results of those analyses.

- There is considerable site-to-site variation in the crash-related results although in almost all instances, there was a reduction in the number of crashes.
- Examination of the background (e.g., citywide, countywide) trends showed that in all cases there was a trend toward lower crash frequencies over time. This is a clear indication that before-to-after comparisons of road diet implementations (or any other change to the road system infrastructure) must be evaluated with explicit control for the background trends.
- Several approaches for controlling for background variation were pursued. The most appropriate were deemed to be a simple control for citywide trends and the consideration of comparison sites.
- Good/acceptable comparison sites could be identified for only a few of the 24 sites and none of the eventual comparisons gave statistically significant results—that is, the calculated CMFs for specific sites were not statistically different from 1.0.
- Average CMFs, adjusted for citywide trends, were calculated across all 24 sites. The result was that the overall naïve (unadjusted) CMF was estimated as 0.63 and **0.91** after adjustment. Considering only those crash types expected to be affected by the road diet (not necessarily only reduced), the CMF was 0.90. And, finally, considering only those crash types expected to be reduced by a road diet, the adjusted CMF was 0.59.

Use of the latter is problematic since there are typically offsetting changes in crash type frequencies. Only the CMF for the "correctable" crashes was statistically different from 1.0.

- While the best estimate of a usable CMF is 0.91, it should be noted that this is not statistically different from 1.0 and is an average across all sites. Perhaps more importantly, there is a great deal of variation from site to site.
- Considering effects of other variables on the overall CMF, it was seen that there was not much change due to high vs. low overall crash frequency sites, nor was there much difference due to driveway or intersection density. However, sites where the land use adjacent to the road diet was primarily residential tended to have a lower CMF than mixed-use or commercial sites.
- Changes in crash severity due to road diets were also examined. The question was whether the distribution of severity changed—i.e., do crashes tend to be more or less severe after road diets are put in place. Again, it was noted that there was considerable variation from site to site (and often the numbers of crashes, especially the more serious, were quite small). The distributional shift over all sites was estimated and compared to statewide shifts over the general analysis period. The finding was that although there was a slightly more substantial shift to less severe crashes for the road diet sites, it did not seem operationally significant. Moreover, the shift could have easily been due to changes in operating speeds, enforcement, or simply random variation rather than the road diets themselves.

IMPLEMENTATION OF ROAD DIETS

One of the issues with road diets (and, really, any street or road improvement) is how and when to engage the public if the action is being initiated by MDOT or other agency. Road diets in Michigan are typically perceived as a safety improvement although there may also be upkeep and maintenance savings as well. A more-detailed implementation guide is presented in Appendix E but summary comments are presented below.

Historically, traffic engineers (and the public agencies they work for) have been perceived as being primarily concerned with expanding or at least maintaining street and road capacity and enhancing traffic flow. However, over the last decade or so, there has been increasing interest in how streets and roads "fit" into the adjacent environment—conversations about complete streets, traffic calming, green design, accommodating pedestrians and bicyclists, and so forth have become much more common. The road diet concept has gained considerable traction with various agencies, and road diets are often proposed by traffic engineers as being better for non-motorized users and having safety benefits. Ironically, some communities resist proposals for road diets because they can reduce capacity in some situations. Regardless of why a road diet is being proposed (e.g., a single stand-alone project, part of a pedestrian/bicyclist plan, part of a complete streets program), there needs to be engagement of the local community if the project is to be smoothly implemented.

ROAD DIET IMPLEMENTATION

Road diets have been implemented in many states including California, Washington, Iowa, Minnesota, Florida, and, of course, Michigan. For the purpose of developing an implementation guide, studies that present information on the process of implementing a road diet were further reviewed. These studies included advantages and disadvantages of a road diet, motivating factors for conversion, and lessons learned following the project (e.g., Gallagher 2007).

The apprehension regarding (or overt dislike of) road diets stems from the counter-intuitiveness of reducing the capacity of the roadway while maintaining an acceptable level of

service. To challenge the general thinking, many agencies implementing road diets have experienced success by utilizing techniques that both educate and involve the community.

An implementation guide encompasses all aspects of the project in a beginning-to-end fashion. Continuous community involvement should be maintained through each phase of the road diet conversion. There are three basic phases: pre-construction (phase I), construction (phase II), and post-construction (phase III) with the following objectives for each phase:

- phase I—community education and acceptance for the road diet project;
- phase II (which can be very short if the project is primarily re-striping)—mitigate any negative effects associated with construction and roadway operations; and
- phase III—demonstrate how the road diet fulfilled community objectives while highlighting the benefits of the new corridor.

Success of a road diet project can be measured on several levels, however, when a road diet fulfills the needs of a community while maintaining the necessary function of the corridor, success is generally recognized.

In **phase I, community education and acceptance**, it is essential to promote community involvement and a sense of ownership from the outset. Many agencies implementing road diets have involved the public through town hall meetings, workshops, and newspaper postings which detail the road diet project specifically (Gallagher 2007). Others have found success by implementing road diet projects through city master plans or other citywide initiatives such as Complete Streets or a community bicycle plan. For example, Michigan's Genesee County Metropolitan Alliance adopted a "Complete Streets" approach where "Transportation improvements in Genesee County are planned, designed and constructed to encourage walking, bicycling, and transit use while promoting safety for all users" (GCMPC undated). Another example includes the "pedscape plan" adopted in Charlotte, North Carolina (Sak 2007). These techniques provide an accepting atmosphere because residents are more receptive to change and look forward to "reinventing" their community with a broader scope. Additionally,

this couples the road diet with other actions which may, for example, have as a goal restoring an out-dated downtown setting. The intent of public meetings during this phase should be to:

- gain an understanding of the needs of a community by generating a list of transportation, economic, and safety objectives;
- develop a broad plan (e.g., a master plan, complete streets program) which considers community objectives and provides a list of projects which fulfill these objectives and provides a context for the road diet;
- provide several alternatives to road diets and explain how different alternatives succeed or fail to meet the goals of corridor and the community;
- demonstrate how a road diet will affect all modes of transportation by providing equal access to motorists, cyclists, and walkers while maintaining safety; and
- perhaps most importantly, provide an unbiased assessment of both the advantages and disadvantages of road diets—overstating the benefits of a road diet sets the project up for failure in the public eye.

With reference to the last point, the operational and safety effects of road diets in Michigan presented earlier in this report provide realistic and relevant information that can be used in "phase I" activities. It is important to not oversell the effects of road diets and to point out the high degree of variance in the safety outcomes that are associated with them.

To maintain community involvement from beginning to end, many engineers/planners involved with road diet projects have utilized public forums such as blogs or social networking sites (e.g., Kazis 2011). This sort of public forum allows citizens to voice concerns, opinions, or support concerning the process of the design and implementation. In turn, this gives the agency an opportunity to answer questions which generally alleviate concerns voiced by community members. Such sites can also provide a central hub for pertinent information regarding street closures, detours, and project progress. Use of the electronic media is much better than relying solely on just one or two "standard" public hearings or meetings in that the new media allow for a dynamic process.

During **phase II, implementation/construction**, public concern, which can arise during the planning phase, can be heightened when construction begins. The degree of discontent will largely be based on the extent of the project. If a road diet is implemented simply by pavement marking re-striping, negative response will be minimal. If the project requires reconstruction, causing travel/commuting to become difficult, additional measures will be necessary to alleviate any concerns. Regardless of the size of the project, any precautions that will lessen the stress associated with the road diet should be taken. Based on past experiences, the following techniques have been used to maintain a positive attitude throughout the community during the construction phase:

- reduce the impact of constructing the road diet on the community by shortening the construction timeline as possible (Sak 2007);
- provide proper detours to maintain access and mobility through the area;
- if logical/possible, consider public transportation options through the corridor;
- select a design which uses the existing curb line;
- change traffic signal timing before construction to allow motorists to become acquainted with the new cycle lengths (Sak 2007);
- implement the road diet in concert with other projects (e.g., installing new utilities); and
- again, use a blog or website to keep users up-to-date on the progress of the project while relaying important detour and closure information.

An often overlooked part of a road diet project is **phase III, project follow-up** to analyze, for example, the post-implementation operational characteristics to understand if the project was successful. This assessment will be important to members of the community who will want to understand if the project met the intended objectives. Similarly, other agencies will be interested if this type of roadway conversion could be successful in their own communities. Success of a road diet should be based on the totality of the project and not just, for example, on motorist delay.

A follow-up evaluation of a road diet plays an important role in the success of the project. By assessing the characteristics of the updated roadway and presenting findings to

community members, a sense of satisfaction and accomplishment can be instilled in the community. Finally, information collected from a converted site can be of use to other agencies considering a similar roadway conversion.

TYPICAL QUESTIONS AND INFORMATION NEEDS REGARDING ROAD DIETS

It is instructive to present a list of typical questions that have come up (Sak 2007) or issues that have been identified (City of Orlando 2002) in various venues regarding road diets. Thinking about these questions/topics in the context of a specific proposal may help frame the content for future presentations.

Some questions (Sak 2007):

- Where does the additional traffic go when the capacity is reduced by half?
- When some communities are widening roadways, why are we narrowing ours?
- How will bus stops be accommodated with a road diet?
- How will emergency response units be affected?
- What if it doesn't work?

Some typical measures of effectiveness (MOEs) that might be developed for a project (City of Orlando 2002):

- increased traffic on neighboring streets
- speeding
- pedestrian and bicyclist volumes
- vehicle (and/or pedestrian/vehicle) crashes
- on-street parking use rates
- resident and merchant pedestrian satisfaction
- parking satisfaction

Actions to address overarching concerns:

- Conduct a thorough analysis of the corridor and make certain a road diet is suitable alternative for the roadway.

- Avoid implementing a road diet without community involvement.
- Develop a plan that not only encompasses the road diet project but the community as a whole such as complete streets or a new bicycle/pedestrian initiative.
- Avoid overstating the benefits of a road diet
- Publish road diet success stories in local newspapers or blogs.
- Use blogs or social networking sites to provide as much information as possible to community members while providing a forum to express any concerns.
- Provide opportunity for additional beautification elements such as stamped concrete, brick accents, planter boxes, curb out-crops, and added landscaping.

SUMMARY AND DISCUSSION

A three-phase process associated with planning, constructing/implementing, and follow-up on road diet projects was presented. The major points to be emphasized during execution of that process are:

- Road diets should not be "oversold" with respect to expected benefits, especially safety benefits. The estimated CMF (last section) is relatively modest and is an average of many sites—this suggests that "guaranteeing" crash savings of a certain magnitude would misrepresent what will be experienced in any specific situation. Actual benefits could be significantly higher or lower.
- Both the pros and cons associated with road diets need to be presented and thoughtfully discussed with the community.
- Use of social media to discuss (and resolve) road diet proposals can be successful as an adjunct to traditional public hearings and other traditional community-involvement techniques.

SUMMARY AND CONCLUSIONS

The summary and conclusions from this study of selected road diet conversions in Michigan include the following points.

From the literature and state of practice reviews—

- As a general statement, crash reductions are experienced with most installations and are most typically reported as percentage changes (CMFs would be < 1.0). There is, however, significant variation in the magnitude of the reduction.
- While there appears to be significant "natural variation" in crash reduction percentage (and CMFs), variation is also introduced because of the variance in the before/after geometry and operating conditions at road diet sites.
- Most studies did not result in the estimate of CMFs per se. The most reliable estimates of CMFs are generally thought to be found on the FHWA-funded website "crash modification factors clearinghouse" maintained by the University of North Carolina Highway Safety Research Center [http://www.cmfclearinghouse.org/]. From that source, road diets are estimated to result in the following CMFs for unspecified roadway types in urban areas: all crash types/all severity levels = 0.63; all crash types/all injury crashes = 1.0; all crash types/PDOs-only = 0.54; angle crashes/all severity levels = 0.63-0.76; and rear-end crashes/all severity levels = 0.59.
- Many, if not most, studies did not control for background variation in crash trends. In virtually all areas, the general decrease in crashes at road diet locations must be adjusted for overall changes in crashes in the surrounding areas during the study period. Otherwise, too much of the reduction in crashes may be attributed to the road diet.

From the on-site assessment of pedestrian and bicyclist use of road diets—

- Provisions for pedestrian and bicyclist are most important when there are existing pedestrian/bicyclist generators on the site and/or when the road diet is part of a larger plan for an area.

- If pedestrian/bicyclist provisions are included in the road diet area, they need to be clearly and consistently (i.e., always) marked.
- While there appears to be a need for additional information/education regarding appropriate use of the road and pedestrian/bicyclist facilities at road diet sites, supplemental signs indicating crosswalks and bike lanes should be considered for routine inclusion at road diet sites.

From the operational analysis of several Michigan road diet sites—

- The operational analysis of the several sites provide reasonably consistent results and support a guideline that suggests that 4-to3-lane road diet conversions result in significant increases in delay for **ADTs over 10,000**.
- More importantly, 4-to-3-lane road diet conversions increase delay when **peak hour volumes of exceed 1,000**.
- However, it is clear that "local" conditions (e.g., varying geometry, significant variation in turning movements, and variations in cross-street traffic) can have a significant impact on the viability of any proposed road diet. Thus, while an initial culling of potential road diet sites can be accomplished using the general guidelines above, in all instances a detailed operational analysis of the corridor (including operations at each intersection) for both 4- and 3-lane sections should be undertaken before the road diet conversion is implemented.

From the safety analysis of selected 4-to-3 lane road diets in Michigan—

- There is considerable site-to-site variation in the crash-related results although in almost all instances, there was a reduction in the number of crashes.
- Examination of the background (e.g., citywide, countywide) trends showed that in all cases there was a trend toward lower crash frequencies over time.
- The most appropriate methods for controlling for background trends were a simple control for citywide trends and the consideration of comparison sites.

- Good/acceptable comparison sites could be identified for only a few of the 24 sites and none of the eventual comparisons gave statistically significant results—that is, the calculated CMFs for specific sites were not statistically different from 1.0.
- Average CMFs, adjusted for citywide trends, were calculated across all 24 sites. The result was that the overall naïve (unadjusted) CMF was estimated as 0.63, and **0.91** after adjustment. Considering only those crash types expected to be affected by the road diet (not necessarily only reduced), the CMF was 0.90. And, finally, considering only those crash types expected to be reduced by a road diet, the adjusted CMF was 0.59. Use of the latter is problematic since there are typically offsetting changes in crash type frequencies. Only the CMF for the "correctable" crashes was statistically different from 1.0.
- While **the best estimate of a usable CMF is 0.91**, it should be noted that this is not statistically different from 1.0 and is an average across all sites. Perhaps more importantly, there is a great deal of variation from site to site.
- Considering effects of other variables on the overall CMF, it was seen that there was not much change due to controlling for other variables except for adjacent land use—residential sites tended to have a lower CMF than mixed-use or commercial sites.
- Changes in crash severity due to road diets were examined and the distributional shift over all sites was estimated (and then compared to statewide changes). The finding was that although there was a slightly more substantial shift to less severe crashes for the road diet sites, it did not seem operationally significant. Moreover, the shift could have easily been due to changes in operating speeds or enforcement rather than the road diets themselves.

From the implementation of road diets—

- Road diets should not be "oversold" with respect to expected benefits, especially safety benefits. Actual benefits of a road diet can vary significantly by site.

- Both the pros and cons associated with road diets need to be presented and thoughtfully discussed with the community.
- Use of social media to discuss (and resolve) road diet proposals can be successful as an adjunct to traditional public hearings and other traditional community-involvement techniques.

Road diets are a useful tool in the traffic engineer's arsenal of making streets and roads a more integral part of the community. As a part of broader plans, they open up "traditional" roads to greater use by pedestrians and, especially, bicyclists. In general, safety benefits can be expected but vary greatly from site to site. When corrected for citywide trends, the results here indicate that only a relatively modest CMF (0.91) is appropriate. This indicates that crash/safety benefits are likely to be considerably less than what is suggested by naïve comparison of before and after crash statistics. Similarly, the results reported here also suggest that operational analyses (e.g., using Synchro) should always be performed early on in the consideration of a road diet proposal. Moreover, the commonly-quoted threshold ADT of 20,000 for consideration of a road diet should be lower (10,000) and, more importantly, realistic peak-hour analyses (based on actual counts) are much more useful. For the sites evaluated here, the peak-hour threshold volume is estimated as 1,000 vph although this could vary with varying volumes of cross traffic at intersections.

RECOMMENDATIONS FOR IMPLEMENTATION OF RESEARCH FINDINGS

The recommendations for implementation of the research findings are presented below as "action items" for MDOT and based on the discussion in each section of the report.

- The results of the literature review and the article-by-article review in Appendix A should be made available to MDOT and local-agency engineers and planners who are interested in and/or dealing with road diet projects.
- When pedestrian/bicyclist provisions are included in a road diet, they need to be clearly and consistently (i.e., always) marked.
- MDOT should share the following quantitative, operations-related findings of this research with the FHWA and suggest changes to the appropriate section of the **Michigan Operations Manual** which is addressed to "4-to-3 Lane Conversions."
    - The ADT threshold for considering such road diets should be changed to ≤10,000.
    - More importantly, detailed operational analysis should be done when ADTs are 10,000 or more **OR** when peak hour volumes exceed 1,000.
    - Finally, because of the variation in intersection geometry, turning volumes, and signal timing from site to site, detailed operations analysis **always** be done.
- Results of the safety analysis and development of crash modification factors (CMFs) related to 4-to-3 lane road diets should also be shared with the FHWA (as above).
    - When studies of the effects (or effectiveness) of road diets are done, there must always be control for background trends with citywide trends generally being the most appropriate to consider.
    - The overall naïve (unadjusted) estimated CMF is 0.63 and **0.91** after adjusting for citywide trends. Considering only those crash types expected to be affected by the road diet (not necessarily only reduced), the estimated CMF is 0.90. If only those crash types expected to be reduced by a road diet are considered, the adjusted CMF is 0.59. Use of the latter is problematic since there are typically offsetting changes in crash type frequencies. Only the CMF for the "correctable" crashes was statistically different from 1.0.

- Operations- and safety-related results should be incorporated into any presentation material developed by MDOT and local agencies regarding the planning and implementation of road diets.
- Road diets should not be “oversold” with respect to expected benefits, especially safety benefits. Actual benefits of a road diet can vary significantly by site.
- Both the pros and cons associated with road diets need to be presented and thoughtfully discussed with the community.
- Use of social media to discuss (and resolve) road diet proposals can be successful as an adjunct to traditional public hearings and other traditional community-involvement techniques.

ABSTRACT

With an increasing desire to design complete streets, it is crucial to determine what constitutes a complete street and how complete streets affect mobility. The general definition of a complete street is one that is safe for all users including drivers, pedestrians, cyclists, and transit riders. This definition is vague and allows the designer to make the decisions about what techniques should be used to create a complete street. To determine what techniques are best for a specific project, first transportation engineers must determine the effect each technique will have on the street, and the tradeoffs that a community may have to live with after construction. Specifically, when working with an existing street, there will be changes in LOS, capacity, delay, and emissions.

Chapter 1

INTRODUCTION

At a recent conference, a speaker stated that it would be more acceptable to have a road with a level of service of D that had a bike lane than to have a road with a level of service C without a bike lane. During a time in American history when global warming is becoming a more important topic, vehicle miles traveled (VMT) is raising at record rates, and obesity is threatening the lifespans of Americans, it is important to ask if bike lanes are the solution to all of these problems. A slightly broader question is equally important: will introducing better facilities for pedestrians, cyclists, and transit riders fix the problems of global warming and obesity in the US and around the world? The answer to this is a very complicated one, but asking the question is crucial to determine the validity of the earlier statement.

Another question that is pertinent to this discussion is how much should drivers be affected by making roads safer and more usable for others? For many decades, the US has been focusing most of its transportation planning on the automobile, often at the expense of other travel modes. This has led to a society that relies heavily on the car not only in daily activities but for longer planning decisions. If the US suddenly changes those policies to focus primarily on other travel modes, what affect will that have on large sections of the population who use their cars for everything?

These background questions lead to the most important questions: what are the tradeoffs associated with designing for all travel modes, and how can roads be

designed that improve usability without seriously affecting mobility for any users? These questions are the basis for complete streets design which focuses on designing roads that are safe and promote mobility for all users. To determine how to best move forward with respect to complete streets design, it is necessary to first answer these questions and decide what is best for a given community. The tradeoffs and road design will depend substantially on the context that a given road is found in. The contextual factors that will be most important are the community, the transportation network, and the density of the surrounding area.

Chapter 2

BACKGROUND AND LITERATURE REVIEW

2.1 Background

There are a significant number of problems related to the current American transportation networks including the obesity epidemic, high gasoline prices, air pollution, and mobility constraints experienced by aging baby boomers[1]. Countries with well-developed urban transit systems and an established bicycle infrastructure are better off than those that depend on cars if there is a downturn in world oil production[1]. The vast majority of trips are taken by car, and urban areas are designed around the ability to drive everywhere. Mobility is determined primarily on the affordability of the automobile because the transportation networks are designed solely for drivers. There is a need for a change at the network level to make streets safer for all users, but concentrating only on changing the transportation network will not fix all of these issues.

It is very difficult to change the status quo and most large social and infrastructural norm changes go through the "four stages": silly, controversial, progressive, and then obvious[2]. These stages take time, and each large infrastructural change requires a lot of work to convince the end users that the change might improve their mobility in the long term. Because of this, it is important to work with the community during the design process to understand what needs the community has and explain the implications of different design aspects.

Complete street techniques are viewed as the best solution to a long list of current problems that the US faces. Currently, there are many interest groups that are pushing for policy to be adopted at the city and state level that requires agencies to design complete streets. The wording is often vague and allows the designer to decide what determines complete street design. Context Sensitive Solutions and Complete Streets are often used interchangeably to explain the same type of street design: streets that are designed in a specific context that cater to the users of that street within a community. While complete streets techniques focus more on the safety of all road users, the techniques that are used in context sensitive design and complete street design are essentially the same.

Most of the interest in complete streets falls on the policy side of the issue. The goal is to design streets are safe for all users, causing people to switch travel modes (from driving to biking, walking, or riding transit), and this will improve the livability of communities and the health of the residents while reducing emissions and accidents. At the federal level, there are a number of groups that are advocates for complete street design including the Partnership for Sustainable Communities and the National Complete Streets Coalition.

The Interagency Partnership for Sustainable Communities (includes the USDOT, HUD, and EPA) attempts to provide more transportation options and support existing communities through transit-oriented, mixed-use development, and land recycling. This partnership defines complete streets as streets that are safe for all users, are customized to the context, and accommodates the needs and expectations of the travelers in and through the neighborhood, community, or region. The partnership

agrees with the National Complete Streets Coalition list of complete streets elements which includes

> "sidewalks, bicycle lanes (or wide, paved shoulders), shared-use paths, designated bus lanes, safe and accessible transit stops, and frequent and safe crossings for pedestrians, including median islands, accessible pedestrian signals, and curb extensions. Certainly, a design for a complete street in a rural area will look quite different from one in an urban or suburban area. For example, a complete street in a rural area could involve providing wide shoulders or a separate multiuse path instead of sidewalks. The common denominator, however, is balancing safety and convenience for everyone using the road." [3]

The partnership references Safe Routes to School, and Context Sensitive Solutions. At the federal level, there is statute 23 USC 217, which requires State DOTs to use a portion of certain Federal funds to hire a State bicycle and pedestrian coordinator. This position is responsible "for promoting and facilitating the increased use of nonmotorized modes of transportation."[3]

The National Complete Streets Coalition is an organization that is working to improve the safety of streets in the United States through education and promoting policy change in cities and states. According to the National Complete Streets Coalition, the benefits of creating complete streets policies are improving safety of roadways, encouraging walking and bicycling for health, addressing climate change and oil dependence, and fostering stronger communities[4]. Some of these benefits are easier to define and measure than others. For example, safety of the roadways can be measured in pedestrian and cyclist fatalities per year. The effectiveness of individual complete streets techniques can be determined by looking at the difference of fatalities before and after the installation. Encouraging walking and biking could be measured, but would need extensive pedestrian and cyclist counts before and after

installation. There are also other factors that affect the choice to drive or use another mode of transportation, for example distance of trip. Complete streets will only address climate change and oil dependence if a number of users switch transportation modes. Fostering strong communities is the most difficult to measure and define. It is important to look at the needs and wishes of a community during road design, but a complete street alone will not build a strong community without the necessary building blocks already in place.

Some techniques are easier to implement than others without affecting an existing road. Audible pedestrian signals do not have an effect on the existing road design and could greatly improve safety for blind pedestrians. Making crosswalks more visible is another way to improve the safety of existing crosswalks. This can be done by adding signs and a blinking light to warn drivers of a possible pedestrian. Adjusting signal timing to allow for the slower pedestrians to clear the intersection also does not affect the existing road design, but may have an effect on traffic because the red light would be longer. Increasing the number of crossing opportunities could affect the road design minimally if they are added at all existing intersections[4].

In addition to the national groups discussed above, there are a number of programs that were started in individual cities to promote the use of complete streets techniques in the design process. They deal primarily with the policy side of the issue instead of the design implementation. Programs include The Partnership for Active Communities in Sacramento CA and Active Seattle. In Sacramento the project continued over five years and supports increased walking and biking through in school programs, land-use development, and transportation infrastructure while focusing on safety of all street users[5]. The Active Seattle program set up a five year plan to

increase the physical activity in Seattle. The program looked at four core areas: planning and partnership, mapping program, physical infrastructure, and health promotion. The program focuses on adopting policy changes at the higher levels of government in Seattle while initiating interest at the neighborhood level[6]. In Hawaii, a comprehensive multilevel social ecological approach was used in the complete streets policy, which worked in conjunction with a Safe Routes to School policy. The approach counted on the collaboration of multiple stakeholders, and it focused on education, capacity building, and networking efforts[7]. None of these initiatives focus only on street design, but also on education and other programs that promote multi-modal use.

2.2 What Makes a Complete Street?

Burden and Litman define complete streets policy with a number of requirements including encouraging street connectivity and creating a comprehensive, integrated, connected network for all nodes, and state that complete streets' solutions are context specific. A number of things need to be done to reduce the negative effects associated with driving (including emissions, death, and obesity). Along with complete streets techniques, proper land development patterns and proper street design must be used together to create complete streets[8]. Complete Streets and Context Specific Solutions should be seen as complementary, not competitive. Complete streets' techniques should be introduced into the very beginning of the design project to make streets that are safe for everyone without adding costs at the end of the project to change designs to accommodate all users. A number of techniques can be used to improve safety for pedestrians and cyclists including road diet, raised medians, curb bulb-outs, and street parking[9].

One goal of complete streets is to make transportation more sustainable. To achieve this, complete streets endeavor to reduce vehicle emissions, reduce vehicle miles traveled, and use intelligent transportation systems (ITS) and traffic engineering applications that support sustainability. Roundabouts should be used instead of signaled intersections to improve safety and reduce emissions. To achieve transportation sustainability, changes would have to include designing systems to provide modal choices and working with land use planners to create connected street systems that reduce urban sprawl[10].

Another aspect of making streets more sustainable is to address the issues related to storm water management. Streets are often comprised of large areas of impervious surfaces which cause problems with storm water runoff. Low-impact development storm water designs are shown to effectively reduce contaminant loads from impervious surfaces. Porous asphalt is one option which improves wet pavement frictional assistance, reduced hydroplaning, and reduced pavement delay[11]. Porous concrete can also be used beneficially in similar applications. Along with using pervious road and sidewalk surfaces, street landscaping can be used to help manage storm water issues. Bioswales, planters, and rain gardens can be used to help curb storm water runoff in addition to making the street more visually interesting and comfortable. Some complete street techniques- chicanes, islands, and curb extensions- are places where street landscaping can be introduced into the existing design[12]. These storm water management techniques have a range of costs and maintenance requirements, but they are simple ways to improve existing streets without changing them too much.

While street design is the focus of complete streets policies, often other initiatives are required to promote the use of these streets. The initiatives that should be used in conjunction with complete streets policies are ones that educate the public about the importance of using different travel modes, increase the availability and promote the use of public transportation, and reduce urban sprawl (or at least the distance that people travel between home, work, and play). Without also addressing these issues, complete street design will not be used effectively and would waste money spent on providing for users who don't exist and will not be created.

2.3 Safety

Safety is the primary concern of complete streets advocates. If the roads are safe for all users, people will want to use them for other activities, not just driving. Depending on the users and the context, making a road safe could mean a number of different things. There is a big difference between the safety measures that should be implemented on an urban road with a lot of pedestrians and speeds of 25 mph or less and a rural road that carries large amount of horse and buggy traffic. In general, safety will focus on the most vulnerable user groups. Cyclists and pedestrians are more vulnerable than drivers, but among cyclists and pedestrians, there are individual groups that are especially vulnerable including the young, the elderly, and the disabled. While it is important to cater to the needs of all of these groups on all roads, it is crucial to focus on these groups in areas that have a large portion of vulnerable pedestrians (for example, areas surrounding a retirement community).

Areas near schools, playgrounds, and other places that attract large numbers of young people should be designed to accommodate the specific needs of young cyclists and pedestrians. The Walk to School movement has potential benefits that include

reducing childhood obesity and early onset diabetes[1]. Safe Routes to School is a program that focuses on making streets safer for children so more are able to walk and bike to school. This program focuses solely on the factors that affect the safety of children travelling to school including the fact that children walk and cycle slower than adults and require pedestrian signals that give them enough time to cross the street. Traffic volume has a negative effect on a child's ability to cross a street safely because they become impatient waiting for an acceptable break in heavy traffic. It becomes more difficult for children to wait for a find an appropriate time to cross the street [13]. Patience is not the only issue that children face. Mid-block collisions more often involved young pedestrians as compared to intersection collisions[14].

Another vulnerable user group, seniors, requires different infrastructure than children: smooth sidewalk surfaces and curb cuts to reduce falls, sidewalks that are wide enough to accommodate a walker, and benches for resting. Brisk walking is adequate for seniors to achieve positive health results and is correlated with neighborhood design [15]. To give seniors the ability to add brisk walking into their daily routines, the sidewalks need to be designed to accommodate their movements and the neighborhood needs to be designed in such a way that there are nearby destinations or public transit options. This allows seniors to have access to neighborhood resources without having to drive.

Disabled pedestrians and cyclists are the final vulnerable group that has specific needs. Disabled pedestrians that use wheelchairs or walkers have similar needs to senior pedestrians (wide, smooth sidewalks that slope down to the street). Blind pedestrians have different needs than pedestrians using walkers and wheelchairs, however. Many cities are designing "shared spaces" in their downtown areas which

are meant to slow down drivers because the road is shared between pedestrians and drivers. This puts blind and partially sighted people at a disadvantage because there is no delineation between safe pedestrian areas and areas that are shared with drivers. "Shared space" designers do not want to include traditional 120 mm curbs because they separate the pedestrian vehicle areas too much. Thomas found that a curb height of at least 60 mm is required to define the difference between the two areas. Along with the 60 mm curb height, dropped curb crossings and tactile paving should be used to mark the edge of the footpath for vulnerable pedestrians[16].

All pedestrians and cyclists are vulnerable groups when sharing the road with cars and the safety of all pedestrians and cyclists needs to be taken into account. Reducing accidents is the focus of many who are trying to improve the safety of pedestrians and cyclists. There have been a number of studies done that determine the factors that lead to accident involving vehicles and pedestrians or cyclists. The factors associated with a vehicle-pedestrian or vehicle-cyclist accidents are largely the same as those of vehicle-vehicle accidents: traffic conflicts and high vehicle speeds. The built environment has a large effect on driver error instead of the widely held belief that driver error is random and road design should reflect this belief (which leads to road design that is forgiving of driver error instead of trying to correct it)[17]. Pedestrian crashes are more common in business districts and in more densely settled residential neighborhoods with a large and less affluent population. The majority of accidents resulted from human error on the part of the pedestrian or the driver[14].

Human error is not something that can be eliminated, but there are a number of techniques that help reduce the impact of human error. Counter measures for improving safety of intersections include more visible pedestrian crossings, adding

pedestrian refuge islands and turn lanes, adding traffic lights instead of other signals, and lowering the speed limit[18]. For six-lane divided highways with high traffic volumes, implementation of the right turn/U-turn concept leads to a 26.4% reduction in crash rate as compared to direct left turns[19]. There are two factors that often determine crash severity and they are speed and sight lines. In loops and lollipops, vehicles are driving slower, but there are shorter sight lines, so there are more crashes, but they are less fatal[20].

The best way to reduce injuries in cyclists and pedestrians is to have facilities for these users that are separate from motorized traffic. Sidewalks and refuge islands are the most effective facilities for pedestrians, and on-road bike routes or off-road bike paths are the most effective facilities for cyclists. They are best placed in city centers, between contiguous neighborhoods, and along major arterial streets because this is where accidents are most likely to occur. Adding street lighting to areas that have poor visibility is also effective in improving safety for pedestrians and cyclists[21]. The most effective pedestrian safety measures include refuges, median openings, ice tracks, ramp for wheelchairs, zebra crossings, signal timing, flashing yellow lights at crossings, and better visibility for vehicles. Pedestrian safety measures are most effective if they are the result of comprehensive policy rather than piecemeal, isolated improvements[22]. There are a variety of low-cost signing and striping technologies or higher-cost geometric features (curb extensions and refuge islands) that can be used to improve safety. The use of marked crosswalks at uncontrolled locations on high-volume, multilane roads can lead to higher pedestrian-related collisions. To improve safety at these crossings, more notice to drivers is necessary by using a combination of signs, signals, and geometric features[23].

In studying an increase in lane width, installation of median barriers, vertical and horizontal improvements in the road alignment, and installation of guide rails on roads with a speed limit of 45 mph or less, all treatments reduced crash rates except the installation of guide rails. Vertical and horizontal alignment had the largest effect, followed by increased lane widths, and then median barriers[24]. While increasing lane widths may reduce the number of crashes, they may also increase speed. It is important to determine if the context requires wider lanes depending on how many crashes occur in the area and how fast people drive on the road and how fast people should be driving on the road.

In any accident involving a cyclist and a driver, one party has the right of way, and the other party is at fault. Type 1 crashes occurred when the cyclist had the right of way, and type 2 crashes when the motorist had the right of way. Type 1 crashes were more likely to occur at intersections with two-way bicycle tracks, well-marked, and reddish colored bicycle crossings. Type 1 crashes were negatively correlated to the presence of a raised bicycle crossing and other speed reducing strategies. Both well marked bike lanes and raised bike crossings have an effect on the cyclists' behavior, but only the raised bicycle crossing has an effect on the motorists' behavior[25].

Compliance rates are very low when pedestrians have to wait in the median for another signal because crossing time was lengthened significantly. One suggestion is to set signal times to allow the majority of pedestrians to cross in one stage, but place a pedestrian detector at the median to accommodate pedestrians that require two stages to cross. The compliance rate dropped significantly during cold and inclement

weather. During these times, pedestrians used unsafe behavior, which coupled with unsafe road conditions can lead to more pedestrian injuries and fatalities[26].

In a case study done of Queens Boulevard in New York City, the main issues were excessively long crosswalks, inadequate pedestrian reservoir space, excessive vehicular speeds, high number of pedestrian/auto accidents, long distances between signalized crossings, and inadequate pedestrian design elements. Another issue is that the medians do not extend to the far edge of the crosswalk so pedestrians do not have an adequate refuge area. The recommendations include more visible crosswalks, curb cuts and ramps, longer pedestrian signal times, refuge islands, new midblock pedestrian signals, and curb bulb-outs[27].

2.4 Bicycle Facilities

Bike facilities are an important aspect of road design when trying to design a complete street. To insure that cyclists use the provided bike facilities, there are a few issues that need to be addressed. Above all else, cyclists need to feel safe and comfortable. Depending on the cyclist's age and ability, this means different things. The top motivators among cyclists to ride were the availability of routes away from traffic noise and pollution, routes with beautiful scenery, and paths separated from traffic. The factors that are most likely to influence the likelihood of cycling were safety, ease of cycling, weather conditions, route conditions, and interactions with motor vehicles. Due to the little difference between the motivators and deterrents for potential and regular riders, the same improvements can increase ridership in both groups[28].

One major issue with bicycle facilities is that they typically take up space on an existing street which is a very controversial planning decision. The space that is

taken up could be travel lanes or parking lanes which are highly coveted in some high-traffic areas. New York is the scene of one of the more public and explosive controversies over a bike lane in the last few years. New York City is currently implementing a policy to calm and decrease automotive traffic by closing areas of the vehicular traffic in Times Square and by improving the facilities for cyclists and pedestrians. While one poll suggests that 59% of all New Yorkers (not just cyclists) approve of the bike lane program, some individual bike lanes are fiercely contested. One bike lane was installed in a neighborhood in Brooklyn near the residence of the city's former transportation commissioner, Iris Weinshall, who demanded the removal of the lane and took the case to the state supreme court where she eventually lost[2].

At intersections there are a few bike lane discontinuities that cause the most discomfort for cyclists: lanes switching sides of the street (right to left) after an intersection, introducing parking after the intersection, long distances across intersections, and width of curb lane. Other factors that affect the safety of cyclists included speed of traffic, a change in the number of traffic lanes, and the direction of the adjacent traffic[29]. A distance of 2 and 5 m between the side of the arterial road and the cycle track is safest for cyclists because cyclists are not riding in the motorists' blind spots and there is more time for turning vehicles to notice cyclists[25].

Current and potential cyclists are interested in bike lane designs that achieve separation from motor vehicle traffic. A separated bike lane can increase ridership by 18 to 20% as opposed to the 5 to 7% increase caused by a regular on-street bike lane[30]. Wide curb lanes and bike lanes should be used to improve riding conditions for cyclists, however if adequate space exists for a bike lane it should be installed

because of the cyclist comfort level is increased and may increase the amount of cycling on that roadway[31].

When designing a bike lane, it is important to understand the risks associated with different types of infrastructure and different contexts. For example, it is reasonable for cyclists to mix with traffic in a small roundabout. Larger roundabouts, however, will require a bike lane for safety[32]. Sidewalks and multi-use trails pose higher risks to cyclists, major roads are more hazardous than minor roads, and bicycle facilities (on and off-road bike lanes) create the lowest risk for cyclists[33]. If a crash occurs on a bike lane and one-way street, it is most likely a door crash[34].

More cyclists ride on cycle tracks (separated bike lanes) than on the streets. The relative risk of injury on cycle tracks was 0.72 compared with bicycling on the street. Since the relative risk is noticeable smaller for cycle tracks, the construction of cycle tracks should not be discouraged in the US. This paper looks at the number of riders in the Netherlands given their large network of cycle tracks[35].

There has been a lot of discussion about how adding bike facilities will affect ridership and vehicular traffic. When bike facilities are introduced, ridership has been found to increase. However, ridership only increased on roads with bike lanes while general ridership remained the same over the two year period of the study. The bike lanes had a minimal effect on vehicular traffic if any effect at all, but on average, bike traffic increased by 23%. Original bike traffic levels ranged from 550 to 1,500 and went up to between 570 and 1,900 cyclists[36].

After the integration of a bike lane on a street in New Orleans, numbers of bicycle riders and found an increase from 90 to 142.5 riders per day on the street. There was a 133% increase in the number of women riders and a 44% increase in the

number of male riders. While the numbers of cyclists riding illegally on the sidewalk did not change, the percentage of cyclists riding in the correct direction (with traffic) increased from 73.3% to 81.8%. This was also during a time when the price of gasoline decreased, which may have had an effect on the results[37].

While there are a number of important factors that determine whether or not people choose to ride over other modes, there seems to be one that has an enormous effect. Creating a network of bike facilities seems increase ridership substantially because people are able to travel from their origin to their destination without leaving a bike facility. Between 1991 and 2004 ridership in Portland increased by 210% and the miles of bikeways increased by 215% (from 65 to 230 miles). Hawthorne Bridge has the largest number of cyclists because of its facilities and proximity to downtown. While ridership had been increasing over time, it jumped 20% when another bridge opened which created a recreational loop within the city. Ridership increased significantly because of the combination of the quantity of facilities with the high quality of the facilities. A bikeway network must be well connected and provide continuous or mostly continuous service. This approach only works when the bike lanes are constructed to the highest standard and the trip distances are relatively short[38].

2.5 Changing Travel Behavior

According to Marchetti, throughout time and around the world humans have always been willing to travel for one hour per day on average regardless of the mode of travel[39]. This means that humans are willing to spend 30 minutes traveling to their destination, and thirty minutes returning. This time will be used to determine what distance is reasonable to commute on foot or bike. There are other factors that

affect an individual's choice to walk or bike versus drive to work and need to be accounted for.

The Federal Highway Administration completed a study in 1992 focusing on why individuals choose one travel mode over another (specifically why individuals choose driving over walking and bicycling for the vast majority of trips). The primary reason that people walk or bike is for exercise and enjoyment. The key findings for bicycles are that the primary individual factor for not cycling is age. The main environmental factor that increases bicycle use is the presence of a university. Other environmental factors that have an effect are commute distance, primary bicycle facilities (for example, parking), and a high ratio of bikeways to road mileage. High density areas have a higher number of cyclists, but having a network of bike facilities was required. Safety was also a primary concern of cyclists; increased bike facilities helped with the feeling of safety. The key findings for walking are that people walk when it is more convenient that other travel modes. Distance is the primary reason why people don't walk more often; other reasons are the hassle of carrying things, time limitations, and fear of crime. It is possible to increase the amount of walking because most short trips are not walked. It is important to make these trips more feasible and pleasant by adding sidewalks, crosswalks, greenery, and landscaping[40].

One of the interesting findings is that there is a discrepancy between the numbers of people who say they are interested in cycling more and the actual number of regular cyclists. The data gathered from surveys may not be as reliable as assumed because while people would be willing to drive, it is much more difficult to actually change behavior because of a number of factors[40].

This article stresses the importance of Active Living by Design (ALbD) projects and the 5Ps: preparation, promotion, programs, policy, and physical projects. These 5Ps work together to create a more successful project instead of using a "build it and they will come" model. This article recognizes the need for broad partnerships, community engagement, and context specific responses to address the issues in each community[41].

An increase in commute distance corresponds with a decrease in the value of attitudes toward other characteristics of bicycling. The characteristics that show a significant decrease from groups commuting less than 5 km to groups travelling more than 10 km are comfort, time-saving, flexible, cheap, pleasant, and suits lifestyle. The study also found that individuals who bike for a number of other purposes are more likely to commute by bicycle over all distances[42].

2.6 Effect of Street Design on Driving Behavior

Driving behavior is affected by the following street environment factors: occurrence and density of junctions controlled by traffic lights, speed limit, street function, and type of neighborhood. There are pronounced negative environmental effects due to regulating junctions with traffic lights. From an environmental point of view, roundabouts may be a better traffic solution than traffic lights[43].

Data shows that the reduction in free-flow speed due to narrow lanes in work zones was higher than reductions given in the *Highway Capacity Manual*. Speed reductions of 10, 7, 4.4, and 2.1 mph should be used for lane widths of 10, 10.5, 11, and 11.5 ft, respectively. The speed reduction for a 12 ft lane without a shoulder was found to be 5.6 mph numbers based on 55 mph work zone speed limit and a 65 mph

regular speed limit (without a work zone). Heavy vehicles reduced their speed more than passenger cars[44].

This study focused on the effects of narrowing a road from 10.8 ft to 9.8 ft with a one ft shoulder. The study found that speeds were not affected by lane narrowing, but drivers drove more to the center of the lane after the narrowing (when they drove more to the left before narrowing). Drivers also shifted more to the right when there was an oncoming vehicle after the lane narrowing[45].

The Highway Capacity Manual (2000) has a lane width factor for determining the speed change based on lane width based on a standard width of 12 feet. The factor equation is

$$f_w = 1 + \frac{(W - 12)}{30}$$

The result of this equation is then multiplied by the speed found using a 12 foot lane to determine the change[46].

2.7 Road Diet Treatments

A 6 block section of an arterial street (West Avenue) in Ocean City, NJ was used to test the efficacy of a road diet design. Four traffic lanes were reduced to three, and pedestrian refuge islands and bike lanes were introduced. The results were that the traffic volumes were unchanged, there was a modest reduction in speed, and the speed reduction was welcome but not as large as anticipated. Ocean City deemed the trial as successful- the new facilities were being utilized and there was not a noticeable increase in delay. The city has decided to extend the project 10 blocks south and is also evaluating the feasibility of extending the project to the north[47].

Crash frequency was reduced by six percent after a road diet treatment was implemented. Crash rate remained the same, however, when comparing the road diet

and comparison sites. Crash severity also remained unchanged. The reason for the reduction in the crash frequency is unknown[48].

This report replaces the previous one done in 2005 (*Evaluation of Lane Reduction "Road Diet" Measures and Their Effects on Crashes and Injuries*). The new research determined that there is an average 29% reduction in total crashes after a road diet plan is implemented. In small urban areas a 47% reduction was found, and in more suburban areas outside a major city a 19% reduction was found. These differences are most likely due to original AADT and 85th percentile speed of vehicles[49].

Chapter 3

METHODOLOGY

While there are many complete streets' techniques, all of them fall into one of the following categories that can affect traffic: lane width change, volume shifts, and delay due to pedestrians.

3.1 Lane Width Changes

Lane width changes occur when there is an existing road that has a set width, and different techniques are applied that were not accounted for in the original width of the road. Standard lane width is 12 ft, and widths of 10, 10.5, 11, and 11.5 ft are reasonable widths of road depending on the speed of the vehicles.

There are a number of sources that discuss the effects of changing lane width. Some describe the effects on capacity, while others focus on the effects on speed. With respect to speed, there are three sources that will be focused on in this study and they are a study on the effect of reducing lane width in a work zone, and the two most recent versions of the Highway Capacity Manual (2000 and 2010). In the 2000 manual, lane width was considered to have an impact on speed, but in 2010, the new Highway Capacity Manual changed the effect of lane width on speed. The current standard states that speed does not change for lane widths of 10 feet to 12.9 feet. If the lane width is between 8 and 10 feet, the factor that the free flow speed is multiplied by is 0.96[50]. Although the speed does not change, the capacity does change.

Table 3.1: Speed based on lane width with a free flow speed of 25 mph

Width (ft)	13	12	11.5	11	10.5	10	9.5
HCM 2010[50]	26.0	25.0	25.0	25.0	25.0	25.0	24
HCM 2000[46]	25.8	25.0	24.6	24.2	23.4	23.3	22.9
Work Zone[44]	N/A	25.0	24.0	23.0	21.8	20.5	N/A

By adding refuge islands, curb bulb-outs, bike lanes, and sidewalks, space is taken away from each lane to accommodate other users without widening the road. There are a number of different ways that an existing road can be changed to make it safer for all users without acquiring the necessary right-of-way to widen the road. For example, a road with two 12-foot travel lanes in each direction and parking lanes on both side can be changed in a number of different ways (Figure 3.1).

Figure 3.1: Different lane configurations based on 76 ft right-of-way

The original street design is meant to be indicative of many streets in urbanized areas across the country. This street design requires a pedestrian to cross 64 feet in one cycle which could be difficult for some pedestrians. It does not allow any separate space for cyclists and does not have any additional facilities for transit users. Using the original right-of-way area, many solutions are possible by reducing the lane width, reducing the number of travel lanes, and taking out one or both of the parking lanes.

Solution A reduces the distance that pedestrians have to cross by adding curb bulb-outs at pedestrian crossings while leaving in the parking lane where there is not a crossing. Curb bulb-outs are also used to increase the visibility of the pedestrians, so drivers see them before they walk into traffic. A median was also added, but the median cannot act as a refuge island because they must be a minimum size of six feet to accommodate pedestrians with disabilities. Solution A and B with two and four-foot islands are not sufficient, but they do create a potential for street vegetation and storm water systems. This is done by reducing each of the travel lanes to 11 feet wide instead of 12 feet.

Solution B reduces the lane width to 10 feet and introduces a median and one bike lane that can accommodate bike traffic in one direction only. The bike lane is protected from traffic by the parking lane. This makes cyclists feel more comfortable because of the separation and reduces the risk of door crashes because the travel lane is not next to the driver-side door. This solution keeps the curb bulb-outs on both sides, but it does accommodate the bike lane on one side.

Solution C has a 10 foot travel lane, and it takes away one parking lane to add a protected, two-direction, bike lane on the other side. It also adds a pedestrian refuge

island that is wide enough to accommodate pedestrians with disabilities. It significantly reduces the distance that a pedestrian has to cross, which changes the amount of time that is required to allow pedestrians to clear the intersection because they only need to make it to the refuge island.

Solution D removes one of the travel lanes in each direction and allows for a turning lane in the center. This is a road diet solution because travel lanes are taken out and replaced by a turning lane and other facilities. This solution keeps both parking lanes and allows for a bike lane on each side and for a slightly wider sidewalk. This option could have refuge islands instead of turning lanes at the intersections. Each of the solutions dramatically reduces the distance a pedestrian has to cross in one light cycle, and also makes pedestrians more visible to drivers using curb bulb-outs. Depending on the available space for a bike lane, there could be a bike lane on each side of the street that moves along with traffic (As shown in solution D), or there could be a two-way bike lane on one side or in the middle of the street (as in solution C).

To determine which techniques are best for a specific project, it is necessary to design based on the context. If the road has a large number of vulnerable pedestrians, the best solution would have short crossing distances. If there are a lot of cyclists in the area, the best solution would have adequate bike lanes to accommodate the users. This plan would require a large network of bike lanes which would take more time than just one project. If the road is near a school, the best solution would allow for young pedestrians and cyclists to travel safely alone or with a parent. These solutions would include different signal timing at intersections, very visible and more frequent crossing opportunities, and bike lanes that are protected from traffic.

Context specific solutions are necessary because each decision made will affect the traffic of the area in some way. Reducing capacity of the street will affect all of the drivers in the area. This may be a determining factor in whether to proceed with a project or not. If everyone in the community is trying to reduce the number of cars in their household, creating infrastructure to accommodate new types of users would be appropriate for the neighborhood. If, however, the community is not interested in reducing the number of cars per household, or if it is not close enough to a central business district, than reducing road capacity by adding in sidewalks is much less appropriate. This could result in an increase in delay and emissions for infrastructure that will go mostly unused.

The most significant impact that needs to be addressed is the change in capacity based on lane width change. To determine capacity change, Highway Capacity Software was used. Their software, Art Plan 2009, was used to simulate the effects of lane width change based on a street in a large urbanized area with two thru lanes in each direction and a free flow speed of 35 mph. A baseline service volume was determined based on the service volumes for this street with 12 foot lanes. The change in service volumes (based on level of service) was determined by using 11, 10, and 9 foot lanes. These service volumes can be used to determine what lane width is necessary for a certain street based on current and projected hourly volumes and the techniques that are desired for a given context.

3.2 Delay Changes

Delay caused by pedestrians can be caused either by changing the signal timing of existing crosswalks, or by adding additional, mid-block, crosswalks. Delay depends heavily on how many pedestrians there are and how compliant those

pedestrians are to the traffic laws. This can be affected by the volume shift if a significant number of users choose to walk instead of drive when using a certain road.

At intersections, signal timing needs to accommodate for the distance pedestrians have to travel using a 3.5 foot per second speed. Assuming pedestrians follow the laws and there is enough time for them to cross, there will be no additional delay. If there are long distances to cross, it is possible that some pedestrians would be left in the crosswalk after the signal has changed, and that could cause some delay.

Midblock crossings, on the other hand, do cause delay. Depending on the type of crossing and number of pedestrians, there could be substantial delay. The cost of each of the options differs depending on what safety features are included. The options range from adding pavement markings at midblock crossing to adding pedestrian signals (Hawks, Pelicans, or Puffins, for example). Midblock signals can be very expensive to install, but they are meant to improve safety for pedestrians. The difference between a signalized and an un-signalized midblock crossing is how the traffic is stopped. In some signalized midblock crossings, the pedestrian pushes a button which creates a red light for the driver and the pedestrian is allowed to cross. In an un-signalized crossing, the pedestrian has the right-of-way and walks out in to the crossing without any warning. Un-signalized crossings in highly-travelled areas can cause problems because there is a constant stream of pedestrians walking through the crossing. If the crossing is signalized, there are breaks in the stream of pedestrians which allow drivers to pass.

To determine the delay caused by pedestrians crossing at a midblock crossing, a simulation was done in VISSIM. This simulation focused on a section of road with two travel lanes in each direction and a midblock crossing. Simulations were done to

determine the travel times for vehicles using different vehicular and pedestrian volumes. Vehicular volumes of 500, 1000, 1500, 2000, and 2500 vehicles per hours were tested. Each vehicular volume was tested using a range of pedestrian volumes: 0 (to establish a travel time without a midblock crossing), 10, 50, 100, 150, 200, and 400 pedestrians per hour. These ranges were used to compare roads that have a low vehicular and pedestrian volume to roads that have a very high vehicular and pedestrian volume and everything in between. Once the travel times were found, the delay was determined by using the difference in travel time between each of the scenarios and the base case (with no midblock crossing). The results can be used as a decision tool for planning organizations to determine if increasing the delay for drivers is a reasonable tradeoff to give pedestrians an extra road crossing.

3.3 Volume Shifts

Volume shifts may occur because people choose to use a different mode of travel based on the current facilities. Drivers may also choose alternate routes because of delay that is caused or a perception that there may be increased delay do to the change in design. It is very difficult to determine what sort of effect this will have on the daily traffic volume. Instead of trying to determine how many drivers will switch modes based on a new road design, it is more important to determine how many drivers have to switch modes so the level of service does not change significantly. This number is based on the techniques chosen for a certain road and are affected by lane width and delay caused by pedestrians.

Chapter 4

RESULTS

4.1 Lane Width Changes

There is a marked difference between the service volumes of a street with 12 foot lanes and those with narrower lanes. Depending on the level of service, the service volume drops a certain amount each time a lane gets narrower. While this seems like common sense, it is important to understand the difference between choosing a 10 foot lane versus an 11 foot lane. Below shows the percentage drop in service volumes based on lane width.

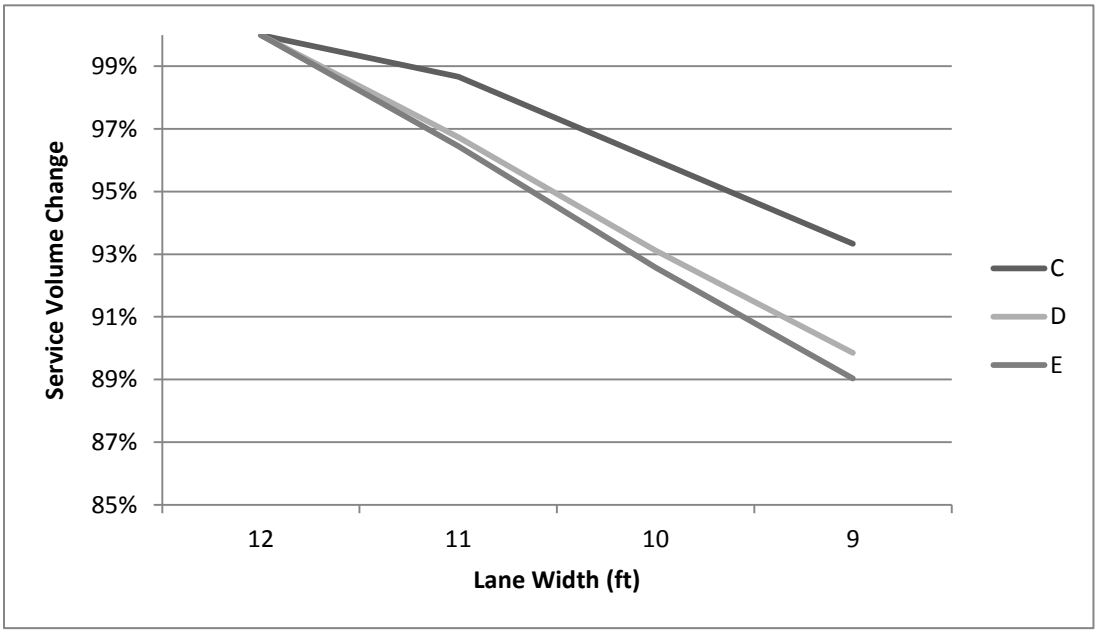

Figure 4.1: Service volume change based on lane width

As figure 4.1 shows, reducing the lane width by 3 feet can reduce the service volume by 10% depending on the level of service. However, a 1 foot reduction only reduces service volumes by 2-3%. This Service volume differs from capacity in that it focuses on a certain set of conditions and a given level of service. This data helps planners understand how much lane width can be reduced based on a target level of service and traffic forecasts for an area.

4.2 Delay Changes

Introducing additional pedestrian facilities at un-signalized intersections causes delay. The amount of delay for drivers depends on the number of vehicles and the number of pedestrians. As the number of pedestrians and vehicles increases, the delay increases substantially.

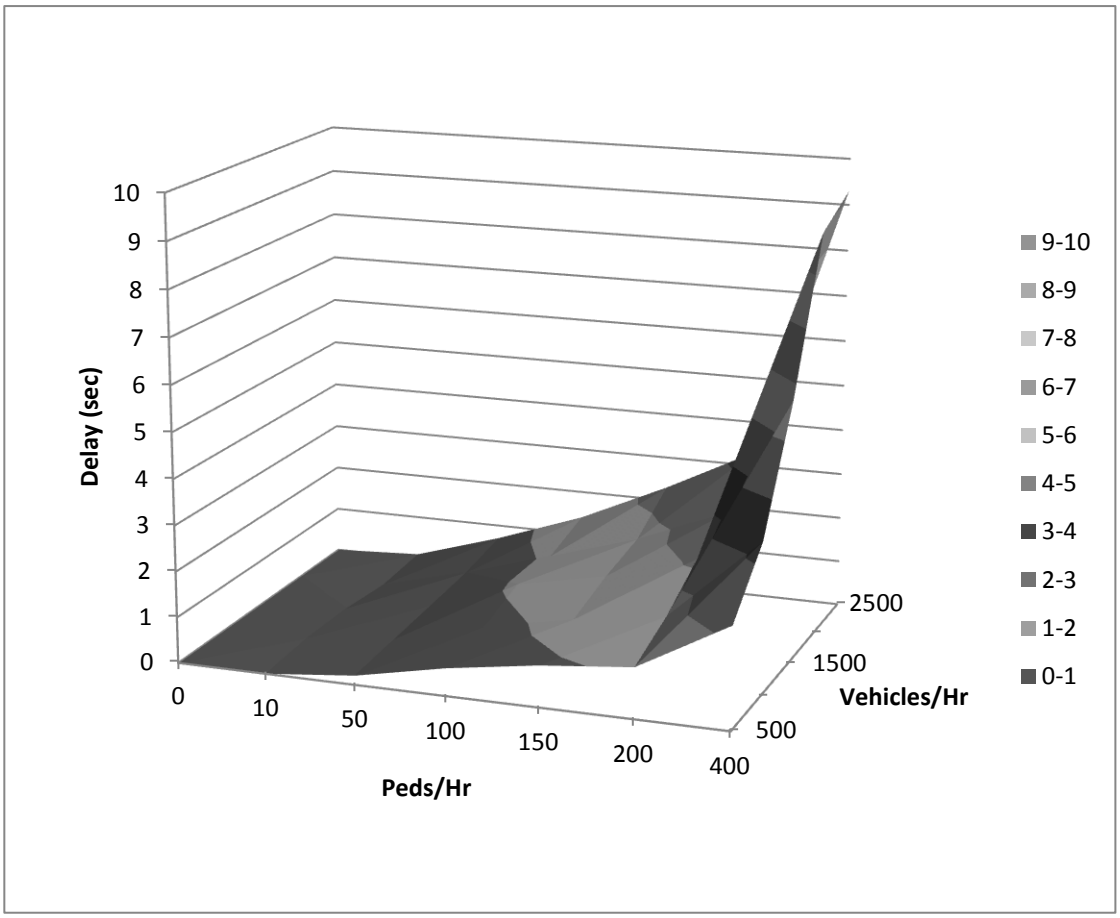

Figure 4.2: Delay based on pedestrian and vehicular volumes

Planners can use this information to determine if the number of vehicles and pedestrians warrants an un-signalized midblock crossing, or if no crossing or a signalized intersection is more appropriate for the context.

4.3 Volume Shifts

Volume shifts are required based on the results for delay changes and lane width changes. For lane width reductions, the volume shift would have to be equal to

the service volume reduction to maintain the same level of service. A road that originally accommodated an annual average daily traffic of 12,400 at a level of service D would only be able to accommodate an AADT of 12,000 if the lane were reduced to 11 feet. To maintain this level of service, 400 (3%) drivers would have to choose a different mode or different route every day. 900 (7%) drivers would have to switch modes or routes with a 10 foot lane, and 1,300 (10%) drivers would have to switch with a 9 foot lane. In all cases, a significant number of drivers would have to switch modes or routes to maintain the level of service.

Delay caused by pedestrians is more complicated. If a substantial number of drivers switched to pedestrians, delay could change if the midblock crossing is used by more people. The important thing to note about the delay change results is that doubling the number of vehicles has a much larger effect on delay than doubling the number of pedestrians.

Chapter 5

CONCLUSION

5.1 Tradeoffs

There is one essential question that all planners need to ask themselves: what techniques are appropriate for this context and this community? The answer to this question is going to vary widely from place to place. The context plays the largest part in determining the answer. Some techniques are only appropriate in dense urban areas, other techniques are appropriate for less dense areas. The primary goal of a complete street design is to increase the safety of all users. To meet this goal, it is important to understand who the users are, what the community wants, and what the community needs.

Difficult decisions are required to determine which techniques are the best to implement in a given area. In a densely populated area, the community may want a sidewalk, a bike lane, and street landscaping/storm water management. In a rural area, the community may want a good drainage system and a wide shoulder for walking and biking. These techniques might be appropriate for each community, but both solutions take up space that may be used currently as a vehicular travel or parking lane, or they might require more right-of-way. These changes could greatly affect the traffic in the area by increasing delay or reducing service volume.

The results shown give planners the opportunity to understand the tradeoffs that need to be part of the discussion. It may be appropriate to reduce the service volume to put in a bike lane if the community wants a bike lane, and the bike lane will

be used enough to warrant affecting traffic. This could cause the community to become divided over the issue, and there will have to be a discussion about whose needs will be met and where compromises need to be made. Compromises could be to add a bike lane only on one side of the road and leaving the parking on the other side.

These results allow planners to determine how much the lane width could be reduced to continue to meet the needs of the current drivers while implementing complete streets techniques that will address the needs of the other road users. As discussed earlier, it is possible to choose different techniques that fit in the current width of the street while not reducing the lane width dramatically. This is a problem that is especially difficult in areas where the areas along the street are developed and there is no additional space to increase the width of the road to accommodate all users. Increasing the width of the road does not meet the sustainability goals of complete street design, but it may be a compromise so all of the safety goals are met.

Deciding whether to add a midblock crossing has similar tradeoffs to deciding whether to reduce the lane width. Midblock crossings are useful in areas where there is a long distance between signalized intersections and have a number of pedestrians that have to go out of their way to get to a signalized intersection. If there are not a lot of pedestrians, a midblock crossing is not going to have a large effect on the drivers in the area, so the planners need to concern themselves only with what type of crossing they will be putting in and how much money they want to spend. If there is a large pedestrian population and fewer drivers, a midblock crossing is appropriate to accommodate many users. If there is a large pedestrian population and a lot of drivers, it is important to weigh the tradeoffs between accommodating the drivers and accommodating the pedestrians. One possible solution in this case could be to put in a

signalized crossing so more pedestrians cross in groups instead of a steady stream. This also lets the drivers and pedestrians know exactly when it is safe to go. Adding in a signalized crossing is much more expensive than adding an un-signalized crossing, but the pedestrian and driver populations might warrant a signalized crossing.

5.2 Future Work

Transportation planning occurs at different levels because individual roads are designed at different times, but all of these roads along with the public transit network all work together as a larger transportation network that impacts a region. This study focused only on the effects of complete streets techniques at the street/arterial level. Now that the impacts of lane width reduction and delay changes have been determined at a more detailed level, it is important to understand the impacts on the larger transportation network.

In 2010, the Highway Safety Manual was introduced which focuses on the safety of road users. Since the primary goal of designing complete streets, it is important to determine if there will be changes in safety based on the different techniques that are implemented. Planners need to determine if it is safer to introduce more pedestrians on a street versus keeping them in cars. If it is not safer to introduce pedestrians on that street, it is necessary to determine how the street could be designed to make it safer. Sometimes this could be difficult because the context makes streets more dangerous for pedestrians, but if there is something that can be done during design, focusing on the safety of all users is necessary to meet the goals of complete street design.

Senate Bill No. 743

CHAPTER 386

An act to amend Sections 65088.1 and 65088.4 of the Government Code, and to amend Sections 21181, 21183, 21186, 21187, 21189.1, and 21189.3 of, to add Section 21155.4 to, to add Chapter 2.7 (commencing with Section 21099) to Division 13 of, to add and repeal Section 21168.6.6 of, and to repeal and add Section 21185 of, the Public Resources Code, relating to environmental quality.

[Approved by Governor September 27, 2013. Filed with Secretary of State September 27, 2013.]

LEGISLATIVE COUNSEL'S DIGEST

SB 743, Steinberg. Environmental quality: transit oriented infill projects, judicial review streamlining for environmental leadership development projects, and entertainment and sports center in the City of Sacramento.

(1) The Jobs and Economic Improvement Through Environmental Leadership Act of 2011 requires a party bringing an action or proceeding alleging that a lead agency's approval of a project certified by the Governor as an environmental leadership development project is in violation of the California Environmental Quality Act to file the action or proceeding with the Court of Appeal with geographic jurisdiction over the project and requires the Court of Appeal to issue its decision within 175 days of the filing of the petition. The Jobs and Economic Improvement Through Environmental Leadership Act of 2011 requires the lead agency to concurrently prepare the record of proceeding for the leadership project with the review and consideration of the project. The Jobs and Economic Improvement Through Environmental Leadership Act of 2011 provides that the above provision does not apply to a project for which a lead agency fails to certify an environmental impact report on or before June 1, 2014. The Jobs and Economic Improvement Through Environmental Leadership Act of 2011 is repealed by its own terms on January 1, 2015.

This bill would instead require the Judicial Council, on or before July 1, 2014, to adopt a rule of court to establish procedures applicable to actions or proceedings seeking judicial review of a public agency's action in certifying the environmental impact report and in granting project approval that requires the actions or proceedings, including any appeals therefrom, be resolved, within 270 days of the certification of the record of proceedings. The bill would extend the operation of the judicial review procedures unless the lead agency fails to certify an environmental impact report for an environmental leadership project on or before January 1, 2016. The bill would provide that the above provisions do not apply to a project if the Governor does not certify the project as an environmental leadership

development project prior to January 1, 2016. Because this bill would extend the time period for which a lead agency would be required to concurrently prepare the record of proceeding with the review and consideration of the environmental leadership development projects, this bill would impose a state-mandated local program. The bill would require the lead agency, within 10 days of the Governor's certification, to issue, at the applicant's expense, a specified public notice, thereby imposing a state-mandated local program. The bill would repeal the Jobs and Economic Improvement Through Environmental Leadership Act of 2011 on January 1, 2017.

(2) The California Environmental Quality Act, commonly known as CEQA, requires a lead agency, as defined, to prepare, or cause to be prepared, and certify the completion of, an environmental impact report on a project that it proposes to carry out or approve that may have a significant effect on the environment or to adopt a negative declaration if it finds that the project will not have that effect. CEQA also requires a lead agency to prepare a mitigated negative declaration for a project that may have a significant effect on the environment if revisions in the project would avoid or mitigate that effect and there is no substantial evidence that the project, as revised, would have a significant effect on the environment. CEQA establishes a procedure by which a person may seek judicial review of the decision of the lead agency made pursuant to CEQA.

This bill would provide that aesthetic and parking impacts of a residential, mixed-use residential, or employment center project, as defined, on an infill site, as defined, within a transit priority area, as defined, shall not be considered significant impacts on the environment. The bill would require the Office of Planning and Research to prepare and submit to the Secretary of the Natural Resources Agency, and the secretary to certify and adopt, revisions to the guidelines for the implementation of CEQA establishing criteria for determining the significance of transportation impacts of projects within transit priority areas.

This bill would, except for specified circumstances, exempt from CEQA residential, employment center, and mixed-use development projects meeting specified criteria. Because a lead agency would be required to determine the applicability of this exemption, this bill would impose a state-mandated local program.

This bill would require the public agency, in certifying the environmental impact report and in granting approvals for a specified entertainment and sports center project located in the City of Sacramento, including the concurrent preparation of the record of proceedings and the certification of the record of proceeding within 5 days of the filing of a specified notice, to comply with specified procedures. Because a public agency would be required to comply with those new procedures, this bill would impose a state-mandated local program. The bill would require the Judicial Council, on or before July 1, 2014, to adopt a rule of court to establish procedures applicable to actions or proceedings seeking judicial review of a public agency's action in certifying the environmental impact report and in granting project approval that requires the actions or proceedings, including any

appeals therefrom, be resolved, to the extent feasible, within 270 days of the certification of the record of proceedings. The bill would provide that the above provisions are inoperative and repealed on January 1 of the following year if the applicant fails to notify the lead agency before the release of the draft environmental impact report for public comment that the applicant is electing to proceed pursuant to the above provisions.

(3) Existing law requires the development, adoption, and updating of a congestion management program for each county that includes an urbanized area, as defined. The plan is required to contain specified elements and to be submitted to regional agencies, as defined, for determination of whether the program is consistent with regional transportation plans. The regional agency is then directed to monitor the implementation of all elements of each congestion management program. The required elements include traffic level of service standards for a system of designated highways and roadways. Existing law defines "infill opportunity zone" for purposes of the above-described provisions and exempts streets and highways in an infill opportunity zone from the level of service standards specified in the above-described provisions and instead requires alternate level of service standards to be applied. Existing law prohibits a city or county from designating an infill opportunity zone after December 31, 2009.

This bill would revise the definition of "infill opportunity zone," as specified. The bill would authorize the designation of an infill opportunity zone that is a transit priority area within a sustainable communities strategy or alternative planning strategy adopted by an applicable metropolitan planning organization.

(4) Existing law terminates the designation of an infill opportunity zone if no development project is completed within that zone within 4 years from the date of the designation.

This bill would repeal this provision.

This bill would make findings and declarations as to the necessity of a special statute for the City of Sacramento.

(5) The California Constitution requires the state to reimburse local agencies and school districts for certain costs mandated by the state. Statutory provisions establish procedures for making that reimbursement.

This bill would provide that no reimbursement is required by this act for a specified reason.

The people of the State of California do enact as follows:

SECTION 1. (a) The Legislature finds and declares the following:

(1) With the adoption of Chapter 728 of the Statutes of 2008, popularly known as the Sustainable Communities and Climate Protection Act of 2008, the Legislature signaled its commitment to encouraging land use and transportation planning decisions and investments that reduce vehicle miles traveled and contribute to the reductions in greenhouse gas emissions required in the California Global Warming Solutions Act of 2006 (Division

25.5 (commencing with Section 38500) of the Health and Safety Code). Similarly, the California Complete Streets Act of 2008 (Chapter 657 of the Statutes of 2008) requires local governments to plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways for safe and convenient travel.

(2) Transportation analyses under the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) typically study changes in automobile delay. New methodologies under the California Environmental Quality Act are needed for evaluating transportation impacts that are better able to promote the state's goals of reducing greenhouse gas emissions and traffic-related air pollution, promoting the development of a multimodal transportation system, and providing clean, efficient access to destinations.

(b) It is the intent of the Legislature to do both of the following:

(1) Ensure that the environmental impacts of traffic, such as noise, air pollution, and safety concerns, continue to be properly addressed and mitigated through the California Environmental Quality Act.

(2) More appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions.

SEC. 2. The Legislature further finds and declares all of the following:

(a) The Federal Reserve has stated that "[m]ost policymakers estimate the longer-run normal rate of unemployment is between 5.2 and 6 percent." At 7.6 percent, the current United States unemployment rate remains markedly higher than the normal rate and both the unemployment rates in Sacramento County and California are higher than the current national unemployment rate.

(b) The California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) requires that the environmental impacts of development projects be identified and mitigated. The act also guarantees the public an opportunity to review and comment on the environmental impacts of a project and to participate meaningfully in the development of mitigation measures for potentially significant environmental impacts.

(c) The existing home of the City of Sacramento's National Basketball Association (NBA) team, the Sleep Train Arena, is an old and outmoded facility located outside of the City of Sacramento's downtown area and is not serviced by the region's existing heavy and light rail transportation networks. It was constructed 25 years ago and a new, more efficient entertainment and sports center located in downtown Sacramento is needed to meet the city's and region's needs.

(d) The City of Sacramento and the region would greatly benefit from the addition of a multipurpose event center capable of hosting a wide range of events including exhibitions, conventions, sporting events, as well as musical, artistic, and cultural events in downtown Sacramento.

(e) The proposed entertainment and sports center project is a public-private partnership between the City of Sacramento and the applicant that will result in the construction of a new state-of-the-art multipurpose event center, and surrounding infill development in downtown Sacramento as described in the notice of preparation released by the City of Sacramento on April 12, 2013.

(f) The project will generate over 4,000 full-time jobs including employees hired both during construction and operation of the entertainment and sports center project. This employment estimate does not include the substantial job generation that will occur with the surrounding development uses, which will generate additional hospitality, office, restaurant, and retail jobs in Sacramento's downtown area.

(g) The project also presents an unprecedented opportunity to implement innovative measures that will significantly reduce traffic and air quality impacts and mitigate the greenhouse gas emissions resulting from the project. The project site is located in downtown Sacramento near heavy and light rail transit facilities, situated to maximize opportunities to encourage nonautomobile modes of travel to the entertainment and sports center project, and is consistent with the policies and regional vision included in the Sustainable Communities Strategy adopted pursuant to Chapter 728 of the Statutes of 2008 by the Sacramento Area Council of Governments in April of 2012. The project is also located within close proximity to three major infill development areas including projects (The Bridge District, Railyards, and Township Nine) that received infill infrastructure grants from the state pursuant to Proposition 1C.

(h) It is in the interest of the state to expedite judicial review of the entertainment and sports center project, as appropriate, while protecting the environment and the right of the public to review, comment on, and, if necessary, seek judicial review of, the adequacy of the environmental impact report for the project.

SEC. 3. Section 65088.1 of the Government Code is amended to read:

65088.1. As used in this chapter the following terms have the following meanings:

(a) Unless the context requires otherwise, "agency" means the agency responsible for the preparation and adoption of the congestion management program.

(b) "Bus rapid transit corridor" means a bus service that includes at least four of the following attributes:

(1) Coordination with land use planning.
(2) Exclusive right-of-way.
(3) Improved passenger boarding facilities.
(4) Limited stops.
(5) Passenger boarding at the same height as the bus.
(6) Prepaid fares.
(7) Real-time passenger information.
(8) Traffic priority at intersections.
(9) Signal priority.

(10) Unique vehicles.

(c) "Commission" means the California Transportation Commission.

(d) "Department" means the Department of Transportation.

(e) "Infill opportunity zone" means a specific area designated by a city or county, pursuant to subdivision (c) of Section 65088.4, that is within one-half mile of a major transit stop or high-quality transit corridor included in a regional transportation plan. A major transit stop is as defined in Section 21064.3 of the Public Resources Code, except that, for purposes of this section, it also includes major transit stops that are included in the applicable regional transportation plan. For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

(f) "Interregional travel" means any trips that originate outside the boundary of the agency. A "trip" means a one-direction vehicle movement. The origin of any trip is the starting point of that trip. A roundtrip consists of two individual trips.

(g) "Level of service standard" is a threshold that defines a deficiency on the congestion management program highway and roadway system which requires the preparation of a deficiency plan. It is the intent of the Legislature that the agency shall use all elements of the program to implement strategies and actions that avoid the creation of deficiencies and to improve multimodal mobility.

(h) "Local jurisdiction" means a city, a county, or a city and county.

(i) "Multimodal" means the utilization of all available modes of travel that enhance the movement of people and goods, including, but not limited to, highway, transit, nonmotorized, and demand management strategies including, but not limited to, telecommuting. The availability and practicality of specific multimodal systems, projects, and strategies may vary by county and region in accordance with the size and complexity of different urbanized areas.

(j) (1) "Parking cash-out program" means an employer-funded program under which an employer offers to provide a cash allowance to an employee equivalent to the parking subsidy that the employer would otherwise pay to provide the employee with a parking space. "Parking subsidy" means the difference between the out-of-pocket amount paid by an employer on a regular basis in order to secure the availability of an employee parking space not owned by the employer and the price, if any, charged to an employee for use of that space.

(2) A parking cash-out program may include a requirement that employee participants certify that they will comply with guidelines established by the employer designed to avoid neighborhood parking problems, with a provision that employees not complying with the guidelines will no longer be eligible for the parking cash-out program.

(k) "Performance measure" is an analytical planning tool that is used to quantitatively evaluate transportation improvements and to assist in determining effective implementation actions, considering all modes and

strategies. Use of a performance measure as part of the program does not trigger the requirement for the preparation of deficiency plans.

(*l*) "Urbanized area" has the same meaning as is defined in the 1990 federal census for urbanized areas of more than 50,000 population.

(m) Unless the context requires otherwise, "regional agency" means the agency responsible for preparation of the regional transportation improvement program.

SEC. 4. Section 65088.4 of the Government Code is amended to read:

65088.4. (a) It is the intent of the Legislature to balance the need for level of service standards for traffic with the need to build infill housing and mixed use commercial developments within walking distance of mass transit facilities, downtowns, and town centers and to provide greater flexibility to local governments to balance these sometimes competing needs.

(b) Notwithstanding any other provision of law, level of service standards described in Section 65089 shall not apply to the streets and highways within an infill opportunity zone.

(c) The city or county may designate an infill opportunity zone by adopting a resolution after determining that the infill opportunity zone is consistent with the general plan and any applicable specific plan, and is a transit priority area within a sustainable communities strategy or alternative planning strategy adopted by the applicable metropolitan planning organization.

SEC. 5. Chapter 2.7 (commencing with Section 21099) is added to Division 13 of the Public Resources Code, to read:

Chapter 2.7. Modernization of Transportation Analysis for Transit-Oriented Infill Projects

21099. (a) For purposes of this section, the following terms mean the following:

(1) "Employment center project" means a project located on property zoned for commercial uses with a floor area ratio of no less than 0.75 and that is located within a transit priority area.

(2) "Floor area ratio" means the ratio of gross building area of the development, excluding structured parking areas, proposed for the project divided by the net lot area.

(3) "Gross building area" means the sum of all finished areas of all floors of a building included within the outside faces of its exterior walls.

(4) "Infill site" means a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses.

(5) "Lot" means all parcels utilized by the project.

(6) "Net lot area" means the area of a lot, excluding publicly dedicated land and private streets that meet local standards, and other public use areas as determined by the local land use authority.

(7) "Transit priority area" means an area within one-half mile of a major transit stop that is existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program adopted pursuant to Section 450.216 or 450.322 of Title 23 of the Code of Federal Regulations.

(b) (1) The Office of Planning and Research shall prepare, develop, and transmit to the Secretary of the Natural Resources Agency for certification and adoption proposed revisions to the guidelines adopted pursuant to Section 21083 establishing criteria for determining the significance of transportation impacts of projects within transit priority areas. Those criteria shall promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses. In developing the criteria, the office shall recommend potential metrics to measure transportation impacts that may include, but are not limited to, vehicle miles traveled, vehicle miles traveled per capita, automobile trip generation rates, or automobile trips generated. The office may also establish criteria for models used to analyze transportation impacts to ensure the models are accurate, reliable, and consistent with the intent of this section.

(2) Upon certification of the guidelines by the Secretary of the Natural Resources Agency pursuant to this section, automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any.

(3) This subdivision does not relieve a public agency of the requirement to analyze a project's potentially significant transportation impacts related to air quality, noise, safety, or any other impact associated with transportation. The methodology established by these guidelines shall not create a presumption that a project will not result in significant impacts related to air quality, noise, safety, or any other impact associated with transportation. Notwithstanding the foregoing, the adequacy of parking for a project shall not support a finding of significance pursuant to this section.

(4) This subdivision does not preclude the application of local general plan policies, zoning codes, conditions of approval, thresholds, or any other planning requirements pursuant to the police power or any other authority.

(5) On or before July 1, 2014, the Office of Planning and Research shall circulate a draft revision prepared pursuant to paragraph (1).

(c) (1) The Office of Planning and Research may adopt guidelines pursuant to Section 21083 establishing alternative metrics to the metrics used for traffic levels of service for transportation impacts outside transit priority areas. The alternative metrics may include the retention of traffic levels of service, where appropriate and as determined by the office.

(2) This subdivision shall not affect the standard of review that would apply to the new guidelines adopted pursuant to this section.

(d) (1) Aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment.

(2) (A) This subdivision does not affect, change, or modify the authority of a lead agency to consider aesthetic impacts pursuant to local design review ordinances or other discretionary powers provided by other laws or policies.

(B) For the purposes of this subdivision, aesthetic impacts do not include impacts on historical or cultural resources.

(e) This section does not affect the authority of a public agency to establish or adopt thresholds of significance that are more protective of the environment.

SEC. 6. Section 21155.4 is added to the Public Resources Code, to read:

21155.4. (a) Except as provided in subdivision (b), a residential, employment center, as defined in paragraph (1) of subdivision (a) of Section 21099, or mixed-use development project, including any subdivision, or any zoning, change that meets all of the following criteria is exempt from the requirements of this division:

(1) The project is proposed within a transit priority area, as defined in subdivision (a) of Section 21099.

(2) The project is undertaken to implement and is consistent with a specific plan for which an environmental impact report has been certified.

(3) The project is consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy for which the State Air Resources Board, pursuant to subparagraph (H) of paragraph (2) of subdivision (b) of Section 65080 of the Government Code, has accepted a metropolitan planning organization's determination that the sustainable communities strategy or the alternative planning strategy would, if implemented, achieve the greenhouse gas emissions reduction targets.

(b) Further environmental review shall be conducted only if any of the events specified in Section 21166 have occurred.

SEC. 7. Section 21168.6.6 is added to the Public Resources Code, to read:

21168.6.6. (a) For the purposes of this section, the following definitions shall have the following meanings:

(1) "Applicant" means a private entity or its affiliates that proposes the project and its successors, heirs, and assignees.

(2) "City" means the City of Sacramento.

(3) "Downtown arena" means the following components of the entertainment and sports center project from demolition and site preparation through operation:

(A) An arena facility that will become the new home to the City of Sacramento's National Basketball Association (NBA) team that does both of the following:

(i) Receives Leadership in Energy and Environmental Design (LEED) gold certification for new construction within one year of completion of the first NBA season.

(ii) Minimizes operational traffic congestion and air quality impacts through either or both project design and the implementation of feasible mitigation measures that will do all of the following:

(I) Achieve and maintain carbon neutrality or better by reducing to at least zero the net emissions of greenhouse gases, as defined in subdivision (g) of Section 38505 of the Health and Safety Code, from private automobile trips to the downtown arena as compared to the baseline as verified by the Sacramento Metropolitan Air Quality Management District.

(II) Achieve a per attendee reduction in greenhouse gas emissions from automobiles and light trucks compared to per attendee greenhouse gas emissions associated with the existing arena during the 2012–13 NBA season that will exceed the carbon reduction targets for 2020 and 2035 achieved in the sustainable communities strategy prepared by the Sacramento Area Council of Governments for the Sacramento region pursuant to Chapter 728 of the Statutes of 2008.

(III) Achieve and maintain vehicle-miles-traveled per attendee for NBA events at the downtown arena that is no more than 85 percent of the baseline.

(B) Associated public spaces.

(C) Facilities and infrastructure for ingress, egress, and use of the arena facility.

(4) "Entertainment and sports center project" or "project" means a project that substantially conforms to the project description for the entertainment and sports center project set forth in the notice of preparation released by the City of Sacramento on April 12, 2013.

(b) (1) The city may prosecute an eminent domain action for 545 and 600 K Street, Sacramento, California, and surrounding publicly accessible areas and rights-of-way within 200 feet of 600 K Street, Sacramento, California, through order of possession pursuant to the Eminent Domain Law (Title 7 (commencing with Section 1230.010) of Part 3 of the Code of Civil Procedure) prior to completing the environmental review under this division.

(2) Paragraph (1) shall not apply to any other eminent domain actions prosecuted by the City of Sacramento or to eminent domain actions based on a finding of blight.

(c) Notwithstanding any other law, the procedures established pursuant to subdivision (d) shall apply to an action or proceeding brought to attack, review, set aside, void, or annul the certification of the environmental impact report for the project or the granting of any project approvals.

(d) On or before July 1, 2014, the Judicial Council shall adopt a rule of court to establish procedures applicable to actions or proceedings brought to attack, review, set aside, void, or annul the certification of the environmental impact report for the project or the granting of any project approvals that require the actions or proceedings, including any potential appeals therefrom, be resolved, to the extent feasible, within 270 days of certification of the record of proceedings pursuant to subdivision (f).

(e) (1) The draft and final environmental impact report shall include a notice in not less than 12-point type stating the following:

THIS EIR IS SUBJECT TO SECTION 21168.6.6 OF THE PUBLIC RESOURCES CODE, WHICH PROVIDES, AMONG OTHER THINGS, THAT THE LEAD AGENCY NEED NOT CONSIDER CERTAIN COMMENTS FILED AFTER THE CLOSE OF THE PUBLIC COMMENT PERIOD FOR THE DRAFT EIR. ANY JUDICIAL ACTION CHALLENGING THE CERTIFICATION OF THE EIR OR THE APPROVAL OF THE PROJECT DESCRIBED IN THE EIR IS SUBJECT TO THE PROCEDURES SET FORTH IN SECTION 21168.6.6 OF THE PUBLIC RESOURCES CODE. A COPY OF SECTION 21168.6.6 OF THE PUBLIC RESOURCES CODE IS INCLUDED IN THE APPENDIX TO THIS EIR.

(2) The draft environmental impact report and final environmental impact report shall contain, as an appendix, the full text of this section.

(3) Within 10 days after the release of the draft environmental impact report, the lead agency shall conduct an informational workshop to inform the public of the key analyses and conclusions of that report.

(4) Within 10 days before the close of the public comment period, the lead agency shall hold a public hearing to receive testimony on the draft environmental impact report. A transcript of the hearing shall be included as an appendix to the final environmental impact report.

(5) (A) Within five days following the close of the public comment period, a commenter on the draft environmental impact report may submit to the lead agency a written request for nonbinding mediation. The lead agency and applicant shall participate in nonbinding mediation with all commenters who submitted timely comments on the draft environmental impact report and who requested the mediation. Mediation conducted pursuant to this paragraph shall end no later than 35 days after the close of the public comment period.

(B) A request for mediation shall identify all areas of dispute raised in the comment submitted by the commenter that are to be mediated.

(C) The lead agency shall select one or more mediators who shall be retired judges or recognized experts with at least five years experience in land use and environmental law or science, or mediation. The applicant shall bear the costs of mediation.

(D) A mediation session shall be conducted on each area of dispute with the parties requesting mediation on that area of dispute.

(E) The lead agency shall adopt, as a condition of approval, any measures agreed upon by the lead agency, the applicant, and any commenter who requested mediation. A commenter who agrees to a measure pursuant to this subparagraph shall not raise the issue addressed by that measure as a basis for an action or proceeding challenging the lead agency’s decision to certify the environmental impact report or to grant one or more initial project approvals.

(6) The lead agency need not consider written comments submitted after the close of the public comment period, unless those comments address any of the following:

(A) New issues raised in the response to comments by the lead agency.

(B) New information released by the public agency subsequent to the release of the draft environmental impact report, such as new information set forth or embodied in a staff report, proposed permit, proposed resolution, ordinance, or similar documents.

(C) Changes made to the project after the close of the public comment period.

(D) Proposed conditions for approval, mitigation measures, or proposed findings required by Section 21081 or a proposed reporting and monitoring program required by paragraph (1) of subdivision (a) of Section 21081.6, where the lead agency releases those documents subsequent to the release of the draft environmental impact report.

(E) New information that was not reasonably known and could not have been reasonably known during the public comment period.

(7) The lead agency shall file the notice required by subdivision (a) of Section 21152 within five days after the last initial project approval.

(f) (1) The lead agency shall prepare and certify the record of the proceedings in accordance with this subdivision and in accordance with Rule 3.1365 of the California Rules of Court. The applicant shall pay the lead agency for all costs of preparing and certifying the record of proceedings.

(2) No later than three business days following the date of the release of the draft environmental impact report, the lead agency shall make available to the public in a readily accessible electronic format the draft environmental impact report and all other documents submitted to or relied on by the lead agency in the preparation of the draft environmental impact report. A document prepared by the lead agency or submitted by the applicant after the date of the release of the draft environmental impact report that is a part of the record of the proceedings shall be made available to the public in a readily accessible electronic format within five business days after the document is prepared or received by the lead agency.

(3) Notwithstanding paragraph (2), documents submitted to or relied on by the lead agency that were not prepared specifically for the project and are copyright protected are not required to be made readily accessible in an electronic format. For those copyright protected documents, the lead agency shall make an index of these documents available in an electronic format no later than the date of the release of the draft environmental impact report, or within five business days if the document is received or relied on by the lead agency after the release of the draft environmental impact report. The index must specify the libraries or lead agency offices in which hardcopies of the copyrighted materials are available for public review.

(4) The lead agency shall encourage written comments on the project to be submitted in a readily accessible electronic format, and shall make any

such comment available to the public in a readily accessible electronic format within five days of its receipt.

(5) Within seven business days after the receipt of any comment that is not in an electronic format, the lead agency shall convert that comment into a readily accessible electronic format and make it available to the public in that format.

(6) The lead agency shall indicate in the record of the proceedings comments received that were not considered by the lead agency pursuant to paragraph (6) of subdivision (e) and need not include the content of the comments as a part of the record.

(7) Within five days after the filing of the notice required by subdivision (a) of Section 21152, the lead agency shall certify the record of the proceedings for the approval or determination and shall provide an electronic copy of the record to a party that has submitted a written request for a copy. The lead agency may charge and collect a reasonable fee from a party requesting a copy of the record for the electronic copy, which shall not exceed the reasonable cost of reproducing that copy.

(8) Within 10 days after being served with a complaint or a petition for a writ of mandate, the lead agency shall lodge a copy of the certified record of proceedings with the superior court.

(9) Any dispute over the content of the record of the proceedings shall be resolved by the superior court. Unless the superior court directs otherwise, a party disputing the content of the record shall file a motion to augment the record at the time it files its initial brief.

(10) The contents of the record of proceedings shall be as set forth in subdivision (e) of Section 21167.6.

(g) (1) As a condition of approval of the project subject to this section, the lead agency shall require the applicant, with respect to any measures specific to the operation of the downtown arena, to implement those measures that will meet the requirements of this division by the end of the first NBA regular season or June of the first NBA regular season, whichever is later, during which an NBA team has played at the downtown arena.

(2) To maximize public health, environmental, and employment benefits, the lead agency shall place the highest priority on feasible measures that will reduce greenhouse gas emissions on the downtown arena site and in the neighboring communities of the downtown arena. Mitigation measures that shall be considered and implemented, if feasible and necessary, to achieve the standards set forth in subclauses (I) to (III), inclusive, of clause (ii) of subparagraph (A) of paragraph (3) of subdivision (a), including, but not limited to:

(A) Temporarily expanding the capacity of a public transit line, as needed, to serve downtown arena events.

(B) Providing private charter buses or other similar services, as needed, to serve downtown arena events.

(C) Paying its fair share of the cost of measures that expand the capacity of a public fixed or light rail station that is used by spectators attending downtown arena events.

(3) Offset credits shall be employed by the applicant only after feasible local emission reduction measures have been implemented. The applicant shall, to the extent feasible, place the highest priority on the purchase of offset credits that produce emission reductions within the city or the boundaries of the Sacramento Metropolitan Air Quality Management District.

(h) (1) (A) In granting relief in an action or proceeding brought pursuant to this section, the court shall not stay or enjoin the construction or operation of the downtown arena unless the court finds either of the following:

(i) The continued construction or operation of the downtown arena presents an imminent threat to the public health and safety.

(ii) The downtown arena site contains unforeseen important Native American artifacts or unforeseen important historical, archaeological, or ecological values that would be materially, permanently, and adversely affected by the continued construction or operation of the downtown arena unless the court stays or enjoins the construction or operation of the downtown arena.

(B) If the court finds that clause (i) or (ii) is satisfied, the court shall only enjoin those specific activities associated with the downtown arena that present an imminent threat to public health and safety or that materially, permanently, and adversely affect unforeseen important Native American artifacts or unforeseen important historical, archaeological, or ecological values.

(2) An action or proceeding to attack, set aside, void, or annul a determination, finding, or decision of the lead agency granting a subsequent project approval shall be subject to the requirements of Chapter 6 (commencing with Section 21165).

(3) Where an action or proceeding brought pursuant to this section challenges aspects of the project other than the downtown arena and those portions or specific project activities are severable from the downtown arena, the court may enter an order as to aspects of the project other than the downtown arena that includes one or more of the remedies set forth in Section 21168.9.

(i) The provisions of this section are severable. If any provision of this section or its application is held invalid, that invalidity shall not affect other provisions or applications that can be given effect without the invalid provision or application.

(j) (1) This section does not apply to the project and shall become inoperative on the date of the release of the draft environmental impact report and is repealed on January 1 of the following year, if the applicant fails to notify the lead agency prior to the release of the draft environmental impact report for public comment that the applicant is electing to proceed pursuant to this section.

(2) The lead agency shall notify the Secretary of State if the applicant fails to notify the lead agency of its election to proceed pursuant to this section.

SEC. 8. Section 21181 of the Public Resources Code is amended to read:

21181. This chapter does not apply to a project if the Governor does not certify a project as an environmental leadership development project eligible for streamlining provided pursuant to this chapter prior to January 1, 2016.

SEC. 9. Section 21183 of the Public Resources Code is amended to read:

21183. The Governor may certify a leadership project for streamlining pursuant to this chapter if all the following conditions are met:

(a) The project will result in a minimum investment of one hundred million dollars ($100,000,000) in California upon completion of construction.

(b) The project creates high-wage, highly skilled jobs that pay prevailing wages and living wages and provide construction jobs and permanent jobs for Californians, and helps reduce unemployment. For purposes of this subdivision, "jobs that pay prevailing wages" means that all construction workers employed in the execution of the project will receive at least the general prevailing rate of per diem wages for the type of work and geographic area, as determined by the Director of Industrial Relations pursuant to Sections 1773 and 1773.9 of the Labor Code. If the project is certified for streamlining, the project applicant shall include this requirement in all contracts for the performance of the work.

(c) The project does not result in any net additional emission of greenhouse gases, including greenhouse gas emissions from employee transportation, as determined by the State Air Resources Board pursuant to Division 25.5 (commencing with Section 38500) of the Health and Safety Code.

(d) The project applicant has entered into a binding and enforceable agreement that all mitigation measures required pursuant to this division to certify the project under this chapter shall be conditions of approval of the project, and those conditions will be fully enforceable by the lead agency or another agency designated by the lead agency. In the case of environmental mitigation measures, the applicant agrees, as an ongoing obligation, that those measures will be monitored and enforced by the lead agency for the life of the obligation.

(e) The project applicant agrees to pay the costs of the Court of Appeal in hearing and deciding any case, including payment of the costs for the appointment of a special master if deemed appropriate by the court, in a form and manner specified by the Judicial Council, as provided in the Rules of Court adopted by the Judicial Council pursuant to subdivision (f) of Section 21185.

(f) The project applicant agrees to pay the costs of preparing the administrative record for the project concurrent with review and consideration of the project pursuant to this division, in a form and manner specified by the lead agency for the project.

SEC. 10. Section 21185 of the Public Resources Code is repealed.

SEC. 11. Section 21185 is added to the Public Resources Code, to read:

21185. On or before July 1, 2014, the Judicial Council shall adopt a rule of court to establish procedures applicable to actions or proceedings brought to attack, review, set aside, void, or annul the certification of the environmental impact report for an environmental leadership development

project certified by the Governor pursuant to this chapter or the granting of any project approvals that require the actions or proceedings, including any potential appeals therefrom, be resolved, within 270 days of certification of the record of proceedings pursuant to Section 21186.

SEC. 12. Section 21186 of the Public Resources Code is amended to read:

21186. Notwithstanding any other law, the preparation and certification of the administrative record for a leadership project certified by the Governor shall be performed in the following manner:

(a) The lead agency for the project shall prepare the administrative record pursuant to this division concurrently with the administrative process.

(b) All documents and other materials placed in the administrative record shall be posted on, and be downloadable from, an Internet Web site maintained by the lead agency commencing with the date of the release of the draft environmental impact report.

(c) The lead agency shall make available to the public in a readily accessible electronic format the draft environmental impact report and all other documents submitted to, or relied on by, the lead agency in the preparation of the draft environmental impact report.

(d) A document prepared by the lead agency or submitted by the applicant after the date of the release of the draft environmental impact report that is a part of the record of the proceedings shall be made available to the public in a readily accessible electronic format within five business days after the document is released or received by the lead agency.

(e) The lead agency shall encourage written comments on the project to be submitted in a readily accessible electronic format, and shall make any comment available to the public in a readily accessible electronic format within five days of its receipt.

(f) Within seven business days after the receipt of any comment that is not in an electronic format, the lead agency shall convert that comment into a readily accessible electronic format and make it available to the public in that format.

(g) Notwithstanding paragraphs (b) to (f), inclusive, documents submitted to or relied on by the lead agency that were not prepared specifically for the project and are copyright protected are not required to be made readily accessible in an electronic format. For those copyright-protected documents, the lead agency shall make an index of these documents available in an electronic format no later than the date of the release of the draft environmental impact report, or within five business days if the document is received or relied on by the lead agency after the release of the draft environmental impact report. The index must specify the libraries or lead agency offices in which hardcopies of the copyrighted materials are available for public review.

(h) The lead agency shall certify the final administrative record within five days of its approval of the project.

(i) Any dispute arising from the administrative record shall be resolved by the superior court. Unless the superior court directs otherwise, a party

disputing the content of the record shall file a motion to augment the record at the time it files its initial brief.

(j) The contents of the record of proceedings shall be as set forth in subdivision (e) of Section 21167.6.

SEC. 13. Section 21187 of the Public Resources Code is amended to read:

21187. Within 10 days of the Governor certifying an environmental leadership development project pursuant to this section, the lead agency shall, at the applicant's expense, issue a public notice in no less than 12-point type stating the following:

"THE APPLICANT HAS ELECTED TO PROCEED UNDER CHAPTER 6.5 (COMMENCING WITH SECTION 21178) OF THE PUBLIC RESOURCES CODE, WHICH PROVIDES, AMONG OTHER THINGS, THAT ANY JUDICIAL ACTION CHALLENGING THE CERTIFICATION OF THE EIR OR THE APPROVAL OF THE PROJECT DESCRIBED IN THE EIR IS SUBJECT TO THE PROCEDURES SET FORTH IN SECTIONS 21185 TO 21186, INCLUSIVE, OF THE PUBLIC RESOURCES CODE. A COPY OF CHAPTER 6.5 (COMMENCING WITH SECTION 21178) OF THE PUBLIC RESOURCES CODE IS INCLUDED BELOW."

The public notice shall be distributed by the lead agency as required for public notices issued pursuant to paragraph (3) of subdivision (b) of Section 21092.

SEC. 14. Section 21189.1 of the Public Resources Code is amended to read:

21189.1. If, prior to January 1, 2016, a lead agency fails to approve a project certified by the Governor pursuant to this chapter, then the certification expires and is no longer valid.

SEC. 15. Section 21189.3 of the Public Resources Code is amended to read:

21189.3. This chapter shall remain in effect until January 1, 2017, and as of that date is repealed unless a later enacted statute extends or repeals that date.

SEC. 16. With respect to certain provisions of this measure, the Legislature finds and declares that a special law is necessary and that a general law cannot be made applicable within the meaning of Section 16 of Article IV of the California Constitution because of the unique need for the development of an entertainment and sports center project in the City of Sacramento in an expeditious manner.

SEC. 17. No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments

sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code.

EXECUTIVE SUMMARY

In the last ten years transit use in Southern California has fallen significantly. This report investigates that falling transit use. We define Southern California as the six counties that participate in the Southern California Association of Governments (SCAG) – Los Angeles, Orange, Riverside, San Bernardino, Ventura and Imperial. We examine patterns of transit service and patronage over time and across the region, and consider an array of explanations for falling transit use: declining transit service levels, eroding transit service quality, rising fares, falling fuel prices, the growth of Lyft and Uber, the migration of frequent transit users to outlying neighborhoods with less transit service, and rising vehicle ownership. While all of these factors probably play some role, we conclude that the most significant factor is increased motor vehicle access, particularly among low-income households that have traditionally supplied the region with its most frequent and reliable transit users.

Transit service and use trends in Southern California

Long associated with the automobile, in the last 25 years Southern California has invested heavily in public transportation. Since 1990, the SCAG region has added over 100 miles of light and heavy rail in Los Angeles County, and over 530 miles of commuter rail region-wide. These investments, however, have not been matched by increases in transit ridership. Transit ridership in the SCAG region reached its postwar peak in 1985. Through the 1990s and 2000s ridership rose and fell modestly, but never again reached its 1985 level. Figure ES-1 shows that per capita trips have been mostly declining in the SCAG region since 2007, and have fallen consistently since 2013.

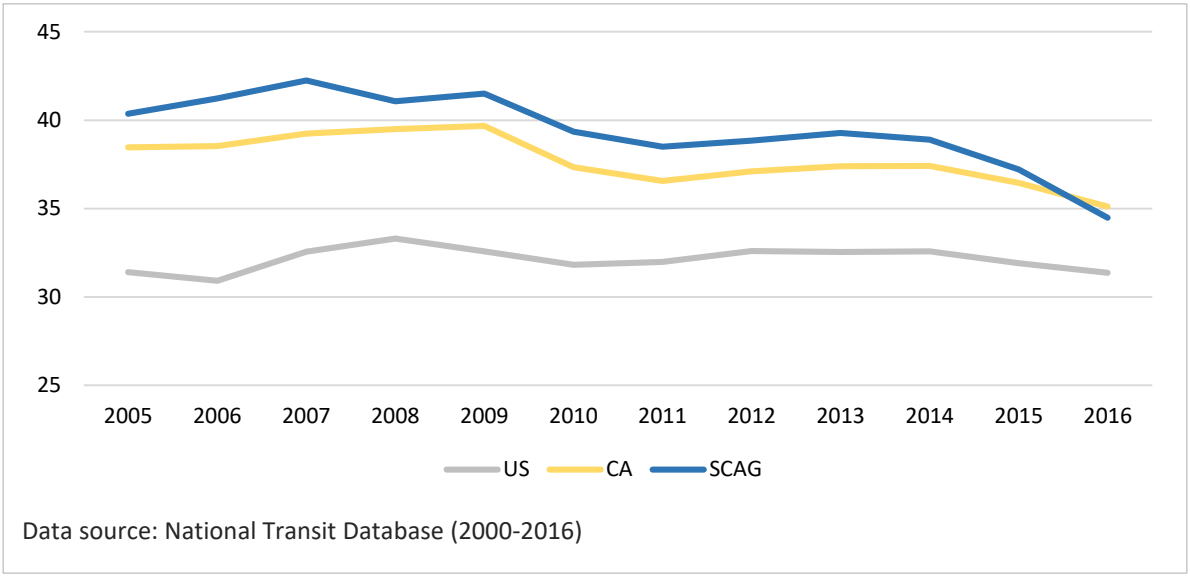

Figure ES 1. Transit trips per capita. *Relatively flat nationally, but down in California since 2009.*

This decline spans modes; it is not simply a case of bus ridership falling while rail ridership increases. Rail ridership, on net, is also down. Further, these aggregate numbers mask large asymmetries in transit service and use. Transit use in particular is heavily concentrated among a relatively small segment of the population, in a small number of the region's neighborhoods, and on a small share of the region's transit systems. As a result of these asymmetries, even small changes in these households, neighborhoods, or transit systems can have an outsized effect on regional transit use.

A few people make most of the trips

The average resident of the SCAG-region made about 35 transit trips in 2016, but the median resident made none. Only a minority of the population rides transit very frequently or even occasionally. About two percent of the population rides transit very frequently (averaging 45 trips/month), another 20 percent of the population rides transit occasionally (averaging 12 trips/month), and more than three-quarters of SCAG-region residents ride transit very little or not at all (averaging less than 1 trip/month). Heavy transit use, moreover, is concentrated among the low-income population, and especially low-income foreign born residents.

A few neighborhoods generate most of the trips

Ten percent of all of the people who commuted to and from work on transit in 2015 lived in 1.4 percent of the region's census tracts, which covered just 0.2 percent of the region's land area; the average number of transit commuters in these few tracts was almost 12 times the regional average. Fully 60 percent of the region's transit commuters lived in 21 percent of the region's census tracts, which occupied 0.9 percent of the region's land area. Overall, the most urban and transit-friendly neighborhoods in the SCAG region comprise less than one percent of the region's land area. These neighborhoods hold about 17 percent the

region's population, but 45 percent of its transit commuters. So while the region's transit systems are increasingly diverse and far reaching, transit riders remain highly concentrated.

A few operators carry most of the passengers

The SCAG region has over 100 transit operators, but just a few them carry the vast majority of riders. Figure ES-2 shows that nine percent of the region's operators are responsible for 60 percent of the region's transit service and carry about 80 percent of all transit riders.

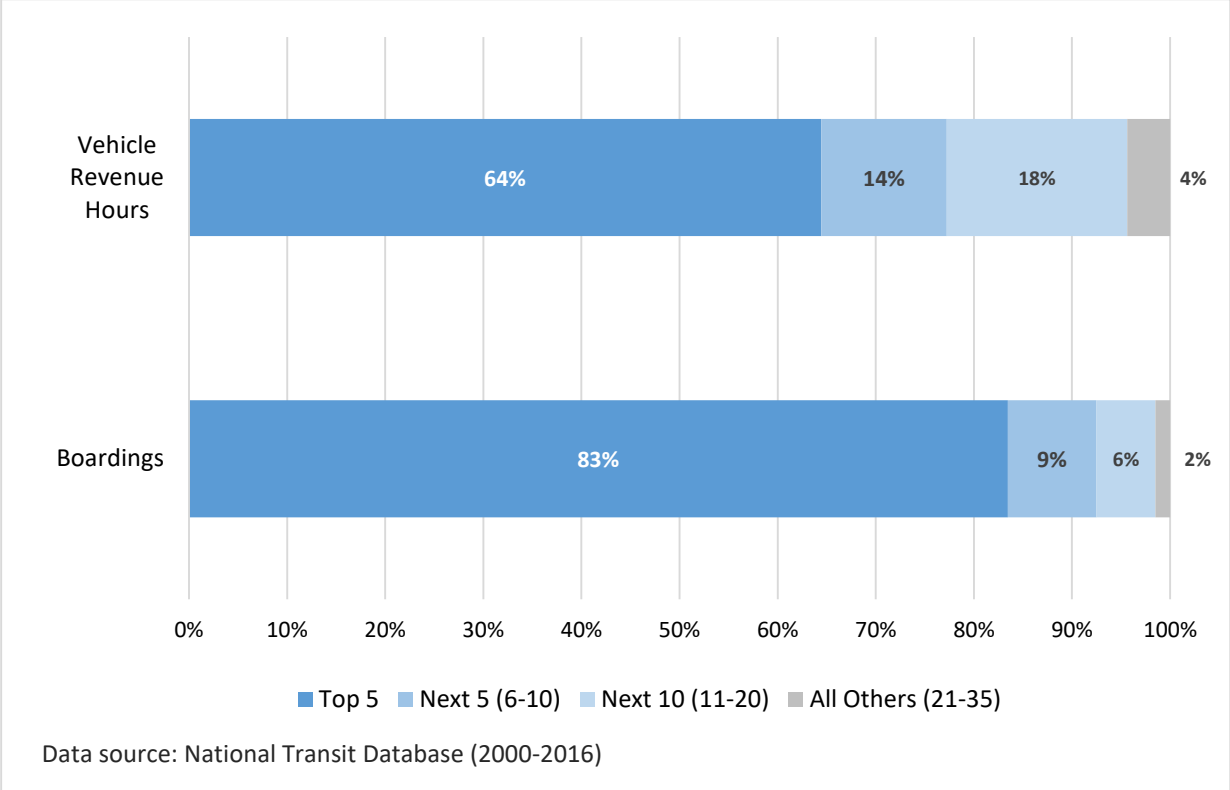

Figure ES 2. Key metrics by operating grouping. *14% of operators carry 83% of the trips.*

Because service and riders are concentrated on the largest systems, ridership losses are concentrated on these systems as well. Four SCAG-region operators—LA Metro, Orange County Transportation Authority (OCTA), Los Angeles Department of Transportation (LADOT), and the Santa Monica Big Blue Bus—accounted for 88 percent of the state's ridership losses between 2010 and 2016. LA Metro by itself accounted for a remarkable 72 percent of the state's losses. Because LA Metro's losses are themselves highly concentrated, a dozen *routes* in LA County account for 38 percent of all the lost ridership in California. In fact, half of California's total lost ridership is accounted for by 17 LA Metro routes (14 bus and 3 rail lines) and one OCTA route.

Possible causes of eroding transit use

Why is transit use falling? We consider a number of potential explanations, and review our findings below.

Changes in transit service and fares have mostly followed and not led falling ridership

Transit use can fall if transit becomes harder to use: if service declines, or fares rise. It does not appear, however, that these factors played a large role in the SCAG region's falling ridership. While transit fare increases are never popular, they are occasionally necessary to keep pace with rising costs. Figure ES-3 shows the inflation-adjusted trends in average fare paid per mile of transit travel between 2002 and 2016 in the U.S., California, and the SCAG region. Fares in Southern California are lower than those in the rest of the state and the country and have been remarkably flat over time.

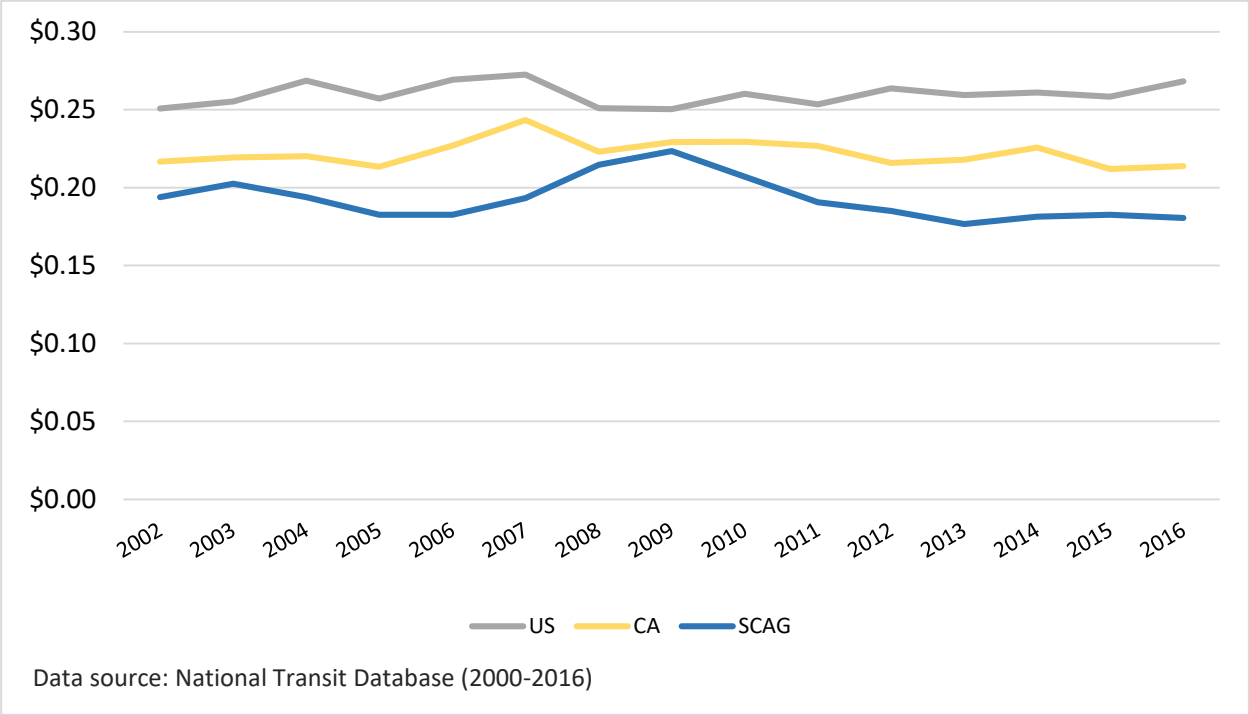

Figure ES 3. Average fare per passenger mile traveled in 2015 dollars. *Average fare per PMT remained fairly consistent and even declined a little since 2009.*

These regional averages can mask significant variation among transit operators. In particular, inflation-adjusted fares per boarding for both OCTA and the Big Blue Bus increased by about 50 percent between 2002 and 2016 — to nearly $1.25 and $0.75 per boarding respectively. So while fares have probably not caused significant ridership declines across the region, they may have played a role at operators like OCTA and Big Blue.

Transit service in the SCAG region, moreover, mostly rose while ridership was falling, and ridership fell even on routes that maintained excellent on-time records. These circumstances suggest that service quantity and reliability were not large factors in falling transit use. There is some evidence, admittedly limited, that riders felt unsafe on transit vehicles in recent years, which may have contributed to the ridership decline.

Fuel prices have likely played a contributing, but not leading role

Fuel prices have been volatile since 1998, but have fallen substantially since peaking in 2012. Figure ES-4 compares trends in fuel prices and transit use in the Los Angeles metropolitan area. While there is a generally positive relationship (as fuel prices rise so too does ridership), it is a relatively weak one – fuel prices rise and fall much more dramatically than transit patronage. The timing of transit's decline, moreover, is not conducive to a fuel price explanation. Per capita transit use in Southern California has been mostly falling since 2007, and it fell between 2009 and 2011 when fuel prices were rising sharply.

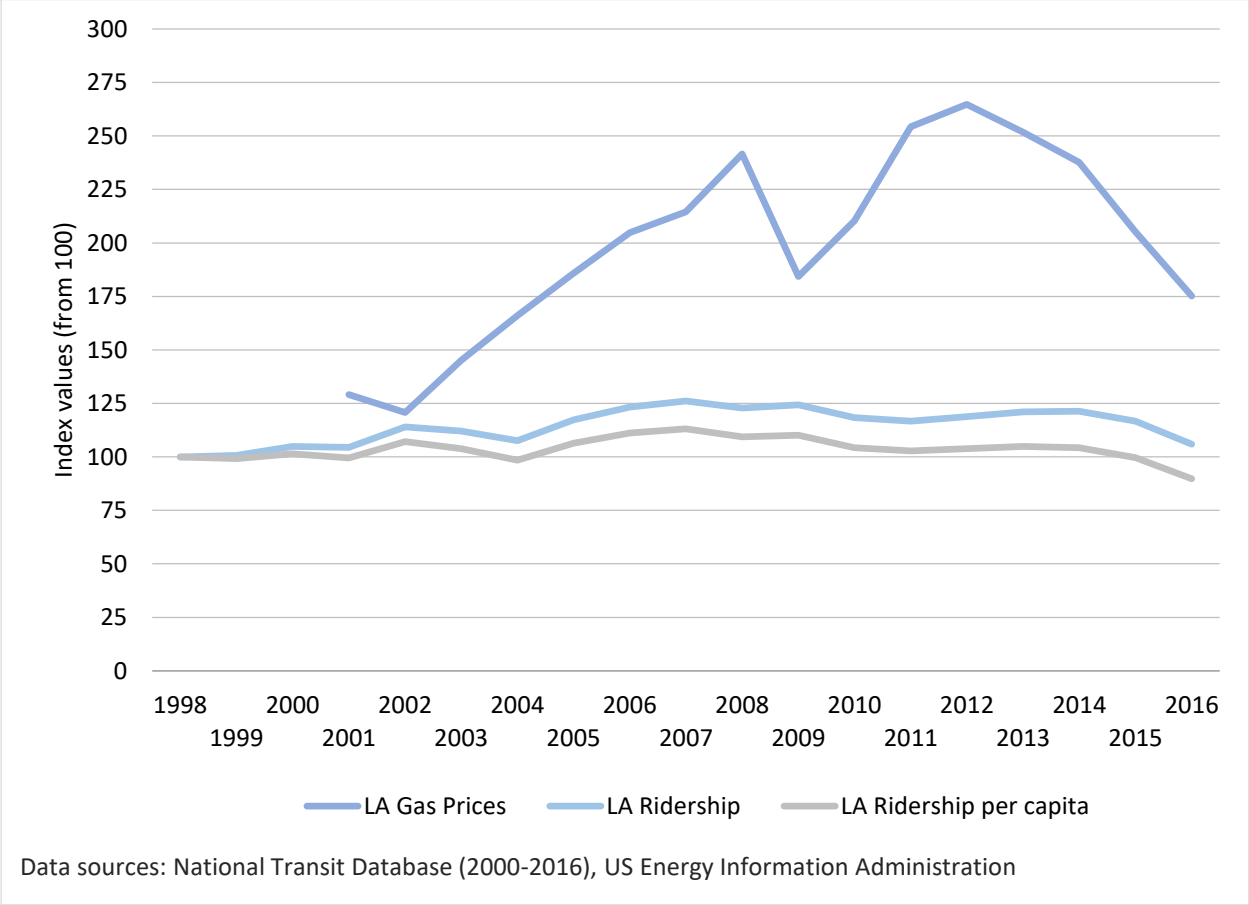

Figure ES 4. Transit ridership and gas prices in Los Angeles Metropolitan Area.

The Transportation Network Companies do not appear to have cannibalized transit

We have very little data that lets us directly measure the effect of transportation network companies (TNCs, like Lyft and Uber) on transit use. What evidence we do have suggests that most TNC trips are probably not replacing large numbers of transit trips. The typical TNC user does not resemble the typical transit rider, the typical TNC trip does not occur when and where most transit trips occur, and most TNC users report no change in their travel by other modes. However, if the pool of TNC users continues to expand, the effect of TNCs on transit use — both positive and negative — may expand as well.

Evidence about neighborhood change and migration of lower-income people is mixed, but suggestive

Transit is heavily-supplied in a small proportion of places, and heavily used by a small proportion of people. If the neighborhoods where transit quality is high change, and become less likely to hold the small group of people who use transit regularly, then transit use could fall. We find some evidence consistent with the idea that neighborhood change has been associated with less transit use. Areas that were heavily populated with transit commuters in the year 2000 became, in the next 15 years, slightly less poor, and significantly less foreign born. Perhaps most important, the share of households without vehicles in these neighborhoods fell notably. All these factors align with a narrative where a transit-using populace is replaced by people who are more likely to drive. We emphasize, however, that this relationship is not one we can measure with precision, and it would be premature to declare neighborhood change a large culprit in falling transit ridership.

Private vehicle access increased substantially from 2000 forward

A defining attribute of regular transit riders is their relative lack of private vehicle access. But between 2000 and 2015, households in the SCAG region, and especially lower-income households, dramatically increased their levels of vehicle ownership. Census data show that from 1990 to 2000 the region added 1.8 million people but only 456,000 household vehicles (or 0.25 vehicles per new resident). From 2000 to 2015, the SCAG region added 2.3 million people and 2.1 million household vehicles (or 0.95 vehicles per new resident).

The growth in vehicle access has been especially dramatic among subsets of the population that are among the heaviest users of transit. Between 2000 and 2015, the share of households in the region with no vehicles fell by 30 percent, and the share of households with fewer vehicles than adults fell 14 percent. Among foreign-born residents, zero-vehicle households were down 42 percent, and those with fewer vehicles than adults were down 22 percent. Finally, among foreign-born households from Mexico, the share of households without vehicles declined an astonishing 66 percent, while households with more adults than vehicles dropped 27 percent. Living in a household without a vehicle is perhaps the strongest single predictor of transit use; the decline of these households has powerful implications for transit in Southern California.

Vehicle ownership is not, of course, the only determinant of regional transit ridership—income, race, age, and nativity, to name a few, also matter. But vehicle access may well be the largest factor. We demonstrate the strong association between vehicle access and transit ridership by building a series of statistical models of transit ridership. The models cover the SCAG region, all of California, Los Angeles

County, and the SCAG region outside of LA County. Each model compares two predicted outcomes: the change in transit use we would expect to see based on due to changes in socioeconomic attributes *other than* vehicle ownership, and the change we would expect to see if we account, in addition, for changes in vehicle access. In short, we compare a scenario where incomes, nativity, racial composition, and various other attributes change the way they did from 2000-2015, but where vehicle access is unchanged, to a scenario where vehicle access changes as well.

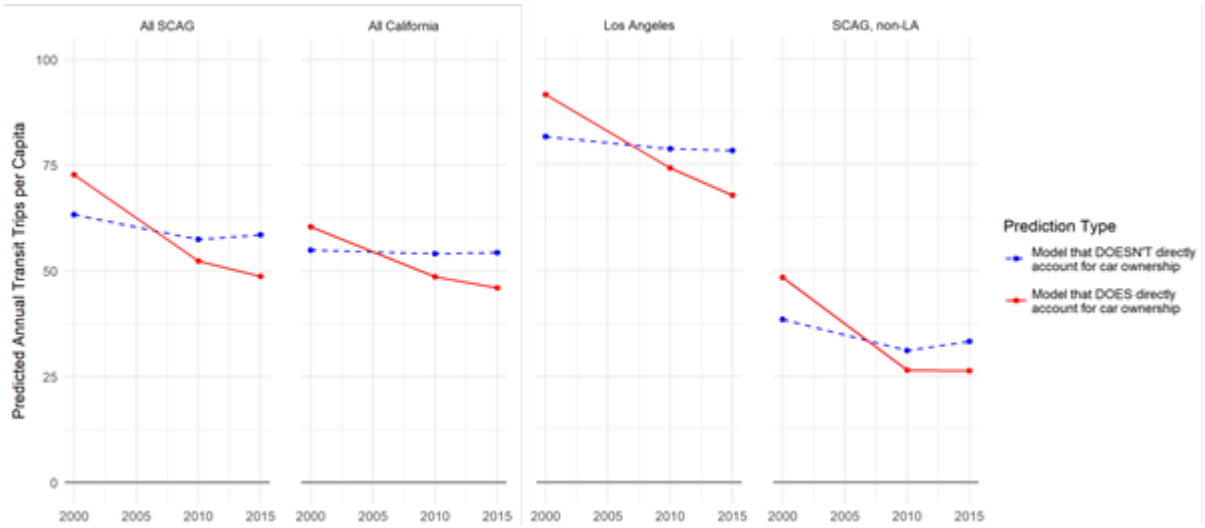

Figure ES 5. Transit use changes based on area.

Figure ES-5 shows the results of these models. The dotted blue line in each case is an estimate of transit ridership trends between 2000 and 2015 based on changes in the region's income, nativity, and so on, but assuming no change in vehicle ownership. The solid red lines represent these same models, but with the region's observed changes in vehicle access included. In all cases the blue line predicts transit use starting at a lower point and declining only modestly, while the red line shows transit use starting at a higher point and falling sharply, more in line with what we are actually observing. The models reinforce the idea that vehicle access is the decisive factor in transit use: income, age, and many other factors matter, but they matter largely because they predict the ability to access and use motor vehicles. In Southern California since 2000, that ability has increased, and transit use has fallen.

Conclusion

Public transportation is unlikely to fare well when Southern California is flooded with additional vehicles, especially when those vehicles are owned disproportionately by transit's traditional riders. Much of the region's built environment is designed to accommodate the presence of private vehicles and to punish their absence. Extensive street and freeway networks link free parking spaces at the origin and destination of most trips. Driving is relatively easy, while moving around by means other than driving is not. These circumstances give people strong economic and social incentives to acquire cars, and — once they have cars — to drive more and ride transit less.

The advantages of automobile access, which are particularly large for low-income people with limited mobility, suggest that transit agencies should not respond to falling ridership by trying to win back former riders who now travel by auto. A better approach may be to convince the vast majority of people who rarely or never use transit to begin riding occasionally instead of driving. This task is unquestionably more difficult than serving frequent-riding transit dependents, and it would likely require weakening or removing some of the state's and region's entrenched subsidies for motor vehicle use. But the opportunity is substantial. The SCAG region, between 2012 and 2016, lost 72 million transit rides annually. That number seems daunting, but the region has a population of 18.8 million, and about 77 percent of those people (roughly 14.5 million), ride transit rarely or never. If one out of every four of those people replaced a single driving trip with a transit trip once every two weeks, annual ridership would grow by 96 million — more than compensating for the losses of recent years. The future of public transit in the SCAG region, then, will be shaped less by the mobility needs of people who do not own vehicles, and more by policy decisions that encourage vehicle-owning households to drive less and use transit more.

FALLING TRANSIT RIDERSHIP: CALIFORNIA AND SOUTHERN CALIFORNIA

In the last 15 years Americans have supported public transportation more and demanded it less. California, the nation's most populous state, is in many ways emblematic of this pattern. Motivated by concerns about congestion and climate change, California's state and local governments have invested heavily in transit, often with the explicit approval of voters. This investment is particularly evident in Southern California. Since 1990, the six-county Southern California Association of Governments (SCAG) region has added over 100 miles of light and heavy rail in Los Angeles County, and over 530 miles of commuter rail region-wide. In November 2016, voters in LA County approved a $120 billion sales tax measure for transportation, with a plurality of the funding dedicated to expanding and improving transit (Measure M: Metro's Plan to Transform Transportation in LA 2016). This measure marked the third such countywide tax increase since 1990, and the fourth one overall. Other SCAG counties have also routinely passed sales tax measures for transportation and transit improvements.

Over the same period, however, California's transit use (depending on how one measures it) has varied from modest increases to relative stagnancy to—in more recent years—steep decline. Southern California is again illustrative. Despite its heavy investments in transit, in absolute terms the region's transit ridership reached its postwar peak in 1985. Through the 1990s and mid-2000s ridership rose and fell modestly, never reaching 1985 levels, and in 2012 it began declining. In per capita terms, ridership has fallen more steadily since the 1980s. Ridership per capita was flat in the early 2000s, but started trending down again in 2007. In California overall, per capita ridership was flat until 2009, when it began a decline from which it has not recovered (The National Transit Database (NTD), 2015).

Why is transit ridership falling? The question is not merely academic. The combination of rising supply and falling demand has profound fiscal implications for transit operators, since it substantially increases the public cost of moving each passenger. Increased transit supply has meant increased public investment, particularly in new rail services. Measured as a ten-year rolling average of capital and operating costs, transit investment in both the US and California rose almost 50 percent between 2000 and 2015. These rising expenditures, when combined with falling patronage, yield falling productivity. Between 2005 and 2016, transit productivity —measured as passenger boardings per vehicle revenue hour (VRH) —has fallen 5 percent in California and 14 percent in the SCAG region. Falling productivity is not sustainable; it usually ends with more subsidies or less service.

Beyond fiscal concerns, falling ridership calls into question a number of California's ambitious environmental goals. California's aggressive agenda for combatting climate change is predicated in part on many people using transit more and driving less. The carbon reduction targets set out in Senate Bill 375, California's landmark climate reduction bill of 2008, involve large mode shifts to transit and away from driving, while the California Department of Transportation's current Strategic Management Plan includes an explicit goal of doubling the state's transit mode share by 2020 (California Department of Transportation, 2015). But transit ridership, despite heavy transit investment, is trending very much in the opposite direction.

This report assesses California's, and particularly Southern California's, recent ridership downturn. We emphasize Southern California because — as we will show — California's falling ridership is in many ways Southern California's falling ridership. Had transit use not fallen in the SCAG region through 2016, it would not have fallen statewide.

Our study considers the years from 2000 to 2015 or 2016 (depending on data availability). While widespread concern about falling transit use did not begin until ridership began falling absolutely in 2012, we focus on the per capita decline that began about five years before that. The falling absolute ridership of the last few years is important, and we do pay outsized attention to it. But we view it as a particularly acute manifestation of the longer-run per capita decline, not as a phenomenon in itself. Absolute declines in ridership are at once more noticeable and less important than per capita declines. Ridership numbers that are not adjusted for population lack context, and focusing only on absolute ridership declines can for that reason yield incomplete or misleading results.

For example, since 2012 gas prices have fallen sharply, transportation network companies (TNCs) like Lyft and Uber have expanded dramatically, undocumented immigrants have been granted drivers' licenses, and the economy has rebounded from the Great Recession. All these factors may have depressed transit use, but all of them also occurred well *after* per capita transit ridership began to decline. Thus none of them, individually or in combination, can fully explain Southern California's, or California's, transit patronage losses.

Our analysis faces data limitations common to examinations of transit. Aggregate data on transit use are widely available through the National Transit Database (NTD), but users of NTD data can never be entirely sure of the data's accuracy.[1] NTD records are compiled from the reports of individual transit operators to the federal government, and for a variety of reasons — from failure to report to mistakes in reporting to errors in correcting those mistakes— NTD data do not always match up with operator data. We have checked some of the NTD data used in this report against operator data and been satisfied that they reasonably conform, but checking all the data would be impossible. We emphasize that this problem is almost universal in transit studies: all data are imperfect, but the NTD is the nation's standard source for transit data.

A second issue is that while data on transit use are easy to find, data on transit *users* are not. Public transportation is used by a small and hard-to-track subset of the population, making riders (and especially former riders) hard to study. The U.S. Census, in its annual American Community Survey (ACS), provides detailed economic and demographic information about transit commuters, but commutes are a minority of transit trips, and commuters (as we will show) are a minority of transit riders. More detailed data on transit users can be found in the California Household Travel Survey (CHTS) which provides an in-depth look at travel of all types by Californians, and complements those travel data with extensive person-level

[1] Transit operators who receive funding from the Federal Transit Administration's Urbanized Area Formula Program, or its Rural Formula program, must submit data to the NTD on the financial and operating conditions of their systems, as well as the conditions of their assets and rolling stock. Just over 660 operators receive such funding and report to the NTD. See https://www.transit.dot.gov/ntd

socioeconomic information. But the CHTS is a one-year snapshot, only available for 2012. As a result, we have a data mismatch: excellent data for a single year, but a research question – why is transit ridership declining? – that demands data on changes over time.

A last data obstacle is that the determinants of transit use are varied, ranging from gas prices to auto ownership to the quality of transit service, and no single data set contains all of them. Some factors thought to influence transit use, like the availability of free parking, are not systematically tracked at all.

To work around these limitations, we draw on an array of spatial, person-level, and administrative data. At different points we use the U.S. Census summary files, the Integrated Public Use Microdata (IPUMS) of the Census,[2] state and national travel diary data, gas price and economic data from the Energy Information Agency and the Bureau of Labor Statistics, and data and rider surveys conducted by some of Southern California's larger transit operators. One operator—the Los Angeles County Metropolitan Transportation Authority (Metro, or LA Metro)—by itself accounts for most of the region's transit use and has ample public data available. As a result, at different points in the report when data for the entire region is lacking, we draw on data specific to LA Metro.

Largely because of these data constraints, the case we build is circumstantial; we offer no definitive proof of cause-and-effect. But the evidence is nevertheless compelling. The primary factor we identify is automobile ownership. In the last 15 years, household vehicle access in the SCAG region has grown dramatically. Vehicle ownership has grown particularly sharply among subgroups most likely to use transit, such as the low-income and the foreign born from Latin America. The steep rise in vehicle access among these groups that occurred as transit ridership began to fall is not direct proof, but it is a smoldering if not a smoking gun. Public transportation is unlikely to fare well when Southern California is flooded with additional vehicles. Much of the region's built environment is designed to accommodate the presence of private vehicles and to punish their absence. Extensive street and freeway networks link free parking spaces at the origin and destination of most trips. These circumstances give people strong incentives to acquire cars, and — once they have cars — to drive more and ride transit less.

The surge in vehicle ownership does not explain all of the transit decline. And it may well have been reinforced by falling gas prices and the rise of TNCs— though again we note that increasing vehicle ownership and declining transit use began before TNCs existed and when gas prices were still high. But increased vehicle ownership by itself probably explains much of Southern California's lost transit ridership.

Our findings accord with previous research about transit patronage. Giuliano (2005) has shown that compared to Americans at large, the poor use transit more but like it less. The typical low-income rider wants to graduate to automobiles, while the typical driver might view transit positively but have little interest in using it (Manville & Cummins, 2015). These facts, coupled with the falling ridership of recent years, raise questions about transit's future.

Transit ridership is not, by itself, a legitimate goal of public policy. Transit use is instead a means to achieve other public ends. Traditionally, transit's goals have been twofold: Providing mobility to disadvantaged people who lack it, and mitigating the social and environmental costs of private automobiles by providing alternatives to them. The first goal has long accounted for more of transit's ridership, while the second

[2] The IPUMS data are from Ruggles et al (2017).

has accounted for more of its rhetoric. Throughout the United States, and particularly in Southern California, public transportation advocates have emphasized transit's potential to manage traffic and reduce pollution. In practice, however, transit has functioned overwhelmingly as a social service for low-income people with little private mobility (Taylor & Morris, 2015).

Because transit has primarily carried low-income people, rising vehicle ownership among those people suggests a future where public transportation's core ridership could dramatically shrink. While this outcome poses a grave problem for transit operators, it is not obvious that transit operators should try to win these low-income riders back, at least not to the very high levels at which they rode transit previously. With very few exceptions, acquiring an automobile in Southern California makes life easier along multiple dimensions, dramatically increasing access to jobs, educational institutions and other opportunities (Kawabata & Shen, 2006). As a result, pulling low-income former riders out of their cars and back onto trains and buses could make transit agencies healthier but the region poorer. If transit agencies want to protect their fiscal health while also increasing social welfare, they may need to convince the vast majority of people who never use transit to begin riding occasionally instead of driving. This task is unquestionably more difficult than serving a large pool of people who have few alternatives to transit. Convincing some drivers to start using transit would likely require weakening or removing some of the state's and region's entrenched subsidies for motor vehicle use. But transit is unlikely to grow substantially, to accomplish its environmental goals, if driving remains artificially inexpensive.

THE SPATIAL AND DEMOGRAPHIC DISTRIBUTION OF AMERICAN PUBLIC TRANSPORTATION

Public transportation use in the United States is distributed unevenly across people and places. Transit accounts for about two percent of all passenger miles travelled (PMT), and about two percent of personal trips overall (NHTS 2009). These small overall numbers, however, conceal transit's outsized importance to some people in some places. The average U.S. resident made about 32 transit trips in 2016 (Neff & Dickens, 2017; U.S. Census Bureau, 2016), but the modal resident made zero trips, and a small number of people rely on transit extensively. Chu (2012) shows that 20 percent of Americans live in neighborhoods without transit, while 60 percent live in neighborhoods with transit but have not used it in the previous month. Another 11 percent uses transit less than ten times per month, while eight percent take ten or more trips monthly.

The small share of people who use transit frequently is concentrated in a handful of metropolitan areas. In 2016, 65 percent of all transit boardings occurred on the nation's ten largest transit operators; the 15 systems in the New York region by themselves account for over 40 percent of the country's transit trips (FTA, 2016). Even within these transit-heavy areas, however, most people do not use transit regularly, because most transit use occurs in the central cities, and specifically among lower-income and foreign-

born people in these cities. And even within these subgroups, whose members are *more likely* to ride transit, *most* people do not use transit.

Why is transit use so rare? In the broadest terms, travelers will choose to ride transit when they believe transit has the lowest relative costs – in money, time, or risk and uncertainty – of the various transportation modes available to them. These factors help explain why so much transit use occurs in New York City. New Yorkers ride transit as much as they do not only because transit service is frequent and extensive, but also because riding a subway across Manhattan is often cheaper, faster and more reliable than driving. Manhattan's streets are clogged with unpredictable congestion and parking is scarce and expensive.[3] In most other places, driving is a faster door-to-door option, and one that people also believe is safer (Yoh, Iseki, Smart, & Taylor, 2011). Driving in these places is also more reliable: when congestion is low and transit service is sparse, riding transit might involve more time waiting at stops and transferring between vehicles, which make trips seem unpredictable, complicated and burdensome (Iseki & Taylor, 2009). For this reason, outside New York and a handful of other urban places, most transit users are people who for various reasons do not have the option of travelling by car.

The fact that so few people use transit regularly is important but often overlooked, especially in discussions about why ridership might fall. Per capita transit use can fall when current riders ride less, when the number of people who never ride grows, or both. Strictly speaking, there is no difference between these root causes. A person who rides and stops is a lost transit rider, but so is a person who moves to a transit service area and never rides. The decision to stop and the failure to start both reduce per capita transit use.

In practice, however, concerns about falling per capita ridership are rarely concerns about new residents who never start riding, and are instead concerns about current riders who leave. This dynamic is understandable, as riders who leave are easier to notice. But it is important to remember that transit riders leave transit regularly, even when ridership is stable or growing. If riders who leave are replaced by others, their departure from transit is less noticeable, and ridership might remain unchanged. For that matter, ridership can remain unchanged even when riders leave and are *not* replaced by other people. If an existing rider stops taking her daily trip and drives instead, but another frequent rider adds a daily trip, the number of riders falls but per capita ridership does not. Conversely, if two riders who take three trips a day each start taking two, the number of riders won't change but ridership will. Riders are not equivalent to ridership; stable ridership can conceal large churn among riders, and vice-versa.

The Spatial Concentration of Transit in California and Southern California

As it is in the nation at large, public transit use in California is unevenly distributed: a small share of people and places account for a large share of overall rides. Northern Californians use transit more intensively than Southern Californians, largely as a result of high ridership in San Francisco and its surrounding areas, but most of California's transit use occurs in Southern California, where a majority of the state's

[3] Manhattan also has relatively few highway lane-miles, which contributes to its surface-street congestion.

population lives (Figure 1). Transit accounts for 6 percent of all trips in the Bay Area, as opposed to 5 percent in the SCAG region, but the SCAG region – because it is so large – accounts for 52 percent of California's transit trips, while the Bay Area accounts for 28 percent. Southern California thus exerts a large influence on California's overall transit use.

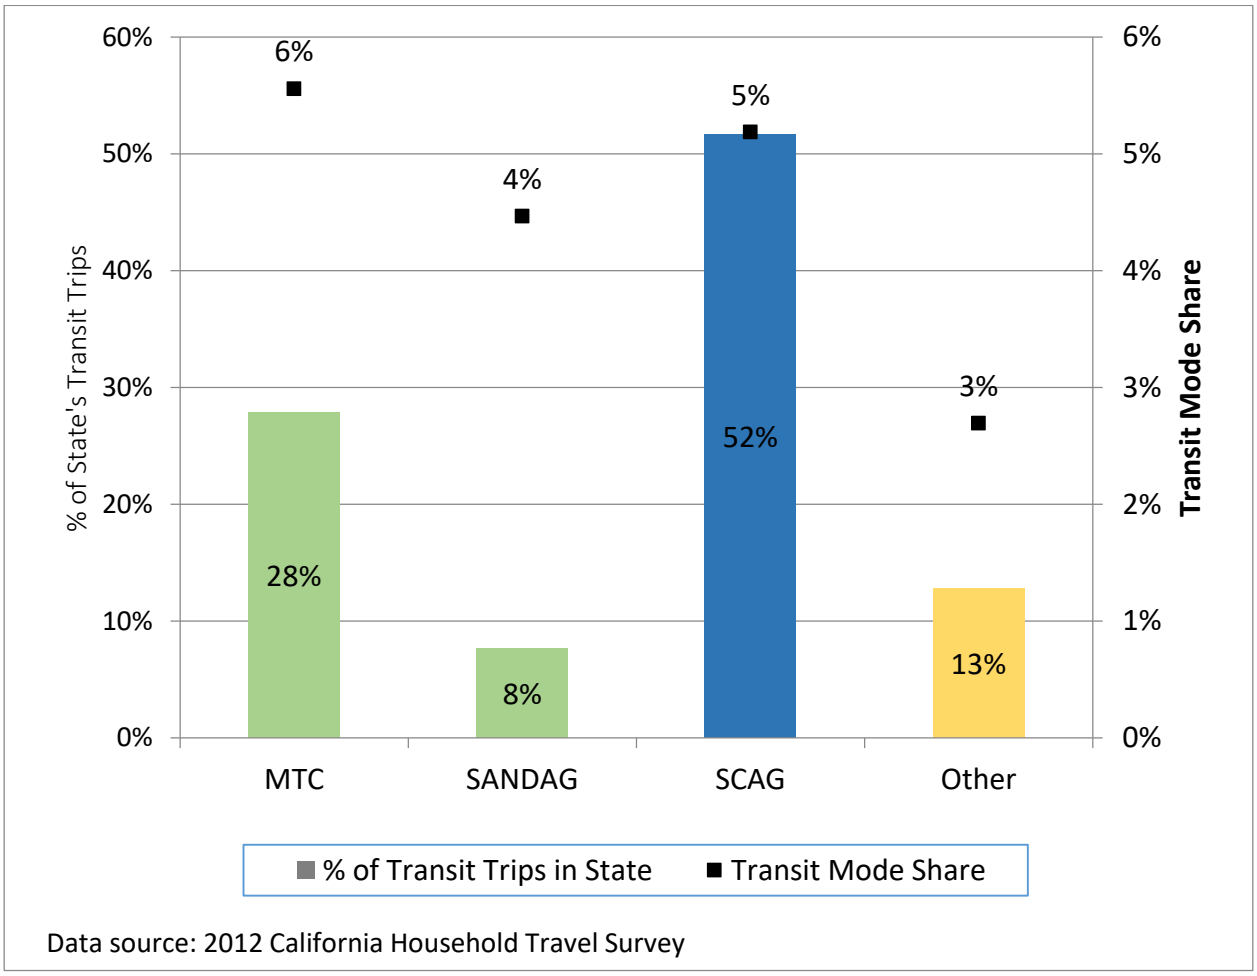

Figure 1. Transit mode share and distribution of transit trips by California region.

Figures 2 and 3 show the trend in transit boardings nationwide, in California, and the SCAG region between 2000 and 2016, first in absolute and then in relative terms. Absolute ridership was largely flat over this time in all three geographies. In relative terms ridership grew steadily between 2004 and 2007 (SCAG region), 2008 (the U.S.), and 2009 (California). This period of growth was followed by patronage losses from the start of the Great Recession through 2011, particularly in California. The recession's end brought a gradual transit patronage recovery, followed by steep declines from 2014 onward.

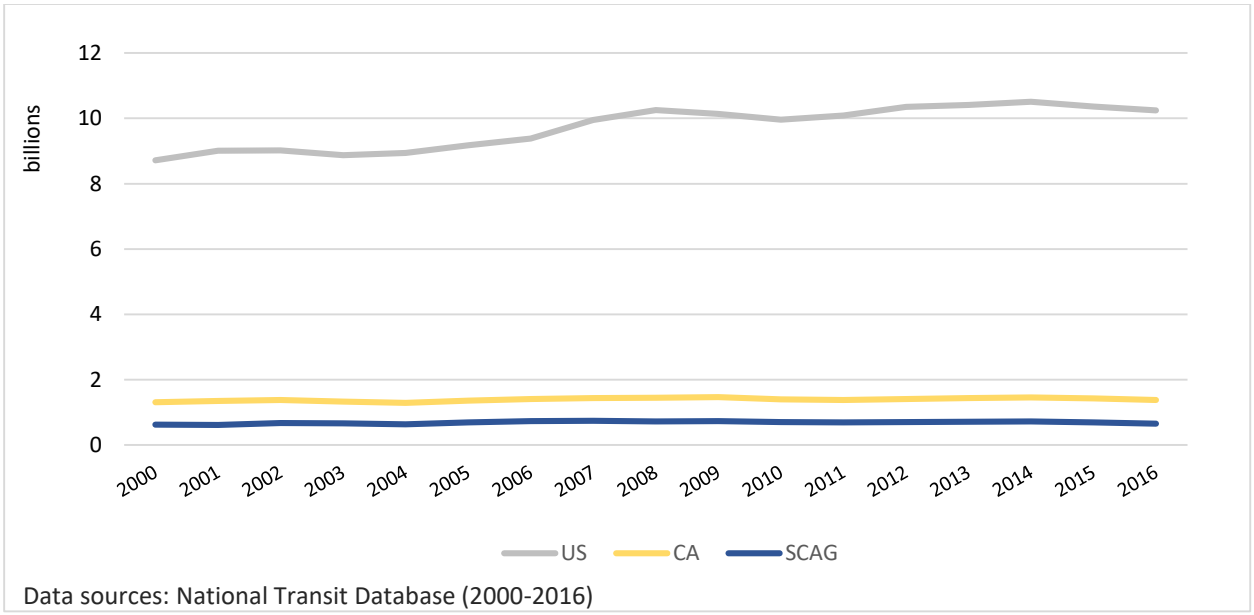

Figure 2. Boardings *(unlinked passenger trips). Growing nationwide, but relatively flat in California and SCAG.*

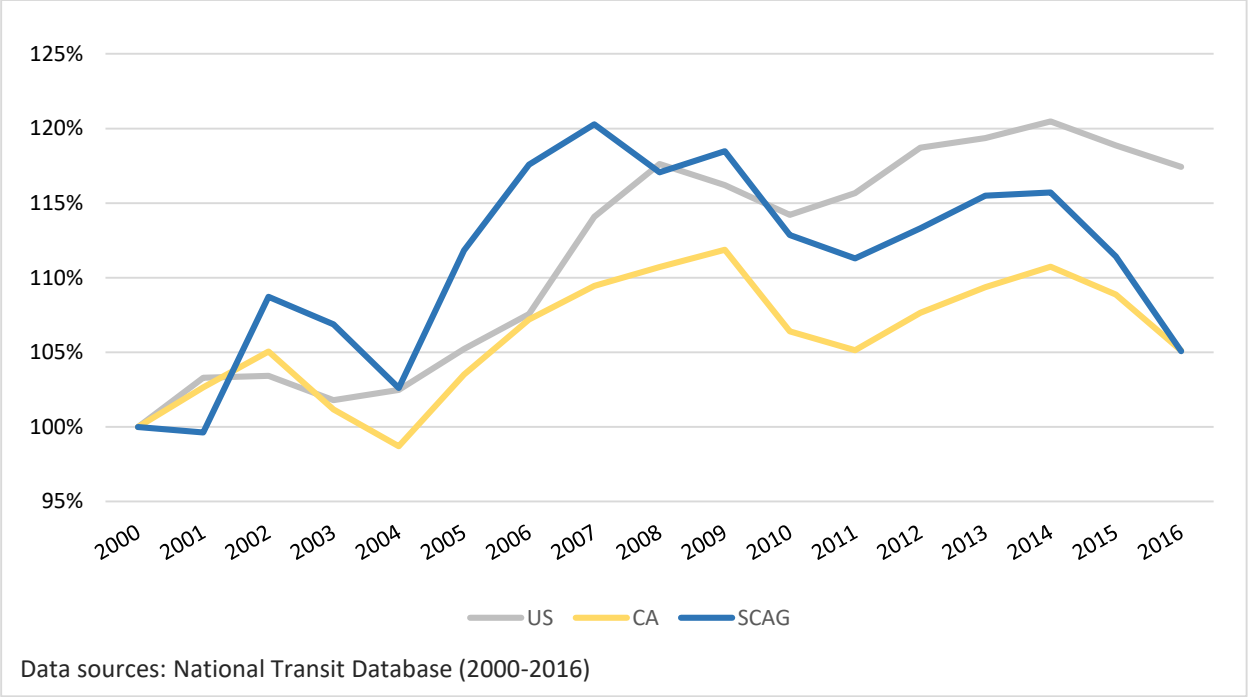

Figure 3. Indexed boardings. *Growing nationwide, but California and SCAG face steeper declines, returning to 2000 levels.*

Figure 4 expresses these ridership trends in per capita terms. Between 2005 and 2016, per capita ridership peaked in California in 2009, in the nation in 2008, and in the SCAG region in 2007. Since 2007, per capita transit use in the SCAG region has been mostly falling—before the recession, the rise of Lyft and Uber, or the post-2012 drop in fuel prices.

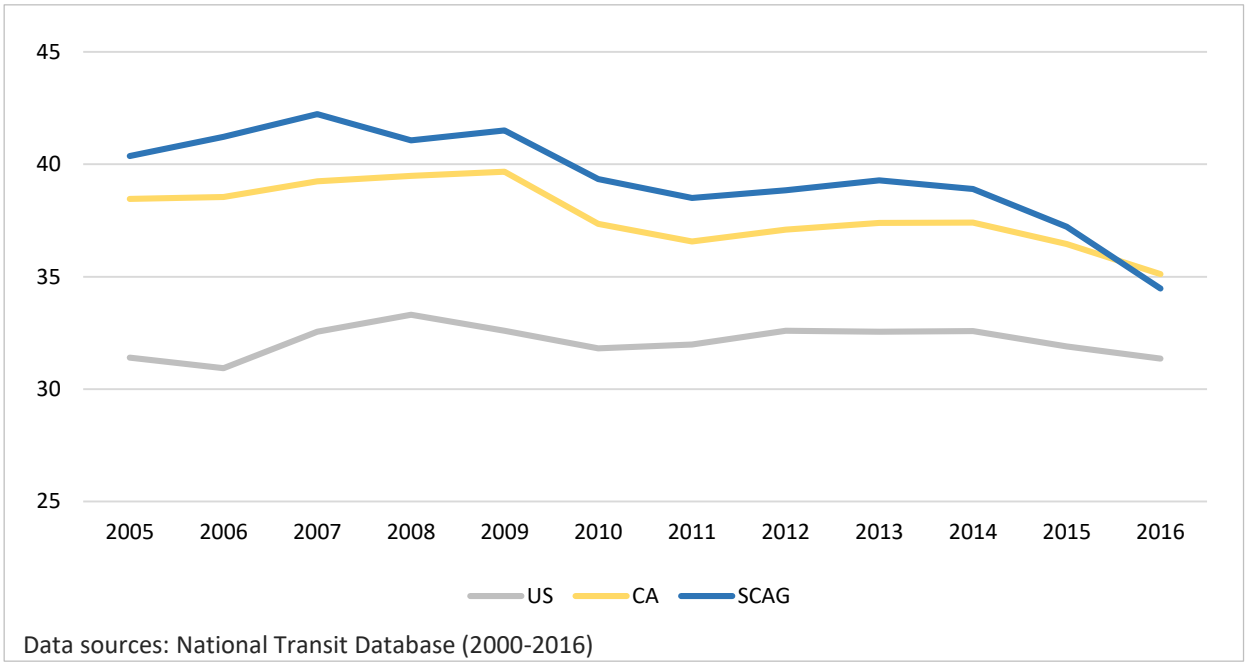

Figure 4. Transit trips per capita. *Relatively flat nationally, but down in California since 2009.*

Because the SCAG region accounts for so much of California's ridership, and because in recent years its decline has been so steep, losses in the SCAG region from 2012 to 2016 actually account for all of California's ridership losses during that time. Figure 5 shows changes in transit ridership across California from 2012 to 2016. During this time annual transit boardings statewide fell by 62.2 million. The SCAG region, however, lost *72 million* annual rides, or 120 percent of the state's total losses. Ridership outside the SCAG region actually rose 20 percent, largely as a result of gains made by transit systems in San Francisco. The Bay Area Rapid Transit District (BART) alone accounted for 28.4 percent of the state's increased transit ridership (although by 2017 ridership on BART, and in California outside the SCAG region, had also started to fall).

Figure 5. CA net change in ridership (2012-2016). *Losses in CA are driven by losses from the largest operators in the SCAG region, while Bay Area region saw growth in ridership.*

Within the SCAG region, transit trips (and lost trips) are similarly geographically concentrated. We can illustrate this concentration in a number of ways. For example, the CHTS shows that in 2012 82 percent of the transit trips in the SCAG region were in Los Angeles County. Another 8 percent were in Orange County, and the remaining ten percent were spread over the other four counties.

A second way to measure concentration, which allows us to examine smaller levels of geography, is to use census data and map the location of the region's transit commuters. While commuters are not the majority of transit riders, they do tend to use transit frequently and intensively, and we have high-quality data about their residential locations. Those locations are intensely concentrated. In 2000, 2010, and 2015, 60 percent of the SCAG region's transit commuters lived in 20 percent of its census tracts, which represented (depending on the year) one to three percent of the region's land area. In all three years, ten percent of the region's transit commuters lived in one percent of the region's census tracts, which accounted for two-tenths of one percent (0.2%) of the region's land area.[4] (Note that even in these tracts, *most* workers do not commute via transit – 7 out of 10 use some other means.) Unsurprisingly, these tracts are overwhelmingly located in LA County, followed by Orange County.

A third way to illustrate the concentration of transit use is to examine transit trips by operator. Figure 6 shows that the ten largest transit agencies in the SCAG region account for 60 percent of all transit service

[4] Calculated from summary file data of the Decennial Census 2000, and the 2010 and 2015 ACS.

(measured in vehicle-revenue hours), and 80 percent of all transit trips. The smallest 60 transit operators, by contrast, account for just over 6 percent of service and just over two percent of trips.

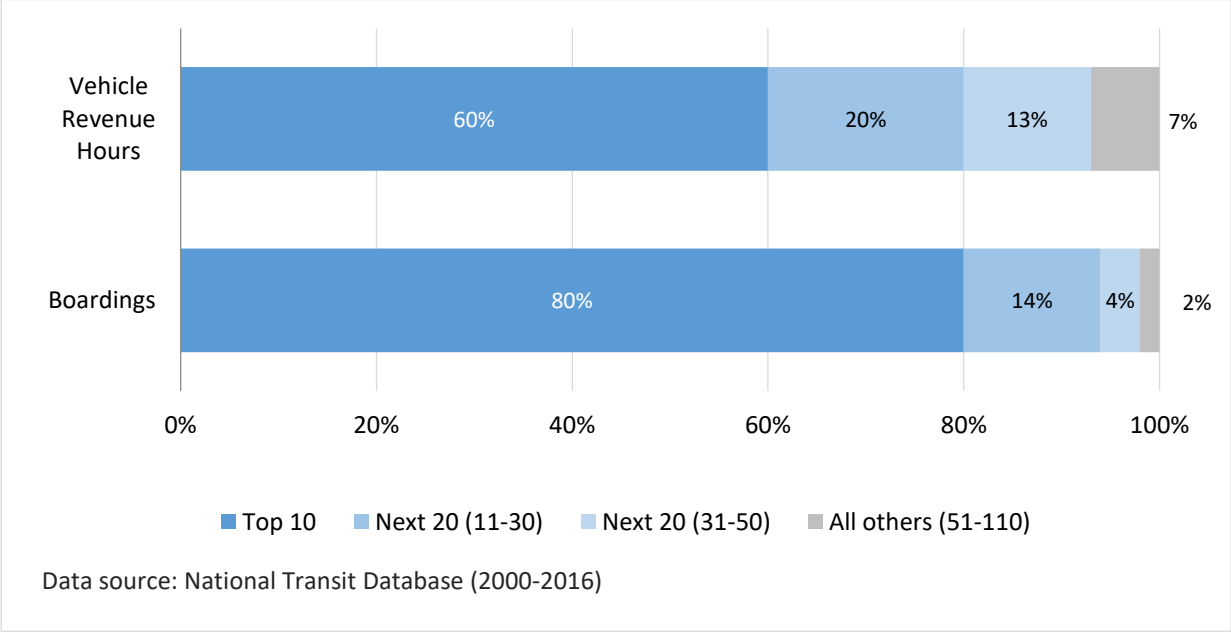

Figure 6. Key metrics by operator grouping. *9% of operators carry 80% of the trips*

Digging still deeper, the distribution of service and trips within these large operators is also highly skewed. LA Metro accounts for most of the SCAG region's trips, and LA Metro's ridership is itself highly concentrated. The agency has over 100 transit routes, but in both 2012 and 2016 over half of its total rides took place on 20 of those routes.[5] Metro's busiest routes are also, unsurprisingly, where the agency has suffered the largest ridership declines. A dozen Metro lines accounted for 53 percent of all the agency's lost rides between 2012 and 2016.

Putting all this information together, we see that declining transit patronage through 2016 in California is essentially declining patronage in Southern California, and that Southern California's ridership declines are themselves remarkably concentrated. As a result, the state's lost ridership can be traced to a small number of Southern California transit operators. Four SCAG operators (LA Metro, the Orange County Transportation Authority (OCTA), the Los Angeles Department of Transportation (LA DOT), and the Santa Monica Big Blue Bus) accounted for 88 percent of the state's ridership losses, and LA Metro by itself accounted for a remarkable 72 percent of the state's losses. Because LA Metro's losses are themselves highly concentrated, a dozen *routes* from LA Metro account for 38 percent of all the lost ridership in California. Half of California's total lost ridership is accounted for by 17 LA Metro routes (14 bus and 3 rail lines) and one OCTA route.

[5] Calculated from Metro ridership-by-line data, 2012 and 2016.

If we examine these routes more closely (Figures 7 and 8), we see that they include both bus and rail. Transit agencies nationwide – LA Metro included – have made substantial investments in rail service, but the bus remains the workhorse of public transit in the US, the SCAG region and LA County. Bus trips are 78 percent of all transit trips in California and 86 percent of transit trips in the SCAG region.[6] Given that buses carry the most passengers, it is not surprising that they have also seen the largest ridership declines, accounting for 84 percent of the lost rides between 2012 and 2016. While some bus routes gained ridership, the bus routes that lost riders lost more than the growing routes gained. The five bus lines with the largest declines were urban routes that travel in and out of downtown LA, while the five lines that gained the most ridership ran more outlying and circumferential routes.

Two Metro rail lines, meanwhile – the Gold and Expo – opened extensions after 2012, and partly as a result their ridership grew. But Metro's remaining rail lines, most of which also travel into downtown LA, saw steep ridership losses that exceeded the Gold and Expo Line's gains. The SCAG transit decline thus spans modes; it is not a simple story of buses falling behind while rail surges. Instead major routes that run into the heart of the city – the sort of routes where transit is traditionally strongest – are losing riders precipitously.

[6] Calculated from the 2012 California Household Travel Survey.

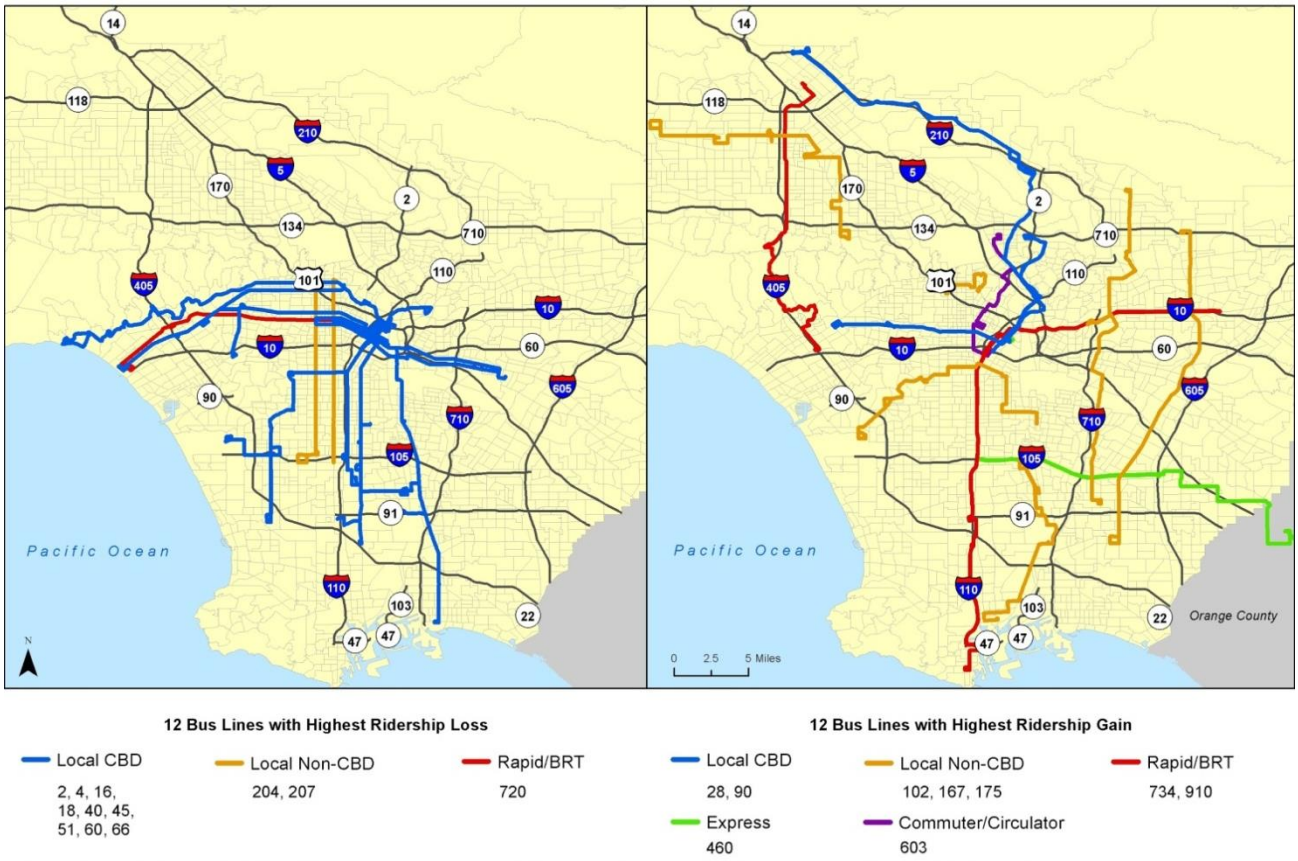

Figure 7. LA MTA: Bus lines with the most ridership change (2012-2016).

Figure 8. LA MTA: Net change in Ridership (2013-2016) by mode. *Buses made up 84% of loss and rail made up 12%.*

The Demographic Concentration of Transit Use in Southern California

Transit use in the SCAG region is concentrated among a small group of people as well as a small number of places. People ride transit for different reasons, but a common thread running through regular transit users is lack of access to a private vehicle. This trait is not universal; many commuter rail passengers, for example, could make their trips by car and choose not to, but commuter rail is a small portion of overall transit ridership. In general, transit ridership is powerfully associated with lack of vehicle access (Taylor & Fink, 2013). Note again, however, that this relationship is not symmetrical. While most regular transit users lack vehicle access, most people without vehicle access do not regularly use transit, in part because transit is unavailable in many places.

Lack of vehicle access might arise for economic reasons, for medical reasons, or out of personal preference or habit (Brown, 2017). The relationship between vehicle access and transit use could also run two ways. People might ride transit because they do not have a car (either they cannot afford a car or cannot use

one for medical or legal reasons) or they may not have access to a car *because* they ride transit (they live and work near high-quality transit and so need not spend money on vehicles).[7]

Non-economic reasons for lacking a vehicle include disabilities or medical conditions that prevent driving, and legal sanctions that forbid it (e.g. losing a license as a result of traffic infractions, or being in the country illegally). In Southern California, perhaps the largest non-economic source of low vehicle access is immigration. Even controlling for income, immigrants are less likely than the native born to have vehicles, and more likely to use public transportation. Why this is so remains something of a puzzle. Scholars have proposed various explanations, including immigrants' tendency to live in dense areas; their tendency to live in close-knit communities that allow for more communal resources, including sharing of cars; a habit of not driving carried over from the native country; and – if the immigrant is undocumented – legal barriers to owning and operating automobiles (Blumenberg & Smart, 2014; Chatman & Klein, 2009, 2013; Liu & Painter, 2012). The evidence suggests, however, that driving less and riding transit more is not universal among the foreign born – immigrants from some countries, particularly Mexico and many countries in Central America, are less likely than others to drive and more likely to ride (Chatman, Klein, & DiPetrillo, 2010). There is also substantial evidence that over time immigrants assimilate and begin to travel more like the native born, with more driving and less transit use (Blumenberg & Evans, 2010). Thus transit ridership cannot be sustained by immigration alone; it requires a steady stream of new immigrants from particular countries, who will arrive with a transit habit and replace those earlier arrivals who assimilate driving.

Economic reasons for lacking vehicle access can include both low incomes and the high cost of driving. In some parts of California, such as northeastern San Francisco, a combination of heavy congestion, high tolls, and scarce and expensive parking make the price of owning and operating a vehicle high, and encourage even affluent people to ride transit (notably, the same density that makes the city congested can makes transit service more effective by putting large numbers of trip origins and destinations within steps of transit stops). Yet there are few places in Southern California where driving is challenging in this way. Congestion is severe, but parking is abundant and often inexpensive if not free, and low-to-moderate densities make transit less able to effectively link many places. As a result, income becomes the principal determining factor in vehicle access, and thus of transit use.

Figure 9 uses CHTS data to illustrate the disproportionate propensity to use transit among the low-income, the foreign-born, and households with limited vehicle access. The figure's dashed vertical line represents the overall average of daily unlinked transit trips in the SCAG region, and the circle associated with each subgroup indicates its relative size in the overall population. The figure shows, in short, that transit use is more common among smaller segments of the population. African Americans and Hispanics ride transit about three times as much as Whites and Asians. Immigrants who have been in the country less than ten years ride substantially more than both the native-born and longtime immigrants who have been in the country longer. Households earning under $25,000 per year ride more than twice as much as households earning $25,000 to $50,000, and these households in turn ride twice as much as households earning over $50,000 annually. By far the largest differences, however, are those that represent vehicle availability. Households without vehicles take almost five times as many transit trips as households with one vehicle,

[7] These reasons might interact. People who cannot afford vehicles might choose to live near transit because of their lack of vehicle access (Glaeser, Kahn, & Rappaport, 2008).

and households with one vehicle take twice as many trips as households with two. If we measure vehicles per adult, households with one vehicle for every two adults take twice as many trips as households with one vehicle per adult. Finally, people without driver's licenses take many more transit trips than licensed residents.

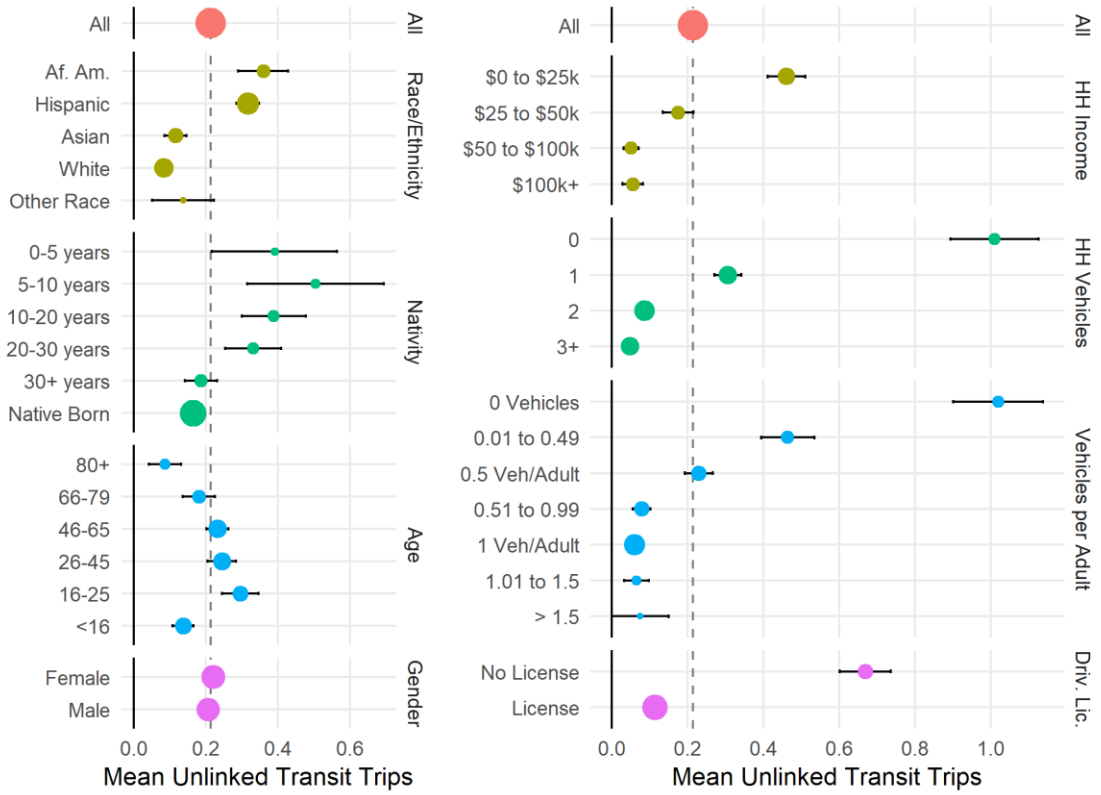

Figure 9. Mean transit trips by socio-economic characteristics and automobile access (CHTS).

The drawback of the CHTS, as we have mentioned before, is that it provides only one year of data. Table 1 uses LA Metro's annual rider surveys to show that the prevalence of people with low incomes and limited vehicle access on transit extends across years. We examine the 2005 survey (the earliest available) and then annual surveys from 2010 to 2016. Across both bus and rail riders, at least 69 percent of transit users (and often closer to 80%) report not having a vehicle available to make their trip. These proportions are higher for bus riders than rail riders, but even among rail riders between 58 and 65 percent (depending on the year) report not having a vehicle. The share of riders reporting not having a vehicle, furthermore, has grown over time.

In addition to limited vehicle access, Metro riders generally have low incomes and are strongly dependent on transit. Close to half of all surveyed LA Metro riders in each year have household incomes under $15,000. The median household income of riders hovers near $16,000, and the average income barely exceeds $25,000 in most years. In most years a strong majority of riders are habitual (riding over 4 days a

week) and a majority are longtime users (riding over 5 years). The riders are also overwhelmingly nonwhite.

All these characteristics make Metro riders – who are, again, most of SCAG's transit users – strikingly different from the population at large. The CHTS shows that in 2012, 73 percent of LA County residents took transit only occasionally or never, and the 2016 Census ACS shows that LA County residents are 26 percent non-Hispanic white, and that county median household income is $62,000. Only 5 percent of the county's households earn less than $15,000 per year. Thus SCAG's largest transit operator has for over a decade been dominated by low-income, nonwhite people with little vehicle access, people who live and move very differently from the typical Southern Californian.

Source: Metro Rider Surveys. Not all questions asked every year. Dollars are nominal. "No vehicle" indicates that respondents lack access to a vehicle for the current trip.

Table 1. Characteristics of LA Metro riders, 2005-2015.

The importance of vehicle access is reinforced by evidence from other transit operators. A small operator in the SCAG region, the Montebello Bus Lines, surveyed residents (not just riders) in 2016. Most respondents did not ride transit, and 55 percent of non-riders said they would only ride if they lost access to their car. Most people who did ride did not have access to a vehicle (Diversified Transportation Solutions 2015). In 2016, the OCTA also surveyed Orange County residents about their travel behavior. The results were similar. Only three percent of people who always had vehicle access listed transit as their primary travel mode, compared to 33 percent of people who never had a vehicle (True North Research 2015).[8]

The OCTA survey also stands out for usefully disaggregating "lack of vehicle access," and demonstrating that vehicle access is not the same as vehicle ownership. Over 70 percent of OCTA transit users had a car in their household, but the car was not available to them. In most instances it was being used by someone else, but 19 percent of current riders were unable to drive, and another eight percent reported having a vehicle that was not working (True North Research 2015). People in households with vehicles can still lack

[8] Note that 2/3 of people without vehicle access still did not use transit regularly.

vehicle access. If a household has more adults than vehicles, and if most adults move around on most days, then someone is without a car, and the odds of using public transportation rise.

We emphasize again, however, that most people simply do not use public transportation very often. The four panels of Figure 10 use 2012 CHTS data to divide the California, Southern California, and LA County populations into three groups: *Transit Commuters* (respondents who use transit for the journey to work); *Transit Non-Commuters* (respondents who used transit in the week prior to the survey but do not use transit for the journey to work); and *Infrequent Transit Users* (respondents who do not use transit for the journey to work and did not use it in the previous week).

In general, and unsurprisingly, transit use is more intensive in the SCAG region than in California, and more intensive in LA County than in the SCAG region. Beyond this difference, the patterns relating to these three types of users are generally consistent across the three geographies. *Transit Commuters*, who garner perhaps the most attention from public officials and transit planners, ride most frequently (44 to 49 trips per month), but are a very small share (2% to 3%) of the population; as a result, they account for just 25 percent to 30 percent of all transit trips taken, despite their frequent use. *Transit Non-Commuters* ride transit less frequently (11 to 16 trips per month) than *Transit Commuters,* but account for a much larger share (20% to 23%) of the population, and as a result they actually account for over half (54% to 57%) of all transit trips. Finally, *Infrequent Transit Users* ride little or not at all, averaging only 0.9 to 1.5 trips per month across the three geographies. This group, however, comprises about three-quarters (73% to 78%) of the population, and because of this large base, *Infrequent Transit Users* account for better than one in seven (16% to 18%) of all transit trips.

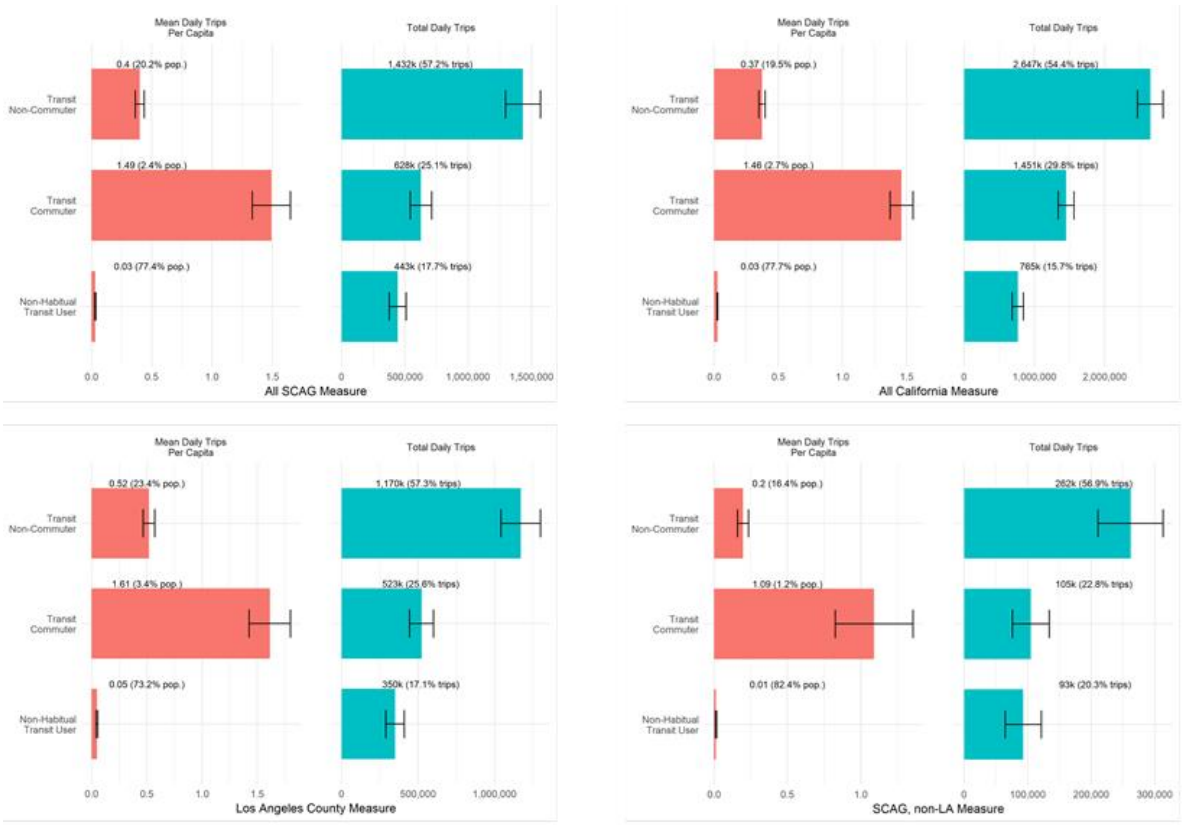

Figure 10. Mean and total daily trips by transit user group for the SCAG region, California, Los Angeles County, and non-Los Angeles SCAG region.

This snapshot of transit users is a picture of asymmetry, and this asymmetry suggests how transit ridership can fall dramatically and seemingly suddenly. The people who ride transit regularly are a narrow segment of the population. They come disproportionately from households with two or more adults per available vehicle, and especially from households with no vehicles. They have lower incomes, on average, and are more likely immigrants, young adults, and African-American or Latino. Many of them do *not* ride transit to or from work; transit commuters are just three percent of the population, and 13 percent of regular transit riders. The transit industry is thus heavily-dependent on a small subset of people, and very sensitive to even small changes in how those people choose to move around.

EXAMINING SOUTHERN CALIFORNIA'S DECLINE IN TRANSIT USE

Transit ridership can fall for multiple reasons. For convenience we divide these reasons into two categories: factors that transit operators (funding permitting) can control, and factors they cannot. We take these up in turn.

Factors Within Transit Operators' Control

The Quantity and Quality of Transit Service

People will ride transit less if service is slow, infrequent, or unreliable, and/or if rides are difficult or dangerous to take. As the quantity or quality of service falls, ridership should fall as well.

The Quantity of Transit Service

Some observers contend that recent drops in transit ridership can be tied directly to declining service quantity. For example, Hertz (2015) ties falling transit ridership to cuts in bus service, and articles in both the Wall Street Journal (Harrison, 2017) and New York Times(Rosenthal, Fitzsimmons, & LaForgia, 2017) make similar arguments. Freemark (2017) argues that LA's declining bus ridership is a function of Metro's falling service levels, and observes that average bus speeds fell 13 percent between 2005 and 2013.

Service levels certainly have a strong influence on ridership, even controlling for reverse causality – the fact that places with more riders often add more service (Alam, Nixon, & Zhang, 2015; Taylor, Miller, Iseki, & Fink, 2009). But service levels can be measured in many ways; two of the most common metrics are vehicle revenue miles (VRMs) and vehicle revenue hours (VRHs). VRM measures the distance transit vehicles cover while in service, while VRH measures the amount of time vehicles are in service. Both Hertz (2015) and Harrison (2017), in relating falling ridership to service declines, measure service using VRM. VRM alone, however, can be a problematic measure of transit service. In practical terms, VRM differentiates faster, longer-distance commuter services from lower speed local service. VRH, in contrast, measures the supply of different kinds of services (local bus service, bus rapid transit, rail transit, express bus, commuter rail, etc.) more similarly. VRH differentiates less among modes and service area types because the time between stops often varies far less than the distance travelled between them. A dozen stops spaced far apart in uncongested outlying suburbs can take a similar amount of time to serve as a dozen closely-spaced stops in a congested urban environment. The miles covered on the two routes will vary greatly, but the time required to serve them may not.

As a result, falling VRM *can* indicate service cuts, but can also reflect transit vehicles operating in higher levels of congestion, or agencies increasing local service rather than express service, or agencies redirecting service from outlying areas to central areas.

For example, if a transit agency shifts service from outlying suburban routes that travel longer distances at higher speeds to shorter, slower urban routes, VRM would almost certainly fall, as would average speed. But VRH may not change. Vehicles moved to dense areas typically cover less ground, but also move more slowly, stop more frequently, and dwell longer at each stop to allow more people to board and alight. In this case a "cut" in VRM would not necessarily be associated with a cut in VRH, and could actually deliver more service to more people.

In short, falling VRM is hard to interpret without also examining VRH. If VRM and VRH fall at roughly the same rate, then service is likely falling absolutely. But VRM falling substantially more than VRH suggests a change in service deployment or operating conditions (such as worsening congestion), rather than a service cut.

With this as background, we can consider the SCAG region's recent trends in VRM and VRH; we will show that rates of change in VRM and VRH have generally not been in concert. Figure 11 shows the relative trends in total VRM for the US, California, the SCAG region, and the SCAG region excluding LA Metro or OCTA between 2000 and 2016.

While VRM has increased across all four geographies, it has grown faster in the SCAG region than the U.S. or California as a whole, and faster still among SCAG's smaller transit operators – suggesting a relative shift in service delivery from LA Metro and OCTA to the smaller operators.

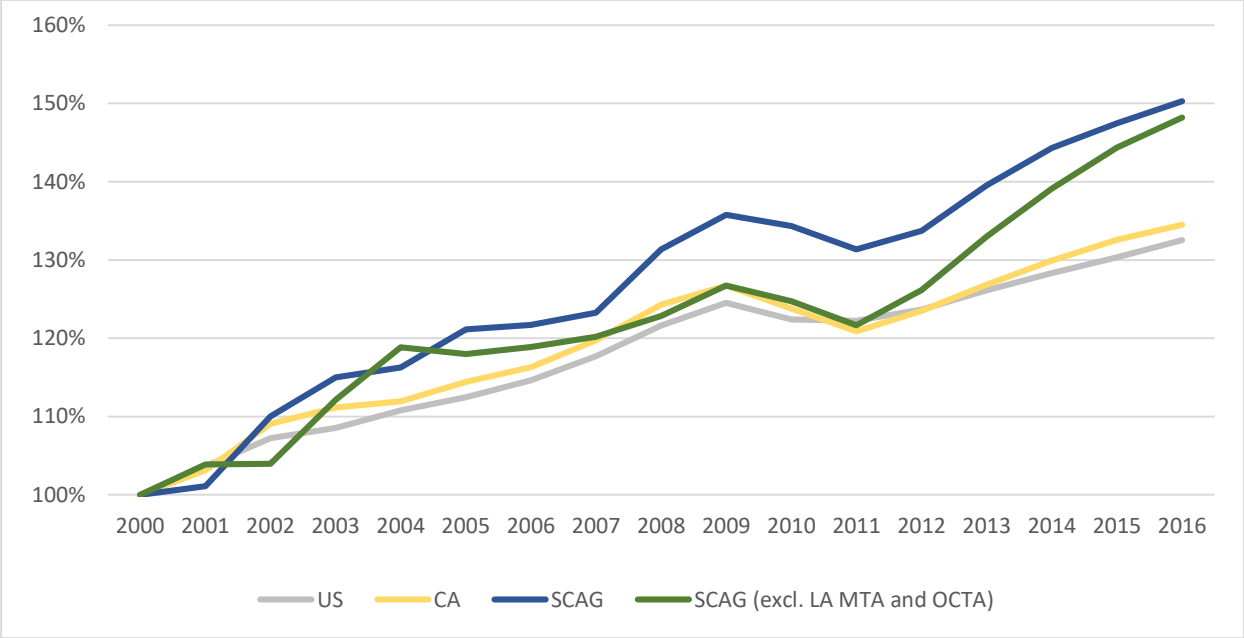

Figure 11. Indexed vehicle revenue miles. *Growth in service in the SCAG region outpaces national and state trends; within the SCAG region, all other operators have collectively added service at a faster rate than LA MTA or OCTA.*

This pattern is confirmed if we examine absolute VRM trends in the SCAG region separately for LA Metro, OCTA, and the remaining SCAG operators (Figure 12). Overall transit VRM has been growing for all three groups, but growing faster at the smaller operators.

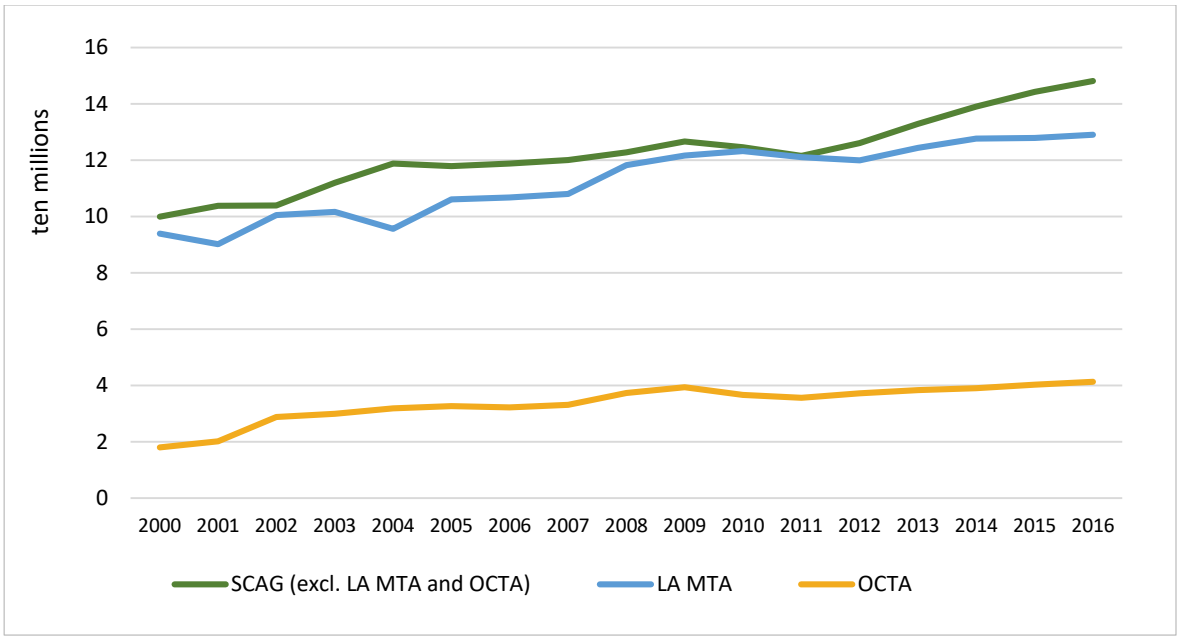

Figure 12. Vehicle revenue miles. *Service levels for LA MTA matches aggregate service provision for all other operators in the region (minus OCTA). Service is growing faster in the SCAG area excluding LA MTA and OCTA than at LA MTA or OCTA.*

While VRM rose in the aggregate from 2000 and 2016, it has not been climbing for all modes. Figure 13 shows the roller coaster that has been the VRM trend for local bus service over this period: Significant growth between 2000 and 2005, little change between 2005 and 2009, a steep drop between 2009 and 2013, and slow growth from 2014 to 2016. Rail service, in contrast, has been steadily rising, especially light rail (Figure 14).

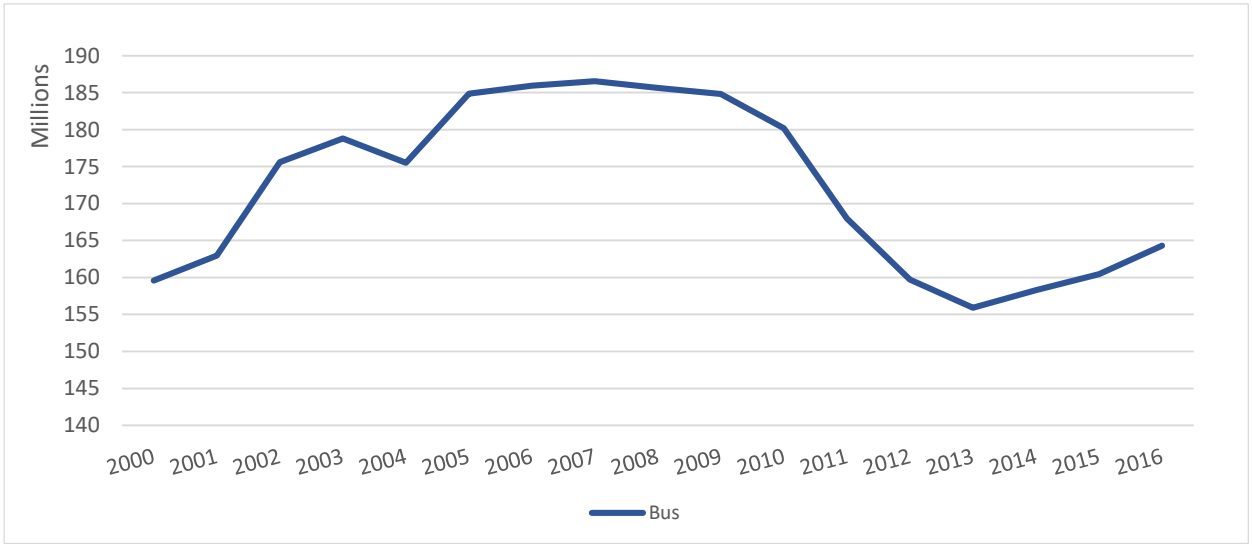

Figure 13. SCAG region: VRM for bus. *Service in miles traveled dropped by 15% between 2007 and 2013. Service has increased since. Hours of service has also declined, but not as rapidly as miles of service, indicating that service is cut on suburban bus lines.*

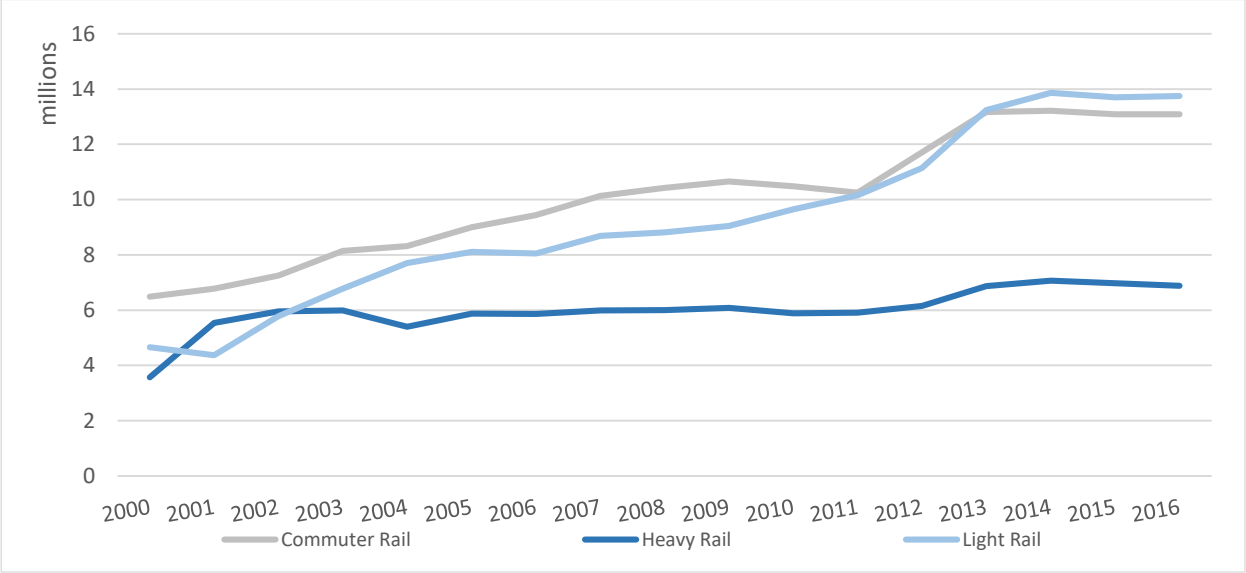

Figure 14. SCAG region: VRM for rail. *Substantial service increases for all commuter and light rail since 2000.*

If we examine service hours (VRH), we see similar aggregate trends. VRH rose from 2000 to 2009 in the US, California, and the SCAG region, fell from 2009 to 2011 during the Great Recession, and then climbed again across all three geographies through 2016 (Figure 15).

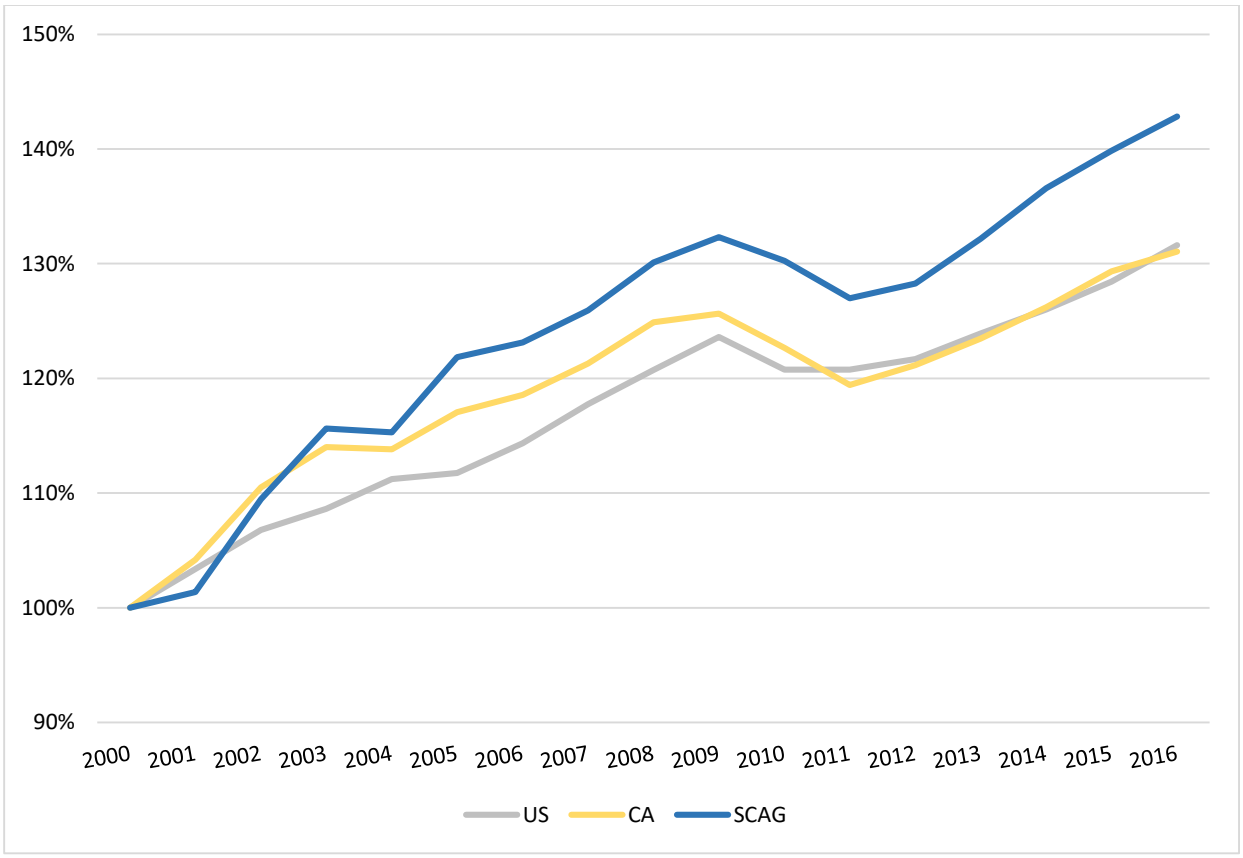

Figure 15. Indexed vehicle revenue hours. *Growth in service in the SCAG region outpaces national and state trends.*

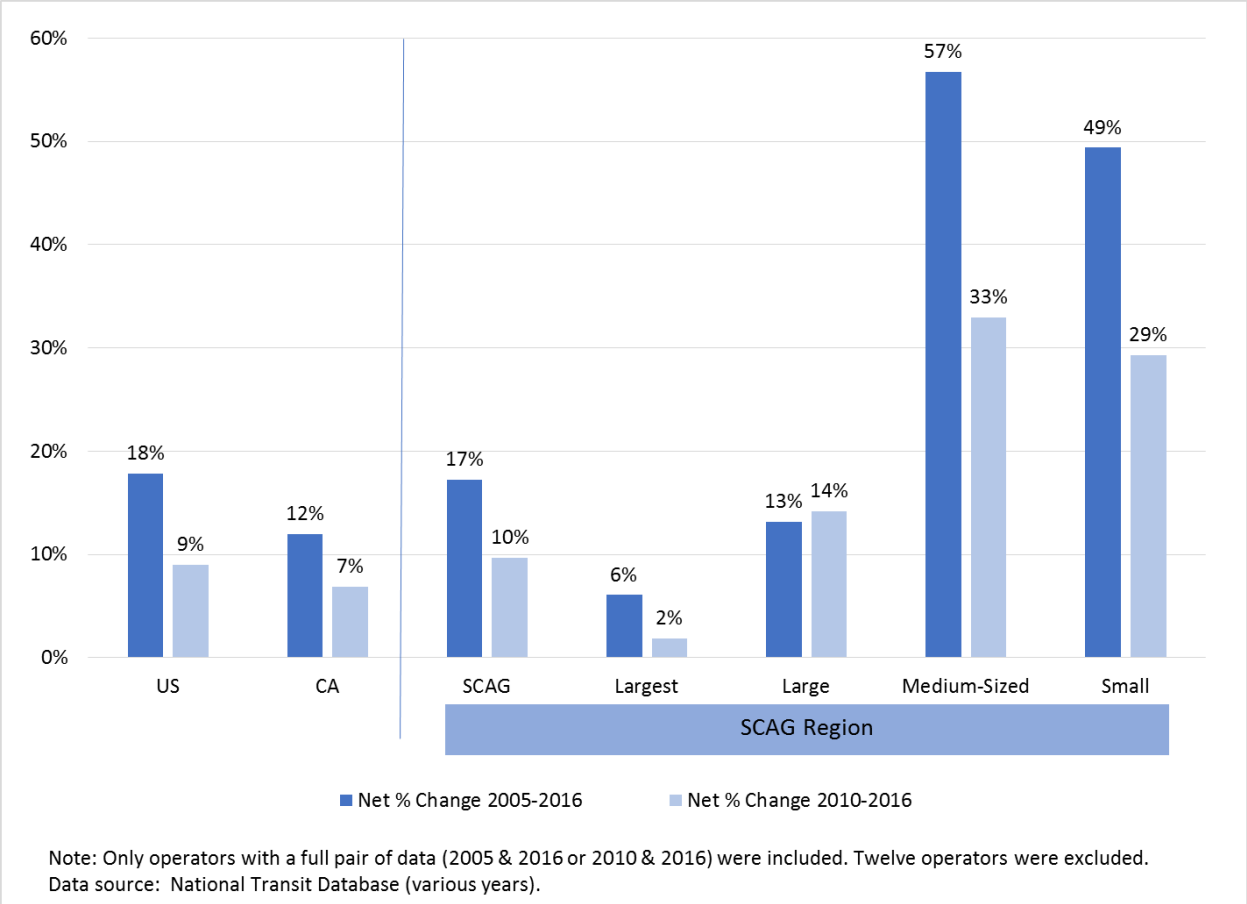
Figure 16 shows the percent change in vehicle revenue hours over two time periods – 2005 to 2016 and 2010 to 2016 – across three geographies (US, California, SCAG region) and across four types of SCAG-region transit operators (Largest, Large, Medium, and Small). The figure shows that VRH increased during both time periods across all three geographies and all four operator types. It also shows, however, that VRH grew least among the largest operators that have lost the most riders, while it increased much more among the smaller operators.



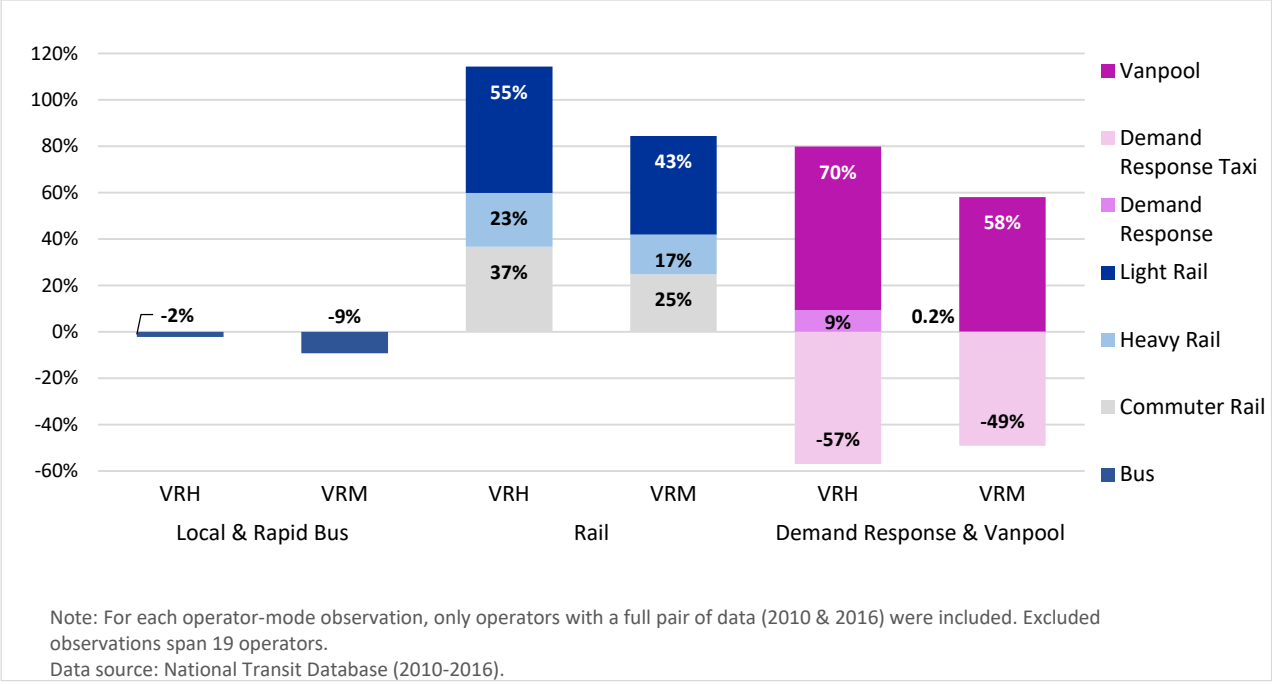


Figure 16. Changes in indexed vehicle revenue hours by region and SCAG transit operator size: 2005-2016 & 2010-2016. *Service growth among the largest SCAG operators was lower than national, state, or regional averages, and much small than smaller SCAG-region operators.*

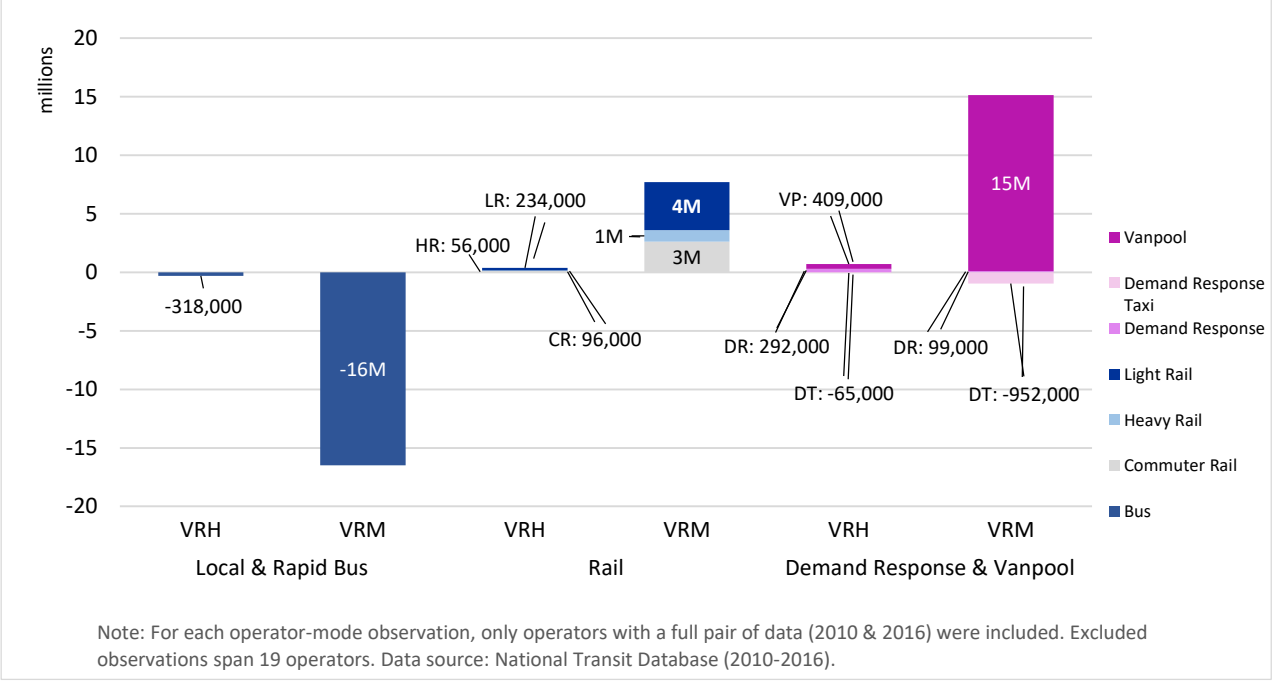

Finally, Figures 17 and 18 show the absolute and relative changes in VRM and VRH by mode between 2010 and 2016.[9] The figures show substantial overall shifts in service among modes, with local bus, rapid bus and demand response taxi service declining, while rail, commuter bus, and vanpool service increased. In absolute terms, local and rapid bus service declined most, while commuter bus and vanpool grew most; in relative terms, rail transit grew most while demand response fell most.

[9] Note that because Figure 17 shows absolute changes in both VRM and VRH on the same Y-axis, the VRM changes appear to be substantially larger than the proportional differences shown in Figure 16. These apparently large differences are mostly an artifact of transit service moving anywhere from about 6 (for the slowest urban bus service) to 40 (for the fastest commuter rail service) miles per hour, on average. This means that, for example, a one million VRH increase might be expected to have a corresponding 10 million or more VRM increase.

Note: For each operator-mode observation, only operators with a full pair of data (2010 & 2016) were included. Excluded observations span 19 operators.
Data source: National Transit Database (2010-2016).

Figure 17. Percent change in service (hours and miles) by mode: SCAG region 2010-2016. *Rail and vanpool have largest % gains, and service is added in the urban core, rather than to outlying areas. Bus service hours were slightly reduced, and came from outlying areas.*

Note: For each operator-mode observation, only operators with a full pair of data (2010 & 2016) were included. Excluded observations span 19 operators. Data source: National Transit Database (2010-2016).

Figure 18. Change in service (hours and miles) by mode: SCAG region 2010-2016. *A 9% reduction in bus service miles is equivalent to 16.5 million bus service miles cut. Vanpool had the most service miles added, reflecting the longer commutes that vanpool serves.*

Overall, these shifts in service provision reflect both the choices and mandates of public policy. For better than three decades Southern California, and Los Angeles County in particular, has chosen to invest heavily in new rail services. As these new services have come on line, they account for a growing share of the region's transit service. Second, federal civil rights legislation, in the form of the Americans with Disabilities Act, has mandated the delivery of both accessible and demand-response transportation services to a growing and aging population. In combination, these choices and mandates have shifted transit service away from buses and toward rail and van services.[10]

What do these changes in transit service supply mean for transit patronage? First, Figure 19 shows the trends per capita VRH and per capita transit boardings over the past quarter century in the SCAG region. Transit service supply has been mostly climbing in the SCAG region for better than a quarter century, while transit use has never reached the 1991 levels. Given this, there is no *prima facie* case that faltering transit service supply is driving down patronage.

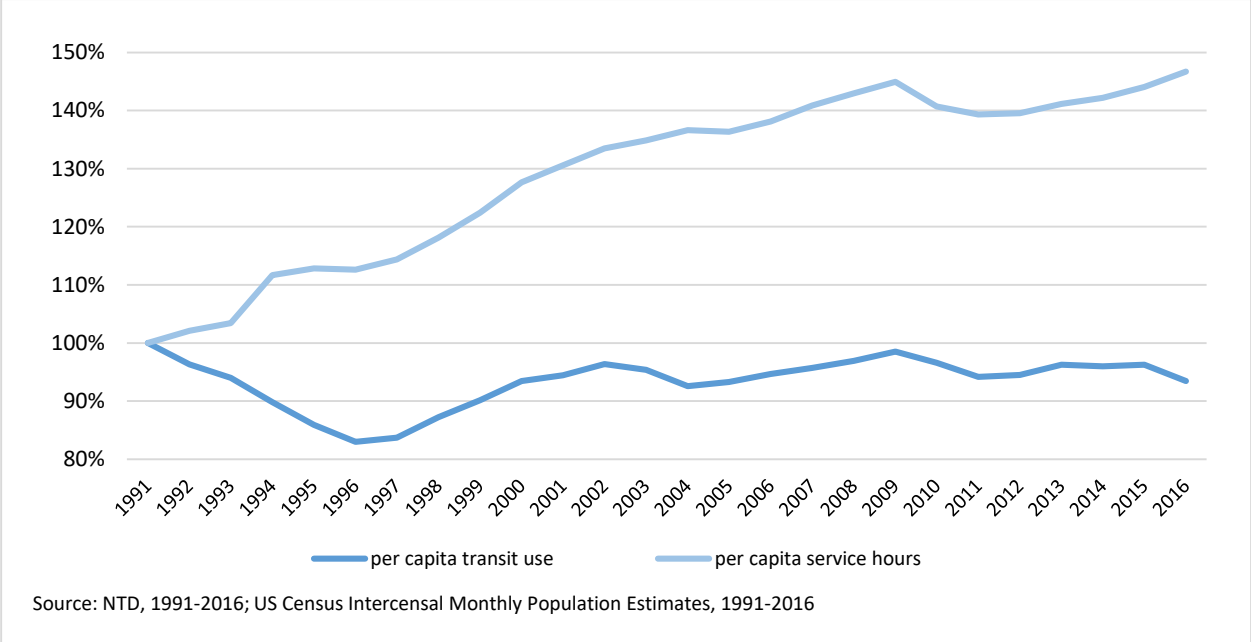

Figure 19. Transit trips and transit supply (1991-2016). *Per capita transit supply has increased 34% since 1991, while per capita transit use has not changed much.*

[10] Though not directly relevant to our question, these shifts have significant budgetary implications beyond just the deployment of various services (Taylor, Garrett, & Iseki, 2000). Local bus and bus rapid transit services (with the exception of those operating in exclusive rights-of-way) tend to be the cheapest to deliver and require the smallest per passenger subsidies. By contrast, the annualized capital plus operating expenses of rail transit tend to be substantially greater per passenger, while the per passenger subsidies for ADA demand response services tend to be the highest of all.

As a final way to examine the relationship between service levels and ridership, we examine the shifts between modes that occurred within the region's largest transit operator, LA Metro. Doing so allows us to address the possibility that aggregate increases in services are masking drops in those types of services— such as buses— that most transit riders rely on. The figures below show the indexed trends in boardings, service (VRH), and productivity (boardings/VRH) for LA Metro bus (Figure 20) and rail (Figure 21) service from 2000 to 2016, and demand response service (Figure 22) since 2008. For local bus and BRT service, transit service supply has tended to follow, rather than lead, changes in ridership — at least through 2014. Beginning in 2014, bus service rose slightly while boardings plunged. Rail service, not surprisingly, has increased more than 150 percent since 2000, and ridership has increased as well, though more slowly. Both service and patronage have tailed off since 2014, but largely in concert— there is no obvious sign of one leading the other. Finally, demand response and van service supply has grown steadily since 2008; boardings increased steadily, albeit more slowly than service, through 2015. Over the past year, service continued to gradually climb, while patronage began to fall.

Collectively, these data offer little evidence that service cuts are driving away customers. Instead service expansion has been accompanied by less ridership, with the main result being lost productivity, particularly for rapidly expanding rail and van services. Rail and van productivity (measured as boardings per VRH) has eroded steadily since 2009, while the service effectiveness of local bus and BRT service began dropping later (and more precipitously) in 2014. Falling service does not seem to be the culprit for falling ridership; falling ridership, in concert with expanding service, is the culprit for falling productivity.

Figure 20. LA MTA: Indexed bus and BRT boardings, service, and productivity. *Declining ridership since 2007, with services' slow growth in the post-recession period leading to declining productivity.*

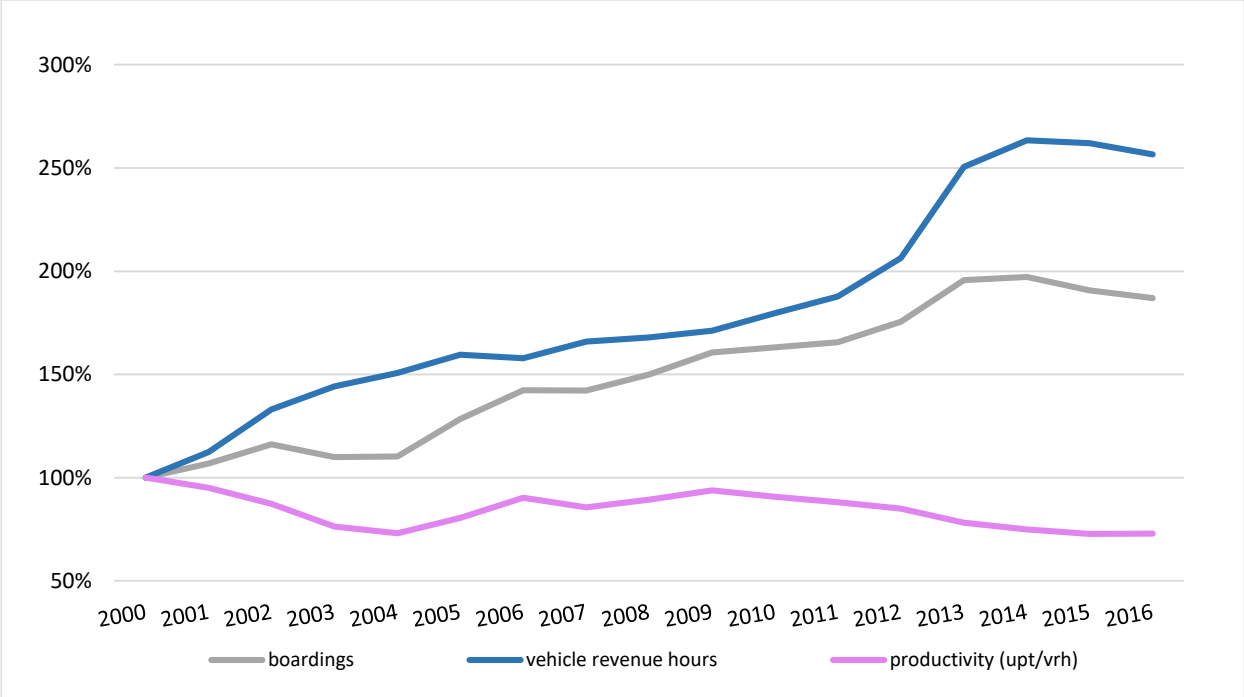

Figure 21. LA MTA: Indexed rail boardings, service, and productivity. *Light rail service doubles with the opening of the Expo Line. Boardings do increase, but slower than the amount of service added.*

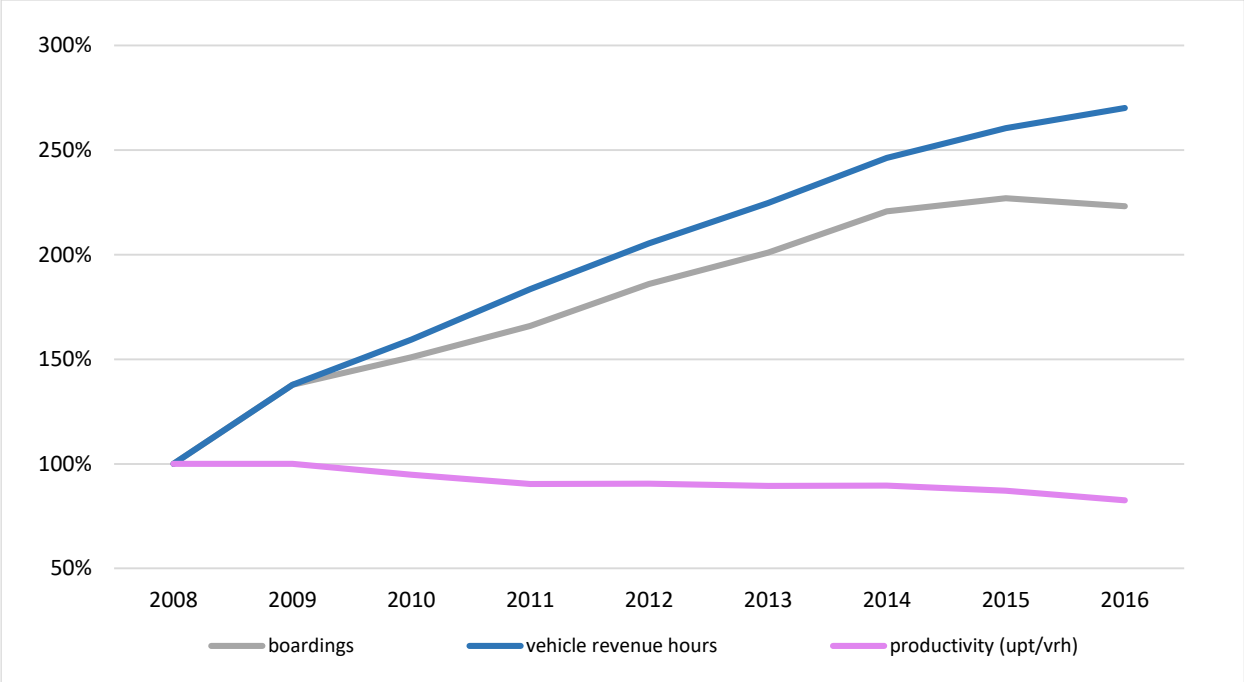

Figure 22. LA MTA: Indexed demand response boardings, service, productivity.
Ridership more than doubled, while service increased by 2.8x.

The Quality of Transit Service

Even if transit quantity does not change, transit quality might. Transit quality has no specific definition, but we can divide it into speed, reliability, and experience. Speed measures how quickly transit vehicles move throughout the region. Reliability is a measure of on-time performance: Do vehicles arrive and depart when they are supposed to? Experience is a measure of how safe or comfortable people feeling during their transit journey, including the time they spend waiting for and transferring among their buses and trains.

Local bus and BRT service in the SCAG region has been slowing down over time. This slowdown is likely a result of many factors, including worsening congestion, shifts from faster suburban to slower urban service, shorter stop spacing, and longer stop "dwell" times to load and unload passengers. Whatever the underlying causes, region-wide bus vehicle speeds declined five percent between 2000 and 2010, and another eight percent between 2010 and 2016, for a total drop in speed of nearly 13 percent over 16 years. By comparison, rail transit speeds were down only two percent between 2000 and 2016.

Falling speeds slow travel times, and if operators do not counteract falling speed by adding more vehicles, then headways (the time between vehicle arrivals at a stop) will rise. Rising headways make transit less attractive by increasing average wait times at stops and lengthening the times of transfers among vehicles. Research has shown that transit passengers find waiting for busses and trains to be especially burdensome, so increased headways can undermine the quality of transit service even if the quantity (in terms of vehicle revenue hours of service) stays unchanged (Iseki & Taylor, 2009).

The SCAG region has 41 transit agencies that operate fixed-route general public service, and on-time performance naturally varies across them.[11] Measuring reliability for all or even most of these operators is therefore beyond the scope of this report. We can, however, examine reliability for LA Metro, which again accounts for the lion's share of the SCAG region's transit trips and lost trips.

Historically, Metro has been unreliable relative to other large transit agencies. A 2008 study by the agency showed that compared to 9 peer operators, Metro had both a lower on-time target and a lower on-time percentage (a vehicle is considered "on-time" if it is less than 5 minutes late). Metro aimed to have 70 percent of its vehicles arrive on time, and attained a rate of 63 percent. In comparison, New York attempted an 83 percent on-time rate and attained an 82 percent rate (Flowers & Snoble, 2008). Metro's reliability problems occur almost entirely on buses, which can easily become trapped in congestion (and which, of course, can also exacerbate congestion).

In the intervening years, however, Metro's on-time performance appears to have improved substantially. An analysis of Metro data by local reporters (Mendelson, 2015) suggests that from 2010 to 2015 Metro rail maintained a 99 percent on-time rate (with subways being late 1 stop out of 200, and light rail 1 stop out of 50), while the buses improved their on-time rate to 81 percent. We say "appears" because this discussion comes with an important caveat: Reliability is a function of the conditions in which buses and trains operate, the efficacy of the bus and train operations, and the schedule that sets the performance expectations. Controlling for conditions or operations, schedules that assume few traffic disruptions and little layover or recovery times can be difficult to meet, while those that assume slower speeds and provide generous layover and recovery times at the ends of routes are easier to meet.

As a result, transit operators can improve measured reliability in two ways. The first involves steps like better field supervision, quicker boarding and alighting procedures that reduce dwell times, and giving buses their own lanes in chronically congested districts. All these steps can change operations, and lower the variability of travel times. But the second way to improve reliability is to change the schedule, by factoring in more slack. Doing so is not necessarily disingenuous, and may simply reflect the challenges of operating in heavy congestion. Adding slack to schedules can allow vehicles to maintain performance even in the face of disruptions (severe congestion, crashes, crowds of people boarding or alighting at particular stops, and so on). The downside to this approach, however, is that too much slack in the schedule might increase reliability on paper but manifest as poorer-quality service in the eyes of riders. As slack increases average vehicle speeds fall, headways rise, and so do timepoint holds (instances where vehicles wait at stops so as not to run ahead of schedule). A service that is on-time because its schedule makes it less frequent is not a high-quality service.

We could not, with the data and time available to us, determine if Metro's schedule adherence improved because its buses met the existing schedule more often, or because schedules themselves were changed. If bus performance improved on the street as opposed to on paper, then we would have little reason to think service reliability was a large factor in falling ridership – bus ridership would have fallen even as schedule adherence increased. But we cannot say for certain that this occurred. We do know, however,

[11] With another 69 systems operating demand-response and other types of transit services, for a total of 110 regional transit service providers.

that rail ridership fell even as rail maintained a near-perfect on-time record. So we have some reason to think that service reliability did not play a large role in the ridership downturn.

We should also note that the advent of mobile apps that track transit vehicles in real time may have diminished the problems caused by unreliable buses. Unreliability is a larger problem when it strands people at stops with little idea of when a vehicle will arrive. To the extent people can follow vehicles in real time and adjust their departures to minimize waiting, some of the worst aspects of irregular transit vehicle arrivals can be mitigated (Yoh et al., 2011). LA Metro has next bus and next train information at its rail stations and BRT stops, and real time information about local and express buses is available on multiple smartphone applications. Metro's 2016 rider survey shows that 51 percent of bus riders have a smartphone, and that 66 percent of these riders use the phone "very often" or "occasionally" to get information about Metro rides.

A transit vehicle that arrives on time can still have poor service quality, if the experience of using the vehicle – which includes walking to the stop, waiting at the stop, and riding – is unpleasant. Specifically, if people using transit feel unsafe or uncomfortable, ridership could fall (Delbosc & Currie, 2012; Iseki & Taylor, 2009). Safety perceptions are often gendered (Loukaitou-Sideris, 2015), and a slight majority of transit users in the SCAG region are women. Note that perceptions of safety are different from, and probably more important than, safety itself. Many behaviors that are not crimes, and that do not directly threaten other people, may nevertheless disturb people nearby, and can discourage them from using transit (Ellickson, 1996; Fink, 2012).

There is some reason to think that transit vehicles, stations, and stops in the SCAG region – and particularly along LA Metro routes – came to feel less safe to riders in recent years. In 2016, LA Metro surveyed former riders, and 28 percent said that the primary reason they stopped riding transit was that they felt either unsafe or uncomfortable. Unfortunately, this survey is not conclusive. Former transit riders are a hard group to reach, and there are responses in the survey that suggest that the overall sample may not have been representative. As a result, we cannot be certain that safety actually loomed so large for former riders. At the same time, even if the survey inflated safety concerns by a factor of two, a nontrivial share of former riders (14 percent) report leaving transit because they felt unsafe. And considerable anecdotal evidence suggests that in recent years transit users started to feel less safe — such reports prompted Metro to completely revamp its security procedures in 2017.

What might explain riders' perceptions that transit is less safe? Possibly some riders have *always* felt unsafe, and what changed was not conditions on transit but the option to leave (if people got access to vehicles or TNCs, for example). We do not discount this possibility, but will take it up later in this report. If we assume that perceptions of safety really did decline in recent years, one potential (and admittedly speculative) reason involves LA County's dramatic increase in homelessness after 2010. Table 2 shows changes in the LA County homeless population from 2005 to 2017, based on homeless counts done by the Los Angeles County Housing Services Administration. Homeless counts, and especially counts of the unsheltered homeless, are for obvious reasons prone to error. Nevertheless, the table suggests that homelessness, while not as severe today as it was in 2005, has in recent years both risen sharply and changed in composition. The unsheltered chronic homeless (people who are not just homeless but also have some sort of disabling condition) became a larger proportion of the homeless overall.

Year	All Homeless		Share	Chronic Homeless		Share
	Total	Unsheltered	Unsheltered	Total	Unsheltered	Unsheltered
2005	65,287	53,429	81.8%			
2007	59,956	39,168	74.0%			
2009	38,602	21,073	54.6%			
2011	39,153	20,157	52.4%			
2013	39,463	25,136	63.7%	7,475	6,652	89.0%
2015	44,359	31,025	69.9%	13,356	nd	nd
2016	46,874	34,701	74.0%	14,644	13,746	93.9%
2017	57,794	42,828	74.1%	17,531	13,321	93.1%
Pct Change, 2005-2017	-13.0%	-24.8%	-10.4%			
Pct Change, 2009-2017	33.2%	50.8%	26.3%			
Pct Change, 2013-2017	46.5%	70.4%	16.3%	57.4%	59.2%	4.4%

Table 2. Changes in LA County homeless population, 2005-2017.

Homelessness— the simple condition of people being without housing— often arises from high housing prices that push some people out of the housing market (O'Flaherty, 1998). Chronic homelessness, however, which tends to be much more visible (in part because the chronic homeless are less likely to be sheltered) often has different underlying causes related to addiction or mental illness. In conversations with transit operators during the writing of this report, some mentioned the impact of California's prison realignment program, which led to many inmates being released from prisons and jails. The state's carceral institutions have traditionally held many mentally ill persons, and discharging them without any corresponding increase in other social services may have increased the number of people with addictions and disabilities living on the streets. No government entity tracks prison realignment's impact on homelessness, but some advocates estimate that up to 20 percent of the state prisoners discharged, and up to 10 percent of county jail inmates, have now become homeless(Holland, 2015). There is also small body of evidence, some academic and some journalistic, suggesting that the unsheltered homeless gather disproportionately around transit facilities. Transit vehicles can provide shelter and protection, while transit stops can provide a roof or even just a bench (Emmons, 2013; National Academies of Sciences, Engineering, and Medicine, Transportation Research Board, Transit Cooperative Research Program, & Boyle, 2016; Trevor, n.d.; Voorhees Center for Neighborhood and Community Improvement, 2016). To the extent some of these people use transit stops and transit vehicles as ad hoc shelters, and to the extent their presence or behavior disturbs others, realignment may have played a role in making transit seem less safe, and reducing ridership. We emphasize again that this line of thinking is quite speculative and warrants further research.

Transit Fares

Potential transit riders weigh the quality of a ride against its price. Like most goods, transit, even at constant quality, will become less attractive if its price rises, and more attractive if the price falls. The postwar high-water mark for transit in Los Angeles County occurred during a three-year program that cut bus fares in half from 1982 to 1985. When this program ended and bus fares returned to their previous levels, transit ridership fell substantially (Southern California Rapid Transit District, 1986).

The inverse relationship between fares and use, however, is complicated by two factors. First, the people who use transit the most – lower-income people with limited or no vehicle access – are generally more price sensitive in that they have less income, but *less* price sensitive in that they have few viable alternatives to transit. As a result, many transit riders are less sensitive to fare increases than one might expect given their incomes. Second, although every transit operator has a posted one-way fare, relatively few riders actually pay that rate, because agencies offer a variety of discounts and bulk payment mechanisms, including daily, weekly or monthly passes, youth and elderly discount passes, and so on that offer substantial discounts to particular classes of riders, including those who ride frequently (Yoh, Taylor, & Gahbauer, 2016). Heavy users who buy monthly passes will typically pay a per-ride rate much lower than the advertised fare. LA Metro's 2016 rider survey showed nearly half (49%) used a daily, weekly, or monthly pass, while about 25 percent paid a discounted fare.

Further complicating this issue is that transit fares can be calculated on a per-trip or per-mile basis. Arguably the most intuitive way to think about fare increases is per-trip: How much does a person pay to get aboard a vehicle? But once a passenger is on board, what follows might be a local bus trip of two blocks or a light rail trip of 22 miles. With the exception of commuter rail and some express bus routes, transit fares generally do not change with distance travelled. If the average fare to board a vehicle rises less quickly than the average distance of a trip, the per-mile fare could fall more than the per-trip fare rises, and transit may in a real sense become less expensive. For our purposes, the fare per trip is probably more relevant, as it is likely more salient to potential riders, but it remains worthwhile to consider both.

This wide array of payment methods and rates, and ways of considering these rates, makes calculating the actual fare paid by different classes of users beyond the scope of this report. We can, however, easily determine the average fare paid per boarding for a given system and the SCAG region, by simply dividing total fare revenues collected by either total boardings or passenger miles. While these metrics will fail to capture some of the nuances of fare payment among different types of users (they cannot completely control, for instance, the bulk discounts for heavy users of different lines) they are a measure of the fare payments actually made by people when they ride.

Figure 23 below displays the average inflation-adjusted fare paid per boarding across all transit systems in the US, California, and the SCAG region between 2002 and 2015. The figure shows, first, that the average transit fare paid is lower in the SCAG region than for California as a whole, which in turn is lower than the average transit fare paid nationwide. Second, the figure shows that the average inflation-adjusted fare paid per boarding in California began creeping up in 2012, and to a lesser extent in the US since 2013 and the SCAG region since 2015. Overall, however, the average inflation-adjusted fare per boarding in the SCAG region has been remarkably flat since 2002.

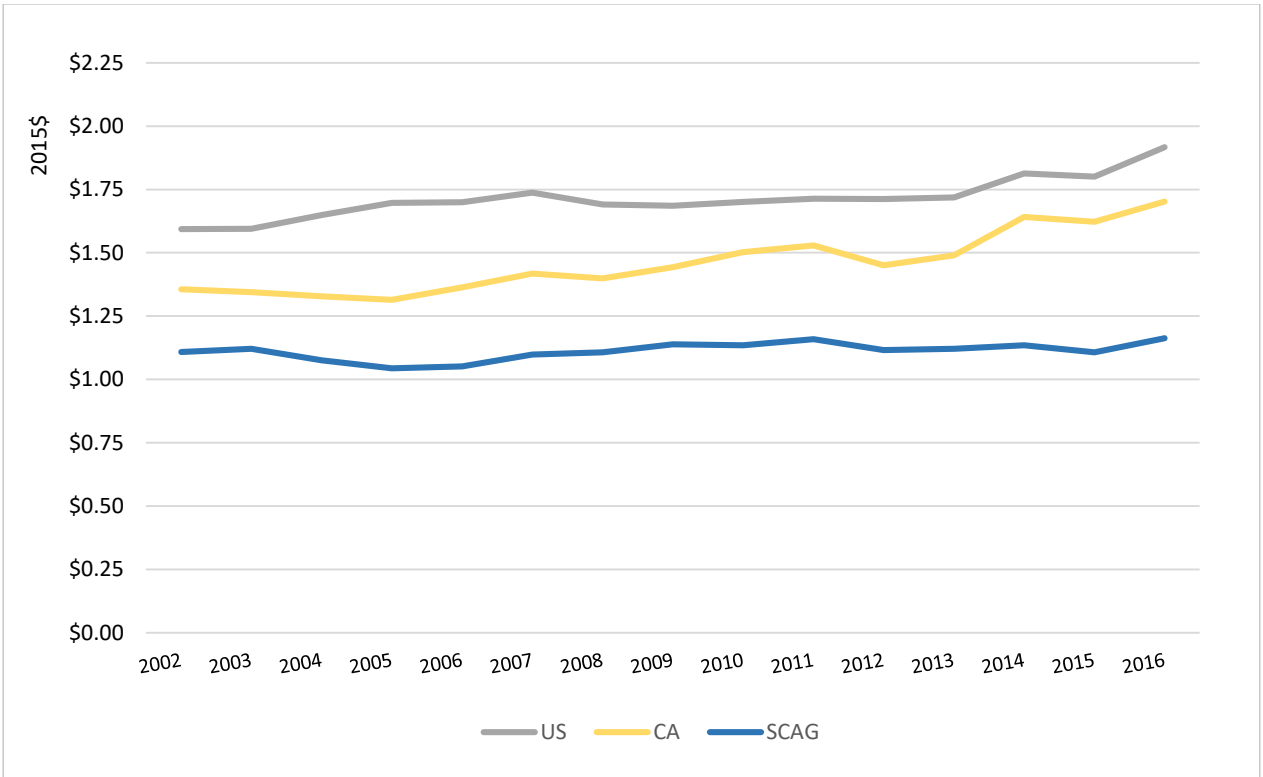

Figure 23. Average fare per boarding in 2015 dollars. *Average fare per boarding has stayed relatively constant in the SCAG region.*

National, state, and regional averages, of course, can mask considerable variation in fares paid across transit systems, services, and riders. Figure 24 shows the same inflation-adjusted trend in fares paid per boarding since 2002 for each of the six largest transit operators in the SCAG region. Focusing on these larger operators tells a different story. With the exception of Long Beach Transit, inflation-adjusted fare payments have been increasing over time on these operators. In particular, inflation-adjusted fares per boarding at both OCTA and the Big Blue Bus increased by about 50 percent between 2002 and 2016 — to nearly $1.25 and $0.75 per boarding respectively. Foothill transit had (in 2016) the highest average fares paid (at $1.25 per boarding), followed in order by OCTA, LA MTA, the Big Blue Bus and Long Beach Transit, while LA DOT had the lowest average fare paid (at just over $0.50 per boarding).

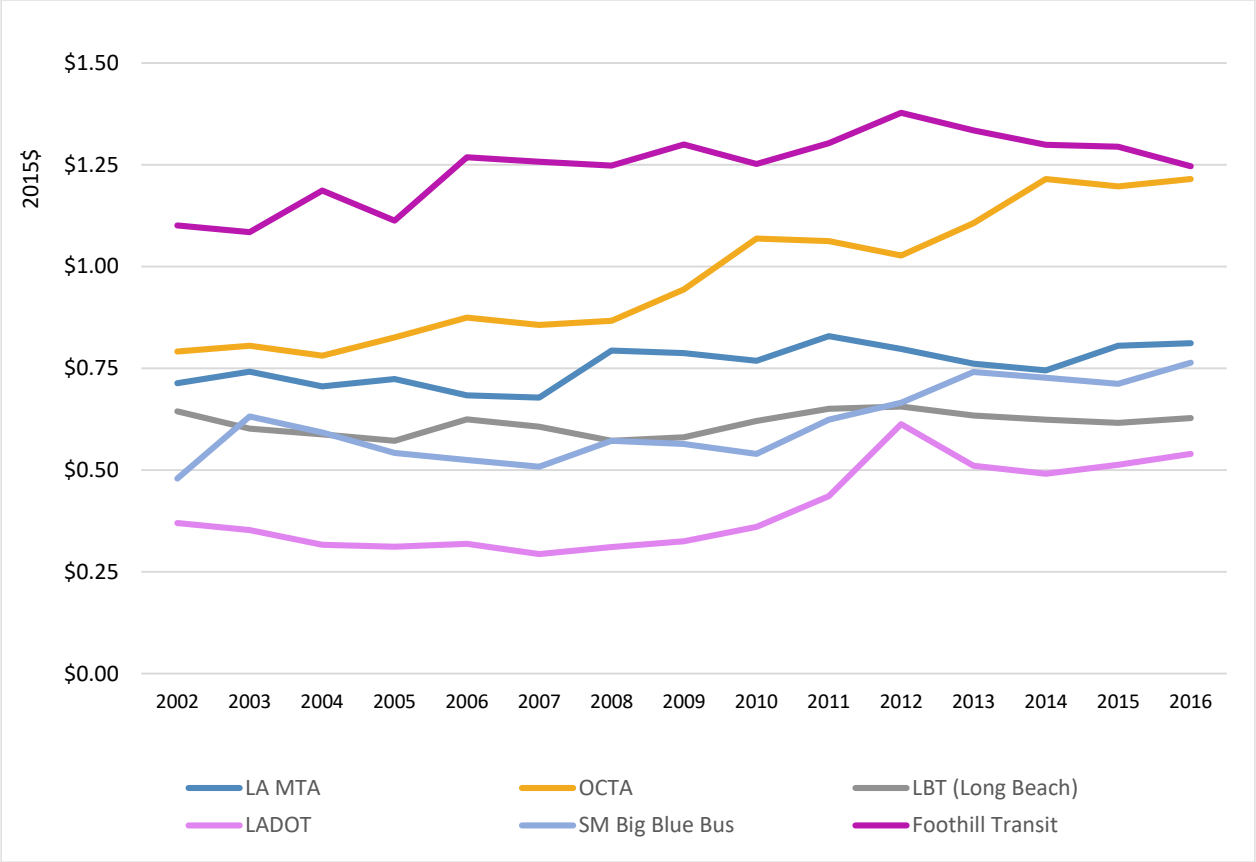

Figure 24. SCAG: Average fare per boarding for largest operators in 2015 dollars.
Inflation-adjusted average fares per boarding have increased the most rapidly for OCTA and LADOT.

Figure 25 shows the 14-year trend in real average fare paid per mile for the nation, California, and the SCAG region. Here we see that average fares paid per mile have remained largely unchanged in the U.S. and California, and in the SCAG region they have actually fallen. Despite being lower than average per mile fares in the state and nation, average per mile fares in the SCAG region have declined about 20 percent since 2009.

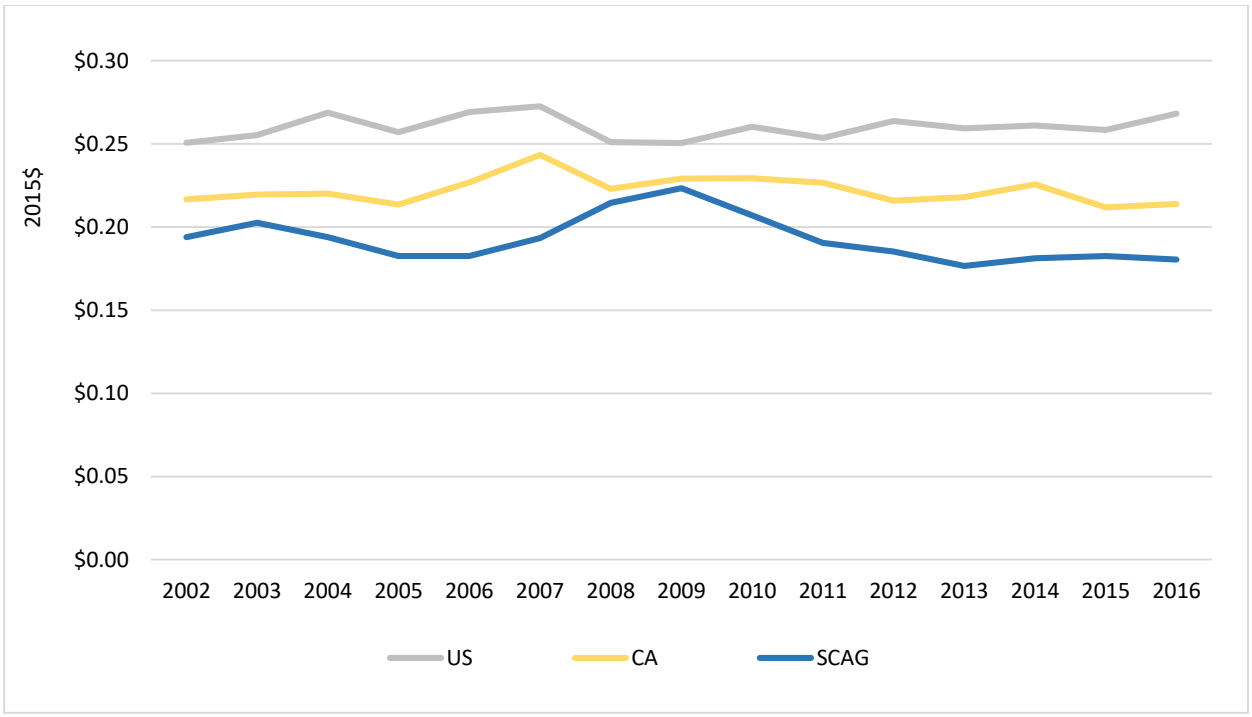

Figure 25. Average fare per passenger mile traveled in 2015 dollars. *Average fare per PMT remained fairly constant, and even declined a little since 2009.*

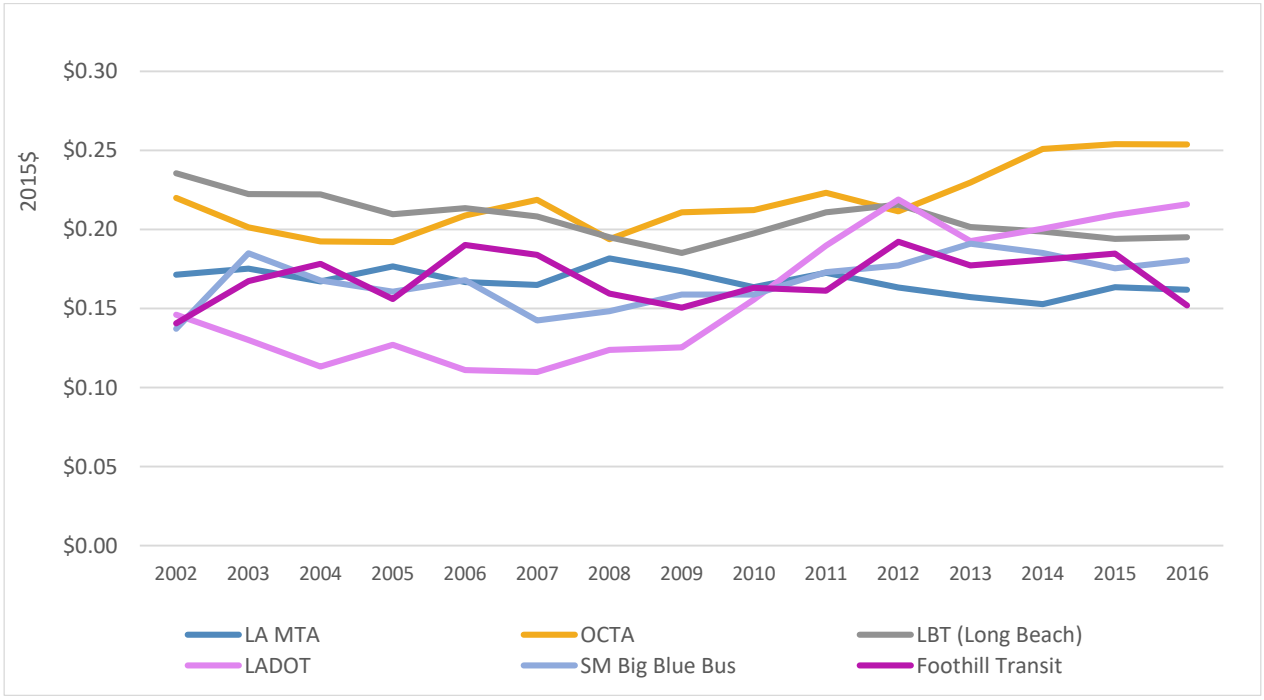

Figure 26. SCAG: Average fare per PMT for largest operators in 2015 dollars. *Average fare per PMT increased the most rapidly (about $0.07 per mile) for LADOT and slightly for OCTA ($0.04 per mile).*

If we zoom in on the six largest transit operators in the SCAG region, we see that inflation-adjusted fares per mile rose notably at two systems — LA DOT (+$0.07/mile) and OCTA (+$0.04/mile). On the Big Blue Bus and Foothill Transit per mile fares rose modestly, and at Long Beach Transit and LA Metro they fell (despite Metro's 2014 fare increase).

The most notable attribute of the figures above is the steep increase in fares for OCTA. OCTA's fares have risen over 50 percent since 2002, and OCTA is also the transit operator that has suffered the sharpest decline in ridership (about 35% since 2007). The transit industry's rule of thumb (sometimes called the Simpson-Curtin rule) suggests that a 10 percent increase in fares will be associated with about a 3 percent reduction in ridership. By this heuristic, OCTA's fare increases should have resulted in a 17 percent ridership decline.

To help isolate the association between fare increases and transit use, we estimated a multivariate regression statistical model using data for each transit operator in the SCAG region for each year between 2002 and 2016. Full details of this model are in the Appendix, but we used fixed effects to control for the panel nature of the data, and controlled for the level of service each operator provided, the average time between each bus or train arrival, and the density, size and population of the service area.

We find, after controlling for these factors, that higher fares are indeed associated with lower ridership, but by less than industry rules of thumb might suggest. Across the SCAG region over this time period, a 10 percent fare increase was associated with a roughly 1.6 percent decrease in ridership. This relationship is relatively "inelastic" (i.e. it suggests people are not very sensitive to prices) though it falls within the range of findings from other studies of how fare increases influence ridership (Cervero, 1990; Linsalata & Pham, 1991). Based on these results, we would expect OCTA patronage to have fallen about 8 percent since 2002, as a result of its fare increases.

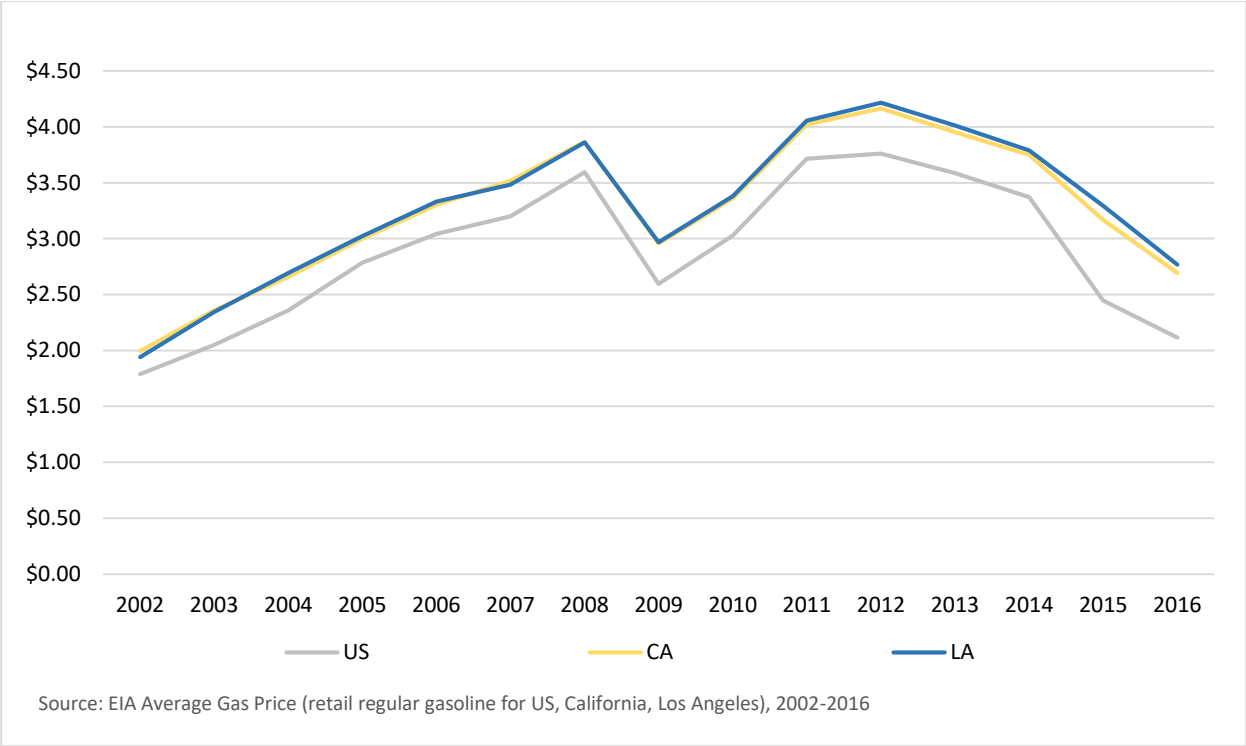
It seems plausible, in light of these data, to suggest that fare increases played some role in OCTA's lost transit trips. But OCTA's losses, as large as they are, account for a small fraction of the SCAG region's total losses. The bulk of those losses were from LA Metro, and it is harder to suggest that fare increases played a big role in Metro's ridership decline.

Factors Outside Transit Operators' Control

Fuel Prices

Fuel prices are a large and highly salient operating cost of driving. As fuel prices rise people drive less, and as they fall people drive more. In general, a ten percent increase in the price of gasoline is associated with a long-run (5 year) one to three percent reduction in vehicle travel (Goodwin, Dargay, & Hanly, 2004). Driving more, however, is not the same as using transit less, since (again) the typical driver almost never uses transit. People who drive less when gas prices are high often walk, carpool, stay home, or drive to nearer destinations (e.g. a restaurant that is 2 miles away instead of 10). Similarly, for many regular transit riders changes in the price of gasoline are immaterial, because many transit users do not have access to private vehicles. As a result of these factors, much of the adjustment to fluctuating fuel gas prices that occurs in the U.S. has no bearing on transit use, and the relationship between fuel prices and transit ridership tends to be weaker than the relationship between fuel prices and driving.

"Weaker," however, is not "nonexistent," and in both Southern California and nationwide, fuel prices rose and fell sharply from the late 1990s through 2015. Prices increased at a record pace from 1998 to 2008, declined, and then rose sharply again until 2013, after which they plunged (Figure 27). Transit ridership also fell steeply from 2013 to 2016. It is reasonable to think that falling gas prices could contribute to falling transit ridership. A steep drop in gas prices could have lured some of the minority of transit riders who do have vehicles away from transit use. Even among riders without vehicles available, falling fuel prices could have an indirect impact. When fuel is cheap rides in cars become more available: Friends or family members who become more likely to drive, and people who might otherwise have used transit might start carpooling for some trips.



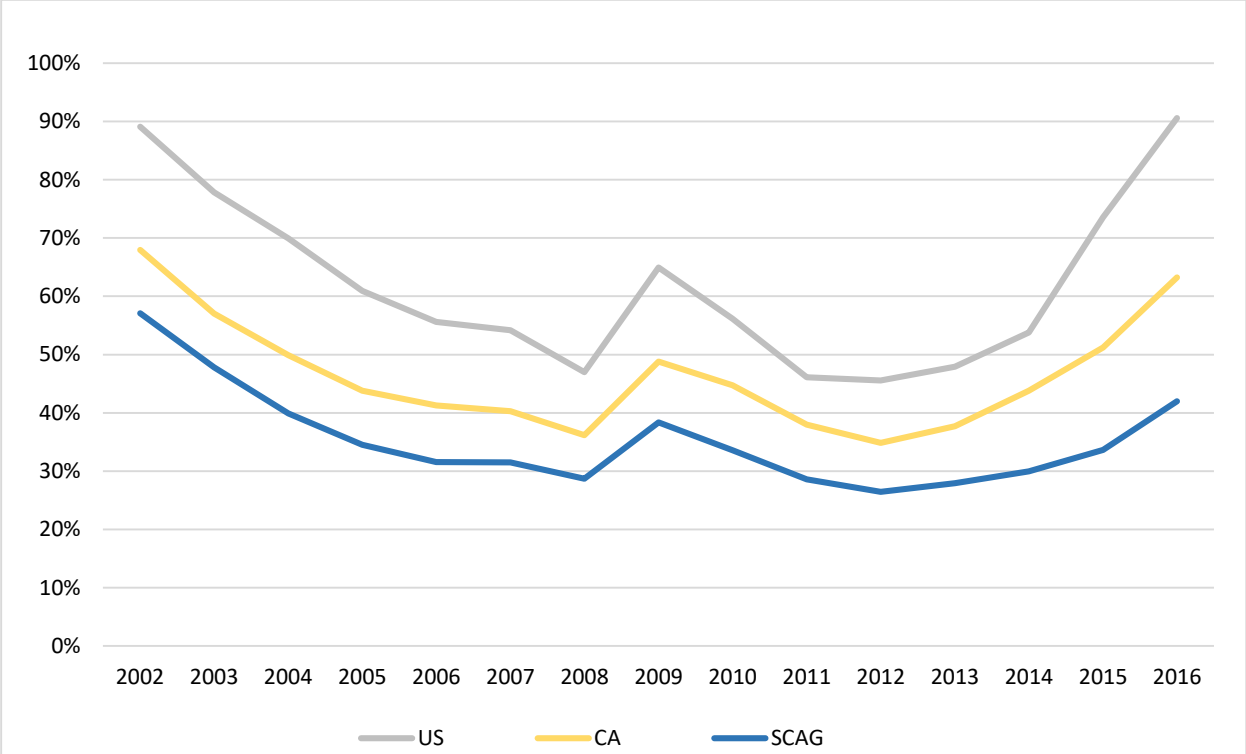


Figure 27. Average gas per gallon in 2015 dollars.

As to how much a steep drop in fuel prices might undermine transit use: the research literature reports a fairly wide array of elasticities (estimates of transit's sensitivity to gas price changes). These range from relatively large effects for commuter rail (0.37, when gasoline costs more than $3 per gallon) (Nowak & Savage, 2013) to much lower average estimates for bus ridership that range from -0.05 to 0.22 (Blanchard, 2009; Iseki & Ali, 2014; Mattson, 2008). Blanchard (2009) used gas price changes in LA County to estimate a bus ridership elasticity of 0.092, a subway elasticity of 0.011, a commuter rail elasticity of 0.126, and light rail elasticity of 0.071. Lane (2010), also studying LA, found similar results. All these estimates suggest that a 10 percent change in fuel prices is associated with about a half-percent change in transit use in the near term, and a 1 to 1.8 percent change in the longer-term. Gas prices fell 30 percent from 2012 to 2016,

which would imply a 3 percent reduction in bus ridership, and larger losses in rail and commuter rail, all else equal.

One way to consider this relationship of fuels prices to fares is to compare the ratio of average fare paid per boarding with the average price of gasoline in the SCAG region over this period (Figure 28). As with fares generally, we see that this fares-to-gas ratio is lower in the SCAG region than in California as a whole, and lower in California than the nation as a whole. Further, while the price of a transit trip relative to a gallon of gas has been climbing across all three geographies since about 2012, the ratio in the SCAG region today remains substantially lower than it was in 2002.

Source: NTD, 2002-2016; EIA Average Gas Price (retail regular gasoline), 2002-2016.
Note: Average LA gas prices are used for the SCAG region.

Figure 28. Average fare as a percent of region's average gas per gallon. *Average fare is consistently less than the cost of a gallon of gas, even as gas prices have been falling since 2014.*

Figure 29 plots the trend in gas prices against the trend in absolute and per capita transit ridership in the SCAG region (we use the Los Angeles Metropolitan Statistical Area average gas prices). The graph suggests a real but fairly modest relationship: Transit use does rise and fall with fuel prices, with a small lag. The response does not appear to be large, however, especially for ridership per capita. But with only one data point per year, we can only say so much about the role of gasoline prices. It would be surprising if falling gas prices did not contribute to the decline in transit ridership, but it is difficult to quantify their precise role. Overall, we consider falling fuel prices to be a real but probably minor driver in falling transit use.

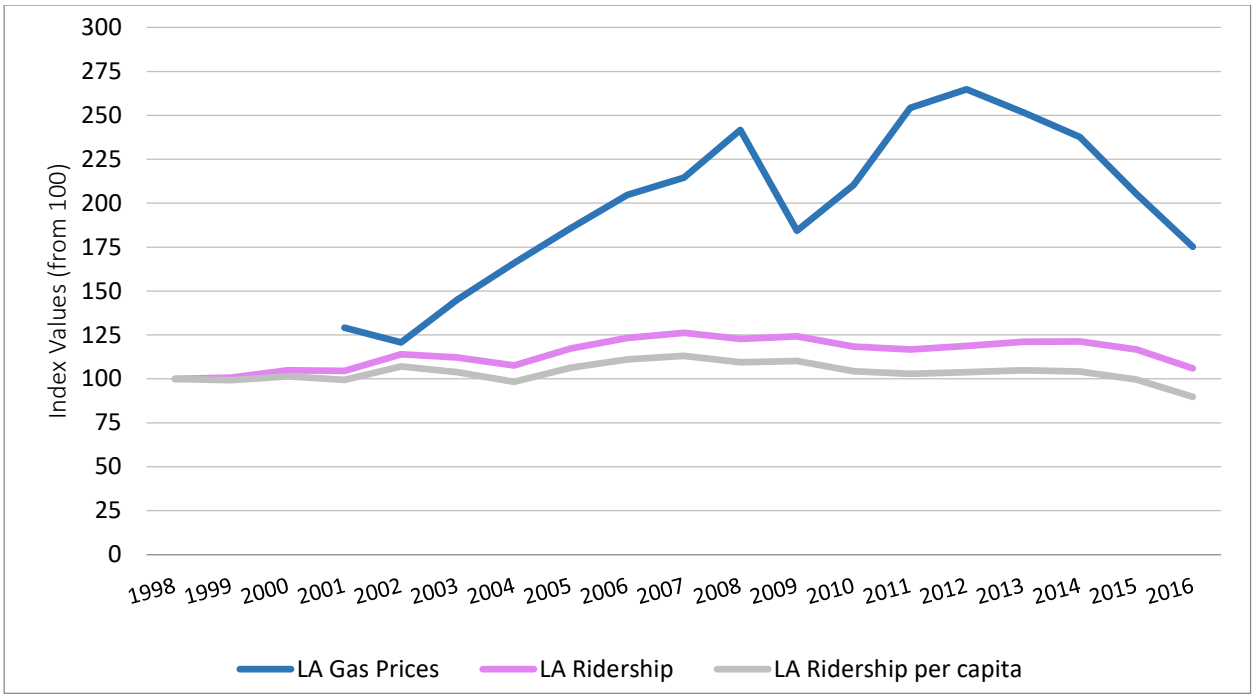

Figure 29. Transit ridership and gas prices in Los Angeles.

The Transportation Network Companies

The large absolute decline in transit ridership coincided not just with falling gas prices but also with the rise of Transportation Network Companies (TNC) like Lyft and Uber. TNCs are a plausible culprit in transit's decline. TNCs can offer the convenience of automobile travel to people who do not own automobiles, and could therefore become viable substitutes for public transportation. Any explanation for falling transit use that hinges on TNCs, however, faces a timing problem: TNCs began operating in Southern California in 2009, and did not begin serving people in large numbers until 2012. Per capita transit ridership began falling in 2007. So while the TNCs may affect transit use, they cannot by themselves explain transit's recent patronage decline.

Moreover, TNCs' influence on mode choice is theoretically ambiguous. On the one hand, TNCs let people purchase vehicle trips *a la carte*. If those trips are inexpensive, then TNCs can be a faster, more direct, less-crowded, and more comfortable substitute for transit. While some TNC trips are substantially more expensive than transit fares, the TNC shared ride services, like Lyft Line and Uber Pool, have sometimes seen fares fall low enough to be competitive with one-way transit fares. Given the speed and convenience these services offer, they could draw some riders away from transit, provided those riders have smartphones and credit cards.

On the other hand, TNCs could also *increase* transit use. TNCs could help solve first-mile/last mile problems, and get people to transit stops that are beyond walking distance. TNCs could also provide transit riders a form of insurance – if some people don't take transit because they worry an emergency might arise where they need a car (for instance, getting a sick child home from school) the option of calling

a TNC during one of those emergencies can lower the perceived risk of taking public transportation, and make it more attractive.

Finally, since most people in most regions do not use transit or even consider doing so, the average TNC trip may have little impact on transit ridership. If the typical Uber passenger has never used a bus and never considered doing so, Uber's growth cannot be blamed for transit's decline.

Because TNCs provide almost no operating data to the public, we do not have sufficient evidence to adjudicate between these scenarios. We do not know even basic information — such as the total number of TNC trips in the SCAG region year over year, or the general areas where those trips originate — that could cast light on the relationship between TNCs and public transportation (Transportation Research Board, & National Academies of Sciences, Engineering, and Medicine, 2016).[12]

What little evidence we do have suggests that most TNC trips do not replace transit trips. Surveys done by independent researchers and organizations suggest that the typical TNC user does not resemble the typical transit rider (TNC users are disproportionately college-educated and affluent), and that the most common times and places for TNC rides are Friday and Saturday nights in popular commercial districts, and trips to airports (Clewlow & Mishra, 2017; Feigon & Murphy, 2016; Rayle, Dai, Chan, Cervero, & Shaheen, 2016). Large surveys by Clewlow and Mishra (2017) and APTA (Murphy 2016) suggest that most TNC trips occur between 10 p.m. and 4 a.m., when transit runs infrequently and carries few riders. Clewlow and Mishra (2017) find that the majority of TNC users report no change in their use of other modes. All this evidence suggests little impact on transit.

The caveat attached to these findings, however, is that the subgroups most likely to take transit – low-income racial and ethnic minorities – are also difficult to survey. Even very large, well-funded surveys often struggle to get adequate coverage of poorer households. As such, we cannot rule out the possibility that actual TNC use in some poorer neighborhoods is higher than the current data suggest.

Moreover, as the pool of TNC users continues to expand, the TNCs' effect on transit use – both positive and negative – may well increase. These amplified effects will be still more likely if TNC prices fall, and TNC use grows disproportionately in dense, high transit ridership areas populated by residents with relatively low levels of household motor vehicle access. For this reason, the relationship between TNCs and transit should be monitored, and there may well be a public interest in letting transit agencies see at least basic data about the location and volume of TNC trips. But relatively little evidence suggests that TNCs are a big player in the current transit decline. The timing, again, does not match up well.

Neighborhood Change and Migration

Transit is heavily-supplied in a small proportion of places, and heavily used by a small proportion of people. This situation creates a potential matching problem. If the small group of people who use transit a lot becomes less likely to live in the small number of places that offers a lot of service, transit use could

[12] TNCs are required under California law to report a host of data on rides given, disability access, and drivers to the California Public Utilities Commission. Unlike transit data in the NTD, however, these TNC data are not public. The CPUC cannot easily turn those data over to the public or public agencies. Such conditions are common throughout the United States. For more - http://www.cpuc.ca.gov/General.aspx?id=3989

fall. Such a mismatch could occur for a number of reasons. The highest-profile explanation is gentrification-driven displacement. If gentrification pushes transit-riding lower-income households away from transit-rich neighborhoods, and replaces them with higher-income residents, transit use may fall. The new higher-income residents may use transit more than they did previously, but less than the lower-income residents they replace (Dominie, 2012).[13]

Gentrification and displacement, however, account for only a small portion of moves by poor and immigrant households. Most moves by such households are by choice, or for reasons unrelated to in-migration by the affluent—for example, a low-income resident might lose a job and be forced to move (either to find new work, or to find a place with lower rent), even if neighborhood rents are not rising (Freeman 2005; Freeman and Braconi 2004; Newman and Wyly 2006; Vigdor 2002). The relevant fact is that in recent years many poor households, when they move for whatever reason, relocate to the suburbs. As poor households suburbanize, they move farther from transit on average (Farrell, 2016; Kneebone, 2014; Kneebone & Garr, 2010; Singer, 2011; Zimmerman, Restrepo, Kates, & Joseph, 2015). Upon arriving in the suburbs, low-income people may well use transit more than other suburbanites, but less than they had used it when they lived in central-city neighborhoods. If they are not replaced in central-city neighborhoods by other people who ride at high rates, then as a result of their migration overall transit use could fall.

Ideally we could examine the extent to which migration influences transit use by following low-income households and their travel behavior over time and across neighborhoods. Unfortunately, the data that would allow us do this do not exist. What we can do instead is use census-tract level data to examine changes in the spatial location of transit commuters and in the characteristics of residents living in high-transit commuting neighborhoods. We approach this task in two ways: identifying tracts with transit-friendly built environments and seeing how they change over time, and identifying tracts with high levels of transit commuting, and examining change within those places over time. These approaches have limits, as we will explain, but in combination they show a decline in the number of transit commuters in many high-transit use neighborhoods in 2010 and 2015, a decline in transit mode share in these neighborhoods (particularly from 2000 to 2010), and a shift in the characteristics of neighborhood residents in ways that help to explain declining transit use.

We have two methods available to identify areas that are highly conducive to transit use. These are areas that, regardless of who lives in them, are transit-friendly, either because of their levels of transit service or attributes of their built environment. Our first measure of transit-conduciveness is SCAG's High Quality Transit Area designation. SCAG defines a High Quality Transit Area as an area within one-half mile of a fixed guideway transit stop or a bus transit corridor where buses arrive at a frequency of every 15 minutes or less during peak commuting hours. SCAG last identified existing High Quality Transit Areas using data for 2012. These High Quality Transit Areas are located in 762 census tracts—about 45 percent of the region's total Census tracts.

Our second measure of transit-conduciveness comes from a typology of neighborhoods developed at the UCLA Institute of Transportation Studies for the US Federal Highway Administration (Voulgaris, Taylor, Blumenberg, Brown, & Ralph, 2016), using data from 2010-2013 (Ramsey & Bell, 2014; Voulgaris et al.,

[13] This outcome could well result in lower transit ridership but also lower VMT and GHG, because the higher income in-migrants are more likely to replace driving with their transit trips (see Chapple et al. 2016, Chapter 4).

2016). This typology characterizes neighborhoods based on their built environment and transportation system characteristics (e.g. density, land use mix, age of housing stock, resident turnover, street network characteristics, and transit supply), but not on the characteristics of the people living in these neighborhoods. In this way the typology can capture how transit-friendly a neighborhood's built environment is. We focus in particular on one neighborhood type called "Old Urban," which indicates very-high density neighborhoods with high-levels of transit supply. Old Urban neighborhoods are much less common than SCAG High Quality Transit Areas—in 2010 there were 719 Old Urban neighborhoods in the region.

For our purposes, the limitations of both the SCAG designation and the Old Urban designation are that the data used to construct them are from 2010 or after. As a result, we can track changes in these neighborhoods from 2010-2015, but we do not have a good measure of tract-level transit supply or transit-conduciveness from 2000 to 2010, the time period when transit use in the SCAG region began to fall.

To examine changes from 2000 forward, we examine the clustering of transit commuters. This method is imperfect, since as we have shown commuters are a minority of transit users, but we assume for this exercise that as regular transit users, commuters tend to cluster in areas conducive to transit use. This assumption is contestable, but we have no other Census tract-level data on transit use that stretches back to 2000. We identify high-transit commuter neighborhoods with data on transit commuters by Census tract from the 2000 Decennial Census, and the 2010 and 2015 ACS.[14] For each year, we rank order tracts by the number of transit commuters in them. As we discussed earlier, transit commuters are highly concentrated in a very small fraction of the SCAG region's land area; eighty percent of transit commuters live on less than five percent of the land area and in less than 40 percent of census tracts. This distribution changed very little from 2000 to 2015.

We examine changes over time using the rank-ordered transit commuting data from the 2000 Census. We identified the census tracts that most intensively host transit commuters; these tracts, which are 1.43 percent of all census tracts in the region and 0.02 percent of the region's land area, hold ten percent of the region's transit commuters. We call these "10% Tracts." The mean number of transit commuters in these tracts is almost 12 times the regional average. For comparison, we also extracted data on the tracts where the top 60 percent of transit commuters live; these neighborhoods comprise 20.6 percent of all census tracts and 0.86 percent of the land area. We call these "60% Tracts." The mean number of transit commuters in these neighborhoods is 4.5 times the regional average. The number of ten percent tracts is extremely small: in 2000, just 48. The number of tracts that hold 60 percent of the commuters, in contrast, is 743—roughly the same number as are in the Old Urban designation.

The tracts in the 10% and 60% designations in 2000 strongly overlap with the SCAG High Quality Transit Area and Old Urban designations. If we take the 10% Tracts in 2000 and follow them forward, we see that about 85 percent are Old Urban tracts, and all of them are SCAG High Quality Transit tracts. Similarly, of the tracts in the 60% designation in 2000, in 2010 55 percent of them are Old Urban, and 85 percent are

[14] Because we are using tract-level data, the ACS data are from the 5-year samples. The 2010 data are from the 2006-2010 ACS, and the 2015 data are from the 2011-2015 ACS.

High Quality Transit. As such, following the trajectory of the 10% and especially the 60% Tracts may be a rough-but-reasonable proxy for following the trajectory of transit-rich areas.

As a first step, we follow three of these four tract designations – 60% Tracts, Old Urban, and High Quality Transit – over time, to the extent we can. For the latter two designations, this means only tracking changes from 2000 to 2015. We follow the year 2000 60% Tracts from 2000 to 2010, and then to 2015. (We use the 60% Tracts, rather than the 10% Tracts, because their numbers are more comparable to the Old Urban tracts).

Figure 30 summarizes the results. Essentially, the 60% Tracts saw substantial changes between 2000 and 2010, and these changes are consistent with the idea that the people most likely to use transit migrated away from transit-rich areas. From 2000 to 2010, the poverty rate in these tracts fell by four percentage points, the share foreign born fell from 48 percentto 45 percent, and the share of households without vehicles fell from 23 percent to 17 percent. From 2010 to 2015, in contrast, relatively little changed, and that same pattern holds if we examine Old Urban tracts and SCAG High Quality Transit Areas. Across all three neighborhood typologies, poverty rose slightly, the share of foreign born fell slightly, and – perhaps most important, given the importance of vehicle access to transit use – the share of households without vehicles stayed at the point it had fallen to. (The same general pattern holds for the 10% Tracts, although to conserve space these are not shown in the figure).

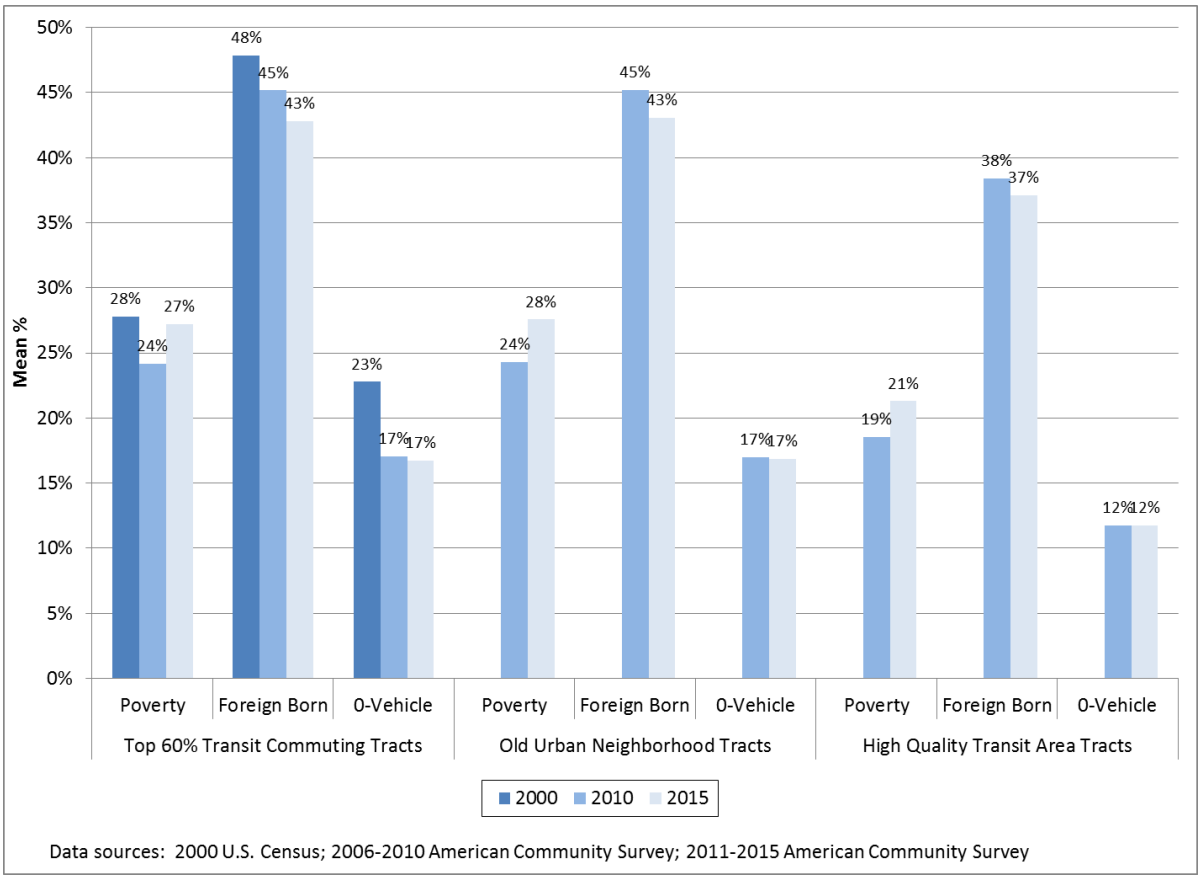

Figure 30. Characteristics of high-transit areas, 2000, 2010, and 2015 (2000 Census tracts over time)

Some additional data also suggest neighborhoods changing in ways not conducive to transit use. Figure 31, for example, shows that in both the 10% and 60% Tracts the transit commute mode share fell between 2000 and 2015 (with most of the decline occurring between 2000 and 2010.) Although not shown graphically, Census data also indicate that in these tracts, both the number of workers and overall earnings for workers rose, but earnings did *not* rise for those commuters using transit to get to work.

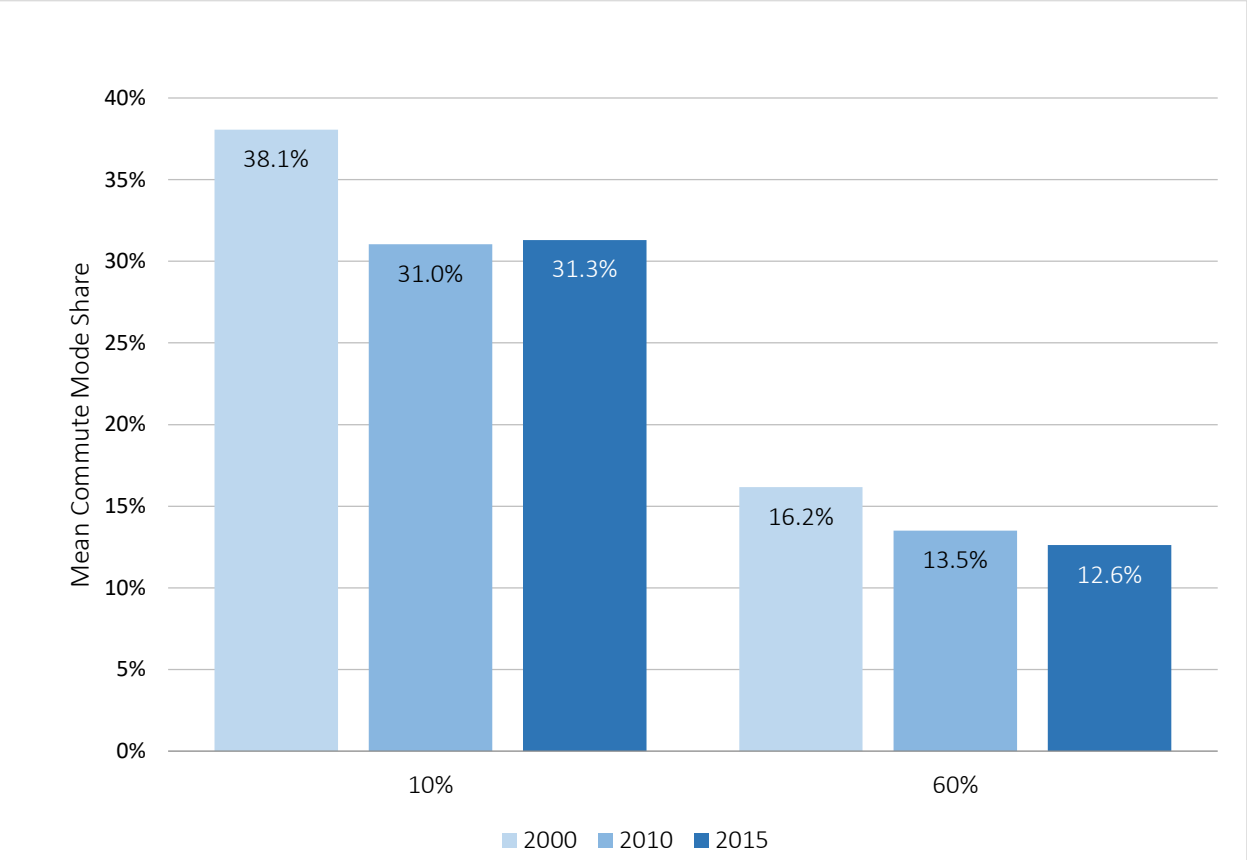

Figure 31. Mean transit commute mode share in high-transit neighborhoods, SCAG Region by year.

In summary, then, we observe changes in census tracts that in the year 2000 were most heavily-populated by transit commuters. These tracts, in turn, overlap substantially with tracts that we know in 2010 were rich in transit supply and/or had transit-friendly built environments, letting us infer (albeit with some uncertainty) that these neighborhoods were transit-rich in 2000 as well. Particularly between 2000 and 2010, in these neighborhoods we see falling transit commuting, falling population, a falling share of immigrants, falling poverty, more vehicle ownership, and higher earnings for workers overall but not those workers who commute via transit. All of this evidence is consonant with these neighborhoods becoming

more affluent, with that affluence being associated with less transit use, and with people left out of that affluence remaining on transit.

We emphasize that this story is far from conclusive. For the reasons we discussed above, the relationship between neighborhood change and transit use is very hard to measure. The data we have are consistent with neighborhood changes in the most transit-friendly SCAG-region neighborhoods contributing to falling transit use, but they are not conclusive. This is an area that warrants substantial further research.

Rising Vehicle Ownership

The defining attribute of regular transit riders is often a lack of vehicle access. Between 2000 and 2015, vehicle access in the SCAG region became much more common. Households in the SCAG region, and especially lower-income households, dramatically increased their levels of vehicle ownership. Census summary file data show that from 2000 to 2015, the SCAG region added 2.3 million people and 2.1 million household vehicles (or 0.95 vehicles per new resident). To put that growth in perspective, from 1990 to 2000 the region added 1.8 million people but only 456,000 household vehicles (0.25 vehicles per new resident). The growth of household vehicles in the last 15 years has been astonishing.

There are strong reasons to believe that this surge in vehicle ownership is largely responsible for the decline in transit use. A back of the envelope calculation can illustrate the magnitude of the problem this vehicle surge could pose for transit operators. Data from the US Consumer Expenditure Survey show that from 2000 to 2015, the average expenditure per household vehicle in LA County was about $3,729.[15] Since SCAG residents added 2.1 million vehicles in this time, a midrange estimate of private expenditures on household vehicle growth is $7.8 billion. Over the same period of time, LA Metro and Metrolink combined to spend about $6.4 billion opening new rail service, and about $7.4 billion on combined rail and Bus Rapid Transit service. Thus even a conservative estimate of private investment in vehicle growth shows it easily outpacing public investment in fixed-route, dedicated right-of-way transit— the type of transit that is supposed to be most competitive with driving. This level of increased vehicle ownership is in many ways incommensurate with robust transit use.

To be sure, much of this vehicle growth would not influence transit use. Because most SCAG residents had never used transit, increased vehicle ownership in most SCAG households would not contribute to transit's decline. The 2000s were when the Millennials, a demographically large cohort, reached ages when many would buy automobiles. Millennial car-buying could help explain the bulge in vehicle acquisition, but unless those Millennials would otherwise be on transit these additional vehicles would not necessarily explain falling transit use.

[15] The Consumer Expenditure Survey tracks the average net outlay per vehicle purchased. Data are not available for the other SCAG counties, but the average net outlays are probably similar across Southern California. Moreover, the $3,729 figure is the average of each annual average. Since more vehicles were purchased in the early to mid-2000s, and at higher prices, this figure likely underestimates the true average. See https://www.bls.gov/cex/csxmsa.htm

Some additional evidence, however, suggests that vehicle ownership did play a role in reducing ridership. When the OCTA surveyed its former riders in 2015, for example, 70 percent reported leaving transit because they had acquired a car (True North Research 2015).

Moreover, we have reason to think that the increase in vehicle ownership occurred disproportionately among populations that are more likely to take transit. Census data show that vehicle access increased most among lower-income households (we return to this point below, in Figure 40). Vehicle access also rose disproportionately among the foreign born. Table 4 shows changes in both zero-vehicle households and those with a vehicle "deficit" (that is, fewer vehicles than adults). Across the entire SCAG region, the share of households without vehicles fell 30 percent between 2000 and 2015, while the share of households with a vehicle deficit fell 14 percent. Among foreign-born households, these percent declines were larger — 42 percent and 22 percent — and among the foreign born from Mexico they were larger still. Among the foreign born from Mexico, the share of households without vehicles fell by two-thirds between 2000 and 2015, and the share with a vehicle deficit fell 28 percent. Thus car ownership rose across-the-board, but rose fastest among subgroups with a high propensity to ride transit. And these changes largely occurred between 2000 and 2010, which aligns with the timing of the transit downturn that began in 2007.

	All SCAG Share Households With:		Foreign Born Share Households With:		Mexican Foreign Born Share Households With:	
	No Vehicles	Vehicle Deficit	No Vehicles	Vehicle Deficit	No Vehicles	Vehicle Deficit
2000	10.2	30.1	14.1	47.1	15.7	57.2
2010	7.7	26.1	9.4	38.9	7.0	46.0
2015	7.1	25.9	8.2	36.6	5.4	41.6
Pct Change	-0.30	-0.14	-0.42	-0.22	-0.66	-0.27

Table 4. Vehicle ownership trends, SCAG region (US Census, Census IPUMs).

To refine our understanding of the association between vehicle ownership and transit use, we estimated a multivariate regression model. As a result of the data constraints we discussed earlier, this process involved two steps. Recall that our fundamental data obstacle was a mismatch between the availability of detailed, person-level information about travel behavior and our need to answer a question about changes over time. The CHTS provides detailed travel behavior, as well as demographic and socioeconomic data, but only for the year 2012. The Census provides detailed annual data, but for almost every category *except* travel behavior and transit use.

We resolve this problem by first using the CHTS to build a model that predicts total unlinked trips as a function of different demographic, socioeconomic, and neighborhood attributes. Importantly, all of these attributes – such as sex, nativity, income, vehicle ownership, and so on – are also tracked in 2000, 2010 and 2015 Census IPUMS microdata. This symmetry allows us to take the parameters of the CHTS model and apply them to time-series data from the Census. We use the CHTS, in short, to estimate the relationship between transit use and different social and economic characteristics, and then use the

Census to track how those characteristics have changed. Once we have measured that change in the Census, we can use the CHTS results to estimate how transit use would have changed as a result.

A core assumption of this approach is that the relationships between transit use and the socioeconomic and demographic attributes, which we can only measure in 2012, are relatively constant across time. We assume that changes in transit use from 2000 to 2015 are driven primarily by changes in the composition of the population, and not by changes in the propensity to use transit by people in different population groups. Our approach is more valid, for example, if transit use changes because there are more or fewer people in poverty, or with vehicles, and not because poor people or people with vehicles become more or less likely to use transit. The latter scenario is possible, but we cannot measure it.

We constructed models for California, the SCAG region, Los Angeles, and the SCAG region outside of Los Angeles. Figure 38 shows results from the first stage of our analysis: the major predictors of transit trips in in the SCAG region. Unsurprisingly, transit trips are highly associated with automobile ownership and access, even accounting for other potential determinants of transit use. Beyond automobile access, transit use is associated with lack of a driver's license, being nonwhite, and being foreign-born — especially being foreign-born and a new arrival.[16]

[16] While we experimented with different functional forms for the regression, we settled on a zero-inflated negative binomial regression. A negative binomial regression is a standard tool for analyzing overdispersed count data, and the zero-inflation corrects for bias that might otherwise be introduced when the value of the dependent variable is frequently zero, as it is with personal transit trips.

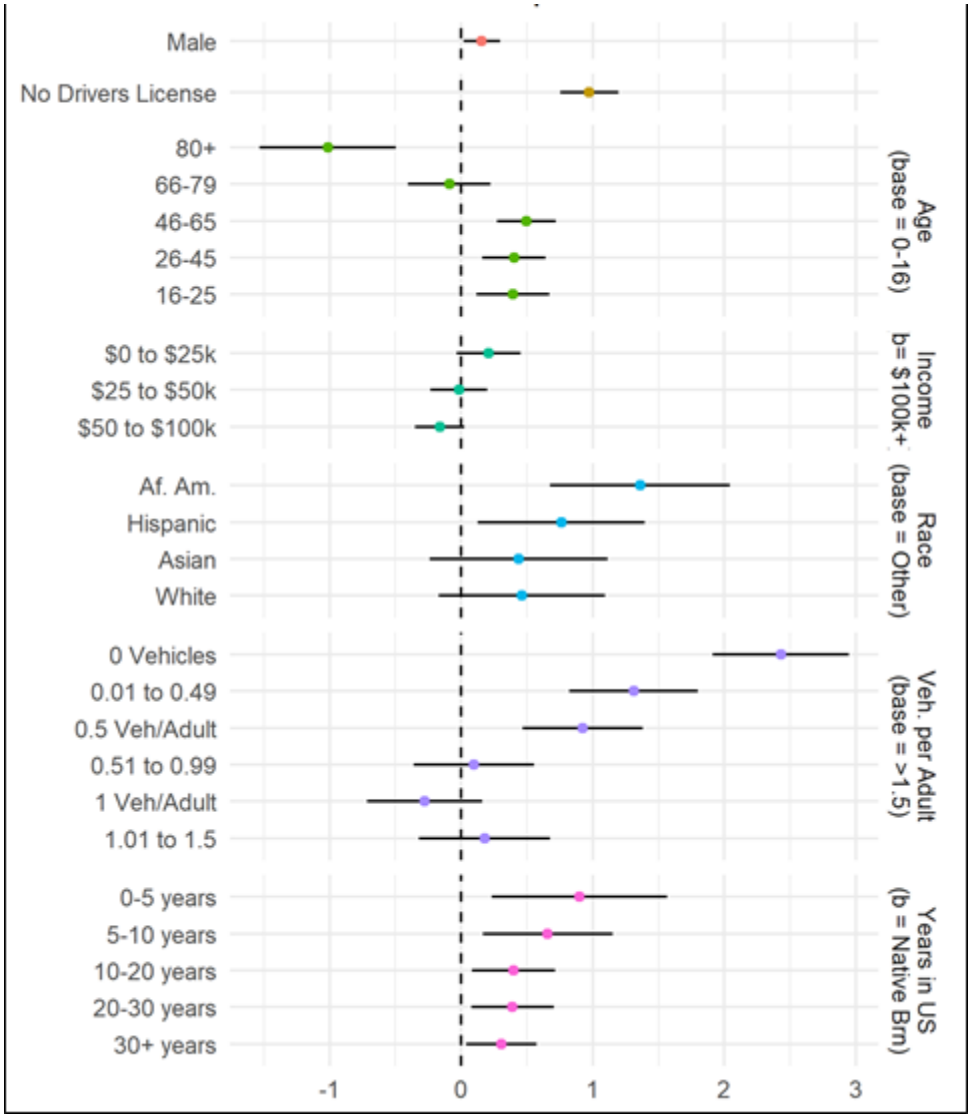

Figure 32. All SCAG unlinked trip predictors (CHTS).

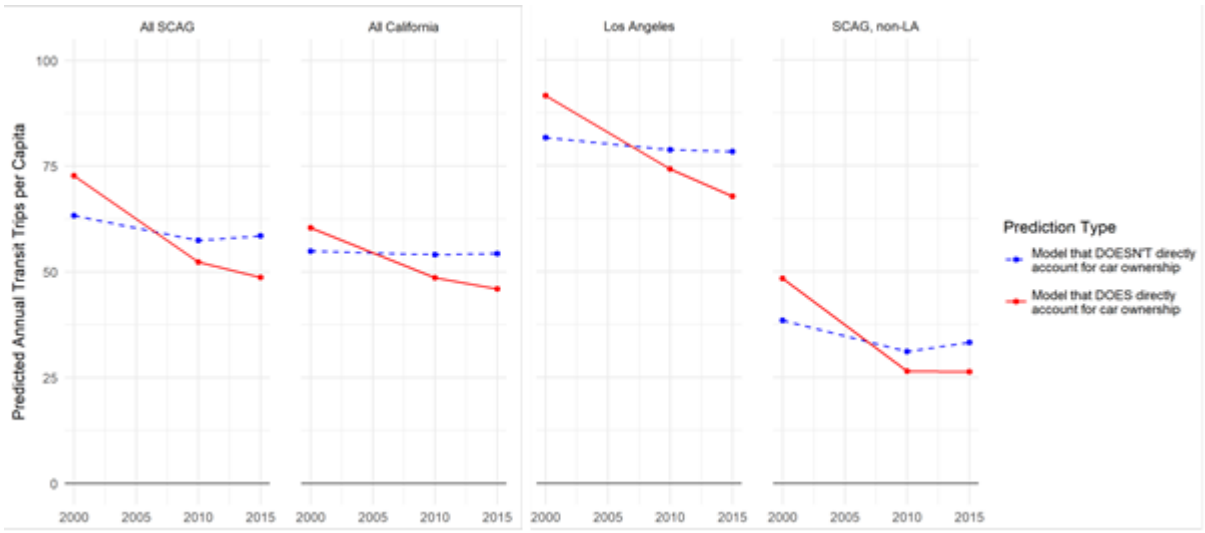

Figure 33. Relationship between increased vehicle ownership and falling transit trips (CHTS and US Census Bureau).

When we apply these parameters to Census IPUMS data from 2000, 2010 and 2015,[17] we see a powerful association between rising household vehicle access and falling transit trips. Figure 39 illustrates this relationship by graphing the results of two models. The first model, represented by the dashed line, predicts the change in county transit trips based on changes in all factors *except* vehicle access. In the SCAG region, the line has a mild negative slope from 2000 to 2010 and then a small positive slope from 2010 to 2015, suggesting that changes in these demographic, economic, and geographic factors would be associated with a small decline in transit use since 2000, albeit with a modest uptick between 2010 and 2015. The graphs for Los Angeles County and the SCAG region outside LA County suggest that this predicted modest uptick (which did not actually occur) would have taken place in SCAG's outlying counties. In Los Angeles County, transit trips were predicted to keep declining through 2015.

The second model, represented by the solid line, is identical to the first model but includes changes in automobile access. The difference in results is dramatic. This line starts at a higher point and falls sharply to a lower point, both of which suggest the important role automobile access has in influencing transit use. An absence of automobiles is associated with much more use, and the acquisition of automobiles is associated with much less. The line also suggests that many socioeconomic attributes play an essentially the intermediary role in mode choice. Income, nativity, age, location within the region, and many other factors can influence transit use, but they do so primarily by predicting people's access to private cars.

[17] A natural concern is that the CHTS might measure nativity, income, etc. differently than the Census. We validated our approach by first using the Census independent variables to replicate the CHTS estimates, suggesting this is not a problem.

Income alone, for example, does not take people off buses. Income helps people buy automobiles, and it is auto access that fuels an exodus from transit.[18]

Why did vehicle ownership rise so much? We cannot answer this question definitively, but as we discussed earlier in this report, vehicle ownership has both economic and non-economic determinants. The non-economic determinants include the growth or decline of immigrant groups who are less likely to acquire vehicles, and changes in licensure laws or other laws that surround owning and operating vehicles. The economic reasons can themselves be divided into two categories: changes in personal spending power, and changes in the price of vehicles themselves.

Since the foreign-born, and particularly the recently-arrived foreign-born, are less likely than the native-born to own vehicles, one possibility is that number or composition of immigrants changed. In absolute terms, the foreign-born population in the SCAG region grew between 2000 and 2015. However, it did not grow as fast as the overall population, so the region's share of foreign-born fell, albeit modestly (from 31% to just over 30%). This proportional decline occurred entirely within LA County, which has the most transit service. Every other SCAG county saw its share of foreign-born rise.

	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura	All SCAG
2000	32.2%	36.2%	29.9%	19.0%	18.6%	20.7%	31.0%
2010	31.9%	35.6%	30.5%	22.4%	21.6%	22.9%	31.0%
2015	32.6%	34.7%	30.5%	22.0%	21.3%	22.8%	30.4%
% Change	1.2%	-4.3%	2.0%	13.7%	12.6%	9.2%	-2.0%

Table 5. Share foreign born residents, Southern California counties (2000-2015). US Census.

The *composition* of immigrants, however, changed more dramatically. Table 6 shows that between 2000 and 2015 (and especially between 2000 and 2010), the share of the foreign-born from Asia rose 23 percent, while the share from Central America fell ten percent, and the share from Mexico fell over 13 percent. In 2000, 48 percent of SCAG immigrants were from Mexico, while by 2015 only 41 percent were. Because existing evidence suggests that immigrants from Mexico and Central America are less likely to have automobiles and drive than immigrants from other origin countries, this shift could contribute to rising auto use, especially among the foreign born (US Census ACS 2015).

[18] We should note that these models are *not* predictive models – their purpose is not to yield output that precisely matches the observed transit ridership in the SCAG region (and in fact our predictions do not match observed ridership). We do not build a predictive model for two reasons. First, we are not using the correct data to do so. Regional ridership counts come from annual reporting to the NTD. Because we need person-level data that includes socioeconomic attributes, we are using one-day travel diary data from the 2012 CHTS, and then matching that to person-level data from three Census years. Second and more important, the goal of the regressions is to test a particular hypothesis – that vehicle access is the decisive factor in transit use – not to predict transit ridership. Our output thus yields an estimate of the relative magnitude of the importance of auto access, *not* a precise measure of how many trips each additional increment of auto access actually cost the SCAG region.

	2000	2010	2015	Change
Asia	28.7%	33.9%	35.3%	23.0%
Americas	63.7%	59.1%	57.7%	-9.4%
Latin America	62.4%	58.0%	56.5%	-9.5%
Central America	58.8%	54.5%	53.0%	-9.9%
Mexico	47.7%	42.4%	41.3%	-13.4%
South America	2.6%	2.7%	2.7%	3.8%

Table 6. Composition of SCAG immigrants (2010-2015).

Moreover, among both the foreign-born overall and the foreign-born from Mexico, in data from the US Census IPUMs we see both an assimilation effect and a cohort effect reinforcing the trend toward more vehicles. More recent waves of immigrants are more likely to have vehicles shortly after arrival, and those who do not are faster to acquire them as time goes on.

In the year 2000, for example, 31 percent of the foreign-born households in the SCAG region that had emigrated from Mexico between 1990 and 1999 had no household vehicle, and 74 percent had a vehicle deficit. By 2010, just 9.3 percent of this same cohort of immigrant households had no vehicle, and only 51 percent had a vehicle deficit. By 2015, these figures were 7 percent and 41 percent. This is the assimilation effect; as time passes, immigrants begin to behave more like the native -born.

The cohort effect, however, is more notable. The more recent waves of immigrants to Southern California are more likely to own vehicles shortly after arrival, and as such they have not fully replenish the stock of zero-vehicle households that shrank as existing immigrants assimilated toward cars. In 2010, only 17 percent of the Mexican immigrant households in the SCAG region that had arrived in the US between 2000 and 2009 had no vehicles, compared to 31 percent for those that arrived between 1990 and 1999 in the year 2000. Similarly, only 62 percent of these 2000-2010 arrivals had a vehicle deficit in 2010; in 2000, 74 percent of Mexican immigrants who had arrived since 1990 had a vehicle deficit. By 2015 the share of zero-vehicle households in thepost-2000 cohort was down to 10 percent, and the share with vehicle deficits down to 49 percent. And by in 2015, only 11 percent of Mexican immigrant households that had arrived in 2010 or after did not have a vehicle. A similar pattern holds for the foreign-born overall. More recent waves of immigrants acquired more vehicles more quickly, meaning that as previous waves of immigrants acquired cars, the ranks of the carless were shrinking rather than being replenished.

In sum, immigrants overall are now a slightly smaller share of the population, but also more likely to own vehicles, and to own them earlier after arrival. Mexican immigrants, who are a mainstay of transit ridership in Southern California, remain more likely than the foreign-born overall to live in households without vehicles, but since 2000 they have both added household vehicles and become a smaller share of total immigrants.

It is not clear *why* the foreign-born began adding more cars. In 2015, California began issuing driver's licenses to undocumented immigrants. While licensure may have increased vehicle ownership, for a variety of reasons we do not think it played a large role. First, a license makes a vehicle more useful, but not more affordable; if the barrier to acquiring a vehicle is price, a license does little to overcome that. One might argue in response that legality and not price was the actual barrier, but existing evidence suggests this is simply not the case: many undocumented immigrants, even without licenses, were already driving (Lovejoy & Handy, 2008). Indeed, the prevalence of undocumented driving was the primary motivation for the law that authorized licensure. The decision to issue licenses was justified primarily on safety, not mobility, grounds – there were concerns, for example, that unlicensed undocumented drivers would flee the scene of accidents. It is possible that undocumented immigrants drove *less* – and took transit more – before being licensed, and that licensing did help depress transit use. Even this scenario, however, has its limits. A law that took effect in 2015 cannot explain a per capita ridership decline that began in 2007 or an explosion in vehicle ownership that began in the early 2000s.

Ruling out legal changes brings us to possible economic factors for increased vehicle ownership: Perhaps immigrants (and others) began acquiring more cars because they had more money. A small but persuasive literature on personal consumption shows that poorer people tend to convert even small increases in income into vehicle purchases – a testament to how valuable vehicle access can be (Aaronson, Agarwal, & French, 2012; Adams, Einav, & Levin, 2009; Leininger, Levy, & Schanzenbach, 2010; Parker, Souleles, Johnson, & McClelland, 2013; Souleles, 1999).

The 2000-2015 period was volatile economically, as the economy grew steadily before cratering during the Great Recession. During most of this time, furthermore, median wages and incomes were stagnant. Median household income in LA County, for example, was about $59,000 in both 2000 and 2015, and was slightly lower during the recession in 2010. The Census suggests that newer waves of immigrants are if anything slightly poorer than the cohorts that came before them: In 2000 average incomes of immigrants that had arrived since 1990 was slightly higher than the average income of immigrants in 2010 who had arrived after 2000. Finally, we can see in Figure 40 that vehicle growth occurred across all income groups, for both the foreign-born and the native-born. In 2000 just under 40 percent of households earning less than $25,000 per year had a vehicle-deficit, as did 60 percent of immigrant households in the same income bracket. In 2015 less than 30 percent of native-born households in the same income bracket had a vehicle-deficit, as did just over 50 percent of immigrant households. The pattern holds for households earning $25,000 to $50,000, and for more affluent households.

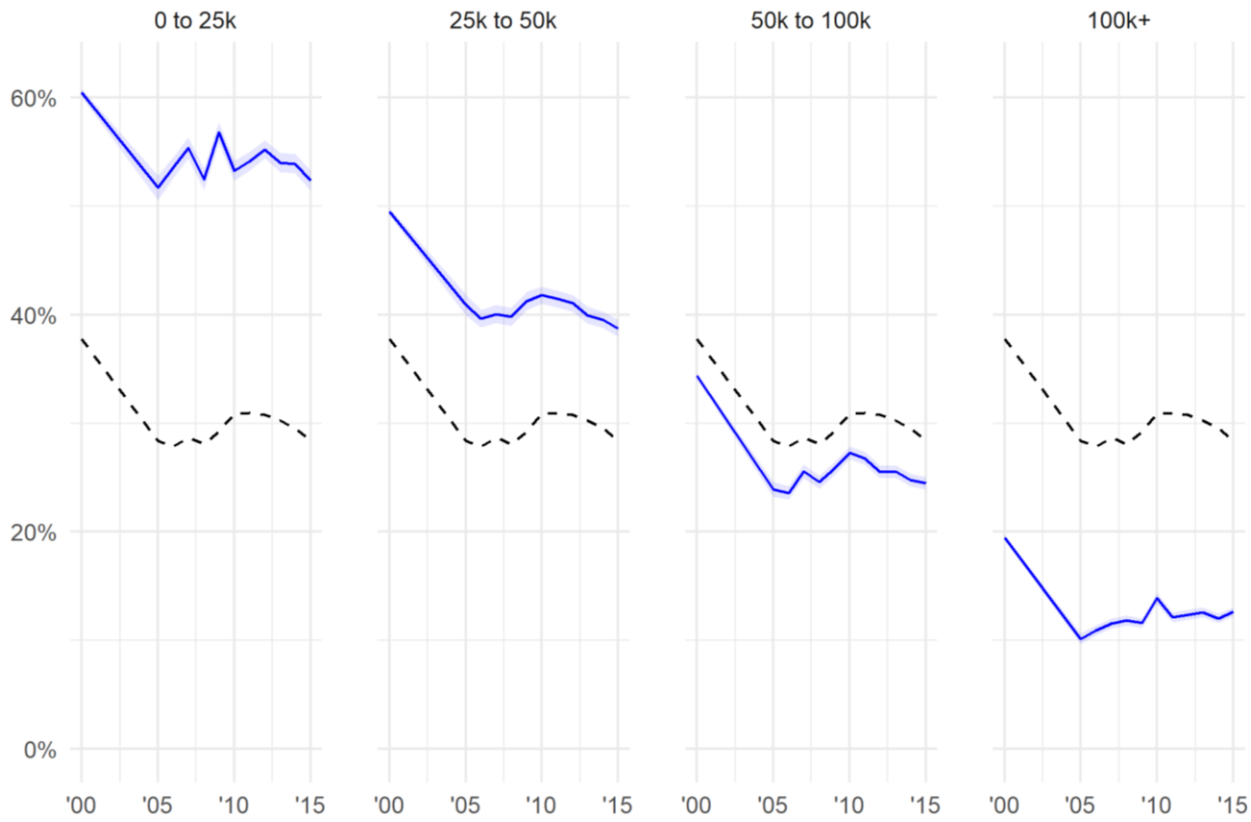

Figure 34. Share of households with vehicle deficits, by income and nativity, 2000-2015, US Census (solid line = foreign born, dashed line = native born).

It is therefore not obvious that rising incomes played a large role in rising vehicle ownership. Certainly the macro-economy played some role in changing levels of transit use. Transit use contracted during the Great Recession: A robust economy puts more people to work, which increases both commuting and discretionary travel. A faltering economy does the reverse. But these same economic trends do not appear to explain why people acquired so many more vehicles than they had in previous periods.

Even at constant incomes, households can acquire more vehicles if the effective price of those vehicles falls. The effective price reflects not the sticker price, but the actual outlay required of a consumer to drive the vehicle home. A large part of this outlay is often a down payment, meaning that vehicles can become more affordable not just if their price declines, but also if financing that price becomes easier.

Some evidence does suggest that vehicle finance became easier during this time. Although lost somewhat in the shadow of easy home-lending credit, automobile credit also surged in the run-up to the Great Recession. And unlike home lending, which tightened considerably after the crash, automobile lending has remained relatively loose. Consumers with good credit scores (typically above 700) can find auto loans with low- and sometimes even zero-interest rates. Since the recession, the share of SCAG-region residents with credit scores below 660 (considered subprime) has fallen (Figure 41), suggesting that consumers have gotten better access over time to low-interest loans (Federal Reserve Bank of New York and Equifax, various). Subprime auto loans also remain prevalent, allowing consumers with poor credit histories or low

incomes to finance vehicle purchases. U.S. auto loan originations among subprime consumers increased 140 percent from 2010 to 2015 (New York Fed Consumer Credit Panel / Equifax). We do not have local-level data on vehicle debt, but inflation-adjusted per capita vehicle debt in California rose 91 percent between 2000 and 2015 (Federal Reserve Bank of New York).[19]

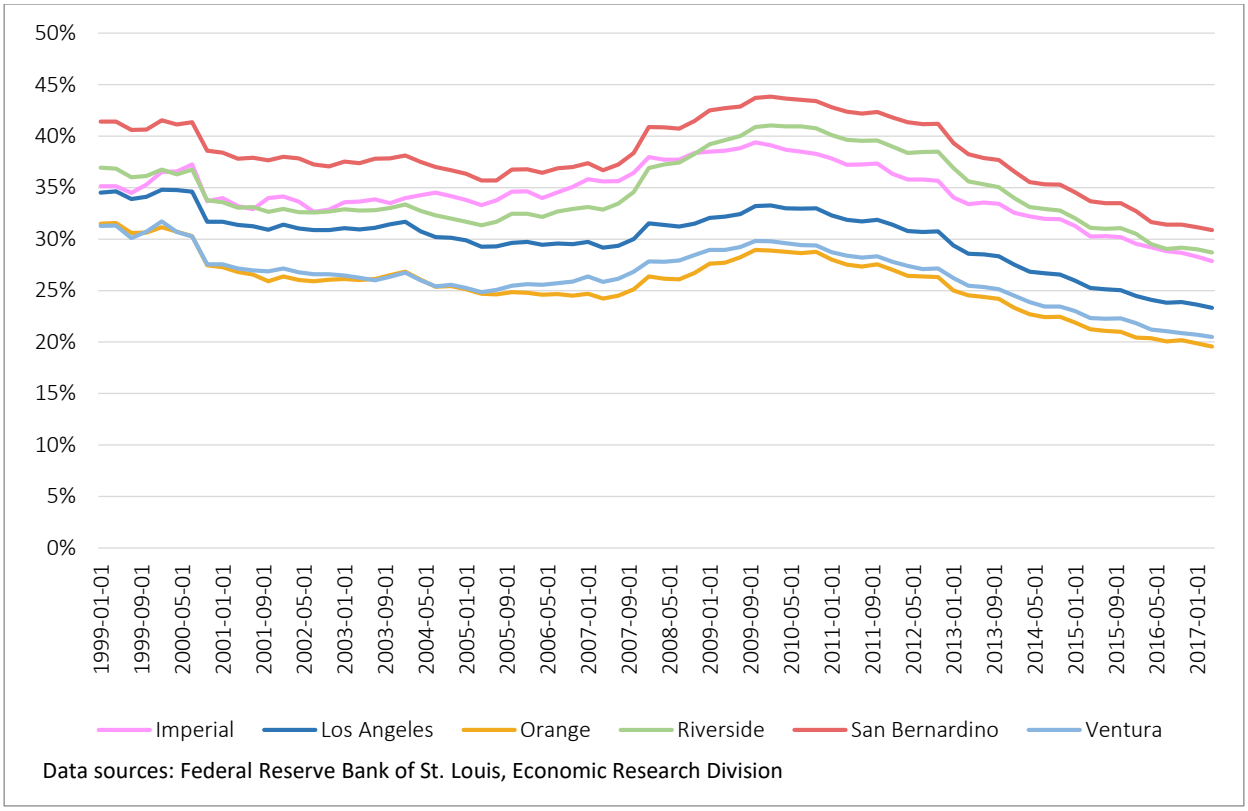

Figure 35. Percent of sample with credit scores below 660, by county in SCAG region.

CONCLUSION

Per capita transit ridership, long sluggish in Southern California, began to fall in 2007. In 2012 that per capita decline accelerated, and manifested as a more noticeable and more alarming absolute decline. The precise reasons for this decline are almost certainly manifold, and hard to disentangle. Gas prices fell sharply after rising steeply. The explosive growth of Uber and Lyft provided new mobility options to some people who had been mobility-constrained. In Orange County, fares rose substantially. On LA Metro, by at least some accounts, feelings of danger increased. Some of the people most likely to use transit moved to areas where transit was less prevalent. Especially in recent years, all these factors most likely contributed to transit's downturn.

[19] Data come from the New York Federal Reserve Bank's Consumer Credit Panel.

But in weighing the evidence, the overwhelming factor appears to be a dramatic increase in the stock of private automobiles. Between 2000 and 2015 Southern Californians acquired vehicles at nearly four times the rate they had between 1990 and 2000. This growth of the private vehicle stock lines up—in timing, in magnitude, and in theory—with the region's falling transit use. Vehicle access grew across all income levels and groups, but disproportionately among those groups, like the low-income and foreign-born, who are most likely to ride transit. Transit ridership in the SCAG region has long depended on a sizable minority of people who did not, largely for economic reasons, have access to cars. After 2000, many of these people acquired cars, and it should not surprise us that they started riding transit less.

To be sure, the case we build in reaching this conclusion is circumstantial. For reasons we have already enumerated, the data available to examine transit riders are scarce and fragmented, which leaves alternative explanations possible if not plausible. Certainly future research should emphasize more data collection. Given the data available today, however, in our judgement rising vehicle ownership is the best explanation for falling transit ridership.

If this explanation is sound, it poses a daunting problem for transit operators. When lower-income people graduate from transit to driving, transit agencies bear a cost, but the other side of that cost is a large benefit for both the people who start driving *and* for society overall. In the aggregate, Southern Californians drive too much, once the various costs of pollution, congestion and crashes are accounted for. But some Southern Californians – the poorest of them – drive *too little*, and both their lives and the region as a whole would be improved if they drove a bit more. The low-income person who acquires a vehicle often makes fewer trips than an affluent person (driving is expensive) and the trips they make are often essential, and have social benefits that exceed their social costs. A car trip by a low-income household is more likely than one by an affluent household to involve finding and keeping work, getting to school, or accessing better health and daycare options. These trips might modestly increase congestion and pollution, but they have large paybacks in employment, earnings, and overall well-being that exceed those costs. Affluent households, in contrast, make many more trips, and more trips whose social value is lower (they might increase congestion and pollution not just by driving to work, but also by driving to lunch, or to visit friends).

Given the powerful difference a car can make in the lives of low-income people, efforts by transit agencies to recapture low-income riders can have a perverse impact: they would target some of the highest-value vehicle trips in the region. Ideally, of course, transit agencies would pull people away from lower-value vehicle trips. It makes little sense to deprive a low-income person of their trip to work at a location poorly served by transit, when affluent people routinely drive for errands and visits that they could easily complete by foot or transit. A quick trip to a store a half mile away (or a trip to a store a mile away when a comparable store is a quarter mile away) is more likely to have social costs that exceed its benefits. And these trips are abundant.

Given this situation, and given the ambitious greenhouse gas reduction goals that California has assigned to transit, planners and operators may need to expand transit's target market. Transit should by no means abdicate its social service mission, but as we stated in the introduction, per capita transit use falls when current riders stop riding, and when new residents don't start. Transit today relies on a high rate of use by a narrow base of people. But if that narrow base of people is acquiring vehicles, transit's healthy future lies in reversing those circumstances, and striving for at least a low rate of use by a broad base of people. The SCAG region lost 72 million transit rides annually from 2012 to 2016. This number seems daunting,

but the region has 18.8 million people. According to the CHTS, about 77 percent of those people (roughly 14.5 million), ride transit rarely or never. Herein lies vast untapped potential. If one out of every four of those people replaced a single driving trip with a transit trip once every two weeks, annual ridership would grow by 96 million—more than compensating for the losses of recent years.

The obstacle to this outcome, however, is large and beyond the direct control of transit operators: driving is too cheap. The large subsidies given to transit in recent years pale next to the longstanding subsidies for automobiles that are hidden in unpriced road use, unpriced or underpriced street parking, high minimum parking requirements, and taxpayer- and developer-financed road-widenings. If public policy does not adequately confront underpriced driving, then transit ridership will likely continue to falter, and transit will not meet its ambitious environmental goals.

Appendix A

Fare regression output.

Descriptive Data (data are in panel form; observations are agency-years). Route coverage = route miles/service area. Headways = route miles/ (revenue miles/service miles). The service area is in square miles. Service area and service population are the difference between UZA average level of service and service area/ service population.

Absolute Levels

	mean	sd	n
unlinked passenger trips	15,213,380	130,300,000	9,030
vehicle revenue hours	395,268	1,659,684	9,037
headway	33.07	51.01	6,954
route coverage	3.18	6.32	6,922
service area	713.2	8,963.3	9,793
service population	718,549	1,729,745	9,794
fare (2015$)	$1.71	$2.52	8,647

Change from Prior Year

	mean	sd	n
change in unlinked passenger trips	170,442	6,338,137	8,037
change in vehicle revenue hours	5,015	87,867	8,047
change in headway	0.02	18.81	6,277
change in route coverage	-0.07	5.45	6,255
change in service area	0.0	0.4	8,852
change in service population	0	0	8,853
change in fare (2015$)	$0.01	$0.64	7,702

Regression Output:
The regressions are linear and all variables are naturally log-transformed.
Models were run with the dependent variables being levels and changes.
Model 4 is the model discussed in the text.

* change from the prior year is calculated using absolute levels

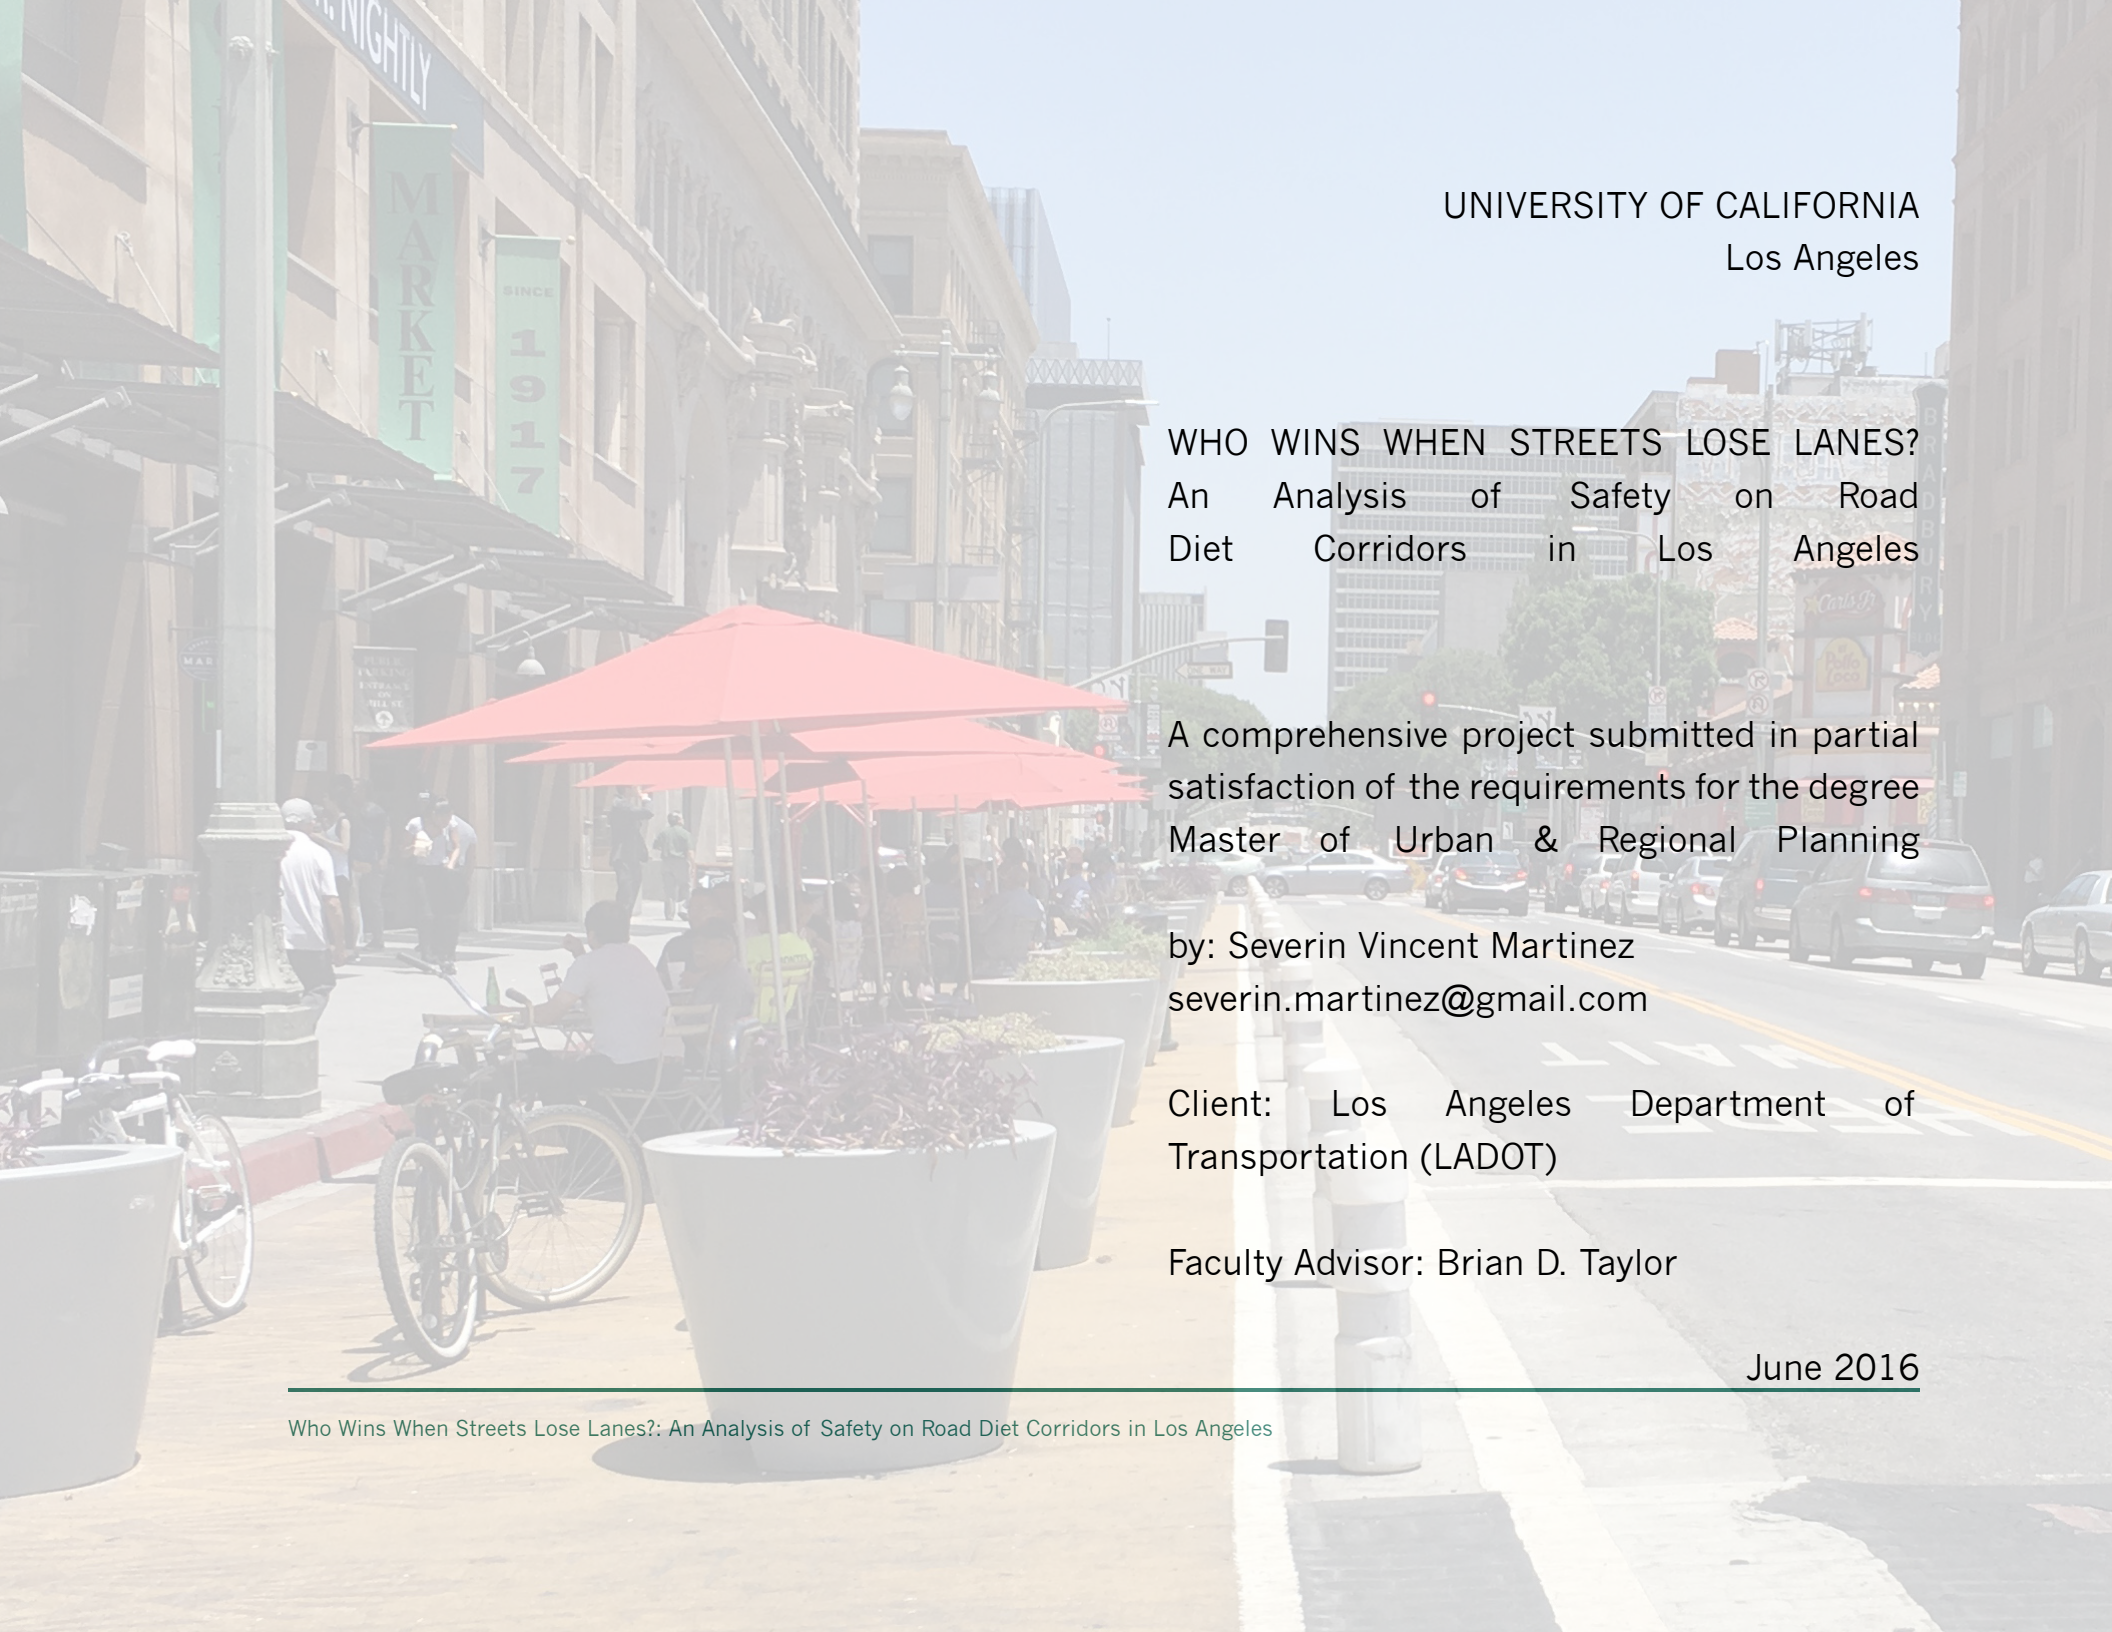
Who Wins When Streets Lose Lanes?

An Analysis of Safety on Road Diet Corridors in Los Angeles



By: Severin Martinez

June 2016

ACKNOWLEDGEMENTS

I would like to thank the following individuals for the irreplaceable support, knowledge, and assistance they provided to help make this project possible:

Brian D. Taylor	UCLA, Faculty Advisor
Michelle Mowery	LADOT, Client Advisor
John Fisher	LADOT (Formerly)
Tim Fremaux	LADOT
Ryan Taylor-Gratzer	UCLA

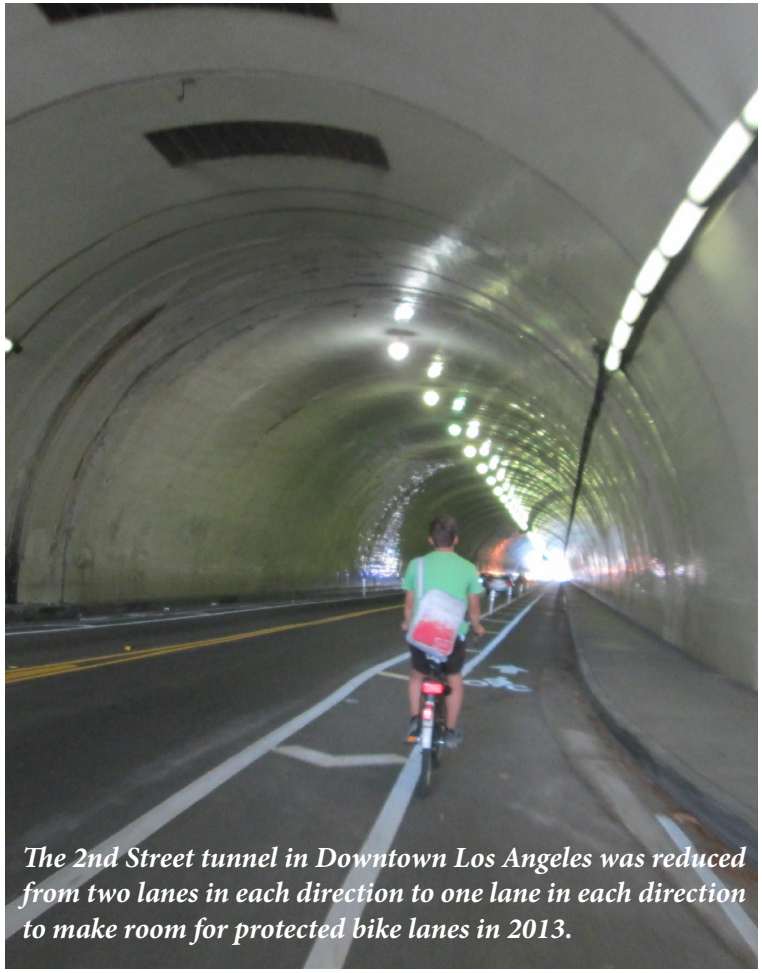
WHO WINS WHEN STREETS LOSE LANES? An Analysis of Safety on Road Diet Corridors in Los Angeles

A comprehensive project submitted in partial satisfaction of the requirements for the degree Master of Urban & Regional Planning

by: Severin Vincent Martinez
severin.martinez@gmail.com

Client: Los Angeles Department of Transportation (LADOT)



Faculty Advisor: Brian D. Taylor

June 2016

DISCLAIMER

This report was prepared in partial fulfillment of the requirements for the Master in Urban and Regional Planning degree in the Department of Urban Planning at the University of California, Los Angeles. It was prepared at the direction of the Department and of Los Angeles Department of Transportation as a planning client. The views expressed herein are those of the authors and not necessarily those of the Department, the UCLA Luskin School of Public Affairs, UCLA as a whole, or the client.

TABLE OF CONTENTS

The 2nd Street tunnel in Downtown Los Angeles was reduced from two lanes in each direction to one lane in each direction to make room for protected bike lanes in 2013.

ABSTRACT

Traffic safety is a growing area of concern in the United States. In recent years, a number of cities have adopted so-called "Vision Zero" policies in an effort to eliminate severe and fatal traffic collisions. In 2015, Los Angeles joined the ranks of cities with such initiatives. One way in which Los Angeles officials hope to achieve this goal is through the implementation of "road diets." A road diet reduces the number of through travel lanes to create space for streetscape elements such as bike lanes, center left turn lanes, and on-street parking. The most common road diet – sometimes referred to as the classic road diet – restripes a street from two lanes in each direction, to a single lane in each direction with a center turn lane. According to the Federal Highway Administration (FHWA) this change is a proven safety countermeasure estimated to reduce crashes, on average, by about 29 percent.

This project analyzes changes in rates of collisions, injuries, and severe and fatal injuries on five streets that received the "classic" road diet treatment in Los Angeles between 2006 and 2009. Through an observational "before and after" analyses with comparison group, on average, the studied road diets experienced statistically significant reductions in crash and injury rates of 32.4 percent (+/-21.5%) and 36.7 percent (+/-15.4%), respectively. Meanwhile, severe and fatal injuries among the streets with road diets experienced an absolute decrease of 1, but no statistically significant change in incident rate. The comparison group, on the other hand, did not experience any statistically significant change in any of the categories studied.

The findings of these analyses echo those from similar and more extensive studies conducted elsewhere that collectively suggest road diets have a range of effectiveness but can typically reduce crashes between 20 and 30 percent. Looking ahead, road diets appear to be a cost-effective means of improving street safety in Los Angeles. However, given the relatively small number of road diets examined here, the City should conduct thorough before-and-after analyses where road diets are implemented to critically evaluate the performance of these projects on a case-by-case basis.

DEFINING A ROAD DIET

The term road diet was first used by pedestrian planner and activist Dan Burden in 1996 in an article he coauthored with Peter Lagerwey, titled "Road Diets: Fixing the Big Roads." Burden defines a road diet as "anytime you take any lane out of a road" (Press, 2011, 00:10). Typically this is done to create space for bike lanes, wider sidewalks, additional parking, medians or dedicated left turn lanes. Some also apply the term to situations in which travel lanes are narrowed, rather than removed (Road Diet Case Studies, 2015; Press, 2011). In my research I use the definition described by Burden but specify three subcategories (Figure 2,3,4):

1) **Removing a general purpose travel lane in one or both directions**

2) **Removing center left turn lane/two-way left-turn lane/ left turn channelization**

3) **Removing a peak-hour lane in one or both directions**

The City of Los Angeles has implemented all three types of road diets in order to create space for bicycle lanes, wider sidewalks, additional on-street parking, center left turn lanes, and medians. Only about 1 percent of the documented road diets

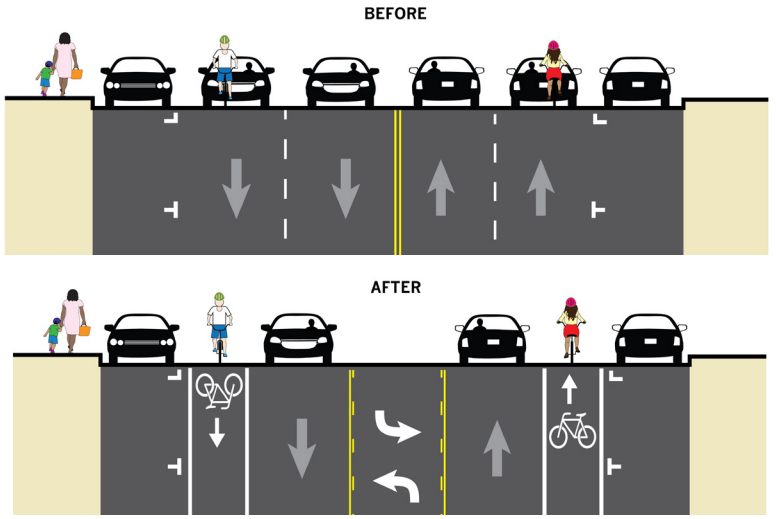

FIGURE 1: The most common type of road diet typically encountered. Sometimes referred to as the "classic" road diet, Los Angeles has implemented 55.7 miles of this type of configuration.

installed in Los Angeles to date involved lane reductions without adding any of the aforementioned street elements.

The most common type of road diet converts a street with two lanes in each direction into one with a single lane in each direction and a center turn lane (Figure 1). This change is sometimes known as the classic road diet or a four lane to three lane conversion.

DEFINING A ROAD DIET

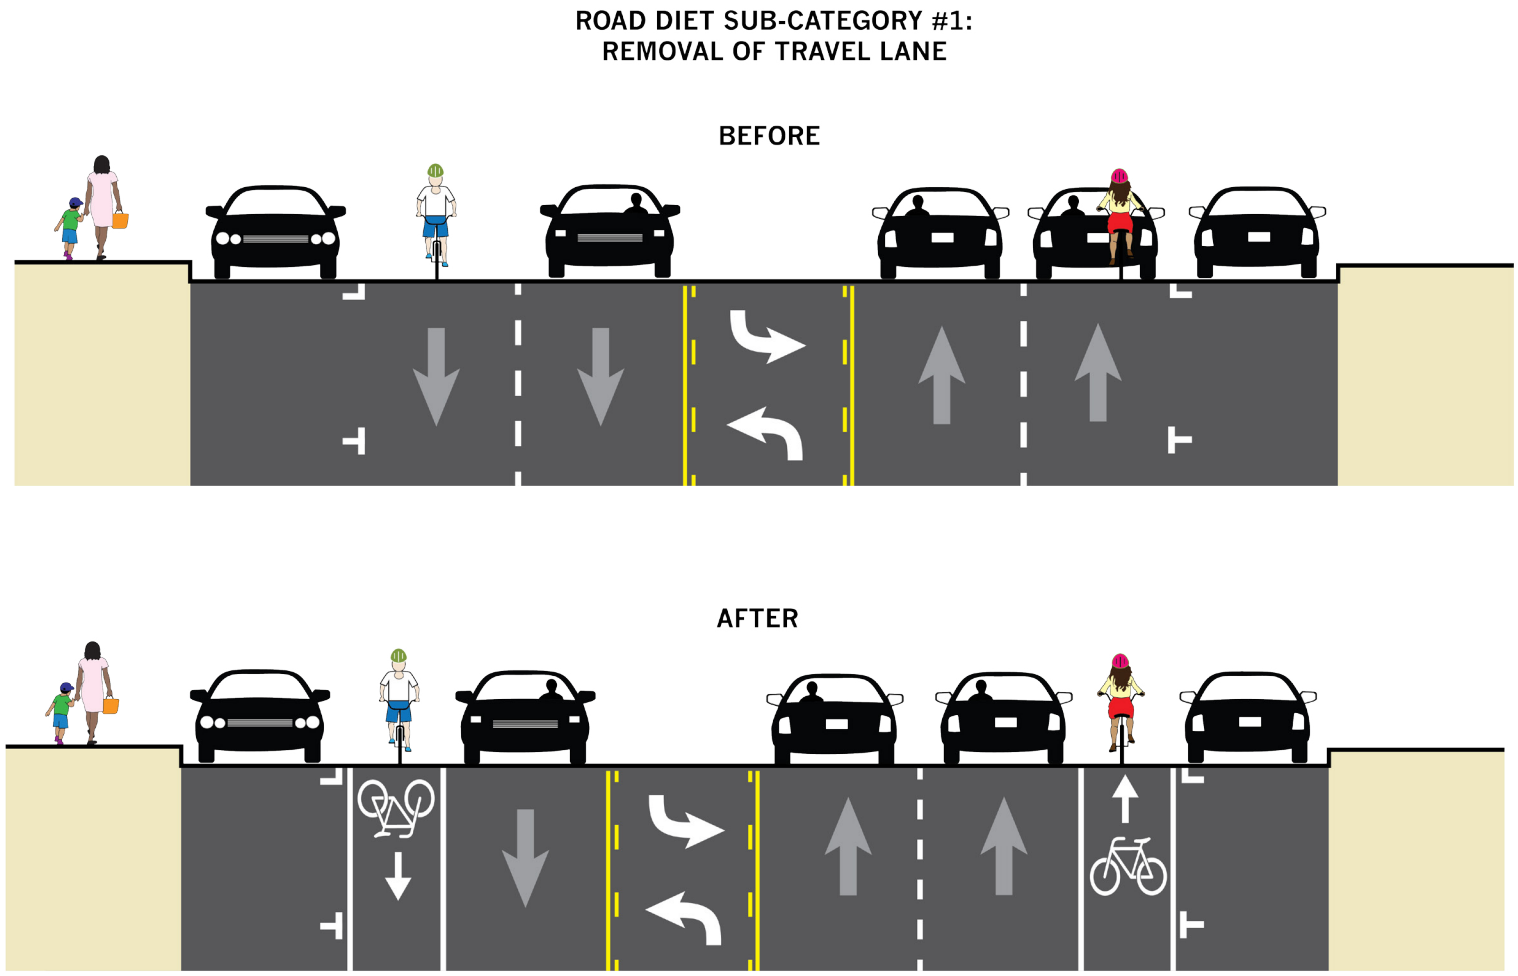

FIGURE 2

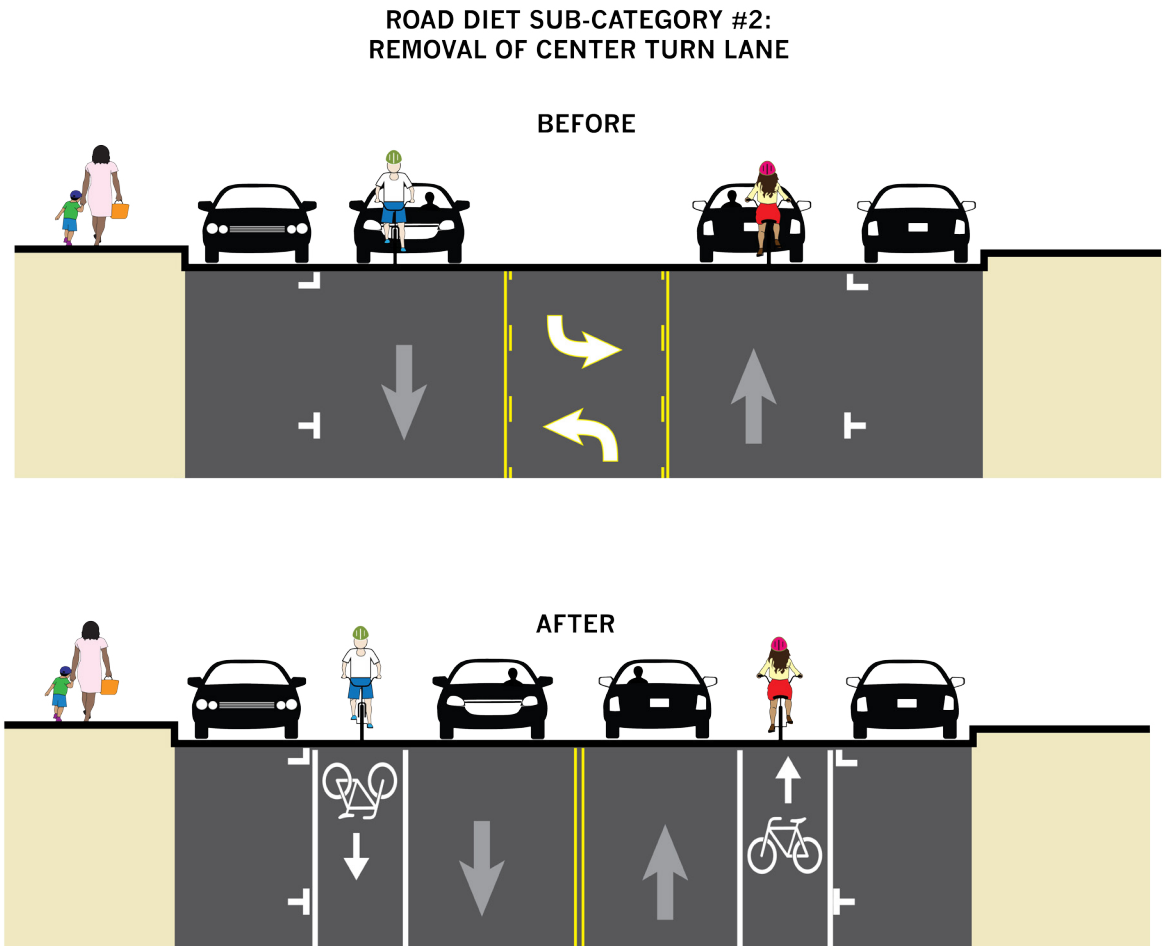

ROAD DIET SUB-CATEGORY #2:
REMOVAL OF CENTER TURN LANE
BEFORE
AFTER

FIGURE 3

DEFINING A ROAD DIET

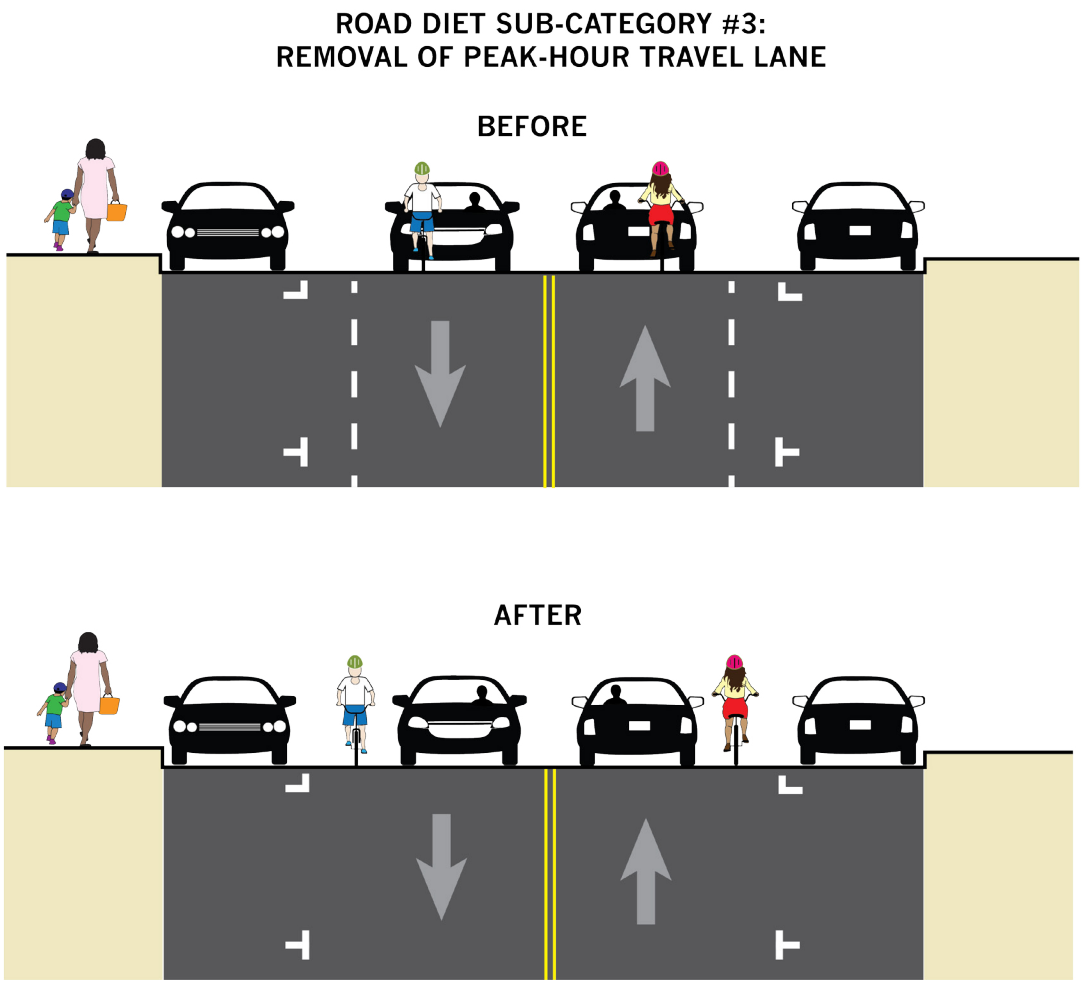

FIGURE 4

Of the roughly 113 miles of road diets documented in this research, 105 miles were implemented through travel lane removal, 6.5 miles through peak hour-lane removal, and 1.3 miles through center turn lane removal.

Road diets are sometimes mistaken as a measure that is only implemented to create space for bike lanes. Although the vast majority of road diets in the City of Los Angeles have produced bike lanes, only 32.6% have produced bike lanes exclusively. Many road diets produce center turn lanes or provide more on-street parking in addition to bike lanes. Approximately 30% of all documented road diets – 33.4 miles – did not receive any bike lanes when installed.

Road diets commonly create a dedicated lane that facilitates left turns removed from the general travel lanes. This space is variously called left turn channelization, two-way left turn lane (TWLTL), or center left turn lane (CLTL). While these terms are interchangeable, in this report I use the term "center left turn lane" because it describes the location of the lane and uses the most common language. I will sometimes shorten the term to "center turn lane" in order to simplify the terminology further.

Top Picture: Eastern Avenue in the City's El Sereno neighborhood requires left turning vehicles do so from the inner lane, which is also the lane faster moving vehicles are expected to use. It does not have a center turn lane. While the street is not scheduled to undergo a road diet at this time, it shows what the "before" situation is like on streets that do receive the "classic" road diet treatment.

Bottom Picture: This portion of San Pedro Street in South LA was formerly two lanes in each direction. It received the "classic" road diet treatment in 2013 and left turning vehicles are now separated from through travel.

1 – INTRODUCTION

Throughout the United States, city officials are increasingly concerned about traffic safety. This is apparent through the number of cities adopting so-called "Vision Zero" policies, which are efforts to eliminate serious and fatal injuries that result from traffic collisions on city streets. On August 24th, 2015, Los Angeles mayor Eric Garcetti formally signed into action Executive Directive Number 10, announcing that the City would institute a Vision Zero initiative. The goal? A 20 percent reduction to the approximately 200 traffic fatalities that occur in the City by the year 2017, and to fully eliminate traffic fatalities citywide by 2025 (Executive Directive, No. 10, 2015). The City has a variety of tools at its disposal to aid its efforts of eliminating traffic fatalities, but key to achieving the set benchmarks will be the implementation of safety enhancing infrastructure and physical reconfigurations to roadways. Unlike other techniques, such as public service announcements and traffic enforcement, which are temporary in both time and place, engineering interventions produce permanent changes to streets.

One tool for addressing traffic safety is an intervention known as the "road diet," a type of street reconfiguration which reduces the number of travel lanes to create space for other streetscape elements such as bike lanes, center left turn lanes, medians, and curbside parking. Often, road diets do not actually narrow the physical width of a roadway, but instead re-arrange how space is used curb-to-curb. The most commonly installed road diet converts a street with two lanes in each direction into a single lane in each direction with a center turn lane.

According to the Federal Highway Administration (FHWA), the road diet is a proven safety countermeasure, estimated to reduce crashes by about 29 percent (Persuad and Lyon, 2010). The reasons why road diets improve safety vary depending on their specific configurations. However, by reducing the number of travel lanes, they typically reduce unsafe lane changes, separate turning movements from through travel, and discourage speeding (Tan, 2011). Although they usually reduce the number of travel lanes, road diets generally have minimal impact on travel times if they are implemented on streets with excess carrying capacity (Tan, 2011). Sometimes, a street with two lanes in each direction might already operate as a "de facto" road diet if the inner lane is frequently used by left turning vehicles. In such situations, the street is effectively

reduced to a single lane of through traffic (Knapp, et. al, 2014, 9).

Not only are road diets an effective safety treatment, they are also comparatively inexpensive. Whereas a traffic signal can cost upward of $250,000 per intersection (Fortin, 2012; EGP Staff Report, 2013), a road diet can often be achieved for a fraction of the cost at approximately $50,000 per mile (Desmond, 2015; T. Fremaux, personal communication, 6 April 2016). If a road diet is implemented as part of routine street resurfacing (Knapp, et. al, 2014), even this cost is nearly entirely eliminated since restriping roadway markings is part of any resurfacing project. Recognizing the low-cost and high-impact of road diets, Los Angeles has implemented dozens of them in recent years, sometimes as part of routine resurfacing but also to explicitly address safety on high-collision corridors. While most road diets the Los Angeles Department of Transportation (LADOT) has installed predate Vision Zero, the majority were still motivated by the idea of improving safety (J. Fisher, personal communication. 29 January 2016).

"Whereas a traffic signal can cost upward of $250,000 per intersection, a road diet can often be achieved for a fraction of the cost at approximately $50,000 per mile."

Need for Research

Despite producing measurable safety improvements and having generally been well-received when implemented elsewhere, road diets have met with mixed reviews locally – especially where road diets have affected traffic as a result of reducing the number of lanes. Those opposed to road diets are sometimes concerned the projects might have unintended consequences, such as traffic jams during rush hour, diversions onto quieter local streets not designed for high volumes of traffic, or potentially delaying emergency responders (Zahniser and Nelson, 2015; Lopez, 2015). Others argue there are more effective ways of reducing collisions without reducing the number of lanes (Lopez, 2015), or that when a road diet is implemented to create bike lanes, the majority of travelers – those who drive – do not benefit from the change (Zahniser, 2015;

Feldman, 2015). Meanwhile, those in favor of additional such road diet projects cite national statistics demonstrating the benefits of road diets (Zahniser and Nelson, 2015; Zahniser, 2015), but struggle to point to any substantive findings in Los Angeles, despite the growing abundance of local examples. When a new road diet is proposed, it is not uncommon for people to share anecdotes about how well or poorly an existing road diet has worked nearby based on personal experience (Kohli, 2015; Meredith, 2015), but there are typically no hard facts on the table to steer the discussion.

Road diets in the City of Los Angeles will continue to be disputed when there is no immediately local evidence of how they impact traffic and safety. Road diets are a context sensitive solution (Knapp, et. al, 2014), so average estimates of safety improvements can undermine, or overstate, the actual effect road diets will have in a particular case. Existing studies suggest road diets can have a range of effectiveness depending on the circumstances in which they are implemented (Thomas, 2013; Harkey, et. al, 2008). Thus, evaluating existing projects would inform local road diet discussions since the City is considering additional such projects.

Project Outline

This research consists of two components that can help guide the on-going conversation of lane allocation and traffic safety. It catalogues all known and documented road diets installed within the City, based on research and consultation with current and former LADOT employees (Appendix A). Knowing where road diets have been installed, and how they have generally been implemented set the context for future discussion. This research also studies collision rates on five "classic" road diets implemented between 2006 and 2009 in different parts of the City, and compares these results with similar, but untreated, street corridors over the same time period. Because collisions can fluctuate randomly and due to broader citywide trends over time, the comparison corridors are used as a control to measure how traffic safety would have been affected had the studied road diets not been implemented.

Before conducting my analyses, I reviewed the literature on road diets, including both guidelines and safety evaluations. Road diets are not a Los Angeles-specific phenomenon and have been documented elsewhere from as early as the 1970's (Lagerwey and Burden, 1999; Knapp, et. al, 2014). Public agencies and researchers

across the country have developed guidelines under which road diets are best suited based on experience from other parts of the country (Knapp, et. al, 2014), and sometimes these guidelines followed in Los Angeles (Collision and Countermeasure Analysis, 2016). Understanding the national literature on road diets as well as the conditions under which road diets have been implemented in the City help frame the interpretation of my analysis and findings. My review finds robust road diet research, most of which controls for:

1) **Regression to the mean**
2) **Changes in traffic flow**
3) **General vehicle crash trends using a comparison group**

After the literature review I describe my methodology for selecting my study corridors and how I evaluate my chosen road diet projects. My goal was to include as many road diets as possible in my analysis from the roughly three dozen road diet projects implemented between 2006 and 2011 that would have at least three years of pre- and post-implementation data. Data constraints limited this list to five projects suitable for study. Based on the findings from the literature review and the data available at the time of this study, I apply a t-test to an observational before-and-after study of the five selected projects and a comparison group of corridors. The comparison group is used to control for general travel and traffic trends along similar streets that did not receive a road diet treatment. To control for changes in traffic volumes, I calculate before and after crash rates per million miles traveled. I do so using an average estimates of volumes based on traffic counts, albeit somewhat limited, available from the Department's Traffic Counts Division.

Using this applied methodology, I display changes in general crash rates and injury rates to see if there discernible differences between the road diet treated corridors and the similar but untreated corridors. Because road diets are to be included in Vision Zero efforts, I also look at changes in the rates of severe and fatal injuries. The results of the analyses reveal statistically significant reductions in crashes and injuries among the road diet projects. The comparison group, however, did not experience any statistically significant reduction in crashes or injuries. Neither

"The results of the analyses reveal statistically significant reductions in crashes and injuries among the road diet projects."

the road diet group nor the comparison group experienced a statistically significant reduction in severe and fatal injuries specifically. This may stem from the fact that this report looks at small samples and these types of injuries are comparatively rare occurrences. Although other factors may influence the findings, the reduction in overall crashes closely mirror the results from studies cited by the FHWA, lending credence to the argument that road diets improve safety where implemented.

Drawing on the results from my analyses and insights from the literature review, I close with recommendations for the City, some of which can be applied more broadly to other municipalities considering road diets. In order for more rigorous local studies to occur, there must be a deliberate effort to gather consistent traffic volume data, not only on streets considered for road diets, but on similar or parallel streets nearby as well. If other elements such as bicycle and pedestrian use are monitored, road diets can also be evaluated for other potential benefits in addition to improving overall safety as they might increase the number of people getting around by active modes of transportation. Lastly, if data determine road diets are successful in reducing collisions, additional streets should be identified and considered for road diets, especially if they can be implemented in tandem with resurfacing or other roadway work.

2 – BACKGROUND

In recent years the City of Los Angeles has implemented several road diet projects, primarily to reallocate space for bike lanes in order to expand the existing bicycle network. Some projects have been controversial due to their impact on vehicle travel times during peak traffic hours. Generally, though, such roadway reconfigurations are frequently contentious because motorists object to the idea of reducing the number of travel lanes – in particular to create bike lanes – which runs counter to popular perceptions of how street space is best used. Specifically, road diets challenge the widely held notions that streets are primarily for cars and that more lanes, all else equal, are better than fewer lanes.

An indicator of how contentious and topical road diets have become over the years in the City's lexicon can be observed in how often the term has been used in the region's principal newspaper, the Los Angeles Times (Figure 5). Although the Los Angeles Times has published on road diets since at least 1999, the ProQuest research platform indicates the term was first used in a local context on October 23rd, 2008. A column, "Road Sage," written by Steve Hymon makes a passing reference to a road diet, suggesting a lane reduction might improve safety on a wide

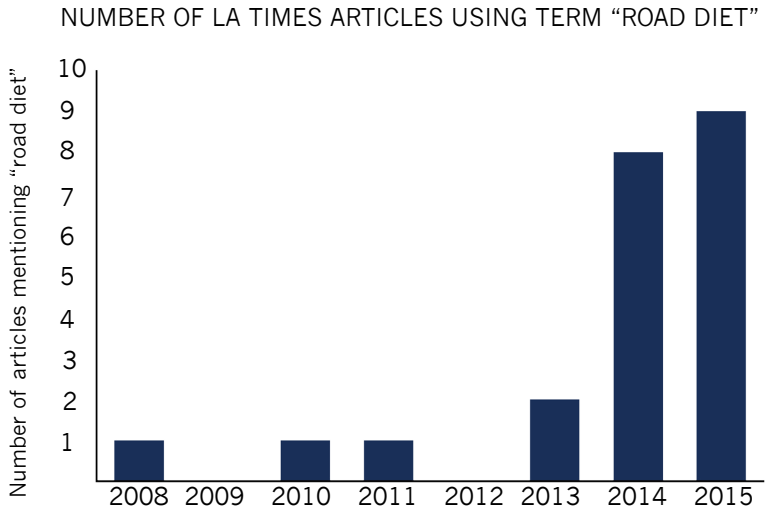

Figure 5: The number of times the term "road diet" appeared in the Los Angeles Times, according to the ProQuest research platform.

boulevard with a notorious safety record. Hymon writes:

> *The city is cracking down on [Colorado Boulevard] with more police patrols, surveillance cameras and a speed-sensitive light at the long exit ramp from the westbound 134 to Colorado and by unsyncing some traffic signals at night to prevent motorists from building a head of steam. All good ideas backed by [Councilmember] Huizar. The real problem here is Colorado's size, and I suggest it go on a road diet and be narrowed*

2 BACKGROUND

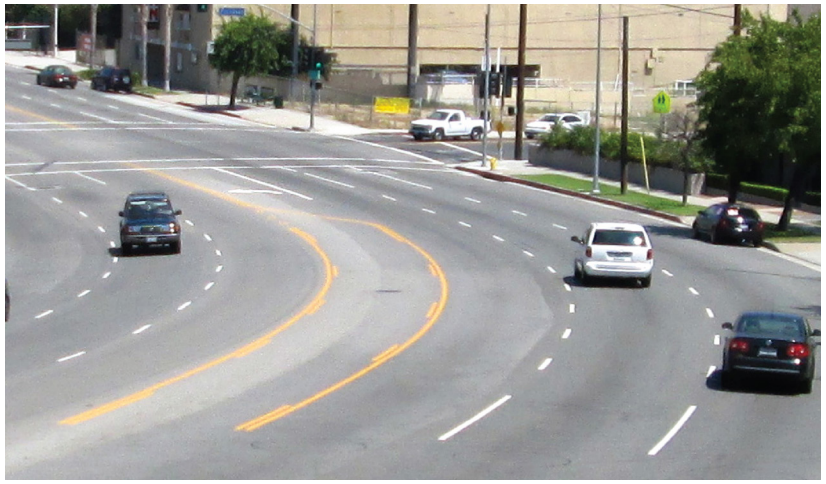
The term next appeared in September 2010 following the installation of a widely debated lane reduction on Wilbur Avenue in the Northridge neighborhood in the San Fernando Valley portion of the City (Banks, 2010). At the time, the Los Angeles Department of Transportation had been pressured to implement bike lanes because the city council was in the process of adopting an updated citywide bike plan. Wilbur Avenue was scheduled for a resurfacing and upon studying the traffic volumes, Assistant General Manager John E. Fisher determined it would be a suitable candidate for a road diet because traffic volumes were low (J. Fisher, personal communication. 29 January, 2016). In the article, titled "Bike lanes stop drivers short; Motorists fume at gridlock after paths are added to busy street," Sandy Banks of the LA Times wrote that the road diet turned a local speedway "into a parking lot." Banks revisited her perspective on the matter roughly half a year later (2011), stating that her trips are actually only a few minutes longer than they were before the road diet, and that encouraging more bicycling might not be a bad idea, especially for shorter trips. Following that article, the term was not used in the LA Times again until 2013, when it was used twice in articles about recently implemented bike lane projects. In 2014, "road diet" appeared in eight different issues in the form of articles and letters to the editor, and in 2015 the term surfaced at least nine times.

Recent road diets have been divisive, drawing enthusiastic support and opposition. The concept has gained traction in recent years as Los Angeles has moved forward with dozens of projects since 2012, but road diets are not new to the City. Although the City Department of Transportation does not catalogue all streets that have undergone lane reductions, the Department does archive hard-copy records of striping plans and street resurfacing projects from as early as the 1960s. Through a combination of consulting an informal record of bicycle-related road diet projects kept by LADOT engineer Tim Fremaux, surveying past striping plans, and speaking with current and former LADOT employees, I have documented approximately 113 miles of road diets striping plan installations within the City over the past 35 years.

In December 1980, the first documented road diets appeared on a pair of streets in the City's southernmost neighborhood of San Pedro to accommodate bicycle lanes as part of what was referred to at the time as a "Paseo Del Mar Bicycle

Route." Paseo Del Mar, a coastal street overlooking the Pacific Ocean was reduced from two travel lanes in each direction, to one lane westbound and two lanes eastbound with the left over space used to create bike lanes for a 1.38 mile segment between Western Avenue and Roxbury Street. Pacific Avenue, a north-south street not far away was reduced from two lanes in each direction to a single lane in each direction with a shared center turn lane and bike lanes on a 0.36 mile stretch between Shepard Street and 36th Street. While these are the earliest documented road diets in Los Angeles, there is photographic evidence suggesting the first road diet may trace back to as early as the mid-1950's when the City introduced continuous two-way left turn lanes as a means of separating left turn movements from through vehicle movement on a portion of Sunset Boulevard through the Silver Lake and Echo Park neighborhoods (J. Fisher, personal communication. 29 January, 2016).

Road diets as defined in this research may not be new, but they have become a controversial topic as motivations for such lane reductions have expanded over time. John E. Fisher worked for the Department of Transportation from 1973 to 2012; he was a longtime senior engineer whose career culminated as Assistant General Manager. During his time with the Department he designed and oversaw implementation of a number of the City's earliest documented road diets. Fisher describes the rationale of the pioneering road diets:



> *They were motivated by the thinking that having smoother and more predictable flow – although possibly with slightly slower speeds – along with the collision reduction that would ultimately accompany it, was a better alternative than having more through lanes that provided more theoretical but unrealized capacity. (personal communication, 29 January 2016)*

While at the Department, Fisher also helped introduce a neighborhood traffic management program that produced road diets, primarily residential streets, as an explicit measure to curb traffic volumes and speeds to improve residents' quality of life.

Road diets as implemented today are still grounded in safety, but increasingly they are implemented on busier streets with specific intent of promoting active forms of transportation through prioritizing safety of those walking and bicycling. The concept's

implementation is moving beyond strictly improving safety on residential streets and corridors with excess capacity. Whereas the majority of early documented road diets gained center left turn lanes, and occasionally curbside parking, since 2012 road diets have gained almost exclusively bike lanes, or bike lanes in addition to center left turn lanes. In 2013, City projects started to also take advantage of State Assembly Bill 2245, which was legislation passed in 2012 that exempts lane striping reconfigurations (including road diets) from full California Environmental Quality Act (CEQA) analyses. Incidentally, the City's first road diet implemented using AB 2245 was the same street Steve Hymon had suggested would benefit from fewer lanes in 2008. On October 4th, 2013 Colorado Boulevard was reduced from three lanes in each direction, to two lanes in each direction as part of a broader neighborhood-driven traffic calming initiative called "Take Back The Boulevard."

Right: Before it went on a road diet, Colorado Boulevard was three lanes in each direction with a center turn lane and curbside parking. The street was reduced to two lanes in each direction by converting a lane in each direction into buffered bike lanes.

Not only are road diets being applied in a wider variety of contexts in Los Angeles, but the pace of implementation has also increased dramatically (Figure 6). Between 1980 and 2010, my research suggests roughly 48.1 miles of road diets were implemented citywide. By 2016, the City had implemented an additional 64.5 miles of road diets, with 24 miles implemented in 2013 alone. Road diet projects are appearing more frequently and on streets with higher traffic volumes, which helps explain the increasing use of the term – more people are simply being exposed to the roadway reconfigurations in more places.

Sometimes affected stakeholders are concerned that road diets may result in more collisions. Even though road diets are recognized by the FHWA as a proven safety countermeasure, this determination is based primarily on studies of road diets in cities smaller in size and population than Los Angeles. Skeptics cite a variety of reasons for why road diets in Los Angeles might not be as effective as elsewhere. Arguments include that the roadway change could result in greater confusion due to the unfamiliarity with the configuration, or by slowing traffic down, the road diet might incite road rage from newly frustrated drivers stuck in traffic. As with many changes by government, locals cannot fully be convinced by successes in other cities. Los Angeles is not Portland, nor is it Seattle. Given that Los Angeles has implemented so many road diets to date but not conducted comprehensive evaluations of them, it is fair for skeptics to call the treatment into question. It thus would benefit both the Department of Transportation, as well as the public, to know how effective existing road diets have been.

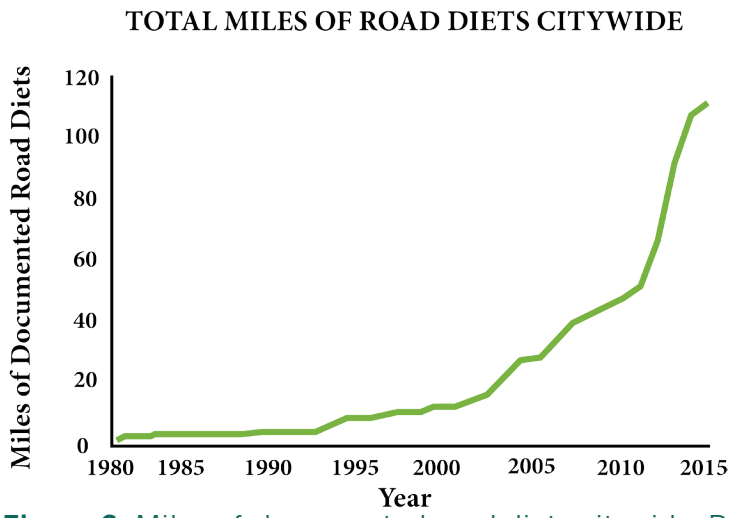


Figure 6: Miles of documented road diets citywide. Pace of road diet implementation has increased drastically over the past decade.

2 BACKGROUND

The current method of evaluating projects – sometimes only with post-implementation data – limits what characteristics can be studied and may undermine or overstate a project's effectiveness since there is no initial baseline to compare conditions before and after implementation. For example, a road diet may be installed with the intent of reducing collisions and increasing bicycle ridership. But if no counts of bicycle traffic are conducted, and collision data show an overall increase in collisions due to a spike in bicycle crashes, the road diet may easily be viewed as a failure. Although an increase in bicycle-related collisions could result from increased bicycle ridership, there is no way of verifying this. Similarly, analyses might show a 20 percent decrease in collisions on a road diet corridor and the project could be hailed as a success. However, if there has been a 20 percent decrease in overall traffic volumes as drivers divert onto different streets in response to the road diet, the road striping's effect on safety could be negligible or non-existent. As these examples suggest, new road diet projects will continue to be met with skepticism if the Department fails to produce more thorough, accurate, and telling project evaluations. Through researching past road diets and analyzing recent projects, I hope in this report to add some clarity to the local road diet conversation.

3 – LITERATURE REVIEW

Objectives and Structure

Road diets – also known as "roadway reconfigurations," "rechannelizations," or "lane reductions" – reduce a street's potential vehicle throughput capacity by converting travel lanes into space for other street elements such as bike lanes, medians, sidewalk extensions, additional curbside parking, and center left turn lanes. Many road diet proponents cite improvements in livability among the reasons to implement these roadway reconfigurations. They argue road diets make streets more accessible, environmentally-friendly, economically vibrant, and aesthetically appealing (Burden and Lagerwey, 1999). Although road diets in the United States have been implemented since at least the 1970's, the livability emphasis is new (Rosales, 2007). While an increasingly important consideration, livability is not the subject of this review. Rather, the primary reason for implementing these roadway reconfigurations since the concept was first introduced has been to improve traffic safety and that is my focus.

This literature review outlines: 1) a broad history of road diet implementation in the United States, 2) the basic principles guiding road diet implementation, and 3) existing research and evaluation methodologies on the effects road diets have on traffic safety. The motivation for early road diets helps clarify which circumstances they are believed to be most effective and what kind of roadway deficiencies they are intended to correct. The current guidelines recommended for road diet implementation set a baseline for comparing the relative successes or failures of the streets analyzed in this report. Lastly, understanding the most robust methodologies currently used in evaluating projects helps to determine the most appropriate ways to measure the effectiveness of road diets, given available data and their shortcomings.

History of Road Diet Implementation

During the 1950s and 1960s, many streets with a single lane in each direction were widened to two lanes in each direction to accommodate greater capacity (Knapp, et. al, 2014; Welch, 1999; Figure 7). Two lanes in each direction, while allowing greater vehicle throughput capacity than a single lane in each direction, resulted in growing numbers of collisions due to increased speeds and lane changes. Prior to widespread adoption of road diets, default solutions to address safety on streets with two lanes in each

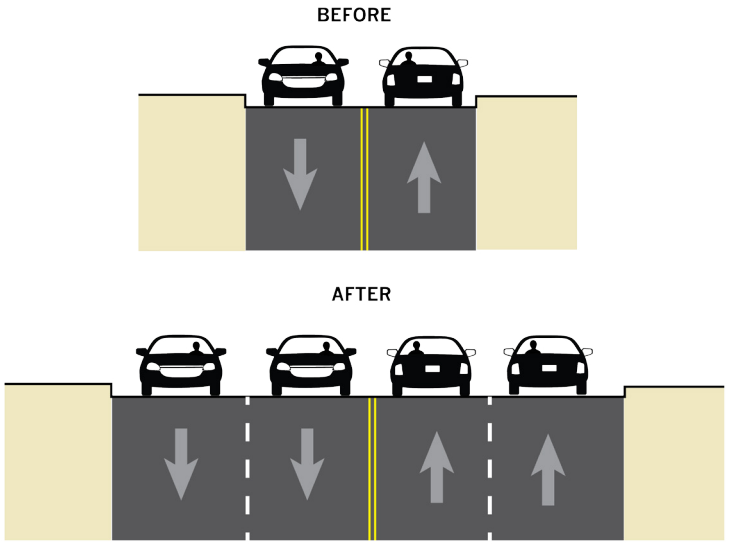

Figure 7: Widening a street from a single lane in each direction to two lanes in each direction allows for greater vehicle capacity

direction included: widening streets to include center left turn lanes, or placing a divider between opposing directions of traffic (Welch, 1999). However, further roadway widening was often unpopular among road-adjacent stakeholders for many of the reasons it is opposed today. Local residents argued widening streets would increase traffic speeds, make the streets noisier, and make it more difficult for pedestrians to cross (Welch, 1999). Because the proposed solutions often involved measures that would widen or speed up vehicular traffic, transportation departments sometimes refrained from widening beyond two lanes in each direction, due to popular backlash, and accepted the short-comings of this design. It was to this dilemma that the conventional or "classic" road diet – which converts a street with two lanes in each direction into a single lane in each direction with a shared center left turn lane – would emerge as a solution in contrast to decades of road widening. The primary goals of the classic road diet were to address the safety concerns of streets with two lanes in each direction and improve efficiency through separating left turning movement from through traffic (Welch, 1999).

One of the first known classic road diets occurred in 1972 on 45th Street in Seattle, Washington (Burden and Lagerwey, 1999). The street had an average daily traffic count (an estimate of the average number of vehicles passing through the corridor on a daily basis, also known as "ADT") of approximately 19,400 vehicles prior to the road diet implementation. After the road diet, the street recorded an ADT of 20,274. Despite an observed increase in

"One of the first known classic road diets occurred in 1972 on 45th Street in Seattle, Washington."

traffic volumes, the street experienced a 48.9 percent reduction in collisions. Another pioneering road diet was introduced on 17th Street in Billings, Montana in 1979, which an unpublished report indicated was a success as the street experienced a reduction in crashes and no significant change to vehicle delay (Knapp, et. al, 2015). The experience from Billings encouraged a state engineer from Iowa, Thomas Welch, to identify streets that might benefit by being put on the now-classic road diet conversion and see safety improve without adversely affecting traffic flow and capacity (Welch, 1999). In 1980, the Iowa Department of Transportation (IDOT) approved some widening of streets with a single lane in each direction to accommodate a center turn lane after having only approved widening to two lanes in each direction. Upon doing so, IDOT conducted one of the first studies comparing corridors with the conventional road diet configurations to corridors with two lanes in each direction, also known as a four-lane, undivided roadway. In comparing the two different conversions, Welch (1999) found that the three-lane configuration (a single lane in each direction and a center turn lane) had a vastly better safety record than the four-lane configuration while carrying comparable traffic volumes. By the 1990's, the concept of putting roads on "diets" became more popular throughout the nation as the safety gains of a three-lane configuration were becoming more apparent through a growing number of case studies (Burden and Lagerwey, 1999).

Road Diet Guidelines

Average Daily Trips (ADT)

Although the reasons for implementing road diets have changed over time, the basic premise was initially – and often still is – based on the argument that they can have minimal effects on carrying capacity and travel times while enhancing roadway safety. In most literature outlining the components of a successful conventional road diet, including guidelines put forward by the FHWA, it is often stated a three-lane roadway can carry as

much traffic as a four-lane roadway without compromising travel times or diverting traffic if the average daily traffic counts do not exceed 20,000 (FHWA). The origin of this threshold is unclear although several road diet guides and articles cite two separate articles published in 1999 that arrived at this conclusion. In Dan Burden and Peter Lagerwey's 1999 article "Road Diets, Fixing the Big Roads," the author's cite over 20 four-to-three lane road diet conversions deemed to be effective, stating of the traffic volumes, "the upper comfort range for arterial conversions appears to be between 20-25,000 ADT. Higher numbers have been achieved. Santa Monica officials feel most comfortable capping at 20,000, although they have hit 25,000" (4). The authors go on to assert, "Researchers do not have enough knowledge to say where and how peaks are reached, but many feel comfortable with 20-23,000 ADT's. Each community must set its own upper limits" (6).

The other article, also published in 1999, is "The Conversion of Four Lane Undivided Urban Roadways to Three Lane Facilities" by Thomas Welch. In it, Welch references a 1998 Minnesota Department of Transportation study that found three-lane roadways to function with ADT's "as high as 20,000 vpd [vehicles per day]" (4). The author of the Minnesota study, Howard Preston, an engineer, is quoted by Welch as stating he would convert most four-lane undivided urban roadways with ADT's less than 20,000 vpd to three lane facilities "in a heart beat" (4). Welch later writes, "At first glance, it is difficult for most...to accept that, in urban corridors with less than 20,000 vpd, reducing the number of traffic lanes will improve traffic safety and maintain an acceptable level of service" (4).

More recent studies, one from 2006 and the other from 2011 have indicated such four-to-three lane road diets are most effective when ADT does not exceed 17,500 (Gates, et. al, 2006) but can be applied when ADT is as high as 23,000 (Stamatiadis, et. al, 2011). In its Road Diet Informational Guide, the FHWA has compiled guidelines from local entities, with Genesee County and the cities of Chicago and Seattle providing specific ADT levels as guidelines for determining suitability for four-to-three lane road diet conversions. Among the three places studied, the upper ADT limit ranges from 18,000 to 25,000. While there is a point at which conventional road diets have significant impacts on travel times, there appears to be no strict limit on ADT as a

barrier to implementation as Burden and Lagerwey suggest. Several four-to-three lane road diets have been installed on streets with ADT's higher than 20,000, including in Los Angeles, and in at least two documented cases on streets where recorded ADT exceeded 30,000 either before or after implementation (Burden and Lagerwey, 1999; Rosales, 2007). As of this writing, Portland, Oregon currently has plans to move forward with a four-to-three lane road diet conversion on a 2.3 mile stretch of Foster Road, a street which carries roughly 30,000 vehicles a day (Law, 2016).

"While there is a point at which conventional road diets have significant impacts on travel times, there appears to be no strict limit on ADT as a barrier to implementation as Burden and Lagerwey suggest."

Peak Hour Traffic Volumes

The ADT threshold is specific to the four-to-three lane road diet conversion and exists in part simply because the majority of streets that have receive road diets have not exceeded 20,000 in average estimates of daily traffic. This threshold, however, is also tied to "peak hour" volumes. While wide streets may experience low traffic volumes most of the day, they are often built to accommodate peak hour demand, when use of the street is highest. This causes some to argue that peak hour volumes are perhaps more important than overall volumes when determining if a street is an appropriate candidate for a road diet, and in determining whether a road diet may cause travel delays or divert traffic.

The FHWA's Road Diet Informational Guide states peak-hour volumes along urban roadways typically represent between 8 and 12 percent of the roadway's total ADT, though this varies significantly depending on local circumstances. In the study "Converting Four-Lane Undivided Roadways to a Three-Lane Cross Section: Factors to Consider," its authors used Level of Service (LOS) analysis assuming 10 percent of ADT occurred in the peak-hour and that directional flow is roughly equal to determine if road diets are feasible for roadways with ADT below 20,000 (Knapp, et. al, 1999). This assumption suggests the conventional

three-lane road diet can carry up to 1,000 vehicles per hour (vph) in each direction during peak hours. Knapp and Giese concluded in a 2001 study that roadways with bi-directional peak-hour volumes less than 1,500 vehicles per hour (vph) should be considered for road diets. This figure was used by the authors to extrapolate that a road diet configuration can reasonably handle 750vph with a single lane in each direction (Knapp et. al, 2015). The same 2001 study also indicated road diets are unlikely to affect LOS if the peak-hour bi-directional volumes are less than 1,750vph (or 875vph per direction), or if the roadway already operates as a de facto road diet with so many left turn movements the intersections effectively reduce through travel to a single lane (10). While existing research offers general guidance, as with ADT guidelines there is no clear limit on maximum peak hour volumes for considering a road diet or what other factors should be considered.

Evaluation Methodologies and Findings from Existing "Before-and-After" Studies

Road diet evaluations vary. Some road diet studies are more robust than others because they control for confounding variables. Early road diet evaluations that helped advance the concept's popularity consisted strictly of simple before and after comparisons in collisions and traffic volumes along road diet corridors (Burden and Lagerwey, 1999).

In a 2013 white paper titled "Road Diet Conversions: A Synthesis of Safety Research," researcher Libby Thomas conducted a comprehensive search of road diet safety evaluation studies, focusing on peer-reviewed articles and reports published between 2002 and 2013. She identified six rigorously constructed road diet safety evaluation studies, three of which had been published in peer-reviewed publications. Thomas notes the more compelling studies use of methods to control for three factors in particular: regression to the mean; changes in traffic flow; and general crash trends using a comparison group. All studies compiled by Thomas found road diets to be successful in improving safety to varying degrees, in part depending on the analysis methodology used. Three of the identified studies used overlapping data from a total of 45 treated sites plus comparison sites (Pawlovich, et. al, 2006; Huang et. al, 2002; Harkey, et. al, 2008). All but one of the studies

(Lyles et. al, 2012) identified by Thomas used comparison sites to differentiate results from road diet corridors and similar but untreated corridors. The number of treatment sites used per study ranged from 8 to 450, while years of analysis covered between one and 21.

One report (Haung, et. al, 2002) looked at 11 road diets and 24 comparison sites across California and Washington. They used a standard yoked comparison analysis and employed a Cochran–Mantel–Haenszel test of overall significance, but did not analyze ADT. The results indicated crash frequencies along road diet corridors were approximately six percent lower than on the similar comparison corridors. In a separate analysis of crash rates only including corridors where ADT data were available, their sample shrunk to 8 road diets and 14 comparison sites and found no statistically significant reduction in crashes.

In 2006, Pawlovich, et al. conducted a full Bayes analysis of 15 road diets in Iowa and compared them to 14 untreated corridors and found a 25.2 percent reduction in crash frequency per mile and an 18.8 percent reduction in crash rate. The authors note the contrast of their results with those of Huang, et al.'s 2002 study, and suggest the difference might be explained by differences in the data. While the two studies applied similar models, Pawlovich, et al. collected 23 years' worth of data for their sites whereas Haung, et al. collected three years of pre- and post- and in some cases only had one year of data from before and after road diet implementation. They also suggest the differences could occur because road diets are not equally effective everywhere they are applied, stating, "Of course, it may also be the case that road diets are not as effective everywhere and that other factors may explain the different results. This possibility suggests that this type of study should be undertaken at other locations" (10).

Reanalyzing data from 2002 (Haung, et al.) and 2006 (Pawlovich, et al.), Harkey, et al. studied the safety impacts on 15 corridors in Iowa, and 30 corridors across Washington and California, that underwent the "classic" road diet treatment (2008). The sites were compared to 296 and 51 similar – but untreated – comparison sites using an empirical Bayes (or EB) before-and-after analysis. The results found a crash reduction of 47 percent for the Iowa sites and a 19 percent for the Washington and California sites. The authors speculate that the reason for the large discrepancy

between the two data sets is due to differences in traffic volumes and site settings. The Iowa sites were more rural in nature; corridor traffic volumes did not exceed 14,000 average daily trips (ADT), and were implemented along state routes in small towns with average populations of 17,000. By contrast, the Washington and California sites were more suburban in character, with corridor ADT ranging from 6,194 to 26,376 in cities with an average population of 269,000 in comparatively urban environments. This explanation lends support to Pawlovich, et al.'s speculation that not all road diets are equally effective. In 2010, Persuad, et al. analyzed the Iowa data using a full Bayes method and found crash reduction similar to Harkey, et al.'s using empirical Bayes.

In 2013, Chen, et al. studied 460 road diet sites in New York City. They analyzed five types of collisions: all, vehicle–vehicle collisions, pedestrian–vehicle collisions, bicycle–vehicle collisions, and collision-related injuries and fatalities. Using five years of pre-treatment data and two years of post-treatment data, Chen, et al. employed a two-group, pre-test post-test design to compare road diet segments with 3,364 untreated sites. Although they did not control for changes in ADT, they did observe an estimated 67 percent reduction in crashes along selected road diet segments and a 70 percent reduction in injuries and fatalities.

Unlike the other studies that only compared road diets to similar but untreated corridors, Lyles, et al. (2012) also compared their selected road diets to citywide crash trends. Their report produced an average crash modification factor (CMF) for 24 road diets in Michigan but was unable to yield any statistically significant results when adjusting for citywide trends or when comparing to similar but untreated corridors. This may partially stem from their small sample of four road diet and untreated sites using an empirical Bayes methodology. Lyles, et al. attempted to match road diet sites with corridors featuring nearly identical characteristics, including: ADT, number of driveways, segment length, intersection density, and crash frequencies. Commenting on this technique, Thomas observes, "...if a larger reference group is used, the importance of matching of exact characteristics takes on less importance. A larger reference group is also more effective in accounting for RTM [regression to the mean]" (12).

"Proven Safety Countermeasure"

Today roadway reconfigurations are recognized by the United States Department of Transportation's (USDOT's) Federal Highway Administration as one of nine "proven safety countermeasures." This means that road diets can be expected to reduce traffic collisions on streets where they are implemented (Furst, 2012). According to the FHWA's Proven Safety Countermeasure webpage, all proven safety countermeasure have "shown great effectiveness in improving safety." The Proven Safety Countermeasure page has a tab specifically for road diets, which states the following:

> *A classic Road Diet typically involves converting an existing four-lane, undivided roadway segment to a three-lane segment consisting of two through lanes and a center, two-way left-turn lane. The resulting benefits include a crash reduction of 19 to 47 percent, reduced vehicle speed differential, improved mobility and access by all road users, and integration of the roadway into surrounding uses that results in an enhanced quality of life.*

The reference to the "classic" road diets being able to reduce crashes by 19 to 47 percent comes the 2008 report by Harkey, et al. The benefit emphasized from reducing the number of through lanes in this particular type of conversion is gaining the center turn lane to decrease turning conflicts and dangerous lane changes. A growing number of cities, such as Los Angeles, are implementing road diets that simply reduce the number of through lanes without necessarily adding a center left turn lane.

Of the research reviewed by Thomas, only the 2013 article, "Safety countermeasures and crash reduction in New York City – Experience and lessons learned" by Chen, et al. studied non-conventional road diet conversions (such as reducing a six lane roadway to four lanes). Most of the 460 road diet segments Chen, et al. studied however consisted of the "classic" four-to-three lane road diet conversion and the effectiveness of road diets were measured as a whole, an average of all the road diet segments whether the "classic" road diet or not. It remains uncertain how effective non-conventional road diets are in reducing collisions and under what circumstances they perform best, especially if they do not result in the creation of a center turn lane. Existing guidance and studies regarding the effectiveness of four-to-three lane road diet conversions may be less applicable to the non-conventional road diets implemented in Los Angeles.

Takeaway from Literature

Road diet studies have focused on the four-to-three lane conversions and generally find the treatment to result in safer roadway conditions. As such they are formally recognized by the FHWA as a proven safety countermeasure. Much of the existing literature, however, comes from cities far smaller in size and population than Los Angeles. This is not due to a lack existing road diets within large cities. The City of Los Angeles, for example, has implemented over 100 miles of road diets (many of them the conventional four-to-three lane conversion) and non-safety related aspects of these roadway changes have been explored in some detail, including the economic impact of a road diet (McCormick, 2012) and the effects a road diet had on bicycle ridership (Road Diet Case Studies, 2015). Some basic road diet safety analyses have been conducted within Los Angeles County (Road Diet Case Studies, 2015); in Santa Monica and Pasadena for example, but no comprehensive studies have been undertaken in the County's largest city.

Transportation planners and engineers generally think an undivided four-lane roadway might be a good candidate for a "classic" road diet if the ADT is below 20,000, but some projects exceed this threshold. Burden and Lagerwey have documented four conventional road diets where ADT exceeds 20,000 either before or after implementation, and reference additional such road diets with ADT around 25,000 and 30,000. They conclude communities should set their own upper limits for conventional road diets. Others have determined 17,500 and 23,000 ADT

"Transportation planners and engineers generally think an undivided four-lane roadway might be a good candidate for a 'classic' road diet if the ADT is below 20,000, but some projects exceed this threshold."

should be the limit for four-to-three lane conversions if traffic delay is a concern. In the City of Los Angeles a growing number of conventional road diets are testing these conventional upper limits, sometimes with the recognition that an increase in delay is a worthwhile trade-off for anticipated safety gains.

In addition to overall ADT, some professionals contend peak-hour traffic volumes are a more accurate measure of whether a street is a good candidate for a road diet since streets are typically built to accommodate travel volumes during the busiest times of day. The literature in this review ranges from 750 vph to 1,000 vph as upper limits before a road diet may start to have impacts on traffic operations and result in significant delays or diversions. In Los Angeles, road diets have historically been applied to streets with low average daily and peak hour traffic volumes, but over the past few years have been implemented on streets with peak hours exceeding the range of vph recommended in this review.

Ultimately, several studies conclude that there can be exceptions to the rules of ADT and peak hour vph. Outside of these factors, road diets might be more – or less – appropriate on certain streets based on local context. Additional factors an implementing agency might consider include: amount of left turning traffic, the number of traffic signals along corridor, density of major intersections along corridor, number of driveways, bicycle volumes, and need to improve safety.

As Los Angeles continues to push the boundaries of road diet guidelines for four-to-three lane conversions, as well as implement other forms of lane reductions to create space for walking and bicycling as part of a shift in transportation priorities, the practice of reducing vehicle capacity on roadways is being increasingly considered. Approximately 60 miles of road diets have been implemented in the past 4 years alone, sparking spirited debates about their merits. Yet despite the noise generated both in favor and against to road diets in the City, comprehensive data indicating the local success or failure these reconfigurations have had in reducing collisions are essentially non-existent. Existing studies suggest road diets are a context sensitive solution. Studies from smaller cities with more traditional development patterns may not necessarily translate to Los Angeles.

Thomas (2013) notes in her thorough road diet literature review that most robust safety evaluations will control for: regression to the mean, changes in traffic flow, and general crash trends using a comparison group. This is important because there is a natural tendency for crashes to fluctuate from year to year, and what appears to be a trend could simply be the result annual variation in crashes. Similarly, traffic volumes could be affected

because or despite accommodating fewer lanes. Without evidence to the contrary, a decrease in crashes could potentially be a result of changes traffic volumes. By controlling for observed changes in traffic volumes in a road diet study, any improvements in safety can more clearly be attributed to a roadway reconfiguration. Lastly, sometimes there are broader, less apparent trends that could affect traffic safety in an area. Comparison groups help account for existing trends unrelated to street striping. Based on this determination my methodology accounts for all three factors and will be framed in the context of traditional road diet guidelines.

4 – METHODOLOGY

To determine if traffic safety has improved where road diets have been implemented, this research employs an observational before-and-after study with a comparison group. Specifically, I apply a one sample t-test to the road diet projects and to the comparison group with a 95 percent confidence interval. The difference is analyzed through three metrics of safety: collision rate, injury rate, and severe and fatal injury rate per million miles traveled. Each rate is calculated using the following formula in Figure 6:

$$\frac{\text{\# collisions OR injuries OR severe \& fatal injuries X 1,000,000}}{\text{average daily traffic estimate X 365 X corridor length}}$$

Figure 6: Formula for calculating rates of collisions, injuries, and severe and fatal injuries per million miles traveled. The estimated average daily traffic (ADT) is calculated from an average of all traffic counts available within each corridor in years prior and following road diet implementation. Traffic counts used to estimate ADT are found in Appendix B

With these data, before and after rates are estimated. I assume that if the road diets were not implemented, that changes in crash rate would be similar to that of the comparison corridors.

For this research, I have available collision data from 2003 through 2014, which provides at least one year of pre- and post-data for approximately 64 miles of the City's documented road diets. However, since just one year of pre- and post- data may be an insufficient indicator of trends in collision rates, I only consider road diets for which there are at least three years of before and after collision data, as recommended by the FHWA (Knapp, et al., 2015). This reduces my sample to anything occurring between 2006 and 2011 – or about 20 miles of road diets. From this group, I eliminate individual projects less than a quarter of a mile in length. I also eliminate road diet projects that were extended shortly after an initial segment was installed and where virtually no collisions occurred before and after road diet implementation. This removes the corridors least suitable for a before and after analysis, including several minor projects. Because the road diets are eventually compared to similar but untreated streets, I also exclude projects with highly unusual "before" configurations where it would be difficult to find suitable comparison corridors with the same roadway configuration.

Taking into account availability of pre- and post-road diet

traffic counts in the road diet treated corridors and potential comparison corridors yields the projects in Table 1. The road diets from Table 1 are matched with at least twice as many similar but untreated corridor miles in the same general geographic region. The comparison corridors I selected for the road diets are found in Tables 2 through 6.

Discussion of Method

Strengths and Weaknesses

I conducted a comprehensive before-and-after analysis of the available data. I compare streets that have undergone road diets with similar but untreated corridors, taking into account changes in ADT over time, which I then test for statistical significance. Each studied corridor have at least three years of pre- and post-collision data. The projects I look at primarily resulted from

Street	Extent 1	Extent 2	Length (mi)	Installation Date	Years of Pre- and Post- Collision Data	Pre- Road Diet ADT	Post- Road Diet ADT
York Bl	Eagle Rock Bl	Ave 54	1.3	3/16/2006	3	18,876	22,969

Table 1: Overview of road diet corridors studied

resurfacing opportunities, not safety concerns, which reduces biases that might arise in looking at high collision corridors. Although these elements give the research strength compared to simple before-and-after analyses conducted in the past, it is not without shortcomings, some of which are unavoidable.

Imperfect ADT estimates

Because road diets in the City have historically been carried out simply as opportunities arise, there have been no deliberate efforts to collect data to measure potential outcomes. This research selected the road diets and comparison groups with

Street	Extent 1	Extent 2	Length (mi)	ADT During "Before" Period	ADT During "After" Period
Whittier Bl	Boyle Ave	Lorena St	1.16	20,709	21,687

Table 3: Colfax Ave Comparison Group

the most consistent traffic counts available to calculate averages for the before and after time periods, but this is an imperfect measure. Some of the streets studied for this research had more counts available than others. Sometimes more ideal comparison corridors could not be used due to insufficient traffic counts for the before and after time periods. Although little can be done to address the ADT estimates for the studied road diet corridors, the size of the comparison groups is an attempt to eliminate undue influence of natural fluctuation in traffic volumes and potential outlier counts.

Imperfect Comparison groups

In any before-and-after study, seldom can comparison groups perfectly fit their assigned treated counterpart. While every

San Pedro St	**Florence Ave**	**Imperial Hwy**	**3**	**11,742**	**10,773**

Table 5: Main St ('07) Comparison Group

effort was made to select the best possible comparison corridors, I was limited to streets with sufficient traffic counts. Also, because the Department of Transportation's implementation of road diets has escalated in recent years, some potential comparison corridors could not be considered because they received road diet treatment at some point during the studied time period. As with the traffic volume data, the size of the comparison group is partially remedies this issue.

Limited Sample Size

Due to data limitations, I look at five road diet projects and 12 streets in a comparison group. For the purposes of statistical analyses, these values are small. Although more streets could potentially be studied – as road diets or part of the comparison group – few had data to calculate "before" and "after" rates based on ADT. The primary shortcoming, like the imperfect comparison group and ADT estimates, is simply limited data.

Street	Extent 1	Extent 2	Length (mi)	ADT During "Before" Period	ADT During "After" Period

5 – FINDINGS

The findings of the analyses display the change in rate of collisions, injuries, and severe and fatal injuries on the road diet corridors studied. The displayed values for the rates and percentage changes are rounded to one decimal point. Along side these results are the changes observed for the similar but untreated comparison group. A 95% confidence interval is calculated for each category studied for both groups using a T-test.

Street	Collision Rate Before Road Diet	Collision Rate After Road Diet	Raw Change	% Change

after the road diets were put in place, with some changes more substantial than others. As previously noted, the FHWA estimates road diets can generally be expected to reduce crashes by about 29 percent, and the literature suggests road diets have a wide range of effectiveness. After adjusting for changes in recorded traffic volumes, crashes on the studied corridors decreased by 32.4 percent (with a 95% confidence interval range of 10.9% to 53.9%), echoing findings from prior road diet studies (Pawlovich, et al., 2006; Harkey, et al., 2008). Similarly, injuries along the studied road diet corridors decreased 36.7 percent (with a 95% confidence interval

Street	Injury Rate Before Road Diet	Injury Rate After Road Diet	Raw Change	% Change
York Bl	3.3	2.2	-1.1	-33.1%

range of 21.3% to 52.1 %). In light of the statistically significant reductions in crash rates, this finding comes as little surprise because most crashes in this study resulted in at least one injury – but occasionally more – and therefore the injury rate experienced a slightly greater reduction than the crashes.

Street	Severe and Fatal Rate Before Road Diet	Severe and Fatal Rate After Road Diet	Raw Change	% Change
York Bl	0.1	0.1	0	0%

decrease in this category on the road diet corridors, it was just by one. Also, when adjusted to a rate per million miles traveled, any discernible difference disappeared. Additionally, in absolute terms the comparison group also experienced a decrease, from 48 in the "before" period to 46 in the "after" period, a decrease of 2, but over a larger number of cases. Of the studies detailed in Thomas' 2013 review, only Chen, et al. (2013) measured changes in categories other than overall crashes. In their study, the authors looked at "injurous

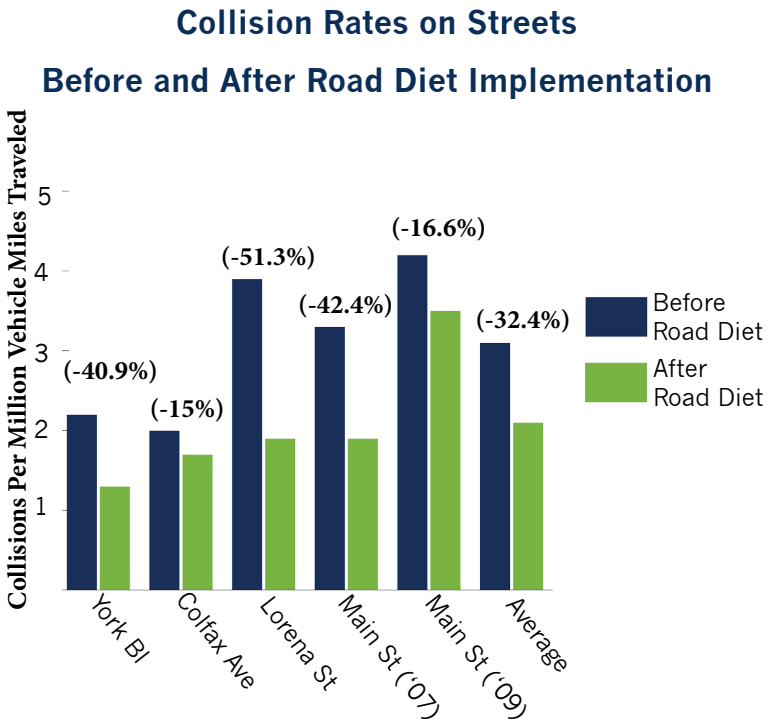

Figure 7: Collision rates on street corridors before and after road diet implementation.

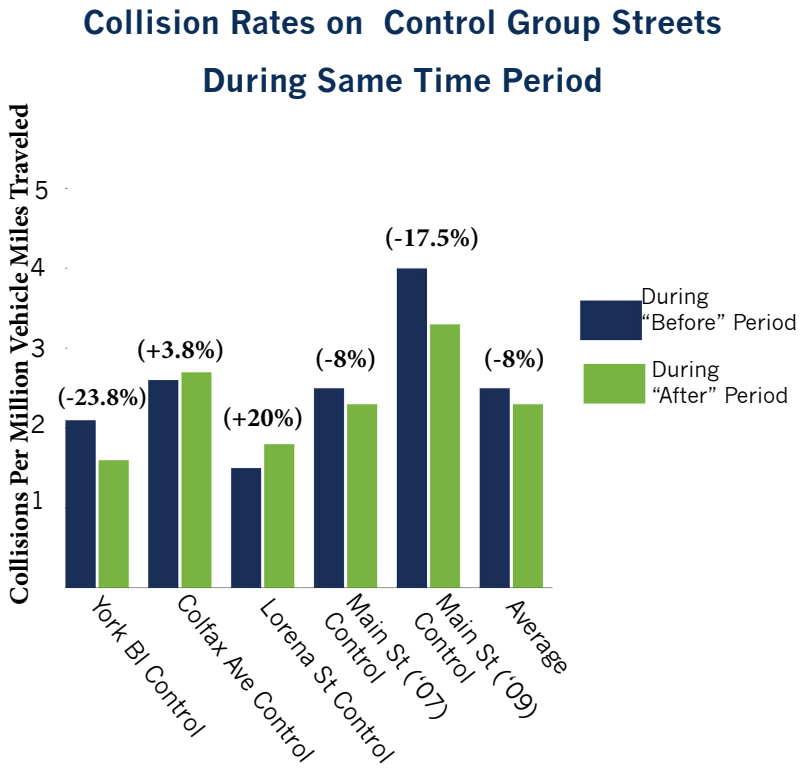

Figure 8: Collision rates for control groups during same time period.

and fatal crashes," for which they observed a 70 percent decrease, but they did not control for changes in traffic volumes. In reflecting upon the existing literature, Thomas herself concludes:

> *Impacts on more severe crashes (fatalities and injuries) and operating speed changes should be a prime consideration in future evaluations. Since it is typically more challenging to detect effects on lower numbers of severe crashes, documenting effects on travel speed distributions would help to document safety benefits and reduction in risk of more severe injuries. Motor vehicle speed is a prime safety consideration for pedestrians. (14)*

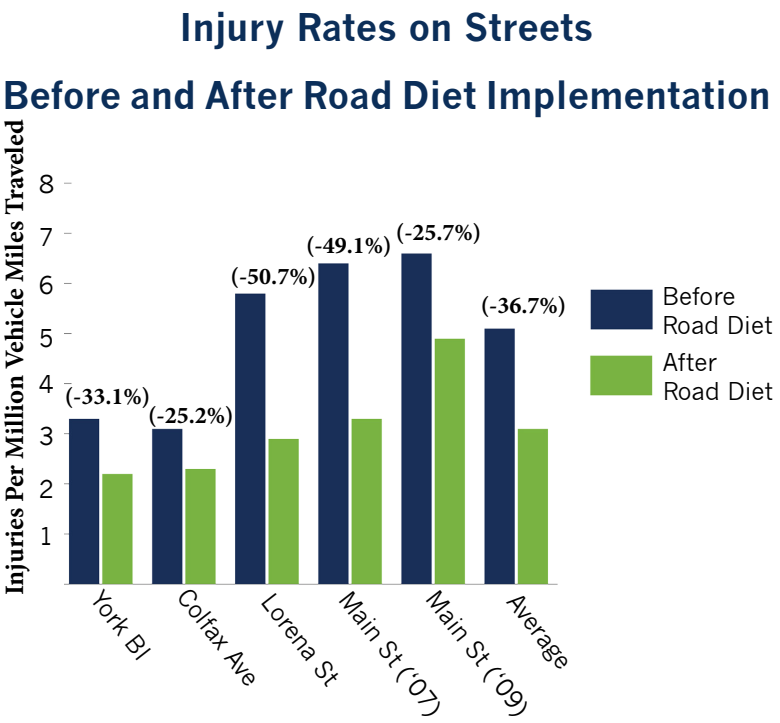

Figure 9: Injury rates on street corridors before and after road diet implementation.

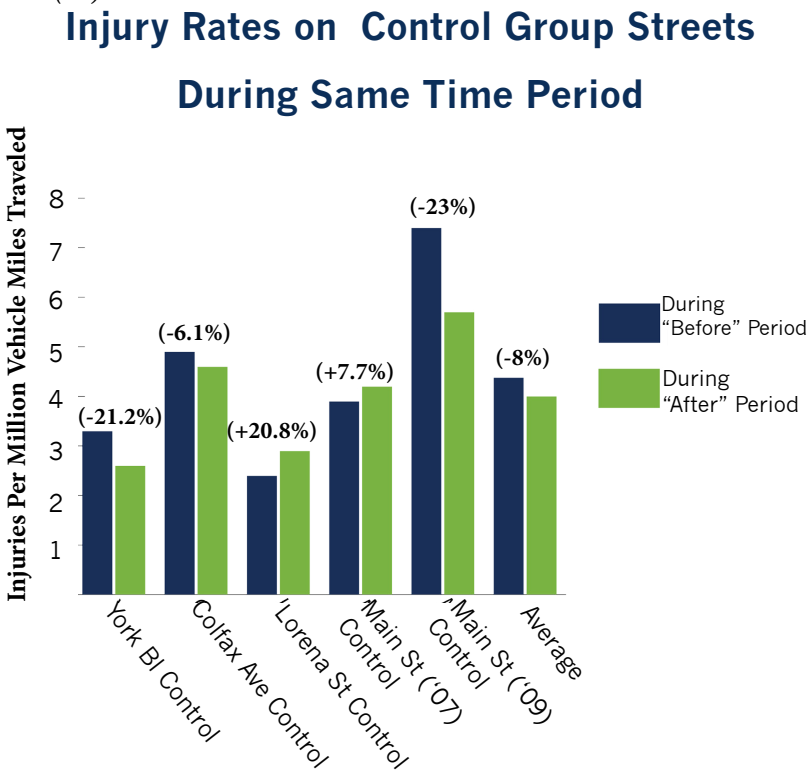

Figure 10: Injury rates for control groups during same time period.

Because serious injuries and deaths are rare, the comparatively few severe and fatal collisions that occur make it difficult to draw conclusions, especially from the small samples in this report. Additional research should be pursued to determine any effect on severe and fatal collisions by examining larger samples or focusing analyses on corridors where road diets are installed to address severe and fatal injuries specifically.

Severe and Fatal Injury Rates on Streets Before and After Road Diet Implementation

Takeaways

The results of these analyses closely mirror the results of existing studies, as well as the summary estimates by the FHWA, suggesting that road diets have measurably improved safety in the City of Los Angeles. The results also suggest, in aggregate, that local road diets may not decrease the rate of severe and fatal injuries. Local road diets do not appear to increase the occurrence of severe and fatal injuries either, despite case studies from other cities indicating they increase the number of pedestrians and bicyclists (vulnerable

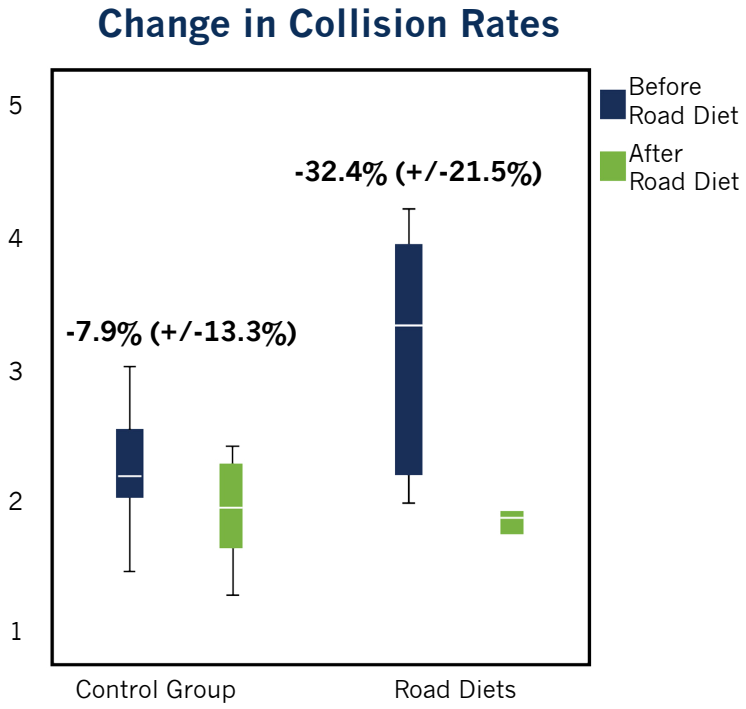

Figure 13: Box plots displaying change in collision rates for road diet corridors and control group

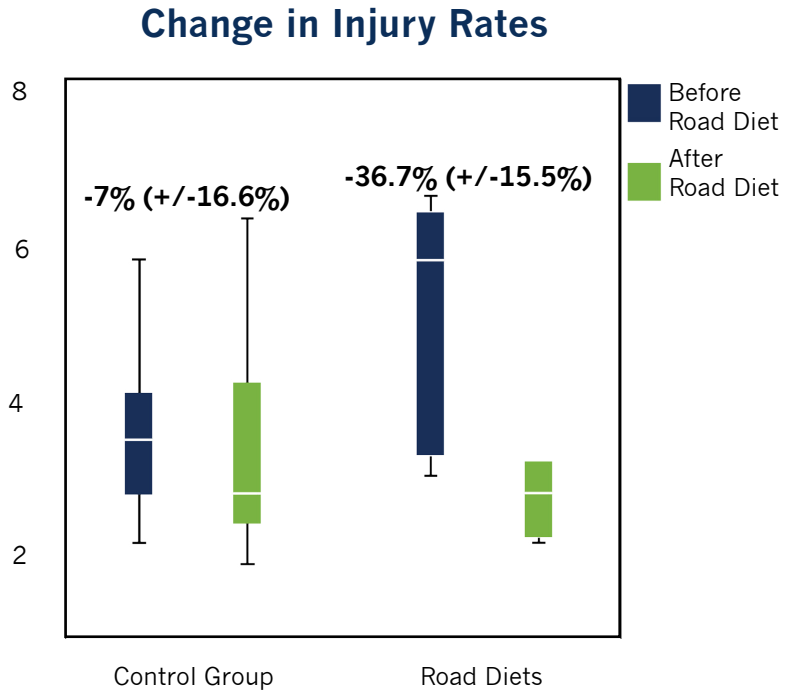

Figure 14: Box plots displaying change in injury rates for road diet corridors and control group

road users) out on the street (Road Diet Case Studies, 2015). Road diets may not be a "silver bullet" when it comes to improving traffic safety, but in the right situations they would appear to come close. When looked at holistically, they have the potential to provide an

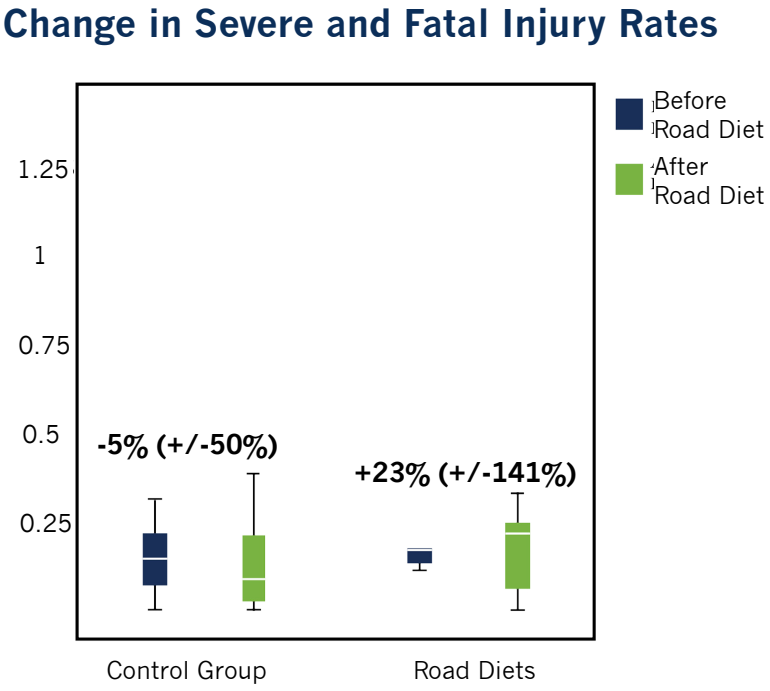

Figure 15: Box plots displaying change in severe and fatal injury rates for road diet corridors and control group

array of benefits, such as increasing levels of walking and bicycling, decreasing speed differentiations, improved perception of safety, and creating opportunities for planted medians, in addition to being among the more cost-effective means of reducing collisions. Oftentimes when there is a desire to improve safety there is a reflexive response among elected officials and the general public to install a stop sign or traffic signal, the latter of which costs five times as much as a mile of road diet and only focuses improvements to a single intersection. Increasingly cities like Los Angeles seek to

"Road diets may not be a 'silver bullet' when it comes to improving traffic safety, but in the right situations they would appear to come close."

address multiple transportation issues at once with changes to road geometries. City officials may not want only to reduce crashes, but also to promote walking and bicycling, enhance businesses along a corridor, reserve space for landscaping, and/or reduce speeding as well. In this regard, existing research suggests road diets might be more appropriate to complement these multiple goals than most other safety countermeasures.

6 – RECOMMENDATIONS

In a national context, there is little dispute that road diets improve safety and this report lends support to the FHWA's estimates that road diet treatments can reduce crashes upwards of 20 to 30 percent. While this report validates the findings of research elsewhere using data for Los Angeles, it does not address all concerns about road diets, nor does it explore their other potential benefits in any detail. With these caveats in mind, I offer the following recommendations in light of the findings presented here:

1) Study traffic and collisions on streets parallel to road diet corridors to better understand extent and effects of traffic diversion.

National best-practice suggests it is necessary to study similar but untreated corridors to extrapolate any effect of road diets (Thomas, 2013) and this report does just that. However, such adjacent control corridors may not be fully independent of the treatment if traffic is diverted by the road diets onto to the control corridors. In cases where it is accepted as fact that a proposed road diet will improve safety, some stakeholders (often nearby residents or motorists) object to them on the grounds that any safety or quality-of-life gains of a road diet might be off-set by rising collisions and traffic on parallel streets (Lopez, 2015). The possibility of traffic diverting in response to road diets is likely increased in an age with smartphone. Sometimes GPS applications (like Waze) direct people onto other routes, including lightly-traversed residential streets as a means of bypassing traffic on primary thoroughfares (Meredith, 2015). It would thus benefit debates over the merits of road diets to know the extent to which diversions occur by monitoring traffic volumes and collisions on nearby streets following the implementation of road diets.

A road diet project may warrant additional traffic calming features on nearby parallel streets to address local concerns and discourage traffic from diverting onto otherwise low-traffic, residential streets. Such traffic calming features can be built into the cost of the road diet as part of a mitigation measure before project implementation. Alternatively, traffic calming on parallel streets can be instituted after the road diet is implemented, if they are deemed necessary. Ultimately, it will be important to study nearby streets either way to better understand which conditions cause major traffic diversion, and where it diverts – if at all – after a road diet is installed.

2) Collect data to study variables other than traffic collisions.

Road diets are most often justified based on the grounds that they improve safety (Burden and Lagerwey, 1999; Knapp, et. al, 2014; J. Fisher, personal communication. 29 January 2016). Increasingly, however, it may not be sufficient for road diets to simply reduce collisions. Various city or community goals, especially those related to sustainability and economic development, may ask transportation projects be implemented to accomplish additional tasks such as promote bicycling, help attract local businesses, and improve local air quality. Research on road diets suggests that reducing the number of travel lanes can produce such "livability" benefits (Rosales, 2007; Knapp, et al., 2014). However, these potential benefits need to be studied in greater detail to determine how well road diets can advance multiple city initiatives and policy goals. Studying such factors can point to less tangible effects of road diets, such as the subjective safety and comfort they might afford (Road Diet Case Studies, 2015).

3) Combine road diets with other streetscape enhancements along corridor for greater effect.

This examination of road diet safety outcomes echoes findings from previous studies demonstrating that road diets are an effective way to reduce collisions. Road diets do not, however, address all neighborhood and safety concerns (Lopez, 2015; Zahniser and Nelson, 2015). To address these other concerns, it might be advisable to complement a road diet with other streetscape enhancements – such as landscaped medians, curb extensions, additional traffic signals – in the long-term to generate successful project delivery that addresses safety, community concerns, and local desired improvements.

4) Produce reports evaluating whether road diet project goals were met and make adjustments as needed.

Road diets are often most easily implemented through converting existing travel lanes into turning and bike lanes (Appendix A), but this latter reconfiguration can obscure the

public perception about what the road diet's goals are and whether the project should be considered a success. It is not uncommon for affected constituents to state that certain road diets have failed because the bike lanes created in the process are "underutilized." The goal of the road diet may not necessarily have been to increase bicycle ridership (Appendix A) but rather to create a center turn lane, reduce speeding, and decrease certain types of road conflicts (Road Diet Case Studies, 2015; Knapp, et. al, 2014; Burden and Lagerwey, 1999; J. Fisher, personal communication. 29 January 2016).

When implementing a road diet, it must be clear what the goals are to users of the corridor and toward that end the implementing agency (most likely the Department of Transportation) should produce and circulate follow-up reports on how effective the project was in achieving its goals (Road Diet Case Studies, 2015). If the primary goal was to reduce collisions, the project should be measured primarily on those terms. However, because a project may change the rate of driving, walking, and bicycling (Burden and Lagerwey, 1999; Road Diet Case Studies, 2015) it will be critical to collect traffic volume data. In some cases, the goal may indeed be to increase the amount of bicycling, or to reduce the number of people bicycling on the sidewalk. In such cases, data should be collected before road diet implementation to set the baseline conditions, and then evaluated based on how much it affected bicycle ridership. If a road diet does not achieve the desired change, it may need to be modified (Lopez, 2015). As noted in the previous recommendation, perhaps a road diet should be coupled with curb extensions to reduce collisions, or maybe the bike lane needs to be further enhanced by making it wider and painting it green to promote greater use.

Although the projects studied in this report all experienced varying degrees crash and injury reductions, it is unrealistic to assume all road diets will be resounding successes and not encounter any issues along the way (Meredith, 2015; Lopez 2015). The City should be willing to make adjustments as needed (perhaps an intersection might need a dedicated left turn signal phase or certain turning restrictions) without compromising the integrity and intent of road diet projects.

5) Consider road diets when resurfacing streets if there is a desire to improve safety along those corridors.

Of the roughly 113 miles of road diets documented as part of this research, at least 22 percent of them (about 25 miles) were installed as part of routine street resurfacing. The cost of a road diet is vastly reduced if implemented in conjunction with planned street resurfacing (Road Diet Case Studies, 2015; Knapp, et. al, 2014). Those 25 miles of road diets incurred negligible costs to the City as the streets were being partially or fully resurfaced anyway.

It is worthwhile to consider that of the five projects analyzed for this report, all but one (Lorena Street) were initiated by street resurfacing. These corridors experienced on average a 32.4 percent reduction in crashes, a 36.7 percent reduction in injuries, and required no road diet specific funding. The exact price tag of these projects is uncertain since they resulted mostly from street resurfacing. Using the estimated road diet cost of $50,000 per mile, the total for the 4.08 miles of road diets would be approximately $204,000. This is $46,000 less than estimated $250,000 to signalize a single intersection. In a time when transportation finance can be uncertain and projects compete for limited financial resources, the City should take advantage of street resurfacing opportunities to implement additional road diets as a means of addressing traffic safety.

Road diet under construction on Fairfax Avenue between Wiloughby Avenue and Melrose Avenue in May 2016. The street is being reduced from three lanes in each direction to two lanes in each direction to create space for buffered bike lanes.

Eagle Rock Boulevard between York Boulevard and Westdale Avenue in Northeast Los Angeles was reduced from three lanes to two lanes in the northbound direction to make room for a bike lane and a wider median in 1998.

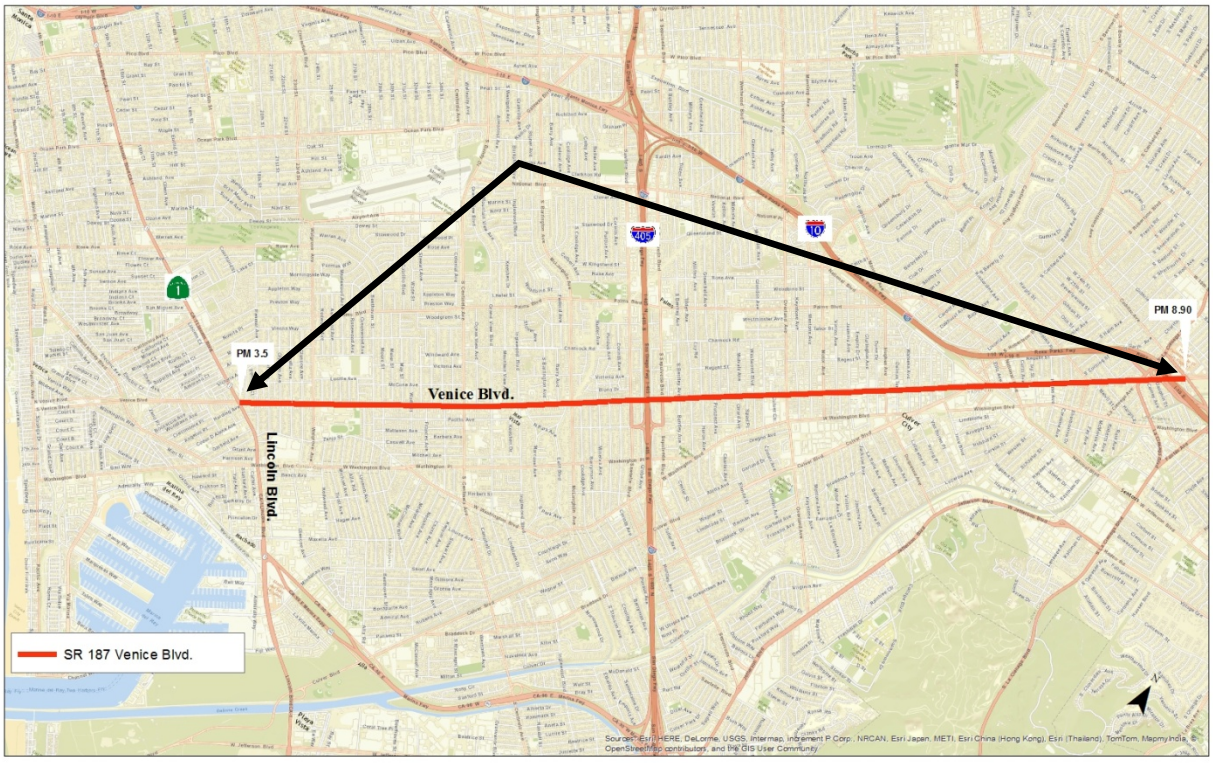
RELINQUISHMENT ASSESSMENT REPORT

For State Route 187 relinquishment within the City of Los Angeles and Culver City



DISTRICT 7

FEBRUARY 28, 2015

Prepared by

Office of Transportation Planning
Division of Planning and Local Assistance
District 7, Department of Transportation

PROPOSED RELINQUISHMENT

State Route (SR) 187, known as Venice Boulevard, extends from PM 3.5 – PM 8.905. This Route is 5.405 miles long and is located from SR-1 (Lincoln Blvd) to Cadillac Ave, just past Interstate 10 (I-10).

Disclaimer: The information and data contained in this document are for planning purposes only and should not be relied upon for final design of any project. Any information in this Relinquishment Assessment Report (RAR) is subject to modification as conditions change and new information is obtained. Although planning information is dynamic and continually changing, the District 07 Transportation Planning Office makes every effort to ensure the accuracy and timeliness of the information contained in the RAR. The information in the RAR does not constitute a standard, or regulation, nor is it intended to address design policies and procedures.

California Department of Transportation

Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability.

I approve this Relinquishment Assessment Report of the proposed relinquishment of State Route 187 to the City of Los Angeles.

David Sosa
Acting Deputy District Director
Division of Planning
District 07

David Sosa

Elements of the State Route Relinquishment Assessment Report

The information provided below should be used by the District and the System Planning Branch in Headquarters to determine whether there is a State Highway System need to retain state ownership of the highway or whether the facility is appropriate for relinquishment. Both the state route RAR and the park and ride lot RAR have six elements to help describe and document the relinquishment. Within each element are various actions that help describe each element. For example, element 1 of a state route relinquishment has five actions which are indicated by the letters A-E. This information is the basis of the RAR Template.

1. Description of Route and Basis of Request for Relinquishment

A. Action: provide county, route-number, post miles, functional classification, and other designations such as Surface Transportation Assistance Act (STAA) truck terminal access route, Interregional Road System (IRRS), or other designations as applicable.

- **County, Route, Post Mile and Location Description**

  - County of Los Angeles, Venice Boulevard, also known as State Route 187 (SR-187), from Post Mile (PM) 3.5 – PM 8.905. SR-187 is 5.405 miles long and is located from SR-1 (Lincoln Blvd) to Cadillac Ave, just past Interstate 10 (I-10) within the City of Los Angeles. Except for a small segment from approximately Bledsoe Ave. (PM 5.6) to Overland Ave. (PM 6.6), that shares City of Los Angeles boundaries with the city limits of Culver City inside SR-187 right of way. SR-187 is a 6- lane conventional highway type.

- **Route Classification**

  - **Functional classification:** The Functional Classification system, implemented by the Federal government in 1976 to help states and their DOT's for many years as a management tool in a variety of areas pertaining to highways. Federal, State, and local government use this tool to assign jurisdictional responsibility, allocate funds, and establish appropriate design standards for roadways.

  - The Functional Classification of SR-187 is "Other Principal Arterial" in its entirety.

- **Route designations:**

    - SR- 187 is federally designated as a Terminal Access Route Surface Transportation Assistance Act (STAA), which allows large trucks to operate on State routes.

    - SR-187 is not in the IRRS, and it is not a part of the Freeway and Expressway System.

B. Action: Demonstrate that the District has identified the route or route segment as a relinquishment candidate in the District System Management Plan (DSMP), Transportation Concept Report (TCR), and/or other district planning documents

- SR- 187 is included in the Two Tier System Report as part of the Secondary system. The District concurs with this designation; SR-187 is predominantly used for local use, as evidenced by its traffic use patterns.

- The most recent, April 1991, TCR proposed this route to be relinquished.

C. Action: Evaluate if the segment proposed is in fact between two logical termini and identify any issues with the proposed limits of the relinquishment. Indicate how identified issues will be addressed. Examples of issues with logical termini are relinquishments that will create a stub route, terminate in mid block or intersection, a break in extra legal truck route, etcetera.

- SR-187 proposed relinquishment is within two logical termini – From SR-1 (Lincoln Ave.) to I-10. No issues are identified. The Route's primary function is for local use, the relinquishment will not impact its traffic use patterns.

- A small segment of SR-187, approximately from Bledsoe Ave. (PM 5.6) to Overland Ave. (PM 6.6), shares City of Los Angeles boundaries with the city limits of Culver City inside SR-187 right of way.

- Ultimately, District 7 intends to relinquish all the Secondary System segments, including SR-187 within Los Angeles County. Due to the authority given and limitations by legislation, plus the challenges of multi-jurisdictional agreements and commitments, it is a general practice to legislatively relinquish route segments in a piece-meal fashion. Though the relinquishment of entire State Highway Route to the local jurisdiction is not occurring simultaneously, this approach would ensure that the relinquishment occurs at the earliest time possible, and avoid the potential of delay or rescission of relinquishment project.

D. Action: Describe the basis of the request for the relinquishment and identify local jurisdiction(s) requesting it. Indicate why the city or county does not want the state route designation. Explain the issues and history including request for encroachment permits and issues with approving or denying requests. Include district/local jurisdiction local development discussions, comments, and issues. Document context sensitive solutions efforts and what could and could not be resolved under state ownership of the route. Explain how the relinquishment benefits local planning and community design and circulation considerations.

- The City of Los Angeles requested the relinquishment in an effort to better meet the needs of and directly serve its community. The City's interest in pursuing the relinquishment is primarily for the flexibility in making future improvements to the corridor. The relinquishment of SR-187 will allow the City of Los Angeles to expedite proposed improvements and maintenance without going through the encroachment permit process, reducing delays. Currently, the City of Los Angeles is planning for a complete street concept project. The relinquishment would allow more for flexibility and resources to expedite this proposed improvement.

- The City of Culver City has not formally expressed interest in pursuing relinquishment of SR-187 within its city limits. However, Culver City has been made aware of the proposed improvement project planned by the City of Los Angeles. The City of Culver City is supportive of the proposed improvement. The City of Los Angeles staff will further coordinate with the City of Culver City regarding the proposed improvement and relinquishment of SR-187 within their city Limits.

- Currently, there are a number of permits that are issued to private owners, government agencies, utility companies, etc. -one to be noted, is the permit issued to the City of Los Angeles, under permit number 713-NUK-1039 to excavate four pits for depth of 12 to 25 feet and to excavate a section of Venice Blvd to place/push a 60" sewer line from Kelton Ave. to Overland Ave.

- City of Los Angeles has recently updated their General Plan's Transportation Element (Mobility Plan), which is consistent with the State's Complete Streets policies and Smart Mobility Framework. Due to the urbanized nature of this route, right-of-way is highly constrained, and the City's potential improvements to enhance mobility options along SR-187 (to be consistent with Complete Streets policies) may not be possible if the City must adhere to State's design criteria. By relinquishing the roadway to the local agency, proposed

improvements to bicycle, pedestrian, and transit modes may become more viable.

- The IGR Branch has no objections to the proposed relinquishment of SR-187. No significant changes to the transportation/circulation system are anticipated as the result of the proposed relinquishment. No major local development projects in the vicinity of SR-187 have been reviewed by the IGR Branch.

E. Action: Identify the status of the route in the local agencies "circulation element" of the general plan and any currently applicable local planning studies or community initiatives that may impact the request.

- There are no known conflicts with the City's General Plan and Circulation Element as a result of relinquishing SR-187 in the City of Los Angeles. The relinquishment would benefit the local agency's planning process with an opportunity to adopt context sensitive solutions, complete streets, community design elements and incorporate local values. The relinquishment is consistent with Caltrans goal to relinquish the entire route.

- The relinquishment is not expected to change the status of the route in the City's Circulation Element or in the City's General Plan. There are no current local planning studies or community initiatives that would negatively impact the relinquishment.

- The City of Los Angeles identifies SR-187 (Venice Boulevard) as a Divided Major Class II highway. The selection criteria for this designation are:

    - **Major highways (Class II)** should typically be located one mile apart in a grid system.
        - 30,000 to 50,000 ADT

    - **Performance Criteria:**
        - Three travel lanes in each direction during peak hours+ left turn lanes at signalized intersections.
        - 2400 vph in each direction during peak hours.

2. Route or Corridor Concept and Recommendations for Route Development

A. Action: Identify the route development or relinquishment recommendation in the most recent District TCR, District System Management Plan (DSMP), or other applicable internal reports or studies.

- The April 1991 TCR proposed this route to be relinquished.

B. Action: Describe current and projected future traffic and components of the traffic stream (5-plus axle trucks) for the route, as it exists on the State Highway System and any system restrictions for large trucks. Identify how this is forecasted to change based on the relinquishment.

- Truck data from the 2012 AADT for SR-187 ranges from 40,000 at SR-1 (Lincoln Blvd) to 70,000 at Route 405.
    - The truck AADT at Lincoln Blvd. is 1323, or 3.31 percent of AADT. Of these, 84.4 percent are 2 axle, 9.83 are 3 axle, 3.03 are 4 axle, and 2.74 are 5 axle.
    - At Route 405, the truck AADT is 1771, or 2.53 percent of AADT. Of these, 84.54 percent are 2 axle, 9.6 percent are 3 axle, 1.67 percent are 4-axle, and 4.19 are 5 axle.
- No significant changes to the current or future highway and circulation system would be anticipated as a result of the relinquishment.
- No truck restriction is currently imposed on this segment of SR-187. There is no known plan to restrict truck access by the City of Los Angeles upon the relinquishment.

C. Action: Identify the primary origins and destinations for travel on the route segment in terms of interregional and major regional trips and sub area functions that may impact relinquishment considerations, for example, connectivity to a regional mall, a regional area industrial park, regional airport, and other functions.

- SR-187 (Venice Boulevard), serves the neighborhoods of Palms, Venice and Mar Vista in West Los Angeles, as well as the City of Culver City.

- ***Trip generators on State Route 187 include:***
  - Venice High School
  - Mark Twain Middle School
  - The Actors' Gang Theater
  - The Culver City Station for the Expo Light Rail Line
  - The Helms Bakery Building (shops and restaurants)
  - The Museum of Jurassic Technology
  - The Mar Vista Branch Public Library
  - Culver City Gospel Hall
  - Hare Krishna Temple
  - And a variety of restaurants and small businesses

- ***Trip generators near State Route 187 include:***
  - Culver Studios
  - Sony Pictures
  - The Culver Hotel (a National Historic Landmark)
  - The Pacific Ocean
  - Marina Del Rey
  - Venice Beach (and the Venice Boardwalk)
  - The Ballona Wetlands Ecological Reserve
  - Santa Monica Airport
  - The Kirk Douglas Theater

- SR-187 also provides access to SR-1 (Lincoln Blvd).

- Bicycles are permitted on SR-187 (Class II facility).

- **Current Transit**

  - ***Buses:***

    1) Metropolitan Transit Authority:

    Metro Bus #33: The 33 bus serves Venice Blvd from Lincoln Ave to Rte 10 and continues on into Downtown Los Angeles. Regular fare is $1.75 and senior fare is $1.00. Metro Rapid Transit line 733 serves Venice Blvd from Ocean and Santa Monica to Union Station in Downtown Los Angeles.

    2) City of Santa Monica Big Blue Bus:

    There are two Big Blue Bus routes that serve small portions of Venice Blvd:

Rte 1: The Route 1 bus serves Venice Blvd from Lincoln Blvd. to Walgrove Ave with "select trips" involving every other bus.

Rte 12: The Route 12 bus serves Venice Blvd from Bagley Ave. to National Blvd.

Regular fare for either route is $1.00 and senior fare is 50 cents.

- ***Light Rail:***

The Culver City Station for the Expo Light Rail Line is located at Venice and Robertson (to the west) and National and Washington (to the east). The actual address is 8817 Washington Blvd, Culver City. The Expo line runs from Culver City to downtown Los Angeles. Additionally, Exposition Transit Corridor, Phase 2 is extending the Metro Expo Line west to Santa Monica from the Culver City Station, running along the old Pacific Electric Exposition right-of-way to 4th St. and Colorado Ave. in downtown Santa Monica.

The 6.6 mile second phase will connect Santa Monica by rail to Downtown LA, Pasadena, San Fernando Valley, South Bay, Long Beach and dozens of points in between. With seven new stations serving diverse LA neighborhoods such as Century City, West Los Angeles, and Santa Monica, the Metro Rail system will expand to 87 stations and over 93 miles of rail to destinations across L.A. County.

Major construction began in 2012 and is scheduled to be completed in 2015. The Exposition Construction Authority awarded the design-build contract for Phase 2 to Skanska-Rados, Joint Venture in March 2011.

Metro is scheduled to begin train safety tests in late 2015, with a projected line opening in early 2016.

Phase 2 includes new stations at:

- Palms
- Westwood/Rancho Park
- Expo/Sepulveda
- Expo/Bundy
- 26th St./Bergamot
- 17th St./SMC

- Downtown Santa Monica

- ***Light Rail Park and Ride Lots:***

  Culver City Station Park and Ride Lot
  8817 W. Washington Blvd
  Culver City, CA
  Open 24 hours, 7 days a week. 586 spaces/8 bike racks/16 bike lockers

- Very little or no impact to transit is expected from the relinquishment. Any future impacts will occur as a result of Metro or the City of Santa Monica transit changes to the existing lines or adding new lines, if needed. Metro re-evaluates all lines biannually in December and June. Poor performing (low ridership) lines are either cancelled or rerouted in the hope of increasing performance. The City of Santa Monica also conducts service assessments twice a year, once in March and again right before the summer.

- A balance is expected between increased gas prices and periodic fare increases. As gas prices increase, a small percentage of riders turn to transit. However, as with any increase in transit fares, a small percentage (conservatively 1% to 2%, depending on the fare increase) of transit riders will forego public transportation and find other modes, usually returning to driving alone, carpooling, bicycling or even walking if the distance is short enough. These increases not only affect home/work trips, but also students, the elderly and the transit dependant.

- SR-187 has existing sidewalks and Class II bike lanes. Primary origins and destinations for pedestrians and bicyclists include all the same primary origins and destinations as for motor vehicles: beaches, harbor, commercial, retail, service business, offices, restaurants, schools, parks, theaters, and residences. Bicyclists have access to the Pacific Coast Bike Route on SR-1, and the Marvin Braude Bike Trail, a Class I bike path, on the coastline is used by both pedestrians and bicyclists.

- No impact to the regional and interregional transportation system would be anticipated due to the relinquishment.

D. Action: Identify issues that could negatively impact interregional or regional travel and connectivity, inter-modal transfer for freight, and other functions. Identify how the

concerns will be addressed. This includes potential local restriction of truck access and truck delivery issues.

- Use of this route for long haul trucking purposes has not been a primary use of SR-187, given other Freeway options, the urbanized nature of this portion of the route and the need for frequent stops on an urban arterial street.

- Relinquishment of this route is not expected to negatively impact interregional, regional travel, connectivity or the trucking industry because its design limits use of this facility for this purpose.

E. Action: Identify if the relinquishment is expected to cause diversion of interregional and regional trips (including large trucks) to other state routes or local arterials thus creating a potential need for additional improvements to accommodate increased travel demand on other routes.

- No diversion is anticipated. It is not anticipated that City of Los Angeles will have access restriction through this segment.

- Relinquishment of this route is not expected to negatively impact interregional or regional travel and connectivity or the trucking industry because its design limits use of this facility for this purpose.

- Interregional and regional travel is accommodated to the North, connecting at the East terminus of SR-187, and running East to West, by I-10 (Santa Monica Freeway). Running North-South, perpendicular and intersecting SR-187, is the I-405 (San Diego Freeway), which connects to I-5 to the north in Los Angeles County, and to the south, in Orange County.

F. Action: Identify any compatibility issues for adjoining jurisdictions created by the proposed relinquishment (such as gaps created by the relinquishment). For example, will a relinquishment terminate at an intersection or mid-way in an identified bikeway segment creating potential traveler confusion or difference in design standards? Identify how compatibility issues will be resolved.

- No compatibility issues exist. With the exception of a small portion where the City of Los Angeles and Culver City share their boundaries within SR-187, from approximately Bledsoe Ave. (PM 5.6) to Overland Ave. (PM 6.6), SR-187 is proposed to be relinquished and lies within the City of Los Angeles, and terminates at logical points, SR-1 and I-10.

- Venice Blvd. (SR-187) is included in the City of Los Angeles Bicycle Plan, which represents a new commitment by the City to complete streets, toward a sustainable transportation system which supports both motor vehicle use as well as other modes of transportation, such as bicycling. The plan includes three bikeway networks: the Backbone network (of which Venice Blvd is part of), the Neighborhood Network, and the Green Network. These bicycle networks have established three goals: (1) increase the number and types of bicyclists who bicycle in the City; (2) make every street a safe place to ride a bicycle; and (3) make the City of Los Angeles a bicycle friendly community. The SR-187 relinquishment will pave the way form the City of Los Angeles to facilitate the transformation of Venice Blvd. to complete streets.

- The Southern California Association of Governments (SCAG), as well as the Los Angeles County Metropolitan Transportation Authority (Metro) support strategies and projects that promote various modes of transportation, such as walking and bicycling.

G. Action: Identify any issues with signs, pavement markings, signal coordination and control along the route and existing agreements with local jurisdictions that will need to be modified as a result of the relinquishment. Identify recommended actions to resolve.

- Traffic signals on SR-187 are currently operated and maintained by the City of Los Angeles Department of Transportation as per a delegated maintenance agreement.

- The relinquishment will have no adverse impact to traffic signal operation within SR-187.

- A traffic sign installation order is in progress for Terminal Access signs (G66-56) at various locations on SR-187:

    - Eastbound on SR-187 (Venice Blvd), just East of SR-1 (Lincoln Blvd).
    - Eastbound on SR-187 at the corner of Melvil St., combined with a G66-21(CA) (mod) END sign.
    - Eastbound on SR-187, at west of La Cienega, combined with a G66-21(CA) (mod) END sign.
    - Westbound on SR-187 Just East of Redwood Ave., combined with a G66-21(CA) (mod) END sign.
    - Westbound I-10 freeway off ramp to Venice Blvd. /La Cienega Blvd., Combined with a G66-21A (CA) (mod) End sign.

- The sign installation is not expected to affect this relinquishment.

H. Action: Identify actions that may be needed to advise interregional travelers and the trucking industry on connecting routes if the segment recommended for relinquishment will impact throughput or connecting trips (based on anticipated or known local redesign and development plans). Include justification for creating this impact; for example, requiring an extra legal transportation permit from local jurisdictions.

- No notification need is currently foreseen, as through and connecting truck trips must still be accommodated, given the commercial properties adjacent to SR-187. Other vehicles can access any route open to trucks.

I. Action: Identify any Department of Transportation funded studies ongoing or completed that impact the route portion (Environmental Justice, Community Planning, State Planning, Research Innovation and System Information, etc.) and related recommendations.

- The Office of Projects and Special Studies shows no projects or documents being prepared that may impact this relinquishment.

- The IGR Branch is not involved in any current planning studies in the vicinity of this proposed relinquishment.

- No other Units contacted have indicated that there are any studies that may impact this relinquishment.

J. Action: Identify adjacent local agency position(s) on the relinquishment and how they have been coordinated and addressed between jurisdictions. This should include tribal governments and law enforcement where applicable.

- No adjacent agencies will be negatively impacted by this relinquishment. The entire relinquishment lies within the City of Los Angeles, except for a small portion (approximately PM 5.6-6.6) where the city of Los Angeles and Culver City share boundaries inside SR-187 right of way. Culver City is the only City adjacent to this relinquishment. City of Los Angeles is in coordination with the City of Culver City regarding the planned improvement project and the relinquishment of SR-187.

K. Action: Identify potential liability issues of relinquishment including but not limited to seismic zones, inundation, and issues pertaining to the American Disabilities Act (ADA).

- SR-187 is located in Los Angeles County, an area prone to earthquake activity. Per the California Department of Conservation, the areas in the vicinity of Routes SR-1/SR-187 interchange, as well as the area in the vicinity of I-10/SR-187 interchange, are located in a liquefaction zone. This should not negatively impact this relinquishment. SR-187 proposed relinquishment is within City of Los Angeles boundaries, and the City is aware of seismic conditions in the area. The department of conservation makes maps available to the public and jurisdictions at the following link: http://www.conservation.ca.gov/cgs/rghm/ap/Pages/Index.aspx

- The complete route is within Seismic Zone 4 (.040 g).

- Fault activity shows quaternary faults less than 130,000 years.

- The route is within proximity of the Newport-Inglewood Fault Zone

    - Newport-Inglewood Fault line is a right-lateral; local reverse slip
    - Approximately 75 km.
    - 0.6 mm/yr slip rate.

- There are five structures within SR-187 right of way: 53-2658M, 53-2659M, 53-3070L/53-3070R, 53-1610G. The two 'M' structures are culvert type. The two 'L/R' structures are newly constructed for light-rail trains, and recently been added into our system. The last 'G' structure is at the I-10 on-ramp, and it should remain in the State's inventory. This structure is approximately 667 feet from the beginning of the structure measured perpendicular to the center line of SR-187.

- SR-187 is not within a flood zone, as determined by the Los Angeles County Department of Public Works Flood Zone Determination Website: http://dpw.lacounty.gov/wmd/floodzone/

- The requirement to provide equivalent access to facilities for all individuals, regardless of disability, is stated in several laws adopted at both the State and Federal level. Two of the most notable references are The Americans with Disabilities Act of 1990 (ADA) which was enacted by the Federal Government and took effect on January 26, 1992, and Section 4450 of the California Government Code.

- ADA standards are required on all new resurfacing projects.

- Future Projects:

    - PID 713000493 - Rehabilitate pavement. – LA 187 PM 3.5 to PM 8.9
    - Mabel Tran Project Manager
    - Program for Fiscal Year 17/18

L. Action: Identify any environmental issues.

- Los Angeles is known for traffic congestion and its impacts. Pollution of various types is typical in this region. Air quality, noise and water pollution are common. Below is the latest California Air Resources Board attainment/nonattainment status of SR-187 Corridor which falls in the South Coast Air Basin.

    - **POLLUTANTS STATE DESIGNATION**
        - Ozone (1hr) -Nonattainment
        - Ozone (8hr) -Nonattainment
        - CO (8hr) - Attainment
        - PM10 (24 hr.) - Nonattainment
        - PM2.5 (24 hr.) - Nonattainment
        - NO2 (Annual) - Attainment
        - SO2 (1 hr) - Attainment
        - Lead - Nonattainment

M. Action: Identify coordination with transit agencies that may provide service on the segment.

- Caltrans Planning has been in contact with Metro. Metro has not expressed any concerns, and has no projects planned that will negatively impact this relinquishment.

N. Action: Identify coordination with neighboring Caltrans districts that may be affected by the relinquishment.

- SR-187 is centrally located within Caltrans District 7. No neighboring District will be affected.

3. District Coordination with RTPA's

A. Action: Identify steps the district has taken to coordinate the relinquishment request with the Regional Transportation Planning Agency (RTPA) and/or Metropolitan Planning Organization (MPO).

- Caltrans District 7 Planning has notified and been in contact with SCAG regarding this relinquishment. SCAG has not expressed any concerns that will adversely affect this relinquishment.

B. Action: Identify the route development strategy in the Regional Transportation Plan and any supportive or contrary recommendations on the relinquishments.

- A specific route development strategy for SR-187 was not prepared as part of SCAG's 2012-2035 Regional Transportation Plan/Sustainable Communities Strategies (RTP/SCS).

- SCAG, as well as Metro, support strategies and projects that promote various modes of transportation, such as walking and bicycling.

- SCAG's 2012-2035 Regional Transportation Plan/Sustainable Communities Strategies (RTP/SCS) invests $6.7 billion towards increasing bikeways, bringing sidewalks into compliance with Americans with Disabilities Act, safety improvements and other Active Transportation Strategies. SCAG supports and encourages implementation of Complete Streets policies in the 2012–2035 RTP/SCS.

- SR 187 relinquishment will pave the way for the City of Los Angeles to facilitate the transformation of Venice Boulevard to Complete Streets.

C. Action: Describe District actions to provide relinquishment information and recommendations to the regional agency Technical Advisory Committee (TAC) and other applicable groups.

- District staff has contacted Metro's Technical Advisory Committee, to advise of SR 187 relinquishment, and request comments. Metro does not anticipate any negative impact resulting from this relinquishment.

D. Action: Identify regional studies that include the proposed route or route segment. Do the recommendations in these studies support, or run contrary to, the relinquishment request?

- Caltrans District 7 maintains and prepares various documents such as the Transportation Concept Report (TCR), Corridor System Management Plan (CSMP), District System Management Plan (DSMP) and others that are constantly coordinated with SCAG, Metro and locally impacted partners. The relinquishment of SR-187 is supported and recommended by the TCR, and is consistent with transportation planning's efforts for comprehensive congestion management.

- The Los Angeles Department of Transportation is leading the Westside Mobility Plan, a comprehensive study to develop potential short-term solutions as well as long-term plans to address congestion and mobility challenges in the Westside. The study boundary is comprised of two areas: the West Los Angeles Transportation Area and the Coastal Transportation Corridor Area. The Coastal area is comprised of the boundaries defined in the Coastal Transportation Corridor Specific Plan, and includes the communities of Venice, Mar Vista, Playa Vista, Westchester and LAX. The Plan is creating a transportation blueprint for the Westside and upon completion will develop recommendations to improve the connectivity of the transit network, better serve all modes of transportation, improve the efficiency of the transportation system, and enhance the livability of the major boulevards in Westside communities. The Westside Council of Governments lists the Westside Mobility Plan as a current project. The plan is in line with City of Los Angeles plans to improve SR-187 to Complete Streets.

4. Coordination with State, Federal, and Tribal Plans and Programs

A. Action: Identify any known plans from other State agencies, departments, local agencies, or non-profits that would potentially impact (or would be impacted by) the relinquishment decision. (e.g. - coastal plans, truck routes, bike plans, pedestrian plans, environmental mitigation).

- SR-187 has existing sidewalks and Class II bike lanes. Bicyclists traveling on SR-187 have access to the Pacific Coast Bike Route on SR-1. This relinquishment is not anticipated to negatively impact these facilities.

- No other known plans other than those already identified in this RAR.

B. Action: Identify any state regulatory agencies that may require input on the relinquishment such as the Coastal Commission, California Environmental Protection Agency.

- The California Coastal Commission (CCC) was contacted and they find SR-187 outside of the coastal zone boundaries.

- The California Coastal Act of 1976 requires local governments to prepare and implement Local Coastal Programs, or LCP, to carry out the mandate to protect coastal resources and maximize public access to the shoreline. In September 5, 2013, the City of Los Angeles applied for a grant from the CCC to develop the "Venice Local Coastal Program", which includes portions of SR-187, from Lincoln Blvd. (SR-1) to Walgrove Ave., and from Walgrove Ave. to Lyceum Ave. This Portion of SR-187 will be part of the "Coastal Transportation Corridor" specific plan mentioned above (Action 3, sec D). The portion of the plan dealing with Climate Resiliency will address the impact of Climate change and sea level rise and include developing a framework for the protection of and development in the City's coastal areas. SR-187 relinquishment will aid City of Los Angeles efforts and coordination with the CCC.

C. Action: Identify projects that are now programmed or planned on the State Highway System within the area or in adjacent segments that may be impacted by the relinquishment. Include all programs regardless of funding type (STIP, SHOPP, Local Programs – CMAQ, and RSTP) and include transit capital projects as applicable.

- Caltrans recently programmed a capital preventive maintenance project for funding fiscal year 2017/2018. The project limits are between SR-1 (Lincoln Blvd), and Cadillac Ave. just past east of I-10, effectively the entire SR-187. The purpose of the project is to preserve and extend the life of the existing pavement and improve ride quality. The strategy is cold plane and AC overlay. Construction is scheduled to start in summer 2018 and will take approximately one year.

- A $630,000 minor project is underway at the intersection of Venice Blvd and Motor Avenue involving signalization of the intersection for operational improvement. Construction started in June and expected to last 4.5 months.

- Additionally, a protective left turn signal phasing has been proposed for Venice Blvd. (SR-187), at the intersection of Grand View Blvd.

- Other improvements made by Caltrans in recent years include:
  - Median island and curb ramp improvements at Maplewood Ave., completed in June 2011 at a cost of $245,000.
  - Installation of left-turn phasing signal and upgrade curb ramps at Beethoven Street, completed in October 2012 at a cost of $301,000.

D. Action: Identify coordination and formal consultation with Native American Tribal Governments that may be affected by the relinquishment.

- No Native American Tribal Governments will be affected by this relinquishment

E. Action: Identify coordination with Federal Agencies (National Park Service, Department of Defense, and Bureau of Land Management).

- SR-187 does not impact any access to lands that are part of the National Park Service, or the Bureau of Land Management.

- SR-187 does not connect to any military bases or part of the Strategic Highway Network; it is not identified as part of the STRAHNET network.

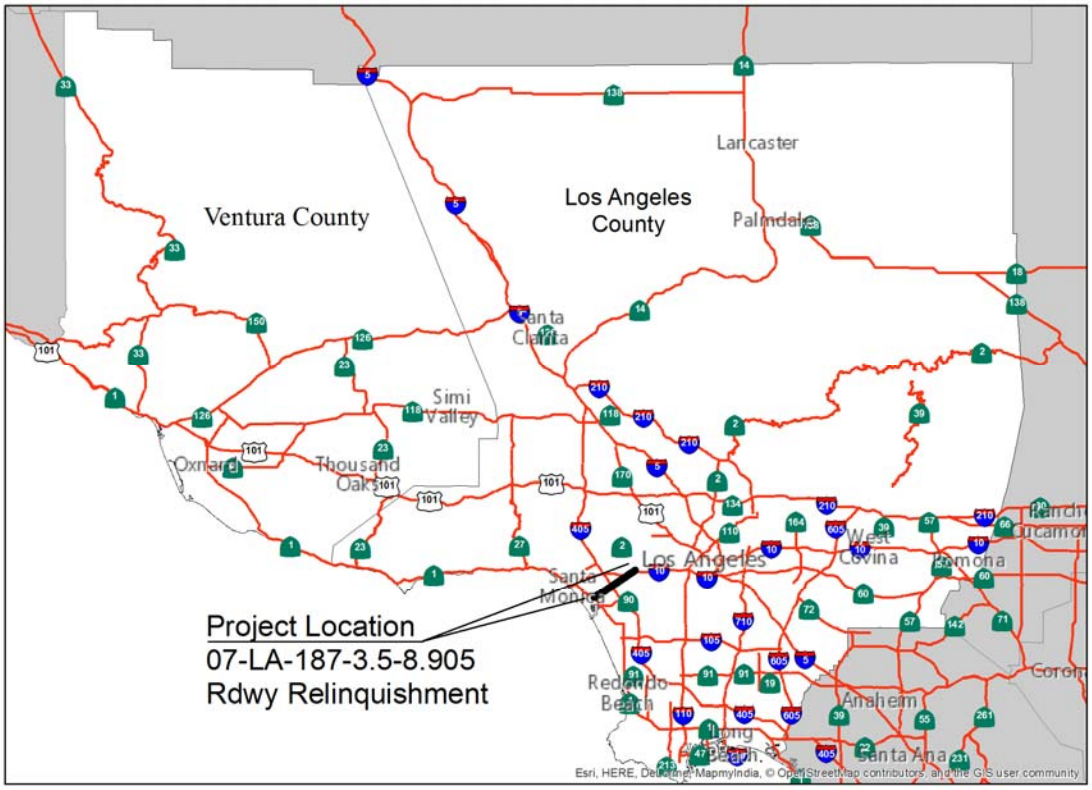
5. Internal District Coordination

A. Action: Identify the functional unit in the district, project manager for the relinquishment package, and the staff contact person for questions on SHS evaluation.

- For relinquishment, contact Richard Chiang (Assistant Relinquishment Program Advisor) at (213) 897-3768.
- For Project Manager, contact David Yan (Senior Project Engineer) at (213) 897-9126.
- For System Analysis, contact Neil Hashiba (Branch Chief, Transportation System Information, Office of Advanced Planning, Division of Planning and Local Assistance) at (213) 897-4369

B. Action: Identify the responsible unit and individual for coordinating the revised state highway information based on the proposed relinquished segment within the district (Maintenance, Traffic Operations Design, etc.) and headquarters division. Ensure local enforcement and safety agencies are informed of the change in route status when it occurs.

- David Yan (Project Manager, Program Project Management) - (213) 897-9126.



C. Action: Identify functional unit and responsible position in the district for ensuring that the State Highway Inventory accurately reflects the relinquished segment post miles with final approval.

- Neil Hashiba (Branch Chief, Transportation System Information, Office of Advanced Planning, Division of Planning and Local Assistance) - (213) 897-4369.

6. **Maps and Photos**

A. Action: For highway relinquishment maps include segment limits with post miles.

Location Map

B. Action: Provide photos that support the analysis within the RAR.

Statewide Analysis to Identify Sites with the Potential for Lane Reconfiguration

What is a 4- to 3-Lane Conversion?

In general, a 4- to 3-lane conversion can simply be described as the removal of a travel lane to increase the utilization and efficiency of the roadway for the traveling public. Reallocating this space in the right locations has been shown to increase the safety and operation of the corridor.[1] In many cases the reallocation of space has provided municipalities an opportunity to grow their network of bike and pedestrian infrastructure and/or align with existing complete streets.

How to Determine Feasibility

The Iowa Department of Transportation's Office of Traffic and Safety (TAS) has expressed interest in developing a list of potential candidate sites for 4- to 3-lane conversion. A number of factors are usually considered to determine the feasibility of converting a four-lane roadway to a three-lane roadway. These factors include[2]:

- Roadway function and environment
- Overall traffic volume
- Level of operational service
- Turning volumes and patterns
- Frequent-stop and/ or slow-moving vehicles
- Weaving, speed, and queues
- Crash types and patterns
- Pedestrian and bike activity
- Right-of-way availability, cost and acquisition impacts
- General characteristics: parallel roadways, offset minor street intersections, parallel parking, corner radii, and at-grade railroad crossings

The above factors are typically analyzed at a corridor level and require significant data gathering and analysis to determine feasibility. A statewide analysis to screen the system for potential candidate sites will only be viable if the factors or data elements are easily accessible. Many of the factors above would require extensive data collection and local knowledge of the candidate locations. Therefore, such a comprehensive analysis would be impractical to perform at a statewide level. In the face of such limitations, it's important to adjust the complexity and scope of the analysis to ensure that potential candidate sites are identified with the understanding that conversion feasibility cannot be determined at such a high level of study.

[1] FHWA, "Road Diet Informational Guide: FHWA Safety Program." FHWA Report No. FHWA-SAT-14-028". (Washington, D.C:2014).

[2] Knapp, Keith, et. al. Guidelines for the Conversion of Urban Four-Lane Undivided Roadways to Three-Lane Two-Way Left-Turn Lane Facilities. Center for Transportation Research and Education, 2001

It was determined by TAS and the Office of Systems Planning (OSP) that a more streamlined approach would be taken to identify potential candidate sites. This approach would lean heavily on the use of existing roadway databases and geographic Information systems (GIS) for the screening. The following is a description of the data elements used and analysis performed to identify potential candidate sites.

Objective of Analysis

The objective of this analysis was to identify four-lane roadway segments, ½ mile or greater in length, that had the potential to be reconfigured to three-lane cross sections. As the analysis progressed, a secondary objective was established to also identify existing three-lane cross sections. It is envisioned that information collected in this effort could support future analyses and studies.

Possible Network Screening Data Elements

The data elements used for the network screening analysis are presented in Table 1 below. Other considerations included total crashes and the presence of signalized intersections.

Table 1: Possible Network Screening Data Elements for Road Diets

Data Element	Field Name/ Table	Source
Major Intersection	INTMAJOR/ ROAD_INV	GIMS
Minor Intersection	INTMINOR/ ROAD_INV	GIMS
Business Entrances	ENTBUSINESS/ ROAD_INV	GIMS
Private Entrances	ENTPRIVATE/ ROAD_INV	GIMS
Median Type	MEDTYPE/ ROAD_INFO	GIMS
Federal Functional Class	FEDFUNC/ ROAD_INFO	GIMS
Number of Lanes	NUMLANES/ ROAD_INFO	GIMS
Average Annual Daily Traffic (AADT)	AADT/ TRAFFIC	GIMS

GIMS stands for Geographic Information Management System

Scope of Analysis

The scope of this analysis included both urban and rural segments. It also included all jurisdictions from local to state-owned roads. In order to identify potential candidate sites, it was decided that an iterative process of filtering locations by attribute information and analyzing the selection for further filtering was the best approach. This process was continued until an optimal number of locations was identified that was neither too broad nor too restrictive. In order to screen the network, a combination of roadway data elements was used. This data was mostly obtained from the Iowa DOT's GIS REST services, but other crucial data elements were utilized, including five-year crash data from TAS and signalized intersection locations from the DOT's intersection database (developed by Iowa State University's Institute for Transportation (InTrans)).

Analysis Structure

This analysis was composed of five different phases. In the sections below, each phase of the analysis is described in summary level detail, which largely excludes the technical aspects of Phases 1-3 of the analysis.

First Phase: Querying of Data

The first phase of this analysis was a high level screening of the network utilizing Iowa DOT's roadway data. The goal of this phase was to simply identify all roadway segments within the state that had four through lanes, no median, and were open to two-way traffic. No other restrictions were made in terms of the roadway. This resulted in identifying segments of both varying lengths and annual average daily traffic (AADT).

Second Phase: Filtering and Calculations

In order to provide a more manageable pool of candidate locations, the segments were filtered by traffic volume. Since it was unlikely that conversion projects would occur on very high volume 4-lane roadways, segments with an AADT above 18,000 were excluded from the analysis. The remaining segments were classified into three traffic volume tiers: low AADT, medium AADT, and high AADT. Those tiers are defined below in Table 2.

Table 2: Road Diet Candidate List AADT Breakouts

AADT	Tier
0–6,000	Low AADT
6,000–12,000	Medium AADT
12,000–18,000	High AADT

As part of the second phase, access density was calculated for each segment using a summation of two roadway elements (business entrances and private entrances) divided by the functional length of the segment. Further, all signalized intersections within 1/8th of a mile of each other were identified through a buffer analysis and spatially joined to the candidate data set.

Third Phase: Geoprocessing and Aggregation

In the third phase of this analysis the segments identified within the previous two phases were aggregated so as to have continuous corridors. Since it was unlikely that conversion projects would take place on short corridors, a minimum corridor length of ½ mile was established. Those corridors less than ½ mile in length were excluded from the analysis. It should be noted that it is possible to consider a lane configuration outside of the thresholds established in this report. These thresholds were developed to manage the scope and number of listings identified through the screening process, but do not limit what could be considered. Finally, segment level crash data was spatially selected and aggregated to each corridor in order to calculate a crash rate and obtain the total number of severe injuries for each potential candidate site.

Fourth Phase: Identification of Existing Three-Lane Configurations (Secondary Screening)

It was determined during the screening process that it would also be helpful to identify and provide a listing of current three-lane roadways. This would give TAS a listing of all known three-lane roadways within the state. In order to identify existing three-lane configurations, the first three phases of analysis described above were repeated, with the only notable difference being in the initial query of the roadway data. Instead of querying the data set for four through lanes, it was queried for three lanes with two of the lanes being coded as through and the middle being coded as two-way left-turn lane (TWLTL).

The query for existing three-lane roadways was supplemented by two sources provided by TAS. The first source was an inventory of three-lane roadways that had been maintained by TAS in spreadsheet form. The second source was from a study titled "Iowa's Experience with Road Diet Measures: Use of Bayesian Approach to Assess Impacts on Crash Frequencies and Crash Rates." In Table 2 of that study (titled: Site Descriptive Information) there is a listing of three-lane roadways.[3] Both lists were combined and the corridors that still existed in that configuration were included in the final listings of this report.

Screening the network for existing three-lane sites was a secondary effort to the original scope of this project. Because of this, the results of that analysis are not included in the main body of this report. However, existing three-lane corridors are listed in Appendix 1, and also appear in some of the maps in Appendix 2.

Fifth Phase: Quality Control

Although Iowa has a very robust roadway database, like many other states, Iowa is not immune to inaccuracies within its database. For this reason, it was important to review the corridors that had been identified to ensure that they accurately represented either potential candidate or existing sites as intended. Each corridor that had been identified through the initial network screening and then filtered through to aggregation was visually inspected using a combination of aerial photography and street-level imagery. Each corridor was inspected to ensure that the number of lanes, approximate length, existence of curbs, etc. was correct. In some instances, aggregation of the segments resulted in discontinuous corridors. This was largely due to the original screening of the roadway data. For example, at an intersection, a four-lane roadway may either experience an increase in the number of lanes (usually turn lanes) or have medians. To resolve this issue and to ensure continuous corridors, segments at intersections where the cross section changed were manually selected and aggregated.[4] After the visual inspection and necessary resolutions were completed, a final listing of corridors was created which consisted of 223 potential candidate sites and 78 existing three-lane sites.

Results of Analysis

In summary, 223 potential candidate sites were identified through the statewide analysis. Of the sites identified, 52 fell within the Low AADT tier, 99 fell within the Medium AADT tier, and 72 fell within the High AADT tier.

Potential Candidates and Existing Three-Lane Sites

In Appendix 1, both the potential candidates and existing three-lane sites are listed. Table 3 presents the breakdown of sites by DOT district and AADT. In summary, both District 1 and District 6 are well represented in number of potential candidate sites. This is likely due to the larger metropolitan areas within both of these districts (notably Des Moines, Ames, Cedar Rapids, Davenport, Dubuque, and Iowa City). Similarly, District 1 had the largest number of existing three-lane sites while the district with the second-highest number came from District 5. Interestingly, District 5 is one of the more rural districts in the state, having no metropolitan areas (population >50,000).

[3] Pawlovich, M., Wen, L., Carriquiry, A., and Welch, T. (2006). "Iowa's Experience with Road Diet Measures: Use of Bayesian Approach to Assess Impacts on Crash Frequencies and Crash Rates," *Transportation Research Record 1953*, 163-171.

[4] In some instances, this manual selection of the segments and aggregation of corridors resulted in corridors with maximum AADT ranges above the originally defined threshold of 18,000 AADT. These corridors were retained in the table listings because the majority of their length was originally identified in the network screening query.

Table 3: Potential Candidates			
DOT District	AADT	Number of Sites	Total Number of Sites
District 1	0–6,000	4	50
	6,000–12,000	16	
	12,000–18,000	30	
District 2	0–6,000	14	44
	6,000–12,000	23	
	12,000–18,000	7	
District 3	0–6,000	11	30
	6,000–12,000	10	
	12,000–18,000	9	
District 4	0–6,000	8	16
	6,000–12,000	8	
	12,000–18,000	0	
District 5	0–6,000	8	34
	6,000–12,000	23	
	12,000–18,000	3	
District 6	0–6,000	6	49
	6,000–12,000	22	
	12,000–18,000	21	

Table Listings and Descriptions

For each district, a separate table has been created for the potential candidates and the existing three-lane sites. Each table is first sorted alphabetically by city and then by ascending AADT. These tables can be found in the next section. Some of the fields contained in the tables are self-explanatory, however, others need a brief description as to how they were calculated. Figure 1 shows the fields contained in the table listings, followed by a short description for the fields that were calculated.

Potential Candidates: District 6										
District	City	MPO/RPA	Route	Begin	End	AADT	Length(Mi.)	Access Density	Traffic Signal	Crash Rate
6	BETTENDORF	BSRC	GREAT RIVER RD	.1 MILES W OF 244TH AVE	S BLUFF BLVD	8,600	2.32	3	NO	124
6	BETTENDORF	BSRC	18TH ST	HEATHER GLEN AVE	LINCOLN HWY	12,100	2.00	36	YES	501

Figure 1: Fields contained in table listing. Please note that the boxes for the District field may be represented in either grey or red. Red indicates that the site is at least partially located on a state route whereas grey indicates that the site is located exclusively on a municipal or county route.

AADT

During the process of identifying the potential candidate sites and existing three-lane sites, segment-level AADT values were aggregated and calculations were performed on that field. Four different calculations were used during the process of aggregation including mean, range, min, and max. However, in order to have concise information in the table listing, only the maximum AADT value is presented. This value represents the highest segment AADT value for the corridor.

Access Density

The density of access points along a corridor can have an impact on traffic operations and safety. Four-lane corridors with higher access densities stand to benefit the most from a conversion to three lanes. A greater number of accesses results in a greater number of left turns. The addition of a continuous center turn-lane provides a safer means of accommodating left-turning vehicles by separating them from the through traffic.

Access density was calculated for each site within the analysis by summing the number of private and business entrances for each segment and dividing it by the segment's length. In the tables, access density is presented as the number of access points per mile

Signalized Intersections

The presence of traffic signals can affect the operational efficiency of a converted corridor. While the effects may be minimal at lower traffic volumes, they can be evident at higher traffic volumes. However, these effects can usually be overcome—and operations improved—by re-timing the signals or by removing those signals that are no longer warranted. A spatial analysis was performed on all signalized intersections within the state to identify those corridors having signalized intersections. In the tables below, the traffic signal field is populated by either a "Yes" or a "No". "Yes" indicates that at least one signalized intersection is located within the corridor, and that traffic flow in the three-lane configuration may be enhanced through a more in-depth analysis of signal operations.

Crash Rate

Reducing the number of lanes from four to three can have a substantial effect on the number of crashes on a roadway. Previous studies have indicated a 19 to 47 percent reduction in overall crashes when a roadway is reconfigured from four lanes to three lanes.[5] Including crash rates into this analysis increases the ability for candidate sites with the greatest potential for crash reductions to be identified. Figure 2 presents the equation used to calculate crash rates for sites. It should be noted that five years (2011-2015) of Iowa DOT crash data were used in this analysis. In the equation below, "Total Crashes" represents the aggregate number of crashes that occurred along a corridor. In the bottom of the equation, vehicle miles traveled (VMT) represents the aggregate volume of the corridor. Finally, "Years of crash history" represents total number of years of crash data. Crash Rate is presented in terms of crashes per 100 million vehicle miles traveled (HMVMT).

$$\left(\frac{\text{Total Crashes}}{\text{VMT*365*Years of crash history}}\right) * 100{,}000{,}000$$

Figure 2 : Equation used to calculate crash rate

[5] FHWA, "Evaluation of Lane Reduction 'Road Diet' Measures on Crashes." FHWA Report No. FHWA-HRT-10-053". (Washington, D.C:2010).

Limitations of Analysis

Data

As mentioned earlier, the completeness and accuracy of the data included in this report rely heavily on the geospatial data obtained through the Iowa DOT's REST services. There were a few instances where the data used was not representative of the current roadway environment, probably due to lags in reporting. Because of this, an extensive effort of visually inspecting the roadway was carried out to ensure the listing was as accurate as possible. However, due to the scope of the analysis, it is possible that errors still exist.

Statistical evaluation

Although a number of attributes aggregated for the sites could be utilized for further statistical analysis, it was not the intention of this effort to perform such analyses. Future efforts might leverage the additional attribute information that was included in the raw aggregate data. This information, if used properly, could lead to case study evaluations or cohort analysis.

Appendix 1: Secondary Analysis

As the original scope of project grew it was decided by TAS that a secondary effort to identify existing three-lane sites would benefit the results of the original project. By identifying existing three-lane sites this secondary screening will not only supplement the original project but also reduce any future efforts to identify such locations. The hope is that in future efforts, this information could be used as a starting point for future analysis.

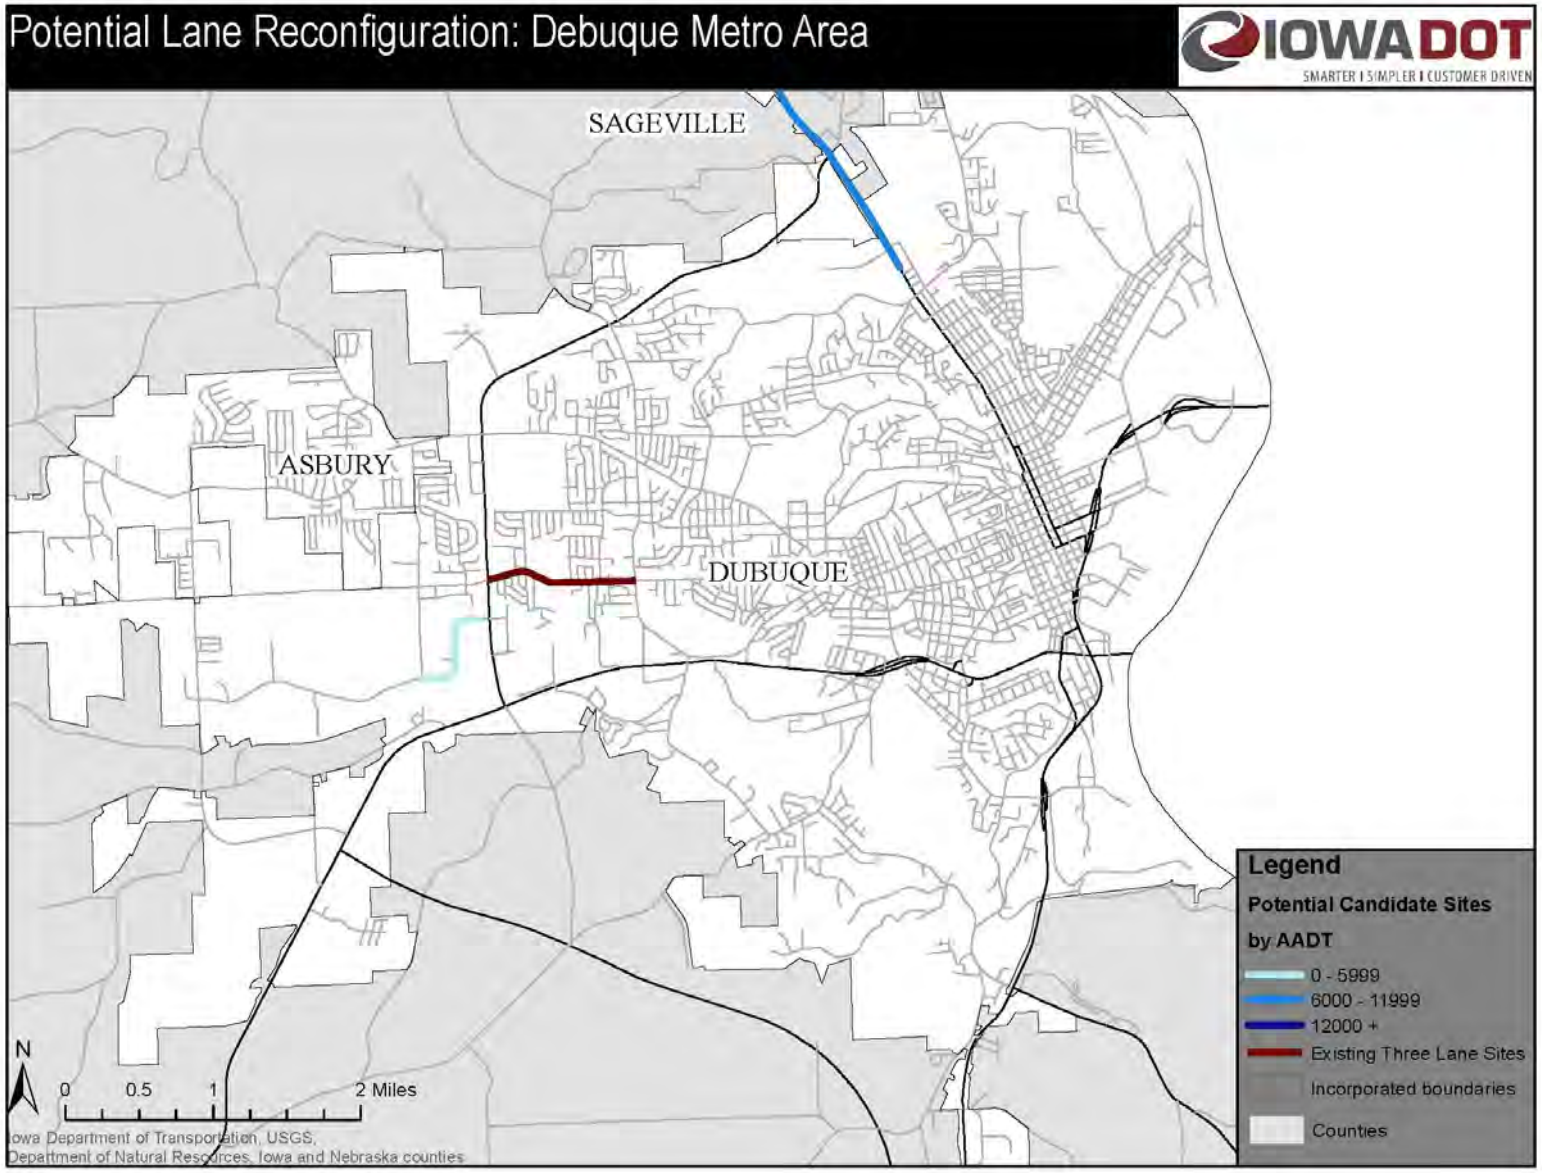
Appendix 2: Maps



In the following pages the potential candidate sites and existing three-lane sites are presented in maps. The maps only include sites within the metro areas of Iowa. By focusing in on only this area it limits the number of maps that needed to be created. It should be noted that the Council Bluffs area was excluded from the maps because of a limited number of both potential candidate and existing three-lane sites.

SPEED CONTROL IN RESIDENTIAL AREAS

ite

DRIVE MICHIGAN SAFELY

FORWARD

This document is a revision of the "Speed Control in Residential Areas" booklet original written by the Residential Area Speed Control Ad-Hoc Committee. This revision represents the latest information and findings of the Institute of Transportation Engineers (ITE) Michigan Section's Technical Project Committee. The makeup of the Technical Project Committee is as follows:

Lori Swanson, Chair	Hubbell, Roth & Clark, Inc.
John Abraham	City of Troy
Matthew Smith	McNamee, Porter & Seeley, Inc.
Mshadoni Smith	Hubbell, Roth & Clark, Inc.
Eric Tripi	Barton-Aschman Associates, Inc. of Michigan

The information presented in this document represents the findings of the authors and does not necessarily reflect the views of the Michigan Office of Highway Safety Planning.

VI. CONCLUSIONS 34

I. INTRODUCTION

The perception of speeding on local streets is probably the most persistent problem facing residents and traffic officials, alike. Although local or residential streets carry the lowest traffic volumes and suffer the fewest traffic crashes, they are the single largest consumer of a traffic engineer's time and energy. Residents observe vehicles being driven at speeds they perceive are too fast and conclude that the speeds would decrease if stop signs were installed. Speeds considered excessive by residents are considered reasonable by these same persons when they are driving in another neighborhood. Every traffic engineer has been shaken by these same residents who announce "if something is not done about the traffic problem on my street, someone is going to be killed and it will be your fault." This is usually followed by a demand for various traffic control measures and often backed up with petitions from residents. Traffic officials then must focus their attention on responding to these pressures, often diverting resources that could be dedicated to solving major capacity and traffic crash problems on other streets.

Residents' complaints are usually accompanied by a proposed solution to the speeding problem...stop signs. Traffic officials respond that stop signs installed to control speeding: (a) don't work, (b) are frequently violated, (c) are detrimental to safety, (d) are not warranted in the Manual* and, (e) actually increase speeds between stop signs. When residents are told that stop signs are not the answer to the speeding problem, they feel they must fight city hall to get them installed. A confrontational relationship is established between residents and traffic officials and the stop sign becomes a "trophy" which is awarded to the winner of the confrontation. Solving the speeding problem becomes secondary to winning the "trophy". The end results of this process are: (1) unhappy citizens, (2) continued complaints and requests for more stop signs, (3) increased political pressure and, (4) often, approval of stop sign installations to bring the controversy, temporarily, to an end. However, experience shows the

* The "Manual" refers to the *Michigan Manual of Uniform Traffic Control Devices* (MMUTCD that specifically states that stop signs should not be used for speed control).

speeding problem is usually not solved. Before and after studies show that stop signs usually increase mid-block speeds and create violators of the stop controls.

This booklet introduces traffic engineers, law enforcement officers, elected officials and community leaders to the concept of traffic calming which may help alleviate speeding in residential areas. Traffic calming is the combination of physical controls and community support to reduce the negative effects of motor vehicle use, alter driver behavior and improve conditions for non-motorized users. Some objectives of traffic calming include: reducing speeds for motor vehicles, reducing crash frequency and severity, increasing safety, reducing the need for police enforcement, and reducing cut-through motor vehicle traffic.

Traffic calming measures are typically installed as part of an area wide traffic management scheme rather than on a single street to avoid shifting the problem from one street to another. A successful traffic calming program must include enforcement, education, engineering and community involvement. Community support and participation is an integral part of a successful traffic calming program. This booklet will give guidance on how to set up a successful traffic calming program in your community.

This booklet provides alternatives that may help decrease speeds on residential streets. It discusses the advantages and disadvantages of each alternative. It points out that there is no single, simple solution to all speeding problems that satisfies residents, is effective, and meets good engineering practices and standards. It also stresses that there may not be a tool to reduce speeds. Regardless of the approach used, there are certain criteria that should be followed:

- All devices must meet Michigan Manual of Uniform Traffic Control Devices requirements.

- The integrity of streets classified as Major under the provisions of Public Act 51 must be preserved.

- Permanent traffic control devices should be used to the minimum extent required to achieve the objectives.

- Access to all properties must be accommodated.
- Access from the nearest arterial to the destination should be as direct as practical.
- Local access to neighborhood facilities must be accommodated.
- All permanently installed devices must be designed to allow emergency vehicle access.
- Consideration must be given to circulation, parking and needs of customers and business owners.
- Consideration should be given to the access needs of essential commercial services such as garbage pickup, snow plowing, student busing, etc.
- Changes must not unduly impact adjacent areas.

It states that residents and local officials must work together with a full understanding of each other's problems, limitations and concerns for the common goal of safety on residential streets. One of the best ways to accomplish this is to have citizens involved in standing or ad hoc community traffic safety committees.

This booklet is intended to be used as a traffic safety tool by traffic engineers, law enforcement officers, elected officials, and community leaders in their day-to-day traffic control responsibilities.

References: 40, 41, 42

II. COMMUNITY INVOLVEMENT

An important component of any traffic calming program is community involvement. If citizens are involved, the chance for problem resolution and a successful traffic calming program is greatly improved. Often the problem cited is one of perception and not fact, and the solution proposed could be ineffective or even counter-productive. One way to avoid the knee-jerk approach to traffic engineering is to develop a process that involves the community. While there are many ways to accomplish public involvement, this section will describe two that have been successful.

Approaches to Citizen Involvement

Standing Committee

Some communities have successfully employed a standing committee, normally referred to as the "Citizen Traffic Committee," to deal with traffic control issues. The makeup, function and authority of the committee are described below:

a. The committee is appointed by the mayor or council. It should consist of an odd number of members who serve staggered terms.

b. Non-voting staff experts (police and engineers) are available to prepare agendas, collect data, provide input and send recommendations to the city council.

c. Efforts should be undertaken to make committee members as knowledgeable as possible about traffic engineering and enforcement principles. This can be realized by providing technical materials and training for committee members.

d. The Committee reviews citizen requests for traffic control devices and staff analysis of those requests, and makes recommendations to the city council.

The Committee should hold monthly, evening meetings. The standing committee offers several advantages; acts as a buffer between the council and citizens; lessens the pressure to install unwarranted devices; may be perceived as more objective than staff; provides technical and citizen input to the council; and dampens the adversary relationship that often develops between citizens and staff. On the other hand, there are some drawbacks: the committee can become politically motivated; one strong member can have too much influence; it can slow the process; and it requires some staff time.

Ad hoc committee

In this approach, an *ad hoc* or advisory committee is formed when a community seeks help in dealing with a specific traffic control problem. While the governmental agency has the ultimate responsibility, it is highly desirable that the committee and agency work through the process and arrive at a consensus. This process works as follows:

a. A working committee of neighborhood residents should be selected to represent different parts of the neighborhood. If the neighborhood has an organized association it should be asked to assist with the appointments; otherwise, volunteers are sought.

b. Committee members should identify the problem brought to their attention.

c. Staff collects the appropriate data and presents it to the committee. The committee sets goals which are quantifiable, e.g., reduce the average speed by a certain percentage, etc.

d. Options should be identified and alternatives presented, listing the pros, cons, cost, etc. of each.

e. Committee and staff reach agreement on the alternative to be recommended.

f. Committee with staff support presents the plan to the larger community through a large meeting or several small meet-

ings. One large meeting is enough if the plan is not controversial; the number of meetings should be directly related to the complexity of the plan. The purpose of the meetings is to obtain community support.

g. Once community support is achieved the plan is implemented. If possible, it is best to install temporary measures to determine the impact. This allows for adjustments and even removal if it is obvious that the measures will not produce the desired results.

The advantages of using advisory committees are that they will help develop neighborhood concerns and determine what, if anything, should be done; it builds a relationship between staff and residents to work through future problems; and the process creates a better understanding of traffic engineering and enforcement principles among lay people. Conversely, this process consumes considerable time and effort of staff. If consensus is not reached, the neighborhood can become divided. If not handled deftly by staff, the process can become unwieldy.

References: 19, 25, 28

III. PROBLEM IDENTIFICATION

The first step in a traffic calming program is to identify the problem. When a resident contacts their City, Village or County, a complaint is recorded. The resident will be directed to discuss their concerns with the other residents or an established traffic advisory committee. If an advisory committee has not been established, the public agency will give guidance on how to start one. Residents will assist the public agency in the identification of the problem.

These residents will also assist the public agency in the collection of data. Speed studies, traffic volume studies and license plate surveys, depending on need, will be performed at locations identified by the residents. The data collected will be analyzed to determine if there is a problem. If a problem is not identified, a letter with the supporting data will be sent to the residents explaining the findings and that no further action is required. If a problem is identified, then the public agency will move to the next steps of the program which include enforcement and education.

References: 42

IV. EDUCATION AND ENFORCEMENT

Once a speeding problem has been identified, the next steps in a traffic calming program is to initiate education and enforcement campaigns. Both of these steps should be conducted at the same time since many times a speeding problem can be reduced through effectively enforcing the traffic ordinances and educating the residents. From past enforcement activities, the City of Farmington Hills, Michigan found that most traffic violators within a residential area were the residents who live in the area. Therefore, it is critical to educate the residents of an area where a traffic problem is occurring.

Reference: 42

A. EDUCATION

1. Public Information And Education

An effective way to educate residents is through public information and education campaigns. Public information and education campaigns should be carried out through the mass media by law enforcement members of safety oriented groups. These campaigns "spread the word" about current enforcement emphasis and encourage voluntary compliance with the law. The perception that violators will be apprehended is essential to develop compliance with the law. Selecting the right media for your message is important. Clearly define the reason for the change; i.e., to reduce traffic crash casualties. The size of the audience and project will be a controlling factor in the media you select. An enforcement effort must be coordinated with the information and education campaign.

Reference: 5

2. Neighborhood Speed Watch Program

Another educational tool is the Neighborhood Speed Watch Program whereby residents can help control speeds with minimal police support.

A Neighborhood Speed Watch Program must involve law enforcement personnel and residents working as a team. Law enforcement's role is to provide the educational material and, if necessary traffic law enforcement. An effective tool used for education is speed radar trailers. The trailers are unmanned and equipped with radar equipment to detect the speed of vehicles. The trailer clocks the speed of an approaching vehicle and displays the speed on a display board that is visible to the motorist. This shows the motorist the actual speed at which they are traveling.

The neighbors must educate each other, establish their goals, and police themselves. Neighbors identify the speeders, the police make personal contact for the purpose of educating the speeder, and involve law enforcement as a last resort.

This program has the benefit of bonding the neighborhood together. The off-shoots of this are invaluable. The reduction of negative contacts with law enforcement enhances its image. The time involvement will depend on the individual's role and the size of neighborhood or community that is targeted. The media relationship involvement relates to the target area.

Neighborhood Speed Watch Programs rely on peer pressure and community spirit to increase awareness in a subdivision that may experience speeding traffic. It considers the fact that in a self-contained subdivision, the drivers involved are neighbors and friends of the people complaining of speeding. Neighborhood Speed Watch Programs have little or no effect on "through" traffic problems.

Typically, to be included in a Neighborhood Speed Watch Program, a street must (1) be a local street, (2) experience 85th percentile speeds in excess of 10 MPH greater than the posted speed, and (3) receive support from most of the households.

Once established, the following actions are taken:

a) A personal letter is sent to all households explaining the Program.

b) Neighborhood Speed Watch Program signs are posted.

c) Committee members call each household in the specific area to explain the program and appeal for cooperation.

d) Radar speed observations are made by local traffic personnel and personal letter are sent by the Chief of Police to drivers or owners of vehicles observed speeding.

e) Periodic speed studies are made to determine the Program's effectiveness.

f) Neighborhood organizations are involved as necessary.

B. ENFORCEMENT

1. Surveillance/Enforcement

Selective traffic law enforcement is the process of assigning police officers to a specific area at specific times to enforce traffic laws relating to a specific problem. The allocation of officers to the area is usually for a limited period.

When a police agency becomes aware of a particular traffic safety problem, officers can be assigned to the problem area to enforce related laws. Decisions must be made as to enforcement strategy, number of officers, time of day or any combination thereof, depending on the variables related to the location, type of violations, available officers, etc.

This type of activity tends to only solve the problem in the presence of the officer. The more officers assigned, the more effective this method. This is a costly process especially when it involves overtime or diverting officers from other assignments.

2. Automated Speed Enforcement Device

The newest tool in speed enforcement is the Automated Speed Enforcement Device, which is currently being tested at selected locations throughout the U.S. This device consists of a speed radar device and a 35 mm camera interfaced through a computer. It is located in an unmarked vehicle parked on the side of a road. As each vehicle comes within radar range its speed is determined. If that speed is over the preset threshold speed, the camera takes a photograph of the vehicle and its license plate.

The owner of the vehicle is then informed by either a warning letter or ticket of the date, time location, posted speed and travel speed of the vehicle. Currently, Michigan law does not permit the issuance of a ticket.

V. ENGINEERING

When the education and enforcement campaigns prove to be ineffective, the location qualifies for further analysis to determine what traffic engineering measure, if any at all, should be installed to effectively reduce speeds. In certain situations, vehicle speeds can only be effectively reduced by physical diversion of the traffic on the travelway. The application of traffic control devices, such as signs, alone normally are not effective in reducing vehicle speeds through residential neighborhoods. However, when used in conjunction with traffic calming devices, the proper use of traffic control signs can be an effective traffic management tool.

A. TRAFFIC CONTROL DEVICES

1. Stop Signs

The basic purpose of stop signs is to assign right-of-way to vehicles at intersections. There are Stop Sign Warrants outlined in the MMUTCD which must be satisfied before a stop sign can be installed. Stop signs are requested by residents more than any other traffic control device for the reduction of vehicle speeds and traffic volumes. Unfortunately, studies have shown that stop signs are largely ineffective in meeting the residents' requests for speed control.

a. Two-Way Stop

This is used to assign right-of-way to traffic on one of two intersecting streets by requiring traffic on one street to come to a complete stop. It is suitable where:

- one street is a major street;
- sight distances approaching the intersection are substandard, and traffic approaching under the general rules for uncontrolled intersections would run a strong risk of being involved in collisions;

- there is a history of a crash pattern that could be corrected by right-of-way controls, yet conditions do not require traffic on both streets to stop.

b. Four-Way Stop

This type of intersection control is intended primarily where two collector or major streets intersect and do not warrant a traffic signal. Its purpose is to assign right-of-way to traffic on both intersecting streets by requiring all approaching vehicles to come to a complete stop.

c. Effect on Traffic Volumes

When local streets offer significant savings in time over congested parallel major and collector routes, or allow avoidance of congestion points, traffic control devices, including stop signs, will do little to reduce traffic volumes. However, when the local streets offer only a slight savings in travel time over other routes, the time lost at stop signs may be enough to keep traffic off of local residential streets.

Stop signs may be installed at uncontrolled intersections in residential neighborhoods with a street network arranged in a grid pattern. Traffic would be stopped on every other block throughout the entire residential neighborhood. With no continuous "through" streets in the neighborhood, an even distribution of traffic would be encouraged.

d. Effect on Traffic Speed

Numerous studies have shown that stop signs are relatively ineffective as a speed control measure, except within 150 feet of the intersection. At the point of installation, speeds are reduced, but the effect on traffic approaching or leaving the stop-controlled intersection is negligible. In fact, some motorists actually increase their speed to make up for the "inconvenience" of stopping or disregard the stop signs. Studies show that more than 50% do not stop.

A study conducted in Boulder, Colorado, demonstrated that the 85th percentile speed and mean speeds on 25 mph and 35 mph roads were greater in areas that were controlled by stop signs.

Studies in various California cities showed a slight increase, or no change, in vehicle speeds after the installation of stop signs.

While the request for stop sign installation leads all resident requests for speed control measures, it must be emphasized that studies have proven there is little or no effect on vehicle speeds in residential road networks after installation.

e. Warrants/Compliance

Warrants for stop sign installations are included in the Michigan Manual of Uniform Traffic Control Devices (MMUTCD). These warrants relate to right-of-way assignment and respond to site safety consideration.

A stop sign observance study of unwarranted four-way stops in Troy, Michigan, found that the percentage of "no" or "roll" stops to be significant after installation of unwarranted stop signs, while there was no significant change in 85th percentile speeds.

Many studies have been conducted to determine the degree to which stop signs are obeyed. When not required to stop by cross street traffic, only 5 to 20 percent of all drivers come to a complete stop; 40 to 60 percent will come to a "rolling" stop below 5 MPH, and 20 to 40 percent will pass through at higher speeds. High-volume, four way stop-controlled intersections have demonstrated the highest compliance levels, while three-way stop controlled intersections have shown the lowest.

In Star City, West Virginia, before and after studies showed an increase in "no-stops" from 14.1% to 25.1% when two-way stop intersections were converted every summer to four-way stops for pedestrian safety. Mean Speed was not significantly affected by the presence of the four-way stops. The recommendation of this particular study was to end the practice of using four-way stops for speed control.

Studies have shown that when a driver does not believe that a stop sign appropriately reflects the actual traffic conditions, the driver often disregards it. The use of unwarranted stop signs not only decreases the compliance levels of motorists, but has the unintended effect of decreasing compliance at intersections where stop signs have been installed for warranted operation and collision reduction.

f. Effect on Traffic Safety

While no study has proven the effectiveness of stop signs as traffic safety measures, general engineering belief is that the unwarranted use of stop signs increases the safety hazard at the intersection. This is shown in the studies of the compliance rates at stop-controlled intersections. In addition, motorists disregard for unwarranted stop signs presents a significant hazard to crossing pedestrians.

Effects of unwarranted stop signs on driver behavior and safety at stop signs throughout a community are difficult to substantiate. Evidence to date on the safety effects of individual stop signs placed for volume and speed reduction purposes is mixed. At some intersections where a degradation in safety was measured, placement of the signs in poor visibility positions and lack of supplementary markings may account for the crash experience. Cases where safety experience was reportedly improved may include instances where traditional warrants for stop sign installation were actually met, or were close to being met.

g. Environmental Effects

Stop signs affect the environment around the intersection, and the use of unwarranted stops signs could unnecessarily add to this problem. Stopping and idling at intersections increases the amount of automobile exhaust in the area. In addition, tire noise and engine noise increase with the braking and acceleration associated with stop signs. Automobile fuel consumption is increased with the stopping, accelerating, and idling of vehicles at stop-controlled intersections.

h. Community Reaction

Residents often see stop signs as a solution to "near miss", as well as actual crashes. They are also viewed as being effective at controlling vehicle speeds. Suggestions that unwarranted stop signs have very poor compliance and that they might be detrimental to safety are generally discounted by residents. Residents also dismiss concerns over a community's exposure to tort liability for unwarranted use of traffic control devices. By disregarding the warrants presented in the MMUTCD, this presents potential liability concerns for the responsible jurisdiction. If a stop sign installation could be considered irresponsible or in clear contradiction to accepted standards, liability suits could result.

Objections to stop signs come mainly from residents at the intersections who are subjected to additional noise and pollution which come from decelerating and accelerating vehicles, and from motorists who think they are being stopped needlessly.

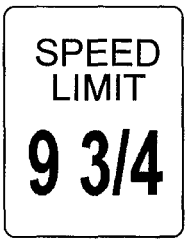
It should be the goal of the traffic engineer and local policy makers to explain to the public why unwarranted stop signs are ineffective at controlling vehicle speeds. Special attention should be given to explaining the adverse effects on the environment, motorist safety, and pedestrian safety.

A community's policy of installing 4-way stops at school crossings should be reviewed in light of the above items. Stops at these locations are only useful about 2% of the time. Therefore, 98% of the time, they can be serious traffic safety hazards.

References: 1, 2, 3, 4, 36, 37, 38, 39, 40

2. Speed Limit Signs

a. Speed Limit Signs/Speed Zoning



The speed limit sign is a regulatory device that informs drivers of the speed limit imposed by the governing agency. Some signs merely remind drivers of the limits applicable to the type of highway and area. Where the speed

limit is not applicable to specific sites because of special hazards, a deviation from that limit is shown by posting advisory speed signs. A new speed limit is determined by an engineering and traffic study of the street section involved. Special attention is given to the character of the street (sidewalks, driveways, and sight obstructions), horizontal and vertical alignment, pedestrian activities, and hazards which may not be easily detected by drivers. If no unusual safety problems are detected, the 85th percentile speed of traffic on a street is usually taken as an indication of the speed limit which could be implemented.

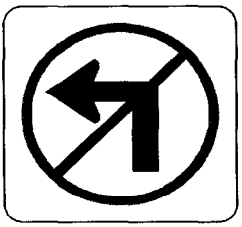
Studies that tested the effect of speed limit signs on speeds have been largely confined to major streets and expressways. Performance on these highways is not considered relevant to the local street situation. Studies have shown that speed limit signs have very little impact on drivers' speeds on major streets. Motorists drive at speeds that they consider reasonable, comfortable, convenient and safe under existing conditions. Drivers appear not to operate their vehicles by the speedometer, but by roadway conditions.

Speed limit signs, other than the standard 5 MPH increment (i.e., 28 MPH), are not standard and may be illegal. The desired effect of posting a non-standard speed limit sign is to gain compliance by capturing the driver's attention with a unique number. If drivers are consciously aware of the speed limit, they are more likely to comply with it. While the signs are inexpensive, they do not conform to the MMUTCD. Initially, the signs would be noticed and make drivers aware of their speed. Once drivers became used to the signs, they have no further effect on drivers' speeds.

If posted speed limits are significantly lower than prevailing traffic speed, residents normally place some hope in them or in subsequent enforcement. However, if the posted limits are within a few miles per hour of the previously prevailing traffic speed, they are not addressing the residents' problem.

b. Speed Limit Signs With Other Devices

Speed limit signs with flashing beacons have been shown to have a minor effect in reducing vehicular speeds. Such signs have been shown to be most effective in school zones. Other traffic activated signs with variable messages and warnings may also have minor effectiveness in reducing speeds.



One such device is a trailer-mounted variable message sign with a radar speed gun which displays the posted speed limit and the approaching driver's speed. The intent is to increase the motorists' awareness of both posted speed limit and their own travel speed.

Observations show that most motorists reduce their speed when they see the device. In addition to reducing motorists' speeds, other advantages of the equipment include the creation of positive public relations, better acceptance of speeding tickets, and its ability to act as a teaching device. The disadvantages include potential vandalism to the equipment if left unattended, and it may encourage speeding by those who wish to "test" it. Its speed reduction effectiveness is isolated to the immediate area and time of its use, and this likely will diminish over time. However, effectiveness can be improved with the use of visible speed enforcement.

References: 5, 6, 7

3. Turn Prohibitions

Turn prohibitions will reduce traffic volumes, noise, and, in some cases, speeds on streets where they are applied. They may also improve traffic safety on streets to which they are applied. However, volumes, noise and speeds will increase on alternate routes. They are difficult to enforce, and reduce access for residents. In some cases, speeds may increase, and traffic safety may decrease, when motorists are forced to take alternate routes.

Turn prohibitions can be used to reduce traffic volumes on local streets by installing them on major/collector streets to prevent traffic from entering local streets. Such controls are usually in effect during peak traffic volume hours, when motorists are seeking less congested, alternate routes.

Although turn prohibitions have been in use for some time, very little quantitative research was found, and it was related to the number of violations. Violations in the range of 10% to 15% of the original turning volume can be expected.

Reference: 8

4. <u>One-Way Streets</u>

The use of one-way streets has mixed results. They are not useful in reducing speeds on local streets. In fact, the use of one-way signs may increase speeds in the permitted direction, and may increase the amount of cut-through traffic on other residential streets.

One-way streets can be used to make travel through a neighborhood difficult by creating a maze effect in the internal street pattern, which may discourage through traffic. However, the amount of traffic on other residential streets may be increased.

Reference: 8

5. <u>Commercial Vehicle Prohibitions</u>

It is a common practice in communities to prohibit commercial vehicles from most, if not all, local streets in residential areas. This is done to protect the pavements and eliminate nuisances. However, commercial vehicles are normally allowed to travel on any street when engaged in pickup and delivery. Such regulations are unlikely to affect vehicle speeds, but they will reduce truck traffic volume and noise.

Reference: 8

6. Special Warning Signs

Special warning signs such as "Children at Play", "Watch for Children", or others that warn of normal conditions are not effective in reducing speeds in residential areas. It is also likely that such signs encourage parents to believe that there is an added degree of protection, which is not the case. These signs suggest that it is acceptable for children to play in the street. The Michigan Vehicle Code prohibits the use of signs not deemed standard by the MMUTCD.

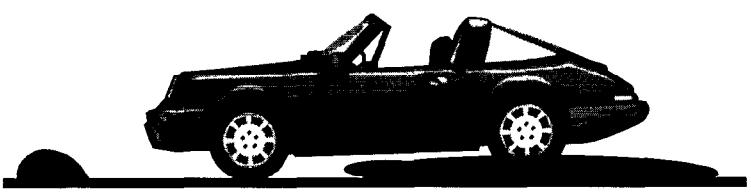
The MMUTCD provides standards for signs warning drivers that they are approaching recreational facilities such as parks and playgrounds. However, there is not enough evidence to determine the effect of these warning signs on vehicle speeds.

Reference: 40

7. Portable Signs

One growing trend in many communities is the use of portable stop signs placed in the street between crosswalks, to protect pedestrians. This has actually turned out to be a very controversial issue in many areas.

Municipalities feel that these signs are very effective in forcing traffic to stop for pedestrians in crosswalks. However, some state departments of transportation have banned the use of these portable signs, citing reports that the signs, when hit by vehicles, have caused injuries to nearby pedestrians. The MMUTCD states "As noted herein or for emergency purposes, portable or part-time STOP signs shall not be used". The exceptions refer to hand-held STOP signs used by construction flaggers and school crossing guards.



B. TRAFFIC CALMING DEVICES

1. Speed Humps and Bumps

The speed hump is generally 3 to 4 inches high, rounded section of pavement, approximately 12 feet in length. A speed bump is approximately 12" to 18" long, causing a more severe "bump" to be felt by the driver.

The speed hump was developed in the Transportation Road Research Laboratories (TRRL) in Great Britain and has been tested in closed test areas and on public roads. Tests in the United States and in various countries around the world, have shown speed humps to be effective in controlling vehicle speeds and in reducing traffic volumes in the immediate area of the hump or bump.

Studies in Australia, the United Kingdom, and the United States have shown reductions in 85th percentile speeds ranging from 3 MPH to 14 MPH between speed humps and from 6 MPH to 27 MPH at the speed hump location. Recent experience in a Michigan community indicated a 5 mph reduction in the 85th percentile speed. Volumes were found to be reduced from 1 to 55 percent.

SPEED BUMP **SPEED HUMP**

Another type of speed hump is the flat top hump or speed table. These humps are typically 22 inches long with a 10 foot flat

section and can be used on collector roads with more than 12,000 vehicles per day. This type of speed hump can serve as pedestrian crossings. Studies have shown these humps not only greatly reduce the 85th percentile speed of mainstream traffic but also have shown that, unlike speed humps, the speed between the humps and at the humps are essentially the same as before hump or bump installation.

Some of the negative effects of speed humps are an increase in noise level from individual vehicles near the humps caused by braking and acceleration, but not due to the sound of vehicles striking the humps. Studies have shown that speed humps have a more severe impact on longer wheel base vehicles and should not be used on neighborhood collectors, major fire and ambulance routes, or on routes frequently used by large trucks or buses. They are a major hindrance to snowplowing efforts.

Often the implementation of such traffic calming measures bring up liability issues. A recent survey of a number of communities using different traffic calming devices found that most had no legal problems at all while the remainder had mostly experienced threats and no action. As more and more traffic calming devices are installed, the question of the legality of these measures are becoming irrelevant.

The reports on speed humps have shown that both the design and location/spacing of speed humps are critical. For typical residential streets the most widely used design is the circular, parabolic speed hump. A series of speed humps is more effective than a single installation. The spacing of speed humps ranges from 200 feet to 750 feet, depending upon the desired 85th percentile speed between speed humps. Formulas have been developed to determine the optimal spacing of humps, depending on the use of either a 3 inch or a 4 inch high hump. Adequate pavement markings and traffic signs are important to warn drivers of speed humps. Speed humps can be installed on roadways carrying 3,000-8,000 vehicles per day. The cross-section design of humps or bumps is critical to their effectiveness.

The speed hump should not be confused with the speed bump that is 3 to 5 inches in height and 1 to 1 ½ feet in length. Because speed bumps are abrupt, they are considered to be potentially hazardous for motor vehicles. The main use of the speed bump

has been in private parking lots and on private roads. They are generally considered to be inappropriate by traffic engineers because they are not included in design guides.

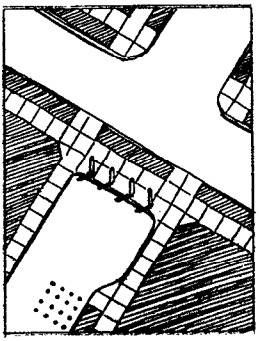
As of September 10, 1997, The Institute of Transportation Engineers (ITE) plans to publish the recommended practices for Guidelines for the Design and Application of Speed Humps.

References: 10, 11, 12, 13, 14, 15, 16, 32, 33

2. Rumble Strips

Rumble strips are a series of either bumps or depressions in the pavement. They are intended to alert drivers of a special situation, such as a speed reduction or stop ahead condition. They are typically ½ to 1 ½ inches high or deep, 3 to 4 inches wide and placed 90° to traffic flow.

Rumble strips produce both an audible rumble and a vibration that creates an awareness of a condition for which a driver must react. They are used most frequently on shoulders of high-speed roadways to alert drivers that they are not driving in the travel lanes of a road. They are also commonly used to alert drivers in rural or high speed areas of an unexpected stop-ahead condition.



Many states now use 'portable' rumble strips, which are basically high density rubber sheets with a series of undulations. Though these are popularly used near construction zones, these may be used as a temporary measure in residential areas before installing permanent rumble strips.

Little research has been performed in residential areas for their use as a speed control device. A study in the City of Rochester Hills showed speed reductions of up to 2 MPH, whereas another study showed reductions of up to 15 MPH. Rumble strips can produce an annoying noise, cause vibration in nearby homes and be snow removal obstructions. One study suggests they should not be used where there is significant bus or truck activity or where traffic volumes exceed 2,500 vehicles per day. Due to the adverse effects, their installation must be carefully considered.

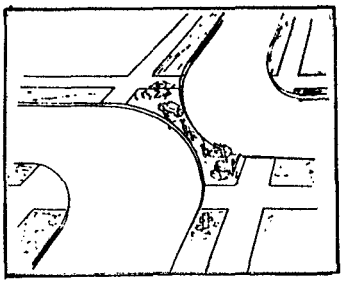
References: 4, 17, 18

3. Street Closures

The primary effect of street closures is to eliminate through traffic rather than to reduce speed. There may be some speed reduction because higher speed through traffic is discouraged from using the neighborhood streets. This is true particularly where a pattern of closures is carefully designed to accomplish this end. Street closures can be constructed at an intersection or at midblock. The midblock application can be effectively used where it is desired to restrict traffic in a residential section while allowing access to a high traffic generator adjacent to the residential area. Generally, whenever a street closure is used, a cul-de-sacs should be constructed so as not to "trap" a vehicle. Cul-de-sacs often require the purchase of right-of-way and often are constructed in a resident's front yard.

Among the disadvantages of street closures are:

- Restricted access to the neighborhood by service and emergency vehicles.
- Problems with vandalism and maintenance.
- Traffic is often transferred to neighboring streets, generating new problems and complaints.



Street closures are difficult to apply to existing roadways and are better suited for newly developing subdivisions.

When cul-de-sacs are used, adequate turnaround areas must be provided at the end of the street. Proper signs must be installed to warn drivers of the end of the street.

Reference: 8, 28

4. Traffic Diverters

a. Diagonal Diverters

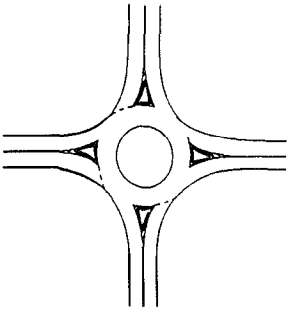
Diagonal diverters are barriers placed diagonally across an intersection. This converts a normal four-legged intersection into two separate roadways, each with a 90° turn. The purpose is to discourage "through" traffic by requiring it to take a circuitous route through the neighborhood.

Speeds of vehicles are only affected in the immediate vicinity of the diverter because drivers must make a 90° turn. Diverters may discourage drivers from using the street as a short-cut route. However, some drivers will simply move to another residential street, thus moving the problem. Since they create formidable barriers in the intersection, they must be marked similar to one-way streets and have appropriate lights so they can be seen at night.

References: 8, 9, 19

b. Semi-Diverters

A semi-diverter is a barrier placed transverse to traffic at the beginning of a block. It prohibits traffic from entering the block, but allows two-way traffic within the block. Since they create formidable barriers in the intersection, they must be marked similar to one-way streets and have appropriate lights so they can be seen at night.



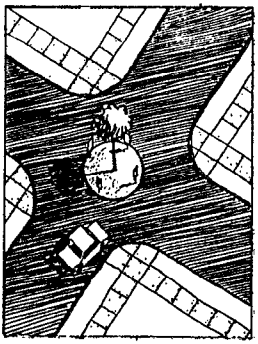
Semi-diverters have no effect on speeds other than in the immediate vicinity of the barrier. They can reduce traffic volumes, but only at the end of the block at which they are placed. The violation incidence can be quite high.

Reference: 8, 19

5. Traffic Islands

a. Traffic Roundabout

Modern roundabouts are different from traditional traffic circles, in that all approaching traffic yields right of way to circulating traffic. This is reinforced through the use of yield signs on the approaches. Other characteristics of roundabouts include deflection and flared approaches. Use of deflection helps slow entering vehicles, leading to safer merges with the circulating traffic stream. The use of splitter islands helps drivers perceive a change in the roadway geometry and enter the roundabout safely. Benefits of roundabouts realized in the states of California, Florida, Maryland and others include slowing of traffic, reducing delay and emissions when compared to stop/signal controlled intersections, improving safety and aesthetics.



Its primary use is to reduce crash frequency at residential intersections. These roundabouts also have an effect on traffic volume and speeds.

At ten study locations, average speeds were reduced 4 MPH (from 27.5 MPH to 23.3 MPH) downstream from the circles, but only for short distances. Speed reductions can be even more significant near the circle, similar to speeds near stop signs.

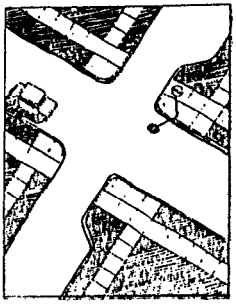
One study shows a significant 77% decrease in crashes. Traffic volumes on the higher volume street at twenty study locations decreased an insignificant 2%. The construction cost of a roundabout is quite high ($10,000 - $30,000).

References: 4, 8, 19, 20, 30

b. Traffic Islands

A traffic island is a defined area, painted or raised, included in highway design for the primary purposes of controlling and directing traffic movements. They also provide refuge for pedestrians, reduce excessive pavement areas, and can be used to indicate proper use of an intersection or to locate traffic control devices.

Painted/striped islands do not affect speeds significantly; raised islands reduce vehicle speeds in some instances, mostly in combination with narrow lanes, which can create hazards.



Improper islands make roadways unsafe. If an island is not large enough to command attention, motorists will drive over it. Curbed islands are sometimes difficult to see at night due to oncoming headlights or other light sources, thus causing crashes.

Islands do not reduce traffic volume by any significant amount, but can be an effective treatment for traffic movement and safety. If a traffic island is used, it might be beneficial to plan an island initially, then observe the effect and change the layout arrangement accordingly. The same process can be repeated until an optimum arrangement is established and a permanent raised island can be installed.

6. Chokers and Road Narrowing

Chokers are narrowed roadway widths using landscaped areas between the sidewalk and street. The pavement width between chokers can be constructed for one or two lanes of traffic. The choker can be constructed parallel to the traveled way or twisted to the direction of travel.

Road narrowing is a method used mostly in residential areas to control vehicle speeds and reduce traffic volume to improve safety. Another road narrowing technique can be found by the use of medians. In one community in Maryland, medians 20 to 50 feet or more in length have been constructed in advance of intersections. It was found to effectively reduce speeds though, it was necessary to construct bulb-outs to force drivers to shift over inconveniently. Once implemented, the 85th percentile speeds were reduced by 2-5 mph.

Chokers and road narrowing can control the speeds of vehicles efficiently and can increase safety and reduce traffic flow if properly installed. However, they should not be used on high volume streets, and sudden road narrowing should always be avoided. Curbside parking may have to be sacrificed to implement these methods. Proper signs should be installed to warn drivers of the chokers.

Reference: 4, 32

7. On-Street Parking

On-street parking is parking that is allowed on a street in the curb lane and is commonly permitted in residential areas.

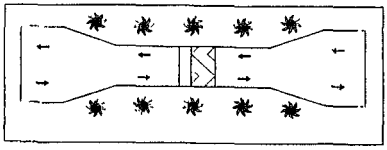
Drivers of through vehicles generally reduce their speed in anticipation of conflict situations with parked vehicles or pedestrians. A study was done in Dallas where parking was removed in four central business districts. A 60-day study showed an increase of 26.7% in vehicle speed. In another study, only peak period prohibitions were reported which increased average speeds by 27%.

A clear relationship exists between crashes and vehicles parked on-street. One study in a community of 65,000 people found that 43% of all local and collector-street crashes involved on-street parking.

The angle of on-street parking has an affect on safety. Although angle parking allows for more parking spaces per unit of curb length than parallel parking, it requires more space for maneuvering, increases the amount of time a car is exposed to oncoming traffic, and can create a visibility problem for drivers when backing out into traffic. Therefore, angle parking has a substantially higher crash rate than parallel parking. Many studies have found that eliminating angle parking and replacing it with parallel parking reduces crashes 19 to 63 percent. A study in Maine found that parallel parking had a crash rate 12 percent lower than angle parking. A study in Nebraska concluded that parking should be of parallel rather than angle type to improve safety by reducing traffic crashes.

Several studies have been conducted that show the safety concerns of on-street parking. Primary hazards are:

1. Parked vehicles make the road width narrower and significantly restrict the flow of traffic. Parked vehicles can easily increase rear-end or side-swipe crashes due to hazardous maneuvers by drivers avoiding parked vehicles or drivers entering or leaving parking stalls.



2. Drivers or rear-seat passengers getting out of parked vehicles on the side street present an added obstacle in the roadway. This produces both rear-end and side-swipe collisions.

3. Reduced sight distances involving pedestrians, especially children, attempting to cross the street from between parked vehicles or at intersections.

It is advisable to avoid on-street parking especially on residential streets because of the crash hazard, traffic volume/capacity/flow reduction, etc. It does, however, reduce speeds by restricting sight distances.

References; 21, 22, 23, 24, 34, 35

8. Combination of Physical Control Measures

Various combinations of traffic control and traffic calming measures can be used to enhance effectiveness. The combinations are governed by the major objectives or purpose for which the installation is planned. For example, the objective of reducing speeds and cut through traffic may be achieved by using a combination of a speed hump and street narrowing. The illustration presents such a combination. This combines the installation of a speed hump as well as street narrowing within the vicinity of the speed hump. The street narrowing helps to reduce speeds over a longer distance than a conventional speed hump.

References: 31

C. ROADWAY MARKINGS

1. Transverse Markings

Transverse pavement markings consist of a series of painted lines placed across the road. The spacing between the lines gradually decreases as the hazard is approached. The paint pattern is intended to give the illusion of high speed and causes drivers to reduce their speeds. In Maine, transverse pavement markings used in conjunction with standard speed limit signs, when entering a small town, increased the number of vehicles traveling below the speed limit by 10 percent. In Scotland, similar

success occurred when yellow transverse markings were applied in advance of a traffic circle. Initial results showed a 30 percent reduction in 85th percentile speeds. which were later reduced to 16 percent after one year. Crashes were reduced at the Scotland site from 14 crashes in the year prior to the installation to only 2 crashes in the 16 months following the installation.

A study in Great Britain showed that speeds were influenced by the existence or non-existence of a hazard following the transverse markings. If no hazard exists at the first location with transverse markings, the driver would not slow down at the second location even if a hazard existed.

It appears from the various studies that if transverse markings are used at locations in advance of potentially hazardous locations or in addition to normal speed limit signing when entering small towns, that speed reductions will occur at both types of locations and crashes will be reduced at the hazardous locations. However, it does not appear from the literature reviewed that reductions in speeds should be anticipated by applying transverse pavement markings in the middle of a typical residential area.

Reference: 27

2. Longitudinal Markings

Longitudinal pavement markings for speed control is intended to give drivers the impression of a narrow lane through which the vehicle must be guided. One study involved the striping of two residential streets to nine foot wide lanes. It was found that speeds changed in a range of a decrease of 1.4 MPH to an increase of 3.2 MPH. It was theorized that the narrowing by striping was ineffective because it actually made the drivers task of tracking the roadway easier.

3. Crosswalks

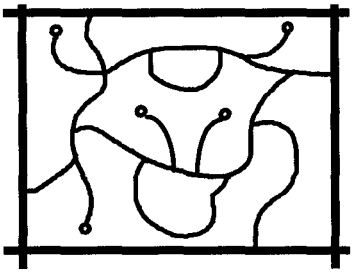
The use of painted crosswalks is to provide improved pedestrian safety by guiding them across the street and to notify drivers of the possibility of the presence of pedestrians. When painted

crosswalks are used, sidewalks on both sides of the road should also be provided. There is no indication in the literature that crosswalks result in lower vehicular speeds.

Reference: 16

D. PLANNING-RELATED ALTERNATIVES

1. Adequate Arterial Capacity



By providing adequate capacity on the surrounding major street network, the amount of through traffic using residential streets can be reduced. Although not specifically a speed regulating method, reducing the traffic volume can decrease the number of speed complaints on residential streets and can improve safety.

Though this is a costly means of reducing residential speeding complaints, improved traffic flow and crash reduction can be realized on residential streets.

Reference: 26

2. Subdivision Planning

Residential street design can influence the speed of vehicles through a neighborhood. Designs that feature curvilinear alignment, a narrow cross-section, short block length, reduced building setback and roadside tree planting can create a feeling of restriction and result in a speed reduction and may increase traffic crashes. Conversely, local streets built to high standards, in an attempt to improve safety, create an environment that allows increased vehicle speeds.

New subdivision streets can be designed to discourage cut-through traffic, which will reduce speeding complaints.

Care must be taken in the design process to ensure adequate sight distances along the roadway and at intersections, to provide the highest level of safety possible.

Reference: 26, 29

VI. CONCLUSIONS

An effective traffic calming program can be implemented by following the guidelines in this booklet. The key to a successful program is **community involvement**. Local officials and residents must work together for the common goal of improving safety on residential streets. This booklet provides alternatives that may help decrease speeds and/or reduce through traffic on residential streets. It also gives direction for developing a traffic calming program in those communities that currently use only traffic law enforcement to control speeds.

Whenever traffic calming devices are used, special care must be taken to advise drivers of the device by installing adequate warning signs and/or permanent markings.

[CRT Docket No. 105; AG Order No. 3180–2010]

RIN 1190–AA46
Nondiscrimination on the Basis of Disability in State and Local Government Services

AGENCY: Department of Justice, Civil Rights Division.
ACTION: Final rule.

SUMMARY: This final rule revises the regulation of the Department of Justice (Department) that implements title II of the Americans with Disabilities Act (ADA), relating to nondiscrimination on the basis of disability in State and local government services. The Department is issuing this final rule in order to adopt enforceable accessibility standards under the ADA that are consistent with the minimum guidelines and requirements issued by the Architectural and Transportation Barriers Compliance Board (Access Board), and to update or amend certain provisions of the title II regulation so that they comport with the Department's legal and practical experiences in enforcing the ADA since 1991. Concurrently with the publication of this final rule for title II, the Department is publishing a final rule amending its ADA title III regulation, which covers nondiscrimination on the basis of disability by public accommodations and in commercial facilities.
DATES: *Effective Date:* March 15, 2011.

Janet L. Blizard, Deputy Chief, or Barbara J. Elkin, Attorney Advisor, Disability Rights Section, Civil Rights Division, U.S. Department of Justice, at (202) 307–0663 (voice or TTY). This is not a toll-free number. Information may also be obtained from the Department's toll-free ADA Information Line at (800) 514–0301 (voice) or (800) 514–0383 (TTY).

This rule is also available in an accessible format on the ADA Home Page at *http://www.ada.gov*. You may obtain copies of this rule in large print or on computer disk by calling the ADA Information Line listed above.

SUPPLEMENTARY INFORMATION:

The Roles of the Access Board and the Department of Justice

The Access Board was established by section 502 of the Rehabilitation Act of 1973. 29 U.S.C. 792. The Board consists of 13 members appointed by the President from among the general public, the majority of whom must be individuals with disabilities, and the heads of 12 Federal departments and agencies specified by statute, including the heads of the Department of Justice and the Department of Transportation (DOT). Originally, the Access Board was established to develop and maintain accessibility guidelines for facilities designed, constructed, altered, or leased with Federal dollars under the Architectural Barriers Act of 1968 (ABA). 42 U.S.C. 4151 *et seq*. The passage of the ADA expanded the Access Board's responsibilities.

The ADA requires the Access Board to ''issue minimum guidelines that shall supplement the existing Minimum Guidelines and Requirements for Accessible Design for purposes of subchapters II and III of this chapter * * * to ensure that buildings, facilities, rail passenger cars, and vehicles are accessible, in terms of architecture and design, transportation, and communication, to individuals with disabilities.'' 42 U.S.C. 12204. The ADA requires the Department to issue regulations that include enforceable accessibility standards applicable to facilities subject to title II or title III that are consistent with the ''minimum guidelines'' issued by the Access Board, 42 U.S.C.

12134(c); 42 U.S.C. 12186(c), but vests in the Attorney General sole responsibility for the promulgation of those standards that fall within the Department's jurisdiction and for enforcement of the regulations.

The ADA also requires the Department to develop regulations with respect to existing facilities subject to title II (subtitle A) and title III. How and to what extent the Access Board's guidelines are used with respect to the barrier removal requirement applicable to existing facilities under title III of the ADA and to the provision of program accessibility under title II of the ADA are solely within the discretion of the Department.

Enactment of the ADA and Issuance of the 1991 Regulations

On July 26, 1990, President George H.W. Bush signed into law the ADA, a comprehensive civil rights law prohibiting discrimination on the basis of disability.[1] The ADA broadly protects the rights of individuals with disabilities in employment, access to State and local government services, places of public accommodation, transportation, and other important areas of American life. The ADA also requires newly designed and constructed or altered State and local government facilities, public accommodations, and commercial facilities to be readily accessible to and usable by individuals with disabilities.

[1] On September 25, 2008, President George W. Bush signed into law the Americans with Disabilities Amendments Act of 2008 (ADA Amendments Act), Public Law 110-325. The ADA Amendments Act amended the ADA definition of disability to clarify its coverage of persons with disabilities and to provide guidance on the application of the definition. This final rule does not contain regulatory language implementing the ADA Amendments Act. The Department intends to publish a supplemental rule to amend the regulatory definition of "disability" to implement the changes mandated by that law.

42 U.S.C. 12101 *et seq*. Section 204(a) of the ADA directs the Attorney General to issue regulations implementing part A of title II but exempts matters within the scope of the authority of the Secretary of Transportation under section 223, 229, or 244. *See* 42 U.S.C. 12134. Section 229(a) and section 244 of the ADA direct the Secretary of Transportation to issue regulations implementing part B of title II, except for section 223. *See* 42 U.S.C 12149; 42 U.S.C. 12164. Title II, which this rule addresses, applies to State and local government entities, and, in subtitle A, protects qualified individuals with disabilities from discrimination on the basis of disability in services, programs, and activities provided by State and local government entities. Title II extends the prohibition on discrimination established by section 504 of the Rehabilitation Act of 1973, as amended, 29 U.S.C. 794, to all activities of State and local governments regardless of whether these entities receive Federal financial assistance. 42 U.S.C. 12131B65.

Title III prohibits discrimination on the basis of disability in the activities of places of public accommodation (businesses that are generally open to the public and that fall into one of twelve categories listed in the ADA, such as restaurants, movie theaters, schools, day care facilities, recreational facilities, and doctors' offices) and requires newly constructed or altered places of public accommodation—as well as commercial facilities (privately owned, nonresidential facilities like factories, warehouses, or office buildings)—to comply with the ADA Standards. 42 U.S.C. 12181B89.

On July 26, 1991, the Department issued rules implementing title II and title III, which are codified at 28 CFR part 35 (title II) and part 36 (title III). Appendix A of the 1991 title III regulation, which is republished as Appendix D to 28 CFR part 36, contains the ADA Standards for Accessible Design (1991 Standards), which were based upon the version of the Americans with Disabilities Act Accessibility Guidelines (1991

ADAAG) published by the Access Board on the same date. Under the Department's 1991 title III regulation, places of public accommodation and commercial facilities currently are required to comply with the 1991 Standards with respect to newly constructed or altered facilities. The Department's 1991 title II regulation gives public entities the option of complying with the Uniform Federal Accessibility Standards (UFAS) or the 1991 Standards with respect to newly constructed or altered facilities.

The Access Board's publication of the 2004 ADA/ABA Guidelines was the culmination of a long-term effort to facilitate ADA compliance by eliminating, to the extent possible, inconsistencies among Federal accessibility requirements and between Federal accessibility requirements and State and local building codes. In support of this effort, the Department is amending its regulation implementing title II and is adopting standards consistent with ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines, naming them the 2010 ADA Standards for Accessible Design. The Department is also amending its title III regulation, which prohibits discrimination on the basis of disability by public accommodations and in commercial facilities, concurrently with the publication of this rule in this issue of the **Federal Register**.

Development of the 2004 ADA/ABA Guidelines

In 1994, the Access Board began the process of updating the 1991 ADAAG by establishing an advisory committee composed of members of the design and construction industry, the building code community, and State and local government entities, as well as individuals with disabilities. In 1998, the Access Board added specific guidelines on State and local government facilities, 63 FR 2000 (Jan. 13, 1998), and building elements designed for use by children, 63 FR 2060 (Jan. 13, 1998). In 1999, based largely on the report and recommendations of the advisory committee, the Access Board issued a Notice of Proposed Rulemaking (NPRM) to update and revise its ADA and ABA Accessibility Guidelines. *See* 64 FR 62248 (Nov. 16, 1999). In 2000, the Access Board added specific guidelines on play areas. *See* 65 FR 62498 (Oct. 18, 2000). The Access Board released an interim draft of its guidelines to the public on April 2, 2002, 67 FR 15509, in order to provide an opportunity for entities with model codes to consider amendments that would promote further harmonization. In September of 2002, the Access Board set forth specific guidelines on recreational facilities. 67 FR 56352 (Sept. 3, 2002).

By the date of its final publication on July 23, 2004, the 2004 ADA/ABA Guidelines had been the subject of extraordinary review and public participation. The Access Board received more than 2,500 comments from individuals with disabilities, affected industries, State and local governments, and others. The Access Board provided further opportunity for participation by holding public hearings.

The Department was involved extensively in the development of the 2004 ADA/ABA Guidelines. As a Federal member of the Access Board, the Attorney General's representative voted to approve the revised guidelines. ADA Chapter 1 and ADA Chapter 2 of the 2004 ADA/ABA Guidelines provided scoping requirements for facilities subject to the ADA; ''scoping'' is a term used in the 2004 ADA/ABA Guidelines to describe requirements that prescribe which elements and spaces— and, in some cases, how many—must comply with the technical specifications. ABA Chapter 1 and ABA Chapter 2 provide scoping requirements for facilities subject to the ABA (*i.e.*, facilities designed, built, altered, or leased with Federal funds). Chapters 3 through 10 provide uniform technical specifications for facilities subject to either the ADA or ABA. This revised format is designed to eliminate unintended conflicts between the two sets of Federal accessibility standards and to minimize conflicts between the Federal regulations and the model

codes that form the basis of many State and local building codes. For the purposes of this final rule, the Department will refer to ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines as the 2004 ADAAG.

These amendments to the 1991 ADAAG have not been adopted previously by the Department as ADA Standards. Through this rule, the Department is adopting revised ADA Standards consistent with the 2004 ADAAG, including all of the amendments to the 1991 ADAAG since 1998. For the purposes of title II, the Department's revised standards are entitled ''The 2010 Standards for Accessible Design'' and consist of the 2004 ADAAG and the requirements in § 35.151. Because the Department has adopted the 2004 ADAAG as part of its title II and title III regulations, once the Department's final rules become effective, the 2004 ADAAG will have legal effect with respect to the Department's title II and title III regulations and will cease to be mere guidance for those areas regulated by the Department. In 2006, the (DOT) adopted the 2004 ADAAG. With respect to those areas regulated by DOT, these guidelines, as adopted by DOT have had legal effect since 2006.

The Department's Rulemaking History

The Department published an advance notice of proposed rulemaking (ANPRM) on September 30, 2004, 69 FR 58768, for two reasons: (1) To begin the process of adopting the 2004 ADAAG by soliciting public input on issues relating to the potential application of the Access Board's revisions once the Department adopts them as revised standards; and (2) to request background information that would assist the Department in preparing a regulatory analysis under the guidance provided in Office of Management and Budget (OMB) Circular AB4, sections D (Analytical Approaches) and E (Identifying and Measuring Benefits and Costs) (Sept. 17, 2003), available at *http://www.whitehouse.gov/OMB/circulars/a004/a-4.pdf* (last visited June 24, 2010). While underscoring that the Department, as a member of the Access Board, already had reviewed comments provided to the Access Board during its development of the 2004 ADAAG, the Department specifically requested public comment on the potential application of the 2004 ADAAG to existing facilities. The extent to which the 2004 ADAAG is used with respect to the program access requirement in title II (as well as with respect to the barrier removal requirement applicable to existing facilities under title III) is within the sole discretion of the Department. The ANPRM dealt with the Department's responsibilities under both title II and title III.

The public response to the ANPRM was substantial. The Department extended the comment deadline by four months at the public's request. 70 FR 2992 (Jan. 19, 2005). By the end of the extended comment period, the Department had received more than 900 comments covering a broad range of issues. Many of the commenters responded to questions posed specifically by the Department, including questions regarding the Department's application of the 2004 ADAAG once adopted by the Department and the Department's regulatory assessment of the costs and benefits of particular elements. Many other commenters addressed areas of desired regulation or of particular concern.

To enhance accessibility strides made since the enactment of the ADA, commenters asked the Department to focus on previously unregulated areas such as ticketing in assembly areas; reservations for hotel rooms, rental cars, and boat slips; and captioning. They also asked for clarification on some issues in the 1991 regulations, such as the requirements regarding service animals. Other commenters dealt with specific requirements in the 2004 ADAAG or responded to questions regarding elements scoped for the first time in the 2004 ADAAG, including recreation facilities and play areas. Commenters also provided some information on how to assess the cost of elements in small facilities, office

buildings, hotels and motels, assembly areas, hospitals and long-term care facilities, residential units, recreation facilities, and play areas. Still other commenters addressed the effective date of the proposed standards, the triggering event by which the effective date is calculated for new construction, and variations on a safe harbor that would excuse elements built in compliance with the 1991 Standards from compliance with the proposed standards.

After careful consideration of the public comments in response to the ANPRM, on June 17, 2008, the Department published an NPRM covering title II (73 FR 34466). The Department also published an NPRM on that day covering title III (73 FR 34508). The NPRMs addressed the issues raised in the public's comments to the ANPRM and sought additional comment, generally and in specific areas, such as the Department's adoption of the 2004 ADAAG, the Department's regulatory assessment of the costs and benefits of the rule, its updates and amendments of certain provisions of the existing title II and III regulations, and areas that were in need of additional clarification or specificity.

A public hearing was held on July 15, 2008, in Washington, D.C. Forty-five individuals testified in person or by phone. The hearing was streamed live over the Internet. By the end of the 60- day comment period, the Department had received 4,435 comments addressing a broad range of issues many of which were common to the title II and title III NPRMs, from representatives of businesses and industries, State and local government agencies, disability advocacy organizations, and private individuals, many of which addressed issues common to both NPRMs.

The Department notes that this rulemaking was unusual in that much of the proposed regulatory text and many of the questions asked across titles II and III were the same. Consequently, many of the commenters did not provide separate sets of documents for the proposed title II and title III rules, and in many instances, the commenters did not specify which title was being commented upon. As a result, where comments could be read to apply to both titles II and III, the Department included them in the comments and responses for each final rule.

Most of the commenters responded to questions posed specifically by the Department, including what were the most appropriate definitions for terms such as ''wheelchair,'' ''mobility device,'' and ''service animal''; how to quantify various benefits that are difficult to monetize; what requirements to adopt for ticketing and assembly areas; whether to adopt safe harbors for small businesses; and how best to regulate captioning. Some comments addressed specific requirements in the 2004 ADAAG or responded to questions regarding elements scoped for the first time in the 2004 ADAAG, including recreation facilities and play areas. Other comments responded to questions posed by the Department concerning certain specific requirements in the 2004 ADAAG.

Relationship to Other Laws

The Department of Justice regulation implementing title II, 28 CFR 35.103, provides the following:

(a) *Rule of interpretation.* Except as otherwise provided in this part, this part shall not be construed to apply a lesser standard than the standards applied under title V of the Rehabilitation Act of 1973 (29 U.S.C. 791) or the regulations issued by Federal agencies pursuant to that title.

(b) *Other laws.* This part does not invalidate or limit the remedies, rights, and procedures of any other Federal, State, or local laws (including State common law) that provide greater or equal protection for the rights of individuals with disabilities or individuals associated with them.

These provisions remain unchanged by the final rule. The Department recognizes that public entities subject to title II of the ADA may also be subject to title I of the ADA, which prohibits discrimination on the basis of disability in

employment; section 504 of the Rehabilitation Act of 1973 and other Federal statutes that prohibit discrimination on the basis of disability in the programs and activities of recipients of Federal financial assistance; and other Federal statutes such as the Air Carrier Access Act (ACAA), 49 U.S.C. 41705 *et seq*., and the Fair Housing Act (FHAct), 42 U.S.C. 3601 *et seq*. Compliance with the Department's title II and title III regulations does not necessarily ensure compliance with other Federal statutes.

Public entities that are subject to the ADA as well as other Federal disability discrimination laws must be aware of the requirements of all applicable laws and must comply with these laws and their implementing regulations. Although in many cases similar provisions of different statutes are interpreted to impose similar requirements, there are circumstances in which similar provisions are applied differently because of the nature of the covered entity or activity or because of distinctions between the statutes. For example, emotional support animals that do not qualify as service animals under the Department's title II regulation may nevertheless qualify as permitted reasonable accommodations for persons with disabilities under the FHAct and the ACAA. *See*, *e.g., Overlook Mutual Homes, Inc. v. Spencer*, 666 F. Supp. 2d 850 (S.D. Ohio 2009). Public entities that operate housing facilities must ensure that they apply the reasonable accommodation requirements of the FHAct in determining whether to allow a particular animal needed by a person with a disability into housing and may not use the ADA definition as a justification for reducing their FHAct obligations. In addition, nothing in the ADA prevents a covered entity subject to one statute from modifying its policies and providing greater access in order to assist individuals with disabilities in achieving access to entities subject to other Federal statutes. For example, a public airport is a title II facility that houses air carriers subject to the ACAA. The public airport operator is required to comply with the title II requirements, but is not covered by the ACAA. Conversely, the air carrier is required to comply with the ACAA, but is not covered by title II of the ADA. If a particular animal is a service animal for purposes of the ACAA and is thus allowed on an airplane, but is not a service animal for purposes of the ADA, nothing in the ADA prohibits an airport from allowing a ticketed passenger with a disability who is traveling with a service animal that meets the ACAA's definition of a service animal to bring that animal into the facility even though under the ADA's definition of service animal the animal could be lawfully excluded.

In addition, public entities (including AMTRAK) that provide public transportation services that are subject to subtitle B of title II should be reminded that the Department's regulation, at 28 CFR 35.102, provides: ''(a) Except as provided in paragraph (b) of this section, this part applies to all services, programs, and activities provided or made available by public entities. (b) To the extent that public transportation services, programs, and activities of public entities are covered by subtitle B of title II of the ADA, 42 U.S.C. 12141 *et seq*., they are not subject to the requirements of this part.'' The ADA regulations of DOT at 49 CFR 37.21(c) state that entities subject to DOT's ADA regulations may also be subject to the ADA regulations of the Department of Justice. As stated in the preamble to § 37.21(c) in DOT's 1991 regulation, ''[t]he DOT rules apply only to the entity's transportation facilities, vehicles, or services; the DOJ rules may cover the entity's activities more broadly.'' 56 FR 45584, 45736 (Sept. 6, 1991). Nothing in this final rule alters these provisions.

The Department recognizes that DOT has its own independent regulatory responsibilities under subtitle B of title II of the ADA. To the extent that the public transportation services, programs, and activities of public entities are covered by subtitle B of title II of the ADA, they are subject to the DOT regulations at 49 CFR parts 37 and

39. Matters covered by subtitle A are covered by this rule. However, this rule should not be read to prohibit DOT from elaborating on the provisions of this rule in its own ADA rules in the specific regulatory contexts for which it is responsible, after appropriate consultation with the Department. For example, DOT may issue such specific provisions with respect to the use of non-traditional mobility devices, *e.g.,* Segways®, on any transportation vehicle subject to subtitle B. While DOT may establish transportation-specific requirements that are more stringent or expansive than those set forth in this rule, any such requirements cannot reduce the protections and requirements set forth in this rule.

In addition, activities not specifically addressed by DOT's ADA regulation may be covered by DOT's regulation implementing section 504 of the Rehabilitation Act for its federally assisted programs and activities at 49 CFR part 27. Like other programs of public entities that are also recipients of Federal financial assistance, those programs would be covered by both the section 504 regulation and this part. Airports operated by public entities are not subject to DOT's ADA regulation, but they are subject to subpart A of title II and to this rule. The Department of Justice regulation implementing title II generally, and the DOT regulations specifically implementing subtitle B of title II, may overlap. If there is overlap in areas covered by subtitle B which DOT regulates, these provisions shall be harmonized in accordance with the DOT regulation at 49 CFR 37.21(c).

Organization of This Rule

Throughout this rule, the original ADA Standards, which are republished as Appendix D to 28 CFR part 36, will be referred to as the ''1991 Standards.'' The original title II regulation, 28 CFR part 35, will be referred to as the ''1991 title II regulation.'' ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines, codified at 36 CFR part 1191, app. B and D (2009) will be referred to as the ''2004 ADAAG.'' The Department's Notice of Proposed Rulemaking, 73 FR 34466 (June 17, 2008), will be referred to as the ''NPRM.'' As noted above, the 2004 ADAAG, taken together with the requirements contained in § 35.151 (New Construction and Alterations) of the final rule, will be referred to as the ''2010 Standards.'' The amendments made to the 1991 title II regulation and the adoption of the 2004 ADAAG, taken together, will be referred to as the ''final rule.''

In performing the required periodic review of its existing regulation, the Department has reviewed the title II regulation section by section, and, as a result, has made several clarifications and amendments in this rule. Appendix A of the final rule, ''Guidance on Revisions to ADA Regulation on Nondiscrimination on the Basis of Disability in State and Local Government Services,'' codified as Appendix A to 28 CFR part 35, provides the Department's response to comments and its explanations of the changes to the regulation. The section entitled ''Section-by-Section Analysis and Response to Comments'' in Appendix A provides a detailed discussion of the changes to the title II regulation. The Section-by-Section Analysis follows the order of the 1991 title II regulation, except that regulatory sections that remain unchanged are not referenced. The discussion within each section explains the changes and the reasoning behind them, as well as the Department's response to related public comments. Subject areas that deal with more than one section of the regulation include references to the related sections, where appropriate. The Section-by-Section Analysis also discusses many of the questions asked by the Department for specific public response. The section of Appendix A entitled ''Other Issues'' discusses public comments on several issues of concern to the Department that were the subject of questions that are not specifically addressed in the Section-by-Section Analysis.

The Department's description of the 2010 Standards, as well as a discussion of the public comments on specific sections of the 2004 ADAAG, is found in Appendix B of the final title III rule, ''Analysis and Commentary on the 2010 ADA Standards for Accessible Design,'' and codified as Appendix B to 28 CFR part 36.

The provisions of this rule generally take effect six months from its publication in the **Federal Register**. The Department has determined, however, that compliance with the 2010 Standards shall not be required until 18 months from the publication date of this rule. This exception is set forth in § 35.151(c) and is discussed in greater detail in Appendix A. *See* Appendix A discussion entitled ''Section 35.151(c) New construction and alterations.''

This final rule only addresses issues that were identified in the NPRM as subjects the Department intended to regulate through this rulemaking proceeding. Because the Department indicated in the NPRM that it did not intend to regulate certain areas, including equipment and furniture, accessible golf cars, and movie captioning and video description, as part of this rulemaking proceeding, the Department believes it would be appropriate to solicit more public comment about these areas prior to making them the subject of a rulemaking. The Department intends to engage in additional rulemaking in the near future addressing accessibility in these areas and others, including next generation 9–1–1 and accessibility of Web sites operated by covered public entities and public accommodations.

Additional Information

Regulatory Process Matters (SBREFA, Regulatory Flexibility Act, and Executive Orders)

The Department must provide two types of assessments as part of its final rule: an analysis of the costs and benefits of adopting the changes contained in this rule, and a periodic review of its existing regulations to consider their impact on small entities, including small businesses, small nonprofit organizations, and small governmental jurisdictions. *See* E.O. 12866, 58 FR 51735, 3 CFR, 1994 Comp., p. 638, as amended; Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), 5 U.S.C. 610(a); OMB Circular A–4, available at *http://www.whitehouse.gov/ OMB/ circulars/a004/a-4.pdf* (last visited June 24, 2010); E.O. 13272, 67 FR 53461, 3 CFR, 2003 Comp., p. 247.

In the NPRM, the Department kept open the possibility that, if warranted by public comments received on an issue raised by the 2004 ADAAG, or by the results of the Department's Initial Regulatory Impact Analysis (available at *ada.gov/NPRM2008/ria.htm*) showing that the likely costs of making a particular feature or facility accessible were disproportionate to the benefits (including both monetized and nonmonetized benefits) to persons with disabilities, the Attorney General, as a member of the Access Board, could return the issue to the Access Board for further consideration. After careful consideration, the Department has determined that it is unnecessary to return any issues to the Access Board for additional consideration.

Executive Order 12866

This rule has been reviewed by the Office of Management and Budget (OMB) under Executive Order 12866. The Department has evaluated its existing regulations for title II and title III section by section, and many of the provisions in the final rule for both titles reflect its efforts to mitigate any negative effects on small entities. A Final Regulatory Impact Analysis (Final RIA or RIA) was prepared by the Department's contractor, HDR|HLB Decision Economics, Inc. (HDR). In accordance with Executive Order 12866, as amended, and OMB Circular A–4, the Department has reviewed and considered the Final RIA and has accepted the results of this analysis as its

assessment of the benefits and costs of the final rules.

Executive Order 12866 refers explicitly not only to monetizable costs and benefits but also to ''distributive impacts'' and ''equity,'' *see* E.O. 12866, section 1(a), and it is important to recognize that the ADA is intended to provide important benefits that are distributional and equitable in character. The ADA states, ''[i]t is the purpose of this [Act] (1) to provide a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities; [and] (2) to provide clear, strong, consistent, enforceable standards addressing discrimination against individuals with disabilities[.]'' 42 U.S.C. 12101(b). Many of the benefits of this rule stem from the provision of such standards, which will promote inclusion, reduce stigma and potential embarrassment, and combat isolation, segregation, and second-class citizenship of individuals with disabilities. Some of these benefits are, in the words of Executive Order 12866, ''difficult to quantify, but nevertheless essential to consider.'' E.O. 12866, section 1(a). The Department has considered such benefits here.

Final Regulatory Impact Analysis

The Final RIA embodies a comprehensive benefit-cost analysis of the final rules for both title II and title III and assesses the incremental benefits and costs of the 2010 Standards relative to a primary baseline scenario (1991 Standards). In addition, the Department conducted additional research and analyses for requirements having the highest negative net present values under the primary baseline scenario. This approach was taken because, while the 1991 Standards are the only uniform set of accessibility standards that apply to public accommodations, commercial facilities, and State and local government facilities nationwide, it is also understood that many State and local jurisdictions have already adopted IBC/ANSI model code provisions that mirror those in the 2004 ADAAG. The assessments based on this approach assume that covered entities currently implementing codes that mirror the 2004 ADAAG will not need to modify their code requirements once the rules are finalized. They also assume that, even without the final rules, the current level of compliance would be unchanged. The Final RIA contains specific information, including data in chart form, detailing which States have already adopted the accessibility standards for this subset of six requirements. The Department believes that the estimates resulting from this approach represent a reasonable upper and lower measure of the likely effects these requirements will have that the Department was able to quantify and monetize.

The Final RIA estimates the benefits and costs for all new (referred to as ''supplemental'') requirements and revised requirements across all types of newly constructed and existing facilities. The Final RIA also incorporates a sophisticated risk analysis process that quantifies the inherent uncertainties in estimating costs and benefits and then assesses (through computer simulations) the relative impact of these factors when varied simultaneously. A copy of the Final RIA will be made available online for public review on the Department's ADA Home Page (*http://www.ada.gov*).

From an economic perspective (as specified in OMB Circular A–4), the results of the Final RIA demonstrate that the Department's final rules increase social resources and thus represent a public good because monetized benefits exceed monetized costs—that is, the regulations have a positive net present value (NPV). Indeed, under every scenario assessed in the Final RIA, the final rules have a positive NPV. The Final RIA's first scenario examines the incremental impact of the final rules using the ''main'' set of assumptions (*i.e.*, assuming a primary baseline (1991 Standards), that the safe harbor applies, and that for title III entities barrier removal is readily

achievable for 50 percent of elements subject to supplemental requirements).

Under this set of assumptions, the final rules have an expected NPV of $9.3 billion (7 percent discount rate) and $40.4 billion (3 percent discount rate). *See* Final RIA, table ES–1 & figure ES– 2.

Expected Impact of the Rules[2] (in billions)

Discount rate	Expected NPV	Total Expected PV (Benefits)	Total Expected PV (Costs)
3%	$40.4	$66.2	$25.8
7%	$9.3	$22.0	$12.8

Water Closet Clearances

The Department gave careful consideration to the costs and benefits of its adoption of the standards relating to water closet clearances in single-user toilet rooms. The primary effect of the Department's proposed final rules governing water closet clearances in single-user toilet rooms with in-swinging and out-swinging doors is to allow sufficient room for ''side'' or ''parallel'' methods of transferring from a wheelchair to a toilet. Under the current 1991 Standards, the requisite clearance space in single-user toilet rooms between and around the toilet and the lavatory does not permit these methods of transfer. Side or parallel transfers are used by large numbers of persons who use wheelchairs and are regularly taught in rehabilitation and occupational therapy. Currently, persons who use side or parallel transfer methods from their wheelchairs are faced with a stark choice at establishments with single-user toilet rooms—*i.e.*, patronize the establishment but run the risk of needing assistance when using the restroom, travel with someone who would be able to provide assistance in toileting, or forgo the visit entirely. The revised water closet clearance regulations would make single-user toilet rooms accessible to all persons who use wheelchairs, not just those with the physical strength, balance, and dexterity and the training to use a front-transfer method. Single-user toilet rooms are located in a wide variety of public and private facilities, including restaurants, fast-food establishments, schools, retail stores, parks, sports stadiums, and hospitals. Final promulgation of these requirements might thus, for example, enable a person who uses a side or parallel transfer method to use the restroom (or use the restroom independently) at his or her local coffee shop for the first time.

Because of the complex nature of its cost-benefit analysis, the Department is providing ''plain language'' descriptions of the benefits calculations for the two revised requirements with the highest estimated total costs: Water closet clearance in single-user toilet rooms with out-swinging doors (RIA Req. # 28) (section 604.3 of the 2010 Standards) and water closet clearance in single-user toilet rooms with in-swinging doors (RIA Req. # 32) (sections 604.3 and 603.2.3 Exception 2 of the 2010 Standards). Since many of the concepts and calculations in the Final RIA are highly technical, it is hoped that, by providing ''lay'' descriptions of how benefits are monetized for an illustrative set of requirements, the Final RIA will be more transparent and afford readers a more complete understanding of the benefits model generally. Because of the widespread adoption of the water closet clearance standards in existing State and local building codes, the following calculations use the IBC/ANSI baseline.

[2] The analysis assumes these regulations will be in force for 15 years. Incremental costs and benefits are calculated for all construction, alterations, and barrier removal that is expected to occur during these 15 years. The analysis also assumes that any new or revised ADA rules enacted 15 years from now will include a safe harbor provision. Thus, any facilities constructed in year 14 of the final rules are assumed to continue to generate benefits to users, and to incur any operating or replacement costs for the life of these buildings, which is assumed to be 40 years.

General description of monetized benefits for water closet clearance in single-user toilet rooms—out-swinging doors (Req. # 28). In order to assess monetized benefits for the requirement covering water closet clearances in single-user toilet rooms with out-swinging doors, a determination needed to be made concerning the population of users with disabilities who would likely benefit from this revised standard. Based on input received from a panel of experts jointly convened by HDR and the Department to discuss benefits related estimates and assumptions used in the RIA model, it was assumed that accessibility changes brought about by this requirement would benefit persons with any type of ambulatory (*i.e.*, mobility-related) disability, such as persons who use wheelchairs, walkers, or braces. Recent census figures estimate that about 11.9 percent of Americans ages 15 and older have an ambulatory disability, or about 35 million people. This expert panel also estimated that single-user toilet rooms with out-swinging doors would be used slightly less than once every other visit to a facility with such toilet rooms covered by the final rules (or, viewed another way, about once every two hours spent at a covered facility assumed to have one or more single-user toilet rooms with out-swinging doors) by an individual with an ambulatory disability. The expert panel further estimated that, for such individuals, the revised requirement would result in an average time savings of about five and a half minutes when using the restroom. This time savings is due to the revised water closet clearance standard, which permits, among other things, greater flexibility in terms of access to the toilet by parallel or side transfer, thereby perhaps reducing the wait for another person to assist with toileting and the need to twist or struggle to access the toilet independently. Based on average hourly wage rates compiled by the U.S. Department of Labor, the time savings for Req. # 28 is valued at just under $10 per hour.

For public and private facilities covered by the final rules, it is estimated that there are currently about 11 million single-user toilet rooms with out-swinging doors. The majority of these types of single-user toilet rooms, nearly 7 million, are assumed to be located at ''Indoor Service Establishments,'' a broad facility group that encompasses various types of indoor retail stores such as bakeries, grocery stores, clothing stores, and hardware stores. Based on construction industry data, it was estimated that approximately 3 percent of existing single-user toilet rooms with out-swinging doors would be altered each year, and that the number of newly constructed facilities with these types of toilet rooms would increase at the rate of about 1 percent each year. However, due to the widespread adoption at the State and local level of model code provisions that mirror Req. # 28, it is further understood that about half of all existing facilities assumed to have single-user toilet rooms with out-swinging doors already are covered by State or local building codes that require equivalent water closet clearances. Due to the general element-by-element safe harbor provision in the final rules, no unaltered single-user toilet rooms that comply with the current 1991 Standards will be required to retrofit to meet the revised clearance requirements in the final rules.

With respect to new construction, it is assumed that each single-user toilet room with an out-swinging door will last the life of the building, about 40 years. For alterations, the amount of time such a toilet room will be used depends upon the remaining life of the building (*i.e.*, a period of time between 1 and 39 years).

Summing up monetized benefits to users with disabilities across all types of public and private facilities covered by the final rules, and assuming 46 percent of covered facilities nationwide are located in jurisdictions that have adopted the relevant equivalent IBC/ ANSI model code provisions, it is expected that the revised requirement for water closet clearance in single-user toilet rooms with out-swinging doors will

result in net benefits of approximately $900 million over the life of these regulations.

General description of monetized benefits for water closet clearance in single-user toilet rooms—in-swinging doors (Req. # 32). For the water closet clearance in single-user toilet rooms with the in-swinging door requirement (Req. #32), the expert panel determined that the primary beneficiaries would be persons who use wheelchairs. As compared to single-user toilet rooms with out-swinging doors, those with in-swinging doors tend to be larger terms of square footage) in order to accommodate clearance for the in-swinging door and, thus, are already likely to have adequate clear floor space for persons with disabilities who use other types of mobility aids such as walkers and crutches.

The expert benefits panel estimated that single-user toilet rooms with in-swinging doors are used less frequently on average—about once every 20 visits to a facility with such a toilet room by a person who uses a wheelchair—than their counterpart toilet rooms with out-swinging doors. This panel also determined that, on average, each user would realize a time savings of about 9 minutes as a result of the enhanced clearances required by this revised standard.

The RIA estimates that there are about 4 million single-user toilet rooms with in-swinging doors in existing facilities. About half of the single-user toilet rooms with in-swinging doors are assumed to be located in single-level stores, and about a quarter of them are assumed to be located in restaurants. Based on construction industry data, it was estimated that approximately 3 percent of existing single-user toilet rooms with in-swinging doors would be altered each year, and that the number of newly constructed facilities with these types of toilet rooms would increase at the rate of about 1 percent each year. However, due to the widespread adoption at the State and local level of model code provisions that mirror Req. #32, it is further understood that slightly more than 70 percent of all existing facilities assumed to have single-user toilet rooms with in-swinging doors already are covered by State or local building codes that require equivalent water closet clearances. Due to the general element-by-element safe harbor provision in the final rules, no unaltered single-user toilet rooms that comply with the current 1991 Standards will be required to retrofit to meet the revised clearance requirements in the final rules.

Similar to the assumptions for Req. #28, it is assumed that newly constructed single-user toilet rooms with in-swinging doors will last the life of the building, about 40 years. For alterations, the amount of time such a toilet room will be used depends upon the remaining life of the building (*i.e.*, a period of time between 1 and 39 years). Over this time period, the total estimated value of benefits to users of water closets with in-swinging doors from the time they will save and decreased discomfort they will experience is nearly $12 million.

Additional benefits of water closet clearance standards. The standards requiring sufficient space in single-user toilet rooms for a wheelchair user to effect a side or parallel transfer are among the most costly (in monetary terms) of the new provisions in the Access Board's guidelines that the Department adopts in this rule—but also, the Department believes, one of the most beneficial in non-monetary terms. Although the monetized costs of these requirements substantially exceed the monetized benefits, the additional benefits that persons with disabilities will derive from greater safety, enhanced independence, and the avoidance of stigma and humiliation— benefits that the Department's economic model could not put in monetary terms—are, in the Department's experience and considered judgment, likely to be quite high. Wheelchair users, including veterans returning from our Nation's wars with disabilities, are taught to transfer onto toilets from the side. Side transfers are the safest, most efficient, and most independence-promoting way for wheelchair users to get onto the toilet. The opportunity

to effect a side transfer will often obviate the need for a wheelchair user or individual with another type of mobility impairment to obtain the assistance of another person to engage in what is, for most people, among the most private of activities. Executive Order 12866 refers explicitly not only to monetizable costs and benefits but also to ''distributive impacts'' and ''equity,'' *see* E.O. 12866, section 1(a), and it is important to recognize that the ADA is intended to provide important benefits that are distributional and equitable in character. These water closet clearance provisions will have non-monetized benefits that promote equal access and equal opportunity for individuals with disabilities, and will further the ADA's purpose of providing ''a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities.'' 42 U.S.C. 12101(b)(1).

The Department's calculations indicated that, in fact, people with the relevant disabilities would have to place only a very small monetary value on these quite substantial benefits for the costs and benefits of these water closet clearance standards to break even. To make these calculations, the Department separated out toilet rooms with out-swinging doors from those with in-swinging doors, because the costs and benefits of the respective water closet clearance requirements are significantly different. The Department estimates that, assuming 46 percent of covered facilities nationwide are located in jurisdictions that have adopted the relevant equivalent IBC/ANSI model code provisions, the costs of the requirement as applied to toilet rooms with out-swinging doors will exceed the monetized benefits by $454 million, an annualized net cost of approximately $32.6 million. But a large number of people with disabilities will realize benefits of independence, safety, and avoided stigma and humiliation as a result of the requirement's application in this context. Based on the estimates of its expert panel and its own experience, the Department believes that both wheelchair users and people with a variety of other mobility disabilities will benefit. The Department estimates that people with the relevant disabilities will use a newly accessible single-user toilet room with an out-swinging door approximately 677 million times per year. Dividing the $32.6 million annual cost by the 677 million annual uses, the Department concludes that for the costs and benefits to break even in this context, people with the relevant disabilities will have to value safety, independence, and the avoidance of stigma and humiliation at just under 5 cents per visit. The Department believes, based on its experience and informed judgment, that 5 cents substantially understates the value people with the relevant disabilities would place on these benefits in this context.

There are substantially fewer single-user toilet rooms with in-swinging doors, and substantially fewer people with disabilities will benefit from making those rooms accessible. While both wheelchair users and individuals with other ambulatory disabilities will benefit from the additional space in a room with an out-swinging door, the Department believes, based on the estimates of its expert panel and its own experience, that wheelchair users likely will be the primary beneficiaries of the in-swinging door requirement. The Department estimates that people with the relevant disabilities will use a newly accessible single-user toilet room with an in-swinging door approximately 8.7 million times per year. Moreover, the alteration costs to make a single-user toilet room with an in-swinging door accessible are substantially higher (because of the space taken up by the door) than the equivalent costs of making a room with an out-swinging door accessible. Thus, the Department calculates that, assuming 72 percent of covered facilities nationwide are located in jurisdictions that have adopted the relevant equivalent IBC/ANSI model code provisions, the costs of applying the toilet room accessibility standard to rooms with in-swinging doors will exceed the monetized benefits of doing so by $266.3 million over the

life of the regulations, or approximately $19.14 million per year. Dividing the $19.14 million annual cost by the 8.7 million annual uses, the Department concludes that for the costs and benefits to break even in this context, people with the relevant disabilities will have to value safety, independence, and the avoidance of stigma and humiliation at approximately $2.20 per visit. The Department believes, based on its experience and informed judgment, that this figure approximates, and probably understates, the value wheelchair users place on safety, independence, and the avoidance of stigma and humiliation in this context.

Alternate Scenarios

Another scenario in the Final RIA explores the incremental impact of varying the assumptions concerning the percentage of existing elements subject to supplemental requirements for which barrier removal would be readily achievable. Readily achievable barrier removal rates are modeled at 0 percent, 50 percent, and 100 percent levels. The results of this scenario show that the expected NPV is positive for each readily achievable barrier removal rate and that varying this assumed rate has little impact on expected NPV. *See* Final RIA, figure ES–3.

A third set of analyses in the Final RIA demonstrates the impact of using alternate baselines based on model codes instead of the primary baseline. The IBC model codes, which have been widely adopted by State and local jurisdictions around the country, are significant because many of the requirements in the final rules mirror accessibility provisions in the IBC model codes (or standards incorporated therein by reference, such as ANSI A117.1). The actual economic impact of the Department's final rules is, therefore, tempered by the fact that many jurisdictions nationwide have already adopted and are enforcing portions of the final rules—indeed, this was one of the goals underlying the Access Board's efforts to harmonize the 2004 ADAAG Standards with the model codes. However, capturing the economic impact of this reality poses a difficult modeling challenge due to the variety of methods by which States and localities have adopted the IBC/ANSI model codes (*e.g.*, in whole, in part, and with or without amendments), as well as the lack of a national ''facility census'' establishing the location, type, and age of existing ADA-covered facilities.

As a result, in the first set of alternate IBC baseline analyses, the Final RIA assumes that all of the three IBC model codes—IBC 2000, IBC 2003, and IBC 2006—have been fully adopted by all jurisdictions and apply to all facilities nationwide. As with the primary baseline scenarios examined in the Final RIA, use of these three alternate IBC baselines results in positive expected NPVs in all cases. *See* Final RIA, figure ES–4. These results also indicate that IBC 2000 and IBC 2006 respectively have the highest and lowest expected NPVs. These results are due to changes in the make-up of the set of requirements that is included in each alternative baseline.

Additionally, a second, more limited alternate baseline analysis in the Final RIA uses a State-specific and requirement-specific alternate IBC/ANSI baseline in order to demonstrate the likely actual incremental impact of an illustrative subset of 20 requirements under current conditions nationwide. For this analysis, research was conducted on a subset of 20 requirements in the final rules that have negative net present values under the primary baseline and readily identifiable IBC/ANSI counterparts to determine the extent to which they each respectively have been adopted at the State or local level. With respect to facilities, the population of adopting jurisdictions was used as a proxy for facility location. In other words, it was assumed that the number of ADA-covered facilities respectively compliant with these 20 requirements was equal to the percentage of the United States population (based on statistics from the Census Bureau) currently residing in those States or local jurisdictions that have adopted the

IBC/ANSI counterparts to these requirements. The results of this more limited analysis, using State-specific and requirement-specific alternate IBC/ANSI baselines for these 20 requirements, demonstrate that the widespread adoption of IBC model codes by States and localities significantly lessens the financial impact of these specific requirements. Indeed, the Final RIA estimates that, if the NPVs for these 20 requirements resulting from the requirement-specific alternate IBC/ANSI baseline are substituted for their respective results under the primary baseline, the overall NPV for the final rules increases from $9.2 billion to $12.0 billion. *See* Final RIA, section 6.2.2 & table 10.

Benefits Not Monetized in the Formal Analysis

Finally, the RIA recognizes that additional benefits are likely to result from the new standards. Many of these benefits are more difficult to quantify. Among the potential benefits that have been discussed by researchers and advocates are reduced administrative costs due to harmonized guidelines, increased business opportunities, increased social development, and improved health benefits. For example, the final rules will substantially increase accessibility at newly scoped facilities such as recreation facilities and judicial facilities, which previously have been very difficult for persons with disabilities to access. Areas where the Department believes entities may incur benefits that are not monetized in the formal analysis include, but may not be limited to, the following:

Use benefits accruing to persons with disabilities. The final rules should improve the overall sense of well-being of persons with disabilities, who will know that public entities and places of public accommodation are generally accessible, and who will have improved individual experiences. Some of the most frequently cited qualitative benefits of increased access are the increase in one's personal sense of dignity that arises from increased access and the decrease in possibly humiliating incidents due to accessibility barriers. Struggling to join classmates on a stage, to use a bathroom with too little clearance, or to enter a swimming pool all negatively affect a person's sense of independence and can lead to humiliating accidents, derisive comments, or embarrassment. These humiliations, together with feelings of being stigmatized as different or inferior from being relegated to use other, less comfortable or pleasant elements of a facility (such as a bathroom instead of a kitchen sink for rinsing a coffee mug at work), all have a negative effect on persons with disabilities.

Use benefits accruing to persons without disabilities. Improved accessibility can affect more than just the rule's target population; persons without disabilities may also benefit from many of the requirements. Even though the requirements were not designed to benefit persons without disabilities, any time savings or easier access to a facility experienced by persons without disabilities are also benefits that should properly be attributed to that change in accessibility. Curb cuts in sidewalks make life easier for those using wheeled suitcases or pushing a baby stroller. For people with a lot of luggage or a need to change clothes, the larger bathroom stalls can be highly valued. A ramp into a pool can allow a child (or adult) with a fear of water to ease into that pool. All are examples of ''unintended'' benefits of the rule. And ideally, all should be part of the calculus of the benefits to society of the rule.

Social benefits. Evidence supports the notion that children with and without disabilities benefit in their social development from interaction with one another. Therefore, there will likely be social development benefits generated by an increase in accessible play areas. However, these benefits are nearly impossible to quantify for several reasons. First, there is no guarantee that accessibility will generate play opportunities between children with and without disabilities. Second, there may be substantial overlap between interactions at accessible play areas and interactions at other facilities, such as schools and religious

facilities. Third, it is not certain what the unit of measurement for social development should be.

Non-use benefits. There are additional, indirect benefits to society that arise from improved accessibility. For instance, resource savings may arise from reduced social service agency outlays when people are able to access centralized points of service delivery rather than receiving home-based care. Home-based and other social services may include home health care visits and welfare benefits. Third-party employment effects can arise when enhanced accessibility results in increasing rates of consumption by disabled and non-disabled populations, which in turn results in reduced unemployment.

Two additional forms of benefits are discussed less often, let alone quantified: Option value and existence value. Option value is the value that people with and without disabilities derive from the option of using accessible facilities at some point in the future. As with insurance, people derive benefit from the knowledge that the option to use the accessible facility exists, even if it ultimately goes unused. Simply because an individual is a nonuser of accessible elements today does not mean that he or she will remain so tomorrow. In any given year, there is some probability that an individual will develop a disability (either temporary or permanent) that will necessitate use of these features. For example, the 2000 Census found that 41.9 percent of adults 65 years and older identified themselves as having a disability. Census Bureau figures, moreover, project that the number of people 65 years and older will more than double between 2000 and 2030—from 35 million to 71.5 million. Therefore, even individuals who have no direct use for accessibility features today get a direct benefit from the knowledge of their existence should such individuals need them in the future.

Existence value is the benefit that individuals get from the plain existence of a good, service or resource—in this case, accessibility. It can also be described as the value that people both with and without disabilities derive from the guarantees of equal treatment and non-discrimination that are accorded through the provision of accessible facilities. In other words, people value living in a country that affords protections to individuals with disabilities, whether or not they themselves are directly or indirectly affected. Unlike use benefits and option value, existence value does not require an individual ever to use the resource or plan on using the resource in the future. There are numerous reasons why individuals might value accessibility even if they do not require it now and do not anticipate needing it in the future.

Costs Not Monetized in the Formal Analysis

The Department also recognizes that in addition to benefits that cannot reasonably be quantified or monetized, there may be negative consequences and costs that fall into this category as well. The absence of a quantitative assessment of such costs in the formal regulatory analysis is not meant to minimize their importance to affected entities; rather, it reflects the inherent difficulty in estimating those costs. Areas where the Department believes entities may incur costs that are not monetized in the formal analysis include, but may not be limited to, the following:

Costs from deferring or forgoing alterations. Entities covered by the final rules may choose to delay otherwise desired alterations to their facilities due to the increased incremental costs imposed by compliance with the new requirements. This may lead to facility deterioration and decrease in the value of such facilities. In extreme cases, the costs of complying with the new requirements may lead some entities to opt to not build certain facilities at all. For example, the Department estimates that the incremental costs of building a new wading pool associated with the final rules will increase by about $142,500 on average. Some facilities may opt to not build such pools to avoid incurring this increased cost.

Loss of productive space while modifying an existing facility. During complex alterations, such as where moving walls or plumbing systems will be necessary to comply with the final rules, productive space may be unavailable until the alterations are complete. For example, a hotel altering its bathrooms to comply with the final rules will be unable to allow guests to occupy these rooms while construction activities are underway, and thus the hotel may forgo revenue from these rooms during this time. While the amount of time necessary to perform alterations varies significantly, the costs associated with unproductive space could be high in certain cases, especially if space is already limited or if an entity or facility is located in an area where real estate values are particularly high (*e.g.*, New York or San Francisco).

Expert fees. Another type of cost to entities that is not monetized in the formal analysis is legal fees to determine what, if anything, a facility needs to do in order to comply with the new rules or to respond to lawsuits. Several commenters indicated that entities will incur increased legal costs because the requirements are changing for the first time since 1991. Since litigation risk could increase, entities could spend more on legal fees than in the past. Likewise, covered entities may face incremental costs when undertaking alterations because their engineers, architects, or other consultants may also need to consider what modifications are necessary to comply with the new requirements. The Department has not quantified the incremental costs of the services of these kinds of experts.

Reduction in facility value and losses to individuals without disabilities due to the new accessibility requirements. It is possible that some changes made by entities to their facilities in order to comply with the new requirements may result in fewer individuals without disabilities using such facilities (because of decreased enjoyment) and may create a disadvantage for individuals without disabilities, even though the change might increase accessibility for individuals with disabilities. For example, the new requirements for wading pools might decrease the value of the pool to the entity that owns it due to fewer individuals using it (because the new requirements for a sloped entry might make the pool too shallow). Similarly, several commenters from the miniature golf industry expressed concern that it would be difficult to comply with the regulations for accessible holes without significantly degrading the experience for other users. Finally, with respect to costs to individuals who do not have disabilities, a very tall person, for example, may be inconvenienced by having to reach further for a lowered light switch.

Section 610 Review

The Department is also required to conduct a periodic regulatory review pursuant to section 610 of the RFA. The review requires agencies to consider five factors: (1) The continued need for the rule; (2) the nature of complaints or comments received concerning the rule from the public; (3) the complexity of the rule; (4) the extent to which the rule overlaps, duplicates, or conflicts with other Federal rules, and, to the extent feasible, with State and local governmental rules; and (5) the length of time since the rule has been evaluated or the degree to which technology, economic conditions, or other factors have changed in the area affected by the rule. *See* 5 U.S.C. 610(b). Based on these factors, the agency is required to determine whether to continue the rule without change or to amend or rescind the rule, to minimize any significant economic impact of the rule on a substantial number of small entities. *See id.* 610(a).

In developing the 2010 Standards, the Department reviewed the 1991 Standards section by section and, as a result, has made several clarifications and amendments in both the title II and title III implementing regulations. The changes reflect the Department's analysis and review of complaints or comments from the

public, as well as changes in technology. Many of the amendments aim to clarify and simplify the obligations of covered entities. As discussed in greater detail above, one significant goal of the development of the 2004 ADAAG was to eliminate duplication or overlap in Federal accessibility guidelines, as well as to harmonize the Federal guidelines with model codes. The Department has also worked to create harmony where appropriate between the requirements of titles II and III. Finally, while the regulation is required by statute and there is a continued need for it as a whole, the Department proposes several modifications that are intended to reduce its effects on small entities.

The Department has consulted with the Small Business Administration's Office of Advocacy about this process. The Office of Advocacy has advised that although the process followed by the Department was ancillary to the proposed adoption of revised ADA Standards, the steps taken to solicit public input and to respond to public concerns are functionally equivalent to the process required to complete a section 610 review. Therefore, this rulemaking fulfills the Department's obligations under section 610 of the RFA.

Final Regulatory Flexibility Analysis

The final rule also has been reviewed by the Small Business Administration's Office of Advocacy (Advocacy) in accordance with Executive Order 13272, 67 FR 53461, 3 CFR, 2003 Comp., p. 247. Chapter Seven of the Final RIA demonstrates that the final rule will not have a significant economic impact on a substantial number of small governmental jurisdictions or facilities. The Department has also conducted a final regulatory flexibility analysis (FRFA) as a component of this rulemaking. Collectively, the ANPRM, NPRM, Initial RIA, Final RIA, and 2010 Standards, include all of the elements of a FRFA required by the Regulatory Flexibility Act (RFA). *See* 5 U.S.C. 604(a)(1)–(5).

Section 604(a) lists the specific requirements for a FRFA. The Department has addressed these RFA requirements throughout the ANPRM, NPRM, the 2010 Standards, and the RIA. In summary, the Department has satisfied its FRFA obligations under section 604(a) by providing the following:

1. *Succinct summaries of the need for, and objectives of, the final rules.* The Department is issuing this final rule in order to comply with its obligations under both the ADA and the SBREFA. The Department is also updating or amending certain provisions of the existing title II regulations so that they are consistent with the title III regulations and accord with the Department's legal and practical experiences in enforcing the ADA.

The ADA requires the Department to adopt enforceable accessibility standards under the ADA that are consistent with the Access Board's minimum accessibility guidelines and requirements. Accordingly, this rule adopts ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines as part of the 2010 Standards, which will give the guidelines legal effect with respect to the Department's title II and title III regulations.

Under the SBREFA, the Department is required to perform a periodic review of its 1991 rule because the rule may have a significant economic impact on a substantial number of small entities. The SBREFA also requires the Department to make a regulatory assessment of the costs and benefits of any significant regulatory action. *See* preamble sections of the final rules for titles II and III entitled, ''Summary'' and ''The Department's Rulemaking History''; Department of Justice ANPRM, 69 FR 58768, 58768–70 (Sept. 30, 2004) (outlining the regulatory history, goals, and rationale underlying DOJ's proposal to revise its regulations implementing titles II and III of the ADA); Department of Justice NPRM, 73 FR 34508, 34508– 14 (June 17, 2008) (outlining the regulatory history and rationale underlying DOJ's

proposal to revise its regulations implementing titles II and III of the ADA).

2. *Summaries of significant issues raised by public comments in response to the Department's initial regulatory flexibility analysis (IRFA) and discussions of regulatory revisions made as a result of such comments.* The Department received no comments addressing specific substantive issues regarding the IRFA for the title II NPRM. However, the Office of Advocacy (Advocacy) of the U.S. Small Business Administration did provide specific comments on the title III NPRM, which may be relevant to the title II IRFA. Accordingly, the Department has included those comments here.

Advocacy acknowledged how the Department took into account the comments and concerns of small entities. However, Advocacy remained concerned about certain items in the Department's NPRM and requested clarification or additional guidance on certain items.

General Safe Harbor. Advocacy expressed support for the Department's proposal to allow an element-by-element safe harbor for elements that now comply with the 1991 ADA Standards and encouraged the Department to include specific technical assistance in the Small Business Compliance Guide that the Department is required to publish pursuant to section 212 of the SBREFA. Advocacy requested that technical assistance outlining which standards are subject to the safe harbor be included in the Department's guidance. The Department has provided a list of the new requirements in the 2010 Standards that are not eligible for the safe harbor in § 35.150(b)(2)(ii)(A) through § 35.150(b)(2)(ii)(L) of the final rule and plans to include additional information about the application of the safe harbor in the Department's Small Business Compliance Guide. Advocacy also requested that guidance regarding the two effective dates for regulations also be provided and the Department plans to include such guidance in its Small Business Compliance Guide.

Indirect Costs. Advocacy expressed concern that small entities would incur substantial indirect costs under the final rules for accessibility consultants, legal counsel, training, and the development of new policies and procedures. The Department believes that such ''indirect costs,'' even assuming they would occur as described by Advocacy, are not properly attributed to the Department's final rules implementing the ADA.

The vast majority of the new requirements are incremental changes subject to a safe harbor. All small entities currently in compliance with the 1991 Standards will neither need to undertake further retrofits nor require the services of a consultant to tell them so. If, on the other hand, elements at an existing facility are not currently in compliance with the 1991 Standards, then the cost of making such a determination and bringing these elements into compliance are not properly attributed to the final rules, but to lack of compliance with the 1991 Standards.

For the limited number of requirements in the final rule that are supplemental (*i.e.*, relating to accessibility at courthouses, play areas, and recreation facilities), the Department believes that covered entities simply need to determine whether they have an element covered by a supplemental requirement (*e.g.*, a swimming pool) and then conduct any work necessary to provide program access either in-house or by contacting a local contractor. Determining whether such an element exists is expected to take only a minimal amount of staff time. Nevertheless, Chapter 5.3 of the Final RIA has a high-end estimate of the additional management costs of such evaluation (from 1 to 8 hours of staff time).

The Department also anticipates that small entities will incur minimal costs for accessibility consultants to ensure compliance with the new requirements for New Construction and Alterations in the final rules. Both the 2004 ADAAG and the proposed requirements have been made public for some time and are already being incorporated into design plans by architects

and builders. Further, in adopting the final rules, the Department has sought to harmonize, to the greatest extent possible, the ADA Standards with model codes that have been adopted on a widespread basis by State and local jurisdictions across the country. Accordingly, many of the requirements in the final rules are already incorporated into building codes nationwide. Additionally, it is assumed to be part of the regular course of business—and thereby incorporated into standard professional services or construction contracts—for architects and contractors to keep abreast of changes in applicable Federal, State, and local laws and building codes. Given these considerations, the Department has determined that the additional costs, if any, for architectural or contractor services that arise out of the final rules are expected to be minimal.

Some business commenters stated that the final rules would require them to develop new policies or manuals to retrain employees on the revised ADA standards. However, it is the Department's view that because the revised and supplemental requirements address architectural issues and features, the final rules would require minimal, if any, changes to the overall policies and procedures of covered entities.

Finally, commenters representing business interests expressed the view that the final rules would cause businesses to incur significant legal costs in order to defend ADA lawsuits. However, regulatory impact analyses are not an appropriate forum for assessing the cost covered entities may bear, or the repercussions they may face, for failing to comply (or allegedly failing to comply) with current law. *See* Final RIA, Ch. 3, section 3.1.4, *id.*, at Ch. 5, *id.* at table 15.

3. *Estimates of the number and type of small entities to which the final rules will apply.* The Department estimates that the final rules will apply to approximately 89,000 facilities operated by small governmental jurisdictions covered by title II. *See* Final RIA, Ch. 7, ''Small Business Impact Analysis,'' table 17, and app. 5, ''Small Business Data of the RIA'' (available for review at *http:// www.ada.gov*); *see also* 73 FR 36964 (June 30, 2008), app. B: Initial Regulatory Assessment, sections entitled, ''Regulatory Alternatives,'' ''Regulatory Proposals with Cost Implications,'' and ''Measurement of Incremental Benefits'' (estimating the number of small entities the Department believes may be impacted by the NPRM and calculating the likely incremental economic impact of these rules on small facilities or entities versus ''typical'' (*i.e.*, average-sized) facilities or entities).

4. *A description of the projected reporting, record-keeping, and other compliance requirements of the final rules, including an estimate of the classes of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record.* The final rules impose no new recordkeeping or reporting requirements. *See* preamble sections of the final rule for titles II and III entitled, ''Paperwork Reduction Act.'' Small entities may incur costs as a result of complying with the final rules. These costs are detailed in the Final RIA, Chapter 7, ''Small Business Impact Analysis'' and accompanying Appendix 5, ''Small Business Data'' (available for review at *http://www.ada.gov*).

5. *Descriptions of the steps taken by the Department to minimize any significant economic impact on small entities consistent with the stated objectives of the ADA, including the reasons for selecting the alternatives adopted in the final rules and for rejecting other significant alternatives.* From the outset of this rulemaking, the Department has been mindful of small entities and has taken numerous steps to minimize the impact of the final rule on small governmental jurisdictions. Several of these steps are summarized below.

As an initial matter, the Department— as a voting member of the Access Board—was extensively involved in the development of the 2004 ADAAG. These guidelines, which are

incorporated into the 2010 Standards, reflect a conscious effort to mitigate any significant economic impact on small entities in several respects. First, one of the express goals of the 2004 ADAAG is harmonization of Federal accessibility guidelines with industry standards and model codes that often form the basis of State and local building codes, thereby minimizing the impact of these guidelines on all covered entities, but especially small entities. Second, the 2004 ADAAG is the product of a 10-year rulemaking effort in which a host of private and public entities, including groups representing government entities, worked cooperatively to develop accessibility guidelines that achieved an appropriate balance between accessibility and cost. For example, as originally recommended by the Access Board's Recreation Access Advisory Committee, all holes on a miniature golf course would be required to be accessible except for sloped surfaces where the ball could not come to rest. *See*, *e.g.,* ''ADA Accessibility Guidelines for Buildings and Facilities—Recreation Facilities and Outdoor Developed Areas,'' Access Board Advance Notice of Proposed Rulemaking, 59 FR 48542 (Sept. 21, 1994). Miniature golf trade groups and facility operators, who are nearly all small businesses or small governmental jurisdictions, expressed significant concern that such requirements would be prohibitively expensive, require additional space, and might fundamentally alter the nature of their courses. *See*, *e.g.,* ''ADA Accessibility Guidelines for Buildings and Facilities—Recreation Facilities,'' Access Board Notice of Proposed Rulemaking, 64 FR 37326 (July 9, 1999). In consideration of such concerns, and after holding informational meetings with miniature golf representatives and persons with disabilities, the Access Board significantly revised the final miniature golf guidelines. The final guidelines not only reduced significantly the number of holes required to be accessible to 50 percent of all holes (with one break in the sequence of consecutive holes permitted), but also added an exemption for carpets used on playing surfaces, modified ramp landing slope and size requirements, and reduced the space required for start of play areas. *See*, *e.g.,* ''ADA Accessibility Guidelines for Buildings and Facilities—Recreation Facilities Final Rule,'' 67 FR 56352, 56375B76 (Sept. 3, 2002) (codified at 36 CFR parts 1190 and 1191).

The Department also published an ANPRM to solicit public input on the adoption of the 2004 ADAAG as the revised Federal accessibility standards implementing titles II and III of the ADA. Among other things, the ANPRM specifically invited comment from small entities regarding the proposed rules' potential economic impact and suggested regulatory alternatives to ameliorate any such impact. *See* ANPRM, 69 FR 58768, 58778-79 (Sept. 30, 2004). The Department received over 900 comments and small entities' interests figured prominently. *See* NPRM, 73 FR 34466, 34468, 34501 (June 17, 2008).

Subsequently, when the Department published its NPRM in June 2008, several regulatory proposals were included to address concerns raised by small businesses and small local governmental jurisdictions in ANPRM comments. First, to mitigate costs to existing facilities, the Department proposed an element-by-element safe harbor that would exempt elements in compliance with applicable technical and scoping requirements in the 1991 Standards from any program accessibility retrofit obligations under the revised title II rules. *Id.* at 34485. While this proposed safe harbor applied to title-II covered entities irrespective of size, it was small governmental jurisdictions that especially stood to benefit since, according to comments from small entities, such jurisdictions are more likely to operate in older buildings and facilities. Additionally, the NPRM sought public input on the inclusion of reduced scoping provisions for certain types of small existing recreational

facilities (*i.e.*, swimming pools, play areas, and saunas). *Id.* at 34485-88.

During the NPRM comment period, the Department engaged in considerable public outreach to small entities. A public hearing was held in Washington, D.C, during which nearly 50 persons testified in person or by phone, including several small business owners. *See Transcript of the Public Hearing on Notices of Proposed Rulemaking* (July 15, 2008), available at *http://www.ada.gov/NPRM2008/ public_ hearing_transcript.htm*. This hearing was also streamed live over the Internet. By the end of the 60-day comment period, the Department had also received nearly 4,500 public comments on the NPRMs, including a significant number of comments reflecting the perspectives of small governmental jurisdictions on a wide range of regulatory issues.

In addition to soliciting input from small entities through the formal process for public comment, the Department also targeted small entities with less formal regulatory discussions, including a Small Business Roundtable convened by the Office of Advocacy and held at the offices of the Small Business Administration in Washington, DC, and an informational question-and-answer session concerning the title II and III NPRMs at the Department of Justice in which business representatives attended in-person and by telephone. These outreach efforts provided the small business community with information on the NPRM proposals being considered by the Department and gave small entities the opportunity to ask questions of the Department and provide feedback.

As a result of the feedback provided by representatives of small business interests on the title II NPRM, the Department was able to assess the impact of various alternatives on small governmental jurisdictions before adopting its final rule and took steps to minimize any significant impact on small entities. Most notably, the final rule retains the element-by-element safe harbor, for which the community of small businesses and small governmental jurisdictions voiced strong support. *See* Appendix A discussion of safe harbor (§ 35.150(b)(2)). The Department believes that this element-by-element safe harbor provision will go a long way toward mitigating the economic impact of the final rule on existing facilities owned or operated by small governmental jurisdictions.

Additional regulatory measures mitigating the economic impact of the final rule on entities covered by title II (including small governmental jurisdictions) include deletion of the proposed requirement for captioning of safety and emergency information on scoreboards at sporting venues, retention of the proposed path of travel safe harbor, and extension of the compliance date of the 2010 Standards as applied to new construction and alterations from 6 months to 18 months after publication of the final rule. *See* Appendix A discussions of captioning at sporting venues (§ 35.160), path of travel safe harbor (§ 35.151(b)(4)(ii)(C)), and accessibility standards compliance dates for new construction and alterations (§ 35.151(c)).

One set of proposed alternative measures that would have potentially provided some cost savings to small public entities—the reduced scoping for certain existing recreational facilities— was not adopted by the Department in the final rule. While these proposals were not specific to small entities, they nonetheless might have mitigated the impact of the final rule for some small governmental jurisdictions that owned or operated existing facilities at which these recreational elements were located. *See* Appendix A discussion of existing facilities. The Department gave careful consideration to how best to insulate small entities from overly burdensome costs under the 2010 Standards for existing small play areas, swimming pools, and saunas, while still ensuring accessible and integrated recreational facilities that are of great importance to persons with disabilities. The Department concluded that the

existing program accessibility standard (coupled with the new general element-by-element safe harbor), rather than specific exemptions for these types of existing facilities, is the most efficacious method by which to protect small governmental jurisdictions.

Once the final rule is promulgated, small entities will also have a wealth of documents to assist them in complying with the 2010 Standards. For example, accompanying the title III final rule in the **Federal Register** is the Department's ''Analysis and Commentary on the 2010 ADA Standards for Accessible Design'' (codified as Appendix B to 28 CFR part 36), which provides a plain language description of the revised scoping and technical requirements in these Standards and provides illustrative figures. The Department also expects to publish guidance specifically tailored to small businesses in the form of a small business compliance guide, as well as to publish technical assistance materials of general interest to all covered entities following promulgation of the final rule. Additionally, the Access Board has published a number of guides that discuss and illustrate application of the 2010 Standards to play areas and various types of recreational facilities.

Executive Order 13132

Executive Order 13132, 64 FR 43255, 3 CFR, 2000 Comp., p. 206, requires executive branch agencies to consider whether a rule will have federalism implications. That is, the rulemaking agency must determine whether the rule is likely to have substantial direct effects on State and local governments, a substantial direct effect on the relationship between the Federal Government and the States and localities, or a substantial direct effect on the distribution of power and responsibilities among the different levels of government. If an agency believes that a rule is likely to have federalism implications, it must consult with State and local elected officials about how to minimize or eliminate the effects.

Title II of the ADA covers State and local government programs, services, and activities and, therefore, clearly has some federalism implications. State and local governments have been subject to the ADA since 1991, and the majority have also been required to comply with the requirements of section 504. Hence, the ADA and the title II regulation are not novel for State and local governments. In its adoption of the 2010 Standards, the Department was mindful of its obligation to meet the objectives of the ADA while also minimizing conflicts between State law and Federal interests.

The 2010 Standards address and minimize federalism concerns. As a member of the Access Board, the Department was privy to substantial feedback from State and local governments throughout the development of the Board's 2004 guidelines. Before those guidelines were finalized as the 2004 ADA/ABA Guidelines, they addressed and minimized federalism concerns expressed by State and local governments during the development process. Because the Department adopted ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines as part of the 2010 Standards, the steps taken in the 2004 ADA/ABA Guidelines to address federalism concerns are reflected in the 2010 Standards.

The Department also solicited and received input from public entities in the September 2004 ANPRM and the June 2008 NPRM. Through the ANPRM and NPRM processes, the Department solicited comments from elected State and local officials and their representative national organizations about the potential federalism implications. The Department received comments addressing whether the ANPRM and NPRM directly affected State and local governments, the relationship between the Federal Government and the States, and the distribution of power and responsibilities among the various levels of government. This rule preempts State laws affecting entities subject to the ADA only to the extent that those laws conflict with the

requirements of the ADA, as set forth in the rule.

Title III of the ADA covers public accommodations and commercial facilities. These facilities are generally subject to regulation by different levels of government, including Federal, State, and local governments. The ADA and the Department's implementing regulations set minimum civil rights protections for individuals with disabilities that in turn may affect the implementation of State and local laws, particularly building codes. The Department's implementing regulations address federalism concerns and mitigate federalism implications, particularly the provisions that streamline the administrative process for State and local governments seeking ADA code certification under title III.

National Technology Transfer and Advancement Act of 1995

The National Technology Transfer and Advancement Act of 1995 (NTTAA) directs that as a general matter, all Federal agencies and departments shall use technical standards that are developed or adopted by voluntary consensus standards bodies, which are private, generally non-profit organizations that develop technical standards or specifications using well-defined procedures that require openness, balanced participation among affected interests and groups, fairness and due process, and an opportunity for appeal, as a means to carry out policy objectives or activities. Public Law 104– 113, section 12(d) (1) (15 U.S.C. 272 note). In addition, the NTTAA directs agencies to consult with voluntary, private sector, consensus standards bodies and requires that agencies participate with such bodies in the development of technical standards when such participation is in the public interest and is compatible with agency and departmental missions, authorities, priorities, and budget resources. *Id.* at section 12(d)(1). The Department, as a member of the Access Board, was an active participant in the lengthy process of developing the 2004 ADAAG, on which the 2010 Standards are based. As part of this update, the Board has made its guidelines more consistent with model building codes, such as the IBC, and industry standards. It coordinated extensively with model code groups and standard-setting bodies throughout the process so that differences could be reconciled. As a result, a historic level of harmonization has been achieved that has brought about improvements to the guidelines, as well as to counterpart provisions in the IBC and key industry standards, including those for accessible facilities issued through the American National Standards Institute.

Plain Language Instructions

The Department makes every effort to promote clarity and transparency in its rulemaking. In any regulation, there is a tension between drafting language that is simple and straightforward and drafting language that gives full effect to issues of legal interpretation. The Department operates a toll-free ADA Information Line (800) 514–0301 (voice); (800) 514–0383 (TTY) that the public is welcome to call at any time to obtain assistance in understanding anything in this rule. If any commenter has suggestions for how the regulation could be written more clearly, please contact Janet L. Blizard, Deputy Chief or Barbara J. Elkin, Attorney Advisor, Disability Rights Section, whose contact information is provided in the introductory section of this rule, entitled, **"FOR FURTHER INFORMATION CONTACT."**

Paperwork Reduction Act

The Paperwork Reduction Act of 1980 (PRA) requires agencies to clear forms and record keeping requirements with OMB before they can be introduced. 44 U.S.C. 3501 *et seq*. This rule does not contain any paperwork or record keeping requirements and does not require clearance under the PRA.

Unfunded Mandates Reform Act

Section 4(2) of the Unfunded Mandates Reform Act of 1995, 2 U.S.C. 1503(2), excludes from coverage under that Act any proposed or final Federal regulation that ''establishes or enforces any statutory rights that prohibit discrimination on the basis of race, color, religion, sex, national origin, age, handicap, or disability.'' Accordingly, this rulemaking is not subject to the provisions of the Unfunded Mandates Reform Act.

List of Subjects for 28 CFR Part 35

Administrative practice and procedure, Buildings and facilities, Civil rights, Communications, Individuals with disabilities, Reporting and recordkeeping requirements, State and local governments.

• By the authority vested in me as Attorney General by law, including 28 U.S.C. 509 and 510, 5 U.S.C. 301, and section 204 of the Americans with Disabilities Act of 1990, Pub. L. 101– 336, 42 U.S.C. 12134, and for the reasons set forth in Appendix A to 28 CFR part 35, chapter I of title 28 of the Code of Federal Regulations shall be amended as follows—

Title II Regulations

Revised Final Title II Regulation with Integrated Text

Department of Justice

This revised title II regulation integrates the Department's new regulatory provisions with the text of the existing title II regulation that was unchanged by the 2010 revisions.

PART 35—NONDISCRIMINATION ON THE BASIS OF DISABILITY IN STATE AND LOCAL GOVERNMENT SERVICES
(as amended by the final rule published on September 15, 2010)

Authority: 5 U.S.C. 301; 28 U.S.C. 509, 510; 42 U.S.C. 12134.

Subpart A—General

§ 35.101 Purpose.

The purpose of this part is to effectuate subtitle A of title II of the Americans with Disabilities Act of 1990 (42 U.S.C. 12131), which prohibits discrimination on the basis of disability by public entities.

§ 35.102 Application.

(a) Except as provided in paragraph (b) of this section, this part applies to all services, programs, and activities provided or made available by public entities.

(b) To the extent that public transportation services, programs, and activities of public entities are covered by subtitle B of title II of the ADA, they are not subject to the requirements of this part.

§ 35.103 Relationship to other laws.

(a) *Rule of interpretation.* Except as otherwise provided in this part, this part shall not be construed to apply a lesser standard than the standards applied under title V of the Rehabilitation Act of 1973 or the regulations issued by Federal agencies pursuant to that title.

(b) *Other laws.* This part does not invalidate or limit the remedies, rights, and procedures of any other Federal laws, or State or local laws (including State common law) that provide greater or equal protection for the rights of individuals with disabilities or individuals associated with them.

§ 35.104 Definitions.

For purposes of this part, the term—

1991 Standards means the requirements set forth in the ADA Standards for Accessible Design, originally published on July 26, 1991, and republished as Appendix D to 28 CFR part 36.

2004 ADAAG means the requirements set forth in appendices B and D to 36 CFR part 1191 (2009).

2010 Standards means the 2010 ADA Standards for Accessible Design, which consist of the 2004 ADAAG and the requirements contained in § 35.151.

Act means the Americans with Disabilities Act (Pub. L. 101-336, 104 Stat. 327, 42 U.S.C. 12101-12213 and 47 U.S.C. 225 and 611).

Assistant Attorney General means the Assistant Attorney General, Civil Rights Division, United States Department of Justice.

Auxiliary aids and services includes—

(1) Qualified interpreters on-site or through video remote interpreting (VRI) services; notetakers; real-time computer-aided transcription services; written materials; exchange of written notes; telephone handset amplifiers; assistive listening devices; assistive listening systems; telephones compatible with hearing aids; closed caption decoders; open and closed captioning, including real-time captioning; voice, text, and video-based telecommunications products and systems, including text telephones (TTYs), videophones, and captioned telephones, or equally effective telecommunications devices; videotext displays; accessible electronic and information technology; or other effective methods of making aurally delivered information available to individuals who are deaf or hard of hearing;

(2) Qualified readers; taped texts; audio recordings; Brailled materials and displays; screen reader software; magnification software; optical readers; secondary auditory programs (SAP); large print materials; accessible electronic and information technology; or other effective methods of making visually delivered materials available to individuals who are blind or have low vision;

(3) Acquisition or modification of equipment or devices; and

(4) Other similar services and actions.

Complete complaint means a written statement that contains the complainant's name and address and describes the public entity's alleged discriminatory action in sufficient detail to inform the agency of the nature and date of the alleged violation of this part. It shall be signed by the complainant or by someone authorized to do so on his or her behalf. Complaints filed on behalf of classes or third parties shall describe or identify (by name, if possible) the alleged victims of discrimination.

Current illegal use of drugs means illegal use of drugs that occurred recently enough to justify a reasonable belief that a person's drug use is current or that continuing use is a real and ongoing problem.

Designated agency means the Federal agency designated under subpart G of this part to oversee compliance activities under this part for particular components of State and local governments.

Direct threat means a significant risk to the health or safety of others that cannot be eliminated by a modification of policies, practices or procedures, or by the provision of auxiliary aids or services as provided in § 35.139.

Disability means, with respect to an individual, a physical or mental impairment that substantially limits one or more of the major life activities of such individual; a record of such an impairment; or being regarded as having such an impairment.

(1)

(i) The phrase *physical or mental impairment* means—

(A) Any physiological disorder or condition, cosmetic disfigurement, or anatomical loss affecting one or more of the following body systems: neurological, musculoskeletal, special sense organs, respiratory (including speech organs), cardiovascular, reproductive, digestive, genitourinary, hemic and lymphatic, skin, and endocrine;

(B) Any mental or psychological disorder such as mental retardation, organic brain syndrome, emotional or mental illness, and specific learning disabilities.

(ii) The phrase *physical or mental impairment* includes, but is not limited to, such contagious and noncontagious diseases and conditions as orthopedic, visual, speech and hearing impairments, cerebral palsy, epilepsy, muscular dystrophy, multiple sclerosis, cancer, heart disease, diabetes, mental retardation, emotional illness, specific learning disabilities, HIV disease (whether symptomatic or asymptomatic), tuberculosis, drug addiction, and alcoholism.

(iii) The phrase *physical or mental impairment* does not include homosexuality or bisexuality.

(2) The phrase *major life activities* means functions such as caring for one's self, performing manual tasks, walking, seeing, hearing, speaking, breathing, learning, and working.

(3) The phrase *has a record of such an impairment* means has a history of, or has been misclassified as having, a mental or physical impairment that substantially limits one or more major life activities.

(4) The phrase *is regarded as having an impairment* means—

(i) Has a physical or mental impairment that does not substantially limit major life activities but that is treated by a public entity as constituting such a limitation;

(ii) Has a physical or mental impairment that substantially limits major life activities only as a result of the attitudes of others toward such impairment; or

(iii) Has none of the impairments defined in paragraph (1) of this definition but is treated by a public entity as having such an impairment.

(5) The term *disability* does not include—

(i) Transvestism, transsexualism, pedophilia, exhibitionism, voyeurism, gender identity disorders not resulting from physical impairments, or other sexual behavior disorders;

(ii) Compulsive gambling, kleptomania, or pyromania; or

(iii) Psychoactive substance use disorders resulting from current illegal use of drugs.

Drug means a controlled substance, as defined in schedules I through V of section 202 of the Controlled Substances Act (21 U.S.C. 812).

Existing facility means a facility in existence on any given date, without regard to whether the facility may also be considered newly constructed or altered under this part.

Facility means all or any portion of buildings, structures, sites, complexes, equipment, rolling stock or other conveyances, roads, walks, passageways, parking lots, or other real or personal property, including the site where the building, property, structure, or equipment is located.

Historic preservation programs means programs conducted by a public entity that have preservation of historic properties as a primary purpose.

Historic properties means those properties that are listed or eligible for listing in the National Register of Historic Places or properties designated as historic under State or local law.

Housing at a place of education means housing operated by or on behalf of an elementary, secondary, undergraduate, or postgraduate school, or other place of education, including dormitories, suites, apartments, or other places of residence.

Illegal use of drugs means the use of one or more drugs, the possession or distribution of which is unlawful under the Controlled Substances Act (21 U.S.C. 812). The term illegal use of drugs does not include the use of a drug taken under supervision by a licensed health care professional, or other uses authorized by the Controlled Substances Act or other provisions of Federal law.

Individual with a disability means a person who has a disability. The term individual with a disability does not include an individual who is currently engaging in the illegal use of drugs, when the public entity acts on the basis of such use.

Other power-driven mobility device means any mobility device powered by batteries, fuel, or other engines—whether or not designed primarily for use by individuals with mobility disabilities—that is used by individuals with mobility disabilities for the purpose of locomotion, including golf cars, electronic personal assistance mobility devices (EPAMDs), such as the Segway® PT, or any mobility device designed to operate in areas without defined pedestrian routes, but that is not a wheelchair within the meaning of this section. This

definition does not apply to Federal wilderness areas; wheelchairs in such areas are defined in section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2).

Public entity means—

(1) Any State or local government;

(2) Any department, agency, special purpose district, or other instrumentality of a State or States or local government; and

(3) The National Railroad Passenger Corporation, and any commuter authority (as defined in section 103(8) of the Rail Passenger Service Act).

Qualified individual with a disability means an individual with a disability who, with or without reasonable modifications to rules, policies, or practices, the removal of architectural, communication, or transportation barriers, or the provision of auxiliary aids and services, meets the essential eligibility requirements for the receipt of services or the participation in programs or activities provided by a public entity.

Qualified interpreter means an interpreter who, via a video remote interpreting (VRI) service or an on-site appearance, is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary. Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.

Qualified reader means a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary.

Section 504 means section 504 of the Rehabilitation Act of 1973 (Pub. L. 93-112, 87 Stat. 394 (29 U.S.C. 794), as amended.

Service animal means any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability. Other species of animals, whether wild or domestic, trained or untrained, are not service animals for the purposes of this definition. The work or tasks performed by a service animal must be directly related to the individual's disability. Examples of work or tasks include, but are not limited to, assisting individuals who are blind or have low vision with navigation and other tasks, alerting individuals who are deaf or hard of hearing to the presence of people or sounds, providing non-violent protection or rescue work, pulling a wheelchair, assisting an individual during a seizure, alerting individuals to the presence of allergens, retrieving items such as medicine or the telephone, providing physical support and assistance with balance and stability to individuals with mobility disabilities, and helping persons with psychiatric and neurological disabilities by preventing or interrupting impulsive or destructive behaviors. The crime deterrent effects of an animal's presence and the provision of emotional support, well-being, comfort, or companionship do not constitute work or tasks for the purposes of this definition.

State means each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the Virgin Islands, the Trust Territory of the Pacific Islands, and the Commonwealth of the Northern Mariana Islands.

Video remote interpreting (VRI) service means an interpreting service that uses video conference technology over dedicated lines or wireless technology offering high-speed, wide-bandwidth video connection that delivers high-quality video images as provided in § 35.160(d).

Wheelchair means a manually-operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor, or of both indoor and outdoor locomotion. This definition does not apply to Federal wilderness areas; wheelchairs in such areas are defined in section 508(c)(2) of the ADA, 42 U.S.C. 12207 (c)(2).

§ 35.105 Self-evaluation.

(a) A public entity shall, within one year of the effective date of this part, evaluate its current services, policies, and practices, and the effects thereof, that do not or may not meet the requirements of this part and, to the extent modification of any such services, policies, and practices is required, the public entity shall proceed to make the necessary modifications.

(b) A public entity shall provide an opportunity to interested persons, including individuals with disabilities or organizations representing individuals with disabilities, to participate in the self-evaluation process by submitting comments.

(c) A public entity that employs 50 or more persons shall, for at least three years following completion of the self-evaluation, maintain on file and make available for public inspection:

(1) A list of the interested persons consulted;

(2) A description of areas examined and any problems identified; and

(3) A description of any modifications made.

(d) If a public entity has already complied with the self-evaluation requirement of a regulation implementing section 504 of the Rehabilitation Act of 1973, then the requirements of this section shall apply only to those policies and practices that were not included in the previous self-evaluation.

§ 35.106 Notice.

A public entity shall make available to applicants, participants, beneficiaries, and other interested persons information regarding the provisions of this part and its applicability to the services, programs, or activities of the public entity, and make such information available to them in such manner as the head of the entity finds necessary to apprise such persons of the protections against discrimination assured them by the Act and this part.

§ 35.107 Designation of responsible employee and adoption of grievance procedures.

(a) *Designation of responsible employee.* A public entity that employs 50 or more persons shall designate at least one employee to coordinate its efforts to comply with and carry out its responsibilities under this part, including any investigation of any complaint communicated to it alleging its noncompliance with this part or alleging any actions that would be prohibited by this part. The public entity shall make available to all interested individuals the name, office address, and telephone number of the employee or employees designated pursuant to this paragraph.

(b) *Complaint procedure.* A public entity that employs 50 or more persons shall adopt and publish grievance procedures providing for prompt and equitable resolution of complaints alleging any action that would be prohibited by this part.

§§ 35.108—35.129 [Reserved]

Subpart B—General Requirements

§ 35.130 General prohibitions against discrimination.

(a) No qualified individual with a disability shall, on the basis of disability, be excluded from participation in or be denied the benefits of the services, programs, or activities of a public entity, or be subjected to discrimination by any public entity.

(b)

(1) A public entity, in providing any aid, benefit, or service, may not, directly or through

contractual, licensing, or other arrangements, on the basis of disability—

(i) Deny a qualified individual with a disability the opportunity to participate in or benefit from the aid, benefit, or service;

(ii) Afford a qualified individual with a disability an opportunity to participate in or benefit from the aid, benefit, or service that is not equal to that afforded others;

(iii) Provide a qualified individual with a disability with an aid, benefit, or service that is not as effective in affording equal opportunity to obtain the same result, to gain the same benefit, or to reach the same level of achievement as that provided to others;

(iv) Provide different or separate aids, benefits, or services to individuals with disabilities or to any class of individuals with disabilities than is provided to others unless such action is necessary to provide qualified individuals with disabilities with aids, benefits, or services that are as effective as those provided to others;

(v) Aid or perpetuate discrimination against a qualified individual with a disability by providing significant assistance to an agency, organization, or person that discriminates on the basis of disability in providing any aid, benefit, or service to beneficiaries of the public entity's program;

(vi) Deny a qualified individual with a disability the opportunity to participate as a member of planning or advisory boards;

(vii) Otherwise limit a qualified individual with a disability in the enjoyment of any right, privilege, advantage, or opportunity enjoyed by others receiving the aid, benefit, or service.

(2) A public entity may not deny a qualified individual with a disability the opportunity to participate in services, programs, or activities that are not separate or different, despite the existence of permissibly separate or different programs or activities.

(3) A public entity may not, directly or through contractual or other arrangements, utilize criteria or methods of administration—

(i) That have the effect of subjecting qualified individuals with disabilities to discrimination on the basis of disability;

(ii) That have the purpose or effect of defeating or substantially impairing accomplishment of the objectives of the public entity's program with respect to individuals with disabilities; or

(iii) That perpetuate the discrimination of another public entity if both public entities are subject to common administrative control or are agencies of the same State.

(4) A public entity may not, in determining the site or location of a facility, make selections—

(i) That have the effect of excluding individuals with disabilities from, denying them the benefits of, or otherwise subjecting them to discrimination; or

(ii) That have the purpose or effect of defeating or substantially impairing the accomplishment of the objectives of the service, program, or activity with respect to individuals with disabilities.

(5) A public entity, in the selection of procurement contractors, may not use criteria that subject qualified individuals with disabilities to discrimination on the basis of disability.

(6) A public entity may not administer a licensing or certification program in a manner that subjects qualified individuals with disabilities to discrimination on the basis of disability, nor may a public entity establish requirements for the programs or activities of licensees or certified entities that subject qualified individuals with disabilities to discrimination on the basis of disability. The programs or activities of entities that are licensed or certified by a public entity are not, themselves, covered by this part.

(7) A public entity shall make reasonable modifications in policies, practices, or

procedures when the modifications are necessary to avoid discrimination on the basis of disability, unless the public entity can demonstrate that making the modifications would fundamentally alter the nature of the service, program, or activity.

(8) A public entity shall not impose or apply eligibility criteria that screen out or tend to screen out an individual with a disability or any class of individuals with disabilities from fully and equally enjoying any service, program, or activity, unless such criteria can be shown to be necessary for the provision of the service, program, or activity being offered.

(c) Nothing in this part prohibits a public entity from providing benefits, services, or advantages to individuals with disabilities, or to a particular class of individuals with disabilities beyond those required by this part.

(d) A public entity shall administer services, programs, and activities in the most integrated setting appropriate to the needs of qualified individuals with disabilities.

(e)

(1) Nothing in this part shall be construed to require an individual with a disability to accept an accommodation, aid, service, opportunity, or benefit provided under the ADA or this part which such individual chooses not to accept.

(2) Nothing in the Act or this part authorizes the representative or guardian of an individual with a disability to decline food, water, medical treatment, or medical services for that individual.

(f) A public entity may not place a surcharge on a particular individual with a disability or any group of individuals with disabilities to cover the costs of measures, such as the provision of auxiliary aids or program accessibility, that are required to provide that individual or group with the nondiscriminatory treatment required by the Act or this part.

(g) A public entity shall not exclude or otherwise deny equal services, programs, or activities to an individual or entity because of the known disability of an individual with whom the individual or entity is known to have a relationship or association.

(h) A public entity may impose legitimate safety requirements necessary for the safe operation of its services, programs, or activities. However, the public entity must ensure that its safety requirements are based on actual risks, not on mere speculation, stereotypes, or generalizations about individuals with disabilities.

§ 35.131 Illegal use of drugs.

(a) General.

(1) Except as provided in paragraph (b) of this section, this part does not prohibit discrimination against an individual based on that individual's current illegal use of drugs.

(2) A public entity shall not discriminate on the basis of illegal use of drugs against an individual who is not engaging in current illegal use of drugs and who—

(i) Has successfully completed a supervised drug rehabilitation program or has otherwise been rehabilitated successfully;

(ii) Is participating in a supervised rehabilitation program; or

(iii) Is erroneously regarded as engaging in such use.

(b) *Health and drug rehabilitation services.*

(1) A public entity shall not deny health services, or services provided in connection with drug rehabilitation, to an individual on the basis of that individual's current illegal use of drugs, if the individual is otherwise entitled to such services.

(2) A drug rehabilitation or treatment program may deny participation to individuals who engage in illegal use of drugs while they are in the program.

(c) *Drug testing*.

(1) This part does not prohibit a public entity from adopting or administering reasonable policies or procedures, including but not limited

to drug testing, designed to ensure that an individual who formerly engaged in the illegal use of drugs is not now engaging in current illegal use of drugs.

(2) Nothing in paragraph (c) of this section shall be construed to encourage, prohibit, restrict, or authorize the conduct of testing for the illegal use of drugs.

§ 35.132 Smoking.

This part does not preclude the prohibition of, or the imposition of restrictions on, smoking in transportation covered by this part.

§ 35.133 Maintenance of accessible features.

(a) A public entity shall maintain in operable working condition those features of facilities and equipment that are required to be readily accessible to and usable by persons with disabilities by the Act or this part.

(b) This section does not prohibit isolated or temporary interruptions in service or access due to maintenance or repairs.

(c) If the 2010 Standards reduce the technical requirements or the number of required accessible elements below the number required by the 1991 Standards, the technical requirements or the number of accessible elements in a facility subject to this part may be reduced in accordance with the requirements of the 2010 Standards.

§ 35.134 Retaliation or coercion.

(a) No private or public entity shall discriminate against any individual because that individual has opposed any act or practice made unlawful by this part, or because that individual made a charge, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under the Act or this part.

(b) No private or public entity shall coerce, intimidate, threaten, or interfere with any individual in the exercise or enjoyment of, or on account of his or her having exercised or enjoyed, or on account of his or her having aided or encouraged any other individual in the exercise or enjoyment of, any right granted or protected by the Act or this part.

§ 35.135 Personal devices and services.

This part does not require a public entity to provide to individuals with disabilities personal devices, such as wheelchairs; individually prescribed devices, such as prescription eyeglasses or hearing aids; readers for personal use or study; or services of a personal nature including assistance in eating, toileting, or dressing.

§ 35.136 Service animals.

(a) *General*. Generally, a public entity shall modify its policies, practices, or procedures to permit the use of a service animal by an individual with a disability.

(b) *Exceptions*. A public entity may ask an individual with a disability to remove a service animal from the premises if—

(1) The animal is out of control and the animal's handler does not take effective action to control it; or

(2) The animal is not housebroken.

(c) *If an animal is properly excluded*. If a public entity properly excludes a service animal under § 35.136(b), it shall give the individual with a disability the opportunity to participate in the service, program, or activity without having the service animal on the premises.

(d) *Animal under handler's control.* A service animal shall be under the control of its handler. A service animal shall have a harness, leash, or other tether, unless either the handler is unable because of a disability to use a harness, leash, or other tether, or the use of a harness, leash, or other tether would interfere with the service animal's safe, effective performance of work or tasks, in which case the service animal must be otherwise under the handler's control (*e.g.*, voice control, signals, or other effective means).

(e) *Care or supervision*. A public entity is not responsible for the care or supervision of a service animal.

(f) *Inquiries*. A public entity shall not ask about the nature or extent of a person's disability, but may make two inquiries to determine whether an animal qualifies as a service animal. A public entity may ask if the animal is required because of a disability and what work or task the animal has been trained to perform. A public entity shall not require documentation, such as proof that the animal has been certified, trained, or licensed as a service animal. Generally, a public entity may not make these inquiries about a service animal when it is readily apparent that an animal is trained to do work or perform tasks for an individual with a disability (*e.g.*, the dog is observed guiding an individual who is blind or has low vision, pulling a person's wheelchair, or providing assistance with stability or balance to an individual with an observable mobility disability).

(g) *Access to areas of a public entity*. Individuals with disabilities shall be permitted to be accompanied by their service animals in all areas of a public entity's facilities where members of the public, participants in services, programs or activities, or invitees, as relevant, are allowed to go.

(h) *Surcharges*. A public entity shall not ask or require an individual with a disability to pay a surcharge, even if people accompanied by pets are required to pay fees, or to comply with other requirements generally not applicable to people without pets. If a public entity normally charges individuals for the damage they cause, an individual with a disability may be charged for damage caused by his or her service animal.

(i) *Miniature horses*.

(1) *Reasonable modifications*. A public entity shall make reasonable modifications in policies, practices, or procedures to permit the use of a miniature horse by an individual with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability.

(2) *Assessment factors*. In determining whether reasonable modifications in policies, practices, or procedures can be made to allow a miniature horse into a specific facility, a public entity shall consider—

(i) The type, size, and weight of the miniature horse and whether the facility can accommodate these features;

(ii) Whether the handler has sufficient control of the miniature horse;

(iii) Whether the miniature horse is housebroken; and

(iv) Whether the miniature horse's presence in a specific facility compromises legitimate safety requirements that are necessary for safe operation.

(3) *Other requirements*. Paragraphs 35.136 (c) through (h) of this section, which apply to service animals, shall also apply to miniature horses.

§ 35.137 Mobility devices.

(a) *Use of wheelchairs and manually-powered mobility aids*. A public entity shall permit individuals with mobility disabilities to use wheelchairs and manually-powered mobility aids, such as walkers, crutches, canes, braces, or other similar devices designed for use by individuals with mobility disabilities in any areas open to pedestrian use.

(b)

(1) *Use of other power-driven mobility devices.* A public entity shall make reasonable modifications in its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with mobility disabilities, unless the public entity can demonstrate that the class of other power-driven mobility devices cannot be operated in accordance with legitimate safety requirements that the public entity has adopted pursuant to § 35.130(h).

(2) *Assessment factors*. In determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification under paragraph (b)(1) of this section, a public entity shall consider—

(i) The type, size, weight, dimensions, and speed of the device;

(ii) The facility's volume of pedestrian traffic (which may vary at different times of the day, week, month, or year);

(iii) The facility's design and operational characteristics (*e.g.*, whether its service, program, or activity is conducted indoors, its square footage, the density and placement of stationary devices, and the availability of storage for the device, if requested by the user);

(iv) Whether legitimate safety requirements can be established to permit the safe operation of the other power-driven mobility device in the specific facility; and

(v) Whether the use of the other power-driven mobility device creates a substantial risk of serious harm to the immediate environment or natural or cultural resources, or poses a conflict with Federal land management laws and regulations.

(c)

(1) *Inquiry about disability*. A public entity shall not ask an individual using a wheelchair or other power-driven mobility device questions about the nature and extent of the individual's disability.

(2) *Inquiry into use of other power-driven mobility device.* A public entity may ask a person using an other power-driven mobility device to provide a credible assurance that the mobility device is required because of the person's disability. A public entity that permits the use of an other power-driven mobility device by an individual with a mobility disability shall accept the presentation of a valid, State-issued, disability parking placard or card, or other State-issued proof of disability as a credible assurance that the use of the other power-driven mobility device is for the individual's mobility disability. In lieu of a valid, State-issued disability parking placard or card, or State-issued proof of disability, a public entity shall accept as a credible assurance a verbal representation, not contradicted by observable fact, that the other power-driven mobility device is being used for a mobility disability. A "valid" disability placard or card is one that is presented by the individual to whom it was issued and is otherwise in compliance with the State of issuance's requirements for disability placards or cards.

§ 35.138 Ticketing.

(a)

(1) For the purposes of this section, "accessible seating" is defined as wheelchair spaces and companion seats that comply with sections 221 and 802 of the 2010 Standards along with any other seats required to be offered for sale to the individual with a disability pursuant to paragraph (d) of this section.

(2) *Ticket sales*. A public entity that sells tickets for a single event or series of events shall modify its policies, practices, or procedures to ensure that individuals with disabilities have an equal opportunity to purchase tickets for accessible seating—

(i) During the same hours;

(ii) During the same stages of ticket sales, including, but not limited to, pre-sales, promotions, lotteries, wait-lists, and general sales;

(iii) Through the same methods of distribution;

(iv) In the same types and numbers of ticketing sales outlets, including telephone service, in-person ticket sales at the facility, or third-party ticketing services, as other patrons; and

(v) Under the same terms and conditions as other tickets sold for the same event or series of events.

(b) *Identification of available accessible seating*. A public entity that sells or distributes tickets for a single event or series of events shall, upon inquiry—

(1) Inform individuals with disabilities, their companions, and third parties purchasing tickets for accessible seating on behalf of individuals with disabilities of the locations of all unsold or otherwise available accessible seating for any ticketed event or events at the facility;

(2) Identify and describe the features of available accessible seating in enough detail to reasonably permit an individual with a disability to assess independently whether a given accessible seating location meets his or her accessibility needs; and

(3) Provide materials, such as seating maps, plans, brochures, pricing charts, or other information, that identify accessible seating and information relevant thereto with the same text or visual representations as other seats, if such materials are provided to the general public.

(c) *Ticket prices*. The price of tickets for accessible seating for a single event or series of events shall not be set higher than the price for other tickets in the same seating section for the same event or series of events. Tickets for accessible seating must be made available at all price levels for every event or series of events. If tickets for accessible seating at a particular price level are not available because of inaccessible features, then the percentage of tickets for accessible seating that should have been available at that price level (determined by the ratio of the total number of tickets at that price level to the total number of tickets in the assembly area) shall be offered for purchase, at that price level, in a nearby or similar accessible location.

(d) *Purchasing multiple tickets.*

(1) *General.* For each ticket for a wheelchair space purchased by an individual with a disability or a third-party purchasing such a ticket at his or her request, a public entity shall make available for purchase three additional tickets for seats in the same row that are contiguous with the wheelchair space, provided that at the time of purchase there are three such seats available. A public entity is not required to provide more than three contiguous seats for each wheelchair space. Such seats may include wheelchair spaces.

(2) *Insufficient additional contiguous seats available*. If patrons are allowed to purchase at least four tickets, and there are fewer than three such additional contiguous seat tickets available for purchase, a public entity shall offer the next highest number of such seat tickets available for purchase and shall make up the difference by offering tickets for sale for seats that are as close as possible to the accessible seats.

(3) *Sales limited to less than four tickets.* If a public entity limits sales of tickets to fewer than four seats per patron, then the public entity is only obligated to offer as many seats to patrons with disabilities, including the ticket for the wheelchair space, as it would offer to patrons without disabilities.

(4) *Maximum number of tickets patrons may purchase exceeds four*. If patrons are allowed to purchase more than four tickets, a public entity shall allow patrons with disabilities to purchase up to the same number of tickets, including the ticket for the wheelchair space.

(5) *Group sales*. If a group includes one or more individuals who need to use accessible seating because of a mobility disability or because their disability requires the use of the accessible features that are provided in accessible seating, the group shall be placed in a seating area with accessible seating so that, if possible, the group can sit together. If it is necessary to divide the group, it should be divided so that the individuals in the group

who use wheelchairs are not isolated from their group.

(e) *Hold-and-release of tickets for accessible seating*.

(1) *Tickets for accessible seating may be released for sale in certain limited circumstances*. A public entity may release unsold tickets for accessible seating for sale to individuals without disabilities for their own use for a single event or series of events only under the following circumstances—

(i) When all non-accessible tickets (excluding luxury boxes, club boxes, or suites) have been sold;

(ii) When all non-accessible tickets in a designated seating area have been sold and the tickets for accessible seating are being released in the same designated area; or

(iii) When all non-accessible tickets in a designated price category have been sold and the tickets for accessible seating are being released within the same designated price category.

(2) *No requirement to release accessible tickets*. Nothing in this paragraph requires a facility to release tickets for accessible seating to individuals without disabilities for their own use.

(3) *Release of series-of-events tickets on a series-of-events basis.*

(i) Series-of-events tickets sell-out when no ownership rights are attached. When series-of-events tickets are sold out and a public entity releases and sells accessible seating to individuals without disabilities for a series of events, the public entity shall establish a process that prevents the automatic reassignment of the accessible seating to such ticket holders for future seasons, future years, or future series so that individuals with disabilities who require the features of accessible seating and who become newly eligible to purchase tickets when these series-of-events tickets are available for purchase have an opportunity to do so.

(ii) *Series-of-events tickets when ownership rights are attached.* When series-of-events tickets with an ownership right in accessible seating areas are forfeited or otherwise returned to a public entity, the public entity shall make reasonable modifications in its policies, practices, or procedures to afford individuals with mobility disabilities or individuals with disabilities that require the features of accessible seating an opportunity to purchase such tickets in accessible seating areas.

(f) *Ticket transfer.* Individuals with disabilities who hold tickets for accessible seating shall be permitted to transfer tickets to third parties under the same terms and conditions and to the same extent as other spectators holding the same type of tickets, whether they are for a single event or series of events.

(g) *Secondary ticket market.*

(1) A public entity shall modify its policies, practices, or procedures to ensure that an individual with a disability may use a ticket acquired in the secondary ticket market under the same terms and conditions as other individuals who hold a ticket acquired in the secondary ticket market for the same event or series of events.

(2) If an individual with a disability acquires a ticket or series of tickets to an inaccessible seat through the secondary market, a public entity shall make reasonable modifications to its policies, practices, or procedures to allow the individual to exchange his ticket for one to an accessible seat in a comparable location if accessible seating is vacant at the time the individual presents the ticket to the public entity.

(h) *Prevention of fraud in purchase of tickets for accessible seating*. A public entity may not require proof of disability, including, for example, a doctor's note, before selling tickets for accessible seating.

(1) *Single-event tickets*. For the sale of single-event tickets, it is permissible to inquire whether the individual purchasing the tickets for accessible seating has a mobility disability or a disability that requires the use of the accessible features that are provided in accessible seating, or is purchasing the tickets for an individual who has a mobility disability or a disability that requires the use of the accessible features that are provided in the accessible seating.

(2) *Series-of-events tickets.* For series-of-events tickets, it is permissible to ask the individual purchasing the tickets for accessible seating to attest in writing that the accessible seating is for a person who has a mobility disability or a disability that requires the use of the accessible features that are provided in the accessible seating.

(3) *Investigation of fraud.* A public entity may investigate the potential misuse of accessible seating where there is good cause to believe that such seating has been purchased fraudulently.

§ 35.139 Direct threat.

(a) This part does not require a public entity to permit an individual to participate in or benefit from the services, programs, or activities of that public entity when that individual poses a direct threat to the health or safety of others.

(b) In determining whether an individual poses a direct threat to the health or safety of others, a public entity must make an individualized assessment, based on reasonable judgment that relies on current medical knowledge or on the best available objective evidence, to ascertain: the nature, duration, and severity of the risk; the probability that the potential injury will actually occur; and whether reasonable modifications of policies, practices, or procedures or the provision of auxiliary aids or services will mitigate the risk.

Subpart C—Employment

§ 35.140 Employment discrimination prohibited.

(a) No qualified individual with a disability shall, on the basis of disability, be subjected to discrimination in employment under any service, program, or activity conducted by a public entity.

(b)

(1) For purposes of this part, the requirements of title I of the Act, as established by the regulations of the Equal Employment Opportunity Commission in 29 CFR part 1630, apply to employment in any service, program, or activity conducted by a public entity if that public entity is also subject to the jurisdiction of title I.

(2) For the purposes of this part, the requirements of section 504 of the Rehabilitation Act of 1973, as established by the regulations of the Department of Justice in 28 CFR part 41, as those requirements pertain to employment, apply to employment in any service, program, or activity conducted by a public entity if that public entity is not also subject to the jurisdiction of title I.

§§ 35.141—35.148 [Reserved]

Subpart D—Program Accessibility

§ 35.149 Discrimination prohibited.

Except as otherwise provided in § 35.150, no qualified individual with a disability shall, because a public entity's facilities are inaccessible to or unusable by individuals with disabilities, be excluded from participation in, or be denied the benefits of the services, programs, or activities of a public entity, or be subjected to discrimination by any public entity.

§ 35.150 Existing facilities.

(a) *General.* A public entity shall operate each service, program, or activity so that the service, program, or activity, when viewed in its entirety,

is readily accessible to and usable by individuals with disabilities. This paragraph does not—

(1) Necessarily require a public entity to make each of its existing facilities accessible to and usable by individuals with disabilities;

(2) Require a public entity to take any action that would threaten or destroy the historic significance of an historic property; or

(3) Require a public entity to take any action that it can demonstrate would result in a fundamental alteration in the nature of a service, program, or activity or in undue financial and administrative burdens. In those circumstances where personnel of the public entity believe that the proposed action would fundamentally alter the service, program, or activity or would result in undue financial and administrative burdens, a public entity has the burden of proving that compliance with §35.150(a) of this part would result in such alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of a public entity or his or her designee after considering all resources available for use in the funding and operation of the service, program, or activity, and must be accompanied by a written statement of the reasons for reaching that conclusion. If an action would result in such an alteration or such burdens, a public entity shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the public entity.

(b) *Methods.*

(1) *General*. A public entity may comply with the requirements of this section through such means as redesign or acquisition of equipment, reassignment of services to accessible buildings, assignment of aides to beneficiaries, home visits, delivery of services at alternate accessible sites, alteration of existing facilities and construction of new facilities, use of accessible rolling stock or other conveyances, or any other methods that result in making its services, programs, or activities readily accessible to and usable by individuals with disabilities. A public entity is not required to make structural changes in existing facilities where other methods are effective in achieving compliance with this section. A public entity, in making alterations to existing buildings, shall meet the accessibility requirements of § 35.151. In choosing among available methods for meeting the requirements of this section, a public entity shall give priority to those methods that offer services, programs, and activities to qualified individuals with disabilities in the most integrated setting appropriate.

(2)

(i) *Safe harbor.* Elements that have not been altered in existing facilities on or after March 15, 2012, and that comply with the corresponding technical and scoping specifications for those elements in either the 1991 Standards or in the Uniform Federal Accessibility Standards (UFAS), Appendix A to 41 CFR part 101–19.6 (July 1, 2002 ed.), 49 FR 31528, app. A (Aug. 7, 1984) are not required to be modified in order to comply with the requirements set forth in the 2010 Standards.

(ii) The safe harbor provided in § 35.150(b)(2)(i) does not apply to those elements in existing facilities that are subject to supplemental requirements (*i.e.*, elements for which there are neither technical nor scoping specifications in the 1991 Standards). Elements in the 2010 Standards not eligible for the element-by-element safe harbor are identified as follows—

(A) *Residential facilities dwelling units*, sections 233 and 809.

(B) *Amusement rides*, sections 234 and 1002; 206.2.9; 216.12.

(C) *Recreational boating facilities*, sections 235 and 1003; 206.2.10.

(D) *Exercise machines and equipment*,

sections 236 and 1004; 206.2.13.

(E) *Fishing piers and platforms*, sections 237 and 1005; 206.2.14.

(F) *Golf facilities*, sections 238 and 1006; 206.2.15.

(G) *Miniature golf facilities*, sections 239 and 1007; 206.2.16.

(H) *Play areas*, sections 240 and 1008; 206.2.17.

(I) *Saunas and steam rooms*, sections 241 and 612.

(J) *Swimming pools, wading pools, and spas*, sections 242 and 1009.

(K) *Shooting facilities with firing positions*, sections 243 and 1010.

(L) *Miscellaneous*.

(1) Team or player seating, section 221.2.1.4.

(2) Accessible route to bowling lanes, section. 206.2.11.

(3) Accessible route in court sports facilities, section 206.2.12.

(3) *Historic preservation programs*. In meeting the requirements of § 35.150(a) in historic preservation programs, a public entity shall give priority to methods that provide physical access to individuals with disabilities. In cases where a physical alteration to an historic property is not required because of paragraph (a)(2) or (a)(3) of this section, alternative methods of achieving program accessibility include—

(i) Using audio-visual materials and devices to depict those portions of an historic property that cannot otherwise be made accessible;

(ii) Assigning persons to guide individuals with handicaps into or through portions of historic properties that cannot otherwise be made accessible; or

(iii) Adopting other innovative methods.

(c) *Time period for compliance*. Where structural changes in facilities are undertaken to comply with the obligations established under this section, such changes shall be made within three years of January 26, 1992, but in any event as expeditiously as possible.

(d) *Transition plan*.

(1) In the event that structural changes to facilities will be undertaken to achieve program accessibility, a public entity that employs 50 or more persons shall develop, within six months of January 26, 1992, a transition plan setting forth the steps necessary to complete such changes. A public entity shall provide an opportunity to interested persons, including individuals with disabilities or organizations representing individuals with disabilities, to participate in the development of the transition plan by submitting comments. A copy of the transition plan shall be made available for public inspection.

(2) If a public entity has responsibility or authority over streets, roads, or walkways, its transition plan shall include a schedule for providing curb ramps or other sloped areas where pedestrian walks cross curbs, giving priority to walkways serving entities covered by the Act, including State and local government offices and facilities, transportation, places of public accommodation, and employers, followed by walkways serving other areas.

(3) The plan shall, at a minimum—

(i) Identify physical obstacles in the public entity's facilities that limit the accessibility of its programs or activities to individuals with disabilities;

(ii) Describe in detail the methods that will be used to make the facilities accessible;

(iii) Specify the schedule for taking the steps necessary to achieve compliance with this section and, if the time period of the transition plan is longer than one year, identify steps that will be taken during each year of the transition period; and

(iv) Indicate the official responsible for implementation of the plan.

(4) If a public entity has already complied

with the transition plan requirement of a Federal agency regulation implementing section 504 of the Rehabilitation Act of 1973, then the requirements of this paragraph (d) shall apply only to those policies and practices that were not included in the previous transition plan.

§ 35.151 New construction and alterations

(a) *Design and construction*.

(1) Each facility or part of a facility constructed by, on behalf of, or for the use of a public entity shall be designed and constructed in such manner that the facility or part of the facility is readily accessible to and usable by individuals with disabilities, if the construction was commenced after January 26, 1992.

(2) *Exception for structural impracticability*.

(i) Full compliance with the requirements of this section is not required where a public entity can demonstrate that it is structurally impracticable to meet the requirements. Full compliance will be considered structurally impracticable only in those rare circumstances when the unique characteristics of terrain prevent the incorporation of accessibility features.

(ii) If full compliance with this section would be structurally impracticable, compliance with this section is required to the extent that it is not structurally impracticable. In that case, any portion of the facility that can be made accessible shall be made accessible to the extent that it is not structurally impracticable.

(iii) If providing accessibility in conformance with this section to individuals with certain disabilities (*e.g.,* those who use wheelchairs) would be structurally impracticable, accessibility shall nonetheless be ensured to persons with other types of disabilities, (*e.g.,* those who use crutches or who have sight, hearing, or mental impairments) in accordance with this section.

(b) *Alterations*.

(1) Each facility or part of a facility altered by, on behalf of, or for the use of a public entity in a manner that affects or could affect the usability of the facility or part of the facility shall, to the maximum extent feasible, be altered in such manner that the altered portion of the facility is readily accessible to and usable by individuals with disabilities, if the alteration was commenced after January 26, 1992.

(2) The path of travel requirements of § 35.151(b)(4) shall apply only to alterations undertaken solely for purposes other than to meet the program accessibility requirements of § 35.150.

(3)

(i) Alterations to historic properties shall comply, to the maximum extent feasible, with the provisions applicable to historic properties in the design standards specified in § 35.151(c).

(ii) If it is not feasible to provide physical access to an historic property in a manner that will not threaten or destroy the historic significance of the building or facility, alternative methods of access shall be provided pursuant to the requirements of § 35.150.

(4) *Path of travel*. An alteration that affects or could affect the usability of or access to an area of a facility that contains a primary function shall be made so as to ensure that, to the maximum extent feasible, the path of travel to the altered area and the restrooms, telephones, and drinking fountains serving the altered area are readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs, unless the cost and scope of such alterations is disproportionate to the cost of the overall alteration.

(i) *Primary function*. A "primary function" is a major activity for which the facility is intended. Areas that contain a primary function include, but are not limited to, the dining area of a cafeteria, the meeting rooms

in a conference center, as well as offices and other work areas in which the activities of the public entity using the facility are carried out.

(A) Mechanical rooms, boiler rooms, supply storage rooms, employee lounges or locker rooms, janitorial closets, entrances, and corridors are not areas containing a primary function. Restrooms are not areas containing a primary function unless the provision of restrooms is a primary purpose of the area, *e.g.,* in highway rest stops.

(B) For the purposes of this section, alterations to windows, hardware, controls, electrical outlets, and signage shall not be deemed to be alterations that affect the usability of or access to an area containing a primary function.

(ii) A "path of travel" includes a continuous, unobstructed way of pedestrian passage by means of which the altered area may be approached, entered, and exited, and which connects the altered area with an exterior approach (including sidewalks, streets, and parking areas), an entrance to the facility, and other parts of the facility.

(A) An accessible path of travel may consist of walks and sidewalks, curb ramps and other interior or exterior pedestrian ramps; clear floor paths through lobbies, corridors, rooms, and other improved areas; parking access aisles; elevators and lifts; or a combination of these elements.

(B) For the purposes of this section, the term "path of travel" also includes the restrooms, telephones, and drinking fountains serving the altered area.

(C) *Safe harbor*. If a public entity has constructed or altered required elements of a path of travel in accordance with the specifications in either the 1991 Standards or the Uniform Federal Accessibility Standards before March 15, 2012, the public entity is not required to retrofit such elements to reflect incremental changes in the 2010 Standards solely because of an alteration to a primary function area served by that path of travel.

(iii) *Disproportionality*.

(A) Alterations made to provide an accessible path of travel to the altered area will be deemed disproportionate to the overall alteration when the cost exceeds 20 % of the cost of the alteration to the primary function area.

(B) Costs that may be counted as expenditures required to provide an accessible path of travel may include:

(1) Costs associated with providing an accessible entrance and an accessible route to the altered area, for example, the cost of widening doorways or installing ramps;

(2) Costs associated with making restrooms accessible, such as installing grab bars, enlarging toilet stalls, insulating pipes, or installing accessible faucet controls;

(3) Costs associated with providing accessible telephones, such as relocating the telephone to an accessible height, installing amplification devices, or installing a text telephone (TTY); and

(4) Costs associated with relocating an inaccessible drinking fountain.

(iv) *Duty to provide accessible features in the event of disproportionality*.

(A) When the cost of alterations necessary to make the path of travel to the altered area fully accessible is disproportionate to the cost of the overall alteration, the path of travel shall be made accessible to the extent that it can be made accessible without incurring disproportionate costs.

(B) In choosing which accessible elements to provide, priority should be given

to those elements that will provide the greatest access, in the following order—

(1) An accessible entrance;

(2) An accessible route to the altered area;

(3) At least one accessible restroom for each sex or a single unisex restroom;

(4) Accessible telephones;

(5) Accessible drinking fountains; and

(6) When possible, additional accessible elements such as parking, storage, and alarms.

(v) *Series of smaller alterations*.

(A) The obligation to provide an accessible path of travel may not be evaded by performing a series of small alterations to the area served by a single path of travel if those alterations could have been performed as a single undertaking.

(B)

(*1*) If an area containing a primary function has been altered without providing an accessible path of travel to that area, and subsequent alterations of that area, or a different area on the same path of travel, are undertaken within three years of the original alteration, the total cost of alterations to the primary function areas on that path of travel during the preceding three-year period shall be considered in determining whether the cost of making that path of travel accessible is disproportionate.

(*2*) Only alterations undertaken on or after March 15, 2011 shall be considered in determining if the cost of providing an accessible path of travel is disproportionate to the overall cost of the alterations.

(c) *Accessibility standards and compliance date*.

(1) If physical construction or alterations commence after July 26, 1992, but prior to September 15, 2010, then new construction and alterations subject to this section must comply with either the UFAS or the 1991 Standards except that the elevator exemption contained at section 4.1.3(5) and section 4.1.6(1)(k) of the 1991 Standards shall not apply. Departures from particular requirements of either standard

Appendix to § 35.151(c)

Compliance Dates for New Construction and Alterations	**Applicable Standards**
Before September 15, 2010	1991 Standards or UFAS
On or after September 15, 2010, and before March 15, 2012	1991 Standards, UFAS, or 2010 Standards
On or after March 15, 2012	2010 Standards

by the use of other methods shall be permitted when it is clearly evident that equivalent access to the facility or part of the facility is thereby provided.

(2) If physical construction or alterations commence on or after September 15, 2010, and before March 15, 2012, then new construction and alterations subject to this section may comply with one of the following: the 2010 Standards, UFAS, or the 1991 Standards except that the elevator exemption contained at section 4.1.3(5) and section 4.1.6(1)(k) of the 1991 Standards shall not apply. Departures from particular requirements of either standard by the use of other methods shall be permitted when it is clearly evident that equivalent access to the facility or part of the facility is thereby provided.

(3) If physical construction or alterations commence on or after March 15, 2012, then new construction and alterations subject to this section shall comply with the 2010 Standards.

(4) For the purposes of this section, ceremonial groundbreaking or razing of structures prior to site preparation do not commence physical construction or alterations.

(5) *Noncomplying new construction and alterations*.

(i) Newly constructed or altered facilities or elements covered by §§ 35.151(a) or (b) that were constructed or altered before March 15, 2012, and that do not comply with the 1991 Standards or with UFAS shall before March 15, 2012, be made accessible in accordance with either the 1991 Standards, UFAS, or the 2010 Standards.

(ii) Newly constructed or altered facilities or elements covered by §§ 35.151(a) or (b) that were constructed or altered before March 15, 2012 and that do not comply with the 1991 Standards or with UFAS shall, on or after March 15, 2012, be made accessible in accordance with the 2010 Standards.

(d) *Scope of coverage*. The 1991 Standards and the 2010 Standards apply to fixed or built-in elements of buildings, structures, site improvements, and pedestrian routes or vehicular ways located on a site. Unless specifically stated otherwise, the advisory notes, appendix notes, and figures contained in the 1991 Standards and the 2010 Standards explain or illustrate the requirements of the rule; they do not establish enforceable requirements.

(e) *Social service center establishments*. Group homes, halfway houses, shelters, or similar social service center establishments that provide either temporary sleeping accommodations or residential dwelling units that are subject to this section shall comply with the provisions of the 2010 Standards applicable to residential facilities, including, but not limited to, the provisions in sections 233 and 809.

(1) In sleeping rooms with more than 25 beds covered by this section, a minimum of 5% of the beds shall have clear floor space complying with section 806.2.3 of the 2010 Standards.

(2) Facilities with more than 50 beds covered by this section that provide common use bathing facilities, shall provide at least one roll-in shower with a seat that complies with the relevant provisions of section 608 of the 2010 Standards. Transfer-type showers are not permitted in lieu of a roll-in shower with a seat, and the exceptions in sections 608.3 and 608.4 for residential dwelling units are not permitted. When separate shower facilities are provided for men and for women, at least one roll-in shower shall be provided for each group.

(f) *Housing at a place of education*. Housing at a place of education that is subject to this section shall comply with the provisions of the 2010 Standards applicable to transient lodging, including, but not limited to, the requirements for transient lodging guest rooms in sections 224 and 806 subject to the following exceptions. For the purposes of the application of this section,

the term "sleeping room" is intended to be used interchangeably with the term "guest room" as it is used in the transient lodging standards.

(1) Kitchens within housing units containing accessible sleeping rooms with mobility features (including suites and clustered sleeping rooms) or on floors containing accessible sleeping rooms with mobility features shall provide turning spaces that comply with section 809.2.2 of the 2010 Standards and kitchen work surfaces that comply with section 804.3 of the 2010 Standards.

(2) Multi-bedroom housing units containing accessible sleeping rooms with mobility features shall have an accessible route throughout the unit in accordance with section 809.2 of the 2010 Standards.

(3) Apartments or townhouse facilities that are provided by or on behalf of a place of education, which are leased on a year-round basis exclusively to graduate students or faculty, and do not contain any public use or common use areas available for educational programming, are not subject to the transient lodging standards and shall comply with the requirements for residential facilities in sections 233 and 809 of the 2010 Standards.

(g) *Assembly areas*. Assembly areas subject to this section shall comply with the provisions of the 2010 Standards applicable to assembly areas, including, but not limited to, sections 221 and 802. In addition, assembly areas shall ensure that—

(1) In stadiums, arenas, and grandstands, wheelchair spaces and companion seats are dispersed to all levels that include seating served by an accessible route;

(2) Assembly areas that are required to horizontally disperse wheelchair spaces and companion seats by section 221.2.3.1 of the 2010 Standards and have seating encircling, in whole or in part, a field of play or performance area shall disperse wheelchair spaces and companion seats around that field of play or performance area;

(3) Wheelchair spaces and companion seats are not located on (or obstructed by) temporary platforms or other movable structures, except that when an entire seating section is placed on temporary platforms or other movable structures in an area where fixed seating is not provided, in order to increase seating for an event, wheelchair spaces and companion seats may be placed in that section. When wheelchair spaces and companion seats are not required to accommodate persons eligible for those spaces and seats, individual, removable seats may be placed in those spaces and seats;

(4) Stadium-style movie theaters shall locate wheelchair spaces and companion seats on a riser or cross-aisle in the stadium section that satisfies at least one of the following criteria—

(i) It is located within the rear 60% of the seats provided in an auditorium; or

(ii) It is located within the area of an auditorium in which the vertical viewing angles (as measured to the top of the screen) are from the 40th to the 100th percentile of vertical viewing angles for all seats as ranked from the seats in the first row (1st percentile) to seats in the back row (100th percentile).

(h) *Medical care facilities*. Medical care facilities that are subject to this section shall comply with the provisions of the 2010 Standards applicable to medical care facilities, including, but not limited to, sections 223 and 805. In addition, medical care facilities that do not specialize in the treatment of conditions that affect mobility shall disperse the accessible patient bedrooms required by section 223.2.1 of the 2010 Standards in a manner that is proportionate by type of medical specialty.

(i) *Curb ramps*.

(1) Newly constructed or altered streets, roads, and highways must contain curb ramps or other sloped areas at any intersection having curbs or other barriers to entry from a street level pedestrian walkway.

(2) Newly constructed or altered street level pedestrian walkways must contain curb ramps or other sloped areas at intersections to streets, roads, or highways.

(j) *Facilities with residential dwelling units for sale to individual owners*.

(1) Residential dwelling units designed and constructed or altered by public entities that will be offered for sale to individuals shall comply with the requirements for residential facilities in the 2010 Standards including sections 233 and 809.

(2) The requirements of paragraph (1) also apply to housing programs that are operated by public entities where design and construction of particular residential dwelling units take place only after a specific buyer has been identified. In such programs, the covered entity must provide the units that comply with the requirements for accessible features to those pre-identified buyers with disabilities who have requested such a unit.

(k) *Detention and correctional facilities*.

(1) New construction of jails, prisons, and other detention and correctional facilities shall comply with the 2010 Standards except that public entities shall provide accessible mobility features complying with section 807.2 of the 2010 Standards for a minimum of 3%, but no fewer than one, of the total number of cells in a facility. Cells with mobility features shall be provided in each classification level.

(2) *Alterations to detention and correctional facilities*. Alterations to jails, prisons, and other detention and correctional facilities shall comply with the 2010 Standards except that public entities shall provide accessible mobility features complying with section 807.2 of the 2010 Standards for a minimum of 3%, but no fewer than one, of the total number of cells being altered until at least 3%, but no fewer than one, of the total number of cells in a facility shall provide mobility features complying with section 807.2. Altered cells with mobility features shall be provided in each classification level. However, when alterations are made to specific cells, detention and correctional facility operators may satisfy their obligation to provide the required number of cells with mobility features by providing the required mobility features in substitute cells (cells other than those where alterations are originally planned), provided that each substitute cell—

(i) Is located within the same prison site;

(ii) Is integrated with other cells to the maximum extent feasible;

(iii) Has, at a minimum, equal physical access as the altered cells to areas used by inmates or detainees for visitation, dining, recreation, educational programs, medical services, work programs, religious services, and participation in other programs that the facility offers to inmates or detainees; and,

(iv) If it is technically infeasible to locate a substitute cell within the same prison site, a substitute cell must be provided at another prison site within the corrections system.

(3) With respect to medical and long-term care facilities in jails, prisons, and other detention and correctional facilities, public entities shall apply the 2010 Standards technical and scoping requirements for those facilities irrespective of whether those facilities are licensed.

§ 35.152 Jails, detention and correctional facilities, and community correctional facilities.

(a) *General*. This section applies to public entities that are responsible for the operation or management of adult and juvenile justice jails, detention and correctional facilities, and community correctional facilities, either directly or through contractual, licensing, or other arrangements with public or private entities, in whole or in part, including private correctional facilities.

(b) *Discrimination prohibited*.

(1) Public entities shall ensure that qualified inmates or detainees with disabilities shall not, because a facility is inaccessible to or unusable by individuals with disabilities, be excluded from participation in, or be denied the benefits of, the services, programs, or activities of a public entity, or be subjected to discrimination by any public entity.

(2) Public entities shall ensure that inmates or detainees with disabilities are housed in the most integrated setting appropriate to the needs of the individuals. Unless it is appropriate to make an exception, a public entity–

(i) Shall not place inmates or detainees with disabilities in inappropriate security classifications because no accessible cells or beds are available;

(ii) Shall not place inmates or detainees with disabilities in designated medical areas unless they are actually receiving medical care or treatment;

(iii) Shall not place inmates or detainees with disabilities in facilities that do not offer the same programs as the facilities where they would otherwise be housed; and

(iv) Shall not deprive inmates or detainees with disabilities of visitation with family members by placing them in distant facilities where they would not otherwise be housed.

(3) Public entities shall implement reasonable policies, including physical modifications to additional cells in accordance with the 2010 Standards, so as to ensure that each inmate with a disability is housed in a cell with the accessible elements necessary to afford the inmate access to safe, appropriate housing.

§§ 35.153—35.159 [Reserved]

Subpart E—Communications

§ 35.160 General.

(a)

(1) A public entity shall take appropriate steps to ensure that communications with applicants, participants, members of the public, and companions with disabilities are as effective as communications with others.

(2) For purposes of this section, "companion" means a family member, friend, or associate of an individual seeking access to a service, program, or activity of a public entity, who, along with such individual, is an appropriate person with whom the public entity should communicate.

(b)

(1) A public entity shall furnish appropriate auxiliary aids and services where necessary to afford qualified individuals with disabilities, including applicants, participants, companions, and members of the public, an equal opportunity to participate in, and enjoy the benefits of, a service, program, or activity of a public entity.

(2) The type of auxiliary aid or service necessary to ensure effective communication will vary in accordance with the method of communication used by the individual; the nature, length, and complexity of the communication involved; and the context in which the communication is taking place. In determining what types of auxiliary aids and services are necessary, a public entity shall give primary consideration to the requests of individuals with disabilities. In order to be effective, auxiliary aids and services must be provided in accessible formats, in a timely manner, and in such a way as to protect the privacy and independence of the individual with a disability.

(c)

(1) A public entity shall not require an individual with a disability to bring another individual to interpret for him or her.

(2) A public entity shall not rely on an adult accompanying an individual with a disability to interpret or facilitate communication except—

(i) In an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available; or

(ii) Where the individual with a disability specifically requests that the accompanying adult interpret or facilitate communication, the accompanying adult agrees to provide such assistance, and reliance on that adult for such assistance is appropriate under the circumstances.

(3) A public entity shall not rely on a minor child to interpret or facilitate communication, except in an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available.

(d) *Video remote interpreting (VRI) services.* A public entity that chooses to provide qualified interpreters via VRI services shall ensure that it provides—

(1) Real-time, full-motion video and audio over a dedicated high-speed, wide-bandwidth video connection or wireless connection that delivers high-quality video images that do not produce lags, choppy, blurry, or grainy images, or irregular pauses in communication;

(2) A sharply delineated image that is large enough to display the interpreter's face, arms, hands, and fingers, and the participating individual's face, arms, hands, and fingers, regardless of his or her body position;

(3) A clear, audible transmission of voices; and

(4) Adequate training to users of the technology and other involved individuals so that they may quickly and efficiently set up and operate the VRI.

§ 35.161 Telecommunications.

(a) Where a public entity communicates by telephone with applicants and beneficiaries, text telephones (TTYs) or equally effective telecommunications systems shall be used to communicate with individuals who are deaf or hard of hearing or have speech impairments.

(b) When a public entity uses an automated-attendant system, including, but not limited to, voice mail and messaging, or an interactive voice response system, for receiving and directing incoming telephone calls, that system must provide effective real-time communication with individuals using auxiliary aids and services, including TTYs and all forms of FCC-approved telecommunications relay system, including Internet-based relay systems.

(c) A public entity shall respond to telephone calls from a telecommunications relay service established under title IV of the ADA in the same manner that it responds to other telephone calls.

§ 35.162 Telephone emergency services.

Telephone emergency services, including 911 services, shall provide direct access to individuals who use TDD's and computer modems.

§ 35.163 Information and signage.

(a) A public entity shall ensure that interested persons, including persons with impaired vision or hearing, can obtain information as to the existence and location of accessible services, activities, and facilities.

(b) A public entity shall provide signage at all inaccessible entrances to each of its facilities, directing users to an accessible entrance or to a location at which they can obtain information about accessible facilities. The international symbol for accessibility shall be used at each accessible entrance of a facility.

§ 35.164 Duties.

This subpart does not require a public entity to take any action that it can demonstrate would result in a fundamental alteration in the nature of a service, program, or activity or in undue

financial and administrative burdens. In those circumstances where personnel of the public entity believe that the proposed action would fundamentally alter the service, program, or activity or would result in undue financial and administrative burdens, a public entity has the burden of proving that compliance with this subpart would result in such alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of the public entity or his or her designee after considering all resources available for use in the funding and operation of the service, program, or activity and must be accompanied by a written statement of the reasons for reaching that conclusion. If an action required to comply with this subpart would result in such an alteration or such burdens, a public entity shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that, to the maximum extent possible, individuals with disabilities receive the benefits or services provided by the public entity.

§§ 35.165—35.169 [Reserved]

Subpart F—Compliance Procedures

§ 35.170 Complaints.

(a) *Who may file*. An individual who believes that he or she or a specific class of individuals has been subjected to discrimination on the basis of disability by a public entity may, by himself or herself or by an authorized representative, file a complaint under this part.

(b) *Time for filing*. A complaint must be filed not later than 180 days from the date of the alleged discrimination, unless the time for filing is extended by the designated agency for good cause shown. A complaint is deemed to be filed under this section on the date it is first filed with any Federal agency.

(c) *Where to file*. An individual may file a complaint with any agency that he or she believes to be the appropriate agency designated under subpart G of this part, or with any agency that provides funding to the public entity that is the subject of the complaint, or with the Department of Justice for referral as provided in §35.171(a)(2).

§ 35.171 Acceptance of complaints.

(a) *Receipt of complaints*.

(1)

(i) Any Federal agency that receives a complaint of discrimination on the basis of disability by a public entity shall promptly review the complaint to determine whether it has jurisdiction over the complaint under section 504.

(ii) If the agency does not have section 504 jurisdiction, it shall promptly determine whether it is the designated agency under subpart G of this part responsible for complaints filed against that public entity.

(2)

(i) If an agency other than the Department of Justice determines that it does not have section 504 jurisdiction and is not the designated agency, it shall promptly refer the complaint to the appropriate designated agency, the agency that has section 504 jurisdiction, or the Department of Justice, and so notify the complainant.

(ii) When the Department of Justice receives a complaint for which it does not have jurisdiction under section 504 and is not the designated agency, it may exercise jurisdiction pursuant to § 35.190(e) or refer the complaint to an agency that does have jurisdiction under section 504 or to the appropriate agency designated in subpart G of this part or, in the case of an employment complaint that is also subject to title I of the Act, to the Equal Employment Opportunity Commission.

(3)

(i) If the agency that receives a complaint has section 504 jurisdiction, it shall process the complaint according to its procedures for enforcing section 504.

(ii) If the agency that receives a complaint does not have section 504 jurisdiction, but is the designated agency, it shall process the complaint according to the procedures established by this subpart.

(b) *Employment complaints*.

(1) If a complaint alleges employment discrimination subject to title I of the Act, and the agency has section 504 jurisdiction, the agency shall follow the procedures issued by the Department of Justice and the Equal Employment Opportunity Commission under section 107(b) of the Act.

(2) If a complaint alleges employment discrimination subject to title I of the Act, and the designated agency does not have section 504 jurisdiction, the agency shall refer the complaint to the Equal Employment Opportunity Commission for processing under title I of the Act.

(3) Complaints alleging employment discrimination subject to this part, but not to title I of the Act shall be processed in accordance with the procedures established by this subpart.

(c) *Complete complaints*.

(1) A designated agency shall accept all complete complaints under this section and shall promptly notify the complainant and the public entity of the receipt and acceptance of the complaint.

(2) If the designated agency receives a complaint that is not complete, it shall notify the complainant and specify the additional information that is needed to make the complaint a complete complaint. If the complainant fails to complete the complaint, the designated agency shall close the complaint without prejudice.

§ 35.172 Investigations and compliance reviews.

(a) The designated agency shall investigate complaints for which it is responsible under § 35.171.

(b) The designated agency may conduct compliance reviews of public entities in order to ascertain whether there has been a failure to comply with the nondiscrimination requirements of this part.

(c) Where appropriate, the designated agency shall attempt informal resolution of any matter being investigated under this section, and, if resolution is not achieved and a violation is found, issue to the public entity and the complainant, if any, a Letter of Findings that shall include—

(1) Findings of fact and conclusions of law;

(2) A description of a remedy for each violation found (including compensatory damages where appropriate); and

(3) Notice of the rights and procedures available under paragraph (d) of this section and §§ 35.173 and 35.174.

(d) At any time, the complainant may file a private suit pursuant to section 203 of the Act, 42 U.S.C. 12133, whether or not the designated agency finds a violation.

§ 35.173 Voluntary compliance agreements.

(a) When the designated agency issues a noncompliance Letter of Findings, the designated agency shall—

(1) Notify the Assistant Attorney General by forwarding a copy of the Letter of Findings to the Assistant Attorney General; and

(2) Initiate negotiations with the public entity to secure compliance by voluntary means.

(b) Where the designated agency is able to secure voluntary compliance, the voluntary compliance agreement shall—

(1) Be in writing and signed by the parties;

(2) Address each cited violation;

(3) Specify the corrective or remedial action to be taken, within a stated period of time, to come into compliance;

(4) Provide assurance that discrimination will not recur; and

(5) Provide for enforcement by the Attorney General.

§ 35.174 Referral.

If the public entity declines to enter into voluntary compliance negotiations or if negotiations are unsuccessful, the designated agency shall refer the matter to the Attorney General with a recommendation for appropriate action.

§ 35.175 Attorney's fees.

In any action or administrative proceeding commenced pursuant to the Act or this part, the court or agency, in its discretion, may allow the prevailing party, other than the United States, a reasonable attorney's fee, including litigation expenses, and costs, and the United States shall be liable for the foregoing the same as a private individual.

§ 35.176 Alternative means of dispute resolution.

Where appropriate and to the extent authorized by law, the use of alternative means of dispute resolution, including settlement negotiations, conciliation, facilitation, mediation, factfinding, minitrials, and arbitration, is encouraged to resolve disputes arising under the Act and this part.

§ 35.177 Effect of unavailability of technical assistance.

A public entity shall not be excused from compliance with the requirements of this part because of any failure to receive technical assistance, including any failure in the development or dissemination of any technical assistance manual authorized by the Act.

§ 35.178 State immunity.

A State shall not be immune under the eleventh amendment to the Constitution of the United States from an action in Federal or State court of competent jurisdiction for a violation of this Act. In any action against a State for a violation of the requirements of this Act, remedies (including remedies both at law and in equity) are available for such a violation to the same extent as such remedies are available for such a violation in an action against any public or private entity other than a State.

§§ 35.179—35.189 [Reserved]

Subpart G—Designated Agencies

§ 35.190 Designated Agencies.

(a) The Assistant Attorney General shall coordinate the compliance activities of Federal agencies with respect to State and local government components, and shall provide policy guidance and interpretations to designated agencies to ensure the consistent and effective implementation of the requirements of this part.
(b) The Federal agencies listed in paragraph (b)(1)-(8) of this section shall have responsibility for the implementation of subpart F of this part for components of State and local governments that exercise responsibilities, regulate, or administer services, programs, or activities in the following functional areas.

(1) *Department of Agriculture*: All programs, services, and regulatory activities relating to farming and the raising of livestock, including extension services.

(2) *Department of Education:* All programs, services, and regulatory activities relating to the operation of elementary and secondary education systems and institutions, institutions of higher education and vocational education (other than schools of medicine, dentistry,

nursing, and other health-related schools), and libraries.

(3) *Department of Health and Human Services*: All programs, services, and regulatory activities relating to the provision of health care and social services, including schools of medicine, dentistry, nursing, and other health-related schools, the operation of health care and social service providers and institutions, including "grass-roots" and community services organizations and programs, and preschool and daycare programs.

(4) *Department of Housing and Urban Development:* All programs, services, and regulatory activities relating to state and local public housing, and housing assistance and referral.

(5) *Department of Interior:* All programs, services, and regulatory activities relating to lands and natural resources, including parks and recreation, water and waste management, environmental protection, energy, historic and cultural preservation, and museums.

(6) *Department of Justice:* All programs, services, and regulatory activities relating to law enforcement, public safety, and the administration of justice, including courts and correctional institutions; commerce and industry, including general economic development, banking and finance, consumer protection, insurance, and small business; planning, development, and regulation (unless assigned to other designated agencies); state and local government support services (*e.g.,* audit, personnel, comptroller, administrative services); all other government functions not assigned to other designated agencies.

(7) *Department of Labor:* All programs, services, and regulatory activities relating to labor and the work force.

(8) *Department of Transportation:* All programs, services, and regulatory activities relating to transportation, including highways, public transportation, traffic management (non-law enforcement), automobile licensing and inspection, and driver licensing.

(c) Responsibility for the implementation of subpart F of this part for components of State or local governments that exercise responsibilities, regulate, or administer services, programs, or activities relating to functions not assigned to specific designated agencies by paragraph (b) of this section may be assigned to other specific agencies by the Department of Justice.

(d) If two or more agencies have apparent responsibility over a complaint, the Assistant Attorney General shall determine which one of the agencies shall be the designated agency for purposes of that complaint.

(e) When the Department receives a complaint directed to the Attorney General alleging a violation of this part that may fall within the jurisdiction of a designated agency or another Federal agency that may have jurisdiction under section 504, the Department may exercise its discretion to retain the complaint for investigation under this part.

§§ 35.191—35.999 [Reserved]

Title II Regulations

2010 Guidance and Section-by-Section Analysis

Department of Justice

Appendix A to Part 35—Guidance to Revisions to ADA Regulation on Nondiscrimination on the Basis of Disability in State and Local Government Services

Note: This Appendix contains guidance providing a section-by-section analysis of the revisions to 28 CFR part 35 published on September 15, 2010.

Section-By-Section Analysis and Response to Public Comments

This section provides a detailed description of the Department's changes to the title II regulation, the reasoning behind those changes, and responses to public comments received on these topics. The Section-by-Section Analysis follows the order of the title II regulation itself, except that, if the Department has not changed a regulatory section, the unchanged section has not been mentioned.

Subpart A—General

Section 35.104 Definitions.

''1991 Standards'' and ''2004 ADAAG''
The Department has included in the final rule new definitions of both the ''1991 Standards'' and the ''2004 ADAAG.'' The term ''1991 Standards'' refers to the ADA Standards for Accessible Design, originally published on July 26, 1991, and republished as Appendix D to part 36. The term ''2004 ADAAG'' refers to ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the Americans with Disabilities Act and Architectural Barriers Act Accessibility Guidelines, which were issued by the Access Board on July 23, 2004, 36 CFR 1191, app. B and D (2009), and which the Department has adopted in this final rule. These terms are included in the definitions section for ease of reference.

''2010 Standards''
The Department has added to the final rule a definition of the term ''2010 Standards.'' The term ''2010 Standards'' refers to the 2010 ADA Standards for Accessible Design, which consist of the 2004 ADAAG and the requirements contained in § 35.151.

''Auxiliary Aids and Services''
In the NPRM, the Department proposed revisions to the definition of auxiliary aids and services under § 35.104 to include several additional types of auxiliary aids that have become more readily available since the promulgation of the 1991 title II regulation, and in recognition of new technology and devices available in some places that may provide effective communication in some situations.

The NPRM proposed adding an explicit reference to written notes in the definition of ''auxiliary aids.'' Although this policy was already enunciated in the Department's 1993 Title II Technical Assistance Manual at II– 7.1000, the Department proposed inclusion in the regulation itself because some Title II entities do not understand that exchange of written notes using paper and pencil is an available option in some circumstances. *See* Department of Justice, *The Americans with Disabilities Act, Title II Technical Assistance Manual Covering State and Local Government Programs and Services* (1993), available at *http://www.ada.gov/ taman2.html.* Comments from several disability advocacy organizations and individuals discouraged the Department from including the exchange of written notes in the list of available auxiliary aids in § 35.104. Advocates and persons with disabilities requested explicit limits on the use of written notes as a form of auxiliary aid because, they argue, most exchanges are not simple and are not communicated effectively using handwritten notes. One major advocacy organization, for example, noted that the speed at which individuals communicate orally or use sign language averages about 200 words per minute or more while exchange of notes often leads to truncated or incomplete communication. For

persons whose primary language is American Sign Language (ASL), some commenters pointed out, using written English in exchange of notes often is ineffective because ASL syntax and vocabulary is dissimilar from English. By contrast, some commenters from professional medical associations sought more specific guidance on when notes are allowed, especially in the context of medical offices and health care situations.

Exchange of notes likely will be effective in situations that do not involve substantial conversation, for example, blood work for routine lab tests or regular allergy shots. Video Interpreting Services (hereinafter referred to as ''video remote interpreting services'' or VRI) or an interpreter should be used when the matter involves greater complexity, such as in situations requiring communication of medical history or diagnoses, in conversations about medical procedures and treatment decisions, or when giving instructions for care at home or elsewhere. In the Section-By-Section Analysis of § 35.160 (Communications) below, the Department discusses in greater detail the kinds of situations in which interpreters or captioning would be necessary. Additional guidance on this issue can be found in a number of agreements entered into with health-care providers and hospitals that are available on the Department's Web site at *http://www.ada.gov*.

In the NPRM, in paragraph (1) of the definition in § 35.104, the Department proposed replacing the term ''telecommunications devices for deaf persons (TDD)'' with the term ''text telephones (TTYs).'' TTY has become the commonly accepted term and is consistent with the terminology used by the Access Board in the 2004 ADAAG. Commenters representing advocates and persons with disabilities expressed approval of the substitution of TTY for TDD in the proposed regulation.

Commenters also expressed the view that the Department should expand paragraph (1) of the definition of auxiliary aids to include ''TTY's and other voice, text, and video-based telecommunications products and systems such as videophones and captioned telephones.'' The Department has considered these comments and has revised the definition of ''auxiliary aids'' to include references to voice, text, and video-based telecommunications products and systems, as well as accessible electronic and information technology.

In the NPRM, the Department also proposed including a reference in paragraph (1) to a new technology, Video Interpreting Services (VIS). The reference remains in the final rule. VIS is discussed in the Section-By- Section Analysis below in reference to § 35.160 (Communications), but is referred to as VRI in both the final rule and Appendix A to more accurately reflect the terminology used in other regulations and among users of the technology.

In the NPRM, the Department noted that technological advances in the 18 years since the ADA's enactment had increased the range of auxiliary aids and services for those who are blind or have low vision. As a result the Department proposed additional examples to paragraph (2) of the definition, including Brailled materials and displays, screen reader software, optical readers, secondary auditory programs (SAP), and accessible electronic and information technology. Some commenters asked for more detailed requirements for auxiliary aids for persons with vision disabilities. The Department has decided it will not make additional changes to that provision at this time.

Several comments suggested expanding the auxiliary aids provision for persons who are both deaf and blind, and in particular, to include in the list of auxiliary aids a new category, ''support service providers (SSP),'' which was described in comments as a navigator and communication facilitator. The Department believes that services provided by communication facilitators are already encompassed in the requirement to provide qualified interpreters. Moreover, the

Department is concerned that as described by the commenters, the category of support service providers would include some services that would be considered personal services and that do not qualify as auxiliary aids. Accordingly, the Department declines to add this new category to the list at this time.

Some commenters representing advocacy organizations and individuals asked the Department to explicitly require title II entities to make any or all of the devices or technology available in all situations upon the request of the person with a disability. The Department recognizes that such devices or technology may provide effective communication and in some circumstances may be effective for some persons, but the Department does not intend to require that every entity covered by title II provide every device or all new technology at all times as long as the communication that is provided is as effective as communication with others. The Department recognized in the preamble to the 1991 title II regulation that the list of auxiliary aids was ''not an all-inclusive or exhaustive catalogue of possible or available auxiliary aids or services. It is not possible to provide an exhaustive list, and an attempt to do so would omit the new devices that will become available with emerging technology.'' 28 CFR part 35, app. A at 560 (2009). The Department continues to endorse that view; thus, the inclusion of a list of examples of possible auxiliary aids in the definition of ''auxiliary aids'' should not be read as a mandate for a title II entity to offer every possible auxiliary aid listed in the definition in every situation.

''Direct Threat''

In Appendix A of the Department's 1991 title II regulation, the Department included a detailed discussion of ''direct threat'' that, among other things, explained that principles established in § 36.208 of the Department's [title III] regulation'' were ''applicable'' as well to title II, insofar as ''questions of safety are involved.'' 28 CFR part 35, app. A at 565 (2009). In the final rule, the Department has included an explicit definition of ''direct threat'' that is parallel to the definition in the title III rule and placed it in the definitions section at § 35.104.

''Existing Facility''

The 1991 title II regulation provided definitions for ''new construction'' at § 35.151(a) and ''alterations'' at § 35.151(b). In contrast, the term ''existing facility'' was not explicitly defined, although it is used in the statute and regulations for title II. *See* 42 U.S.C. 12134(b); 28 CFR 35.150. It has been the Department's view that newly constructed or altered facilities are also existing facilities with continuing program access obligations, and that view is made explicit in this rule.

The classification of facilities under the ADA is neither static nor mutually exclusive. Newly constructed or altered facilities are also existing facilities. A newly constructed facility remains subject to the accessibility standards in effect at the time of design and construction, with respect to those elements for which, at that time, there were applicable ADA Standards. And at some point, the facility may undergo alterations, which are subject to the alterations requirements in effect at the time. *See* § 35.151(b)–(c). The fact that the facility is also an existing facility does not relieve the public entity of its obligations under the new construction and alterations requirements in this part.

For example, a facility constructed or altered after the effective date of the original title II regulations but prior to the effective date of the revised title II regulation and Standards, must have been built or altered in compliance with the Standards (or UFAS) in effect at that time, in order to be in compliance with the ADA. In addition, a ''newly constructed'' facility or ''altered'' facility is also an ''existing facility'' for purposes of application of the title II program accessibility requirements. Once the 2010 Standards take effect, they will become the new

reference point for determining the program accessibility obligations of all existing facilities. This is because the ADA contemplates that as our knowledge and understanding of accessibility advances and evolves, this knowledge will be incorporated into and result in increased accessibility in the built environment. Under title II, this goal is accomplished through the statute's program access framework. While newly constructed or altered facilities must meet the accessibility standards in effect at the time, the fact that these facilities are also existing facilities ensures that the determination of whether a program is accessible is not frozen at the time of construction or alteration. Program access may require consideration of potential barriers to access that were not recognized as such at the time of construction or alteration, including, but not limited to, the elements that are first covered in the 2010 Standards, as that term is defined in § 35.104. Adoption of the 2010 Standards establishes a new reference point for title II entities that choose to make structural changes to existing facilities to meet their program access requirements.

The NPRM included the following proposed definition of ''existing facility.'' ''A facility that has been constructed and remains in existence on any given date.'' 73 FR 34466, 34504 (June 17, 2008). The Department received a number of comments on this issue. The commenters urged the Department to clarify that all buildings remain subject to the standards in effect at the time of their construction, that is, that a facility designed and constructed for first occupancy between January 26, 1992, and the effective date of the final rule is still considered ''new construction'' and that alterations occurring between January 26, 1992, and the effective date of the final rule are still considered ''alterations.''

The final rule includes clarifying language to ensure that the Department's interpretation is accurately reflected. As established by this rule, existing facility means a facility in existence on any given date, without regard to whether the facility may also be considered newly constructed or altered under this part. Thus, this definition reflects the Department's interpretation that public entities have program access requirements that are independent of, but may coexist with, requirements imposed by new construction or alteration requirements in those same facilities.

''Housing at a Place of Education''

The Department has added a new definition to § 35.104, ''housing at a place of education,'' to clarify the types of educational housing programs that are covered by this title. This section defines ''housing at a place of education'' as ''housing operated by or on behalf of an elementary, secondary, undergraduate, or postgraduate school, or other place of education, including dormitories, suites, apartments, or other places of residence.'' This definition does not apply to social service programs that combine residential housing with social services, such as a residential job training program.

''Other Power-Driven Mobility Device'' and ''Wheelchair''

Because relatively few individuals with disabilities were using nontraditional mobility devices in 1991, there was no pressing need for the 1991 title II regulation to define the terms ''wheelchair'' or ''other power-driven mobility device,'' to expound on what would constitute a reasonable modification in policies, practices, or procedures under § 35.130(b)(7), or to set forth within that section specific requirements for the accommodation of mobility devices. Since the issuance of the 1991 title II regulation, however, the choices of mobility devices available to individuals with disabilities have increased dramatically. The Department has received complaints about and has become aware of situations where individuals with mobility disabilities have utilized devices that are not designed primarily for use by an individual with

a mobility disability, including the Segway ® Personal Transporter (Segway ® PT), golf cars, all-terrain vehicles (ATVs), and other locomotion devices.

The Department also has received questions from public entities and individuals with mobility disabilities concerning which mobility devices must be accommodated and under what circumstances. Indeed, there has been litigation concerning the legal obligations of covered entities to accommodate individuals with mobility disabilities who wish to use an electronic personal assistance mobility device (EPAMD), such as the Segway ® PT, as a mobility device. The Department has participated in such litigation as *amicus curiae*. *See Ault v. Walt Disney World Co.*, No. 6:07–cv–1785–Orl–31KRS, 2009 WL 3242028 (M.D. Fla. Oct. 6, 2009). Much of the litigation has involved shopping malls where businesses have refused to allow persons with disabilities to use EPAMDs. *See*, *e.g.*, *McElroy v. Simon Property Group*, No. 08– 404 RDR, 2008 WL 4277716 (D. Kan. Sept. 15, 2008) (enjoining mall from prohibiting the use of a Segway ® PT as a mobility device where an individual agrees to all of a mall's policies for use of the device, except indemnification); Shasta Clark, *Local Man Fighting Mall Over Right to Use Segway*, WATE 6 News, July 26, 2005, available at *http://www.wate.com/Global/ story.asp?s=3643674* (last visited June 24, 2010).

In response to questions and complaints from individuals with disabilities and covered entities concerning which mobility devices must be accommodated and under what circumstances, the Department began developing a framework to address the use of unique mobility devices, concerns about their safety, and the parameters for the circumstances under which these devices must be accommodated. As a result, the Department's NPRM proposed two new approaches to mobility devices. First, the Department proposed a two-tiered mobility device definition that defined the term ''wheelchair'' separately from ''other power-driven mobility device.'' Second, the Department proposed requirements to allow the use of devices in each definitional category. In § 35.137(a), the NPRM proposed that wheelchairs and manually-powered mobility aids used by individuals with mobility disabilities shall be permitted in any areas open to pedestrian use. Section 35.137(b) of the NPRM provided that a public entity ''shall make reasonable modifications in its policies, practices, and procedures to permit the use of other power-driven mobility devices by individuals with disabilities, unless the public entity can demonstrate that the use of the device is not reasonable or that its use will result in a fundamental alteration of the public entity's service, program, or activity.''
73 FR 34466, 34504 (June 17, 2008).

The Department sought public comment with regard to whether these steps would, in fact, achieve clarity on these issues. Toward this end, the Department's NPRM asked several questions relating to the definitions of ''wheelchair,'' ''other power-driven mobility device,'' and ''manually-powered mobility aids''; the best way to categorize different classes of mobility devices; the types of devices that should be included in each category; and the circumstances under which certain mobility devices must be accommodated or may be excluded pursuant to the policy adopted by the public entity.

Because the questions in the NPRM that concerned mobility devices and their accommodation were interrelated, many of the commenters' responses did not identify the specific question to which they were responding. Instead, the commenters grouped the questions together and provided comments accordingly. Most commenters spoke to the issues addressed in the Department's questions in broad terms and general concepts. As a result, the responses to the questions posed are discussed below in broadly grouped issue categories rather than on a question-by-question basis.

Two-tiered definitional approach. Commenters supported the Department's proposal to use a two-tiered definition of mobility device. Commenters nearly universally said that wheelchairs always should be accommodated and that they should never be subject to an assessment with regard to their admission to a particular public facility. In contrast, the vast majority of commenters indicated they were in favor of allowing public entities to conduct an assessment as to whether, and under which circumstances, other power-driven mobility devices would be allowed on-site.

Many commenters indicated their support for the two-tiered approach in responding to questions concerning the definition of ''wheelchair'' and ''other-powered mobility device.'' Nearly every disability advocacy group said that the Department's two-tiered approach strikes the proper balance between ensuring access for individuals with disabilities and addressing fundamental alteration and safety concerns held by public entities; however, a minority of disability advocacy groups wanted other power-driven mobility devices to be included in the definition of ''wheelchair.'' Most advocacy, nonprofit, and individual commenters supported the concept of a separate definition for ''other power-driven mobility device'' because it maintains existing legal protections for wheelchairs while recognizing that some devices that are not designed primarily for individuals with mobility disabilities have beneficial uses for individuals with mobility disabilities. They also favored this concept because it recognizes technological developments and that the innovative uses of varying devices may provide increased access to individuals with mobility disabilities.

Many environmental, transit system, and government commenters indicated they opposed in its entirety the concept of ''other power-driven mobility devices'' as a separate category. They believe that the creation of a second category of mobility devices will mean that other power-driven mobility devices, specifically ATVs and off-highway vehicles, must be allowed to go anywhere on national park lands, trails, recreational areas, etc.; will conflict with other Federal land management laws and regulations; will harm the environment and natural and cultural resources; will pose safety risks to users of these devices, as well as to pedestrians not expecting to encounter motorized devices in these settings; will interfere with the recreational enjoyment of these areas; and will require too much administrative work to regulate which devices are allowed and under which circumstances. These commenters all advocated a single category of mobility devices that excludes all fuel-powered devices.

Whether or not they were opposed to the two-tier approach in its entirety, virtually every environmental commenter and most government commenters associated with providing public transportation services or protecting land, natural resources, fish and game, etc., said that the definition of ''other power-driven mobility device'' is too broad. They suggested that they might be able to support the dual category approach if the definition of ''other power-driven mobility device'' were narrowed. They expressed general and program-specific concerns about permitting the use of other power-driven mobility devices. They noted the same concerns as those who opposed the two-tiered concept—that these devices create a host of environmental, safety, cost, administrative and conflict of law issues. Virtually all of these commenters indicated that their support for the dual approach and the concept of other power-driven mobility devices is, in large measure, due to the other power-driven mobility device assessment factors in § 35.137(c) of the NPRM.

By maintaining the two-tiered approach to mobility devices and defining ''wheelchair'' separately from ''other power-driven mobility device,'' the Department is able to preserve the protection users of traditional wheelchairs and other manually powered mobility aids have had since the ADA was enacted, while also

recognizing that human ingenuity, personal choice, and new technologies have led to the use of devices that may be more beneficial for individuals with certain mobility disabilities.

Moreover, the Department believes the two-tiered approach gives public entities guidance to follow in assessing whether reasonable modifications can be made to permit the use of other power-driven mobility devices on-site and to aid in the development of policies describing the circumstances under which persons with disabilities may use such devices. The two-tiered approach neither mandates that all other power-driven mobility devices be accommodated in every circumstance, nor excludes these devices. This approach, in conjunction with the factor assessment provisions in § 35.137(b)(2), will serve as a mechanism by which public entities can evaluate their ability to accommodate other power-driven mobility devices. As will be discussed in more detail below, the assessment factors in § 35.137(b)(2) are designed to provide guidance to public entities regarding whether it is appropriate to bar the use of a specific ''other power-driven mobility device in a specific facility. In making such a determination, a public entity must consider the device's type, size, weight, dimensions, and speed; the facility's volume of pedestrian traffic; the facility's design and operational characteristics; whether the device conflicts with legitimate safety requirements; and whether the device poses a substantial risk of serious harm to the immediate environment or natural or cultural resources, or conflicts with Federal land management laws or regulations. In addition, if under § 35.130(b)(7), the public entity claims that it cannot make reasonable modifications to its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with disabilities, the burden of proof to demonstrate that such devices cannot be operated in accordance with legitimate safety requirements rests upon the public entity.

Categorization of wheelchair versus other power-driven mobility devices. Implicit in the creation of the two-tiered mobility device concept is the question of how to categorize which devices are wheelchairs and which are other power-driven mobility devices. Finding weight and size to be too restrictive, the vast majority of advocacy, nonprofit, and individual commenters opposed using the Department of Transportation's definition of ''common wheelchair'' to designate the mobility device's appropriate category. Commenters who generally supported using weight and size as the method of categorization did so because of their concerns about potentially detrimental impacts on the environment and cultural and natural resources; on the enjoyment of the facility by other recreational users, as well as their safety; on the administrative components of government agencies required to assess which devices are appropriate on narrow, steeply sloped, or foot-and-hoof only trails; and about the impracticality of accommodating such devices in public transportation settings.

Many environmental, transit system, and government commenters also favored using the device's intended-use to categorize which devices constitute wheelchairs and which are other power-driven mobility devices. Furthermore, the intended-use determinant received a fair amount of support from advocacy, nonprofit, and individual commenters, either because they sought to preserve the broad accommodation of wheelchairs or because they sympathized with concerns about individuals without mobility disabilities fraudulently bringing other power-driven mobility devices into public facilities.

Commenters seeking to have the Segway® PT included in the definition of ''wheelchair'' objected to classifying mobility devices on the basis of their intended use because they felt that such a classification would be unfair and prejudicial to Segway® PT users and would stifle personal choice, creativity, and innovation. Other advocacy and nonprofit commenters

objected to employing an intended-use approach because of concerns that the focus would shift to an assessment of the device, rather than the needs or benefits to the individual with the mobility disability. They were of the view that the mobility-device classification should be based on its function—whether it is used for a mobility disability. A few commenters raised the concern that an intended-use approach might embolden public entities to assess whether an individual with a mobility disability really needs to use the other power-driven mobility device at issue or to question why a wheelchair would not provide sufficient mobility. Those citing objections to the intended use determinant indicated it would be more appropriate to make the categorization determination based on whether the device is being used for a mobility disability in the context of the impact of its use in a specific environment. Some of these commenters preferred this approach because it would allow the Segway® PT to be included in the definition of ''wheelchair.''

Many environmental and government commenters were inclined to categorize mobility devices by the way in which they are powered, such as battery-powered engines versus fuel or combustion engines. One commenter suggested using exhaust level as the determinant. Although there were only a few commenters who would make the determination based on indoor or outdoor use, there was nearly universal support for banning the indoor use of devices that are powered by fuel or combustion engines.

A few commenters thought it would be appropriate to categorize the devices based on their maximum speed. Others objected to this approach, stating that circumstances should dictate the appropriate speed at which mobility devices should be operated— for example, a faster speed may be safer when crossing streets than it would be for sidewalk use—and merely because a device can go a certain speed does not mean it will be operated at that speed. The Department has decided to maintain the device's intended use as the appropriate determinant for which devices are categorized as ''wheelchairs.'' However, because wheelchairs may be intended for use by individuals who have temporary conditions affecting mobility, the Department has decided that it is more appropriate to use the phrase ''primarily designed'' rather than ''solely designed'' in making such categorizations. The Department will not foreclose any future technological developments by identifying or banning specific devices or setting restrictions on size, weight, or dimensions. Moreover, devices designed primarily for use by individuals with mobility disabilities often are considered to be medical devices and are generally eligible for insurance reimbursement on this basis. Finally, devices designed primarily for use by individuals with mobility disabilities are less subject to fraud concerns because they were not designed to have a recreational component. Consequently, rarely, if ever, is any inquiry or assessment as to their appropriateness for use in a public entity necessary.

Definition of ''wheelchair.'' In seeking public feedback on the NPRM's definition of ''wheelchair,'' the Department explained its concern that the definition of ''wheelchair'' in section 508(c)(2) of the ADA (formerly section 507(c)(2), July 26, 1990, 104 Stat. 372, 42 U.S.C. 12207, renumbered section 508(c)(2), Public Law 110–325 section 6(a)(2), Sept. 25, 2008, 122 Stat. 3558), which pertains to Federal wilderness areas, is not specific enough to provide clear guidance in the array of settings covered by title II and that the stringent size and weight requirements for the Department of Transportation's definition of ''common wheelchair'' are not a good fit in the context of most public entities. The Department noted in the NPRM that it sought a definition of ''wheelchair'' that would include manually-operated and power-driven wheelchairs and mobility scooters (*i.e.*, those that typically are single-user, have three to four wheels, and are appropriate for both indoor and outdoor pedestrian

areas), as well as a variety of types of wheelchairs and mobility scooters with individualized or unique features or models with different numbers of wheels. The NPRM defined a wheelchair as ''a device designed solely for use by an individual with a mobility impairment for the primary purpose of locomotion in typical indoor and outdoor pedestrian areas. A wheelchair may be manually-operated or power-driven.'' 73 FR 34466, 34479 (June 17, 2008). Although the NPRM's definition of ''wheelchair'' excluded mobility devices that are not designed solely for use by individuals with mobility disabilities, the Department, noting that the use of the Segway® PT by individuals with mobility disabilities is on the upswing, inquired as to whether this device should be included in the definition of ''wheelchair.'' Many environment and Federal government employee commenters objected to the Department's proposed definition of ''wheelchair'' because it differed from the definition of ''wheelchair'' found in section 508(c)(2) of the ADA—a definition used in the statute only in connection with a provision relating to the use of a wheelchair in a designated wilderness area. *See* 42 U.S.C. 12207(c)(1). Other government commenters associated with environmental issues wanted the phrase ''outdoor pedestrian use'' eliminated from the definition of ''wheelchair.'' Some transit system commenters wanted size, weight, and dimensions to be part of the definition because of concerns about costs associated with having to accommodate devices that exceed the dimensions of the ''common wheelchair'' upon which the 2004 ADAAG was based.

Many advocacy, nonprofit, and individual commenters indicated that as long as the Department intends the scope of the term ''mobility impairments'' to include other disabilities that cause mobility impairments (*e.g.,* respiratory, circulatory, stamina, etc.), they were in support of the language. Several commenters indicated a preference for the definition of ''wheelchair'' in section 508(c)(2) of the ADA. One commenter indicated a preference for the term ''assistive device,'' as it is defined in the Rehabilitation Act of 1973, over the term ''wheelchair.'' A few commenters indicated that strollers should be added to the preamble's list of examples of wheelchairs because parents of children with disabilities frequently use strollers as mobility devices until their children get older.

In the final rule, the Department has rearranged some wording and has made some changes in the terminology used in the definition of ''wheelchair,'' but essentially has retained the definition, and therefore the rationale, that was set forth in the NPRM. Again, the text of the ADA makes the definition of ''wheelchair'' contained in section 508(c)(2) applicable only to the specific context of uses in designated wilderness areas, and therefore does not compel the use of that definition for any other purpose. Moreover, the Department maintains that limiting the definition to devices suitable for use in an ''indoor pedestrian area'' as provided for in section 508(c)(2) of the ADA, would ignore the technological advances in wheelchair design that have occurred since the ADA went into effect and that the inclusion of the phrase ''indoor pedestrian area'' in the definition of ''wheelchair'' would set back progress made by individuals with mobility disabilities who, for many years now, have been using devices designed for locomotion in indoor and outdoor settings. The Department has concluded that same rationale applies to placing limits on the size, weight, and dimensions of wheelchairs.

With regard to the term ''mobility impairments,'' the Department intended a broad reading so that a wide range of disabilities, including circulatory and respiratory disabilities, that make walking difficult or impossible, would be included. In response to comments on this issue, the Department has revisited the issue and has concluded that the most apt term to achieve this intent is ''mobility disability.'' In addition, the Department has decided that it is more appropriate

to use the phrase ''primarily'' designed for use by individuals with disabilities in the final rule, rather than ''solely'' designed for use by individuals with disabilities—the phrase proposed in the NPRM. The Department believes that this phrase more accurately covers the range of devices the Department intends to fall within the definition of ''wheelchair.''

After receiving comments that the word ''typical'' is vague and the phrase ''pedestrian areas'' is confusing to apply, particularly in the context of similar, but not identical, terms used in the proposed Standards, the Department decided to delete the term ''typical indoor and outdoor pedestrian areas'' from the final rule. Instead, the final rule references ''indoor or of both indoor and outdoor locomotion,'' to make clear that the devices that fall within the definition of ''wheelchair'' are those that are used for locomotion on indoor and outdoor pedestrian paths or routes and not those that are intended exclusively for traversing undefined, unprepared, or unimproved paths or routes. Thus, the final rule defines the term ''wheelchair'' to mean ''a manually operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor or of both indoor and outdoor locomotion.''

Whether the definition of ''wheelchair'' includes the Segway® PT. As discussed above, because individuals with mobility disabilities are using the Segway® PT as a mobility device, the Department asked whether it should be included in the definition of ''wheelchair.'' The basic Segway® PT model is a two-wheeled, gyroscopically-stabilized, battery-powered personal transportation device. The user stands on a platform suspended three inches off the ground by wheels on each side, grasps a T-shaped handle, and steers the device similarly to a bicycle. Most Segway® PTs can travel up to 12½ miles per hour, compared to the average pedestrian walking speed of three to four miles per hour and the approximate maximum speed for power-operated wheelchairs of six miles per hour. In a study of trail and other non-motorized transportation users including EPAMDs, the Federal Highway Administration (FHWA) found that the eye height of individuals using EPAMDs ranged from approximately 69 to 80 inches. *See* Federal Highway Administration, *Characteristics of Emerging Road and Trail Users and Their Safety* (Oct. 14, 2004), available at *http://www.tfhrc.gov/safety/ pubs/04103* (last visited June 24, 2010). Thus, the Segway® PT can operate at much greater speeds than wheelchairs, and the average user stands much taller than most wheelchair users.

The Segway® PT has been the subject of debate among users, pedestrians, disability advocates, State and local governments, businesses, and bicyclists. The fact that the Segway® PT is not designed primarily for use by individuals with disabilities, nor used primarily by persons with disabilities, complicates the question of to what extent individuals with disabilities should be allowed to operate them in areas and facilities where other power-driven mobility devices are not allowed. Those who question the use of the Segway® PT in pedestrian areas argue that the speed, size, and operating features of the devices make them too dangerous to operate alongside pedestrians and wheelchair users.

Comments regarding whether to include the Segway® PT in the definition of ''wheelchair'' were, by far, the most numerous received in the category of comments regarding wheelchairs and other power-driven mobility devices. Significant numbers of veterans with disabilities, individuals with multiple sclerosis, and those advocating on their behalf made concise statements of general support for the inclusion of the Segway® PT in the definition of ''wheelchair.'' Two veterans offered extensive comments on the topic, along with a few advocacy and nonprofit groups and individuals with disabilities for whom sitting is uncomfortable or impossible.

While there may be legitimate safety issues for EPAMD users and bystanders in some

circumstances, EPAMDs and other nontraditional mobility devices can deliver real benefits to individuals with disabilities. Among the reasons given by commenters to include the Segway® PT in the definition of ''wheelchair'' were that the Segway® PT is well-suited for individuals with particular conditions that affect mobility including multiple sclerosis, Parkinson's disease, chronic obstructive pulmonary disease, amputations, spinal cord injuries, and other neurological disabilities, as well as functional limitations, such as gait limitation, inability to sit or discomfort in sitting, and diminished stamina issues. Such individuals often find that EPAMDs are more comfortable and easier to use than more traditional mobility devices and assist with balance, circulation, and digestion in ways that wheelchairs do not. *See* Rachel Metz, *Disabled Embrace Segway*, New York Times, Oct. 14, 2004. Commenters specifically cited pressure relief, reduced spasticity, increased stamina, and improved respiratory, neurologic, and muscular health as secondary medical benefits from being able to stand.

Other arguments for including the Segway® PT in the definition of ''wheelchair'' were based on commenters' views that the Segway® PT offers benefits not provided by wheelchairs and mobility scooters, including its intuitive response to body movement, ability to operate with less coordination and dexterity than is required for many wheelchairs and mobility scooters, and smaller footprint and turning radius as compared to most wheelchairs and mobility scooters. Several commenters mentioned improved visibility, either due to the Segway® PT's raised platform or simply by virtue of being in a standing position. And finally, some commenters advocated for the inclusion of the Segway® PT simply based on civil rights arguments and the empowerment and self-esteem obtained from having the power to select the mobility device of choice. Many commenters, regardless of their position on whether to include the Segway® PT in the definition of ''wheelchair,'' noted that the Segway® PT's safety record is as good as, if not better, than the record for wheelchairs and mobility scooters.

Most environmental, transit system, and government commenters were opposed to including the Segway® PT in the definition of ''wheelchair'' but were supportive of its inclusion as an ''other power-driven mobility device.'' Their concerns about including the Segway® PT in the definition of ''wheelchair'' had to do with the safety of the operators of these devices (*e.g.*, height clearances on trains and sloping trails in parks) and of pedestrians, particularly in confined and crowded facilities or in settings where motorized devices might be unexpected; the potential harm to the environment; the additional administrative, insurance, liability, and defensive litigation costs; potentially detrimental impacts on the environment and cultural and natural resources; and the impracticality of accommodating such devices in public transportation settings. Other environmental, transit system, and government commenters would have banned all fuel-powered devices as mobility devices. In addition, these commenters would have classified non-motorized devices as ''wheelchairs'' and would have categorized motorized devices, such as the Segway® PT, battery-operated wheelchairs, and mobility scooters as ''other power-driven mobility devices.'' In support of this position, some of these commenters argued that because their equipment and facilities have been designed to comply with the dimensions of the ''common wheelchair'' upon which the ADAAG is based, any device that is larger than the prototype wheelchair would be misplaced in the definition of ''wheelchair.''

Still others in this group of commenters wished for only a single category of mobility devices and would have included wheelchairs, mobility scooters, and the Segway® PT as ''mobility devices'' and excluded fuel-powered devices from that definition.

Many disability advocacy and nonprofit commenters did not support the inclusion of the Segway® PT in the definition of ''wheelchair.'' Paramount to these commenters was the maintenance of existing protections for wheelchair users. Because there was unanimous agreement that wheelchair use rarely, if ever, may be restricted, these commenters strongly favored categorizing wheelchairs separately from the Segway® PT and other power-driven mobility devices and applying the intended-use determinant to assign the devices to either category. They indicated that while they support the greatest degree of access in public entities for all persons with disabilities who require the use of mobility devices, they recognize that under certain circumstances, allowing the use of other power-driven mobility devices would result in a fundamental alteration of programs, services, or activities, or run counter to legitimate safety requirements necessary for the safe operation of a public entity. While these groups supported categorizing the Segway® PT as an ''other power-driven mobility device,'' they universally noted that in their view, because the Segway® PT does not present environmental concerns and is as safe to use as, if not safer than, a wheelchair, it should be accommodated in most circumstances.

The Department has considered all the comments and has concluded that it should not include the Segway® PT in the definition of ''wheelchair.'' The final rule provides that the test for categorizing a device as a wheelchair or an other power-driven mobility device is whether the device is designed primarily for use by individuals with mobility disabilities. Mobility scooters are included in the definition of ''wheelchair'' because they are designed primarily for users with mobility disabilities. However, because the current generation of EPAMDs, including the Segway® PT, was designed for recreational users and not primarily for use by individuals with mobility disabilities, the Department has decided to continue its approach of excluding EPAMDs from the definition of ''wheelchair'' and including them in the definition of ''other power-driven mobility device.'' Although EPAMDs, such as the Segway® PT, are not included in the definition of a ''wheelchair,'' public entities must assess whether they can make reasonable modifications to permit individuals with mobility disabilities to use such devices on their premises. The Department recognizes that the Segway® PT provides many benefits to those who use them as mobility devices, including a measure of privacy with regard to the nature of one's particular disability, and believes that in the vast majority of circumstances, the application of the factors described in § 35.137 for providing access to other-powered mobility devices will result in the admission of the Segway® PT.

Treatment of ''manually-powered mobility aids.'' The Department's NPRM did not define the term ''manually-powered mobility aids.'' Instead, the NPRM included a non- exhaustive list of examples in § 35.137(a). The NPRM queried whether the Department should maintain this approach to manually powered mobility aids or whether it should adopt a more formal definition.

Only a few commenters addressed ''manually-powered mobility aids.'' Virtually all commenters were in favor of maintaining a non-exhaustive list of examples of ''manually-powered mobility aids'' rather than adopting a definition of the term. Of those who commented, a few sought clarification of the term ''manually-powered.'' One commenter suggested that the term be changed to ''human-powered.'' Other commenters requested that the Department include ordinary strollers in the non-exhaustive list of ''manually-powered mobility aids.'' Since strollers are not devices designed primarily for individuals with mobility disabilities, the Department does not consider them to be manually-powered mobility aids; however, strollers used in the context of transporting individuals with disabilities are subject to the same assessment required by the ADA's title II reasonable modification standards at

§ 35.130(b)(7). The Department believes that because the existing approach is clear and understood easily by the public, no formal definition of the term ''manually-powered mobility aids'' is required.

Definition of ''other power-driven mobility device.'' The Department's NPRM defined the term ''other power-driven mobility device'' in § 35.104 as ''any of a large range of devices powered by batteries, fuel, or other engines—whether or not designed solely for use by individuals with mobility impairments—that are used by individuals with mobility impairments for the purpose of locomotion, including golf cars, bicycles, electronic personal assistance mobility devices (EPAMDs), or any mobility aid designed to operate in areas without defined pedestrian routes.'' 73 FR 34466, 34504 (June 17, 2008).

Nearly all environmental, transit systems, and government commenters who supported the two-tiered concept of mobility devices said that the Department's definition of ''other power-driven mobility device'' is overbroad because it includes fuel-powered devices. These commenters sought a ban on fuel-powered devices in their entirety because they believe they are inherently dangerous and pose environmental and safety concerns. They also argued that permitting the use of many of the contemplated other power-driven mobility devices, fuel-powered ones especially, would fundamentally alter the programs, services, or activities of public entities.

Advocacy, nonprofit, and several individual commenters supported the definition of ''other power-driven mobility device'' because it allows new technologies to be added in the future, maintains the existing legal protections for wheelchairs, and recognizes that some devices, particularly the Segway® PT, which are not designed primarily for individuals with mobility disabilities, have beneficial uses for individuals with mobility disabilities. Despite support for the definition of ''other power-driven mobility device,'' however, most advocacy and nonprofit commenters expressed at least some hesitation about the inclusion of fuel-powered mobility devices in the definition. While virtually all of these commenters noted that a blanket exclusion of any device that falls under the definition of ''other power-driven mobility device'' would violate basic civil rights concepts, they also specifically stated that certain devices, particularly, off-highway vehicles, cannot be permitted in certain circumstances. They also made a distinction between the Segway® PT and other power-driven mobility devices, noting that the Segway® PT should be accommodated in most circumstances because it satisfies the safety and environmental elements of the policy analysis. These commenters indicated that they agree that other power-driven mobility devices must be assessed, particularly as to their environmental impact, before they are accommodated.

Although many commenters had reservations about the inclusion of fuel-powered devices in the definition of other power-driven mobility devices, the Department does not want the definition to be so narrow that it would foreclose the inclusion of new technological developments (whether powered by fuel or by some other means). It is for this reason that the Department has maintained the phrase ''any mobility device designed to operate in areas without defined pedestrian routes'' in the final rule's definition of other power-driven mobility devices. The Department believes that the limitations provided by ''fundamental alteration'' and the ability to impose legitimate safety requirements will likely prevent the use of fuel and combustion engine-driven devices indoors, as well as in outdoor areas with heavy pedestrian traffic. The Department notes, however, that in the future, technological developments may result in the production of safe fuel-powered mobility devices that do not pose environmental and safety concerns. The final rule allows consideration to be given as to whether the use of a fuel-powered device would create a substantial risk of serious harm to the environment

or natural or cultural resources, and to whether the use of such a device conflicts with Federal land management laws or regulations; this aspect of the final rule will further limit the inclusion of fuel-powered devices where they are not appropriate. Consequently, the Department has maintained fuel-powered devices in the definition of ''other power-driven mobility device.'' The Department has also added language to the definition of ''other power-driven mobility device'' to reiterate that the definition does not apply to Federal wilderness areas, which are not covered by title II of the ADA; the use of wheelchairs in such areas is governed by section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2). '

''Qualified Interpreter''

In the NPRM, the Department proposed adding language to the definition of ''qualified interpreter'' to clarify that the term includes, but is not limited to, sign language interpreters, oral interpreters, and cued-speech interpreters. As the Department explained, not all interpreters are qualified for all situations. For example, a qualified interpreter who uses American Sign Language (ASL) is not necessarily qualified to interpret orally. In addition, someone with only a rudimentary familiarity with sign language or finger spelling is not qualified, nor is someone who is fluent in sign language but unable to translate spoken communication into ASL or to translate signed communication into spoken words.

As further explained, different situations will require different types of interpreters. For example, an oral interpreter who has special skill and training to mouth a speaker's words silently for individuals who are deaf or hard of hearing may be necessary for an individual who was raised orally and taught to read lips or was diagnosed with hearing loss later in life and does not know sign language. An individual who is deaf or hard of hearing may need an oral interpreter if the speaker's voice is unclear, if there is a quick-paced exchange of communication (*e.g.,* in a meeting), or when the speaker does not directly face the individual who is deaf or hard of hearing. A cued-speech interpreter functions in the same manner as an oral interpreter except that he or she also uses a hand code or cue to represent each speech sound.

The Department received many comments regarding the proposed modifications to the definition of ''interpreter.'' Many commenters requested that the Department include within the definition a requirement that interpreters be certified, particularly if they reside in a State that licenses or certifies interpreters. Other commenters opposed a certification requirement as unduly limiting, noting that an interpreter may well be qualified even if that same interpreter is not certified. These commenters noted the absence of nationwide standards or universally accepted criteria for certification.

On review of this issue, the Department has decided against imposing a certification requirement under the ADA. It is sufficient under the ADA that the interpreter be qualified. However, as the Department stated in the original preamble, this rule does not invalidate or limit State or local laws that impose standards for interpreters that are equal to or more stringent than those imposed by this definition. *See* 28 CFR part 35, app. A at 566 (2009). For instance, the definition would not supersede any requirement of State law for use of a certified interpreter in court proceedings.

With respect to the proposed additions to the rule, most commenters supported the expansion of the list of qualified interpreters, and some advocated for the inclusion of other types of interpreters on the list as well, such as deaf-blind interpreters, certified deaf interpreters, and speech-to-speech interpreters. As these commenters explained, deaf-blind interpreters are interpreters who have specialized skills and training to interpret for individuals who are deaf and blind; certified deaf interpreters are deaf

or hard of hearing interpreters who work with hearing sign language interpreters to meet the specific communication needs of deaf individuals; and speech-to-speech interpreters have special skill and training to interpret for individuals who have speech disabilities.

The list of interpreters in the definition of qualified interpreter is illustrative, and the Department does not believe it necessary or appropriate to attempt to provide an exhaustive list of qualified interpreters. Accordingly, the Department has decided not to expand the proposed list. However, if a deaf and blind individual needs interpreter services, an interpreter who is qualified to handle the needs of that individual may be required. The guiding criterion is that the public entity must provide appropriate auxiliary aids and services to ensure effective communication with the individual. Commenters also suggested various definitions for the term ''cued-speech interpreters,'' and different descriptions of the tasks they performed. After reviewing the various comments, the Department has determined that it is more accurate and appropriate to refer to such individuals as ''cued-language transliterators.'' Likewise, the Department has changed the term ''oral interpreters'' to ''oral transliterators.'' These two changes have been made to distinguish between sign language interpreters, who translate one language into another language (*e.g.*, ASL to English and English to ASL), from transliterators who interpret within the same language between deaf and hearing individuals. A cued-language transliterator is an interpreter who has special skill and training in the use of the Cued Speech system of handshapes and placements, along with non-manual information, such as facial expression and body language, to show auditory information visually, including speech and environmental sounds. An oral transliterator is an interpreter who has special skill and training to mouth a speaker's words silently for individuals who are deaf or hard of hearing. While the Department included definitions for ''cued speech interpreter'' and ''oral interpreter'' in the regulatory text proposed in the NPRM, the Department has decided that it is unnecessary to include such definitions in the text of the final rule.

Many commenters questioned the proposed deletion of the requirement that a qualified interpreter be able to interpret both receptively and expressively, noting the importance of both these skills. Commenters stated that this phrase was carefully crafted in the original regulation to make certain that interpreters both (1) are capable of understanding what a person with a disability is saying and (2) have the skills needed to convey information back to that individual. These are two very different skill sets and both are equally important to achieve effective communication. For example, in a medical setting, a sign language interpreter must have the necessary skills to understand the grammar and syntax used by an ASL user (receptive skills) and the ability to interpret complicated medical information—presented by medical staff in English—back to that individual in ASL (expressive skills). The Department agrees and has put the phrase ''both receptively and expressively'' back in the definition.

Several advocacy groups suggested that the Department make clear in the definition of qualified interpreter that the interpreter may appear either on-site or remotely using a video remote interpreting (VRI) service. Given that the Department has included in this rule both a definition of VRI services and standards that such services must satisfy, such an addition to the definition of qualified interpreter is appropriate.

After consideration of all relevant information submitted during the public comment period, the Department has modified the definition from that initially proposed in the NPRM. The final definition now states that ''[q]ualified interpreter means an interpreter who, via a video remote interpreting (VRI) service or an on-site appearance, is able to interpret effectively,

accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary. Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.''

''Qualified Reader''

The 1991 title II regulation identifies a qualified reader as an auxiliary aid, but did not define the term. *See* 28 CFR 35.104(2). Based upon the Department's investigation of complaints alleging that some entities have provided ineffective readers, the Department proposed in the NPRM to define ''qualified reader'' similarly to ''qualified interpreter'' to ensure that entities select qualified individuals to read an examination or other written information in an effective, accurate, and impartial manner. This proposal was suggested in order to make clear to public entities that a failure to provide a qualified reader to a person with a disability may constitute a violation of the requirement to provide appropriate auxiliary aids and services.

The Department received comments supporting inclusion in the regulation of a definition of a ''qualified reader.'' Some commenters suggested the Department add to the definition a requirement prohibiting the use of a reader whose accent, diction, or pronunciation makes full comprehension of material being read difficult. Another commenter requested that the Department include a requirement that the reader ''will follow the directions of the person for whom he or she is reading.'' Commenters also requested that the Department define ''accurately'' and ''effectively'' as used in this definition.

While the Department believes that its proposed regulatory definition adequately addresses these concerns, the Department emphasizes that a reader, in order to be ''qualified,'' must be skilled in reading the language and subject matter and must be able to be easily understood by the individual with the disability. For example, if a reader is reading aloud the questions for a college microbiology examination, that reader, in order to be qualified, must know the proper pronunciation of scientific terminology used in the text, and must be sufficiently articulate to be easily understood by the individual with a disability for whom he or she is reading. In addition, the terms ''effectively'' and ''accurately'' have been successfully used and understood in the Department's existing definition of ''qualified interpreter'' since 1991 without specific regulatory definitions. Instead, the Department has relied upon the common use and understanding of those terms from standard English dictionaries. Thus, the definition of ''qualified reader'' has not been changed from that contained in the NPRM. The final rule defines ''qualified reader'' to mean ''a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary.''

''Service Animal''

Although there is no specific language in the 1991 title II regulation concerning service animals, title II entities have the same legal obligations as title III entities to make reasonable modifications in policies, practices, or procedures to allow service animals when necessary in order to avoid discrimination on the basis of disability, unless the entity can demonstrate that making the modifications would fundamentally alter the nature of the service, program, or activity. *See* 28 CFR 35.130(b)(7). The 1991 title III regulation, 28 CFR 36.104, defines a ''service animal'' as ''any guide dog, signal dog, or other animal individually trained to do work or perform tasks for the benefit of an individual with a disability, including, but not limited to, guiding individuals with impaired vision, alerting individuals with impaired hearing to intruders or sounds, providing minimal protection or rescue work, pulling a wheelchair, or fetching dropped items.'' Section 36.302(c)(1) of the 1991 title III regulation requires that ''[g]enerally, a public accommodation shall modify policies, practices, or procedures to permit the use of a service animal by an individual with a

disability.'' Section 36.302(c)(2) of the 1991 title III regulation states that ''a public accommodation [is not required] to supervise or care for a service animal.''

The Department has issued guidance and provided technical assistance and publications concerning service animals since the 1991 regulations became effective. In the NPRM, the Department proposed to modify the definition of service animal, added the definition to title II, and asked for public input on several issues related to the service animal provisions of the title II regulation: whether the Department should clarify the phrase ''providing minimal protection'' in the definition or remove it; whether there are any circumstances where a service animal ''providing minimal protection'' would be appropriate or expected; whether certain species should be eliminated from the definition of ''service animal,'' and, if so, which types of animals should be excluded; whether ''common domestic animal'' should be part of the definition; and whether a size or weight limitation should be imposed for common domestic animals even if the animal satisfies the ''common domestic animal'' part of the NPRM definition.

The Department received extensive comments on these issues, as well as requests to clarify the obligations of State and local government entities to accommodate individuals with disabilities who use service animals, and has modified the final rule in response. In the interests of avoiding unnecessary repetition, the Department has elected to discuss the issues raised in the NPRM questions about service animals and the corresponding public comments in the following discussion of the definition of ''service animal.''

The Department's final rule defines ''service animal'' as ''any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability. Other species of animals, whether wild or domestic, trained or untrained, are not service animals for the purposes of this definition. The work or tasks performed by a service animal must be directly related to the individual's disability. Examples of work or tasks include, but are not limited to, assisting individuals who are blind or have low vision with navigation and other tasks, alerting individuals who are deaf or hard of hearing to the presence of people or sounds, providing non-violent protection or rescue work, pulling a wheelchair, assisting an individual during a seizure, alerting individuals to the presence of allergens, retrieving items such as medicine or the telephone, providing physical support and assistance with balance and stability to individuals with mobility disabilities, and helping persons with psychiatric and neurological disabilities by preventing or interrupting impulsive or destructive behaviors. The crime deterrent effects of an animal's presence and the provision of emotional support, well-being, comfort, or companionship do not constitute work or tasks for the purposes of this definition.''

This definition has been designed to clarify a key provision of the ADA. Many covered entities indicated that they are confused regarding their obligations under the ADA with regard to individuals with disabilities who use service animals. Individuals with disabilities who use trained guide or service dogs are concerned that if untrained or unusual animals are termed ''service animals,'' their own right to use guide or service dogs may become unnecessarily restricted or questioned. Some individuals who are not individuals with disabilities have claimed, whether fraudulently or sincerely (albeit mistakenly), that their animals are service animals covered by the ADA, in order to gain access to courthouses, city or county administrative offices, and other title II facilities. The increasing use of wild, exotic, or unusual species, many of which are untrained, as service animals has also added to the confusion.

Finally, individuals with disabilities who have the legal right under the Fair Housing Act (FHAct) to use certain animals in their homes as

a reasonable accommodation to their disabilities have assumed that their animals also qualify under the ADA. This is not necessarily the case, as discussed below.

The Department recognizes the diverse needs and preferences of individuals with disabilities protected under the ADA, and does not wish to unnecessarily impede individual choice. Service animals play an integral role in the lives of many individuals with disabilities and, with the clarification provided by the final rule, individuals with disabilities will continue to be able to use their service animals as they go about their daily activities and civic interactions. The clarification will also help to ensure that the fraudulent or mistaken use of other animals not qualified as service animals under the ADA will be deterred. A more detailed analysis of the elements of the definition and the comments responsive to the service animal provisions of the NPRM follows.

Providing minimal protection. As previously noted, the 1991 title II regulation does not contain specific language concerning service animals. The 1991 title III regulation included language stating that ''minimal protection'' was a task that could be performed by an individually trained service animal for the benefit of an individual with a disability. In the Department's ''ADA Business Brief on Service Animals'' (2002), the Department interpreted the ''minimal protection'' language within the context of a seizure (*i.e.*, alerting and protecting a person who is having a seizure). The Department received many comments in response to the question of whether the ''minimal protection'' language should be clarified. Many commenters urged the removal of the ''minimal protection'' language from the service animal definition for two reasons: (1) The phrase can be interpreted to allow any dog that is trained to be aggressive to qualify as a service animal simply by pairing the animal with a person with a disability; and (2) the phrase can be interpreted to allow any untrained pet dog to qualify as a service animal, since many consider the mere presence of a dog to be a crime deterrent, and thus sufficient to meet the minimal protection standard. These commenters argued, and the Department agrees, that these interpretations were not contemplated under the original title III regulation, and, for the purposes of the final title II regulations, the meaning of ''minimal protection'' must be made clear.

While many commenters stated that they believe that the ''minimal protection'' language should be eliminated, other commenters recommended that the language be clarified, but retained. Commenters favoring clarification of the term suggested that the Department explicitly exclude the function of attack or exclude those animals that are trained solely to be aggressive or protective. Other commenters identified nonviolent behavioral tasks that could be construed as minimally protective, such as interrupting self-mutilation, providing safety checks and room searches, reminding the individual to take medications, and protecting the individual from injury resulting from seizures or unconsciousness.

Several commenters noted that the existing direct threat defense, which allows the exclusion of a service animal if the animal exhibits unwarranted or unprovoked violent behavior or poses a direct threat, prevents the use of ''attack dogs'' as service animals. One commenter noted that the use of a service animal trained to provide ''minimal protection'' may impede access to care in an emergency, for example, where the first responder, usually a title II entity, is unable or reluctant to approach a person with a disability because the individual's service animal is in a protective posture suggestive of aggression.

Many organizations and individuals stated that in the general dog training community, ''protection'' is code for attack or aggression training and should be removed from the definition. Commenters stated that there appears to be a broadly held misconception that aggression-trained animals are appropriate service

animals for persons with post traumatic stress disorder (PTSD). While many individuals with PTSD may benefit by using a service animal, the work or tasks performed appropriately by such an animal would not involve unprovoked aggression but could include actively cuing the individual by nudging or pawing the individual to alert to the onset of an episode and removing the individual from the anxiety-provoking environment.

The Department recognizes that despite its best efforts to provide clarification, the ''minimal protection'' language appears to have been misinterpreted. While the Department maintains that protection from danger is one of the key functions that service animals perform for the benefit of persons with disabilities, the Department recognizes that an animal individually trained to provide aggressive protection, such as an attack dog, is not appropriately considered a service animal. Therefore, the Department has decided to modify the ''minimal protection'' language to read ''nonviolent protection,'' thereby excluding so-called ''attack dogs'' or dogs with traditional ''protection training'' as service animals. The Department believes that this modification to the service animal definition will eliminate confusion, without restricting unnecessarily the type of work or tasks that service animals may perform. The Department's modification also clarifies that the crime-deterrent effect of a dog's presence, by itself, does not qualify as work or tasks for purposes of the service animal definition.

Alerting to intruders. The phrase ''alerting to intruders'' is related to the issues of minimal protection and the work or tasks an animal may perform to meet the definition of a service animal. In the original 1991 regulatory text, this phrase was intended to identify service animals that alert individuals who are deaf or hard of hearing to the presence of others. This language has been misinterpreted by some to apply to dogs that are trained specifically to provide aggressive protection, resulting in the assertion that such training qualifies a dog as a service animal under the ADA. The Department reiterates that title II entities are not required to admit any animal whose use poses a direct threat under § 35.139. In addition, the Department has decided to remove the word ''intruders'' from the service animal definition and replace it with the phrase ''the presence of people or sounds.'' The Department believes this clarifies that so-called ''attack training'' or other aggressive response types of training that cause a dog to provide an aggressive response do not qualify a dog as a service animal under the ADA.

Conversely, if an individual uses a breed of dog that is perceived to be aggressive because of breed reputation, stereotype, or the history or experience the observer may have with other dogs, but the dog is under the control of the individual with a disability and does not exhibit aggressive behavior, the title II entity cannot exclude the individual or the animal from a State or local government program, service, or facility. The animal can only be removed if it engages in the behaviors mentioned in § 35.136(b) (as revised in the final rule) or if the presence of the animal constitutes a fundamental alteration to the nature of the service, program, or activity of the title II entity.

Doing ''work'' or ''performing tasks.'' The NPRM proposed that the Department maintain the requirement, first articulated in the 1991 title III regulation, that in order to qualify as a service animal, the animal must ''perform tasks'' or ''do work'' for the individual with a disability. The phrases ''perform tasks'' and ''do work'' describe what an animal must do for the benefit of an individual with a disability in order to qualify as a service animal.

The Department received a number of comments in response to the NPRM proposal urging the removal of the term ''do work'' from the definition of a service animal. These commenters argued that the Department should emphasize the performance of tasks instead. The

Department disagrees. Although the common definition of work includes the performance of tasks, the definition of work is somewhat broader, encompassing activities that do not appear to involve physical action.

One service dog user stated that in some cases, ''critical forms of assistance can't be construed as physical tasks,'' noting that the manifestations of ''brain-based disabilities,'' such as psychiatric disorders and autism, are as varied as their physical counterparts. The Department agrees with this statement but cautions that unless the animal is individually trained to do something that qualifies as work or a task, the animal is a pet or support animal and does not qualify for coverage as a service animal. A pet or support animal may be able to discern that the individual is in distress, but it is what the animal is trained to do in response to this awareness that distinguishes a service animal from an observant pet or support animal.

The NPRM contained an example of ''doing work'' that stated ''a psychiatric service dog can help some individuals with dissociative identity disorder to remain grounded in time or place.'' 73 FR 34466, 34504 (June 17, 2008). Several commenters objected to the use of this example, arguing that grounding was not a ''task'' and therefore, the example inherently contradicted the basic premise that a service animal must perform a task in order to mitigate a disability. Other commenters stated that ''grounding'' should not be included as an example of ''work'' because it could lead to some individuals claiming that they should be able to use emotional support animals in public because the dog makes them feel calm or safe. By contrast, one commenter with experience in training service animals explained that grounding is a trained task based upon very specific behavioral indicators that can be observed and measured. These tasks are based upon input from mental health practitioners, dog trainers, and individuals with a history of working with psychiatric service dogs.

It is the Department's view that an animal that is trained to ''ground'' a person with a psychiatric disorder does work or performs a task that would qualify it as a service animal as compared to an untrained emotional support animal whose presence affects a person's disability. It is the fact that the animal is trained to respond to the individual's needs that distinguishes an animal as a service animal. The process must have two steps: Recognition and response. For example, if a service animal senses that a person is about to have a psychiatric episode and it is trained to respond for example, by nudging, barking, or removing the individual to a safe location until the episode subsides, then the animal has indeed performed a task or done work on behalf of the individual with the disability, as opposed to merely sensing an event.

One commenter suggested defining the term ''task,'' presumably to improve the understanding of the types of services performed by an animal that would be sufficient to qualify the animal for coverage. The Department believes that the common definition of the word ''task'' is sufficiently clear and that it is not necessary to add to the definitions section. However, the Department has added examples of other kinds of work or tasks to help illustrate and provide clarity to the definition. After careful evaluation of this issue, the Department has concluded that the phrases ''do work'' and ''perform tasks'' have been effective during the past two decades to illustrate the varied services provided by service animals for the benefit of individuals with all types of disabilities. Thus, the Department declines to depart from its longstanding approach at this time.

Species limitations. When the Department originally issued its title III regulation in the early 1990s, the Department did not define the parameters of acceptable animal species. At that time, few anticipated the variety of animals that would be promoted as service animals in the years to come, which ranged from pigs and

miniature horses to snakes, iguanas, and parrots. The Department has followed this particular issue closely, keeping current with the many unusual species of animals represented to be service animals. Thus, the Department has decided to refine further this aspect of the service animal definition in the final rule.

The Department received many comments from individuals and organizations recommending species limitations. Several of these commenters asserted that limiting the number of allowable species would help stop erosion of the public's trust, which has resulted in reduced access for many individuals with disabilities who use trained service animals that adhere to high behavioral standards. Several commenters suggested that other species would be acceptable if those animals could meet nationally recognized behavioral standards for trained service dogs. Other commenters asserted that certain species of animals (*e.g.,* reptiles) cannot be trained to do work or perform tasks, so these animals would not be covered.

In the NPRM, the Department used the term ''common domestic animal'' in the service animal definition and excluded reptiles, rabbits, farm animals (including horses, miniature horses, ponies, pigs, and goats), ferrets, amphibians, and rodents from the service animal definition. 73 FR 34466, 34478 (June 17, 2008). However, the term ''common domestic animal'' is difficult to define with precision due to the increase in the number of domesticated species. Also, several State and local laws define a ''domestic'' animal as an animal that is not wild. The Department agrees with commenters' views that limiting the number and types of species recognized as service animals will provide greater predictability for State and local government entities as well as added assurance of access for individuals with disabilities who use dogs as service animals. As a consequence, the Department has decided to limit this rule's coverage of service animals to dogs, which are the most common service animals used by individuals with disabilities.

Wild animals, monkeys, and other nonhuman primates. Numerous business entities endorsed a narrow definition of acceptable service animal species, and asserted that there are certain animals (*e.g.,* reptiles) that cannot be trained to do work or perform tasks. Other commenters suggested that the Department should identify excluded animals, such as birds and llamas, in the final rule. Although one commenter noted that wild animals bred in captivity should be permitted to be service animals, the Department has decided to make clear that all wild animals, whether born or bred in captivity or in the wild, are eliminated from coverage as service animals. The Department believes that this approach reduces risks to health or safety attendant with wild animals. Some animals, such as certain nonhuman primates including certain monkeys, pose a direct threat; their behavior can be unpredictably aggressive and violent without notice or provocation. The American Veterinary Medical Association (AVMA) issued a position statement advising against the use of monkeys as service animals, stating that ''[t]he AVMA does not support the use of nonhuman primates as assistance animals because of animal welfare concerns, and the potential for serious injury and zoonotic [animal to human disease transmission] risks.'' AVMA Position Statement, *Nonhuman Primates as Assistance Animals,* (2005) available at *http://www.avma.org/issues/policy/ nonhuman_primates.asp* (last visited June 24, 2010).

An organization that trains capuchin monkeys to provide in-home services to individuals with paraplegia and quadriplegia was in substantial agreement with the AVMA's views but requested a limited recognition in the service animal definition for the capuchin monkeys it trains to provide assistance for persons with disabilities. The organization commented that its trained capuchin monkeys undergo scrupulous veterinary examinations to ensure that the animals pose

no health risks, and are used by individuals with disabilities exclusively in their homes. The organization acknowledged that the capuchin monkeys it trains are not necessarily suitable for use in State or local government facilities. The organization noted that several State and local government entities have local zoning, licensing, health, and safety laws that prohibit nonhuman primates, and that these prohibitions would prevent individuals with disabilities from using these animals even in their homes.

The organization argued that including capuchin monkeys under the service animal umbrella would make it easier for individuals with disabilities to obtain reasonable modifications of State and local licensing, health, and safety laws that would permit the use of these monkeys. The organization argued that this limited modification to the service animal definition was warranted in view of the services these monkeys perform, which enable many individuals with paraplegia and quadriplegia to live and function with increased independence.

The Department has carefully considered the potential risks associated with the use of nonhuman primates as service animals in State and local government facilities, as well as the information provided to the Department about the significant benefits that trained capuchin monkeys provide to certain individuals with disabilities in residential settings. The Department has determined, however, that nonhuman primates, including capuchin monkeys, will not be recognized as service animals for purposes of this rule because of their potential for disease transmission and unpredictable aggressive behavior. The Department believes that these characteristics make nonhuman primates unsuitable for use as service animals in the context of the wide variety of public settings subject to this rule. As the organization advocating the inclusion of capuchin monkeys acknowledges, capuchin monkeys are not suitable for use in public facilities.

The Department emphasizes that it has decided only that capuchin monkeys will not be included in the definition of service animals for purposes of its regulation implementing the ADA. This decision does not have any effect on the extent to which public entities are required to allow the use of such monkeys under other Federal statutes. For example, under the FHAct, an individual with a disability may have the right to have an animal other than a dog in his or her home if the animal qualifies as a ''reasonable accommodation'' that is necessary to afford the individual equal opportunity to use and enjoy a dwelling, assuming that the use of the animal does not pose a direct threat. In some cases, the right of an individual to have an animal under the FHAct may conflict with State or local laws that prohibit all individuals, with or without disabilities, from owning a particular species. However, in this circumstance, an individual who wishes to request a reasonable modification of the State or local law must do so under the FHAct, not the ADA.

Having considered all of the comments about which species should qualify as service animals under the ADA, the Department has determined the most reasonable approach is to limit acceptable species to dogs.

Size or weight limitations. The vast majority of commenters did not support a size or weight limitation. Commenters were typically opposed to a size or weight limit because many tasks performed by service animals require large, strong dogs. For instance, service animals may perform tasks such as providing balance and support or pulling a wheelchair. Small animals may not be suitable for large adults. The weight of the service animal user is often correlated with the size and weight of the service animal. Others were concerned that adding a size and weight limit would further complicate the difficult process of finding an appropriate service animal. One commenter noted that there is no need for a limit because ''if, as a practical matter, the size or weight of an individual's service animal

creates a direct threat or fundamental alteration to a particular public entity or accommodation, there are provisions that allow for the animal's exclusion or removal.'' Some common concerns among commenters in support of a size and weight limit were that a larger animal may be less able to fit in various areas with its handler, such as toilet rooms and public seating areas, and that larger animals are more difficult to control.

Balancing concerns expressed in favor of and against size and weight limitations, the Department has determined that such limitations would not be appropriate. Many individuals of larger stature require larger dogs. The Department believes it would be inappropriate to deprive these individuals of the option of using a service dog of the size required to provide the physical support and stability these individuals may need to function independently. Since large dogs have always served as service animals, continuing their use should not constitute fundamental alterations or impose undue burdens on title II entities.

Breed limitations. A few commenters suggested that certain breeds of dogs should not be allowed to be used as service animals. Some suggested that the Department should defer to local laws restricting the breeds of dogs that individuals who reside in a community may own. Other commenters opposed breed restrictions, stating that the breed of a dog does not determine its propensity for aggression and that aggressive and non-aggressive dogs exist in all breeds.

The Department does not believe that it is either appropriate or consistent with the ADA to defer to local laws that prohibit certain breeds of dogs based on local concerns that these breeds may have a history of unprovoked aggression or attacks. Such deference would have the effect of limiting the rights of persons with disabilities under the ADA who use certain service animals based on where they live rather than on whether the use of a particular animal poses a direct threat to the health and safety of others. Breed restrictions differ significantly from jurisdiction to jurisdiction. Some jurisdictions have no breed restrictions. Others have restrictions that, while well-meaning, have the unintended effect of screening out the very breeds of dogs that have successfully served as service animals for decades without a history of the type of unprovoked aggression or attacks that would pose a direct threat, *e.g.,* German Shepherds. Other jurisdictions prohibit animals over a certain weight, thereby restricting breeds without invoking an express breed ban. In addition, deference to breed restrictions contained in local laws would have the unacceptable consequence of restricting travel by an individual with a disability who uses a breed that is acceptable and poses no safety hazards in the individual's home jurisdiction but is nonetheless banned by other jurisdictions. State and local government entities have the ability to determine, on a case-by-case basis, whether a particular service animal can be excluded based on that particular animal's actual behavior or history—not based on fears or generalizations about how an animal or breed might behave. This ability to exclude an animal whose behavior or history evidences a direct threat is sufficient to protect health and safety.

Recognition of psychiatric service animals but not "emotional support animals." The definition of ''service animal'' in the NPRM stated the Department's longstanding position that emotional support animals are not included in the definition of ''service animal.'' The proposed text in § 35.104 provided that ''[a]nimals whose sole function is to provide emotional support, comfort, therapy, companionship, therapeutic benefits or to promote emotional well-being are not service animals.'' 73 FR 34466, 34504 (June 17, 2008).

Many advocacy organizations expressed concern and disagreed with the exclusion of comfort and emotional support animals. Others have been more specific, stating that individuals with disabilities may need their emotional support animals in order to have equal access. Some commenters noted that individuals with

disabilities use animals that have not been trained to perform tasks directly related to their disability. These animals do not qualify as service animals under the ADA. These are emotional support or comfort animals.

Commenters asserted that excluding categories such as ''comfort'' and ''emotional support'' animals recognized by laws such as the FHAct or the Air Carrier Access Act (ACAA) is confusing and burdensome. Other commenters noted that emotional support and comfort animals perform an important function, asserting that animal companionship helps individuals who experience depression resulting from multiple sclerosis.

Some commenters explained the benefits emotional support animals provide, including emotional support, comfort, therapy, companionship, therapeutic benefits, and the promotion of emotional well-being. They contended that without the presence of an emotional support animal in their lives they would be disadvantaged and unable to participate in society. These commenters were concerned that excluding this category of animals will lead to discrimination against, and the excessive questioning of, individuals with non-visible or non-apparent disabilities. Other commenters expressing opposition to the exclusion of individually trained ''comfort'' or ''emotional support'' animals asserted that the ability to soothe or de-escalate and control emotion is ''work'' that benefits the individual with the disability.

Many commenters requested that the Department carve out an exception that permits current or former members of the military to use emotional support animals. They asserted that a significant number of service members returning from active combat duty have adjustment difficulties due to combat, sexual assault, or other traumatic experiences while on active duty. Commenters noted that some current or former members of the military service have been prescribed animals for conditions such as PTSD. One commenter stated that service women who were sexually assaulted while in the military use emotional support animals to help them feel safe enough to step outside their homes. The Department recognizes that many current and former members of the military have disabilities as a result of service-related injuries that may require emotional support and that such individuals can benefit from the use of an emotional support animal and could use such animal in their home under the FHAct. However, having carefully weighed the issues, the Department believes that its final rule appropriately addresses the balance of issues and concerns of both the individual with a disability and the public entity. The Department also notes that nothing in this part prohibits a public entity from allowing current or former military members or anyone else with disabilities to utilize emotional support animals if it wants to do so.

Commenters asserted the view that if an animal's ''mere presence'' legitimately provides such benefits to an individual with a disability and if those benefits are necessary to provide equal opportunity given the facts of the particular disability, then such an animal should qualify as a ''service animal.'' Commenters noted that the focus should be on the nature of a person's disability, the difficulties the disability may impose and whether the requested accommodation would legitimately address those difficulties, not on evaluating the animal involved. The Department understands this approach has benefitted many individuals under the FHAct and analogous State law provisions, where the presence of animals poses fewer health and safety issues, and where emotional support animals provide assistance that is unique to residential settings. The Department believes, however, that the presence of such animals is not required in the context of title II entities such as courthouses, State and local government administrative buildings, and similar title II facilities.

Under the Department's previous regulatory framework, some individuals and entities assumed

that the requirement that service animals must be individually trained to do work or perform tasks excluded all individuals with mental disabilities from having service animals. Others assumed that any person with a psychiatric condition whose pet provided comfort to them was covered by the 1991 title II regulation. The Department reiterates that psychiatric service animals that are trained to do work or perform a task for individuals whose disability is covered by the ADA are protected by the Department's present regulatory approach. Psychiatric service animals can be trained to perform a variety of tasks that assist individuals with disabilities to detect the onset of psychiatric episodes and ameliorate their effects. Tasks performed by psychiatric service animals may include reminding the individual to take medicine, providing safety checks or room searches for persons with PTSD, interrupting self-mutilation, and removing disoriented individuals from dangerous situations.

The difference between an emotional support animal and a psychiatric service animal is the work or tasks that the animal performs. Traditionally, service dogs worked as guides for individuals who were blind or had low vision. Since the original regulation was promulgated, service animals have been trained to assist individuals with many different types of disabilities.

In the final rule, the Department has retained its position on the exclusion of emotional support animals from the definition of ''service animal.'' The definition states that ''[t]he provision of emotional support, well-being, comfort, or companionship, * * * do[es] not constitute work or tasks for the purposes of this definition.'' The Department notes, however, that the exclusion of emotional support animals from coverage in the final rule does not mean that individuals with psychiatric or mental disabilities cannot use service animals that meet the regulatory definition. The final rule defines service animal as follows: ''[s]ervice animal means any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability.'' This language simply clarifies the Department's longstanding position.

The Department's position is based on the fact that the title II and title III regulations govern a wider range of public settings than the housing and transportation settings for which the Department of Housing and Urban Development (HUD) and DOT regulations allow emotional support animals or comfort animals. The Department recognizes that there are situations not governed by the title II and title III regulations, particularly in the context of residential settings and transportation, where there may be a legal obligation to permit the use of animals that do not qualify as service animals under the ADA, but whose presence nonetheless provides necessary emotional support to persons with disabilities. Accordingly, other Federal agency regulations, case law, and possibly State or local laws governing those situations may provide appropriately for increased access for animals other than service animals as defined under the ADA. Public officials, housing providers, and others who make decisions relating to animals in residential and transportation settings should consult the Federal, State, and local laws that apply in those areas (*e.g.,* the FHAct regulations of HUD and the ACAA) and not rely on the ADA as a basis for reducing those obligations.

Retain term "service animal." Some commenters asserted that the term ''assistance animal'' is a term of art and should replace the term ''service animal.'' However, the majority of commenters preferred the term ''service animal'' because it is more specific. The Department has decided to retain the term ''service animal'' in the final rule. While some agencies, like HUD, use the term ''assistance animal,'' ''assistive animal,'' or ''support animal,'' these terms are used to denote a broader category of animals

than is covered by the ADA. The Department has decided that changing the term used in the final rule would create confusion, particularly in view of the broader parameters for coverage under the FHAct, *cf*., preamble to HUD's Final Rule for Pet Ownership for the Elderly and Persons with Disabilities, 73 FR 63834–38 (Oct. 27, 2008); HUD Handbook No. 4350.3 Rev–1, Chapter 2, Occupancy Requirements of Subsidized Multifamily Housing Programs (June 2007), available at *http://www.hud.gov/offices/adm/hudclips/handbooks/hsgh/4350.3* (last visited June 24, 2010). Moreover, as discussed above, the Department's definition of ''service animal'' in the title II final rule does not affect the rights of individuals with disabilities who use assistance animals in their homes under the FHAct or who use ''emotional support animals'' that are covered under the ACAA and its implementing regulations. *See* 14 CFR 382.7 *et seq*.; *see also* Department of Transportation, *Guidance Concerning Service Animals in Air Transportation*, 68 FR 24874, 24877 (May 9, 2003) (discussing accommodation of service animals and emotional support animals on aircraft).

''Video Remote Interpreting'' (VRI) Services

In the NPRM, the Department proposed adding Video Interpreting Services (VIS) to the list of auxiliary aids available to provide effective communication described in § 35.104. In the preamble to the NPRM, VIS was defined as ''a technology composed of a video phone, video monitors, cameras, a high-speed Internet connection, and an interpreter. The video phone provides video transmission to a video monitor that permits the individual who is deaf or hard of hearing to view and sign to a video interpreter (*i.e.*, a live interpreter in another location), who can see and sign to the individual through a camera located on or near the monitor, while others can communicate by speaking. The video monitor can display a split screen of two live images, with the interpreter in one image and the individual who is deaf or hard of hearing in the other image.'' 73 FR 34446, 34479 (June 17, 2008). Comments from advocacy organizations and individuals unanimously requested that the Department use the term ''video remote interpreting (VRI),'' instead of VIS, for consistency with Federal Communications Commission (FCC) regulations. *See* FCC Public Notice, DA– 0502417 (Sept. 7, 2005), and with common usage by consumers. The Department has made that change throughout the regulation to avoid confusion and to make the regulation more consistent with existing regulations.

Many commenters also requested that the Department distinguish between VRI and ''video relay service (VRS).'' Both VRI and VRS use a remote interpreter who is able to see and communicate with a deaf person and a hearing person, and all three individuals may be connected by a video link. VRI is a fee-based interpreting service conveyed via videoconferencing where at least one person, typically the interpreter, is at a separate location. VRI can be provided as an on-demand service or by appointment. VRI normally involves a contract in advance for the interpreter who is usually paid by the covered entity.

VRS is a telephone service that enables persons with disabilities to use the telephone to communicate using video connections and is a more advanced form of relay service than the traditional voice to text telephones (TTY) relay systems that were recognized in the 1991 title II regulation. More specifically, VRS is a video relay service using interpreters connected to callers by video hook-up and is designed to provide telephone services to persons who are deaf and use American Sign Language that are functionally equivalent to those provided to users who are hearing. VRS is funded through the Interstate Telecommunications Relay Services Fund and overseen by the FCC. *See* 47 CFR 64.601(a)(26). There are no fees for callers to use the VRS interpreters and the video connection, although there may be relatively inexpensive initial costs

to the title II entities to purchase the videophone or camera for on-line video connection, or other equipment to connect to the VRS service. The FCC has made clear that VRS functions as a telephone service and is not intended to be used for interpreting services where both parties are in the same room; the latter is reserved for VRI. The Department agrees that VRS cannot be used as a substitute for in-person interpreters or for VRI in situations that would not, absent one party's disability, entail use of the telephone.

Many commenters strongly recommended limiting the use of VRI to circumstances where it will provide effective communication. Commenters from advocacy groups and persons with disabilities expressed concern that VRI may not always be appropriate to provide effective communication, especially in hospitals and emergency rooms. Examples were provided of patients who are unable to see the video monitor because they are semi-conscious or unable to focus on the video screen; other examples were given of cases where the video monitor is out of the sightline of the patient or the image is out of focus; still other examples were given of patients who could not see the image because the signal was interrupted, causing unnatural pauses in the communication, or the image was grainy or otherwise unclear. Many commenters requested more explicit guidelines on the use of VRI, and some recommended requirements for equipment maintenance, high-speed, wide-bandwidth video links using dedicated lines or wireless systems, and training of staff using VRI, especially in hospital and health care situations. Several major organizations requested a requirement to include the interpreter's face, head, arms, hands, and eyes in all transmissions. Finally, one State agency asked for additional guidance, outreach, and mandated advertising about the availability of VRI in title II situations so that local government entities would budget for and facilitate the use of VRI in libraries, schools, and other places.

After consideration of the comments and the Department's own research and experience, the Department has determined that VRI can be an effective method of providing interpreting services in certain circumstances, but not in others. For example, VRI should be effective in many situations involving routine medical care, as well as in the emergency room where urgent care is important, but no in-person interpreter is available; however, VRI may not be effective in situations involving surgery or other medical procedures where the patient is limited in his or her ability to see the video screen. Similarly, VRI may not be effective in situations where there are multiple people in a room and the information exchanged is highly complex and fast-paced. The Department recognizes that in these and other situations, such as where communication is needed for persons who are deaf-blind, it may be necessary to summon an in-person interpreter to assist certain individuals. To ensure that VRI is effective in situations where it is appropriate, the Department has established performance standards in § 35.160(d).

Subpart B—General Requirements

Section 35.130(h) Safety.

Section 36.301(b) of the 1991 title III regulation provides that a public accommodation ''may impose legitimate safety requirements that are necessary for safe operation. Safety requirements must be based on actual risks, and not on mere speculation, stereotypes, or generalizations about individuals with disabilities.'' 28 CFR 36.301(b). Although the 1991 title II regulation did not include similar language, the Department's 1993 ADA Title II Technical Assistance Manual at II–3.5200 makes clear the Department's view that public entities also have the right to impose legitimate safety requirements necessary for the safe operation of services, programs, or activities. To ensure consistency between the title II and title III regulations, the Department has added a new

§ 35.130(h) in the final rule incorporating this longstanding position relating to imposition of legitimate safety requirements.

Section 35.133 Maintenance of accessible features.

Section 35.133 in the 1991 title II regulation provides that a public entity must maintain in operable working condition those features of facilities and equipment that are required to be readily accessible to and usable by qualified individuals with disabilities. *See* 28 CFR 35.133(a). In the NPRM, the Department clarified the application of this provision and proposed one change to the section to address the discrete situation in which the scoping requirements provided in the 2010 Standards reduce the number of required elements below the requirements of the 1991 Standards. In that discrete event, a public entity may reduce such accessible features in accordance with the requirements in the 2010 Standards.

The Department received only four comments on this proposed amendment. None of the commenters opposed the change. In the final rule, the Department has revised the section to make it clear that if the 2010 Standards reduce either the technical requirements or the number of required accessible elements below that required by the 1991 Standards, then the public entity may reduce the technical requirements or the number of accessible elements in a covered facility in accordance with the requirements of the 2010 Standards.

One commenter urged the Department to amend § 35.133(b) to expand the language of the section to restocking of shelves as a permissible activity for isolated or temporary interruptions in service or access. It is the Department's position that a temporary interruption that blocks an accessible route, such as restocking of shelves, is already permitted by § 35.133(b), which clarifies that ''isolated or temporary interruptions in service or access due to maintenance or repairs'' are permitted. Therefore, the Department will not make any additional changes in the final rule to the language of § 35.133(b) other than those discussed in the preceding paragraph.

Section 35.136 Service animals.

The 1991 title II regulation states that ''[a] public entity shall make reasonable modifications in policies, practices, or procedures when the modifications are necessary to avoid discrimination on the basis of disability, unless the public entity can demonstrate that making the modifications would fundamentally alter the nature of the service, program or activity.'' 28 CFR 130(b)(7). Unlike the title III regulation, the 1991 title II regulation did not contain a specific provision addressing service animals.

In the NPRM, the Department stated the intention of providing the broadest feasible access to individuals with disabilities and their service animals, unless a public entity can demonstrate that making the modifications to policies excluding animals would fundamentally alter the nature of the public entity's service, program, or activity. The Department proposed creating a new § 35.136 addressing service animals that was intended to retain the scope of the 1991 title III regulation at § 36.302(c), while clarifying the Department's longstanding policies and interpretations, as outlined in published technical assistance, *Commonly Asked Questions About Service Animals in Places of Business* (1996), available at *http:// www.ada.gov/qasrvc.ftm* and *ADA Guide for Small Businesses* (1999), available at *http:// www.ada.gov/smbustxt.htm*, and to add that a public entity may exclude a service animal in certain circumstances where the service animal fails to meet certain behavioral standards. The Department received extensive comments in response to proposed § 35.136 from individuals, disability advocacy groups, organizations involved in training service animals, and public entities.

Those comments and the Department's response are discussed below.

Exclusion of service animals. In the NPRM, the Department proposed incorporating the title III regulatory language of § 36.302(c) into new § 35.136(a), which states that ''[g]enerally, a public entity shall modify its policies, practices, or procedures to permit the use of a service animal by an individual with a disability, unless the public entity can demonstrate that the use of a service animal would fundamentally alter the public entity's service, program, or activity.'' The final rule retains this language with some modifications.

In addition, in the NPRM, the Department proposed clarifying those circumstances where otherwise eligible service animals may be excluded by public entities from their programs or facilities. The Department proposed in § 35.136(b)(1) of the NPRM that a public entity may ask an individual with a disability to remove a service animal from a title II service, program, or activity if: ''[t]he animal is out of control and the animal's handler does not take effective action to control it.'' 73 FR 34466, 34504 (June 17, 2008).

The Department has long held that a service animal must be under the control of the handler at all times. Commenters overwhelmingly were in favor of this language, but noted that there are occasions when service animals are provoked to disruptive or aggressive behavior by agitators or troublemakers, as in the case of a blind individual whose service dog is taunted or pinched. While all service animals are trained to ignore and overcome these types of incidents, misbehavior in response to provocation is not always unreasonable. In circumstances where a service animal misbehaves or responds reasonably to a provocation or injury, the public entity must give the handler a reasonable opportunity to gain control of the animal. Further, if the individual with a disability asserts that the animal was provoked or injured, or if the public entity otherwise has reason to suspect that provocation or injury has occurred, the public entity should seek to determine the facts and, if provocation or injury occurred, the public entity should take effective steps to prevent further provocation or injury, which may include asking the provocateur to leave the public entity. This language is unchanged in the final rule.

The NPRM also proposed language at § 35.136(b)(2) to permit a public entity to exclude a service animal if the animal is not housebroken (*i.e.*, trained so that, absent illness or accident, the animal controls its waste elimination) or the animal's presence or behavior fundamentally alters the nature of the service the public entity provides (*e.g.,* repeated barking during a live performance). Several commenters were supportive of this NPRM language, but cautioned against overreaction by the public entity in these instances. One commenter noted that animals get sick, too, and that accidents occasionally happen. In these circumstances, simple clean up typically addresses the incident. Commenters noted that the public entity must be careful when it excludes a service animal on the basis of ''fundamental alteration,'' asserting for example that a public entity should not exclude a service animal for barking in an environment where other types of noise, such as loud cheering or a child crying, is tolerated. The Department maintains that the appropriateness of an exclusion can be assessed by reviewing how a public entity addresses comparable situations that do not involve a service animal. The Department has retained in § 35.136(b) of the final rule the exception requiring animals to be housebroken. The Department has not retained the specific NPRM language stating that animals can be excluded if their presence or behavior fundamentally alters the nature of the service provided by the public entity, because the Department believes that this exception is covered by the general reasonable modification requirement contained in § 35.130(b)(7).

The NPRM also proposed at § 35.136(b)(3) that a service animal can be excluded where ''[t]he animal poses a direct threat to the health or safety of others that cannot be eliminated by reasonable modifications.'' 73 FR 34466, 34504 (June 17, 2008). Commenters were universally supportive of this provision as it makes express the discretion of a public entity to exclude a service animal that poses a direct threat. Several commenters cautioned against the overuse of this provision and suggested that the Department provide an example of the rule's application. The Department has decided not to include regulatory language specifically stating that a service animal can be excluded if it poses a direct threat. The Department believes that the addition of new § 35.139, which incorporates the language of the title III provisions at § 36.302 relating to the general defense of direct threat, is sufficient to establish the availability of this defense to public entities.

Access to a public entity following the proper exclusion of a service animal. The NPRM proposed that in the event a public entity properly excludes a service animal, the public entity must give the individual with a disability the opportunity to access the programs, services, and facilities of the public entity without the service animal. Most commenters welcomed this provision as a common sense approach. These commenters noted that they do not wish to preclude individuals with disabilities from the full and equal enjoyment of the State or local government's programs, services, or facilities, simply because of an isolated problem with a service animal. The Department has elected to retain this provision in § 35.136(a).

Other requirements. The NPRM also proposed that the regulation include the following requirements: that the work or tasks performed by the service animal must be directly related to the handler's disability; that a service animal must be individually trained to do work or perform a task, be housebroken, and be under the control of the handler; and that a service animal must have a harness, leash, or other tether. Most commenters addressed at least one of these issues in their responses. Most agreed that these provisions are important to clarify further the 1991 service animal regulation. The Department has moved the requirement that the work or tasks performed by the service animal must be related directly to the individual's disability to the definition of ''service animal'' in § 35.104. In addition, the Department has modified the proposed language in § 35.136(d) relating to the handler's control of the animal with a harness, leash, or other tether to state that ''[a] service animal shall have a harness, leash, or other tether, unless either the handler is unable because of a disability to use a harness, leash, or other tether, or the use of a harness, leash, or other tether would interfere with the service animal's safe, effective performance of work or tasks, in which case the service animal must be otherwise under the handler's control (*e.g.*, voice control, signals, or other effective means).'' The Department has retained the requirement that the service animal must be individually trained (*see* Appendix A discussion of § 35.104, definition of ''service animal''), as well as the requirement that the service animal be housebroken.

Responsibility for supervision and care of a service animal. The NPRM proposed language at § 35.136(e) stating that ''[a] public entity is not responsible for caring for or supervising a service animal.'' 73 FR 34466, 34504 (June 17, 2008). Most commenters did not address this particular provision. The Department recognizes that there are occasions when a person with a disability is confined to bed in a hospital for a period of time. In such an instance, the individual may not be able to walk or feed the service animal. In such cases, if the individual has a family member, friend, or other person willing to take on these responsibilities in the place of the individual with disabilities, the individual's obligation to be responsible for the care and supervision of the

service animal would be satisfied. The language of this section is retained, with minor modifications, in § 35.136(e) of the final rule.

Inquiries about service animals. The NPRM proposed language at § 35.136(f) setting forth parameters about how a public entity may determine whether an animal qualifies as a service animal. The proposed section stated that a public entity may ask if the animal is required because of a disability and what task or work the animal has been trained to do but may not require proof of service animal certification or licensing. Such inquiries are limited to eliciting the information necessary to make a decision without requiring disclosure of confidential disability-related information that a State or local government entity does not need. This language is consistent with the policy guidance outlined in two Department publications, *Commonly Asked Questions about Service Animals in Places of Business* (1996), available at *http:// www.ada.gov/qasrvc.htm*, and *ADA Guide for Small Businesses,* (1999), available at *http:// www.ada.gov/smbustxt.htm*.

Although some commenters contended that the NPRM service animal provisions leave unaddressed the issue of how a public entity can distinguish between a psychiatric service animal, which is covered under the final rule, and a comfort animal, which is not, other commenters noted that the Department's published guidance has helped public entities to distinguish between service animals and pets on the basis of an individual's response to these questions. Accordingly, the Department has retained the NPRM language incorporating its guidance concerning the permissible questions into the final rule.

Some commenters suggested that a title II entity be allowed to require current documentation, no more than one year old, on letterhead from a mental health professional stating the following: (1) That the individual seeking to use the animal has a mental health-related disability; (2) that having the animal accompany the individual is necessary to the individual's mental health or treatment or to assist the person otherwise; and (3) that the person providing the assessment of the individual is a licensed mental health professional and the individual seeking to use the animal is under that individual's professional care. These commenters asserted that this will prevent abuse and ensure that individuals with legitimate needs for psychiatric service animals may use them. The Department believes that this proposal would treat persons with psychiatric, intellectual, and other mental disabilities less favorably than persons with physical or sensory disabilities. The proposal would also require persons with disabilities to obtain medical documentation and carry it with them any time they seek to engage in ordinary activities of daily life in their communities—something individuals without disabilities have not been required to do. Accordingly, the Department has concluded that a documentation requirement of this kind would be unnecessary, burdensome, and contrary to the spirit, intent, and mandates of the ADA.

Areas of a public entity open to the public, participants in services, programs, or activities, or invitees. The NPRM proposed at § 35.136(g) that an individual with a disability who uses a service animal has the same right of access to areas of a title II entity as members of the public, participants in services, programs, or activities, or invitees. Commenters indicated that allowing individuals with disabilities to go with their service animals into the same areas as members of the public, participants in programs, services, or activities, or invitees is accepted practice by most State and local government entities. The Department has included a slightly modified version of this provision in § 35.136(g) of the final rule.

The Department notes that under the final rule, a healthcare facility must also permit a person with a disability to be accompanied by a service animal in all areas of the facility in which that

person would otherwise be allowed. There are some exceptions, however. The Department follows the guidance of the Centers for Disease Control and Prevention (CDC) on the use of service animals in a hospital setting. Zoonotic diseases can be transmitted to humans through bites, scratches, direct contact, arthropod vectors, or aerosols.

Consistent with CDC guidance, it is generally appropriate to exclude a service animal from limited-access areas that employ general infection-control measures, such as operating rooms and burn units. *See* Centers for Disease Control and Prevention, *Guidelines for Environmental Infection Control in Health-Care Facilities: Recommendations of CDC and the Healthcare Infection Control Practices Advisory Committee* (June 2003), available at *http://www.cdc.gov/hicpac/pdf/guidelines/ eic_in_HCF_03.pdf* (last visited June 24, 2010). A service animal may accompany its handler to such areas as admissions and discharge offices, the emergency room, inpatient and outpatient rooms, examining and diagnostic rooms, clinics, rehabilitation therapy areas, the cafeteria and vending areas, the pharmacy, restrooms, and all other areas of the facility where healthcare personnel, patients, and visitors are permitted without added precaution.

Prohibition against surcharges for use of a service animal. In the NPRM, the Department proposed to incorporate the previously mentioned policy guidance, which prohibits the assessment of a surcharge for the use of a service animal, into proposed § 35.136(h). Several commenters agreed that this provision makes clear the obligation of a public entity to admit an individual with a service animal without surcharges, and that any additional costs imposed should be factored into the overall cost of administering a program, service, or activity, and passed on as a charge to all participants, rather than an individualized surcharge to the service animal user. Commenters also noted that service animal users cannot be required to comply with other requirements that are not generally applicable to other persons. If a public entity normally charges individuals for the damage they cause, an individual with a disability may be charged for damage caused by his or her service animal. The Department has retained this language, with minor modifications, in the final rule at § 35.136(h).

Training requirement. Certain commenters recommended the adoption of formal training requirements for service animals. The Department has rejected this approach and will not impose any type of formal training requirements or certification process, but will continue to require that service animals be individually trained to do work or perform tasks for the benefit of an individual with a disability. While some groups have urged the Department to modify this position, the Department has determined that such a modification would not serve the full array of individuals with disabilities who use service animals, since individuals with disabilities may be capable of training, and some have trained, their service animal to perform tasks or do work to accommodate their disability. A training and certification requirement would increase the expense of acquiring a service animal and might limit access to service animals for individuals with limited financial resources.

Some commenters proposed specific behavior or training standards for service animals, arguing that without such standards, the public has no way to differentiate between untrained pets and service animals. Many of the suggested behavior or training standards were lengthy and detailed. The Department believes that this rule addresses service animal behavior sufficiently by including provisions that address the obligations of the service animal user and the circumstances under which a service animal may be excluded, such as the requirements that an animal be housebroken and under the control of its handler.

Miniature horses. The Department has been persuaded by commenters and the available research to include a provision that would require

public entities to make reasonable modifications to policies, practices, or procedures to permit the use of a miniature horse by a person with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability. The traditional service animal is a dog, which has a long history of guiding individuals who are blind or have low vision, and over time dogs have been trained to perform an even wider variety of services for individuals with all types of disabilities. However, an organization that developed a program to train miniature horses, modeled on the program used for guide dogs, began training miniature horses in 1991.

Although commenters generally supported the species limitations proposed in the NPRM, some were opposed to the exclusion of miniature horses from the definition of a service animal. These commenters noted that these animals have been providing assistance to persons with disabilities for many years. Miniature horses were suggested by some commenters as viable alternatives to dogs for individuals with allergies, or for those whose religious beliefs preclude the use of dogs. Another consideration mentioned in favor of the use of miniature horses is the longer life span and strength of miniature horses in comparison to dogs. Specifically, miniature horses can provide service for more than 25 years while dogs can provide service for approximately 7 years, and, because of their strength, miniature horses can provide services that dogs cannot provide. Accordingly, use of miniature horses reduces the cost involved to retire, replace, and train replacement service animals.

The miniature horse is not one specific breed, but may be one of several breeds, with distinct characteristics that produce animals suited to service animal work. The animals generally range in height from 24 inches to 34 inches measured to the withers, or shoulders, and generally weigh between 70 and 100 pounds. These characteristics are similar to those of large breed dogs such as Labrador Retrievers, Great Danes, and Mastiffs. Similar to dogs, miniature horses can be trained through behavioral reinforcement to be ''housebroken.'' Most miniature service horse handlers and organizations recommend that when the animals are not doing work or performing tasks, the miniature horses should be kept outside in a designated area, instead of indoors in a house.

According to information provided by an organization that trains service horses, these miniature horses are trained to provide a wide array of services to their handlers, primarily guiding individuals who are blind or have low vision, pulling wheelchairs, providing stability and balance for individuals with disabilities that impair the ability to walk, and supplying leverage that enables a person with a mobility disability to get up after a fall. According to the commenter, miniature horses are particularly effective for large stature individuals. The animals can be trained to stand (and in some cases, lie down) at the handler's feet in venues where space is at a premium, such as assembly areas or inside some vehicles that provide public transportation. Some individuals with disabilities have traveled by train and have flown commercially with their miniature horses.

The miniature horse is not included in the definition of service animal, which is limited to dogs. However, the Department has added a specific provision at § 35.136(i) of the final rule covering miniature horses. Under this provision, a public entity must make reasonable modifications in policies, practices, or procedures to permit the use of a miniature horse by an individual with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability. The public entity may take into account a series of assessment factors in determining whether to allow a miniature horse into a specific facility. These include the type, size, and weight of the miniature horse; whether the handler has sufficient

control of the miniature horse; whether the miniature horse is housebroken; and whether the miniature horse's presence in a specific facility compromises legitimate safety requirements that are necessary for safe operation. In addition, paragraphs (c)–(h) of this section, which are applicable to dogs, also apply to miniature horses.

Ponies and full-size horses are not covered by § 35.136(i). Also, because miniature horses can vary in size and can be larger and less flexible than dogs, covered entities may exclude this type of service animal if the presence of the miniature horse, because of its larger size and lower level of flexibility, results in a fundamental alteration to the nature of the programs activities, or services provided.

Section 35.137 Mobility devices.

Section 35.137 of the NPRM clarified the scope and circumstances under which covered entities are legally obligated to accommodate various ''mobility devices.'' Section 35.137 set forth specific requirements for the accommodation of ''mobility devices,'' including wheelchairs, manually-powered mobility aids, and other power-driven mobility devices.

In both the NPRM and the final rule, § 35.137(a) states the general rule that in any areas open to pedestrians, public entities shall permit individuals with mobility disabilities to use wheelchairs and manually-powered mobility aids, including walkers, crutches, canes, braces, or similar devices. Because mobility scooters satisfy the definition of ''wheelchair'' (*i.e.*, ''manually-operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor, or of both indoor and outdoor locomotion''), the reference to them in § 35.137(a) of the final rule has been omitted to avoid redundancy.

Some commenters expressed concern that permitting the use of other power-driven mobility devices by individuals with mobility disabilities would make such devices akin to wheelchairs and would require them to make physical changes to their facilities to accommodate their use. This concern is misplaced. If a facility complies with the applicable design requirements in the 1991 Standards or the 2010 Standards, the public entity will not be required to exceed those standards to accommodate the use of wheelchairs or other power-driven mobility devices that exceed those requirements.

Legal standard for other power-driven mobility devices. The NPRM version of § 35.137(b) provided that ''[a] public entity shall make reasonable modifications in its policies, practices, and procedures to permit the use of other power-driven mobility devices by individuals with disabilities, unless the public entity can demonstrate that the use of the device is not reasonable or that its use will result in a fundamental alteration in the public entity's service, program, or activity.'' 73 FR 34466, 34505 (June 17, 2008). In other words, public entities are by default required to permit the use of other power-driven mobility devices; the burden is on them to prove the existence of a valid exception.

Most commenters supported the notion of assessing whether the use of a particular device is reasonable in the context of a particular venue. Commenters, however, disagreed about the meaning of the word ''reasonable'' as it is used in § 35.137(b) of the NPRM. Advocacy and nonprofit groups almost universally objected to the use of a general reasonableness standard with regard to the assessment of whether a particular device should be allowed at a particular venue. They argued that the assessment should be based on whether reasonable modifications could be made to allow a particular device at a particular venue, and that the only factors that should be part of the calculus that results in the exclusion of a particular device are undue burden, direct threat, and fundamental alteration.

A few commenters opposed the proposed provision requiring public entities to assess whether reasonable modifications can be made to allow other power-driven mobility devices, preferring instead that the Department issue guidance materials so that public entities would not have to incur the cost of such analyses. Another commenter noted a ''fox guarding the hen house''-type of concern with regard to public entities developing and enforcing their own modification policy.

In response to comments received, the Department has revised § 35.137(b) to provide greater clarity regarding the development of legitimate safety requirements regarding other power-driven mobility devices and has added a new § 35.130(h) (Safety) to the title II regulation which specifically permits public entities to impose legitimate safety requirements necessary for the safe operation of their services, programs, and activities. (*See* discussion below.) The Department has not retained the proposed NPRM language stating that an other power-driven mobility device can be excluded if a public entity can demonstrate that its use is unreasonable or will result in a fundamental alteration of the entity's service, program, or activity, because the Department believes that this exception is covered by the general reasonable modification requirement contained in § 35.130(b)(7).

Assessment factors. Section 35.137(c) of the NPRM required public entities to ''establish policies to permit the use of other power-driven mobility devices'' and articulated four factors upon which public entities must base decisions as to whether a modification is reasonable to allow the use of a class of other power-driven mobility devices by individuals with disabilities in specific venues (*e.g.*, parks, courthouses, office buildings, etc.). 73 FR 34466, 34504 (June 17, 2008).

The Department has relocated and modified the NPRM text that appeared in § 35.137(c) to new paragraph § 35.137(b)(2) to clarify what factors the public entity shall use in determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification. Section 35.137(b)(2) now states that ''[i]n determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification under (b)(1), a public entity shall consider'' certain enumerated factors. The assessment factors are designed to assist public entities in determining whether allowing the use of a particular other power-driven mobility device in a specific facility is reasonable. Thus, the focus of the analysis must be on the appropriateness of the use of the device at a specific facility, rather than whether it is necessary for an individual to use a particular device.

The NPRM proposed the following specific assessment factors: (1) The dimensions, weight, and operating speed of the mobility device in relation to a wheelchair; (2) the potential risk of harm to others by the operation of the mobility device; (3) the risk of harm to the environment or natural or cultural resources or conflict with Federal land management laws and regulations; and (4) the ability of the public entity to stow the mobility device when not in use, if requested by the user.

Factor 1 was designed to help public entities assess whether a particular device was appropriate, given its particular physical features, for a particular location. Virtually all commenters said the physical features of the device affected their view of whether a particular device was appropriate for a particular location. For example, while many commenters supported the use of another power-driven mobility device if the device were a Segway® PT, because of environmental and health concerns they did not offer the same level of support if the device were an off-highway vehicle, all-terrain vehicle (ATV), golf car, or other device with a fuel-powered or combustion engine. Most commenters noted that indicators such as speed, weight, and dimension really were an assessment of the appropriateness of a

particular device in specific venues and suggested that factor 1 say this more specifically.

The term ''in relation to a wheelchair'' in the NPRM's factor 1 apparently created some concern that the same legal standards that apply to wheelchairs would be applied to other power-driven mobility devices. The Department has omitted the term ''in relation to a wheelchair'' from § 35.137(b)(2)(i) to clarify that if a facility that is in compliance with the applicable provisions of the 1991 Standards or the 2010 Standards grants permission for an other power-driven mobility device to go on-site, it is not required to exceed those standards to accommodate the use of other power-driven mobility devices.

In response to requests that NPRM factor 1 state more specifically that it requires an assessment of an other power-driven mobility device's appropriateness under particular circumstances or in particular venues, the Department has added several factors and more specific language. In addition, although the NPRM made reference to the operation of other power-driven mobility devices in ''specific venues,'' the Department's intent is captured more clearly by referencing ''specific facility'' in paragraph (b)(2). The Department also notes that while speed is included in factor 1, public entities should not rely solely on a device's top speed when assessing whether the device can be accommodated; instead, public entities should also consider the minimum speeds at which a device can be operated and whether the development of speed limit policies can be established to address concerns regarding the speed of the device. Finally, since the ability of the public entity to stow the mobility device when not in use is an aspect of its design and operational characteristics, the text proposed as factor 4 in the NPRM has been incorporated in paragraph (b)(2)(iii).

The NPRM's version of factor 2 provided that the ''risk of potential harm to others by the operation of the mobility device'' is one of the determinants in the assessment of whether other power-driven mobility devices should be excluded from a site. The Department intended this requirement to be consistent with the Department's longstanding interpretation, expressed in § II–3.5200 (Safety) of the 1993 Title II Technical Assistance Manual, which provides that public entities may ''impose legitimate safety requirements that are necessary for safe operation.'' (This language parallels the provision in the title III regulation at § 36.301(b).) However, several commenters indicated that they read this language, particularly the phrase ''risk of potential harm,'' to mean that the Department had adopted a concept of risk analysis different from that which is in the existing standards. The Department did not intend to create a new standard and has changed the language in paragraphs (b)(1) and (b)(2) to clarify the applicable standards, thereby avoiding the introduction of new assessments of risk beyond those necessary for the safe operation of the public entity. In addition, the Department has added a new section, 35.130(h), which incorporates the existing safety standard into the title II regulation.

While all applicable affirmative defenses are available to public entities in the establishment and execution of their policies regarding other power-driven mobility devices, the Department did not explicitly incorporate the direct threat defense into the assessment factors because § 35.130(h) provides public entities the appropriate framework with which to assess whether legitimate safety requirements that may preclude the use of certain other power-driven mobility devices are necessary for the safe operation of the public entities. In order to be legitimate, the safety requirement must be based on actual risks and not mere speculation regarding the device or how it will be operated. Of course, public entities may enforce legitimate safety rules established by the public entity for the operation of other power-driven mobility devices (*e.g.*, reasonable speed restrictions). Finally, NPRM

factor 3 concerning environmental resources and conflicts of law has been relocated to § 35.137(b)(2)(v).

As a result of these comments and requests, NPRM factors 1, 2, 3, and 4 have been revised and renumbered within paragraph (b)(2) in the final rule.

Several commenters requested that the Department provide guidance materials or more explicit concepts of which considerations might be appropriate for inclusion in a policy that allows the use of other power-driven mobility devices. A public entity that has determined that reasonable modifications can be made in its policies, practices, or procedures to allow the use of other power-driven mobility devices should develop a policy that clearly states the circumstances under which the use of other power-driven mobility devices by individuals with a mobility disability will be permitted. It also should include clear, concise statements of specific rules governing the operation of such devices. Finally, the public entity should endeavor to provide individuals with disabilities who use other power-driven mobility devices with advanced notice of its policy regarding the use of such devices and what rules apply to the operation of these devices.

For example, the U.S. General Services Administration (GSA) has developed a policy allowing the use of the Segway® PT and other EPAMDs in all Federal buildings under GSA's jurisdiction. *See* General Services Administration, I*nterim Segway® Personal Transporter Policy* (Dec. 3, 2007), available at *http://www.gsa.gov/graphics/pbs/ Interim_Segway_Policy_121007.pdf* (last visited June 24, 2010). The GSA policy defines the policy's scope of coverage by setting out what devices are and are not covered by the policy. The policy also sets out requirements for safe operation, such as a speed limit, prohibits the use of EPAMDs on escalators, and provides guidance regarding security screening of these devices and their operators.

A public entity that determines that it can make reasonable modifications to permit the use of an other power-driven mobility device by an individual with a mobility disability might include in its policy the procedure by which claims that the other power-driven mobility device is being used for a mobility disability will be assessed for legitimacy (*i.e.*, a credible assurance that the device is being used for a mobility disability, including a verbal representation by the person with a disability that is not contradicted by observable fact, or the presentation of a disability parking space placard or card, or State-issued proof of disability); the type or classes of other power-driven mobility devices are permitted to be used by individuals with mobility disabilities; the size, weight, and dimensions of the other power-driven mobility devices that are permitted to be used by individuals with mobility disabilities; the speed limit for the other power-driven mobility devices that are permitted to be used by individuals with mobility disabilities; the places, times, or circumstances under which the use of the other power-driven mobility device is or will be restricted or prohibited; safety, pedestrian, and other rules concerning the use of the other power-driven mobility device; whether, and under which circumstances, storage for the other power-driven mobility device will be made available; and how and where individuals with a mobility disability can obtain a copy of the other power-driven mobility device policy.

Public entities also might consider grouping other power-driven mobility devices by type (*e.g.,* EPAMDs, golf cars, gasoline-powered vehicles, and other devices). For example, an amusement park may determine that it is reasonable to allow individuals with disabilities to use EPAMDs in a variety of outdoor programs and activities, but that it would not be reasonable to allow the use of golf cars as mobility devices in similar circumstances. At the same time, the entity may address its concerns about factors such as space limitations by disallowing use of EPAMDs by members

of the general public who do not have mobility disabilities.

The Department anticipates that, in many circumstances, public entities will be able to develop policies that will allow the use of other power-driven mobility devices by individuals with mobility disabilities. Consider the following example:

A county courthouse has developed a policy whereby EPAMDs may be operated in the pedestrian areas of the courthouse if the operator of the device agrees not to operate the device faster than pedestrians are walking; to yield to pedestrians; to provide a rack or stand so that the device can stand upright; and to use the device only in courtrooms that are large enough to accommodate such devices. If the individual is selected for jury duty in one of the smaller courtrooms, the county's policy indicates that if it is not possible for the individual with the disability to park the device and walk into the courtroom, the location of the trial will be moved to a larger courtroom.

Inquiry into the use of other power-driven mobility device. The NPRM version of § 35.137(d) provided that ''[a] public entity may ask a person using a power-driven mobility device if the mobility device is needed due to the person's disability. A public entity shall not ask a person using a mobility device questions about the nature and extent of the person's disability.'' 73 FR 34466, 34504 (June 17, 2008).

Many environmental, transit system, and government commenters expressed concern about people feigning mobility disabilities to be able to use other power-driven mobility devices in public entities in which their use is otherwise restricted. These commenters felt that a mere inquiry into whether the device is being used for a mobility disability was an insufficient mechanism by which to detect fraud by other power-driven mobility device users who do not have mobility disabilities. These commenters believed they should be given more latitude to make inquiries of other power-driven mobility device users claiming a mobility disability than they would be given for wheelchair users. They sought the ability to establish a policy or method by which public entities may assess the legitimacy of the mobility disability. They suggested some form of certification, sticker, or other designation. One commenter suggested a requirement that a sticker bearing the international symbol for accessibility be placed on the device or that some other identification be required to signal that the use of the device is for a mobility disability. Other suggestions included displaying a disability parking placard on the device or issuing EPAMDs, like the Segway® PT, a permit that would be similar to permits associated with parking spaces reserved for those with disabilities.

Advocacy, nonprofit, and several individual commenters balked at the notion of allowing any inquiry beyond whether the device is necessary for a mobility disability and encouraged the Department to retain the NPRM's language on this topic. Other commenters, however, were empathetic with commenters who had concerns about fraud. At least one Segway® PT advocate suggested it would be permissible to seek documentation of the mobility disability in the form of a simple sign or permit.

The Department has sought to find common ground by balancing the needs of public entities and individuals with mobility disabilities wishing to use other power-driven mobility devices with the Department's longstanding, well-established policy of not allowing public entities or establishments to require proof of a mobility disability. There is no question that public entities have a legitimate interest in ferreting out fraudulent representations of mobility disabilities, especially given the recreational use of other power-driven mobility devices and the potential safety concerns created by having too many such devices in a specific facility at one time. However, the privacy of individuals with mobility disabilities and respect for those individuals, is also vitally important.

Neither § 35.137(d) of the NPRM nor § 35.137(c) of the final rule permits inquiries into the nature of a person's mobility disability. However, the Department does not believe it is unreasonable or overly intrusive for an individual with a mobility disability seeking to use an other power-driven mobility device to provide a credible assurance to verify that the use of the other power-driven mobility device is for a mobility disability. The Department sought to minimize the amount of discretion and subjectivity exercised by public entities in assessing whether an individual has a mobility disability and to allow public entities to verify the existence of a mobility disability. The solution was derived from comments made by several individuals who said they have been admitted with their Segway® PTs into public entities and public accommodations that ordinarily do not allow these devices on-site when they have presented or displayed State-issued disability parking placards. In the examples provided by commenters, the parking placards were accepted as verification that the Segway® PTs were being used as mobility devices.

Because many individuals with mobility disabilities avail themselves of State programs that issue disability parking placards or cards and because these programs have penalties for fraudulent representations of identity and disability, utilizing the parking placard system as a means to establish the existence of a mobility disability strikes a balance between the need for privacy of the individual and fraud protection for the public entity. Consequently, the Department has decided to include regulatory text in § 35.137(c)(2) of the final rule that requires public entities to accept the presentation of a valid, State-issued disability parking placard or card, or State-issued proof of disability, as verification that an individual uses the other power-driven mobility device for his or her mobility disability. A ''valid'' disability placard or card is one that is presented by the individual to whom it was issued and is otherwise in compliance with the State of issuance's requirements for disability placards or cards. Public entities are required to accept a valid, State-issued disability parking placard or card, or State-issued proof of disability as a credible assurance, but they cannot demand or require the presentation of a valid disability placard or card, or State-issued proof of disability, as a prerequisite for use of an other power-driven mobility device, because not all persons with mobility disabilities have such means of proof. If an individual with a mobility disability does not have such a placard or card, or State-issued proof of disability, he or she may present other information that would serve as a credible assurance of the existence of a mobility disability.

In lieu of a valid, State-issued disability parking placard or card, or State-issued proof of disability, a verbal representation, not contradicted by observable fact, shall be accepted as a credible assurance that the other power-driven mobility device is being used because of a mobility disability. This does not mean, however, that a mobility disability must be observable as a condition for allowing the use of an other power-driven mobility device by an individual with a mobility disability, but rather that if an individual represents that a device is being used for a mobility disability and that individual is observed thereafter engaging in a physical activity that is contrary to the nature of the represented disability, the assurance given is no longer credible and the individual may be prevented from using the device.

Possession of a valid, State-issued disability parking placard or card or a verbal assurance does not trump a public entity's valid restrictions on the use of other power-driven mobility devices. Accordingly, a credible assurance that the other power-driven mobility device is being used because of a mobility disability is not a guarantee of entry to a public entity because, notwithstanding such credible assurance, use of the device in a particular venue may be at odds with the legal standard in § 35.137(b)(1) or with

one or more of the § 35.137(b)(2) factors. Only after an individual with a disability has satisfied all of the public entity's policies regarding the use of other power-driven mobility devices does a credible assurance become a factor in allowing the use of the device. For example, if an individual seeking to use an other power-driven mobility device fails to satisfy any of the public entity's stated policies regarding the use of other power-driven mobility devices, the fact that the individual legitimately possesses and presents a valid, State-issued disability parking placard or card, or State-issued proof of disability, does not trump the policy and require the public entity to allow the use of the device. In fact, in some instances, the presentation of a legitimately held placard or card, or State-issued proof of disability, will have no relevance or bearing at all on whether the other power-driven mobility device may be used, because the public entity's policy does not permit the device in question on-site under any circumstances (*e.g.,* because its use would create a substantial risk of serious harm to the immediate environment or natural or cultural resources). Thus, an individual with a mobility disability who presents a valid disability placard or card, or State-issued proof of disability, will not be able to use an ATV as an other power-driven mobility device in a State park if the State park has adopted a policy banning their use for any or all of the above-mentioned reasons. However, if a public entity permits the use of a particular other power-driven mobility device, it cannot refuse to admit an individual with a disability who uses that device if the individual has provided a credible assurance that the use of the device is for a mobility disability.

Section 35.138 Ticketing

The 1991 title II regulation did not contain specific regulatory language on ticketing. The ticketing policies and practices of public entities, however, are subject to title II's nondiscrimination provisions. Through the investigation of complaints, enforcement actions, and public comments related to ticketing, the Department became aware that some venue operators, ticket sellers, and distributors were violating title II's nondiscrimination mandate by not providing individuals with disabilities the same opportunities to purchase tickets for accessible seating as they provided to spectators purchasing conventional seats. In the NPRM, the Department proposed § 35.138 to provide explicit direction and guidance on discriminatory practices for entities involved in the sale or distribution of tickets.

The Department received comments from advocacy groups, assembly area trade associations, public entities, and individuals. Many commenters supported the addition of regulatory language pertaining to ticketing and urged the Department to retain it in the final rule. Several commenters, however, questioned why there were inconsistencies between the title II and title III provisions and suggested that the same language be used for both titles. The Department has decided to retain ticketing regulatory language and to ensure consistency between the ticketing provisions in title II and title III.

Because many in the ticketing industry view season tickets and other multi-event packages differently from individual tickets, the Department bifurcated some season ticket provisions from those concerning single-event tickets in the NPRM. This structure, however, resulted in some provisions being repeated for both types of tickets but not for others even though they were intended to apply to both types of tickets. The result was that it was not entirely clear that some of the provisions that were not repeated also were intended to apply to season tickets. The Department is addressing the issues raised by these commenters using a different approach. For the purposes of this section, a *single event* refers to an individual performance for which tickets may be purchased. In contrast, *a series of events* includes, but is not limited to, subscription events,

event packages, season tickets, or any other tickets that may be purchased for multiple events of the same type over the course of a specified period of time whose ownership right reverts to the public entity at the end of each season or time period. Series-of-events tickets that give their holders an enhanced ability to purchase such tickets from the public entity in seasons or periods of time that follow, such as a right of first refusal or higher ranking on waiting lists for more desirable seats, are subject to the provisions in this section. In addition, the final rule merges together some NPRM paragraphs that dealt with related topics and has reordered and renamed some of the paragraphs that were in the NPRM.

Ticket sales. In the NPRM, the Department proposed, in § 35.138(a), a general rule that a public entity shall modify its policies, practices, or procedures to ensure that individuals with disabilities can purchase tickets for accessible seating for an event or series of events in the same way as others (*i.e.*, during the same hours and through the same distribution methods as other seating is sold). 73 FR 34466, 34504 (June 17, 2008). ''Accessible seating'' is defined in §35.138(a)(1) of the final rule to mean ''wheelchair spaces and companion seats that comply with sections 221 and 802 of the 2010 Standards along with any other seats required to be offered for sale to the individual with a disability pursuant to paragraph (d) of this section.'' The defined term does not include designated aisle seats. A ''wheelchair space'' refers to a space for a single wheelchair and its occupant.

The NPRM proposed requiring that accessible seats be sold through the ''same methods of distribution'' as non-accessible seats. Comments from venue managers and others in the business community, in general, noted that multiple parties are involved in ticketing, and because accessible seats may not be allotted to all parties involved at each stage, such parties should be protected from liability. For example, one commenter noted that a third-party ticket vendor, like Ticketmaster, can only sell the tickets it receives from its client. Because § 35.138(a)(2)(iii) of the final rule requires venue operators to make available accessible seating through the same methods of distribution they use for their regular tickets, venue operators that provide tickets to third-party ticket vendors are required to provide accessible seating to the third-party ticket vendor. This provision will enhance third-party ticket vendors' ability to acquire and sell accessible seating for sale in the future. The Department notes that once third-party ticket vendors acquire accessible tickets, they are obligated to sell them in accordance with these rules.

The Department also has received frequent complaints that individuals with disabilities have not been able to purchase accessible seating over the Internet, and instead have had to engage in a laborious process of calling a customer service line, or sending an e-mail to a customer service representative and waiting for a response. Not only is such a process burdensome, but it puts individuals with disabilities at a disadvantage in purchasing tickets for events that are popular and may sell out in minutes. Because § 35.138(e) of the final rule authorizes venues to release accessible seating in case of a sellout, individuals with disabilities effectively could be cut off from buying tickets unless they also have the ability to purchase tickets in real time over the Internet. The Department's new regulatory language is designed to address this problem.

Several commenters representing assembly areas raised concerns about offering accessible seating for sale over the Internet. They contended that this approach would increase the incidence of fraud since anyone easily could purchase accessible seating over the Internet. They also asserted that it would be difficult technologically to provide accessible seating for sale in real time over the Internet, or that to do so would require simplifying the rules concerning the purchase of multiple additional accompanying

seats. Moreover, these commenters argued that requiring an individual purchasing accessible seating to speak with a customer service representative would allow the venue to meet the patron's needs most appropriately and ensure that wheelchair spaces are reserved for individuals with disabilities who require wheelchair spaces. Finally, these commenters argued that individuals who can transfer effectively and conveniently from a wheelchair to a seat with a movable armrest seat could instead purchase designated aisle seats.

The Department considered these concerns carefully and has decided to continue with the general approach proposed in the NPRM. Although fraud is an important concern, the Department believes that it is best combated by other means that would not have the effect of limiting the ability of individuals with disabilities to purchase tickets, particularly since restricting the purchase of accessible seating over the Internet will, of itself, not curb fraud. In addition, the Department has identified permissible means for covered entities to reduce the incidence of fraudulent accessible seating ticket purchases in § 35.138(h) of the final rule.

Several commenters questioned whether ticket websites themselves must be accessible to individuals who are blind or have low vision, and if so, what that requires. The Department has consistently interpreted the ADA to cover websites that are operated by public entities and stated that such sites must provide their services in an accessible manner or provide an accessible alternative to the website that is available 24 hours a day, seven days a week. The final rule, therefore, does not impose any new obligation in this area. The accessibility of websites is discussed in more detail in the section of Appendix A entitled ''Other Issues.''

In § 35.138(b) of the NPRM, the Department also proposed requiring public entities to make accessible seating available during all stages of tickets sales including, but not limited to, pre-sales, promotions, lotteries, waitlists, and general sales. For example, if tickets will be presold for an event that is open only to members of a fan club, or to holders of a particular credit card, then tickets for accessible seating must be made available for purchase through those means. This requirement does not mean that any individual with a disability would be able to purchase those seats. Rather, it means that an individual with a disability who meets the requirement for such a sale (*e.g.,* who is a member of the fan club or holds that credit card) will be able to participate in the special promotion and purchase accessible seating. The Department has maintained the substantive provisions of the NPRM's § 35.138(a) and (b) but has combined them in a single paragraph at § 35.138(a)(2) of the final rule so that all of the provisions having to do with the manner in which tickets are sold are located in a single paragraph.

Identification of available accessible seating. In the NPRM, the Department proposed § 35.138(c), which, as modified and renumbered as paragraph (b)(3) in the final rule, requires a facility to identify available accessible seating through seating maps, brochures, or other methods if that information is made available about other seats sold to the general public. This rule requires public entities to provide information about accessible seating to the same degree of specificity that it provides information about general seating. For example, if a seating map displays color-coded blocks pegged to prices for general seating, then accessible seating must be similarly color-coded. Likewise, if covered entities provide detailed maps that show exact seating and pricing for general seating, they must provide the same for accessible seating.

The NPRM did not specify a requirement to identify prices for accessible seating. The final rule requires that if such information is provided for general seating, it must be provided for accessible seating as well.

In the NPRM, the Department proposed in

§ 35.138(d) that a public entity, upon being asked, must inform persons with disabilities and their companions of the locations of all unsold or otherwise available seating. This provision is intended to prevent the practice of ''steering'' individuals with disabilities to certain accessible seating so that the facility can maximize potential ticket sales by releasing unsold accessible seating, especially in preferred or desirable locations, for sale to the general public. The Department received no significant comment on this proposal. The Department has retained this provision in the final rule but has added it, with minor modifications, to § 35.138(b) as paragraph (1).

Ticket prices. In the NPRM, the Department proposed § 35.138(e) requiring that ticket prices for accessible seating be set no higher than the prices for other seats in that seating section for that event. The NPRM's provision also required that accessible seating be made available at every price range, and if an existing facility has barriers to accessible seating within a particular price range, a proportionate amount of seating (determined by the ratio of the total number of seats at that price level to the total number of seats in the assembly area) must be offered in an accessible location at that same price. Under this rule, for example, if a public entity has a 20,000-seat facility built in 1980 with inaccessible seating in the $20-price category, which is on the upper deck, and it chooses not to put accessible seating in that section, then it must place a proportionate number of seats in an accessible location for $20. If the upper deck has 2,000 seats, then the facility must place 10 percent of its accessible seating in an accessible location for $20 provided that it is part of a seating section where ticket prices are equal to or more than $20—a facility may not place the $20-accessible seating in a $10-seating section. The Department received no significant comment on this rule, and it has been retained, as amended, in the final rule in § 35.138(c).

Purchase of multiple tickets. In the NPRM, the Department proposed § 35.138(i) to address one of the most common ticketing complaints raised with the Department: That individuals with disabilities are not able to purchase more than two tickets. The Department proposed this provision to facilitate the ability of individuals with disabilities to attend events with friends, companions, or associates who may or may not have a disability by enabling individuals with disabilities to purchase the maximum number of tickets allowed per transaction to other spectators; by requiring venues to place accompanying individuals in general seating as close as possible to accessible seating (in the event that a group must be divided because of the large size of the group); and by allowing an individual with a disability to purchase up to three additional contiguous seats per wheelchair space if they are available at the time of sale. Section 35.138(i)(2) of the NPRM required that a group containing one or more wheelchair users must be placed together, if possible, and that in the event that the group could not be placed together, the individuals with disabilities may not be isolated from the rest of the group.

The Department asked in the NPRM whether this rule was sufficient to effectuate the integration of individuals with disabilities. Many advocates and individuals praised it as a welcome and much-needed change, stating that the trade-off of being able to sit with their family or friends was worth reducing the number of seats available for individuals with disabilities. Some commenters went one step further and suggested that the number of additional accompanying seats should not be restricted to three.

Although most of the substance of the proposed provision on the purchase of multiple tickets has been maintained in the final rule, it has been renumbered as § 35.138(d), reorganized, and supplemented. To preserve the availability of accessible seating for other individuals with disabilities, the Department has not expanded the rule beyond three additional contiguous seats. Section 35.138(d)(1) of the final rule requires

public entities to make available for purchase three additional tickets for seats in the same row that are contiguous with the wheelchair space provided that at the time of the purchase there are three such seats available. The requirement that the additional seats be ''contiguous with the wheelchair space'' does not mean that each of the additional seats must be in actual contact or have a border in common with the wheelchair space; however, at least one of the additional seats should be immediately adjacent to the wheelchair space. The Department recognizes that it will often be necessary to use vacant wheelchair spaces to provide for contiguous seating.

The Department has added paragraphs (d)(2) and (d)(3) to clarify that in situations where there are insufficient unsold seats to provide three additional contiguous seats per wheelchair space or a ticket office restricts sales of tickets to a particular event to less than four tickets per customer, the obligation to make available three additional contiguous seats per wheelchair space would be affected. For example, if at the time of purchase, there are only two additional contiguous seats available for purchase because the third has been sold already, then the ticket purchaser would be entitled to two such seats. In this situation, the public entity would be required to make up the difference by offering one additional ticket for sale that is as close as possible to the accessible seats. Likewise, if ticket purchases for an event are limited to two per customer, a person who uses a wheelchair who seeks to purchase tickets would be entitled to purchase only one additional contiguous seat for the event.

The Department also has added paragraph (d)(4) to clarify that the requirement for three additional contiguous seats is not intended to serve as a cap if the maximum number of tickets that may be purchased by members of the general public exceeds the four tickets an individual with a disability ordinarily would be allowed to purchase (*i.e.*, a wheelchair space and three additional contiguous seats). If the maximum number of tickets that may be purchased by members of the general public exceeds four, an individual with a disability is to be allowed to purchase the maximum number of tickets; however, additional tickets purchased by an individual with a disability beyond the wheelchair space and the three additional contiguous seats provided in § 35.138(d)(1) do not have to be contiguous with the wheelchair space.

The NPRM proposed at § 35.138(i)(2) that for group sales, if a group includes one or more individuals who use a wheelchair, then the group shall be placed in a seating area with accessible seating so that, if possible, the group can sit together. If it is necessary to divide the group, it should be divided so that the individuals in the group who use wheelchairs are not isolated from the rest of the members of their group. The final rule retains the NPRM language in paragraph (d)(5).

Hold-and-release of unsold accessible seating. The Department recognizes that not all accessible seating will be sold in all assembly areas for every event to individuals with disabilities who need such seating and that public entities may have opportunities to sell such seating to the general public. The Department proposed in the NPRM a provision aimed at striking a balance between affording individuals with disabilities adequate time to purchase accessible seating and the entity's desire to maximize ticket sales. In the NPRM, the Department proposed § 35.138(f), which allowed for the release of accessible seating under the following circumstances: (i) When all seating in the facility has been sold, excluding luxury boxes, club boxes, or suites; (ii) when all seating in a designated area has been sold and the accessible seating being released is in the same area; or (iii) when all seating in a designated price range has been sold and the accessible seating being released is within the same price range.

The Department's NPRM asked ''whether additional regulatory guidance is required or appropriate in terms of a more detailed or set

schedule for the release of tickets in conjunction with the three approaches described above. For example, does the proposed regulation address the variable needs of assembly areas covered by the ADA? Is additional regulatory guidance required to eliminate discriminatory policies, practices and procedures related to the sale, hold, and release of accessible seating? What considerations should appropriately inform the determination of when unsold accessible seating can be released to the general public?'' 73 FR 34466, 34484 (June 17, 2008).

The Department received comments both supporting and opposing the inclusion of a hold-and-release provision. One side proposed loosening the restrictions on the release of unsold accessible seating. One commenter from a trade association suggested that tickets should be released regardless of whether there is a sell-out, and that these tickets should be released according to a set schedule. Conversely, numerous individuals, advocacy groups, and at least one public entity urged the Department to tighten the conditions under which unsold tickets for accessible seating may be released. These commenters suggested that venues should not be permitted to release tickets during the first two weeks of sale, or alternatively, that they should not be permitted to be released earlier than 48 hours before a sold-out event. Many of these commenters criticized the release of accessible seating under the second and third prongs of § 35.138(f) in the NPRM (when there is a sell-out in general seating in a designated seating area or in a price range), arguing that it would create situations where general seating would be available for purchase while accessible seating would not be.

Numerous commenters—both from the industry and from advocacy groups—asked for clarification of the term ''sell-out.'' Business groups commented that industry practice is to declare a sell-out when there are only ''scattered singles'' available— isolated seats that cannot be purchased as a set of adjacent pairs. Many of those same commenters also requested that ''sell-out'' be qualified with the phrase ''of all seating available for sale'' since it is industry practice to hold back from release tickets to be used for groups connected with that event (*e.g.,* the promoter, home team, or sports league). They argued that those tickets are not available for sale and any return of these tickets to the general inventory happens close to the event date. Noting the practice of holding back tickets, one advocacy group suggested that covered entities be required to hold back accessible seating in proportion to the number of tickets that are held back for later release.

The Department has concluded that it would be inappropriate to interfere with industry practice by defining what constitutes a ''sell-out'' and that a public entity should continue to use its own approach to defining a ''sell-out.'' If, however, a public entity declares a sell-out by reference to those seats that are available for sale, but it holds back tickets that it reasonably anticipates will be released later, it must hold back a proportional percentage of accessible seating to be released as well.

Adopting any of the alternatives proposed in the comments summarized above would have upset the balance between protecting the rights of individuals with disabilities and meeting venues' concerns about lost revenue from unsold accessible seating. As a result, the Department has retained § 35.138(f) (renumbered as § 35.138(e)) in the final rule.

The Department has, however, modified the regulation text to specify that accessible seating may be released only when ''all nonaccessible tickets in a designated seating area have been sold and the tickets for accessible seating are being released in the same designated area.'' As stated in the NPRM, the Department intended for this provision to allow, for example, the release of accessible seating at the orchestra level when all other seating at the orchestra level is sold. The

Department has added this language to the final rule at § 35.138(e)(1)(ii) to clarify that venues cannot designate or redesignate seating areas for the purpose of maximizing the release of unsold accessible seating. So, for example, a venue may not determine on an ad hoc basis that a group of seats at the orchestra level is a designated seating area in order to release unsold accessible seating in that area.

The Department also has maintained the hold-and-release provisions that appeared in the NPRM but has added a provision to address the release of accessible seating for series-of-events tickets on a series-of-events basis. Many commenters asked the Department whether unsold accessible seating may be converted to general seating and released to the general public on a season-ticket basis or longer when tickets typically are sold as a season-ticket package or other long-term basis. Several disability rights organizations and individual commenters argued that such a practice should not be permitted, and, if it were, that conditions should be imposed to ensure that individuals with disabilities have future access to those seats.

The Department interprets the fundamental principle of the ADA as a requirement to give individuals with disabilities equal, not better, access to those opportunities available to the general public. Thus, for example, a public entity that sells out its facility on a seasonticket only basis is not required to leave unsold its accessible seating if no persons with disabilities purchase those season-ticket seats. Of course, public entities may choose to go beyond what is required by reserving accessible seating for individuals with disabilities (or releasing such seats for sale to the general public) on an individual-game basis.

If a covered entity chooses to release unsold accessible seating for sale on a season-ticket or other long-term basis, it must meet at least two conditions. Under § 35.138(g) of the final rule, public entities must leave flexibility for game-day changeouts to accommodate ticket transfers on the secondary market. And public entities must modify their ticketing policies so that, in future years, individuals with disabilities will have the ability to purchase accessible seating on the same basis as other patrons (*e.g.,* as season tickets). Put differently, releasing accessible seating to the general public on a season-ticket or other long-term basis cannot result in that seating being lost to individuals with disabilities in perpetuity. If, in future years, season tickets become available and persons with disabilities have reached the top of the waiting list or have met any other eligibility criteria for seasonticket purchases, public entities must ensure that accessible seating will be made available to the eligible individuals. In order to accomplish this, the Department has added § 35.138(e)(3)(i) to require public entities that release accessible season tickets to individuals who do not have disabilities that require the features of accessible seating to establish a process to prevent the automatic reassignment of such ticket holders to accessible seating. For example, a public entity could have in place a system whereby accessible seating that was released because it was not purchased by individuals with disabilities is not in the pool of tickets available for purchase for the following season unless and until the conditions for ticket release have been satisfied in the following season. Alternatively, a public entity might release tickets for accessible seating only when a purchaser who does not need its features agrees that he or she has no guarantee of or right to the same seats in the following season, or that if season tickets are guaranteed for the following season, the purchaser agrees that the offer to purchase tickets is limited to non-accessible seats having to the extent practicable, comparable price, view, and amenities to the accessible seats such individuals held in the prior year. The Department is aware that this rule may require some administrative changes but believes that this process will not create undue financial and administrative burdens. The Department believes that this approach is balanced and beneficial. It will allow public entities to sell all

of their seats and will leave open the possibility, in future seasons or series of events, that persons who need accessible seating may have access to it.

The Department also has added § 35.138(e)(3)(ii) to address how season tickets or series-of-events tickets that have attached ownership rights should be handled if the ownership right returns to the public entity (*e.g.,* when holders forfeit their ownership right by failing to purchase season tickets or sell their ownership right back to a public entity). If the ownership right is for accessible seating, the public entity is required to adopt a process that allows an eligible individual with a disability who requires the features of such seating to purchase the rights and tickets for such seating.

Nothing in the regulatory text prevents a public entity from establishing a process whereby such ticket holders agree to be voluntarily reassigned from accessible seating to another seating area so that individuals with mobility disabilities or disabilities that require the features of accessible seating and who become newly eligible to purchase season tickets have an opportunity to do so. For example, a public entity might seek volunteers to relocate to another location that is at least as good in terms of its location, price, and amenities, or a public entity might use a seat with forfeited ownership rights as an inducement to get a ticket holder to give up accessible seating he or she does not need.

Ticket transfer. The Department received many comments asking whether accessible seating has the same transfer rights as general seats. The proposed regulation at § 35.138(e) required that individuals with disabilities must be allowed to purchase season tickets for accessible seating on the same terms and conditions as individuals purchasing season tickets for general seating, including the right—if it exists for other ticket-holders—to transfer individual tickets to friends or associates. Some commenters pointed out that the NPRM proposed explicitly allowing individuals with disabilities holding season tickets to transfer tickets but did not address the transfer of tickets purchased for individual events. Several commenters representing assembly areas argued that persons with disabilities holding tickets for an individual event should not be allowed to sell or transfer them to third parties because such ticket transfers would increase the risk of fraud or would make unclear the obligation of the entity to accommodate secondary ticket transfers. They argued that individuals holding accessible seating should either be required to transfer their tickets to another individual with a disability or return them to the facility for a refund.

Although the Department is sympathetic to concerns about administrative burden, curtailing transfer rights for accessible seating when other ticket holders are permitted to transfer tickets would be inconsistent with the ADA's guiding principle that individuals with disabilities must have rights equal to others. Thus, the Department has added language in the final rule in § 35.138(f) that requires that individuals with disabilities holding accessible seating for any event have the same transfer rights accorded other ticket holders for that event. Section 35.138(f) also preserves the rights of individuals with disabilities who hold tickets to accessible seats for a series of events to transfer individual tickets to others, regardless of whether the transferee needs accessible seating. This approach recognizes the common practice of individuals splitting season tickets or other multi-event ticket packages with friends, colleagues, or other spectators to make the purchase of season tickets affordable; individuals with disabilities should not be placed in the burdensome position of having to find another individual with a disability with whom to share the package.

This provision, however, does not require public entities to seat an individual who holds a ticket to an accessible seat in such seating if the individual does not need the accessible features of the seat. A public entity may reserve the right to switch these individuals to different seats if they are available, but a public entity is not required

to remove a person without a disability who is using accessible seating from that seating, even if a person who uses a wheelchair shows up with a ticket from the secondary market for a non-accessible seat and wants accessible seating.

Secondary ticket market. Section 35.138(g) is a new provision in the final rule that requires a public entity to modify its policies, practices, or procedures to ensure that an individual with a disability, who acquires a ticket in the secondary ticket market, may use that ticket under the same terms and conditions as other ticket holders who acquire a ticket in the secondary market for an event or series of events. This principle was discussed in the NPRM in connection with § 35.138(e), pertaining to season-ticket sales. There, the Department asked for public comment regarding a public entity's proposed obligation to accommodate the transfer of accessible seating tickets on the secondary ticket market to those who do not need accessible seating and vice versa.

The secondary ticket market, for the purposes of this rule, broadly means any transfer of tickets after the public entity's initial sale of tickets to individuals or entities. It thus encompasses a wide variety of transactions, from ticket transfers between friends to transfers using commercial exchange systems. Many commenters noted that the distinction between the primary and secondary ticket market has become blurred as a result of agreements between teams, leagues, and secondary market sellers. These commenters noted that the secondary market may operate independently of the public entity, and parts of the secondary market, such as ticket transfers between friends, undoubtedly are outside the direct jurisdiction of the public entity.

To the extent that venues seat persons who have purchased tickets on the secondary market, they must similarly seat persons with disabilities who have purchased tickets on the secondary market. In addition, some public entities may acquire ADA obligations directly by formally entering the secondary ticket market.

The Department's enforcement experience with assembly areas also has revealed that venues regularly provide for and make last-minute seat transfers. As long as there are vacant wheelchair spaces, requiring venues to provide wheelchair spaces for patrons who acquired inaccessible seats and need wheelchair spaces is an example of a reasonable modification of a policy under title II of the ADA. Similarly, a person who has a ticket for a wheelchair space but who does not require its accessible features could be offered non-accessible seating if such seating is available.

The Department's longstanding position that title II of the ADA requires venues to make reasonable modifications in their policies to allow individuals with disabilities who acquired non-accessible tickets on the secondary ticket market to be seated in accessible seating, where such seating is vacant, is supported by the only Federal court to address this issue. *See Independent Living Resources v. Oregon Arena Corp.*, 1 F. Supp. 2d 1159, 1171 (D. Or. 1998). The Department has incorporated this position into the final rule at § 35.138(g)(2).

The NPRM contained two questions aimed at gauging concern with the Department's consideration of secondary ticket market sales. The first question asked whether a secondary purchaser who does not have a disability and who buys an accessible seat should be required to move if the space is needed for someone with a disability.

Many disability rights advocates answered that the individual should move provided that there is a seat of comparable or better quality available for him and his companion. Some venues, however, expressed concerns about this provision, and asked how they are to identify who should be moved and what obligations apply if there are no seats available that are equivalent or better in quality.

The Department's second question asked

whether there are particular concerns about the obligation to provide accessible seating, including a wheelchair space, to an individual with a disability who purchases an inaccessible seat through the secondary market.

Industry commenters contended that this requirement would create a ''logistical nightmare,'' with venues scrambling to reseat patrons in the short time between the opening of the venues' doors and the commencement of the event. Furthermore, they argued that they might not be able to reseat all individuals and that even if they were able to do so, patrons might be moved to inferior seats (whether in accessible or non-accessible seating). These commenters also were concerned that they would be sued by patrons moved under such circumstances.

These commenters seem to have misconstrued the rule. Covered entities are not required to seat every person who acquires a ticket for inaccessible seating but needs accessible seating, and are not required to move any individual who acquires a ticket for accessible seating but does not need it. Covered entities that allow patrons to buy and sell tickets on the secondary market must make reasonable modifications to their policies to allow persons with disabilities to participate in secondary ticket transfers. The Department believes that there is no one-size-fits-all rule that will suit all assembly areas. In those circumstances where a venue has accessible seating vacant at the time an individual with a disability who needs accessible seating presents his ticket for inaccessible seating at the box office, the venue must allow the individual to exchange his ticket for an accessible seat in a comparable location if such an accessible seat is vacant. Where, however, a venue has sold all of its accessible seating, the venue has no obligation to provide accessible seating to the person with a disability who purchased an inaccessible seat on the secondary market. Venues may encourage individuals with disabilities who hold tickets for inaccessible seating to contact the box office before the event to notify them of their need for accessible seating, even though they may not require ticketholders to provide such notice.

The Department notes that public entities are permitted, though not required, to adopt policies regarding moving patrons who do not need the features of an accessible seat. If a public entity chooses to do so, it might mitigate administrative concerns by marking tickets for accessible seating as such, and printing on the ticket that individuals who purchase such seats but who do not need accessible seating are subject to being moved to other seats in the facility if the accessible seating is required for an individual with a disability. Such a venue might also develop and publish a ticketing policy to provide transparency to the general public and to put holders of tickets for accessible seating who do not require it on notice that they may be moved.

Prevention of fraud in purchase of accessible seating. Assembly area managers and advocacy groups have informed the Department that the fraudulent purchase of accessible seating is a pressing concern. Curbing fraud is a goal that public entities and individuals with disabilities share. Steps taken to prevent fraud, however, must be balanced carefully against the privacy rights of individuals with disabilities. Such measures also must not impose burdensome requirements upon, nor restrict the rights of, individuals with disabilities.

In the NPRM, the Department struck a balance between these competing concerns by proposing § 35.138(h), which prohibited public entities from asking for proof of disability before the purchase of accessible seating but provided guidance in two paragraphs on appropriate measures for curbing fraud. Paragraph (1) proposed allowing a public entity to ask individuals purchasing single-event tickets for accessible seating whether they are wheelchair users. Paragraph (2) proposed allowing a public entity to require the individuals purchasing accessible seating for season tickets or other multi-event ticket packages

to attest in writing that the accessible seating is for a wheelchair user. Additionally, the NPRM proposed to permit venues, when they have good cause to believe that an individual has fraudulently purchased accessible seating, to investigate that individual.

Several commenters objected to this rule on the ground that it would require a wheelchair user to be the purchaser of tickets. The Department has reworded this paragraph to reflect that the individual with a disability does not have to be the ticket purchaser. The final rule allows third parties to purchase accessible tickets at the request of an individual with a disability.

Commenters also argued that other individuals with disabilities who do not use wheelchairs should be permitted to purchase accessible seating. Some individuals with disabilities who do not use wheelchairs urged the Department to change the rule, asserting that they, too, need accessible seating. The Department agrees that such seating, although designed for use by a wheelchair user, may be used by non-wheelchair users, if those persons are persons with a disability who need to use accessible seating because of a mobility disability or because their disability requires the use of the features that accessible seating provides (*e.g.,* individuals who cannot bend their legs because of braces, or individuals who, because of their disability, cannot sit in a straight-back chair).

Some commenters raised concerns that allowing venues to ask questions to determine whether individuals purchasing accessible seating are doing so legitimately would burden individuals with disabilities in the purchase of accessible seating. The Department has retained the substance of this provision in § 35.138(h) of the final rule, but emphasizes that such questions should be asked at the initial time of purchase. For example, if the method of purchase is via the Internet, then the question(s) should be answered by clicking a yes or no box during the transaction. The public entity may warn purchasers that accessible seating is for individuals with disabilities and that individuals purchasing such tickets fraudulently are subject to relocation.

One commenter argued that face-to-face contact between the venue and the ticket holder should be required in order to prevent fraud and suggested that individuals who purchase accessible seating should be required to pick up their tickets at the box office and then enter the venue immediately. The Department has declined to adopt that suggestion. It would be discriminatory to require individuals with disabilities to pick up tickets at the box office when other spectators are not required to do so. If the assembly area wishes to make face-to-face contact with accessible seating ticket holders to curb fraud, it may do so through its ushers and other customer service personnel located within the seating area.

Some commenters asked whether it is permissible for assembly areas to have voluntary clubs where individuals with disabilities self-identify to the public entity in order to become a member of a club that entitles them to purchase accessible seating reserved for club members or otherwise receive priority in purchasing accessible seating. The Department agrees that such clubs are permissible, provided that a reasonable amount of accessible seating remains available at all prices and dispersed at all locations for individuals with disabilities who are non-members.

§ 35.139 Direct threat.

In Appendix A of the Department's 1991 title II regulation, the Department included a detailed discussion of ''direct threat'' that, among other things, explained that ''the principles established in § 36.208 of the Department's [title III] regulation'' were ''applicable'' as well to title II, insofar as ''questions of safety are involved.'' 28 CFR part 35, app. A at 565 (2009). In the final rule, the Department has included specific requirements related to ''direct threat'' that parallel those in the title III rule. These

requirements are found in new § 35.139.

Subpart D—Program Accessibility

Section 35.150(b)(2) Safe harbor

The ''program accessibility'' requirement in regulations implementing title II of the Americans with Disabilities Act requires that each service, program, or activity, *when viewed in its entirety*, be readily accessible to and usable by individuals with disabilities. 28 CFR 35.150(a). Because title II evaluates a public entity's programs, services, and activities in their entirety, public entities have flexibility in addressing accessibility issues. Program access does not necessarily require a public entity to make each of its existing facilities accessible to and usable by individuals with disabilities, and public entities are not required to make structural changes to existing facilities where other methods are effective in achieving program access. *See id*. [3] Public entities do, however, have program access considerations that are independent of, but may coexist with, requirements imposed by new construction or alteration requirements in those same facilities.

Where a public entity opts to alter existing facilities to comply with its program access requirements, the entity must meet the accessibility requirements for alterations set out in § 35.151. Under the final rule, these alterations will be subject to the 2010 Standards. The 2010 Standards introduce technical and scoping specifications for many elements not covered by the 1991 Standards. In existing facilities, these supplemental requirements need to be taken into account by a public entity in ensuring program access. Also included in the 2010 Standards are revised technical and scoping requirements for a number of elements that were addressed in the 1991 Standards. These revised requirements reflect incremental changes that were added either because of additional study by the Access Board or in order to harmonize requirements with the model codes.

Although the program accessibility standard offers public entities a level of discretion in determining how to achieve program access, in the NPRM, the Department proposed an addition to § 35.150 at § 35.150(b)(2), denominated ''Safe Harbor,'' to clarify that ''[i]f a public entity has constructed or altered elements * * * in accordance with the specifications in either the 1991 Standards or the Uniform Federal Accessibility Standard, such public entity is not, solely because of the Department's adoption of the [2010] Standards, required to retrofit such elements to reflect incremental changes in the proposed standards.'' 73 FR 34466, 34505 (June 17, 2008). In these circumstances, the public entity would be entitled to a safe harbor for the already compliant elements until those elements are altered. The safe harbor does not negate a public entity's new construction or alteration obligations. A public entity must comply with the new construction or alteration requirements in effect at the time of the construction or alteration. With respect to existing facilities designed and constructed after January 26, 1992, but before the public entities are required to comply with the 2010 Standards, the rule is that any elements in these facilities that were not constructed in conformance with UFAS or the 1991 Standards are in violation of the ADA and must be brought into compliance. If elements in existing facilities were altered after January 26, 1992, and those alterations were not made in conformance with the alteration requirements in effect at the time, then those alteration violations must be corrected. Section 35.150(b)(2) of the final rule specifies that until the compliance date for the Standards (18 months from the date of publication of the rule), facilities or elements covered by § 35.151(a) or (b) that are noncompliant with either the 1991 Standards or UFAS shall be made accessible in accordance with the 1991 Standards, UFAS, or

[3]The term ''existing facility'' is defined in § 35.104 as amended by this rule.

the 2010 Standards. Once the compliance date is reached, such noncompliant facilities or elements must be made accessible in accordance with the 2010 Standards.

The Department received many comments on the safe harbor during the 60-day public comment period. Advocacy groups were opposed to the safe harbor for compliant elements in existing facilities. These commenters objected to the Department's characterization of revisions between the 1991 and 2010 Standards as incremental changes and assert that these revisions represent important advances in accessibility for individuals with disabilities. Commenters saw no basis for ''grandfathering'' outdated accessibility standards given the flexibility inherent in the program access standard. Others noted that title II's ''undue financial and administrative burdens'' and ''fundamental alteration'' defenses eliminate any need for further exemptions from compliance. Some commenters suggested that entities' past efforts to comply with the program access standard of 28 CFR 35.150(a) might appropriately be a factor in determining what is required in the future.

Many public entities welcomed the Department's proposed safe harbor. These commenters contend that the safe harbor allows public entities needed time to evaluate program access in light of the 2010 Standards, and incorporate structural changes in a careful and thoughtful way toward increasing accessibility entity-wide. Many felt that it would be an ineffective use of public funds to update buildings to retrofit elements that had already been constructed or modified to Department-issued and sanctioned specifications. One entity pointed to the ''possibly budget-breaking'' nature of forcing compliance with incremental changes.

The Department has reviewed and considered all information received during the 60-day public comment period. Upon review, the Department has decided to retain the title II safe harbor with minor revisions. The Department believes that the safe harbor provides an important measure of clarity and certainty for public entities as to the effect of the final rule with respect to existing facilities. Additionally, by providing a safe harbor for elements already in compliance with the technical and scoping specifications in the 1991 Standards or UFAS, funding that would otherwise be spent on incremental changes and repeated retrofitting is freed up to be used toward increased entity-wide program access. Public entities may thereby make more efficient use of the resources available to them to ensure equal access to their services, programs, or activities for all individuals with disabilities.

The safe harbor adopted with this final rule is a narrow one, as the Department recognizes that this approach may delay, in some cases, the increased accessibility that the revised requirements would provide, and that for some individuals with disabilities the impact may be significant. This safe harbor operates only with respect to elements that are in compliance with the scoping and technical specifications in either the 1991 Standards or UFAS; it does not apply to supplemental requirements, those elements for which scoping and technical specifications are first provided in the 2010 Standards.

Existing Facilities

Existing play areas. The 1991 Standards do not include specific requirements for the design and construction of play areas. To meet program accessibility requirements where structural changes are necessary, public entities have been required to apply the general new construction and alteration standards to the greatest extent possible, including with respect to accessible parking, routes to the playground, playground equipment, and playground amenities (*e.g.*, picnic tables and restrooms). The Access Board published final guidelines for play areas in October 2000. The guidelines extended beyond general playground access to establish specific scoping and technical

requirements for ground-level and elevated play components, accessible routes connecting the components, accessible ground surfaces, and maintenance of those surfaces. These guidelines filled a void left by the 1991 Standards. They have been referenced in Federal playground construction and safety guidelines and have been used voluntarily when many play areas across the country have been altered or constructed.

In adopting the 2004 ADAAG (which includes the 2000 play area guidelines), the Department acknowledges both the importance of integrated, full access to play areas for children and parents with disabilities, as well as the need to avoid placing an untenable fiscal burden on public entities. In the NPRM, the Department stated it was proposing two specific provisions to reduce the impact on existing facilities that undertake structural modifications pursuant to the program accessibility requirement. First, the Department proposed in § 35.150(b)(4) that existing play areas that are not being altered would be permitted to meet a reduced scoping requirement with respect to their elevated play components. Elevated play components, which are found on most playgrounds, are the individual components that are linked together to form large-scale composite playground equipment (*e.g.,* the monkey bars attached to the suspension bridge attached to the tube slide, etc.) The 2010 Standards provide that a play area that includes both ground level and elevated play components must ensure that a specified number of the ground-level play components and at least 50 percent of the elevated play components are accessible.

In the NPRM, the Department asked for specific public comment with regard to whether existing play areas should be permitted to substitute additional ground-level play components for the elevated play components they would otherwise have been required to make accessible. The Department also queried if there were other requirements applicable to play areas in the 2004 ADAAG for which the Department should consider exemptions or reduced scoping. Many commenters opposed permitting existing play areas to make such substitutions. Several commenters stated that the Access Board already completed significant negotiation and cost balancing in its rulemaking, so no additional exemptions should be added in either meeting program access requirements or in alterations. Others noted that elevated components are generally viewed as the more challenging and exciting by children, so making more ground than elevated play components accessible would result in discrimination against children with disabilities in general and older children with disabilities in particular. They argued that the ground components would be seen as equipment for younger children and children with disabilities, while elevated components would serve only older children without disabilities. In addition, commenters advised that including additional ground-level play components would require more accessible route and use zone surfacing, which would result in a higher cost burden than making elevated components accessible.

The Department also asked for public comment on whether it would be appropriate for the Access Board to consider issuing guidelines for alterations to play and recreational facilities that would permit reduced scoping of accessible components or substitution of ground-level play components in lieu of elevated play components. Most commenters opposed any additional reductions in scoping and substitutions. These commenters uniformly stated that the Access Board completed sufficient negotiation during its rulemaking on its play area guidelines published in 2000 and that those guidelines consequently should stand as is. One commenter advocated reduced scoping and substitution of ground play components during alterations only for those play areas built prior to the finalization of the guidelines.

The Department has considered the comments it has received and has determined that it is not

necessary to provide a specific exemption to the scoping for components for existing play areas or to recommend reduced scoping or additional exemptions for alteration, and has deleted the reduced scoping proposed in NPRM § 35.150(b)(4)(i) from the final rule. The Department believes that it is preferable for public entities to try to achieve compliance with the design standards established in the 2010 Standards. If this is not possible to achieve in an existing setting, the requirements for program accessibility provide enough flexibility to permit the covered entity to pursue alternative approaches to provide accessibility.

Second, in § 35.150(b)(5)(i) of the NPRM, the Department proposed language stating that existing play areas that are less than 1,000 square feet in size and are not otherwise being altered, need not comply with the scoping and technical requirements for play areas in section 240 of the 2004 ADAAG. The Department stated it selected this size based on the provision in section 1008.2.4.1 of the 2004 ADAAG, Exception 1, which permits play areas less than 1,000 square feet in size to provide accessible routes with a reduced clear width (44 inches instead of 60 inches). In its 2000 regulatory assessment for the play area guidelines, the Access Board assumed that such ''small'' play areas represented only about 20 percent of the play areas located in public schools, and none of the play areas located in city and State parks (which the Board assumed were typically larger than 1,000 square feet).

In the NPRM, the Department asked if existing play areas less than 1,000 square feet should be exempt from the requirements applicable to play areas. The vast majority of commenters objected to such an exemption. One commenter stated that many localities that have parks this size are already making them accessible; many cited concerns that this would leave all or most public playgrounds in small towns inaccessible; and two commenters stated that, since many of New York City's parks are smaller than 1,000 square feet, only scattered larger parks in the various boroughs would be obliged to become accessible. Residents with disabilities would then have to travel substantial distances outside their own neighborhoods to find accessible playgrounds. Some commenters responded that this exemption should not apply in instances where the play area is the only one in the program, while others said that if a play area is exempt for reasons of size, but is the only one in the area, then it should have at least an accessible route and 50 percent of its ground-level play components accessible. One commenter supported the exemption as presented in the question.

The Department is persuaded by these comments that it is inappropriate to exempt public play areas that are less than 1,000 square feet in size. The Department believes that the factors used to determine program accessibility, including the limits established by the undue financial and administrative burdens defense, provide sufficient flexibility to public entities in determining how to make their existing play areas accessible. In those cases where a title II entity believes that present economic concerns make it an undue financial and administrative burden to immediately make its existing playgrounds accessible in order to comply with program accessibility requirements, then it may be reasonable for the entity to develop a multiyear plan to bring its facilities into compliance.

In addition to requesting public comment about the specific sections in the NPRM, the Department also asked for public comment about the appropriateness of a general safe harbor for existing play areas and a safe harbor for public entities that have complied with State or local standards specific to play areas. In the almost 200 comments received on title II play areas, the vast majority of commenters strongly opposed all safe harbors, exemptions, and reductions in scoping. By contrast, one commenter advocated a safe harbor from compliance with the 2004 ADAAG play area requirements along with

reduced scoping and exemptions for both program accessibility and alterations; a second commenter advocated only the general safe harbor from compliance with the supplemental requirements.

In response to the question of whether the Department should exempt public entities from specific compliance with the supplemental requirements for play areas, commenters stated that since no specific standards previously existed, play areas are more than a decade behind in providing full access for individuals with disabilities. When accessible play areas were created, public entities, acting in good faith, built them according to the 2004 ADAAG requirements; many equipment manufacturers also developed equipment to meet those guidelines. If existing playgrounds were exempted from compliance with the supplemental guidelines, commenters said, those entities would be held to a lesser standard and left with confusion, a sense of wasted resources, and federally condoned discrimination and segregation. Commenters also cited Federal agency settlement agreements on play areas that required compliance with the guidelines. Finally, several commenters observed that the provision of a safe harbor in this instance was invalid for two reasons: (1) The rationale for other safe harbors—that entities took action to comply with the 1991 Standards and should not be further required to comply with new standards—does not exist; and (2) concerns about financial and administrative burdens are adequately addressed by program access requirements.

The question of whether accessibility of play areas should continue to be assessed on the basis of case-by-case evaluations elicited conflicting responses. One commenter asserted that there is no evidence that the case-by-case approach is not working and so it should continue until found to be inconsistent with the ADA's goals. Another commenter argued that case-by-case evaluations result in unpredictable outcomes which result in costly and long court actions. A third commenter, advocating against case-by-case evaluations, requested instead increased direction and scoping to define what constitutes an accessible play area program.

The Department has considered all of the comments it received in response to its questions and has concluded that there is insufficient basis to establish a safe harbor from compliance with the supplemental guidelines. Thus, the Department has eliminated the proposed exemption contained in § 35.150(b)(5)(i) of the NPRM for existing play areas that are less than 1,000 square feet. The Department believes that the factors used to determine program accessibility, including the limits established by the undue financial and administrative burdens defense, provide sufficient flexibility to public entities in determining how to make their existing play areas accessible.

In the NPRM, the Department also asked whether there are State and local standards addressing play and recreation area accessibility and, to the extent that there are such standards, whether facilities currently governed by, and in compliance with, such State and local standards or codes should be subject to a safe harbor from compliance with applicable requirements in the 2004 ADAAG. The Department also asked whether it would be appropriate for the Access Board to consider the implementation of guidelines that would permit such a safe harbor with respect to play and recreation areas undertaking alterations. In response, commenters stated that few State or local governments have standards that address issues of accessibility in play areas, and one commenter organization said that it was unaware of any State or local standards written specifically for accessible play areas. One commenter observed from experience that most State and local governments were waiting for the Access Board guidelines to become enforceable standards as they had no standards themselves to follow. Another commenter offered that public entities across the United States already include in their playground construction bid specifications language that requires compliance with the Access

Board's guidelines. A number of commenters advocated for the Access Board's guidelines to become comprehensive Federal standards that would complement any abbreviated State and local standards. One commenter, however, supported a safe harbor for play areas undergoing alterations if the areas currently comply with State or local standards.

The Department is persuaded by these comments that there is insufficient basis to establish a safe harbor for program access or alterations for play areas built in compliance with State or local laws.

In the NPRM, the Department asked whether ''a reasonable number, but at least one'' is a workable standard to determine the appropriate number of existing play areas that a public entity must make accessible. Many commenters objected to this standard, expressing concern that the phrase ''at least one'' would be interpreted as a maximum rather than a minimum requirement. Such commenters feared that this language would allow local governments to claim compliance by making just one public park accessible, regardless of the locality's size, budget, or other factors, and would support segregation, forcing children with disabilities to leave their neighborhoods to enjoy an accessible play area. While some commenters criticized what they viewed as a new analysis of program accessibility, others asserted that the requirements of program accessibility should be changed to address issues related to play areas that are not the main program in a facility but are essential components of a larger program (*e.g.*, drop-in child care for a courthouse).

The Department believes that those commenters who opposed the Department's ''reasonable number, but at least one'' standard for program accessibility misunderstood the Department's proposal. The Department did not intend any change in its longstanding interpretation of the program accessibility requirement. Program accessibility requires that each service, program, or activity be operated ''so that the service, program, or activity, when viewed in its entirety, is readily accessible to and usable by individuals with disabilities,'' 28 CFR 35.150(a), subject to the undue financial and administrative burdens and fundamental alterations defenses provided in 28 CFR 35.150. In determining how many facilities of a multi-site program must be made accessible in order to make the overall program accessible, the standard has always been an assessment of what is reasonable under the circumstances to make the program readily accessible to and usable by individuals with disabilities, taking into account such factors as the size of the public entity, the particular program features offered at each site, the geographical distance between sites, the travel times to the sites, the number of sites, and availability of public transportation to the sites. In choosing among available methods for meeting this requirement, public entities are required to give priority ''to those methods that offer services, programs, and activities * * * in the most integrated setting appropriate.'' 28 CFR 35.150(b)(1). As a result, in cases where the sites are widely dispersed with difficult travel access and where the program features offered vary widely between sites, program accessibility will require a larger number of facilities to be accessible in order to ensure program accessibility than where multiple sites are located in a concentrated area with easy travel access and uniformity in program offerings.

Commenters responded positively to the Department's question in the NPRM whether the final rule should provide a list of factors that a public entity should use to determine how many of its existing play areas should be made accessible. Commenters also asserted strongly that the number of existing parks in the locality should not be the main factor. In addition to the Department's initial list—including number of play areas in an area, travel times or geographic distances between play areas, and the size of the public entity—commenters recommended such factors as availability of accessible pedestrian routes to

the playgrounds, ready availability of accessible transportation, comparable amenities and services in and surrounding the play areas, size of the playgrounds, and sufficient variety in accessible play components within the playgrounds. The Department agrees that these factors should be considered, where appropriate, in any determination of whether program accessibility has been achieved. However, the Department has decided that it need not address these factors in the final rule itself because the range of factors that might need to be considered would vary depending upon the circumstances of particular public entities. The Department does not believe any list would be sufficiently comprehensive to cover every situation.

The Department also requested public comment about whether there was a ''tipping point'' at which the costs of compliance with the new requirements for existing play areas would be so burdensome that the entity would simply shut down the playground. Commenters generally questioned the feasibility of determining a ''tipping point.'' No commenters offered a recommended ''tipping point.'' Moreover, most commenters stated that a ''tipping point'' is not a valid consideration for various reasons, including that ''tipping points'' will vary based upon each entity's budget and other mandates, and costs that are too high will be addressed by the limitations of the undue financial and administrative burdens defense in the program accessibility requirement and that a ''tipping point'' must be weighed against quality of life issues, which are difficult to quantify. The Department has decided that comments did not establish any clear ''tipping point'' and therefore provides no regulatory requirement in this area.

Swimming pools. The 1991 Standards do not contain specific scoping or technical requirements for swimming pools. As a result, under the 1991 title II regulation, title II entities that operate programs or activities that include swimming pools have not been required to provide an accessible route into those pools via a ramp or pool lift, although they are required to provide an accessible route to such pools. In addition, these entities continue to be subject to the general title II obligation to make their programs usable and accessible to persons with disabilities.

The 2004 ADAAG includes specific technical and scoping requirements for new and altered swimming pools at sections 242 and 1009. In the NPRM, the Department sought to address the impact of these requirements on existing swimming pools. Section 242.2 of the 2004 ADAAG states that swimming pools must provide two accessible means of entry, except that swimming pools with less than 300 linear feet of swimming pool wall are only required to provide one accessible means of entry, provided that the accessible means of entry is either a swimming pool lift complying with section 1009.2 or a sloped entry complying with section 1009.3.

In the NPRM, the Department proposed, in § 35.150(b)(4)(ii), that for measures taken to comply with title II's program accessibility requirements, existing swimming pools with at least 300 linear feet of swimming pool wall would be required to provide only one accessible means of access that complied with section 1009.2 or section 1009.3 of the 2004 ADAAG.

The Department specifically sought comment from public entities and individuals with disabilities on the question whether the Department should ''allow existing public entities to provide only one accessible means of access to swimming pools more than 300 linear feet long?'' The Department received significant public comment on this proposal.

Most commenters opposed any reduction in the scoping required in the 2004 ADAAG, citing the fact that swimming is a common therapeutic form of exercise for many individuals with disabilities. Many commenters also stated that the cost of a swimming pool lift, approximately $5,000, or other nonstructural options for pool access such as transfer steps, transfer walls,

and transfer platforms, would not be an undue financial and administrative burden for most title II entities. Other commenters pointed out that the undue financial and administrative burdens defense already provided public entities with a means to reduce their scoping requirements. A few commenters cited safety concerns resulting from having just one accessible means of access, and stated that because pools typically have one ladder for every 75 linear feet of pool wall, they should have more than one accessible means of access. One commenter stated that construction costs for a public pool are approximately $4,000– 4,500 per linear foot, making the cost of a pool with 300 linear feet of swimming pool wall approximately $1.2 million, compared to $5,000 for a pool lift. Some commenters did not oppose the one accessible means of access for larger pools so long as a lift was used. A few commenters approved of the one accessible means of access for larger pools. The Department also considered the American National Standard for Public Swimming Pools, ANSI/NSPI–1 2003, section 23 of which states that all pools should have at least two means of egress.

In the NPRM, the Department also proposed at § 35.150(b)(5)(ii) that existing swimming pools with less than 300 linear feet of swimming pool wall be exempted from having to comply with the provisions of section 242.2. The Department's NPRM requested public comment about the potential effect of this approach, asking whether existing swimming pools with less than 300 linear feet of pool wall should be exempt from the requirements applicable to swimming pools.

Most commenters were opposed to this proposal. A number of commenters stated, based on the Access Board estimates that 90 percent of public high school pools, 40 percent of public park and community center pools, and 30 percent of public college and university pools have less than 300 linear feet of pool wall, that a large number of public swimming pools would fall under this exemption. Other commenters pointed to the existing undue financial and administrative burdens defenses as providing public entities with sufficient protection from excessive compliance costs. Few commenters supported this exemption.

The Department also considered the fact that many existing swimming pools owned or operated by public entities are recipients of Federal financial assistance and therefore, are also subject to the program accessibility requirements of section 504 of the Rehabilitation Act.

The Department has carefully considered all the information available to it including the comments submitted on these two proposed exemptions for swimming pools owned or operated by title II entities. The Department acknowledges that swimming provides important therapeutic, exercise, and social benefits for many individuals with disabilities and is persuaded that exemption of many publicly owned or operated pools from the 2010 Standards is neither appropriate nor necessary. The Department agrees with the commenters that title II already contains sufficient limitations on public entities' obligations to make their programs accessible. In particular, the Department agrees that those public entities that can demonstrate that making particular existing swimming pools accessible in accordance with the 2010 Standards would be an undue financial and administrative burden are sufficiently protected from excessive compliance costs. Thus, the Department has eliminated proposed §§ 35.150(b)(4)(ii) and (b)(5)(ii) from the final rule.

In addition, although the NPRM contained no specific proposed regulatory language on this issue, the NPRM sought comment on what would be a workable standard for determining the appropriate number of existing swimming pools that a public entity must make accessible for its program to be accessible. The Department asked whether a ''reasonable number, but at least one'' would be a workable standard and, if not, whether there was a more appropriate specific standard. The Department also asked if, in the alternative,

the Department should provide ''a list of factors that a public entity could use to determine how many of its existing swimming pools to make accessible, *e.g.*, number of swimming pools, travel times or geographic distances between swimming pools, and the size of the public entity?"

A number of commenters expressed concern over the ''reasonable number, but at least one'' standard and contended that, in reality, public entities would never provide more than one accessible existing pool, thus segregating individuals with disabilities. Other commenters felt that the existing program accessibility standard was sufficient. Still others suggested that one in every three existing pools should be made accessible. One commenter suggested that all public pools should be accessible. Some commenters proposed a list of factors to determine how many existing pools should be accessible. Those factors include the total number of pools, the location, size, and type of pools provided, transportation availability, and lessons and activities available. A number of commenters suggested that the standard should be based on geographic areas, since pools serve specific neighborhoods. One commenter argued that each pool should be examined individually to determine what can be done to improve its accessibility.

The Department did not include any language in the final rule that specifies the ''reasonable number, but at least one'' standard for program access. However, the Department believes that its proposal was misunderstood by many commenters. Each service, program, or activity conducted by a public entity, when viewed in its entirety, must still be readily accessible to and usable by individuals with disabilities unless doing so would result in a fundamental alteration in the nature of the program or activity or in undue financial and administrative burdens. Determining which pool(s) to make accessible and whether more than one accessible pool is necessary to provide program access requires analysis of a number of factors, including, but not limited to, the size of the public entity, geographical distance between pool sites, whether more than one community is served by particular pools, travel times to the pools, the total number of pools, the availability of lessons and other programs and amenities at each pool, and the availability of public transportation to the pools. In many instances, making one existing swimming pool accessible will not be sufficient to ensure program accessibility. There may, however, be some circumstances where a small public entity can demonstrate that modifying one pool is sufficient to provide access to the public entity's program of providing public swimming pools. In all cases, a public entity must still demonstrate that its programs, including the program of providing public swimming pools, when viewed in their entirety, are accessible.

Wading pools. The 1991 Standards do not address wading pools. Section 242.3 of the 2004 ADAAG requires newly constructed or altered wading pools to provide at least one sloped means of entry to the deepest part of the pool. The Department was concerned about the potential impact of this new requirement on existing wading pools. Therefore, in the NPRM, the Department sought comments on whether existing wading pools that are not being altered should be exempt from this requirement, asking, ''[w]hat site constraints exist in existing facilities that could make it difficult or infeasible to install a sloped entry in an existing wading pool? Should existing wading pools that are not being altered be exempt from the requirement to provide a sloped entry? '' 73 FR 34466, 34487–88 (June 17, 2008). Most commenters agreed that existing wading pools that are not being altered should be exempt from this requirement. Almost all commenters felt that during alterations a sloped entry should be provided unless it was technically infeasible to do so. Several commenters felt that the required clear deck space surrounding a pool provided sufficient

space for a sloped entry during alterations.

The Department also solicited comments on the possibility of exempting existing wading pools from the obligation to provide program accessibility. Most commenters argued that installing a sloped entry in an existing wading pool is not very feasible. Because covered entities are not required to undertake modifications that would be technically infeasible, the Department believes that the rule as drafted provides sufficient protection from unwarranted expense to the operators of small existing wading pools. Other existing wading pools, particularly those larger pools associated with facilities such as aquatic centers or water parks, must be assessed on a case-by-case basis. Therefore, the Department has not included such an exemption for wading pools in its final rule.

Saunas and steam rooms. The 1991 Standards do not address saunas and steam rooms. Section 35.150(b)(5)(iii) of the NPRM exempted existing saunas and steam rooms that seat only two individuals and were not being altered from section 241 of the 2004 ADAAG, which requires an accessible turning space. Two commenters objected to this exemption as unnecessary, and argued that the cost of accessible saunas is not high and public entities still have an undue financial and administrative burdens defense.

The Department considered these comments and has decided to eliminate the exemption for existing saunas and steam rooms that seat only two people. Such an exemption is unnecessary because covered entities will not be subject to program accessibility requirements to make existing saunas and steam rooms accessible if doing so constitutes an undue financial and administrative burden. The Department believes it is likely that because of their prefabricated forms, which include built-in seats, it would be either technically infeasible or an undue financial and administrative burden to modify such saunas and steams rooms. Consequently, a separate exemption for saunas and steam rooms would have been superfluous. Finally, employing the program accessibility standard for small saunas and steam rooms is consistent with the Department's decisions regarding the proposed exemptions for play areas and swimming pools.

Several commenters also argued in favor of a specific exemption for existing spas. The Department notes that the technical infeasibility and program accessibility defenses are applicable equally to existing spas and declines to adopt such an exemption.

Other recreational facilities. In the NPRM, the Department asked about a number of issues relating to recreation facilities such as team or player seating areas, areas of sport activity, exercise machines, boating facilities, fishing piers and platforms, and miniature golf courses. The Department's questions addressed the costs and benefits of applying the 2004 ADAAG to these spaces and facilities and the application of the specific technical requirements in the 2004 ADAAG for these spaces and facilities. The discussion of the comments received by the Department on these issues and the Department's response to those comments can be found in either the section of Appendix A to this rule entitled ''Other Issues,'' or in Appendix B to the final title III rule, which will be published today elsewhere in this volume.

Section 35.151 New construction and alterations

Section 35.151(a), which provided that those facilities that are constructed or altered by, on behalf of, or for the use of a public entity shall be designed, constructed, or altered to be readily accessible to and usable by individuals with disabilities, is unchanged in the final rule, but has been redesignated as § 35.151(a)(1). The Department has added a new section, designated as § 35.151(a)(2), to provide that full compliance with the requirements of this section is not required where an entity can demonstrate that it is structurally impracticable to meet the

requirements. Full compliance will be considered structurally impracticable only in those rare circumstances when the unique characteristics of terrain prevent the incorporation of accessibility features. This exception was contained in the title III regulation and in the 1991 Standards (applicable to both public accommodations and facilities used by public entities), so it has applied to any covered facility that was constructed under the 1991 Standards since the effective date of the ADA. The Department added it to the text of § 35.151 to maintain consistency between the design requirements that apply under title II and those that apply under title III. The Department received no significant comments about this section.

Section 35.151(b) Alterations

The 1991 title II regulation does not contain any specific regulatory language comparable to the 1991 title III regulation relating to alterations and path of travel for covered entities, although the 1991 Standards describe standards for path of travel during alterations to a primary function. *See* 28 CFR part 36, app A., section 4.1.6(a) (2009).

The path of travel requirements contained in the title III regulation are based on section 303(a)(2) of the ADA, 42 U.S.C. 12183(a)(2), which provides that when an entity undertakes an alteration to a place of public accommodation or commercial facility that affects or could affect the usability of or access to an area that contains a primary function, the entity shall ensure that, to the maximum extent feasible, the path of travel to the altered area—and the restrooms, telephones, and drinking fountains serving it—is readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs.

The NPRM proposed amending § 35.151 to add both the path of travel requirements and the exemption relating to barrier removal (as modified to apply to the program accessibility standard in title II) that are contained in the title III regulation to the title II regulation. Proposed § 35.151(b)(4) contained the requirements for path of travel. Proposed § 35.151(b)(2) stated that the path of travel requirements of § 35.151(b)(4) shall not apply to measures taken solely to comply with program accessibility requirements.

Where the specific requirements for path of travel apply under title III, they are limited to the extent that the cost and scope of alterations to the path of travel are disproportionate to the cost of the overall alteration, as determined under criteria established by the Attorney General.

The Access Board included the path of travel requirement for alterations to facilities covered by the standards (other than those subject to the residential facilities standards) in section 202.4 of 2004 ADAAG. Section 35.151(b)(4)(iii) of the final rule establishes the criteria for determining when the cost of alterations to the path of travel is ''disproportionate'' to the cost of the overall alteration.

The NPRM also provided that areas such as supply storage rooms, employee lounges and locker rooms, janitorial closets, entrances, and corridors are not areas containing a primary function. Nor are restroom areas considered to contain a primary function unless the provision of restrooms is a primary purpose of the facility, such as at a highway rest stop. In that situation, a restroom would be considered to be an ''area containing a primary function'' of the facility.

The Department is not changing the requirements for program accessibility. As provided in § 35.151(b)(2) of the regulation, the path of travel requirements of § 35.151(b)(4) only apply to alterations undertaken solely for purposes other than to meet the program accessibility requirements. The exemption for the specific path of travel requirement was included in the regulation to ensure that the specific requirements and disproportionality exceptions for path of travel are not applied when areas are being altered to meet the title II program accessibility requirements in § 35.150.

In contrast, when areas are being altered to meet program accessibility requirements, they must comply with all of the applicable requirements referenced in section 202 of the 2010 Standards. A covered title II entity must provide accessibility to meet the requirements of § 35.150 unless doing so is an undue financial and administrative burden in accordance with § 35.150(a)(3). A covered title II entity may not use the disproportionality exception contained in the path of travel provisions as a defense to providing an accessible route as part of its obligation to provide program accessibility. The undue financial and administrative burden standard does not contain any bright line financial tests.

The Department's proposed § 35.151(b)(4) adopted the language now contained in § 36.403 of the title III regulation, including the disproportionality limitation (*i.e.*, alterations made to provide an accessible path of travel to the altered area would be deemed disproportionate to the overall alteration when the cost exceeds 20 percent of the cost of the alteration to the primary function area). Proposed § 35.151(b)(2) provided that the path of travel requirements do not apply to alterations undertaken solely to comply with program accessibility requirements.

The Department received a substantial number of comments objecting to the Department's adoption of the exemption for the path of travel requirements when alterations are undertaken solely to meet program accessibility requirements. These commenters argued that the Department had no statutory basis for providing this exemption nor does it serve any purpose. In addition, these commenters argued that the path of travel exemption has the effect of placing new limitations on the obligations to provide program access. A number of commenters argued that doing away with the path of travel requirement would render meaningless the concept of program access. They argued that just as the requirement to provide an accessible path of travel to an altered area (regardless of the reason for the alteration), including making the restrooms, telephones, and drinking fountains that serve the altered area accessible, is a necessary requirement in other alterations, it is equally necessary for alterations made to provide program access. Several commenters expressed concern that a readily accessible path of travel be available to ensure that persons with disabilities can get to the physical location in which programs are held. Otherwise, they will not be able to access the public entity's service, program, or activity. Such access is a cornerstone of the protections provided by the ADA. Another commenter argued that it would be a waste of money to create an accessible facility without having a way to get to the primary area. This commenter also stated that the International Building Code (IBC) requires the path of travel to a primary function area, up to 20 percent of the cost of the project. Another commenter opposed the exemption, stating that the trigger of an alteration is frequently the only time that a facility must update its facilities to comply with evolving accessibility standards.

In the Department's view, the commenters objecting to the path of travel exemption contained in § 35.151(b)(2) did not understand the intention behind the exemption. The exemption was not intended to eliminate any existing requirements related to accessibility for alterations undertaken in order to meet program access obligations under § 35.149 and § 35.150. Rather, it was intended to ensure that covered entities did not apply the path of travel requirements in lieu of the overarching requirements in this Subpart that apply when making a facility accessible in order to comply with program accessibility. The exemption was also intended to make it clear that the disproportionality test contained in the path of travel standards is not applicable in determining whether providing program access results in an undue financial and administration burden within the meaning of § 35.150(a)(3). The exemption

was also provided to maintain consistency with the title III path of travel exemption for barrier removal, *see* § 36.304(d), in keeping with the Department's regulatory authority under title II of the ADA. *See* 42 U.S.C. 12134(b); *see also* H. R Rep. No. 101B485, pt. 2, at 84 (1990) (''The committee intends, however, that the forms of discrimination prohibited by section 202 be identical to those set out in the applicable provisions of titles I and III of this legislation.'').

For title II entities, the path of travel requirements are of significance in those cases where an alteration is being made solely for reasons other than program accessibility. For example, a public entity might have six courtrooms in two existing buildings and might determine that only three of those courtrooms and the public use and common use areas serving those courtrooms in one building are needed to be made accessible in order to satisfy its program access obligations. When the public entity makes those courtrooms and the public use and common use areas serving them accessible in order to meet its program access obligations, it will have to comply with the 2010 Standards unless the public entity can demonstrate that full compliance would result in undue financial and administrative burdens as described in § 35.150(a)(3). If such action would result in an undue financial or administrative burden, the public entity would nevertheless be required to take some other action that would not result in such an alteration or such burdens but would ensure that the benefits and services provided by the public entity are readily accessible to persons with disabilities. When the public entity is making modifications to meet its program access obligation, it may not rely on the path of travel exception under § 35.151(b)(4), which limits the requirement to those alterations where the cost and scope of the alterations are not disproportionate to the cost and scope of the overall alterations. If the public entity later decides to alter courtrooms in the other building, for purposes of updating the facility (and, as previously stated, has met its program access obligations) then in that case, the public entity would have to comply with the path of travel requirements in the 2010 Standards subject to the disproportionality exception set forth in § 35.151(b)(4).

The Department has slightly revised proposed § 35.151(b)(2) to make it clearer that the path of travel requirements only apply when alterations are undertaken solely for purposes other than program accessibility.

Section 35.151(b)(4)(ii)(C) Path of travel— safe harbor

In § 35.151(b)(4)(ii)(C) of the NPRM, the Department included a provision that stated that public entities that have brought required elements of path of travel into compliance with the 1991 Standards are not required to retrofit those elements in order to reflect incremental changes in the 2010 Standards solely because of an alteration to a primary function area that is served by that path of travel. In these circumstances, the public entity is entitled to a safe harbor and is only required to modify elements to comply with the 2010 Standards if the public entity is planning an alteration to the element.

A substantial number of commenters objected to the Department's imposition of a safe harbor for alterations to facilities of public entities that comply with the 1991 Standards. These commenters argued that if a public entity is already in the process of altering its facility, there should be a legal requirement that individuals with disabilities be entitled to increased accessibility by using the 2010 Standards for path of travel work. They also stated that they did not believe there was a statutory basis for ''grandfathering'' facilities that comply with the 1991 Standards.

The ADA is silent on the issue of ''grandfathering'' or establishing a safe harbor for measuring compliance in situations where the covered entity is not undertaking a planned

alteration to specific building elements. The ADA delegates to the Attorney General the responsibility for issuing regulations that define the parameters of covered entities' obligations when the statute does not directly address an issue. This regulation implements that delegation of authority.

One commenter proposed that a previous record of barrier removal be one of the factors in determining, prospectively, what renders a facility, when viewed in its entirety, usable and accessible to persons with disabilities. Another commenter asked the Department to clarify, at a minimum, that to the extent compliance with the 1991 Standards does not provide program access, particularly with regard to areas not specifically addressed in the 1991 Standards, the safe harbor will not operate to relieve an entity of its obligations to provide program access.

One commenter supported the proposal to add a safe harbor for path of travel.

The final rule retains the safe harbor for required elements of a path of travel to altered primary function areas for public entities that have already complied with the 1991 Standards with respect to those required elements. The Department believes that this safe harbor strikes an appropriate balance between ensuring that individuals with disabilities are provided access to buildings and facilities and potential financial burdens on existing public entities that are undertaking alterations subject to the 2010 Standards. This safe harbor is not a blanket exemption for facilities. If a public entity undertakes an alteration to a primary function area, only the required elements of a path of travel to that area that already comply with the 1991 Standards are subject to the safe harbor. If a public entity undertakes an alteration to a primary function area and the required elements of a path of travel to the altered area do not comply with the 1991 Standards, then the public entity must bring those elements into compliance with the 2010 Standards.

Section 35.151(b)(3) Alterations to historic facilities

The final rule renumbers the requirements for alterations to historic facilities enumerated in current § 35.151(d)(1) and (2) as § 35.151(b)(3)(i) and (ii). Currently, the regulation provides that alterations to historic facilities shall comply to the maximum extent feasible with section 4.1.7 of UFAS or section 4.1.7 of the 1991 Standards. *See* 28 CFR 35.151(d)(1). Section 35.151(b)(3)(i) of the final rule eliminates the option of using UFAS for alterations that commence on or after March 15, 2012. The substantive requirement in current § 35.151(d)(2)—that alternative methods of access shall be provided pursuant to the requirements of § 35.150 if it is not feasible to provide physical access to an historic property in a manner that will not threaten or destroy the historic significance of the building or facility—is contained in § 35.151(b)(3)(ii).

Section 35.151(c) Accessibility standards for new construction and alterations

Section 35.151(c) of the NPRM proposed to adopt ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the Americans with Disabilities Act and Architectural Barriers Act Guidelines (2004 ADAAG) into the ADA Standards for Accessible Design (2010 Standards). As the Department has noted, the development of these standards represents the culmination of a lengthy effort by the Access Board to update its guidelines, to make the Federal guidelines consistent to the extent permitted by law, and to harmonize the Federal requirements with the private sector model codes that form the basis of many State and local building code requirements. The full text of the 2010 Standards is available for public review on the ADA Home Page (*http://www.ada.gov*) and on the Access Board's Web site (*http:// www.access-board.gov/gs.htm*) (last visited June 24, 2010). The Access Board

site also includes an extensive discussion of the development of the 2004 ADA/ABA Guidelines, and a detailed comparison of the 1991 Standards, the 2004 ADA/ABA Guidelines, and the 2003 International Building Code.

Section 204 of the ADA, 42 U.S.C. 12134, directs the Attorney General to issue regulations to implement title II that are consistent with the minimum guidelines published by the Access Board. The Attorney General (or his designee) is a statutory member of the Access Board (*see* 29 U.S.C. 792(a)(1)(B(vii)) and was involved in the development of the 2004 ADAAG. Nevertheless, during the process of drafting the NPRM, the Department reviewed the 2004 ADAAG to determine if additional regulatory provisions were necessary. As a result of this review, the Department decided to propose new sections, which were contained in § 35.151(e)–(h) of the NPRM, to clarify how the Department will apply the proposed standards to social service center establishments, housing at places of education, assembly areas, and medical care facilities. Each of these provisions is discussed below.

Congress anticipated that there would be a need for close coordination of the ADA building requirements with State and local building code requirements. Therefore, the ADA authorized the Attorney General to establish an ADA code certification process under title III of the ADA. That process is addressed in 28 CFR part 36, subpart F. Revisions to that process are addressed in the regulation amending the title III regulation published elsewhere in the **Federal Register** today. In addition, the Department operates an extensive technical assistance program. The Department anticipates that once this rule is final, revised technical assistance material will be issued to provide guidance about its implementation.

Section 35.151(c) of the 1991 title II regulation establishes two standards for accessible new construction and alteration. Under paragraph (c), design, construction, or alteration of facilities in conformance with UFAS or with the 1991 Standards (which, at the time of the publication of the rule were also referred to as the Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (1991 ADAAG)) is deemed to comply with the requirements of this section with respect to those facilities (except that if the 1991 Standards are chosen, the elevator exemption does not apply). The 1991 Standards were based on the 1991 ADAAG, which was initially developed by the Access Board as guidelines for the accessibility of buildings and facilities that are subject to title III. The Department adopted the 1991 ADAAG as the standards for places of public accommodation and commercial facilities under title III of the ADA and it was published as Appendix A to the Department's regulation implementing title III, 56 FR 35592 (July 26, 1991) as amended, 58 FR 17522 (April 5, 1993), and as further amended, 59 FR 2675 (Jan. 18, 1994), codified at 28 CFR part 36 (2009).

Section 35.151(c) of the final rule adopts the 2010 Standards and establishes the compliance date and triggering events for the application of those standards to both new construction and alterations. Appendix B of the final title III rule (Analysis and Commentary on the 2010 ADA Standards for Accessible Design) (which will be published today elsewhere in this volume and codified as Appendix B to 28 CFR part 36) provides a description of the major changes in the 2010 Standards (as compared to the 1991 ADAAG) and a discussion of the public comments that the Department received on specific sections of the 2004 ADAAG. A number of commenters asked the Department to revise certain provisions in the 2004 ADAAG in a manner that would reduce either the required scoping or specific technical accessibility requirements. As previously stated, although the ADA requires the enforceable standards issued by the Department under title II and title III to be consistent with the minimum guidelines published by the Access Board, it is the sole responsibility

of the Attorney General to promulgate standards and to interpret and enforce those standards. The guidelines adopted by the Access Board are ''minimum guidelines.'' 42 U.S.C. 12186(c).

Compliance date. When the ADA was enacted, the effective dates for various provisions were delayed in order to provide time for covered entities to become familiar with their new obligations. Titles II and III of the ADA generally became effective on January 26, 1992, six months after the regulations were published. *See* 42 U.S.C. 12131 note; 42 U.S.C. 12181 note. New construction under title II and alterations under either title II or title III had to comply with the design standards on that date. *See* 42 U.S.C. 12183(a)(1). For new construction under title III, the requirements applied to facilities designed and constructed for first occupancy after January 26, 1993—18 months after the 1991 Standards were published by the Department. In the NPRM, the Department proposed to amend § 35.151(c)(1) by revising the current language to limit the application of the 1991 standards to facilities on which construction commences within six months of the final rule adopting revised standards. The NPRM also proposed adding paragraph (c)(2) to § 35.151, which states that facilities on which construction commences on or after the date six months following the effective date of the final rule shall comply with the proposed standards adopted by that rule.

As a result, under the NPRM, for the first six months after the effective date, public entities would have the option to use either UFAS or the 1991 Standards and be in compliance with title II. Six months after the effective date of the rule, the new standards would take effect. At that time, construction in accordance with UFAS would no longer satisfy ADA requirements. The Department stated that in order to avoid placing the burden of complying with both standards on public entities, the Department would coordinate a government-wide effort to revise Federal agencies' section 504 regulations to adopt the 2004 ADAAG as the standard for new construction and alterations.

The purpose of the proposed six-month delay in requiring compliance with the 2010 Standards was to allow covered entities a reasonable grace period to transition between the existing and the proposed standards. For that reason, if a title II entity preferred to use the 2010 Standards as the standard for new construction or alterations commenced within the six-month period after the effective date of the final rule, such entity would be considered in compliance with title II of the ADA.

The Department received a number of comments about the proposed six-month effective date for the title II regulation that were similar in content to those received on this issue for the proposed title III regulation. Several commenters supported the six-month effective date. One commenter stated that any revisions to its State building code becomes effective six months after adoption and that this has worked well. In addition, this commenter stated that since 2004 ADAAG is similar to IBC 2006 and ICC/ANSI A117.1– 2003, the transition should be easy. By contrast, another commenter advocated for a minimum 12-month effective date, arguing that a shorter effective date could cause substantial economic hardships to many cities and towns because of the lengthy lead time necessary for construction projects. This commenter was concerned that a six-month effective date could lead to projects having to be completely redrawn, rebid, and rescheduled to ensure compliance with the new standards. Other commenters advocated that the effective date be extended to at least 18 months after the publication of the rule. One of these commenters expressed concern that the kinds of bureaucratic organizations subject to the title II regulations lack the internal resources to quickly evaluate the regulatory changes, determine whether they are currently compliant with the 1991 standards, and determine what they have to do to comply with the new standards. The other commenter argued that 18 months is

the minimum amount of time necessary to ensure that projects that have already been designed and approved do not have to undergo costly design revisions at taxpayer expense.

The Department is persuaded by the concerns raised by commenters for both the title II and III regulations that the six-month compliance date proposed in the NPRM for application of the 2010 Standards may be too short for certain projects that are already in the midst of the design and permitting process. The Department has determined that for new construction and alterations, compliance with the 2010 Standards will not be required until 18 months from the date the final rule is published. Until the time compliance with the 2010 Standards is required, public entities will have the option of complying with the 2010 Standards, the UFAS, or the 1991 Standards. However, public entities that choose to comply with the 2010 Standards in lieu of the 1991 Standards or UFAS prior to the compliance date described in this rule must choose one of the three standards, and may not rely on some of the requirements contained in one standard and some of the requirements contained in the other standards.

Triggering event. In § 35.151(c)(2) of the NPRM, the Department proposed that the commencement of construction serve as the triggering event for applying the proposed standards to new construction and alterations under title II. This language is consistent with the triggering event set forth in § 35.151(a) of the 1991 title II regulation. The Department received only four comments on this section of the title II rule. Three commenters supported the use of ''start of construction'' as the triggering event. One commenter argued that the Department should use the ''last building permit or start of physical construction, whichever comes first,'' stating that ''altering a design after a building permit has been issued can be an undue burden.''

After considering these comments, the Department has decided to continue to use the commencement of physical construction as the triggering event for application of the 2010 Standards for entities covered by title II. The Department has also added clarifying language at § 35.151(c)(4) to the regulation to make it clear that the date of ceremonial groundbreaking or the date a structure is razed to make it possible for construction of a facility to take place does not qualify as the commencement of physical construction.

Section 234 of the 2010 Standards provides accessibility guidelines for newly designed and constructed amusement rides. The amusement ride provisions do not provide a ''triggering event'' for new construction or alteration of an amusement ride. An industry commenter requested that the triggering event of ''first use,'' as noted in the Advisory note to section 234.1 of the 2004 ADAAG, be included in the final rule. The Advisory note provides that ''[a] custom designed and constructed ride is new upon its first use, which is the first time amusement park patrons take the ride.'' The Department declines to treat amusement rides differently than other types of new construction and alterations. Under the final rule, they are subject to § 35.151(c). Thus, newly constructed and altered amusement rides shall comply with the 2010 Standards if the start of physical construction or the alteration is on or after 18 months from the publication date of this rule. The Department also notes that section 234.4.2 of the 2010 Standards only applies where the structural or operational characteristics of an amusement ride are altered. It does not apply in cases where the only change to a ride is the theme.

Noncomplying new construction and alterations. The element-by-element safe harbor referenced in § 35.150(b)(2) has no effect on new or altered elements in existing facilities that were subject to the 1991 Standards or UFAS on the date that they were constructed or altered, but do not comply with the technical and scoping specifications for those elements in the 1991 Standards or UFAS. Section 35.151(c)(5) of the

final rule sets forth the rules for noncompliant new construction or alterations in facilities that were subject to the requirements of this part. Under those provisions, noncomplying new construction and alterations constructed or altered after the effective date of the applicable ADA requirements and before March 15, 2012 shall, before March 15, 2012, be made accessible in accordance with either the 1991 Standards, UFAS, or the 2010 Standards. Noncomplying new construction and alterations constructed or altered after the effective date of the applicable ADA requirements and before March 15, 2012, shall, on or after March 15, 2012 be made accessible in accordance with the 2010 Standards.

Section 35.151(d) Scope of coverage

In the NPRM, the Department proposed a new provision, § 35.151(d), to clarify that the requirements established by § 35.151, including those contained in the 2004 ADAAG, prescribe what is necessary to ensure that buildings and facilities, including fixed or built-in elements in new or altered facilities, are accessible to individuals with disabilities. Once the construction or alteration of a facility has been completed, all other aspects of programs, services, and activities conducted in that facility are subject to the operational requirements established in this final rule. Although the Department may use the requirements of the 2010 Standards as a guide to determining when and how to make equipment and furnishings accessible, those determinations fall within the discretionary authority of the Department.

The Department also wishes to clarify that the advisory notes, appendix notes, and figures that accompany the 1991 and 2010 Standards do not establish separately enforceable requirements unless specifically stated otherwise in the text of the standards. This clarification has been made to address concerns expressed by ANPRM commenters who mistakenly believed that the advisory notes in the 2004 ADAAG established requirements beyond those established in the text of the guidelines (*e.g.,* Advisory 504.4 suggests, but does not require, that covered entities provide visual contrast on stair tread nosing to make them more visible to individuals with low vision). The Department received no significant comments on this section and it is unchanged in the final rule.

Definitions of residential facilities and transient lodging. The 2010 Standards add a definition of ''residential dwelling unit'' and modify the current definition of ''transient lodging.'' Under section 106.5 of the 2010 Standards, ''residential dwelling unit'' is defined as ''[a] unit intended to be used as a residence, that is primarily long-term in nature'' and does not include transient lodging, inpatient medical care, licensed long-term care, and detention or correctional facilities. Additionally, section 106.5 of the 2010 Standards changes the definition of ''transient lodging'' to a building or facility ''containing one or more guest room(s) for sleeping that provides accommodations that are primarily short-term in nature.'' ''Transient lodging'' does not include residential dwelling units intended to be used as a residence. The references to ''dwelling units'' and ''dormitories'' that are in the definition of the 1991 Standards are omitted from the 2010 Standards.

The comments about the application of transient lodging or residential standards to social service center establishments, and housing at a place of education are addressed separately below. The Department received one additional comment on this issue from an organization representing emergency response personnel seeking an exemption from the transient lodging accessibility requirements for crew quarters and common use areas serving those crew quarters (*e.g*., locker rooms, exercise rooms, day room) that are used exclusively by on-duty emergency response personnel and that are not used for any public purpose. The commenter argued that since emergency response personnel must meet certain physical qualifications that have the effect of

exempting persons with mobility disabilities, there is no need to build crew quarters and common use areas serving those crew quarters to meet the 2004 ADAAG. In addition, the commenter argued that applying the transient lodging standards would impose significant costs and create living space that is less usable for most emergency response personnel.

The ADA does not exempt spaces because of a belief or policy that excludes persons with disabilities from certain work. However, the Department believes that crew quarters that are used exclusively as a residence by emergency response personnel and the kitchens and bathrooms exclusively serving those quarters are more like residential dwelling units and are therefore covered by the residential dwelling standards in the 2010 Standards, not the transient lodging standards. The residential dwelling standards address most of the concerns of the commenter. For example, the commenter was concerned that sinks in kitchens and lavatories in bathrooms that are accessible under the transient lodging standards would be too low to be comfortably used by emergency response personnel. The residential dwelling standards allow such features to be adaptable so that they would not have to be lowered until accessibility was needed. Similarly, grab bars and shower seats would not have to be installed at the time of construction provided that reinforcement has been installed in walls and located so as to permit their installation at a later date.

Section 35.151(e) Social service center establishments

In the NPRM, the Department proposed a new § 35.151(e) requiring group homes, halfway houses, shelters, or similar social service center establishments that provide temporary sleeping accommodations or residential dwelling units to comply with the provisions of the 2004 ADAAG that apply to residential facilities, including, but not limited to, the provisions in sections 233 and 809.

The NPRM explained that this proposal was based on two important changes in the 2004 ADAAG. First, for the first time, residential dwelling units are explicitly covered in the 2004 ADAAG in section 233. Second, the 2004 ADAAG eliminates the language contained in the 1991 Standards addressing scoping and technical requirements for homeless shelters, group homes, and similar social service center establishments. Currently, such establishments are covered in section 9.5 of the transient lodging section of the 1991 Standards. The deletion of section 9.5 creates an ambiguity of coverage that must be addressed.

The NPRM explained the Department's belief that transferring coverage of social service center establishments from the transient lodging standards to the residential facilities standards would alleviate conflicting requirements for social service center providers. The Department believes that a substantial percentage of social service center establishments are recipients of Federal financial assistance from the Department of Housing and Urban Development (HUD). The Department of Health and Human Services (HHS) also provides financial assistance for the operation of shelters through the Administration for Children and Families programs. As such, these establishments are covered both by the ADA and section 504 of the Rehabilitation Act. UFAS is currently the design standard for new construction and alterations for entities subject to section 504. The two design standards for accessibility— the 1991 Standards and UFAS—have confronted many social service providers with separate, and sometimes conflicting, requirements for design and construction of facilities. To resolve these conflicts, the residential facilities standards in the 2004 ADAAG have been coordinated with the section 504 requirements. The transient lodging standards, however, are not similarly coordinated. The deletion of section 9.5 of the

1991 Standards from the 2004 ADAAG presented two options: (1) Require coverage under the transient lodging standards, and subject such facilities to separate, conflicting requirements for design and construction; or (2) require coverage under the residential facilities standards, which would harmonize the regulatory requirements under the ADA and section 504. The Department chose the option that harmonizes the regulatory requirements: coverage under the residential facilities standards.

In the NPRM, the Department expressed concern that the residential facilities standards do not include a requirement for clear floor space next to beds similar to the requirement in the transient lodging standards and as a result, the Department proposed adding a provision that would require certain social service center establishments that provide sleeping rooms with more than 25 beds to ensure that a minimum of 5 percent of the beds have clear floor space in accordance with section 806.2.3 of the 2004 ADAAG.

In the NPRM, the Department requested information from providers who operate homeless shelters, transient group homes, halfway houses, and other social service center establishments, and from the clients of these facilities who would be affected by this proposed change, asking, ''[t]o what extent have conflicts between the ADA and section 504 affected these facilities? What would be the effect of applying the residential dwelling unit requirements to these facilities, rather than the requirements for transient lodging guest rooms?'' 73 FR 34466, 34491 (June 17, 2008).

Many of the commenters supported applying the residential facilities requirements to social service center establishments, stating that even though the residential facilities requirements are less demanding in some instances, the existence of one clear standard will result in an overall increased level of accessibility by eliminating the confusion and inaction that are sometimes caused by the current existence of multiple requirements. One commenter also stated that ''it makes sense to treat social service center establishments like residential facilities because this is how these establishments function in practice.''

Two commenters agreed with applying the residential facilities requirements to social service center establishments but recommended adding a requirement for various bathing options, such as a roll-in shower (which is not required under the residential standards).

One commenter objected to the change and asked the Department to require that social service center establishments continue to comply with the transient lodging standards. One commenter stated that it did not agree that the standards for residential coverage would serve persons with disabilities as well as the 1991 transient lodging standards. This commenter expressed concern that the Department had eliminated guidance for social service agencies and that the rule should be put on hold until those safeguards are restored. Another commenter argued that the rule that would provide the greatest access for persons with disabilities should prevail.

Several commenters argued for the application of the transient lodging standards to all social service center establishments except those that were ''intended as a person's place of abode,'' referencing the Department's question related to the definition of ''place of lodging'' in the title III NPRM. One commenter stated that the International Building Code requires accessible units in all transient facilities. The commenter expressed concern that group homes should be built to be accessible, rather than adaptable.

The Department continues to be concerned about alleviating the challenges for social service providers that are also subject to section 504 and would likely be subject to conflicting requirements if the transient lodging standards were applied. Thus, the Department has retained the requirement that social service center establishments comply with the residential dwelling standards. The Department believes,

however, that social service center establishments that provide emergency shelter to large transient populations should be able to provide bathing facilities that are accessible to persons with mobility disabilities who need roll-in showers. Because of the transient nature of the population of these large shelters, it will not be feasible to modify bathing facilities in a timely manner when faced with a need to provide a roll-in shower with a seat when requested by an overnight visitor. As a result, the Department has added a requirement that social service center establishments with sleeping accommodations for more than 50 individuals must provide at least one roll-in shower with a seat that complies with the relevant provisions of section 608 of the 2010 Standards. Transfer-type showers are not permitted in lieu of a roll-in shower with a seat and the exceptions in sections 608.3 and 608.4 for residential dwelling units are not permitted. When separate shower facilities are provided for men and for women, at least one roll-in shower shall be provided for each group. This supplemental requirement to the residential facilities standards is in addition to the supplemental requirement that was proposed in the NPRM for clear floor space in sleeping rooms with more than 25 beds.

The Department also notes that while dwelling units at some social service center establishments are also subject to the Fair Housing Act (FHAct) design and construction requirements that require certain features of adaptable and accessible design, FHAct units do not provide the same level of accessibility that is required for residential facilities under the 2010 Standards. The FHAct requirements, where also applicable, should not be considered a substitute for the 2010 Standards. Rather, the 2010 Standards must be followed in addition to the FHAct requirements.

The Department also notes that whereas the NPRM used the term ''social service establishment,'' the final rule uses the term ''social service center establishment.'' The Department has made this editorial change so that the final rule is consistent with the terminology used in the ADA. *See* 42 U.S.C. 12181(7)(k).

Section 35.151(f) Housing at a place of education

The Department of Justice and the Department of Education share responsibility for regulation and enforcement of the ADA in postsecondary educational settings, including its requirements for architectural features. In addition, the Department of Housing and Urban Development (HUD) has enforcement responsibility for housing subject to title II of the ADA. Housing facilities in educational settings range from traditional residence halls and dormitories to apartment or townhouse-style residences. In addition to title II of the ADA, public universities and schools that receive Federal financial assistance are also subject to section 504, which contains its own accessibility requirements through the application of UFAS. Residential housing in an educational setting is also covered by the FHAct, which requires newly constructed multifamily housing to include certain features of accessible and adaptable design. Covered entities subject to the ADA must always be aware of, and comply with, any other Federal statutes or regulations that govern the operation of residential properties.

Although the 1991 Standards mention dormitories as a form of transient lodging, they do not specifically address how the ADA applies to dormitories or other types of residential housing provided in an educational setting. The 1991 Standards also do not contain any specific provisions for residential facilities, allowing covered entities to elect to follow the residential standards contained in UFAS. Although the 2004 ADAAG contains provisions for both residential facilities and transient lodging, the guidelines do not indicate which requirements apply to housing provided in an educational setting, leaving it to the adopting agencies to make that choice. After evaluating both sets of standards, the Department concluded that the benefits

of applying the transient lodging standards outweighed the benefits of applying the residential facilities standards. Consequently, in the NPRM, the Department proposed a new § 35.151(f) that provided that residence halls or dormitories operated by or on behalf of places of education shall comply with the provisions of the proposed standards for transient lodging, including, but not limited to, the provisions in sections 224 and 806 of the 2004 ADAAG.

Both public and private school housing facilities have varied characteristics. College and university housing facilities typically provide housing for up to one academic year, but may be closed during school vacation periods. In the summer, they are often used for short-term stays of one to three days, a week, or several months. Graduate and faculty housing is often provided year-round in the form of apartments, which may serve individuals or families with children. These housing facilities are diverse in their layout. Some are double-occupancy rooms with a shared toilet and bathing room, which may be inside or outside the unit. Others may contain cluster, suite, or group arrangements where several rooms are located inside a defined unit with bathing, kitchen, and similar common facilities. In some cases, these suites are indistinguishable in features from traditional apartments. Universities may build their own housing facilities or enter into agreements with private developers to build, own, or lease housing to the educational institution or to its students. Academic housing may be located on the campus of the university or may be located in nearby neighborhoods.

Throughout the school year and the summer, academic housing can become program areas in which small groups meet, receptions and educational sessions are held, and social activities occur. The ability to move between rooms—both accessible rooms and standard rooms—in order to socialize, to study, and to use all public use and common use areas is an essential part of having access to these educational programs and activities. Academic housing is also used for short-term transient educational programs during the time students are not in regular residence and may be rented out to transient visitors in a manner similar to a hotel for special university functions.

The Department was concerned that applying the new construction requirements for residential facilities to educational housing facilities could hinder access to educational programs for students with disabilities. Elevators are not generally required under the 2004 ADAAG residential facilities standards unless they are needed to provide an accessible route from accessible units to public use and common use areas, while under the 2004 ADAAG as it applies to other types of facilities, multistory public facilities must have elevators unless they meet very specific exceptions. In addition, the residential facilities standards do not require accessible roll-in showers in bathrooms, while the transient lodging requirements require some of the accessible units to be served by bathrooms with roll-in showers. The transient lodging standards also require that a greater number of units have accessible features for persons with communication disabilities. The transient lodging standards provide for installation of the required accessible features so that they are available immediately, but the residential facilities standards allow for certain features of the unit to be adaptable. For example, only reinforcements for grab bars need to be provided in residential dwellings, but the actual grab bars must be installed under the transient lodging standards. By contrast, the residential facilities standards do require certain features that provide greater accessibility within units, such as more usable kitchens, and an accessible route throughout the dwelling. The residential facilities standards also require 5 percent of the units to be accessible to persons with mobility disabilities, which is a continuation of the same scoping that is currently required under UFAS, and is therefore applicable to any educational institution that is covered by section 504. The transient lodging

standards require a lower percentage of accessible sleeping rooms for facilities with large numbers of rooms than is required by UFAS. For example, if a dormitory had 150 rooms, the transient lodging standards would require seven accessible rooms while the residential standards would require eight. In a large dormitory with 500 rooms, the transient lodging standards would require 13 accessible rooms and the residential facilities standards would require 25. There are other differences between the two sets of standards as well with respect to requirements for accessible windows, alterations, kitchens, accessible route throughout a unit, and clear floor space in bathrooms allowing for a side transfer.

In the NPRM, the Department requested public comment on how to scope educational housing facilities, asking, ''[w]ould the residential facility requirements or the transient lodging requirements in the 2004 ADAAG be more appropriate for housing at places of education? How would the different requirements affect the cost when building new dormitories and other student housing?'' 73 FR 34466, 34492 (June 17, 2008).

The vast majority of the comments received by the Department advocated using the residential facilities standards for housing at a place of education instead of the transient lodging standards, arguing that housing at places of public education are in fact homes for the students who live in them. These commenters argued, however, that the Department should impose a requirement for a variety of options for accessible bathing and should ensure that all floors of dormitories be accessible so that students with disabilities have the same opportunities to participate in the life of the dormitory community that are provided to students without disabilities. Commenters representing persons with disabilities and several individuals argued that, although the transient lodging standards may provide a few more accessible features (such as roll-in showers), the residential facilities standards would ensure that students with disabilities have access to all rooms in their assigned unit, not just to the sleeping room, kitchenette, and wet bar. One commenter stated that, in its view, the residential facilities standards were congruent with overlapping requirements from HUD, and that access provided by the residential facilities requirements within alterations would ensure dispersion of accessible features more effectively. This commenter also argued that while the increased number of required accessible units for residential facilities as compared to transient lodging may increase the cost of construction or alteration, this cost would be offset by a reduced need to adapt rooms later if the demand for accessible rooms exceeds the supply. The commenter also encouraged the Department to impose a visitability (accessible doorways and necessary clear floor space for turning radius) requirement for both the residential facilities and transient lodging requirements to allow students with mobility impairments to interact and socialize in a fully integrated fashion.

Two commenters supported the Department's proposed approach. One commenter argued that the transient lodging requirements in the 2004 ADAAG would provide greater accessibility and increase the opportunity of students with disabilities to participate fully in campus life. A second commenter generally supported the provision of accessible dwelling units at places of education, and pointed out that the relevant scoping in the International Building Code requires accessible units ''consistent with hotel accommodations.''

The Department has considered the comments recommending the use of the residential facilities standards and acknowledges that they require certain features that are not included in the transient lodging standards and that should be required for housing provided at a place of education. In addition, the Department notes that since educational institutions often use their academic housing facilities as short-term transient lodging in the summers, it is important that accessible features be installed at the outset.

It is not realistic to expect that the educational institution will be able to adapt a unit in a timely manner in order to provide accessible accommodations to someone attending a one-week program during the summer.

The Department has determined that the best approach to this type of housing is to continue to require the application of transient lodging standards, but at the same time to add several requirements drawn from the residential facilities standards related to accessible turning spaces and work surfaces in kitchens, and the accessible route throughout the unit. This will ensure the maintenance of the transient lodging standard requirements related to access to all floors of the facility, roll-in showers in facilities with more than 50 sleeping rooms, and other important accessibility features not found in the residential facilities standards, but will also ensure usable kitchens and access to all the rooms in a suite or apartment.

The Department has added a new definition to § 35.104, ''Housing at a Place of Education,'' and has revised § 35.151(f) to reflect the accessible features that now will be required in addition to the requirements set forth under the transient lodging standards. The Department also recognizes that some educational institutions provide some residential housing on a year-round basis to graduate students and staff which is comparable to private rental housing, and which contains no facilities for educational programming.

Section 35.151(f)(3) exempts from the transient lodging standards apartments or townhouse facilities provided by or on behalf of a place of education that are leased on a year-round basis exclusively to graduate students or faculty, and do not contain any public use or common use areas available for educational programming; instead, such housing shall comply with the requirements for residential facilities in sections 233 and 809 of the 2010 Standards. Section 35.151(f) uses the term ''sleeping room'' in lieu of the term ''guest room,'' which is the term used in the transient lodging standards. The Department is using this term because it believes that, for the most part, it provides a better description of the sleeping facilities used in a place of education than ''guest room.'' The final rule states that the Department intends the terms to be used interchangeably in the application of the transient lodging standards to housing at a place of education.

Section 35.151(g) Assembly areas

In the NPRM, the Department proposed § 35.151(g) to supplement the assembly area requirements of the 2004 ADAAG, which the Department is adopting as part of the 2010 Standards. The NPRM proposed at § 35.151(g)(1) to require wheelchair spaces and companion seating locations to be dispersed to all levels of the facility and are served by an accessible route. The Department received no significant comments on this paragraph and has decided to adopt the proposed language with minor modifications. The Department has retained the substance of this section in the final rule but has clarified that the requirement applies to stadiums, arenas, and grandstands. In addition, the Department has revised the phrase ''wheelchair and companion seating locations'' to ''wheelchair spaces and companion seats.''

Section 35.151(g)(1) ensures that there is greater dispersion of wheelchair spaces and companion seats throughout stadiums, arenas, and grandstands than would otherwise be required by sections 221 and 802 of the 2004 ADAAG. In some cases, the accessible route may not be the same route that other individuals use to reach their seats. For example, if other patrons reach their seats on the field by an inaccessible route (*e.g.*, by stairs), but there is an accessible route that complies with section 206.3 of the 2010 Standards that could be connected to seats on the field, wheelchair spaces and companion seats

must be placed on the field even if that route is not generally available to the public.

Regulatory language that was included in the 2004 ADAAG advisory, but that did not appear in the NPRM, has been added by the Department in § 35.151(g)(2). Section 35.151(g)(2) now requires an assembly area that has seating encircling, in whole or in part, a field of play or performance area such as an arena or stadium, to place wheelchair spaces and companion seats around the entire facility. This rule, which is designed to prevent a public entity from placing wheelchair spaces and companion seats on one side of the facility only, is consistent with the Department's enforcement practices and reflects its interpretation of section 4.33.3 of the 1991 Standards.

In the NPRM, the Department proposed § 35.151(g)(2) which prohibits wheelchair spaces and companion seating locations from being ''located on, (or obstructed by) temporary platforms or other moveable structures.'' Through its enforcement actions, the Department discovered that some venues place wheelchair spaces and companion seats on temporary platforms that, when removed, reveal conventional seating underneath, or cover the wheelchair spaces and companion seats with temporary platforms on top of which they place risers of conventional seating. These platforms cover groups of conventional seats and are used to provide groups of wheelchair seats and companion seats.

Several commenters requested an exception to the prohibition of the use of temporary platforms for public entities that sell most of their tickets on a season-ticket or other multi-event basis. Such commenters argued that they should be able to use temporary platforms because they know, in advance, that the patrons sitting in certain areas for the whole season do not need wheelchair spaces and companion seats. The Department declines to adopt such an exception. As it explained in detail in the NPRM, the Department believes that permitting the use of movable platforms that seat four or more wheelchair users and their companions have the potential to reduce the number of available wheelchair seating spaces below the level required, thus reducing the opportunities for persons who need accessible seating to have the same choice of ticket prices and amenities that are available to other patrons in the facility. In addition, use of removable platforms may result in instances where last minute requests for wheelchair and companion seating cannot be met because entire sections of accessible seating will be lost when a platform is removed. *See* 73 FR 34466, 34493 (June 17, 2008). Further, use of temporary platforms allows facilities to limit persons who need accessible seating to certain seating areas, and to relegate accessible seating to less desirable locations. The use of temporary platforms has the effect of neutralizing dispersion and other seating requirements (*e.g.*, line of sight) for wheelchair spaces and companion seats. *Cf. Independent Living Resources v. Oregon Arena Corp.*, 1 F. Supp. 2d 1159, 1171 (D. Or. 1998) (holding that while a public accommodation may ''infill'' wheelchair spaces with removable seats when the wheelchair spaces are not needed to accommodate individuals with disabilities, under certain circumstances ''[s]uch a practice might well violate the rule that wheelchair spaces must be dispersed throughout the arena in a manner that is roughly proportionate to the overall distribution of seating''). In addition, using temporary platforms to convert unsold wheelchair spaces to conventional seating undermines the flexibility facilities need to accommodate secondary ticket markets exchanges as required by § 35.138(g) of the final rule.

As the Department explained in the NPRM, however, this provision was not designed to prohibit temporary seating that increases seating for events (*e.g.*, placing temporary seating on the floor of a basketball court for a concert). Consequently, the final rule, at § 35.151(g)(3), has been amended to clarify that if an entire seating

section is on a temporary platform for a particular event, then wheelchair spaces and companion seats may be in that seating section. However, adding a temporary platform to create wheelchair spaces and companion seats that are otherwise dissimilar from nearby fixed seating and then simply adding a small number of additional seats to the platform would not qualify as an ''entire seating section'' on the platform. In addition, § 35.151(g)(3) clarifies that facilities may fill in wheelchair spaces with removable seats when the wheelchair spaces are not needed by persons who use wheelchairs.

The Department has been responsive to assembly areas' concerns about reduced revenues due to unused accessible seating. Accordingly, the Department has reduced scoping requirements significantly—by almost half in large assembly areas—and determined that allowing assembly areas to infill unsold wheelchair spaces with readily removable temporary individual seats appropriately balances their economic concerns with the rights of individuals with disabilities. *See* section 221.2 of the 2010 Standards.

For stadium-style movie theaters, in § 35.151(g)(4) of the NPRM the Department proposed requiring placement of wheelchair seating spaces and companion seats on a riser or cross-aisle in the stadium section of the theater and placement of such seating so that it satisfies at least one of the following criteria: (1) It is located within the rear 60 percent of the seats provided in the auditorium; or (2) it is located within the area of the auditorium where the vertical viewing angles are between the 40th to 100th percentile of vertical viewing angles for all seats in that theater as ranked from the first row (1st percentile) to the back row (100th percentile). The vertical viewing angle is the angle between a horizontal line perpendicular to the seated viewer's eye to the screen and a line from the seated viewer's eye to the top of the screen.

The Department proposed this bright-line rule for two reasons: (1) The movie theater industry petitioned for such a rule; and (2) the Department has acquired expertise on the design of stadium style theaters from litigation against several major movie theater chains. *See U.S. v. AMC Entertainment*, 232 F. Supp. 2d 1092 (C.D. Ca. 2002), *rev'd in part*, 549 F. 3d 760 (9th Cir. 2008); *U.S. v. Cinemark USA, Inc*., 348 F. 3d 569 (6th Cir. 2003), *cert. denied*, 542 U.S. 937 (2004). Two industry commenters—at least one of whom otherwise supported this rule—requested that the Department explicitly state that this rule does not apply retroactively to existing theaters. Although this rule on its face applies to new construction and alterations, these commenters were concerned that the rule could be interpreted to apply retroactively because of the Department's statement in the ANPRM that this bright-line rule, although newly-articulated, does not represent a ''substantive change from the existing line-of-sight requirements'' of section 4.33.3 of the 1991 Standards. *See* 69 FR 58768, 58776 (Sept. 30, 2004).

Although the Department intends for § 35.151(g)(4) of this rule to apply prospectively to new construction and alterations, this rule is not a departure from, and is consistent with, the line-of-sight requirements in the 1991 Standards. The Department has always interpreted the line-of-sight requirements in the 1991 Standards to require viewing angles provided to patrons who use wheelchairs to be comparable to those afforded to other spectators. Section 35.151(g)(4) merely represents the application of these requirements to stadium-style movie theaters.

One commenter from a trade association sought clarification whether § 35.151(g)(4) applies to stadium-style theaters with more than 300 seats, and argued that it should not since dispersion requirements apply in those theaters. The Department declines to limit this rule to stadium-style theaters with 300 or fewer seats; stadium-style theaters of all sizes must comply with this rule. So, for example, stadium-style theaters that must vertically disperse wheelchair and

companion seats must do so within the parameters of this rule.

The NPRM included a provision that required assembly areas with more than 5,000 seats to provide at least five wheelchair spaces with at least three companion seats for each of those five wheelchair spaces. The Department agrees with commenters who asserted that group seating is better addressed through ticketing policies rather than design and has deleted that provision from this section of the final rule.

Section 35.151(h) Medical care facilities

In the 1991 title II regulation, there was no provision addressing the dispersion of accessible sleeping rooms in medical care facilities. The Department is aware, however, of problems that individuals with disabilities face in receiving full and equal medical care when accessible sleeping rooms are not adequately dispersed. When accessible rooms are not fully dispersed, a person with a disability is often placed in an accessible room in an area that is not medically appropriate for his or her condition, and is thus denied quick access to staff with expertise in that medical specialty and specialized equipment. While the Access Board did not establish specific design requirements for dispersion in the 2004 ADAAG, in response to extensive comments in support of dispersion it added an advisory note, Advisory 223.1 General, encouraging dispersion of accessible rooms within the facility so that accessible rooms are more likely to be proximate to appropriate qualified staff and resources.

In the NPRM, the Department sought additional comment on the issue, asking whether it should require medical care facilities, such as hospitals, to disperse their accessible sleeping rooms, and if so, by what method (by specialty area, floor, or other criteria). All of the comments the Department received on this issue supported dispersing accessible sleeping rooms proportionally by specialty area. These comments, from individuals, organizations, and a building code association, argued that it would not be difficult for hospitals to disperse rooms by specialty area, given the high level of regulation to which hospitals are subject and the planning that hospitals do based on utilization trends. Further, commenters suggested that without a requirement, it is unlikely that hospitals would disperse the rooms. In addition, concentrating accessible rooms in one area perpetuates segregation of individuals with disabilities, which is counter to the purpose of the ADA.

The Department has decided to require medical care facilities to disperse their accessible sleeping rooms in a manner that is proportionate by type of medical specialty. This does not require exact mathematical proportionality, which at times would be impossible. However, it does require that medical care facilities disperse their accessible rooms by medical specialty so that persons with disabilities can, to the extent practical, stay in an accessible room within the wing or ward that is appropriate for their medical needs. The language used in this rule (''in a manner that is proportionate by type of medical specialty'') is more specific than that used in the NPRM (''in a manner that enables patients with disabilities to have access to appropriate specialty services'') and adopts the concept of proportionality proposed by the commenters. Accessible rooms should be dispersed throughout all medical specialties, such as obstetrics, orthopedics, pediatrics, and cardiac care.

Section 35.151(i) Curb ramps

Section 35.151(e) on curb ramps in the 1991 rule has been redesignated as § 35.151(i). In the NPRM, the Department proposed making a minor editorial change to this section, deleting the phrase ''other sloped areas'' from the two places in which it appears in the 1991 title II regulation. In the NPRM, the Department stated that the phrase ''other sloped areas'' lacks technical

precision. The Department received no significant public comments on this proposal. Upon further consideration, however, the Department has concluded that the regulation should acknowledge that there are times when there are transitions from sidewalk to road surface that do not technically qualify as ''curb ramps'' (sloped surfaces that have a running slope that exceed 5 percent). Therefore, the Department has decided not to delete the phrase ''other sloped areas.''

Section 35.151(j) Residential housing for sale to individual owners

Although public entities that operate residential housing programs are subject to title II of the ADA, and therefore must provide accessible residential housing, the 1991 Standards did not contain scoping or technical standards that specifically applied to residential housing units. As a result, under the Department's title II regulation, these agencies had the choice of complying with UFAS, which contains specific scoping and technical standards for residential housing units, or applying the ADAAG transient lodging standards to their housing. Neither UFAS nor the 1991 Standards distinguish between residential housing provided for rent and those provided for sale to individual owners. Thus, under the 1991 title II regulation, public entities that construct residential housing units to be sold to individual owners must ensure that some of those units are accessible. This requirement is in addition to any accessibility requirements imposed on housing programs operated by public entities that receive Federal financial assistance from Federal agencies such as HUD.

The 2010 Standards contain scoping and technical standards for residential dwelling units. However, section 233.3.2 of the 2010 Standards specifically defers to the Department and to HUD, the standard-setting agency under the ABA, to decide the appropriate scoping for those residential dwelling units built by or on behalf of public entities with the intent that the finished units will be sold to individual owners. These programs include, for example, HUD's public housing and HOME programs as well as State-funded programs to construct units for sale to individuals. In the NPRM, the Department did not make a specific proposal for this scoping. Instead, the Department stated that after consultation and coordination with HUD, the Department would make a determination in the final rule. The Department also sought public comment on this issue stating that ''[t]he Department would welcome recommendations from individuals with disabilities, public housing authorities, and other interested parties that have experience with these programs. Please comment on the appropriate scoping for residential dwelling units built by or on behalf of public entities with the intent that the finished units will be sold to individual owners.'' 73 FR 34466, 34492 (June 17, 2008).

All of the public comments received by the Department in response to this question were supportive of the Department's ensuring that the residential standards apply to housing built on behalf of public entities with the intent that the finished units would be sold to individual owners. The vast majority of commenters recommended that the Department require that projects consisting of five or more units, whether or not the units are located on one or multiple locations, comply with the 2004 ADAAG requirements for scoping of residential units, which require that 5 percent, and no fewer than one, of the dwelling units provide mobility features, and that 2 percent, and no fewer than one, of the dwelling units provide communication features. *See* 2004 ADAAG Section 233.3. These commenters argued that the Department should not defer to HUD because HUD has not yet adopted the 2004 ADAAG and there is ambiguity on the scope of coverage of pre-built for sale units under HUD's current section 504 regulations. In addition, these commenters expressed concern that HUD's current regulation, 24 CFR 8.29, presumes that

a prospective buyer is identified before design and construction begins so that disability features can be incorporated prior to construction. These commenters stated that State and Federally funded homeownership programs typically do not identify prospective buyers before construction has commenced. One commenter stated that, in its experience, when public entities build accessible for-sale units, they often sell these units through a lottery system that does not make any effort to match persons who need the accessible features with the units that have those features. Thus, accessible units are often sold to persons without disabilities. This commenter encouraged the Department to make sure that accessible for-sale units built or funded by public entities are placed in a separate lottery restricted to income-eligible persons with disabilities.

Two commenters recommended that the Department develop rules for four types of for-sale projects: single family pre-built (where buyer selects the unit after construction), single family post-built (where the buyer chooses the model prior to its construction), multi-family pre-built, and multi-family post-built. These commenters recommended that the Department require pre-built units to comply with the 2004 ADAAG 233.1 scoping requirements. For post-built units, the commenters recommended that the Department require all models to have an alternate design with mobility features and an alternate design with communications features in compliance with 2004 ADAAG. Accessible models should be available at no extra cost to the buyer. One commenter recommended that, in addition to required fully accessible units, all ground floor units should be readily convertible for accessibility or for sensory impairments technology enhancements.

The Department believes that consistent with existing requirements under title II, housing programs operated by public entities that design and construct or alter residential units for sale to individual owners should comply with the 2010 Standards, including the requirements for residential facilities in sections 233 and 809. These requirements will ensure that a minimum of 5 percent of the units, but no fewer than one unit, of the total number of residential dwelling units will be designed and constructed to be accessible for persons with mobility disabilities. At least 2 percent, but no fewer than one unit, of the total number of residential dwelling units shall provide communication features.

The Department recognizes that there are some programs (such as the one identified by the commenter), in which units are not designed and constructed until an individual buyer is identified. In such cases, the public entity is still obligated to comply with the 2010 Standards. In addition, the public entity must ensure that pre-identified buyers with mobility disabilities and visual and hearing disabilities are afforded the opportunity to buy the accessible units. Once the program has identified buyers who need the number of accessible units mandated by the 2010 Standards, it may have to make reasonable modifications to its policies, practices, and procedures in order to provide accessible units to other buyers with disabilities who request such units.

The Department notes that the residential facilities standards allow for construction of units with certain features of adaptability. Public entities that are concerned that fully accessible units are less marketable may choose to build these units to include the allowable adaptable features, and then adapt them at their own expense for buyers with mobility disabilities who need accessible units. For example, features such as grab bars are not required but may be added by the public entity if needed by the buyer at the time of purchase and cabinets under sinks may be designed to be removable to allow access to the required knee space for a forward approach.

The Department agrees with the commenters that covered entities may have to make reasonable modifications to their policies, practices, and procedures in order to ensure that when they offer pre-built accessible residential units for

sale, the units are offered in a manner that gives access to those units to persons with disabilities who need the features of the units and who are otherwise eligible for the housing program. This may be accomplished, for example, by adopting preferences for accessible units for persons who need the features of the units, holding separate lotteries for accessible units, or other suitable methods that result in the sale of accessible units to persons who need the features of such units. In addition, the Department believes that units designed and constructed or altered that comply with the requirements for residential facilities and are offered for sale to individuals must be provided at the same price as units without such features.

Section 35.151(k) Detention and correctional facilities

The 1991 Standards did not contain specific accessibility standards applicable to cells in correctional facilities. However, correctional and detention facilities operated by or on behalf of public entities have always been subject to the nondiscrimination and program accessibility requirements of title II of the ADA. The 2004 ADAAG established specific requirements for the design and construction and alterations of cells in correctional facilities for the first time.

Based on complaints received by the Department, investigations, and compliance reviews of jails, prisons, and other detention and correctional facilities, the Department has determined that many detention and correctional facilities do not have enough accessible cells, toilets, and shower facilities to meet the needs of their inmates with mobility disabilities and some do not have any at all. Inmates are sometimes housed in medical units or infirmaries separate from the general population simply because there are no accessible cells. In addition, some inmates have alleged that they are housed at a more restrictive classification level simply because no accessible housing exists at the appropriate classification level. The Department's compliance reviews and investigations have substantiated certain of these allegations.

The Department believes that the insufficient number of accessible cells is, in part, due to the fact that most jails and prisons were built long before the ADA became law and, since then, have undergone few alterations that would trigger the obligation to provide accessible features in accordance with UFAS or the 1991 Standards. In addition, the Department has found that even some new correctional facilities lack accessible features. The Department believes that the unmet demand for accessible cells is also due to the changing demographics of the inmate population. With thousands of prisoners serving life sentences without eligibility for parole, prisoners are aging, and the prison population of individuals with disabilities and elderly individuals is growing. A Bureau of Justice Statistics study of State and Federal sentenced inmates (those sentenced to more than one year) shows the total estimated count of State and Federal prisoners aged 55 and older grew by 36,000 inmates from 2000 (44,200) to 2006 (80,200). William J. Sabol *et al.*, *Prisoners in 2006*, Bureau of Justice Statistics Bulletin, Dec. 2007, at 23 (app. table 7), available at *http://bjs.ojp.usdoj.gov/ index.cfm?ty=pbdetail&iid=908* (last visited July 16, 2008); Allen J. Beck *et al*., *Prisoners in 2000,* Bureau of Justice Statistics Bulletin, Aug. 2001, at 10 (Aug. 2001) (Table 14), available at *bjs.ojp.usdoj.gov/ index.cfm?ty=pbdetail&iid=927* (last visited July 16, 2008). This jump constitutes an increase of 81 percent in prisoners aged 55 and older during this period.

In the NPRM, the Department proposed a new section, § 35.152, which combined a range of provisions relating to both program accessibility and application of the proposed standards to detention and correctional facilities. In the final rule, the Department is placing those provisions that refer to design, construction, and alteration

of detention and correction facilities in a new paragraph (k) of § 35.151, the section of the rule that addresses new construction and alterations for covered entities. Those portions of the final rule that address other issues, such as placement policies and program accessibility, are placed in the new § 35.152.

In the NPRM, the Department also sought input on how best to meet the needs of inmates with mobility disabilities in the design, construction, and alteration of detention and correctional facilities. The Department received a number of comments in response to this question.

New Construction. The NPRM did not expressly propose that new construction of correctional and detention facilities shall comply with the proposed standards because the Department assumed it would be clear that the requirements of § 35.151 would apply to new construction of correctional and detention facilities in the same manner that they apply to other facilities constructed by covered entities. The Department has decided to create a new section, § 35.151(k)(1), which clarifies that new construction of jails, prisons, and other detention facilities shall comply with the requirements of 2010 Standards. Section 35.151(k)(1) also increases the scoping for accessible cells from the 2 percent specified in the 2004 ADAAG to 3 percent.

Alterations. Although the 2010 Standards contain specifications for alterations in existing detention and correctional facilities, section 232.2 defers to the Attorney General the decision as to the extent these requirements will apply to alterations of cells. The NPRM proposed at § 35.152(c) that ''[a]lterations to jails, prisons, and other detention and correctional facilities will comply with the requirements of § 35.151(b).'' 73 FR 34466, 34507 (June 17, 2008). The final rule retains that requirement at § 35.151(k)(2), but increases the scoping for accessible cells from the 2 percent specified in the 2004 ADAAG to 3 percent.

Substitute cells. In the ANPRM, the Department sought public comment about the most effective means to ensure that existing correctional facilities are made accessible to prisoners with disabilities and presented three options: (1) Require all altered elements to be accessible, which would maintain the current policy that applies to other ADA alteration requirements; (2) permit substitute cells to be made accessible within the same facility, which would permit correctional authorities to meet their obligation by providing the required accessible features in cells within the same facility, other than those specific cells in which alterations are planned; or (3) permit substitute cells to be made accessible within a prison system, which would focus on ensuring that prisoners with disabilities are housed in facilities that best meet their needs, as alterations within a prison environment often result in piecemeal accessibility.

In § 35.152(c) of the NPRM, the Department proposed language based on Option 2, providing that when cells are altered, a covered entity may satisfy its obligation to provide the required number of cells with mobility features by providing the required mobility features in substitute cells (*i.e.*, cells other than those where alterations are originally planned), provided that each substitute cell is located within the same facility, is integrated with other cells to the maximum extent feasible, and has, at a minimum, physical access equal to that of the original cells to areas used by inmates or detainees for visitation, dining, recreation, educational programs, medical services, work programs, religious services, and participation in other programs that the facility offers to inmates or detainees.

The Department received few comments on this proposal. The majority who chose to comment supported an approach that allowed substitute cells to be made accessible within the same facility. In their view, such an approach balanced administrators' needs, cost considerations, and the needs of inmates with disabilities. One commenter noted, however, that with older facilities, required

modifications may be inordinately costly and technically infeasible. A large county jail system supported the proposed approach as the most viable option allowing modification or alteration of existing cells based on need and providing a flexible approach to provide program and mobility accessibility. It noted, as an alternative, that permitting substitute cells to be made accessible within a prison system would also be a viable option since such an approach could create a centralized location for accessibility needs and, because that jail system's facilities were in close proximity, it would have little impact on families for visitation or on accessible programming.

A large State department of corrections objected to the Department's proposal. The commenter stated that some very old prison buildings have thick walls of concrete and reinforced steel that are difficult, if not impossible to retrofit, and to do so would be very expensive. This State system approaches accessibility by looking at its system as a whole and providing access to programs for inmates with disabilities at selected prisons. This commenter explained that not all of its facilities offer the same programs or the same levels of medical or mental health services. An inmate, for example, who needs education, substance abuse treatment, and sex offender counseling may be transferred between facilities in order to meet his needs. The inmate population is always in flux and there are not always beds or program availability for every inmate at his security level. This commenter stated that the Department's proposed language would put the State in the position of choosing between adding accessible cells and modifying paths of travel to programs and services at great expense or not altering old facilities, causing them to become in states of disrepair and obsolescent, which would be fiscally irresponsible.

The Department is persuaded by these comments and has modified the alterations requirement in § 35.151(k)(2)(iv) in the final rule to allow that if it is technically infeasible to provide substitute cells in the same facility, cells can be provided elsewhere within the corrections system.

Number of accessible cells. Section 232.2.1 of the 2004 ADAAG requires at least 2 percent, but no fewer than one, of the cells in newly constructed detention and correctional facilities to have accessibility features for individuals with mobility disabilities. Section 232.3 provides that, where special holding cells or special housing cells are provided, at least one cell serving each purpose shall have mobility features. The Department sought input on whether these 2004 ADAAG requirements are sufficient to meet the needs of inmates with mobility disabilities. A major association representing county jails throughout the country stated that the 2004 ADAAG 2 percent requirement for accessible cells is sufficient to meet the needs of county jails. Similarly, a large county sheriff's department advised that the 2 percent requirement far exceeds the need at its detention facility, where the average age of the population is 32. This commenter stressed that the regulations need to address the differences between a local detention facility with low average lengths of stay as opposed to a State prison housing inmates for lengthy periods. This commenter asserted that more stringent requirements will raise construction costs by requiring modifications that are not needed. If more stringent requirements are adopted, the commenter suggested that they apply only to State and Federal prisons that house prisoners sentenced to long terms. The Department notes that a prisoner with a mobility disability needs a cell with mobility features regardless of the length of incarceration. However, the length of incarceration is most relevant in addressing the needs of an aging population.

The overwhelming majority of commenters responded that the 2 percent ADAAG requirement is inadequate to meet the needs of the incarcerated. Many commenters suggested that the requirement be expanded to apply to each

area, type, use, and class of cells in a facility. They asserted that if a facility has separate areas for specific programs, such as a dog training program or a substance abuse unit, each of these areas should also have 2 percent accessible cells but not less than one. These same commenters suggested that 5–7 percent of cells should be accessible to meet the needs of both an aging population and the larger number of inmates with mobility disabilities. One organization recommended that the requirement be increased to 5 percent overall, and that at least 2 percent of each type and use of cell be accessible. Another commenter recommended that 10 percent of cells be accessible. An organization with extensive corrections experience noted that the integration mandate requires a sufficient number and distribution of accessible cells so as to provide distribution of locations relevant to programs to ensure that persons with disabilities have access to the programs.

Through its investigations and compliance reviews, the Department has found that in most detention and correctional facilities, a 2 percent accessible cell requirement is inadequate to meet the needs of the inmate population with disabilities. That finding is supported by the majority of the commenters that recommended a 5–7 percent requirement. Indeed, the Department itself requires more than 2 percent of the cells to be accessible at its own corrections facilities. The Federal Bureau of Prisons is subject to the requirements of the 2004 ADAAG through the General Services Administration's adoption of the 2004 ADAAG as the enforceable accessibility standard for Federal facilities under the Architectural Barriers Act of 1968. 70 FR 67786, 67846–47 (Nov. 8, 2005). However, in order to meet the needs of inmates with mobility disabilities, the Bureau of Prisons has elected to increase that percentage and require that 3 percent of inmate housing at its facilities be accessible. Bureau of Prisons, Design Construction Branch, Design Guidelines, Attachment A: Accessibility Guidelines for Design, Construction, and Alteration of Federal Bureau of Prisons (Oct. 31, 2006).

The Department believes that a 3 percent accessible requirement is reasonable. Moreover, it does not believe it should impose a higher percentage on detention and corrections facilities than it utilizes for its own facilities. Thus, the Department has adopted a 3 percent requirement in § 35.151(k) for both new construction and alterations. The Department notes that the 3 percent requirement is a minimum. As corrections systems plan for new facilities or alterations, the Department urges planners to include numbers of inmates with disabilities in their population projections in order to take the necessary steps to provide a sufficient number of accessible cells to meet inmate needs.

Dispersion of Cells. The NPRM did not contain express language addressing dispersion of cells in a facility. However, Advisory 232.2 of the 2004 ADAAG recommends that ''[a]ccessible cells or rooms should be dispersed among different levels of security, housing categories, and holding classifications (*e.g.*, male/female and adult/juvenile) to facilitate access.'' In explaining the basis for recommending, but not requiring, this type of dispersal, the Access Board stated that ''[m]any detention and correctional facilities are designed so that certain areas (*e.g.*, 'shift' areas) can be adapted to serve as different types of housing according to need'' and that ''[p]lacement of accessible cells or rooms in shift areas may allow additional flexibility in meeting requirements for dispersion of accessible cells or rooms.''

The Department notes that inmates are typically housed in separate areas of detention and correctional facilities based on a number of factors, including their classification level. In many instances, detention and correctional facilities have housed inmates in inaccessible cells, even though accessible cells were available elsewhere in the facility, because there were

no cells in the areas where they needed to be housed, such as in administrative or disciplinary segregation, the women's section of the facility, or in a particular security classification area.

The Department received a number of comments stating that dispersal of accessible cells together with an adequate number of accessible cells is necessary to prevent inmates with disabilities from placement in improper security classification and to ensure integration. Commenters recommended modification of the scoping requirements to require a percentage of accessible cells in each program, classification, use or service area. The Department is persuaded by these comments. Accordingly, § 35.151(k)(1) and (k)(2) of the final rule require accessible cells in each classification area.

Medical facilities. The NPRM also did not propose language addressing the application of the 2004 ADAAG to medical and long-term care facilities in correctional and detention facilities. The provisions of the 2004 ADAAG contain requirements for licensed medical and long-term care facilities, but not those that are unlicensed. A disability advocacy group and a number of other commenters recommended that the Department expand the application of section 232.4 to apply to all such facilities in detention and correctional facilities, regardless of licensure. They recommended that whenever a correctional facility has a program that is addressed specifically in the 2004 ADAAG, such as a long-term care facility, the 2004 ADAAG scoping and design features should apply for those elements. Similarly, a building code organization noted that its percentage requirements for accessible units is based on what occurs in the space, not on the building type.

The Department is persuaded by these comments and has added § 35.151(k)(3), which states that ''[w]ith respect to medical and long-term care facilities in jails, prisons, and other detention and correctional facilities, public entities shall apply the 2010 Standards technical and scoping requirements for those facilities irrespective of whether those facilities are licensed.''

Section 35.152 Detention and correctional facilities—program requirements

As noted in the discussion of § 35.151(k), the Department has determined that inmates with mobility and other disabilities in detention and correctional facilities do not have equal access to prison services. The Department's concerns are based not only on complaints it has received, but the Department's substantial experience in investigations and compliance reviews of jails, prisons, and other detention and correctional facilities. Based on that review, the Department has found that many detention and correctional facilities have too few or no accessible cells, toilets, and shower facilities to meet the needs of their inmates with mobility disabilities. These findings, coupled with statistics regarding the current percentage of inmates with mobility disabilities and the changing demographics of the inmate population reflecting thousands of prisoners serving life sentences and increasingly large numbers of aging inmates who are not eligible for parole, led the Department to conclude that a new regulation was necessary to address these concerns.

In the NPRM, the Department proposed a new section, § 35.152, which combined a range of provisions relating to both program accessibility and application of the proposed standards to detention and correctional facilities. As mentioned above, in the final rule, the Department is placing those provisions that refer to design, construction, and alteration of detention and correction facilities in new paragraph (k) in § 35.151 dealing with new construction and alterations for covered entities. Those portions of the final rule that address other program requirements remain in § 35.152.

The Department received many comments in

response to the program accessibility requirements in proposed § 35.152. These comments are addressed below.

Facilities operated through contractual, licensing, or other arrangements with other public entities or private entities. The Department is aware that some public entities are confused about the applicability of the title II requirements to correctional facilities built or run by other public entities or private entities. It has consistently been the Department's position that title II requirements apply to correctional facilities used by State or local government entities, irrespective of whether the public entity contracts with another public or private entity to build or run the correctional facility. The power to incarcerate citizens rests with the State or local government, not a private entity. As the Department stated in the preamble to the original title II regulation, ''[a]ll governmental activities of public entities are covered, even if they are carried out by contractors.'' 28 CFR part 35, app. A at 558 (2009). If a prison is occupied by State prisoners and is inaccessible, the State is responsible under title II of the ADA. The same is true for a county or city jail. In essence, the private builder or contractor that operates the correctional facility does so at the direction of the government entity. Moreover, even if the State enters into a contractual, licensing, or other arrangement for correctional services with a public entity that has its own title II obligations, the State is still responsible for ensuring that the other public entity complies with title II in providing these services.

Also, through its experience in investigations and compliance reviews, the Department has noted that public entities contract for a number of services to be run by private or other public entities, for example, medical and mental health services, food services, laundry, prison industries, vocational programs, and drug treatment and substance abuse programs, all of which must be operated in accordance with title II requirements.

Proposed § 35.152(a) in the NPRM was designed to make it clear that title II applies to all State and local detention and correctional facilities, regardless of whether the detention or correctional facility is directly operated by the public entity or operated by a private entity through a contractual, licensing, or other arrangement. Commenters specifically supported the language of this section. One commenter cited Department of Justice statistics stating that of the approximately 1.6 million inmates in State and Federal facilities in December 2006, approximately 114,000 of these inmates were held in private prison facilities. *See* William J. Sabol *et al*., *Prisoners in 2006*, Bureau of Justice Statistics Bulletin, Dec. 2007, at 1, 4, available at *http:// bjs.ojp.usdoj.gov/ index.cfm?ty=pbdetail&iid=908*. Some commenters wanted the text ''through contracts or other arrangements'' changed to read ''through contracts or any other arrangements'' to make the intent clear. However, a large number of commenters recommended that the text of the rule make explicit that it applies to correctional facilities operated by private contractors. Many commenters also suggested that the text make clear that the rule applies to adult facilities, juvenile justice facilities, and community correctional facilities. In the final rule, the Department is adopting these latter two suggestions in order to make the section's intent explicit.

Section 35.152(a) of the final rule states specifically that the requirements of the section apply to public entities responsible for the operation or management of correctional facilities, ''either directly or through contractual, licensing, or other arrangements with public or private entities, in whole or in part, including private correctional facilities.'' Additionally, the section explicitly provides that it applies to adult and juvenile justice detention and correctional facilities and community correctional facilities.

Discrimination prohibited. In the NPRM, § 35.152(b)(1) proposed language stating that public entities are prohibited from excluding

qualified detainees and inmates from participation in, or denying, benefits, services, programs, or activities because a facility is inaccessible to persons with disabilities ''unless the public entity can demonstrate that the required actions would result in a fundamental alteration or undue burden.'' 73 FR 34446, 34507 (June 17, 2008). One large State department of corrections objected to the entire section applicable to detention and correctional facilities, stating that it sets a higher standard for correctional and detention facilities because it does not provide a defense for undue administrative burden. The Department has not retained the proposed NPRM language referring to the defenses of fundamental alteration or undue burden because the Department believes that these exceptions are covered by the general language of 35.150(a)(3), which states that a public entity is not required to take ''any action that it can demonstrate would result in a fundamental alteration in the nature of a service, program, or activity, or in undue financial and administrative burdens.'' The Department has revised the language of § 35.152(b)(1) accordingly.

Integration of inmates and detainees with disabilities. In the NPRM, the Department proposed language in § 35.152(b)(2) specifically applying the ADA's general integration mandate to detention and correctional facilities. The proposed language would have required public entities to ensure that individuals with disabilities are housed in the most integrated setting appropriate to the needs of the individual. It further stated that unless the public entity can demonstrate that it is appropriate to make an exception for a specific individual, a public entity:

(1) Should not place inmates or detainees with disabilities in locations that exceed their security classification because there are no accessible cells or beds in the appropriate classification;

(2) should not place inmates or detainees with disabilities in designated medical areas unless they are actually receiving medical care or treatment;

(3) should not place inmates or detainees with disabilities in facilities that do not offer the same programs as the facilities where they would ordinarily be housed; and

(4) should not place inmates or detainees with disabilities in facilities farther away from their families in order to provide accessible cells or beds, thus diminishing their opportunity for visitation based on their disability. 73 FR 34466, 34507 (June 17, 2008).

In the NPRM, the Department recognized that there are a wide range of considerations that affect decisions to house inmates or detainees and that in specific cases there may be compelling reasons why a placement that does not meet the general requirements of § 35.152(b)(2) may, nevertheless, comply with the ADA. However, the Department noted that it is essential that the planning process initially assume that inmates or detainees with disabilities will be assigned within the system under the same criteria that would be applied to inmates who do not have disabilities. Exceptions may be made on a case-by-case basis if the specific situation warrants different treatment. For example, if an inmate is deaf and communicates only using sign language, a prison may consider whether it is more appropriate to give priority to housing the prisoner in a facility close to his family that houses no other deaf inmates, or if it would be preferable to house the prisoner in a setting where there are sign language interpreters and other sign language users with whom he can communicate.

In general, commenters strongly supported the NPRM's clarification that the title II integration mandate applies to State and local corrections agencies and the facilities in which they house inmates. Commenters pointed out that inmates with disabilities continue to be segregated based on their disabilities and also excluded from participation in programs. An organization actively involved in addressing the needs of prisoners cited a number of recent lawsuits in which prisoners allege such discrimination.

The majority of commenters objected to

the language in proposed § 35.152(b)(2) that creates an exception to the integration mandate when the ''public entity can demonstrate that it is appropriate to make an exception for a specific individual.'' 73 FR 34466, 34507 (June 17, 2008). The vast majority of commenters asserted that, given the practice of many public entities to segregate and cluster inmates with disabilities, the exception will be used to justify the status quo. The commenters acknowledged that the intent of the section is to ensure that an individual with a disability who can be better served in a less integrated setting can legally be placed in that setting. They were concerned, however, that the proposed language would allow certain objectionable practices to continue, *e.g.*, automatically placing persons with disabilities in administrative segregation. An advocacy organization with extensive experience working with inmates recommended that the inmate have ''input'' in the placement decision.

Others commented that the exception does not provide sufficient guidance on when a government entity may make an exception, citing the need for objective standards. Some commenters posited that a prison administration may want to house a deaf inmate at a facility designated and equipped for deaf inmates that is several hundred miles from the inmate's home. Although under the exception language, such a placement may be appropriate, these commenters argued that this outcome appears to contradict the regulation's intent to eliminate or reduce the segregation of inmates with disabilities and prevent them from being placed far from their families. The Department notes that in some jurisdictions, the likelihood of such outcomes is diminished because corrections facilities with different programs and levels of accessibility are clustered in close proximity to one another, so that being far from family is not an issue. The Department also takes note of advancements in technology that will ease the visitation dilemma, such as family visitation through the use of videoconferencing.

Only one commenter, a large State department of corrections, objected to the integration requirement. This commenter stated it houses all maximum security inmates in maximum security facilities. Inmates with lower security levels may or may not be housed in lower security facilities depending on a number of factors, such as availability of a bed, staffing, program availability, medical and mental health needs, and enemy separation. The commenter also objected to the proposal to prohibit housing inmates with disabilities in medical areas unless they are receiving medical care. This commenter stated that such housing may be necessary for several days, for example, at a stopover facility for an inmate with a disability who is being transferred from one facility to another. Also, this commenter stated that inmates with disabilities in disciplinary status may be housed in the infirmary because not every facility has accessible cells in disciplinary housing. Similarly the commenter objected to the prohibition on placing inmates in facilities without the same programs as facilities where they normally would be housed. Finally, the commenter objected to the prohibition on placing an inmate at a facility distant from where the inmate would normally be housed. The commenter stressed that in its system, there are few facilities near most inmates' homes. The commenter noted that most inmates are housed at facilities far from their homes, a fact shared by all inmates, not just inmates with disabilities. Another commenter noted that in some jurisdictions, inmates who need assistance in activities of daily living cannot obtain that assistance in the general population, but only in medical facilities where they must be housed.

The Department has considered the concerns raised by the commenters with respect to this section and recognizes that corrections systems may move inmates routinely and for a variety of reasons, such as crowding, safety, security, classification change, need for specialized programs, or to provide medical care. Sometimes

these moves are within the same facility or prison system. On other occasions, inmates may be transferred to facilities in other cities, counties, and States. Given the nature of the prison environment, inmates have little say in their placement and administrators must have flexibility to meet the needs of the inmates and the system. The Department has revised the language of the exception contained in renumbered § 35.152(b)(2) to better accommodate corrections administrators' need for flexibility in making placement decisions based on legitimate, specific reasons. Moreover, the Department believes that temporary, short-term moves that are necessary for security or administrative purposes (*e.g.,* placing an inmate with a disability in a medical area at a stopover facility during a transfer from one facility to another) do not violate the requirements of § 35.152(b)(2).

The Department notes that § 35.150(a)(3) states that a public entity is not required to take ''any action that it can demonstrate would result in a fundamental alteration in the nature of a service, program, or activity or in undue financial and administrative burdens.'' Thus, corrections systems would not have to comply with the requirements of § 35.152(b)(1) in any specific circumstance where these defenses are met.

Several commenters recommended that the word ''should'' be changed to ''shall'' in the subparts to § 35.152(b)(2). The Department agrees that because the rule contains a specific exception and because the integration requirement is subject to the defenses provided in paragraph (a) of that section, it is more appropriate to use the word ''shall'' and the Department accordingly is making that change in the final rule.

Program requirements. In a unanimous decision, the Supreme Court, in *Pennsylvania Department of Corrections v. Yeskey*, 524 U.S. 206 (1998), stated explicitly that the ADA covers the operations of State prisons; accordingly, title II's program accessibility requirements apply to State and local correctional and detention facilities. In the NPRM, in addressing the accessibility of existing correctional and detention facilities, the Department considered the challenges of applying the title II program access requirement for existing facilities under § 31.150(a) in light of the realities of many inaccessible correctional facilities and strained budgets.

Correctional and detention facilities commonly provide a variety of different programs for education, training, counseling, or other purposes related to rehabilitation. Some examples of programs generally available to inmates include programs to obtain GEDs, computer training, job skill training and on-the-job training, religious instruction and guidance, alcohol and substance abuse groups, anger management, work assignments, work release, halfway houses, and other programs. Historically, individuals with disabilities have been excluded from such programs because they are not located in accessible locations, or inmates with disabilities have been segregated in units without equivalent programs. In light of the Supreme Court's decision in *Yeskey* and the requirements of title II, however, it is critical that public entities provide these opportunities to inmates with disabilities. In proposed § 35.152, the Department sought to clarify that title II required equal access for inmates with disabilities to participate in programs offered to inmates without disabilities.

The Department wishes to emphasize that detention and correctional facilities are unique facilities under title II. Inmates cannot leave the facilities and must have their needs met by the corrections system, including needs relating to a disability. If the detention and correctional facilities fail to accommodate prisoners with disabilities, these individuals have little recourse, particularly when the need is great (*e.g.*, an accessible toilet; adequate catheters; or a shower chair). It is essential that corrections systems fulfill their nondiscrimination and program access obligations by adequately addressing the needs of prisoners with disabilities, which include, but

are not limited to, proper medication and medical treatment, accessible toilet and shower facilities, devices such as a bed transfer or a shower chair, and assistance with hygiene methods for prisoners with physical disabilities.

In the NPRM, the Department also sought input on whether it should establish a program accessibility requirement that public entities modify additional cells at a detention or correctional facility to incorporate the accessibility features needed by specific inmates with mobility disabilities when the number of cells required by sections 232.2 and 232.3 of the 2004 ADAAG are inadequate to meet the needs of their inmate population.

Commenters supported a program accessibility requirement, viewing it as a flexible and practical means of allowing facilities to meet the needs of inmates in a cost effective and expedient manner. One organization supported a requirement to modify additional cells when the existing number of accessible cells is inadequate. It cited the example of a detainee who was held in a hospital because the local jail had no accessible cells. Similarly, a State agency recommended that the number of accessible cells should be sufficient to accommodate the population in need. One group of commenters voiced concern about accessibility being provided in a timely manner and recommended that the rule specify that the program accessibility requirement applies while waiting for the accessibility modifications. A group with experience addressing inmate needs recommended the inmate's input should be required to prevent inappropriate segregation or placement in an inaccessible or inappropriate area.

The Department is persuaded by these comments. Accordingly, § 35.152(b)(3) requires public entities to ''implement reasonable policies, including physical modifications to additional cells in accordance with the 2010 Standards, so as to ensure that each inmate with a disability is housed in a cell with the accessible elements necessary to afford the inmate access to safe, appropriate housing.''

Communication. Several large disability advocacy organizations commented on the 2004 ADAAG section 232.2.2 requirement that at least 2 percent of the general holding cells and housing cells must be equipped with audible emergency alarm systems. Permanently installed telephones within these cells must have volume control. Commenters said that the communication features in the 2004 ADAAG do not address the most common barriers that deaf and hard-of-hearing inmates face. They asserted that few cells have telephones and the requirements to make them accessible is limited to volume control, and that emergency alarm systems are only a small part of the amplified information that inmates need. One large association commented that it receives many inmate complaints that announcements are made over loudspeakers or public address systems, and that inmates who do not hear announcements for inmate count or other instructions face disciplinary action for failure to comply. They asserted that inmates who miss announcements miss meals, exercise, showers, and recreation. They argued that systems that deliver audible announcements, signals, and emergency alarms must be made accessible and that TTYs must be made available. Commenters also recommended that correctional facilities should provide access to advanced forms of telecommunications. Additional commenters noted that few persons now use TTYs, preferring instead to communicate by email, texting, and videophones.

The Department agrees with the commenters that correctional facilities and jails must ensure that inmates who are deaf or hard of hearing actually receive the same information provided to other inmates. The Department believes, however, that the reasonable modifications, program access, and effective communications requirements of title II are sufficient to address the needs of individual deaf and hard of hearing inmates, and as a result, declines to add specific requirements for communications features in cells

for deaf and hard of hearing inmates at this time. The Department notes that as part of its ongoing enforcement of the reasonable modifications, program access, and effective communications requirements of title II, the Department has required correctional facilities and jails to provide communication features in cells serving deaf and hard of hearing inmates.

Subpart E—Communications

Section 35.160 Communications.

Section 35.160 of the 1991 title II regulation requires a public entity to take appropriate steps to ensure that communications with applicants, participants, and members of the public with disabilities are as effective as communications with others. 28 CFR 35.160(a). In addition, a public entity must ''furnish appropriate auxiliary aids and services where necessary to afford an individual with a disability an equal opportunity to participate in, and enjoy the benefits of, a service, program, or activity conducted by a public entity.'' 28 CFR 35.160(b)(1). Moreover, the public entity must give ''primary consideration to the requests of the individual with disabilities'' in determining what type of auxiliary aid and service is necessary. 28 CFR 35.160(b)(2).

Since promulgation of the 1991 title II regulation, the Department has investigated hundreds of complaints alleging failures by public entities to provide effective communication, and many of these investigations resulted in settlement agreements and consent decrees. From these investigations, the Department has concluded that public entities sometimes misunderstand the scope of their obligations under the statute and the regulation. Section 35.160 in the final rule codifies the Department's longstanding policies in this area and includes provisions that reflect technological advances in the area of auxiliary aids and services.

In the NPRM, the Department proposed adding ''companion'' to the scope of coverage under § 35.160 to codify the Department's longstanding position that a public entity's obligation to ensure effective communication extends not just to applicants, participants, and members of the public with disabilities, but to companions as well, if any of them are individuals with disabilities. The NPRM defined companion as a person who is a family member, friend, or associate of a program participant, who, along with the program participant, is ''an appropriate person with whom the public entity should communicate.'' 73 FR 34466, 34507 (June 17, 2008).

Many commenters supported inclusion of ''companions'' in the rule, and urged even more specific language about public entities' obligations. Some commenters asked the Department to clarify that a companion with a disability may be entitled to effective communication from a public entity even though the applicants, participants, or members of the general public seeking access to, or participating in, the public entity's services, programs, or activities are not individuals with disabilities. Others requested that the Department explain the circumstances under which auxiliary aids and services should be provided to companions. Still others requested explicit clarification that where the individual seeking access to or participating in the public entity's program, services, or activities requires auxiliary aids and services, but the companion does not, the public entity may not seek out, or limit its communications to, the companion instead of communicating directly with the individual with a disability when it would be appropriate to do so.

Some in the medical community objected to the inclusion of any regulatory language regarding companions, asserting that such language is overbroad, seeks services for individuals whose presence is not required by the public entity, is not necessary for the delivery of the services or participation in the program, and places additional burdens on the medical community.

These commenters asked that the Department limit the public entity's obligation to communicate effectively with a companion to situations where such communications are necessary to serve the interests of the person who is receiving the public entity's services.

After consideration of the many comments on this issue, the Department believes that explicit inclusion of ''companions'' in the final rule is appropriate to ensure that public entities understand the scope of their effective communication obligations. There are many situations in which the interests of program participants without disabilities require that their companions with disabilities be provided effective communication. In addition, the program participant need not be physically present to trigger the public entity's obligations to a companion. The controlling principle is that auxiliary aids and services must be provided if the companion is an appropriate person with whom the public entity should or would communicate.

Examples of such situations include back-to-school nights or parent-teacher conferences at a public school. If the faculty writes on the board or otherwise displays information in a visual context during a back-to-school night, this information must be communicated effectively to parents or guardians who are blind or have low vision. At a parent-teacher conference, deaf parents or guardians must be provided with appropriate auxiliary aids and services to communicate effectively with the teacher and administrators. It makes no difference that the child who attends the school does not have a disability. Likewise, when a deaf spouse attempts to communicate with public social service agencies about the services necessary for the hearing spouse, appropriate auxiliary aids and services to the deaf spouse must be provided by the public entity to ensure effective communication. Parents or guardians, including foster parents, who are individuals with disabilities, may need to interact with child services agencies on behalf of their children; in such a circumstance, the child services agencies would need to provide appropriate auxiliary aids and services to those parents or guardians.

Effective communication with companions is particularly critical in health care settings where miscommunication may lead to misdiagnosis and improper or delayed medical treatment. The Department has encountered confusion and reluctance by medical care providers regarding the scope of their obligation with respect to such companions. Effective communication with a companion is necessary in a variety of circumstances. For example, a companion may be legally authorized to make health care decisions on behalf of the patient or may need to help the patient with information or instructions given by hospital personnel. A companion may be the patient's next-of-kin or health care surrogate with whom hospital personnel must communicate about the patient's medical condition. A companion could be designated by the patient to communicate with hospital personnel about the patient's symptoms, needs, condition, or medical history. Or the companion could be a family member with whom hospital personnel normally would communicate.

Accordingly, § 35.160(a)(1) in the final rule now reads, ''[a] public entity shall take appropriate steps to ensure that communications with applicants, participants, members of the public, and companions with disabilities are as effective as communications with others.'' Section 35.160(a)(2) further defines ''companion'' as ''a family member, friend, or associate of an individual seeking access to a service, program, or activity of a public entity, who, along with the individual, is an appropriate person with whom the public entity should communicate.'' Section 35.160(b)(1) clarifies that the obligation to furnish auxiliary aids and services extends to companions who are individuals with disabilities, whether or not the individual accompanied also is an individual with a disability. The provision now states that ''[a] public entity shall furnish

appropriate auxiliary aids and services where necessary to afford individuals with disabilities, including applicants, participants, companions, and members of the public, an equal opportunity to participate in, and enjoy the benefits of, a service, program, or activity of a public entity.''

These provisions make clear that if the companion is someone with whom the public entity normally would or should communicate, then the public entity must provide appropriate auxiliary aids and services to that companion to ensure effective communication with the companion. This common-sense rule provides the guidance necessary to enable public entities to properly implement the nondiscrimination requirements of the ADA.

As set out in the final rule, § 35.160(b)(2) states, in pertinent part, that ''[t]he type of auxiliary aid or service necessary to ensure effective communication will vary in accordance with the method of communication used by the individual, the nature, length, and complexity of the communication involved, and the context in which the communication is taking place. In determining what types of auxiliary aids and services are necessary, a public entity shall give primary consideration to the requests of individuals with disabilities.''

The second sentence of § 35.160(b)(2) of the final rule restores the ''primary consideration'' obligation set out at § 35.160(b)(2) in the 1991 title II regulation. This provision was inadvertently omitted from the NPRM, and the Department agrees with the many commenters on this issue that this provision should be retained. As noted in the preamble to the 1991 title II regulation, and reaffirmed here: ''The public entity shall honor the choice [of the individual with a disability] unless it can demonstrate that another effective means of communication exists or that use of the means chosen would not be required under § 35.164. Deference to the request of the individual with a disability is desirable because of the range of disabilities, the variety of auxiliary aids and services, and different circumstances requiring effective communication.'' 28 CFR part 35, app. A at 580 (2009).

The first sentence in § 35.160(b)(2) codifies the axiom that the type of auxiliary aid or service necessary to ensure effective communication will vary with the situation, and provides factors for consideration in making the determination, including the method of communication used by the individual; the nature, length, and complexity of the communication involved; and the context in which the communication is taking place. Inclusion of this language under title II is consistent with longstanding policy in this area. *See, e.g., The Americans with Disabilities Act Title II Technical Assistance Manual Covering State and Local Government Programs and Services,* section II–7.1000, available at *www.ada.gov/taman2.html* (''The type of auxiliary aid or service necessary to ensure effective communication will vary in accordance with the length and complexity of the communication involved. * * * Sign language or oral interpreters, for example, may be required when the information being communicated in a transaction with a deaf individual is complex, or is exchanged for a lengthy period of time. Factors to be considered in determining whether an interpreter is required include the context in which the communication is taking place, the number of people involved, and the importance of the communication.''); *see also* 28 CFR part 35, app. A at 580 (2009). As explained in the NPRM, an individual who is deaf or hard of hearing may need a qualified interpreter to communicate with municipal hospital personnel about diagnoses, procedures, tests, treatment options, surgery, or prescribed medication (*e.g.*, dosage, side effects, drug interactions, etc.), or to explain follow-up treatments, therapies, test results, or recovery. In comparison, in a simpler, shorter interaction, the method to achieve effective communication can be more basic. An individual who is seeking local tax forms may only need an exchange of written notes to achieve effective

communication.

Section 35.160(c)(1) has been added to the final rule to make clear that a public entity shall not require an individual with a disability to bring another individual to interpret for him or her. The Department receives many complaints from individuals who are deaf or hard of hearing alleging that public entities expect them to provide their own sign language interpreters. Proposed § 35.160(c)(1) was intended to clarify that when a public entity is interacting with a person with a disability, it is the public entity's responsibility to provide an interpreter to ensure effective communication. It is not appropriate to require the person with a disability to bring another individual to provide such services.

Section 35.160(c)(2) of the NPRM proposed codifying the Department's position that there are certain limited instances when a public entity may rely on an accompanying individual to interpret or facilitate communication: (1) In an emergency involving a threat to the public safety or welfare; or (2) if the individual with a disability specifically requests it, the accompanying individual agrees to provide the assistance, and reliance on that individual for this assistance is appropriate under the circumstances.

Many commenters supported this provision, but sought more specific language to address what they see as a particularly entrenched problem. Some commenters requested that the Department explicitly require the public entity first to notify the individual with a disability that the individual has a right to request and receive appropriate auxiliary aids and services without charge from the public entity before using that person's accompanying individual as a communication facilitator. Advocates stated that an individual who is unaware of his or her rights may decide to use a third party simply because he or she believes that is the only way to communicate with the public entity.

The Department has determined that inclusion of specific language requiring notification is unnecessary. Section 35.160(b)(1) already states that is the responsibility of the public entity to provide auxiliary aids and services. Moreover, § 35.130(f) already prohibits the public entity from imposing a surcharge on a particular individual with a disability or on any group of individuals with disabilities to cover the costs of auxiliary aids. However, the Department strongly advises public entities that they should first inform the individual with a disability that the public entity can and will provide auxiliary aids and services, and that there would be no cost for such aids or services.

Many commenters requested that the Department make clear that the public entity cannot request, rely upon, or coerce an adult accompanying an individual with a disability to provide effective communication for that individual with a disability—that only a voluntary offer is acceptable. The Department states unequivocally that consent of, and for, the adult accompanying the individual with a disability to facilitate communication must be provided freely and voluntarily both by the individual with a disability and the accompanying third party—absent an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available. The public entity may not coerce or attempt to persuade another adult to provide effective communication for the individual with a disability. Some commenters expressed concern that the regulation could be read by public entities, including medical providers, to prevent parents, guardians, or caregivers from providing effective communication for children or that a child, regardless of age, would have to specifically request that his or her caregiver act as interpreter. The Department does not intend § 35.160(c)(2) to prohibit parents, guardians, or caregivers from providing effective communication for children where so doing would be appropriate. Rather, the rule prohibits public entities, including medical

providers, from requiring, relying on, or forcing adults accompanying individuals with disabilities, including parents, guardians, or caregivers, to facilitate communication.

Several commenters asked that the Department make absolutely clear that children are not to be used to provide effective communication for family members and friends, and that it is the public entity's responsibility to provide effective communication, stating that often interpreters are needed in settings where it would not be appropriate for children to be interpreting, such as those involving medical issues, domestic violence, or other situations involving the exchange of confidential or adult-related material. Commenters observed that children are often hesitant to turn down requests to provide communication services, and that such requests put them in a very difficult position vis-a-vis family members and friends. The Department agrees. It is the Department's position that a public entity shall not rely on a minor child to facilitate communication with a family member, friend, or other individual, except in an emergency involving imminent threat to the safety or welfare of an individual or the public where there is no interpreter available. Accordingly, the Department has revised the rule to state: ''A public entity shall not rely on a minor child to interpret or facilitate communication, except in an emergency involving imminent threat to the safety or welfare of an individual or the public where there is no interpreter available.'' § 35.160(c)(3). Sections 35.160(c)(2) and (3) have no application in circumstances where an interpreter would not otherwise be required in order to provide effective communication (*e.g.*, in simple transactions such as purchasing movie tickets at a theater). The Department stresses that privacy and confidentiality must be maintained but notes that covered entities, such as hospitals, that are subject to the Health Insurance Portability and Accountability Act of 1996 (HIPAA), Public Law 104–191, Privacy Rules are permitted to disclose to a patient's relative, close friend, or any other person identified by the patient (such as an interpreter) relevant patient information if the patient agrees to such disclosures. *See* 45 CFR parts 160 and 164. The agreement need not be in writing. Covered entities should consult the HIPAA Privacy Rules regarding other ways disclosures might be able to be made to such persons.

With regard to emergency situations, the NPRM proposed permitting reliance on an individual accompanying an individual with a disability to interpret or facilitate communication in an emergency involving a threat to the public safety or welfare. Commenters requested that the Department make clear that often a public entity can obtain appropriate auxiliary aids and services in advance of an emergency by making necessary advance arrangements, particularly in anticipated emergencies such as predicted dangerous weather or certain medical situations such as childbirth. These commenters did not want public entities to be relieved of their responsibilities to provide effective communication in emergency situations, noting that the obligation to provide effective communication may be more critical in such situations. Several commenters requested a separate rule that requires public entities to provide timely and effective communication in the event of an emergency, noting that the need for effective communication escalates in an emergency.

Commenters also expressed concern that public entities, particularly law enforcement authorities and medical personnel, would apply the ''emergency situation'' provision in inappropriate circumstances and would rely on accompanying individuals without making any effort to seek appropriate auxiliary aids and services. Other commenters asked that the Department narrow this provision so that it would not be available to entities that are responsible for emergency preparedness and response. Some commenters noted that certain exigent circumstances, such as those that exist during and perhaps immediately

after, a major hurricane, temporarily may excuse public entities of their responsibilities to provide effective communication. However, they asked that the Department clarify that these obligations are ongoing and that, as soon as such situations begin to abate or stabilize, the public entity must provide effective communication.

The Department recognizes that the need for effective communication is critical in emergency situations. After due consideration of all of these concerns raised by commenters, the Department has revised § 35.160(c) to narrow the exception permitting reliance on individuals accompanying the individual with a disability during an emergency to make it clear that it only applies to emergencies involving an ''imminent threat to the safety or welfare of an individual or the public.'' *See* § 35.160(c)(2)–(3). Arguably, all visits to an emergency room or situations to which emergency workers respond are by definition emergencies. Likewise, an argument can be made that most situations that law enforcement personnel respond to involve, in one way or another, a threat to the safety or welfare of an individual or the public. The imminent threat exception in § 35.160(c)(2)– (3) is not intended to apply to the typical and foreseeable emergency situations that are part of the normal operations of these institutions. As such, a public entity may rely on an accompanying individual to interpret or facilitate communication under the § 35.160(c)(2)–(3) imminent threat exception only where in truly exigent circumstances, *i.e.*, where any delay in providing immediate services to the individual could have life-altering or life-ending consequences.

Many commenters urged the Department to stress the obligation of State and local courts to provide effective communication. The Department has received many complaints that State and local courts often do not provide needed qualified sign language interpreters to witnesses, litigants, jurors, potential jurors, and companions and associates of persons participating in the legal process. The Department cautions public entities that without appropriate auxiliary aids and services, such individuals are denied an opportunity to participate fully in the judicial process, and denied benefits of the judicial system that are available to others.

Another common complaint about access to State and local court systems is the failure to provide effective communication in deferral programs that are intended as an alternative to incarceration, or for other court-ordered treatment programs. These programs must provide effective communication, and courts referring individuals with disabilities to such programs should only refer individuals with disabilities to programs or treatment centers that provide effective communication. No person with a disability should be denied access to the benefits conferred through participation in a court-ordered referral program on the ground that the program purports to be unable to provide effective communication.

The general nondiscrimination provision in § 35.130(a) provides that no individual with a disability shall, on the basis of disability, be excluded from participation in or be denied the benefits of the services, programs, or activities of a public entity. The Department consistently interprets this provision and § 35.160 to require effective communication in courts, jails, prisons, and with law enforcement officers. Persons with disabilities who are participating in the judicial process as witnesses, jurors, prospective jurors, parties before the court, or companions of persons with business in the court, should be provided auxiliary aids and services as needed for effective communication. The Department has developed a variety of technical assistance and guidance documents on the requirements for title II entities to provide effective communication; those materials are available on the Department Web site at: *http:// www.ada.gov.*

Many advocacy groups urged the Department to add language in the final rule that would require public entities to provide accessible material in a

manner that is timely, accurate, and private. The Department has included language in § 35.160(b)(2) stating that ''[i]n order to be effective, auxiliary aids and services must be provided in accessible formats, in a timely manner, and in such a way so as to protect the privacy and independence of the individual with a disability.''

Because the appropriateness of particular auxiliary aids and services may vary as a situation changes, the Department strongly encourages public entities to do a communication assessment of the individual with a disability when the need for auxiliary aids and services is first identified, and to reassess communication effectiveness regularly throughout the communication. For example, a deaf individual may go to an emergency department of a public community health center with what is at first believed to be a minor medical emergency, such as a sore knee, and the individual with a disability and the public community health center both believe that exchanging written notes will be effective. However, during that individual's visit, it is determined that the individual is, in fact, suffering from an anterior cruciate ligament tear and must have surgery to repair the torn ligament. As the situation develops and the diagnosis and recommended course of action evolve into surgery, an interpreter most likely will be necessary. A public entity has a continuing obligation to assess the auxiliary aids and services it is providing, and should consult with individuals with disabilities on a continuing basis to assess what measures are required to ensure effective communication. Public entities are further advised to keep individuals with disabilities apprised of the status of the expected arrival of an interpreter or the delivery of other requested or anticipated auxiliary aids and services.

Video remote interpreting (VRI) services. In § 35.160(d) of the NPRM, the Department proposed the inclusion of four performance standards for VRI (which the NPRM termed video interpreting services (VIS)), for effective communication: (1) High-quality, clear, real-time, full-motion video and audio over a dedicated high-speed Internet connection; (2) a clear, sufficiently large, and sharply delineated picture of the participating individual's head, arms, hands, and fingers, regardless of his body position; (3) clear transmission of voices; and (4) persons who are trained to set up and operate the VRI quickly. Commenters generally approved of those performance standards, but recommended that some additional standards be included in the final rule. Some State agencies and advocates for persons with disabilities requested that the Department add more detail in the description of the first standard, including modifying the term ''dedicated high-speed Internet connection'' to read ''dedicated high-speed, wide-bandwidth video connection.'' These commenters argued that this change was necessary to ensure a high-quality video image that will not produce lags, choppy images, or irregular pauses in communication. The Department agrees with those comments and has amended the provision in the final rule accordingly.

For persons who are deaf with limited vision, commenters requested that the Department include an explicit requirement that interpreters wear high-contrast clothing with no patterns that might distract from their hands as they are interpreting, so that a person with limited vision can see the signs made by the interpreter. While the Department reiterates the importance of such practices in the delivery of effective VRI, as well as in-person interpreting, the Department declines to adopt such performance standards as part of this rule. In general, professional interpreters already follow such practices—the Code of Professional Conduct for interpreters developed by the Registry of Interpreters for the Deaf, Inc. and the National Association of the Deaf incorporates attire considerations into their standards of professionalism and conduct. (This code is available at *http:// www.vid.org/userfiles/file/pdfs/codeofethics. pdf* (Last visited July 18, 2010).

Moreover, as a result of this code, many VRI agencies have adopted detailed dress standards that interpreters hired by the agency must follow. In addition, commenters urged that a clear image of the face and eyes of the interpreter and others be explicitly required. Because the face includes the eyes, the Department has amended § 35.160(d)(2) of the final rule to include a requirement that the interpreter's face be displayed.

In response to comments seeking more training for users and non-technicians responsible for VRI in title II facilities, the Department is extending the requirement in § 35.160(d)(4) to require training for ''users of the technology'' so that staff who would have reason to use the equipment in an emergency room, State or local court, or elsewhere are properly trained. Providing for such training will enhance the success of VRI as means of providing effective communication.

Captioning at sporting venues. In the NPRM at § 35.160(e), the Department proposed that sports stadiums that have a capacity of 25,000 or more shall provide captioning for safety and emergency information on scoreboards and video monitors. In addition, the Department posed four questions about captioning of information, especially safety and emergency information announcements, provided over public address (PA) systems. The Department received many extremely detailed and divergent responses to each of the four questions and the proposed regulatory text. Because comments submitted on the Department's title II and title III proposals were intertwined, because of the similarity of issues involved for title II entities and title III entities, and in recognition of the fact that many large sports stadiums are covered by both title II and title III as joint operations of State or local governments and one or more public accommodations, the Department presents here a single consolidated review and summary of the issues raised in comments.

The Department asked whether requiring captioning of safety and emergency information made over the public address system in stadiums seating fewer than 25,000 would create an undue burden for smaller entities, whether it would be feasible for small stadiums, or whether a larger threshold, such as sports stadiums with a capacity of 50,000 or more, would be appropriate.

There was a consensus among the commenters, including disability advocates as well as venue owners and stadium designers and operators, that using the stadium size or seating capacity as the exclusive deciding factor for any obligation to provide captioning for safety and emergency information broadcast over the PA system is not preferred. Most disability advocacy organizations and individuals with disabilities complained that using size or seating capacity as a threshold for captioning safety and emergency information would undermine the ''undue burden'' defense found in both titles II and III. Many commenters provided examples of facilities like professional hockey arenas that seat less than 25,000 fans but which, commenters argued, should be able to provide real-time captioning. Other commenters suggested that some high school or college stadiums, for example, may hold 25,000 fans or more and yet lack the resources to provide real-time captioning. Many commenters noted that real-time captioning would require trained stenographers and that most high school and college sports facilities rely upon volunteers to operate scoreboards and PA systems, and they would not be qualified stenographers, especially in case of an emergency. One national association noted that the typical stenographer expense for a professional football game in Washington, DC is about $550 per game. Similarly, one trade association representing venues estimated that the cost for a professional stenographer at a sporting event runs between $500 and $1,000 per game or event, the cost of which, they argued, would be unduly burdensome in many cases. Some commenters posited that schools that do not sell tickets to athletic events would find it difficult to meet such expenses, in contrast to major college athletic programs and professional sports teams,

which would be less likely to prevail using an ''undue burden'' defense.

Some venue owners and operators and other covered entities argued that stadium size should not be the key consideration when requiring scoreboard captioning. Instead, these entities suggested that equipment already installed in the stadium, including necessary electrical equipment and backup power supply, should be the determining factor for whether captioning is mandated. Many commenters argued that the requirement to provide captioning should only apply to stadiums with scoreboards that meet the National Fire Protection Association (NFPA) National Fire Alarm Code (NFPA 72). Commenters reported that NFPA 72 requires at least two independent and reliable power supplies for emergency information systems, including one source that is a generator or battery sufficient to run the system in the event the primary power fails. Alternatively, some stadium designers and title II entities commented that the requirement should apply when the facility has at least one elevator providing firefighter emergency operation, along with approval of authorities with responsibility for fire safety. Other commenters argued for flexibility in the requirements for providing captioning and that any requirement should only apply to stadiums constructed after the effective date of the regulation.

In the NPRM, the Department also asked whether the rule should address the specific means of captioning equipment, whether it should be provided through any effective means (scoreboards, line boards, handheld devices, or other means), or whether some means, such as handheld devices, should be eliminated as options. This question elicited many comments from advocates for persons with disabilities as well as from covered entities. Advocacy organizations and individuals with experience using handheld devices argue that such devices do not provide effective communication. These commenters noted that information is often delayed in the transmission to such devices, making them hard to use when following action on the playing field or in the event of an emergency when the crowd is already reacting to aural information provided over the PA system well before it is received on the handheld device.

Several venue owners and operators and others commented that handheld technology offers advantages of flexibility and portability so that it may be used successfully regardless of where in the facility the user is located, even when not in the line of sight of a scoreboard or other captioning system. Still other commenters urged the Department not to regulate in such a way as to limit innovation and use of such technology now and in the future. Cost considerations were included in some comments from some stadium designers and venue owners and operators, who reported that the cost of providing handheld systems is far less than the cost of real-time captioning on scoreboards, especially in facilities that do not currently have the capacity to provide real-time captions on existing equipment. Others noted that handheld technology is not covered by fire and safety model codes, including the NFPA, and thus would be more easily adapted into existing facilities if captioning were required by the Department.

The Department also asked about providing open captioning of all public address announcements, and not limiting captioning to safety and emergency information. A variety of advocates and persons with disabilities argued that all information broadcast over a PA system should be captioned in real time at all facilities in order to provide effective communication and that a requirement only to provide emergency and safety information would not be sufficient. A few organizations for persons with disabilities commented that installation of new systems should not be required, but that all systems within existing facilities that are capable of providing captioning must be utilized to the maximum extent possible to provide captioning of as much

information as possible. Several organizations representing persons with disabilities commented that all facilities must include in safety planning the requirement to caption all aurally-provided information for patrons with communication disabilities. Some advocates suggested that demand for captions will only increase as the number of deaf and hard of hearing persons grows with the aging of the general population and with increasing numbers of veterans returning from war with disabilities. Multiple comments noted that the captioning would benefit others as well as those with communication disabilities.

By contrast, venue owners and operators and others commented that the action on the sports field is self-explanatory and does not require captioning and they objected to an explicit requirement to provide real-time captioning for all information broadcast on the PA system at a sporting event. Other commenters objected to requiring captioning even for emergency and safety information over the scoreboard rather than through some other means. By contrast, venue operators, State government agencies, and some model code groups, including NFPA, commented that emergency and safety information must be provided in an accessible format and that public safety is a paramount concern. Other commenters argued that the best method to deliver safety and emergency information would be television monitors showing local TV broadcasts with captions already mandated by the FCC. Some commenters posited that the most reliable information about a major emergency would be provided on the television news broadcasts. Several commenters argued that television monitors may be located throughout the facility, improving line of sight for patrons, some of whom might not be able to see the scoreboard from their seats or elsewhere in the facility. Some stadium designers, venue operators, and model code groups pointed out that video monitors are not regulated by the NFPA or other agencies, so that such monitors could be more easily provided. Video monitors may receive transmissions from within the facility and could provide real-time captions if there is the necessary software and equipment to feed the captioning signal to a closed video network within the facility. Several comments suggested that using monitors would be preferable to requiring captions on the scoreboard if the regulation mandates realtime captioning. Some venue owners and operators argued that retrofitting existing stadiums with new systems could easily cost hundreds of thousands of dollars per scoreboard or system. Some stadium designers and others argued that captioning should only be required in stadiums built after the effective date of the regulation. For stadiums with existing systems that allow for real-time captioning, one commenter posited that dedicating the system exclusively to real-time captioning would lead to an annual loss of between $2 and $3 million per stadium in revenue from advertising currently running in that space.

After carefully considering the wide range of public comments on this issue, the Department has concluded that the final rule will not provide additional requirements for effective communication or emergency information provided at sports stadiums at this time. The 1991 title II and title III regulations and statutory requirements are not in any way affected by this decision. The decision to postpone rulemaking on this complex issue is based on a number of factors, including the multiple layers of existing regulation by various agencies and levels of government, and the wide array of information, requests, and recommendations related to developing technology offered by the public. In addition, there is a huge variety of covered entities, information and communication systems, and differing characteristics among sports stadiums. The Department has concluded that further consideration and review would be prudent before it issues specific regulatory requirements.

Section 35.161 Telecommunications.

The Department proposed to retitle this section ''Telecommunications'' to reflect situations in which the public entity must provide an effective means to communicate by telephone for individuals with disabilities. First, the NPRM proposed redesignating § 35.161 as § 35.161(a) and replacing the term ''Telecommunications devices for the deaf (TDD)'' with ''Text telephones (TTY).'' Public comment was universally supportive of this change in nomenclature to TTY.

In the NPRM, at § 35.161(b), the Department addressed automated-attendant systems that handle telephone calls electronically. Often individuals with disabilities, including persons who are deaf or hard of hearing, are unable to use such automated systems. Some systems are not compatible with TTYs or the telecommunications relay service. Automated systems can and often do disconnect calls from TTYs or relay calls, making it impossible for persons using a TTY or relay system to do business with title II entities in the same manner as others. The Department proposed language that would require a telecommunications service to permit persons using relay or TTYs or other assistive technology to use the automated-attendant system provided by the public entity. The FCC raised this concern with the Department after the 1991 title II regulation went into effect, and the Department acted upon that request in the NPRM. Comments from disability advocates and persons with disabilities consistently requested the provision be amended to cover ''voice mail, messaging, auto-attendant, and interactive voice response systems.'' The Department recognizes that those are important features of widely used telecommunications technology that should be as accessible to persons who are deaf or hard of hearing as they are to others, and has amended the section in the final rule to include the additional features.

Many commenters, including advocates and persons with disabilities, as well as State agencies and national organizations, asked that all automated systems have an option for the caller to bypass the automated system and speak to a live person who could communicate using relay services. The Department understands that automated telecommunications systems typically do not offer the opportunity to avoid or bypass the automated system and speak to a live person. The Department believes that at this time it is inappropriate to add a requirement that all such systems provide an override capacity that permits a TTY or relay caller to speak with a live clerk on a telecommunications relay system. However, if a system already provides an option to speak to a person, that system must accept TTY and relay calls and must not disconnect or refuse to accept such calls.

Other comments from advocacy organizations and individuals urged the Department to require specifications for the operation of such systems that would involve issuing technical requirements for encoding and storage of automated text, as well as controls for speed, pause, rewind, and repeat, and prompts without any background noise. The same comments urged that these requirements should be consistent with a pending advisory committee report to the Access Board, submitted in April 2008. *See* Telecommunications and Electronic Information Technology Advisory Committee, Report to the Access Board Refreshed Accessibility Standards and Guidelines in Telecommunications and Electronic and Information Technology (Apr. 2008) available at *http://www.access-board. gov/sec508/refresh/report/.* The Department is declining at this time to preempt ongoing consideration of these issues by the Board. Instead, the Department will monitor activity by the Board. The Department is convinced that the general requirement to make such automated systems usable by persons with disabilities is appropriate at this time and title II entities should evaluate their automated systems in light of concerns about providing systems that

offer effective communication to persons with disabilities.

Finally, the Department has adopted in § 35.161(c) of the final rule the requirement that all such systems must not disconnect or refuse to take calls from all forms of FCC-approved telecommunications relay systems, including Internet-based relay systems. (Internet-based relay systems refer to the mechanism by which the message is relayed). They do not require a public entity to have specialized computer equipment. Commenters from some State agencies, many advocacy organizations, and individuals strongly urged the Department to mandate such action because of the high proportion of TTY calls and relay service calls that are not completed because the title II entity's phone system or employees do not take the calls. This presents a serious obstacle for persons doing business with State and local government and denies persons with disabilities access to use the telephone for business that is typically handled over the phone for others.

In addition, commenters requested that the Department include ''real-time'' before any mention of ''computer-aided'' technology to highlight the value of simultaneous translation of any communication. The Department has added ''real-time'' before ''computer-aided transcription services'' in the definition of ''auxiliary aids in § 35.104 and before ''communication'' in § 35.161(b).

Subpart F—Compliance Procedures

Section 35.171 Acceptance of complaints.

In the NPRM, the Department proposed changing the current language in § 35.171(a)(2)(i) regarding misdirected complaints to make it clear that if an agency receives a complaint for which it lacks jurisdiction either under section 504 or as a designated agency under the ADA, the agency may refer the complaint to the appropriate agency with title II or section 504 jurisdiction or to the Department of Justice. The language of the 1991 title II regulation only requires the agency to refer such a complaint to the Department, which in turn refers the complaint to the appropriate designated agency. The proposed revisions to § 35.171 made it clear that an agency can refer a misdirected complaint either directly to the appropriate agency or to the Department. This amendment was intended to protect against the unnecessary backlogging of complaints and to prevent undue delay in an agency taking action on a complaint.

Several commenters supported this amendment as a more efficient means of directing title II complaints to the appropriate enforcing agency. One commenter requested that the Department emphasize the need for timeliness in referring a complaint. The Department does not believe it is appropriate to adopt a specific time frame but will continue to encourage designated agencies to make timely referrals. The final rule retains, with minor modifications, the language in proposed § 35.171(a)(2)(i). The Department has also amended § 35.171(a)(2)(ii) to be consistent with the changes in the rule at § 35.190(e), as discussed below.

Section 35.172 Investigations and compliance reviews.

In the NPRM, the Department proposed a number of changes to language in § 35.172 relating to the resolution of complaints. Subtitle A of title II of the ADA defines the remedies, procedures, and rights provided for qualified individuals with disabilities who are discriminated against on the basis of disability in the services, programs, or activities of State and local governments. 42 U.S.C. 12131–12134. Subpart F of the current regulation establishes administrative procedures for the enforcement of title II of the ADA. 28 CFR 35.170–35.178. Subpart G identifies eight ''designated agencies,'' including the Department, that have responsibility for investigating complaints under title II. *See* 28

CFR 35.190(b).

The Department's 1991 title II regulation is based on the enforcement procedures established in regulations implementing section 504. Thus, the Department's 1991 title II regulation provides that the designated agency ''shall investigate each complete complaint'' alleging a violation of title II and shall ''attempt informal resolution'' of such complaint. 28 CFR 35.172(a). The full range of remedies (including compensatory damages) that are available to the Department when it resolves a complaint or resolves issues raised in a compliance review are available to designated agencies when they are engaged in informal complaint resolution or resolution of issues raised in a compliance review under title II.

In the years since the 1991 title II regulation went into effect, the Department has received many more complaints alleging violations of title II than its resources permit it to resolve. The Department has reviewed each complaint that the Department has received and directed its resources to resolving the most critical matters. In the NPRM, the Department proposed deleting the word ''each'' as it appears before ''complaint'' in § 35.172(a) of the 1991 title II regulation as a means of clarifying that designated agencies may exercise discretion in selecting title II complaints for resolution.

Many commenters opposed the removal of the term ''each,'' requesting that all title II complaints be investigated. The commenters explained that complaints against title II entities implicate the fundamental right of access to government facilities and programs, making an administrative enforcement mechanism critical. Rather than aligning enforcement discretion of title II complaints with the discretion under the enforcement procedures of title III, the commenters favored obtaining additional resources to address more complaints. The commenters highlighted the advantage afforded by Federal involvement in complaint investigations in securing favorable voluntary resolutions. When Federal involvement results in settlement agreements, commenters believed those agreements are more persuasive to other public entities than private settlements. Private litigation as a viable alternative was rejected by the commenters because of the financial limitations of many complainants, and because in some scenarios legal barriers foreclose private litigation as an option.

Several of those opposing this amendment argued that designated agencies are required to investigate each complaint under section 504, and a departure for title II complaints would be an inconsistency. The Department believes that § 35.171(a) of the final rule is consistent with the obligation to evaluate all complaints. However, there is no statutory requirement that every title II complaint receive a full investigation. Section 203 of the ADA, 42 U.S.C. 12133, adopts the ''remedies, procedures, and rights set forth in section 505 of the Rehabilitation Act of 1973'' (29 U.S.C. 794a). Section 505 of the Rehabilitation Act, in turn, incorporates the remedies available under title VI of the Civil Rights Act of 1964 into section 504. Under these statutes, agencies may engage in conscientious enforcement without fully investigating each citizen complaint. An agency's decision to conduct a full investigation requires a complicated balancing of a number of factors that are particularly within its expertise. Thus, the agency must not only assess whether a violation may have occurred, but also whether agency resources are best spent on this complaint or another, whether the agency is likely to succeed if it acts, and whether the particular enforcement action requested best fits the agency's overall policies. Availability of resources will always be a factor, and the Department believes discretion to maximize these limited resources will result in the most effective enforcement program. If agencies are bound to investigate each complaint fully, regardless of merit, such a requirement could have a deleterious effect on their overall enforcement efforts. The Department continues to expect that

each designated agency will review the complaints the agency receives to determine whether further investigation is appropriate.

The Department also proposed revising § 35.172 to add a new paragraph (b) that provided explicit authority for compliance reviews consistent with the Department's longstanding position that such authority exists. The proposed section stated, ''[t]he designated agency may conduct compliance reviews of public entities based on information indicating a possible failure to comply with the nondiscrimination requirements of this part.'' Several commenters supported this amendment, identifying title III compliance reviews as having been a successful means for the Department and designated agencies to improve accessibility. The Department has retained this section. However, the Department has modified the language of the section to make the authority to conduct compliance reviews consistent with that available under section 504 and title VI. *See, e.g.,* 28 CFR 42.107(a). The new provision reads as follows: ''(b) The designated agency may conduct compliance reviews of public entities in order to ascertain whether there has been a failure to comply with the nondiscrimination requirements of this part.'' The Department has also added a provision to § 35.172(c)(2) clarifying the Department's longstanding view that agencies may obtain compensatory damages on behalf of complainants as the result of a finding of discrimination pursuant to a compliance review or in informal resolution of a complaint.

Finally, in the NPRM, the Department proposed revising the requirements for letters of findings for clarification and to reflect current practice. Section 35.172(a) of the 1991 title II regulation required designated agencies to issue a letter of findings at the conclusion of an investigation if the complaint was not resolved informally, and to attempt to negotiate a voluntary compliance agreement if a violation was found. The Department's proposed changes to the 1991 title II regulation moved the discussion of letters of findings to a new paragraph (c) in the NPRM, and clarified that letters of findings are only required when a violation is found.

One commenter opposed the proposal to eliminate the obligation of the Department and designated agencies to issue letters of finding at the conclusion of every investigation. The commenter argued that it is beneficial for public entities, as well as complainants, for the Department to provide a reasonable explanation of both compliance and noncompliance findings.

The Department has considered this comment but continues to believe that this change will promote the overall effectiveness of its enforcement program. The final rule retains the proposed language.

Subpart G—Designated Agencies

Section 35.190 Designated agencies.

Subpart G of the 1991 title II regulation designates specific Federal agencies to investigate certain title II complaints. Paragraph 35.190(b) specifies these agency designations. Paragraphs 35.190(c) and (d), respectively, grant the Department discretion to designate further oversight responsibilities for matters not specifically assigned or where there are apparent conflicts of jurisdiction. The NPRM proposed adding a new § 35.190(e) further refining procedures for complaints filed with the Department of Justice. Proposed § 35.190(e) provides that when the Department receives a complaint alleging a violation of title II that is directed to the Attorney General but may fall within the jurisdiction of a designated agency or another Federal agency with jurisdiction under section 504, the Department may exercise its discretion to retain the complaint for investigation under this part. The Department would, of course, consult with the designated agency when the Department plans to retain a complaint.

In appropriate circumstances, the Department and the designated agency may conduct a joint investigation.

Several commenters supported this amendment as a more efficient means of processing title II complaints. The commenters supported the Department using its discretion to conduct timely investigations of such complaints. The language of the proposed § 35.190(e) remains unchanged in the final rule.

Other Issues

Questions Posed in the NPRM Regarding Costs and Benefits of Complying With the 2010 Standards

In the NPRM, the Department requested comment on various cost and benefit issues related to eight requirements in the Department's Initial Regulatory Impact Analysis (Initial RIA), available at *ada.gov/ NPRM2008/ria.htm)*, that were projected to have incremental costs exceeding monetized benefits by more than $100 million when using the 1991 Standards as the comparative baseline, *i.e.*, side reach, water closet clearances in single-user toilet rooms with in-swinging doors, stairs, elevators, location of accessible routes to stages, accessible attorney areas and witness stands, assistive listening systems, and accessible teeing grounds, putting greens, and weather shelters at golf courses. 73 FR 34466, 34469 (June 17, 2008). The Department noted that pursuant to the ADA, the Department does not have statutory authority to modify the 2004 ADAAG and is required instead to issue regulations implementing the ADA that are consistent with the Board's guidelines. In that regard, the Department also requested comment about whether any of these eight elements in the 2010 Standards should be returned to the Access Board for further consideration, in particular as applied to alterations. Many of the comments received by the Department in response to these questions addressed both titles II and III. As a result, the Department's discussion of these comments and its response are collectively presented for both titles.

Side reach. The 1991 Standards at section 4.2.6 establish a maximum side-reach height of 54 inches. The 2010 Standards at section 308.3 reduce that maximum height to 48 inches. The 2010 Standards also add exceptions for certain elements to the scoping requirement for operable parts.

The vast majority of comments the Department received were in support of the lower side-reach maximum of 48 inches in the 2010 Standards. Most of these comments, but not all, were received from individuals of short stature, relatives of individuals of short stature, or organizations representing the interests of persons with disabilities, including individuals of short stature. Comments from individuals with disabilities and disability advocacy groups stated that the 48-inch side reach would permit independence in performing many activities of daily living for individuals with disabilities, including individuals of short stature, persons who use wheelchairs, and persons who have limited upper body strength. In this regard, one commenter who is a business owner pointed out that as a person of short stature there were many occasions when he was unable to exit a public restroom independently because he could not reach the door handle. The commenter said that often elevator control buttons are out of his reach and, if he is alone, he often must wait for someone else to enter the elevator so that he can ask that person to press a floor button for him. Another commenter, who is also a person of short stature, said that he has on several occasions pulled into a gas station only to find that he was unable to reach the credit card reader on the gas pump. Unlike other customers who can reach the card reader, swipe their credit or debit cards, pump their gas and leave the station, he must use another method to pay for his gas. Another comment from

a person of short stature pointed out that as more businesses take steps to reduce labor costs—a trend expected to continue—staffed booths are being replaced with automatic machines for the sale, for example, of parking tickets and other products. He observed that the ''ability to access and operate these machines becomes ever more critical to function in society,'' and, on that basis, urged the Department to adopt the 48-inch side-reach requirement. Another individual commented that persons of short stature should not have to carry with them adaptive tools in order to access building or facility elements that are out of their reach, any more than persons in wheelchairs should have to carry ramps with them in order to gain access to facilities.

Many of the commenters who supported the revised side-reach requirement pointed out that lowering the side-reach requirement to 48 inches would avoid a problem sometimes encountered in the built environment when an element was mounted for a parallel approach at 54 inches only to find afterwards that a parallel approach was not possible. Some commenters also suggested that lowering the maximum unobstructed side reach to 48 inches would reduce confusion among design professionals by making the unobstructed forward and side-reach maximums the same (the unobstructed forward reach in both the 1991 and 2010 Standards is 48 inches maximum). These commenters also pointed out that the ICC/ANSI A117.1 Standard, which is a private sector model accessibility standard, has included a 48-inch maximum high side-reach requirement since 1998. Many jurisdictions have already incorporated this requirement into their building codes, which these commenters believed would reduce the cost of compliance with the 2010 Standards. Because numerous jurisdictions have already adopted the 48-inch side-reach requirement, the Department's failure to adopt the 48-inch side-reach requirement in the 2010 Standards, in the view of many commenters, would result in a significant reduction in accessibility, and would frustrate efforts that have been made to harmonize private sector model construction and accessibility codes with Federal accessibility requirements. Given these concerns, they overwhelmingly opposed the idea of returning the revised side-reach requirement to the Access Board for further consideration.

The Department also received comments in support of the 48-inch side-reach requirement from an association of professional commercial property managers and operators and from State governmental entities. The association of property managers pointed out that the revised side-reach requirement provided a reasonable approach to ''regulating elevator controls and all other operable parts'' in existing facilities in light of the manner in which the safe harbor, barrier removal, and alterations obligations will operate in the 2010 Standards. One governmental entity, while fully supporting the 48-inch side-reach requirement, encouraged the Department to adopt an exception to the lower reach range for existing facilities similar to the exception permitted in the ICC/ANSI A117.1 Standard. In response to this latter concern, the Department notes that under the safe harbor, existing facilities that are in compliance with the 1991 Standards, which require a 54-inch side-reach maximum, would not be required to comply with the lower side-reach requirement, unless there is an alteration. *See* § 35.150(b)(2).

A number of commenters expressed either concern with, or opposition to, the 48-inch side-reach requirement and suggested that it be returned to the Access Board for further consideration. These commenters included trade and business associations, associations of retail stores, associations of restaurant owners, retail and convenience store chains, and a model code organization. Several businesses expressed the view that the lower side-reach requirement would discourage the use of their products and equipment by most of the general public. In particular, concerns were expressed by a national association of pay phone service providers

regarding the possibility that pay telephones mounted at the lower height would not be used as frequently by the public to place calls, which would result in an economic burden on the pay phone industry. The commenter described the lower height required for side reach as creating a new ''barrier'' to pay phone use, which would reduce revenues collected from pay phones and, consequently, further discourage the installation of new pay telephones. In addition, the commenter expressed concern that phone service providers would simply decide to remove existing pay phones rather than incur the costs of relocating them at the lower height. With regard to this latter concern, the commenter misunderstood the manner in which the safe harbor obligation will operate in the revised title II regulation for elements that comply with the 1991 Standards. If the pay phones comply with the 1991 Standards or UFAS, the adoption of the 2010 Standards does not require retrofitting of these elements to reflect incremental changes in the 2010 Standards (*see* § 35.150(b)(2)). However, pay telephones that were required to meet the 1991 Standards as part of new construction or alterations, but do not in fact comply with those standards, will need to be brought into compliance with the 2010 Standards as of 18 months from the publication date of this final rule. *See* § 35.151(c)(5)(ii).

The Department does not agree with the concerns expressed by the commenter about reduced revenues from pay phones mounted at lower heights. The Department believes that, while given the choice some individuals may prefer to use a pay phone that is at a higher height, the availability of some phones at a lower height will not deter individuals from making needed calls.

The 2010 Standards will not require every pay phone to be installed or moved to a lowered height. The table accompanying section 217.2 of the 2010 Standards makes clear that, where one or more telephones are provided on a floor, level, or an exterior site, only one phone per floor, level, or exterior site must be placed at an accessible height. Similarly, where there is one bank of phones per floor, level, or exterior site, only one phone per floor, level, or exterior site must be accessible. And if there are two or more banks of phones per floor, level, or exterior site, only one phone per bank must be placed at an accessible height.

Another comment in opposition to the lower reach range requirement was submitted on behalf of a chain of convenience stores with fuel stops. The commenter expressed the concern that the 48-inch side reach ''will make it uncomfortable for the majority of the public,'' including persons of taller stature who would need to stoop to use equipment such as fuel dispensers mounted at the lower height. The commenter offered no objective support for the observation that a majority of the public would be rendered uncomfortable if, as required in the 2010 Standards, at least one of each type of fuel dispenser at a facility was made accessible in compliance with the lower reach range. Indeed, the Department received no comments from any individuals of tall stature expressing concern about accessible elements or equipment being mounted at the 48-inch height.

Several convenience store, restaurant, and amusement park commenters expressed concern about the burden the lower side-reach requirement would place on their businesses in terms of self-service food stations and vending areas if the 48-inch requirement were applied retroactively. The cost of lowering counter height, in combination with the lack of control businesses exercise over certain prefabricated service or vending fixtures, outweighed, they argued, any benefits to persons with disabilities. For this reason, they suggested the lower side-reach requirement be referred back to the Access Board.

These commenters misunderstood the safe harbor and barrier removal obligations that will be in effect under the 2010 Standards. Those existing

self-service food stations and vending areas that already are in compliance with the 1991 Standards will not be required to satisfy the 2010 Standards unless they engage in alterations. With regard to prefabricated vending machines and food service components that will be purchased and installed in businesses after the 2010 Standards become effective, the Department expects that companies will design these machines and fixtures to comply with the 2010 Standards in the future, as many have already done in the 10 years since the 48-inch side-reach requirement has been a part of the model codes and standards used by many jurisdictions as the basis for their construction codes.

A model code organization commented that the lower side-reach requirement would create a significant burden if it required entities to lower the mounting height for light switches, environmental controls, and outlets when an alteration did not include the walls where these elements were located, such as when ''an area is altered or as a path of travel obligation.'' The Department believes that the final rule adequately addresses those situations about which the commenter expressed concern by not requiring the relocation of existing elements, such as light switches, environmental controls, and outlets, unless they are altered. Moreover, under § 35.151(b)(4)(iii) of the final rule, costs for altering the path of travel to an altered area of primary function that exceed 20 percent of the overall costs of the alteration will be deemed disproportionate.

The Department has determined that the revised side-reach requirement should not be returned to the Access Board for further consideration, based in large part on the views expressed by a majority of the commenters regarding the need for, and importance of, the lower side-reach requirement to ensure access for persons with disabilities.

Alterations and Water Closet Clearances in Single-User Toilet Rooms With In-Swinging Doors

The 1991 Standards allow a lavatory to be placed a minimum of 18 inches from the water closet centerline and a minimum of 36 inches from the side wall adjacent to the water closet, which precludes side transfers. The 1991 Standards do not allow an in-swinging door in a toilet or bathing room to overlap the required clear floor space at any accessible fixture. To allow greater transfer options, section 604.3.2 of the 2010 Standards prohibits lavatories from overlapping the clear floor space at water closets, except in residential dwelling units. Section 603.2.3 of the 2010 Standards maintains the prohibition on doors swinging into the clear floor space or clearance required for any fixture, except that they permit the doors of toilet or bathing rooms to swing into the required turning space, provided that there is sufficient clearance space for the wheelchair outside the door swing. In addition, in single-user toilet or bathing rooms, exception 2 of section 603.2.3 of the 2010 Standards permits the door to swing into the clear floor space of an accessible fixture if a clear floor space that measures at least 30 inches by 48 inches is available outside the arc of the door swing.

The majority of commenters believed that this requirement would increase the number of toilet rooms accessible to individuals with disabilities who use wheelchairs or mobility scooters, and will make it easier for them to transfer. A number of commenters stated that there was no reason to return this provision to the Access Board. Numerous commenters noted that this requirement is already included in other model accessibility standards and many State and local building codes and that the adoption of the 2010 Standards is an important part of harmonization efforts.

Other commenters, mostly trade associations, opposed this requirement, arguing that the added cost to the industry outweighs any increase in accessibility. Two commenters stated that these proposed requirements would add two feet to the width of an accessible single-user toilet room; however, another commenter said the drawings in the proposed regulation demonstrated that

there would be no substantial increase in the size of the toilet room. Several commenters stated that this requirement would require moving plumbing fixtures, walls, or doors at significant additional expense. Two commenters wanted the permissible overlap between the door swing and clearance around any fixture eliminated. One commenter stated that these new requirements will result in fewer alterations to toilet rooms to avoid triggering the requirement for increased clearances, and suggested that the Department specify that repairs, maintenance, or minor alterations would not trigger the need to provide increased clearances. Another commenter requested that the Department exempt existing guest room bathrooms and single-user toilet rooms that comply with the 1991 Standards from complying with the increased clearances in alterations.

After careful consideration of these comments, the Department believes that the revised clearances for single-user toilet rooms will allow safer and easier transfers for individuals with disabilities, and will enable a caregiver, aide, or other person to accompany an individual with a disability into the toilet room to provide assistance. The illustrations in Appendix B to the final title III rule, ''Analysis and Commentary on the 2010 ADA Standards for Accessible Design,'' published elsewhere in this volume and codified as Appendix B to 28 CFR part 36, describe several ways for public entities and public accommodations to make alterations while minimizing additional costs or loss of space. Further, in any isolated instances where existing structural limitations may entail loss of space, the public entity and public accommodation may have a technical infeasibility defense for that alteration. The Department also recognizes that in attempting to create the required clear floor space pursuant to section 604.3.2, there may be certain specific circumstances where it would be technically infeasible for a covered entity to comply with the clear floor space requirement, such as where an entity must move a plumbing wall in a multistory building where the mechanical chase for plumbing is an integral part of a building's structure or where the relocation of a wall or fixture would violate applicable plumbing codes. In such circumstances, the required clear floor space would not have to be provided although the covered entity would have to provide accessibility to the maximum extent feasible. The Department has, therefore, decided not to return this requirement to the Access Board.

Alterations to stairs. The 1991 Standards only require interior and exterior stairs to be accessible when they provide access to levels that are not connected by an elevator, ramp, or other accessible means of vertical access. In contrast, section 210.1 of the 2010 Standards requires all newly constructed stairs that are part of a means of egress to be accessible. However, exception 2 of section 210.1 of the 2010 Standards provides that in alterations, stairs between levels connected by an accessible route need not be accessible, except that handrails shall be provided. Most commenters were in favor of this requirement for handrails in alterations, and stated that adding handrails to stairs during alterations was not only feasible and not cost-prohibitive, but also provided important safety benefits. One commenter stated that making all points of egress accessible increased the number of people who could use the stairs in an emergency. A majority of the commenters did not want this requirement returned to the Access Board for further consideration.

The International Building Code (IBC), which is a private sector model construction code, contains a similar provision, and most jurisdictions enforce a version of the IBC as their building code, thereby minimizing the impact of this provision on public entities and public accommodations. The Department believes that by requiring only the addition of handrails to altered stairs where levels are connected by an accessible route, the costs of compliance for public entities and public accommodations are minimized, while

safe egress for individuals with disabilities is increased. Therefore, the Department has decided not to return this requirement to the Access Board.

Alterations to elevators. Under the 1991 Standards, if an existing elevator is altered, only that altered elevator must comply with the new construction requirements for accessible elevators to the maximum extent feasible. It is therefore possible that a bank of elevators controlled by a single call system may contain just one accessible elevator, leaving an individual with a disability with no way to call an accessible elevator and thus having to wait indefinitely until an accessible elevator happens to respond to the call system. In the 2010 Standards, when an element in one elevator is altered, section 206.6.1 will require the same element to be altered in all elevators that are programmed to respond to the same call button as the altered elevator.

Most commenters favored the proposed requirement. This requirement, according to these commenters, is necessary so a person with a disability need not wait until an accessible elevator responds to his or her call. One commenter suggested that elevator owners could also comply by modifying the call system so the accessible elevator could be summoned independently. One commenter suggested that this requirement would be difficult for small businesses located in older buildings, and one commenter suggested that this requirement be sent back to the Access Board.

After considering the comments, the Department agrees that this requirement is necessary to ensure that when an individual with a disability presses a call button, an accessible elevator will arrive in a timely manner. The IBC contains a similar provision, and most jurisdictions enforce a version of the IBC as their building code, minimizing the impact of this provision on public entities and public accommodations. Public entities and businesses located in older buildings need not comply with this requirement where it is technically infeasible to do so. Further, as pointed out by one commenter, modifying the call system so the accessible elevator can be summoned independently is another means of complying with this requirement in lieu of altering all other elevators programmed to respond to the same call button. Therefore, the Department has decided not to return this requirement to the Access Board.

Location of accessible routes to stages. The 1991 Standards at section 4.33.5 require an accessible route to connect the accessible seating and the stage, as well as other ancillary spaces used by performers. The 2010 Standards at section 206.2.6 provide in addition that where a circulation path directly connects the seating area and the stage, the accessible route must directly connect the accessible seating and the stage, and, like the 1991 Standards, an accessible route must connect the stage with the ancillary spaces used by performers.

In the NPRM, the Department asked operators of auditoria about the extent to which auditoria already provide direct access to stages and whether there were planned alterations over the next 15 years that included accessible direct routes to stages. The Department also asked how to quantify the benefits of this requirement for persons with disabilities, and invited commenters to provide illustrative anecdotal experiences about the requirement's benefits. The Department received many comments regarding the costs and benefits of this requirement. Although little detail was provided, many industry and governmental entity commenters anticipated that the costs of this requirement would be great and that it would be difficult to implement. They noted that premium seats may have to be removed and that load-bearing walls may have to be relocated. These commenters suggested that the significant costs would deter alterations to the stage area for a great many auditoria. Some commenters suggested that ramps to the front of the stage may interfere with means of egress and emergency exits. Several commenters requested that the requirement

apply to new construction only, and one industry commenter requested an exemption for stages used in arenas or amusement parks where there is no audience participation or where the stage is a work area for performers only. One commenter requested that the requirement not apply to temporary stages.

The final rule does not require a direct accessible route to be constructed where a direct circulation path from the seating area to the stage does not exist. Consequently, those commenters who expressed concern about the burden imposed by the revised requirement (*i.e.*, where the stage is constructed with no direct circulation path connecting the general seating and performing area) should note that the final rule will not require the provision of a direct accessible route under these circumstances. The final rule applies to permanent stages, as well as ''temporary stages,'' if there is a direct circulation path from the seating area to the stage. However, the Department does recognize that in some circumstances, such as an alteration to a primary function area, the ability to provide a direct accessible route to a stage may be costly or technically infeasible, the auditorium owner is not precluded by the revised requirement from asserting defenses available under the regulation. In addition, the Department notes that since section 4.33.5 of the 1991 Standards requires an accessible route to a stage, the safe harbor will apply to existing facilities whose stages comply with the 1991 Standards.

Several governmental entities supported accessible auditoria and the revised requirement. One governmental entity noted that its State building code already required direct access, that it was possible to provide direct access, and that creative solutions had been found to do so.

Many advocacy groups and individual commenters strongly supported the revised requirement, discussing the acute need for direct access to stages as it impacts a great number of people at important life events such as graduations and awards ceremonies, at collegiate and competitive performances and other school events, and at entertainment events that include audience participation. Many commenters expressed the belief that direct access is essential for integration mandates to be satisfied and that separate routes are stigmatizing and unequal. The Department agrees with these concerns.

Commenters described the impact felt by persons in wheelchairs who are unable to access the stage at all when others are able to do so. Some of these commenters also discussed the need for performers and production staff who use wheelchairs to have direct access to the stage and provided a number of examples that illustrated the importance of the rule proposed in the NPRM. Personal anecdotes were provided in comments and at the Department's public hearing on the NPRM. One mother spoke passionately and eloquently about the unequal treatment experienced by her daughter, who uses a wheelchair, at awards ceremonies and band concerts. Her daughter was embarrassed and ashamed to be carried by her father onto a stage at one band concert. When the venue had to be changed for another concert to an accessible auditorium, the band director made sure to comment that he was unhappy with the switch. Rather than endure the embarrassment and indignities, her child dropped out of band the following year. Another father commented about how he was unable to speak from the stage at a PTA meeting at his child's school. Speaking from the floor limited his line of sight and his participation. Several examples were provided of children who could not participate on stage during graduation, awards programs, or special school events, such as plays and festivities. One student did not attend his college graduation because he would not be able to get on stage. Another student was unable to participate in the class Christmas programs or end-of-year parties unless her father could attend and lift her onto the stage. These commenters did not provide a method to quantify

the benefits that would accrue by having direct access to stages. One commenter stated, however, that ''the cost of dignity and respect is without measure.''

Many industry commenters and governmental entities suggested that the requirement be sent back to the Access Board for further consideration. One industry commenter mistakenly noted that some international building codes do not incorporate the requirement and that therefore there is a need for further consideration. However, the Department notes that both the 2003 and 2006 editions of the IBC include scoping provisions that are almost identical to this requirement and that these editions of the model code are the most frequently used. Many individuals and advocacy group commenters requested that the requirement be adopted without further delay. These commenters spoke of the acute need for direct access to stages and the amount of time it would take to resubmit the requirement to the Access Board. Several commenters noted that the 2004 ADAAG tracks recent model codes and thus there is no need for further consideration. The Department agrees that no further delay is necessary and therefore has decided not to return the requirement to the Access Board for further consideration.

Attorney areas and witness stands. The 1991 Standards do not require that public entities meet specific architectural standards with regard to the construction and alteration of courtrooms and judicial facilities. Because it is apparent that the judicial facilities of State and local governments have often been inaccessible to individuals with disabilities, as part of the NPRM, the Department proposed the adoption of sections 206.2.4, 231.2, 808, 304, 305, and 902 of the 2004 ADAAG concerning judicial facilities and courtrooms, including requirements for accessible courtroom stations and accessible jury boxes and witness stands.

Those who commented on access to judicial facilities and courtrooms uniformly favored the adoption of the 2010 Standards. Virtually all of the commenters stated that accessible judicial facilities are crucial to ensuring that individuals with disabilities are afforded due process under law and have an equal opportunity to participate in the judicial process. None of the commenters favored returning this requirement to the Access Board for further consideration.

The majority of commenters, including many disability rights and advocacy organizations, stated that it is crucial for individuals with disabilities to have effective and meaningful access to our judicial system so as to afford them due process under law. They objected to asking the Access Board to reconsider this requirement. In addition to criticizing the initial RIA for virtually ignoring the intangible and non-monetary benefits associated with accessible courtrooms, these commenters frequently cited the Supreme Court's decision in *Tennessee v. Lane,* 541 U.S. 509, 531 (2004),[4] as ample justification for the requirement, noting the Court's finding that ''[t]he unequal treatment of disabled persons in the administration of judicial services has a long history, and has persisted despite several legislative efforts to remedy the problem of disability discrimination.'' *Id.* at 531. These commenters also made a number of observations, including the following: providing effective access to individuals with mobility impairments is not possible when architectural barriers impede their path of travel and negatively emphasize an individual's disability; the perception generated by makeshift accommodations discredits witnesses and attorneys with disabilities, who should not be stigmatized or treated like second-class citizens; the cost of accessibility modifications to existing courthouses can often be significantly decreased

[4] The Supreme Court in *Tennessee v. Lane*, 541 U.S. 509, 5330534 (2004), held that title II of the ADA constitutes a valid exercise of Congress' enforcement power under the Fourteenth Amendment in cases implicating the fundamental access to the courts.

by planning ahead, by focusing on low-cost options that provide effective access, and by addressing existing barriers when reasonable modifications to the courtroom can be made; by planning ahead and by following best practices, jurisdictions can avoid those situations where it is apparent that someone's disability is the reason why ad hoc arrangements have to be made prior to the beginning of court proceedings; and accessibility should be a key concern during the planning and construction process so as to ensure that both courtroom grandeur and accessibility are achieved. One commenter stated that, in order for attorneys with disabilities to perform their professional duties to their clients and the court, it is essential that accessible courtrooms, conference rooms, law libraries, judicial chambers, and other areas of a courthouse be made barrier-free by taking accessible design into account prior to construction.

Numerous commenters identified a variety of benefits that would accrue as a result of requiring judicial facilities to be accessible. These included the following: maintaining the decorum of the courtroom and eliminating the disruption of court proceedings when individuals confront physical barriers; providing an accessible route to the witness stand and attorney area and clear floor space to accommodate a wheelchair within the witness area; establishing crucial lines of sight between the judge, jury, witnesses, and attorneys—which commenters described as crucial; ensuring that the judge and the jury will not miss key visual indicators of a witness; maintaining a witness's or attorney's dignity and credibility; shifting the focus from a witness's disability to the substance of that person's testimony; fostering the independence of an individual with disability; allowing persons with mobility impairments to testify as witnesses, including as expert witnesses; ensuring the safety of various participants in a courtroom proceeding; and avoiding unlawful discrimination. One commenter stated that equal access to the well of the courtroom for both attorney and client is important for equal participation and representation in our court system. Other commenters indicated that accessible judicial facilities benefit a wide range of people, including many persons without disabilities, senior citizens, parents using strollers with small children, and attorneys and court personnel wheeling documents into the courtroom. One commenter urged the adoption of the work area provisions because they would result in better workplace accessibility and increased productivity. Several commenters urged the adoption of the rule because it harmonizes the ADAAG with the model IBC, the standards developed by the American National Standards Institute (ANSI), and model codes that have been widely adopted by State and local building departments, thus increasing the prospects for better understanding and compliance with the ADAAG by architects, designers, and builders.

Several commenters mentioned the report ''Justice for All: Designing Accessible Courthouses'' (Nov. 15, 2006), available at *http://www.access-board.gov/caac/ report.htm* (Nov. 24, 2009) (last visited June 24, 2010). The report, prepared by the Courthouse Access Advisory Committee for the Access Board, contained recommendations for the Board's use in developing and disseminating guidance on accessible courthouse design under the ADA and the ABA. These commenters identified some of the report's best practices concerning courtroom accessibility for witness stands, jury boxes, and attorney areas; addressed the costs and benefits arising from the use of accessible courtrooms; and recommended that the report be incorporated into the Department's final rule. With respect to existing courtrooms, one commenter in this group suggested that consideration be given to ensuring that there are barrier-free emergency evacuation routes for all persons in the courtroom, including different evacuation routes for different classes of individuals given the unique nature of judicial facilities and courtrooms.

The Department declines to incorporate the report into the regulation. However, the Department encourages State and local governments to consult the Committee report as a useful guide on ways to facilitate and increase accessibility of their judicial facilities. The report includes many excellent examples of accessible courtroom design.

One commenter proposed that the regulation also require a sufficient number of accessible benches for judges with disabilities. Under section 206.2.4 of the 2004 ADAAG, raised courtroom stations used by judges and other judicial staff are not required to provide full vertical access when first constructed or altered, as long as the required clear floor space, maneuvering space, and any necessary electrical service for future installation of a means of vertical access, is provided at the time of new construction or can be achieved without substantial reconstruction during alterations. The Department believes that this standard easily allows a courtroom station to be adapted to provide vertical access in the event a judge requires an accessible judge's bench.

The Department received several anecdotal accounts of courtroom experiences of individuals with disabilities. One commenter recalled numerous difficulties that her law partner faced as the result of inaccessible courtrooms, and their concerns that the attention of judge and jury was directed away from the merits of case to the lawyer and his disability. Among other things, the lawyer had to ask the judges on an appellate panel to wait while he maneuvered through insufficient space to the counsel table; ask judges to relocate bench conferences to accessible areas; and make last-minute preparations and rearrangements that his peers without disabilities did not have to make. Another commenter with extensive experience as a lawyer, witness, juror, and consultant observed that it is common practice for a witness who uses mobility devices to sit in front of the witness stand. He described how disconcerting and unsettling it has been for him to testify in front of the witness stand, which allowed individuals in the courtroom to see his hands or legs shaking because of spasticity, making him feel like a second-class citizen.

Two other commenters with mobility disabilities described their experiences testifying in court. One accessibility consultant stated that she was able to represent her clients successfully when she had access to an accessible witness stand because it gave her the ability ''to look the judge in the eye, speak comfortably and be heard, hold up visual aids that could be seen by the judge, and perform without an architectural stigma.'' She did not believe that she was able to achieve a comparable outcome or have meaningful access to the justice system when she testified from an inaccessible location. Similarly, a licensed clinical social worker indicated that she has testified in several cases in accessible courtrooms, and that having full access to the witness stand in the presence of the judge and the jury was important to her effectiveness as an expert witness. She noted that accessible courtrooms often are not available, and that she was aware of instances in which victims, witnesses, and attorneys with disabilities have not been able to obtain needed disability accommodations in order to fulfill their roles at trial.

Two other commenters indicated that they had been chosen for jury duty but that they were effectively denied their right to participate as jurors because the courtrooms were not accessible. Another commenter indicated that he has had to sit apart from the other jurors because the jury box was inaccessible.

A number of commenters expressed approval of actions taken by States to facilitate access in judicial facilities. A member of a State commission on disability noted that the State had been working toward full accessibility since 1997 when the Uniform Building Code required interior accessible routes. This commenter stated that the State's district courts had been renovated to the maximum extent feasible to provide

greater access. This commenter also noted that a combination of Community Development Block Grant money and State funds are often awarded for renovations of courtroom areas. One advocacy group that has dealt with court access issues stated that members of the State legal community and disability advocates have long been promoting efforts to ensure that the State courts are accessible to individuals with disabilities. The comment cited a publication distributed to the Washington State courts by the State bar association entitled, ''Ensuring Equal Access to the Courts for Persons with Disabilities.'' (Aug. 2006), available at *http:// www.wsba.org/ ensuringaccessguidebook.pdf* (last visited July 20, 2010). In addition, the commenter also indicated that the State supreme court had promulgated a new rule governing how the courts should respond to requests of accommodation based upon disability; the State legislature had created the position of Disability Access Coordinator for Courts to facilitate accessibility in the court system; and the State legislature had passed a law requiring that all planned improvements and alterations to historic courthouses be approved by the ADA State facilities program manager and committee in order to ensure that the alterations will enhance accessibility.

The Department has decided to adopt the requirements in the 2004 ADAAG with respect to judicial facilities and courtrooms and will not ask the Access Board to review these requirements. The final rule is wholly consistent with the objectives of the ADA. It addresses a well-documented history of discrimination with respect to judicial administration and significantly increases accessibility for individuals with disabilities. It helps ensure that they will have an opportunity to participate equally in the judicial process. As stated, the final rule is consistent with a number of model and local building codes that have been widely adopted by State and local building departments and provides greater uniformity for planners, architects, and builders.

Assistive listening systems. The 1991 Standards at sections 4.33.6 and 4.33.7 require assistive listening systems (ALS) in assembly areas and prescribe general performance standards for ALS systems. In the NPRM, the Department proposed adopting the technical specifications in the 2004 ADAAG for ALS that are intended to ensure better quality and effective delivery of sound and information for persons with hearing impairments, especially those using hearing aids. The Department noted in the NPRM that since 1991, advancements in ALS and the advent of digital technology have made these systems more amenable to uniform standards, which, among other things, should ensure that a certain percentage of required ALS systems are hearing-aid compatible. 73 FR 34466, 34471 (June 17, 2008). The 2010 Standards at section 219 provide scoping requirements and at section 706 address receiver jacks, hearing aid compatibility, sound pressure level, signal-to-noise ratio, and peak clipping level. The Department requested comments specifically from arena and assembly area administrators on the cost and maintenance issues associated with ALS, asked generally about the costs and benefits of ALS, and asked whether, based upon the expected costs of ALS, the issue should be returned to the Access Board for further consideration.

Comments from advocacy organizations noted that persons who develop significant hearing loss often discontinue their normal routines and activities, including meetings, entertainment, and large group events, due to a sense of isolation caused by the hearing loss or embarrassment. Individuals with longstanding hearing loss may never have participated in group activities for many of the same reasons. Requiring ALS may allow individuals with disabilities to contribute to the community by joining in government and public events, and increasing economic activity associated with community activities and entertainment. Making public events and entertainment accessible to persons

with hearing loss also brings families and other groups that include persons with hearing loss into more community events and activities, thus exponentially increasing the benefit from ALS.

Many commenters noted that when a person has significant hearing loss, that person may be able to hear and understand information in a quiet situation with the use of hearing aids or cochlear implants; however, as background noise increases and the distance between the source of the sound and the listener grows, and especially where there is distortion in the sound, an ALS becomes essential for basic comprehension and understanding. Commenters noted that among the 31 million Americans with hearing loss, and with a projected increase to over 78 million Americans with hearing loss by 2030, the benefit from ALS is huge and growing. Advocates for persons with disabilities and individuals commented that they appreciated the improvements in the 2004 ADAAG standards for ALS, including specifications for the ALS systems and performance standards. They noted that neckloops that translate the signal from the ALS transmitter to a frequency that can be heard on a hearing aid or cochlear implant are much more effective than separate ALS system headsets, which sometimes create feedback, often malfunction, and may create distractions for others seated nearby. Comments from advocates and users of ALS systems consistently noted that the Department's regulation should, at a minimum, be consistent with the 2004 ADAAG. Although there were requests for adjustments in the scoping requirements from advocates seeking increased scoping requirements, and from large venue operators seeking fewer requirements, there was no significant concern expressed by commenters about the technical specifications for ALS in the 2004 ADAAG.

Some commenters from trade associations and large venue owners criticized the scoping requirements as too onerous and one commenter asked for a remand to the Access Board for new scoping rules. However, one State agency commented that the 2004 ADAAG largely duplicates the requirements in the 2006 IBC and the 2003 ANSI codes, which means that entities that comply with those standards would not incur additional costs associated with ADA compliance.

According to one State office of the courts, the cost to install either an infrared system or an FM system at average-sized facilities, including most courtrooms covered by title II, would be between $500 and $2,000, which the agency viewed as a small price in comparison to the benefits of inclusion. Advocacy organizations estimated wholesale costs of ALS systems at about $250 each and individual neckloops to link the signal from the ALS transmitter to hearing aids or cochlear implants at less than $50 per unit. Many commenters pointed out that if a facility already is using induction neckloops, it would already be in compliance and would not have any additional installation costs. One major city commented that annual maintenance is about $2,000 for the entire system of performance venues in the city. A trade association representing very large venues estimated annual maintenance and upkeep expenses, including labor and replacement parts, to be at most about $25,000 for a very large professional sports stadium.

One commenter suggested that the scoping requirements for ALS in the 2004 ADAAG were too stringent and that the Department should return them to the Access Board for further review and consideration. Others commented that the requirement for new ALS systems should mandate multichannel receivers capable of receiving audio description for persons who are blind, in addition to a channel for amplification for persons who are hard of hearing. Some comments suggested that the Department should require a set schedule and protocol of mandatory maintenance. Department regulations already require maintenance of accessible features at § 35.133(a) of the title II regulation, which obligates a title II entity

to maintain ALS in good working order. The Department recognizes that maintenance of ALS is key to its usability. Necessary maintenance will vary dramatically from venue to venue based upon a variety of factors including frequency of use, number of units, quality of equipment, and others items. Accordingly, the Department has determined that it is not appropriate to mandate details of maintenance, but notes that failure to maintain ALS would violate § 35.133(a) of this rule.

The NPRM asked whether the Department should return the issue of ALS requirements to the Access Board. The Department has received substantial feedback on the technical and scoping requirements for ALS and is convinced that these requirements are reasonable and that the benefits justify the requirements. In addition, the Department believes that the new specifications will make ALS work more effectively for more persons with disabilities, which, together with a growing population of new users, will increase demand for ALS, thus mooting criticism from some large venue operators about insufficient demand. Thus, the Department has determined that it is unnecessary to refer this issue back to the Access Board for reconsideration.

Accessible teeing grounds, putting greens, and weather shelters. In the NPRM, the Department sought public input on the proposed requirements for accessible golf courses. These requirements specifically relate to accessible routes within the boundaries of courses, as well as the accessibility of golfing elements (*e.g.*, teeing grounds, putting greens, weather shelters).

In the NPRM, the Department sought information from the owners and operators of golf courses, both public and private, on the extent to which their courses already have golf car passages, and, if so, whether they intended to avail themselves of the proposed accessible route exception for golf car passages. 73 FR 34466, 34471 (June 17, 2008).

Most commenters expressed support for the adoption of an accessible route requirement that includes an exception permitting golf car passage as all or part of an accessible route. Comments in favor of the proposed standard came from golf course owners and operators, individuals, organizations, and disability rights groups, while comments opposing adoption of the golf course requirements generally came from golf courses and organizations representing the golf course industry.

The majority of commenters expressed the general viewpoint that nearly all golf courses provide golf cars and have either well-defined paths or permit golf cars to drive on the course where paths are not present, thus meeting the accessible route requirement. Several commenters disagreed with the assumption in the initial RIA, that virtually every tee and putting green on an existing course would need to be regraded in order to provide compliant accessible routes. According to one commenter, many golf courses are relatively flat with little slope, especially those heavily used by recreational golfers. This commenter concurred with the Department that it is likely that most existing golf courses have a golf car passage to tees and greens, thereby substantially minimizing the cost of bringing an existing golf course into compliance with the proposed standards. One commenter reported that golf course access audits found that the vast majority of public golf courses would have little difficulty in meeting the proposed golf course requirements. In the view of some commenters, providing access to golf courses would increase golf participation by individuals with disabilities.

The Department also received many comments requesting clarification of the term ''golf car passage.'' For example, one commenter requesting clarification of the term ''golf car passage'' argued that golf courses typically do not provide golf car paths or pedestrian paths onto the actual teeing grounds or greens, many of which are higher or lower than the car path. This commenter argued that if golf car passages were required to extend

onto teeing grounds and greens in order to qualify for an exception, then some golf courses would have to substantially regrade teeing grounds and greens at a high cost.

After careful consideration of the comments, the Department has decided to adopt the 2010 Standards specific to golf facilities. The Department believes that in order for individuals with mobility disabilities to have an opportunity to play golf that is equal to golfers without disabilities, it is essential that golf courses provide an accessible route or accessible golf car passage to connect accessible elements and spaces within the boundary of the golf course, including teeing grounds, putting greens, and weather shelters.

Public Comments on Other NPRM Issues

Equipment and furniture. In the 1991 title II regulation, there are no specific provisions addressing equipment and furniture, although § 35.150(b) states that one means by which a public entity can make its program accessible to individuals with disabilities is ''redesign of equipment.'' In the NPRM, the Department announced its intention not to regulate equipment, proposing instead to continue with the current approach, under which equipment and furniture are covered by other provisions, including those requiring reasonable modifications of policies, practices, or procedures, program accessibility, and effective communication. The Department suggested that entities apply the accessibility standards for fixed equipment in the 2004 ADAAG to analogous free-standing equipment in order to ensure that such equipment is accessible, and that entities consult relevant portions of the 2004 ADAAG and standards from other Federal agencies to make equipment accessible to individuals who are blind or have low vision (*e.g.*, the communication-related standards for ATMs in the 2004 ADAAG).

The Department received numerous comments objecting to this decision and urging the Department to issue equipment and furniture regulations. Based on these comments, the Department has decided that it needs to revisit the issuance of equipment and furniture regulations and it intends to do so in future rulemaking.

Among the commenters' key concerns, many from the disability community and some public entities, were objections to the Department's earlier decision not to issue equipment regulations, especially for medical equipment. These groups recommended that the Department list by name certain types of medical equipment that must be accessible, including exam tables (that lower to 15 inches above floor or lower), scales, medical and dental chairs, and radiologic equipment (including mammography equipment). These commenters emphasized that the provision of medically related equipment and furniture should also be specifically regulated since they are not included in the 2004 ADAAG (while depositories, change machines, fuel dispensers, and ATMs were) and because of their crucial role in the provision of healthcare. Commenters described how the lack of accessible medical equipment negatively affects the health of individuals with disabilities. For example, some individuals with mobility disabilities do not get thorough medical care because their health providers do not have accessible examination tables or scales.

Commenters also said that the Department's stated plan to assess the financial impact of free-standing equipment on businesses was not necessary, as any regulations could include a financial balancing test. Other commenters representing persons who are blind or have low vision urged the Department to mandate accessibility for a wide range of equipment—including household appliances (stoves, washers, microwaves, and coffee makers), audiovisual equipment (stereos and DVD players), exercise machines, vending equipment, ATMs, computers at Internet cafes or hotel business centers, reservations kiosks at hotels, and point-of-sale

devices— through speech output and tactile labels and controls. They argued that modern technology allows such equipment to be made accessible at minimal cost. According to these commenters, the lack of such accessibility in point-of-sale devices is particularly problematic because it forces blind individuals to provide personal or sensitive information (such as personal identification numbers) to third parties, which exposes them to identity fraud. Because the ADA does not apply directly to the manufacture of products, the Department lacks the authority to issue design requirements for equipment designed exclusively for use in private homes. *See* Department of Justice, Americans with Disabilities Act, *ADA Title III Technical Assistance Manual Covering Public Accommodations and Commercial Facilities,* III–4.4200, available at *http://www.ada.gov/ taman3*.

Some commenters urged the Department to require swimming pool operators to provide aquatic wheelchairs for the use of persons with disabilities when the swimming pool has a sloped entry. If there is a sloped entry, a person who uses a wheelchair would require a wheelchair designed for use in the water in order to gain access to the pool because taking a personal wheelchair into water would rust and corrode the metal on the chair and damage any electrical components of a power wheelchair. Providing an aquatic wheelchair made of non-corrosive materials and designed for access into the water will protect the water from contamination and avoid damage to personal wheelchairs or other mobility aids.

Additionally, many commenters urged the Department to regulate the height of beds in accessible hotel guest rooms and to ensure that such beds have clearance at the floor to accommodate a mechanical lift. These commenters noted that in recent years, hotel beds have become higher as hotels use thicker mattresses, thereby making it difficult or impossible for many individuals who use wheelchairs to transfer onto hotel beds. In addition, many hotel beds use a solid-sided platform base with no clearance at the floor, which prevents the use of a portable lift to transfer an individual onto the bed. Consequently, individuals who bring their own lift to transfer onto the bed cannot independently get themselves onto the bed. Some commenters suggested various design options that might avoid these situations.

The Department intends to provide specific guidance relating to both hotel beds and aquatic wheelchairs in a future rulemaking. For the present, the Department reminds covered entities that they have an obligation to undertake reasonable modifications to their current policies and to make their programs accessible to persons with disabilities. In many cases, providing aquatic wheelchairs or adjusting hotel bed heights may be necessary to comply with those requirements.

The Department has decided not to add specific scoping or technical requirements for equipment and furniture in this final rule. Other provisions of the regulation, including those requiring reasonable modifications of policies, practices, or procedures, program accessibility, and effective communication may require the provision of accessible equipment in individual circumstances. The 1991 title II regulation at § 35.150(a) requires that entities operate each service, program, or activity so that, when viewed in its entirety, each is readily accessible to, and usable by, individuals with disabilities, subject to a defense of fundamental alteration or undue financial and administrative burdens. Section 35.150(b) specifies that such entities may meet their program accessibility obligation through the ''redesign of equipment.'' The Department expects to undertake a rulemaking to address these issues in the near future.

Accessible golf cars. An accessible golf car means a device that is designed and manufactured to be driven on all areas of a golf course, is independently usable by individuals with mobility disabilities, has a hand-operated brake and accelerator, carries golf clubs in an accessible

location, and has a seat that both swivels and raises to put the golfer in a standing or semi-standing position.

The 1991 title II regulation contained no language specifically referencing accessible golf cars. After considering the comments addressing the ANPRM's proposed requirement that golf courses make at least one specialized golf car available for the use of individuals with disabilities, and the safety of accessible golf cars and their use on golf course greens, the Department stated in the NPRM that it would not issue regulations specific to golf cars.

The Department received many comments in response to its decision to propose no new regulation specific to accessible golf cars. The majority of commenters urged the Department to require golf courses to provide accessible golf cars. These comments came from individuals, disability advocacy and recreation groups, a manufacturer of accessible golf cars, and representatives of local government. Comments supporting the Department's decision not to propose a new regulation came from golf course owners, associations, and individuals.

Many commenters argued that while the existing title II regulation covered the issue, the Department should nonetheless adopt specific regulatory language requiring golf courses to provide accessible golf cars. Some commenters noted that many local governments and park authorities that operate public golf courses have already provided accessible golf cars. Experience indicates that such golf cars may be used without damaging courses. Some argued that having accessible golf cars would increase golf course revenue by enabling more golfers with disabilities to play the game. Several commenters requested that the Department adopt a regulation specifically requiring each golf course to provide one or more accessible golf cars. Other commenters recommended allowing golf courses to make ''pooling'' arrangements to meet demands for such cars. A few commenters expressed support for using accessible golf cars to accommodate golfers with and without disabilities. Commenters also pointed out that the Departments of the Interior and Defense have already mandated that golf courses under their jurisdictional control must make accessible golf cars available unless it can be demonstrated that doing so would change the fundamental nature of the game.

While an industry association argued that at least two models of accessible golf cars meet the specifications recognized in the field, and that accessible golf cars cause no more damage to greens or other parts of golf courses than players standing or walking across the course, other commenters expressed concerns about the potential for damage associated with the use of accessible golf cars. Citing safety concerns, golf organizations recommended that an industry safety standard be developed.

Although the Department declines to add specific scoping or technical requirements for golf cars to this final rule, the Department expects to address requirements for accessible golf cars in future rulemaking. In the meantime, the Department believes that golfers with disabilities who need accessible golf cars are protected by other existing provisions in the title II regulation, including those requiring reasonable modifications of policies, practices, or procedures, and program accessibility.

Web site accessibility. Many commenters expressed disappointment that the NPRM did not require title II entities to make their Web sites, through which they offer programs and services, accessible to individuals with disabilities, including those who are blind or have low vision. Commenters argued that the cost of making Web sites accessible, through Web site design, is minimal, yet critical to enabling individuals with disabilities to benefit from the entity's programs and services. Internet Web sites, when accessible, provide individuals with disabilities great independence, and have become an essential tool for many Americans. Commenters recommended

that the Department require covered entities, at a minimum, to meet the section 508 Standard for Electronic and Information Technology for Internet accessibility. Under section 508 of the Rehabilitation Act of 1973, Federal agencies are required to make their Web sites accessible. 29 U.S.C. 794(d); 36 CFR 1194.

The Department agrees that the ability to access, on an equal basis, the programs and activities offered by public entities through Internet-based Web sites is of great importance to individuals with disabilities, particularly those who are blind or who have low vision. When the ADA was enacted in 1990, the Internet was unknown to most Americans. Today, the Internet plays a critical role in daily life for personal, civic, commercial, and business purposes. In a period of shrinking resources, public entities increasingly rely on the web as an efficient and comprehensive way to deliver services and to inform and communicate with their citizens and the general public. In light of the growing importance Web sites play in providing access to public services and to disseminating the information citizens need to participate fully in civic life, accessing the Web sites of public entities can play a significant role in fulfilling the goals of the ADA.

Although the language of the ADA does not explicitly mention the Internet, the Department has taken the position that title II covers Internet Web site access. Public entities that choose to provide services through web-based applications (*e.g.*, renewing library books or driver's licenses) or that communicate with their constituents or provide information through the Internet must ensure that individuals with disabilities have equal access to such services or information, unless doing so would result in an undue financial and administrative burden or a fundamental alteration in the nature of the programs, services, or activities being offered. The Department has issued guidance on the ADA as applied to the Web sites of public entities in a 2003 publication entitled, *Accessibility of State and Local Government Web sites to People with Disabilities*, (June 2003) available at *http:// www.ada.gov/websites2.htm*. As the Department stated in that publication, an agency with an inaccessible Web site may also meet its legal obligations by providing an alternative accessible way for citizens to use the programs or services, such as a staffed telephone information line. However, such an alternative must provide an equal degree of access in terms of hours of operation and the range of options and programs available. For example, if job announcements and application forms are posted on an inaccessible Web site that is available 24 hours a day, seven days a week to individuals without disabilities, then the alternative accessible method must also be available 24 hours a day, 7 days a week. Additional guidance is available in the Web Content Accessibility Guidelines (WCAG), (May 5, 1999) available at *http:// www.w3.org/ TR/WAI–WEBCONTENT* (last visited June 24, 2010) which are developed and maintained by the Web Accessibility Initiative, a subgroup of the World Wide Web Consortium (W3C®).

The Department expects to engage in rulemaking relating to website accessibility under the ADA in the near future. The Department has enforced the ADA in the area of website accessibility on a case-by-case basis under existing rules consistent with the guidance noted above, and will continue to do so until the issue is addressed in a final regulation.

Multiple chemical sensitivities. The Department received comments from a number of individuals asking the Department to add specific language to the final rule addressing the needs of individuals with chemical sensitivities. These commenters expressed concern that the presence of chemicals interferes with their ability to participate in a wide range of activities. These commenters also urged the Department to add multiple chemical sensitivities to the definition of a disability.

The Department has determined not to include

specific provisions addressing multiple chemical sensitivities in the final rule. In order to be viewed as a disability under the ADA, an impairment must substantially limit one or more major life activities. An individual's major life activities of respiratory or neurological functioning may be substantially limited by allergies or sensitivity to a degree that he or she is a person with a disability. When a person has this type of disability, a covered entity may have to make reasonable modifications in its policies and practices for that person. However, this determination is an individual assessment and must be made on a case-by-case basis.

Examinations and Courses. The Department received one comment requesting that it specifically include language regarding examinations and courses in the title II regulation. Because section 309 of the ADA 42 U.S.C. 12189, reaches ''[a]ny person that offers examinations or courses related to applications, licensing, certification, or credentialing for secondary or post secondary education, professional, or trade purposes,'' public entities also are covered by this section of the ADA. Indeed, the requirements contained in title II (including the general prohibitions against discrimination, the program access requirements, the reasonable modifications requirements, and the communications requirements) apply to courses and examinations administered by public entities that meet the requirements of section 309. While the Department considers these requirements to be sufficient to ensure that examinations and courses administered by public entities meet the section 309 requirements, the Department acknowledges that the title III regulation, because it addresses examinations in some detail, is useful as a guide for determining what constitutes discriminatory conduct by a public entity in testing situations. *See* 28 CFR 36.309.

Hotel Reservations. In the NPRM, at § 36.302(e), the Department proposed adding specific language to title III addressing the requirements that hotels, timeshare resorts, and other places of lodging make reasonable modifications to their policies, practices, or procedures, when necessary to ensure that individuals with disabilities are able to reserve accessible hotel rooms with the same efficiency, immediacy, and convenience as those who do not need accessible guest rooms. The NPRM did not propose adding comparable language to the title II regulation as the Department believes that the general nondiscrimination, program access, effective communication, and reasonable modifications requirements of title II provide sufficient guidance to public entities that operate places of lodging (*i.e.*, lodges in State parks, hotels on public college campuses). The Department received no public comments suggesting that it add language on hotel reservations comparable to that proposed for the title III regulation. Although the Department continues to believe that it is unnecessary to add specific language to the title II regulation on this issue, the Department acknowledges that the title III regulation, because it addresses hotel reservations in some detail, is useful as a guide for determining what constitutes discriminatory conduct by a public entity that operates a reservation system serving a place of lodging. *See* 28 CFR 36.302(e).

•18. Revise the heading to Appendix B to read as follows:

Appendix B to Part 35—Guidance on ADA Regulation on Nondiscrimination on the Basis of Disability in State and Local Government Services Originally Published July 26, 1991

Dated: July 23, 2010.
Eric H. Holder, Jr., Attorney General.

Title II Regulations

1991 Section-by-Section Analysis

Department of Justice

Appendix B to the title II rule incorporates the guidance, i.e., the 1991 Section-by-Section Analysis, to the title II rule published July 26, 1991. The 1991 analysis remains relevant to the extent it is not contradicted by the amendments to the rules or it provides guidance on provisions of the rules unchanged by the revised 2010 ADA regulations.

APPENDIX B TO PART 35 — GUIDANCE ON ADA REGULATION ON NONDISCRIMINATION ON THE BASIS OF DISABILITY IN STATE AND LOCAL GOVERNMENT SERVICES ORIGINALLY PUBLISHED JULY 26, 1991

SECTION-BY-SECTION ANALYSIS

Subpart A—General

Section 35.101 Purpose

Section 35.101 states the purpose of the rule, which is to effectuate subtitle A of title II of the Americans with Disabilities Act of 1990 (the Act), which prohibits discrimination on the basis of disability by public entities. This part does not, however, apply to matters within the scope of the authority of the Secretary of Transportation under subtitle B of title II of the Act.

Section 35.102 Application

This provision specifies that, except as provided in paragraph (b), the regulation applies to all services, programs, and activities provided or made available by public entities, as that term is defined in §35.104. Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794), which prohibits discrimination on the basis of handicap in federally assisted programs and activities, already covers those programs and activities of public entities that receive Federal financial assistance. Title II of the ADA extends this prohibition of discrimination to include all services, programs, and activities provided or made available by State and local governments or any of their instrumentalities or agencies, regardless of the receipt of Federal financial assistance. Except as provided in §35.134, this part does not apply to private entities.

The scope of title II's coverage of public entities is comparable to the coverage of Federal Executive agencies under the 1978 amendment to section 504, which extended section 504's application to all programs and activities ''conducted by'' Federal Executive agencies, in that title II applies to anything a public entity does. Title II coverage, however, is not limited to ''Executive'' agencies, but includes activities of the legislative and judicial branches of State and local governments. All governmental activities of public

entities are covered, even if they are carried out by contractors. For example, a State is obligated by title II to ensure that the services, programs, and activities of a State park inn operated under contract by a private entity are in compliance with title II's requirements. The private entity operating the inn would also be subject to the obligations of public accommodations under title III of the Act and the Department's title III regulations at 28 CFR part 36.

Aside from employment, which is also covered by title I of the Act, there are two major categories of programs or activities covered by this regulation: those involving general public contact as part of ongoing operations of the entity and those directly administered by the entities for program beneficiaries and participants. Activities in the first category include communication with the public (telephone contacts, office walk-ins, or interviews) and the public's use of the entity's facilities. Activities in the second category include programs that provide State or local government services or benefits.

Paragraph (b) of §35.102 explains that to the extent that the public transportation services, programs, and activities of public entities are covered by subtitle B of title II of the Act, they are subject to the regulation of the Department of Transportation (DOT) at 49 CFR part 37, and are not covered by this part. The Department of Transportation's ADA regulation establishes specific requirements for construction of transportation facilities and acquisition of vehicles. Matters not covered by subtitle B, such as the provision of auxiliary aids, are covered by this rule. For example, activities that are covered by the Department of Transportation's regulation implementing subtitle B are not required to be included in the self-evaluation required by §35.105. In addition, activities not specifically addressed by DOT's ADA regulation may be covered by DOT's regulation implementing section 504 for its federally assisted programs and activities at 49 CFR part 27. Like other programs of public entities that are also recipients of Federal financial assistance, those programs would be covered by both the section 504 regulation and this part. Although airports operated by public entities are not subject to DOT's ADA regulation, they are subject to subpart A of title II and to this rule.

Some commenters asked for clarification about the responsibilities of public school systems under section 504 and the ADA with respect to programs, services, and activities that are not covered by the Individuals with Disabilities Education Act (IDEA), including, for example, programs open to parents or to the public, graduation ceremonies, parent-teacher organization meetings, plays and other events open to the public, and adult education classes. Public school systems must comply with the ADA in all of their services, programs, or activities, including those that are open to parents or to the public. For instance, public school systems must provide program accessibility to parents and guardians with disabilities to these programs, activities, or services, and appropriate auxiliary aids and services whenever necessary to ensure effective communication, as long as the provision of the auxiliary aids results neither in an undue burden or in a fundamental alteration of the program.

Section 35.103 Relationship to Other Laws

Section 35.103 is derived from sections 501 (a) and (b) of the ADA. Paragraph (a) of this section provides that, except as otherwise specifically provided by this part, title II of the ADA is not intended to apply lesser standards than are required under title V of the Rehabilitation Act of 1973, as amended (29 U.S.C. 790–94), or the regulations implementing that title. The standards of title V of the Rehabilitation Act apply for purposes of the ADA to the extent that the ADA has not explicitly adopted a different standard than title V. Because title II of the ADA essentially extends the antidiscrimination prohibition embodied in section 504 to all actions of State and local governments, the standards adopted in this part are generally the same as those required under section 504 for federally assisted programs. Title II, however, also incorporates those provisions of titles I and III of the ADA that are not inconsistent with the regulations implementing section 504. Judiciary Committee report, H.R. Rep. No. 485, 101st Cong., 2d Sess., pt. 3, at 51 (1990) (hereinafter ''Judiciary report'') ; Education and Labor Committee report, H.R. Rep. No. 485, 101st Cong., 2d Sess., pt. 2, at 84 (1990) (hereinafter ''Education and Labor report''). Therefore, this part also includes appropriate provisions derived from the regulations implementing those titles. The inclusion of specific language in this part, however, should not be interpreted as an indication that a requirement is not included under a regulation implementing section 504.

Paragraph (b) makes clear that Congress did not intend to displace any of the rights or remedies provided by other Federal laws (including section 504) or other State laws (including State common law) that provide greater or equal protection to individuals with disabilities. As discussed above, the standards adopted by title II of the ADA for State and local government services are generally the same as those required under section 504 for federally assisted programs and activities. Subpart F of the regulation establishes compliance procedures for processing complaints covered by both this part and section 504.

With respect to State law, a plaintiff may choose to pursue claims under a State law that does not confer greater substantive rights, or even confers fewer substantive rights, if the alleged violation is protected under the alternative law and the remedies are greater. For example, a person with a physical disability could seek damages under a State law that allows compensatory and punitive damages for discrimination on the basis of physical disability, but not on the basis of mental disability. In that situation, the State law would provide narrower coverage, by excluding mental disabilities, but broader remedies, and an individual covered by both laws could choose to bring an action under both laws. Moreover, State tort claims confer greater remedies and are not preempted by the ADA. A plaintiff may join a State tort claim to a case brought under the ADA. In such a case, the plaintiff must, of course, prove all the elements of the State tort claim in order to prevail under that cause of action.

Section 35.104 Definitions

''Act.'' The word ''Act'' is used in this part to refer to the Americans with Disabilities Act of 1990, Public Law 101–336, which is also referred to as the ''ADA.''

''Assistant Attorney General.'' The term ''Assistant Attorney General'' refers to the Assistant Attorney General of the Civil Rights Division of the Department of Justice.

''Auxiliary aids and services.'' Auxiliary aids and services include a wide range of services and devices for ensuring effective communication. The proposed definition in §35.104 provided a list of examples of auxiliary aids and services that were taken from the definition of auxiliary aids and services in section 3(1) of the ADA and were supplemented by examples from regulations implementing section 504 in federally conducted programs (see 28 CFR 39.103).

A substantial number of commenters suggested that additional examples be added to this list. The Department has added several items to this list but wishes to clarify that the list is not an all-inclusive or exhaustive catalogue of possible or available auxiliary aids or services. It is not possible to provide an exhaustive list, and an attempt to do so would omit the new devices that will become available with emerging technology.

Subparagraph (1) lists several examples, which would be considered auxiliary aids and services to make aurally delivered materials available to individuals with hearing impairments. The Department has changed the phrase used in the proposed rules, ''orally delivered materials,'' to the statutory phrase, ''aurally delivered materials,'' to track section 3 of the ADA and to include non-verbal sounds and alarms, and computer generated speech.

The Department has added videotext displays, transcription services, and closed and open captioning to the list of examples. Videotext displays have become an important means of accessing auditory communications through a public address system. Transcription services are used to relay aurally delivered material almost simultaneously in written form to persons who are deaf or hearing-impaired. This technology is often used at conferences, conventions, and hearings. While the proposed rule expressly included television decoder equipment as an auxiliary aid or service, it did not mention captioning itself. The final rule rectifies this omission by mentioning both closed and open captioning.

Several persons and organizations requested that the Department replace the term ''telecommunications devices for deaf persons'' or ''TDD's'' with the term ''text telephone.'' The Department has declined to do so. The Department is aware that the Architectural and Transportation Barriers Compliance Board (ATBCB) has used the phrase ''text telephone'' in lieu of the statutory term ''TDD'' in its final accessibility guidelines. Title IV of the ADA, however, uses the term ''Telecommunications Device for the Deaf'' and the Department believes it would be inappropriate to abandon this statutory term at this time.

Several commenters urged the Department to include in the definition of ''auxiliary aids and services'' devices that are now available or that may become available with emerging technology. The Department declines to do so in the rule. The Department, however, emphasizes that, although the definition would include ''state of the art'' devices, public entities are not required to use the newest or most advanced technologies as long as the auxiliary aid or service that is selected affords effective communication.

Subparagraph (2) lists examples of aids and services for making visually delivered materials accessible to persons with visual impairments. Many commenters proposed additional examples, such as signage or mapping, audio description services, secondary auditory programs, telebraillers, and reading machines. While the Department declines to add these items to the list, they are auxiliary aids and services and may be appropriate depending on the circumstances.

Subparagraph (3) refers to acquisition or modification of equipment or devices. Several commenters suggested the addition of current technological innovations in microelectronics and computerized control systems (e.g., voice recognition systems, automatic dialing telephones, and infrared elevator and light control systems) to the list of auxiliary aids. The Department interprets auxiliary aids and services as those aids and

services designed to provide effective communications, i.e., making aurally and visually delivered information available to persons with hearing, speech, and vision impairments. Methods of making services, programs, or activities accessible to, or usable by, individuals with mobility or manual dexterity impairments are addressed by other sections of this part, including the provision for modifications in policies, practices, or procedures (§35.130 (b)(7)).

Paragraph (b)(4) deals with other similar services and actions. Several commenters asked for clarification that ''similar services and actions'' include retrieving items from shelves, assistance in reaching a marginally accessible seat, pushing a barrier aside in order to provide an accessible route, or assistance in removing a sweater or coat. While retrieving an item from a shelf might be an ''auxiliary aid or service'' for a blind person who could not locate the item without assistance, it might be a method of providing program access for a person using a wheelchair who could not reach the shelf, or a reasonable modification to a self-service policy for an individual who lacked the ability to grasp the item. As explained above, auxiliary aids and services are those aids and services required to provide effective communications. Other forms of assistance are more appropriately addressed by other provisions of the final rule.

''Complete complaint.'' ''Complete complaint'' is defined to include all the information necessary to enable the Federal agency designated under subpart G as responsible for investigation of a complaint to initiate its investigation.

''Current illegal use of drugs.'' The phrase ''current illegal use of drugs'' is used in §35.131. Its meaning is discussed in the preamble for that section.

''Designated agency.'' The term ''designated agency'' is used to refer to the Federal agency designated under subpart G of this rule as responsible for carrying out the administrative enforcement responsibilities established by subpart F of the rule.

''Disability.'' The definition of the term ''disability'' is the same as the definition in the title III regulation codified at 28 CFR part 36. It is comparable to the definition of the term ''individual with handicaps'' in section 7(8) of the Rehabilitation Act and section 802(h) of the Fair Housing Act. The Education and Labor Committee report makes clear that the analysis of the term ''individual with handicaps'' by the Department of Health, Education, and Welfare (HEW) in its regulations implementing section 504 (42 FR 22685 (May 4, 1977)) and the analysis by the Department of Housing and Urban Development in its regulation implementing the Fair Housing Amendments Act of 1988 (54 FR 3232 (Jan. 23, 1989)) should also apply fully to the term ''disability'' (Education and Labor report at 50).

The use of the term ''disability'' instead of ''handicap'' and the term ''individual with a disability'' instead of ''individual with handicaps'' represents an effort by Congress to make use of up-to-date, currently accepted terminology. As with racial and ethnic epithets, the choice of terms to apply to a person with a disability is overlaid with stereotypes, patronizing attitudes, and other emotional connotations. Many individuals with disabilities, and organizations representing such individuals, object to the use of such terms as ''handicapped person'' or ''the handicapped.'' In other recent legislation, Congress also recognized this shift in terminology, e.g., by changing the name of the National Council on the Handicapped to the National Council on Disability (Pub. L. 100–630).

In enacting the Americans with Disabilities Act, Congress concluded that it was important for the current legislation to use terminology most in line with the sensibilities of most Americans with disabilities. No change in definition or substance is intended nor should one be attributed to this change in phraseology.

The term ''disability'' means, with respect to an individual—

(A) A physical or mental impairment that substantially limits one or more of the major life activities of such individual;

(B) A record of such an impairment; or

(C) Being regarded as having such an impairment. If an individual meets any one of these three tests, he or she is considered to be an individual with a disability for purposes of coverage under the Americans with Disabilities Act.

Congress adopted this same basic definition of ''disability,'' first used in the Rehabilitation Act of 1973 and in the Fair Housing Amendments Act of 1988, for a number of reasons. First, it has worked well since it was adopted in 1974. Second, it would not be possible to guarantee comprehensiveness by providing a list of specific disabilities, especially because new disorders may be recognized in the future, as they have since the definition was first established in 1974.

TEST A—A PHYSICAL OR MENTAL IMPAIRMENT THAT SUBSTANTIALLY LIMITS ONE OR MORE OF THE MAJOR LIFE ACTIVITIES OF SUCH INDIVIDUAL

Physical or mental impairment. Under the first test, an individual must have a physical or mental impairment. As explained in paragraph (1)(i) of the definition, ''impairment'' means any physiological disorder or condition, cosmetic disfigurement, or anatomical loss affecting one or more of the following body systems: neurological; musculoskeletal; special sense organs (which would

include speech organs that are not respiratory such as vocal cords, soft palate, tongue, etc.); respiratory, including speech organs; cardiovascular; reproductive; digestive; genitourinary; hemic and lymphatic; skin; and endocrine. It also means any mental or psychological disorder, such as mental retardation, organic brain syndrome, emotional or mental illness, and specific learning disabilities. This list closely tracks the one used in the regulations for section 504 of the Rehabilitation Act of 1973 (see, *e.g.*, 45 CFR 84.3(j)(2)(i)).

Many commenters asked that ''traumatic brain injury'' be added to the list in paragraph (1)(i). Traumatic brain injury is already included because it is a physiological condition affecting one of the listed body systems, i.e., ''neurological.'' Therefore, it was unnecessary to add the term to the regulation, which only provides representative examples of physiological disorders.

It is not possible to include a list of all the specific conditions, contagious and noncontagious diseases, or infections that would constitute physical or mental impairments because of the difficulty of ensuring the comprehensiveness of such a list, particularly in light of the fact that other conditions or disorders may be identified in the future. However, the list of examples in paragraph (1)(ii) of the definition includes: orthopedic, visual, speech and hearing impairments, cerebral palsy, epilepsy, muscular dystrophy, multiple sclerosis, cancer, heart disease, diabetes, mental retardation, emotional illness, specific learning disabilities, HIV disease (symptomatic or asymptomatic), tuberculosis, drug addiction, and alcoholism. The phrase ''symptomatic or asymptomatic'' was inserted in the final rule after ''HIV disease'' in response to commenters who suggested the clarification was necessary.

The examples of ''physical or mental impairments'' in paragraph (1)(ii) are the same as those contained in many section 504 regulations, except for the addition of the phrase ''contagious and noncontagious'' to describe the types of diseases and conditions included, and the addition of ''HIV disease (symptomatic or asymptomatic)'' and ''tuberculosis'' to the list of examples. These additions are based on the committee reports, caselaw, and official legal opinions interpreting section 504. In *School Board of Nassau County* v. *Arline,* 480 U.S. 273 (1987), a case involving an individual with tuberculosis, the Supreme Court held that people with contagious diseases are entitled to the protections afforded by section 504. Following the *Arline* decision, this Department's Office of Legal Counsel issued a legal opinion that concluded that symptomatic HIV disease is an impairment that substantially limits a major life activity; therefore it has been included in the definition of disability under this part. The opinion also concluded that asymptomatic HIV disease is an impairment that substantially limits a major life activity, either because of its actual effect on the individual with HIV disease or because the reactions of other people to individuals with HIV disease cause such individuals to be treated as though they are disabled. See Memorandum from Douglas W. Kmiec, Acting Assistant Attorney General, Office of Legal Counsel, Department of Justice, to Arthur B. Culvahouse, Jr., Counsel to the President (Sept. 27, 1988), reprinted in Hearings on S. 933, the Americans with Disabilities Act, Before the Subcomm. on the Handicapped of the Senate Comm. on Labor and Human Resources, 101st. Cong., 1st Sess. 346 (1989).

Paragraph (1)(iii) states that the phrase ''physical or mental impairment'' does not include homosexuality or bisexuality. These conditions were never considered impairments under other Federal disability laws. Section 511(a) of the statute makes clear that they are likewise not to be considered impairments under the Americans with Disabilities Act.

Physical or mental impairment does not include simple physical characteristics, such as blue eyes or black hair. Nor does it include environmental, cultural, economic, or other disadvantages, such as having a prison record, or being poor. Nor is age a disability. Similarly, the definition does not include common personality traits such as poor judgment or a quick temper where these are not symptoms of a mental or psychological disorder. However, a person who has these characteristics and also has a physical or mental impairment may be considered as having a disability for purposes of the Americans with Disabilities Act based on the impairment.

Substantial Limitation of a Major Life Activity. Under Test A, the impairment must be one that ''substantially limits a major life activity.'' Major life activities include such things as caring for one's self, performing manual tasks, walking, seeing, hearing, speaking, breathing, learning, and working.

For example, a person who is paraplegic is substantially limited in the major life activity of walking, a person who is blind is substantially limited in the major life activity of seeing, and a person who is mentally retarded is substantially limited in the major life activity of learning. A person with traumatic brain injury is substantially limited in the major life activities of caring for one's self, learning, and working because of memory deficit, confusion, contextual difficulties, and inability to reason appropriately.

A person is considered an individual with a disability for purposes of Test A, the first prong of the definition, when the individual's important life activities are restricted as to the conditions, manner, or duration under

which they can be performed in comparison to most people. A person with a minor, trivial impairment, such as a simple infected finger, is not impaired in a major life activity. A person who can walk for 10 miles continuously is not substantially limited in walking merely because, on the eleventh mile, he or she begins to experience pain, because most people would not be able to walk eleven miles without experiencing some discomfort.

The Department received many comments on the proposed rule's inclusion of the word ''temporary'' in the definition of ''disability.'' The preamble indicated that impairments are not necessarily excluded from the definition of ''disability'' simply because they are temporary, but that the duration, or expected duration, of an impairment is one factor that may properly be considered in determining whether the impairment substantially limits a major life activity. The preamble recognized, however, that temporary impairments, such as a broken leg, are not commonly regarded as disabilities, and only in rare circumstances would the degree of the limitation and its expected duration be substantial. Nevertheless, many commenters objected to inclusion of the word ''temporary'' both because it is not in the statute and because it is not contained in the definition of ''disability'' set forth in the title I regulations of the Equal Employment Opportunity Commission (EEOC). The word ''temporary'' has been deleted from the final rule to conform with the statutory language.

The question of whether a temporary impairment is a disability must be resolved on a case-by-case basis, taking into consideration both the duration (or expected duration) of the impairment and the extent to which it actually limits a major life activity of the affected individual.

The question of whether a person has a disability should be assessed without regard to the availability of mitigating measures, such as reasonable modification or auxiliary aids and services. For example, a person with hearing loss is substantially limited in the major life activity of hearing, even though the loss may be improved through the use of a hearing aid. Likewise, persons with impairments, such as epilepsy or diabetes, that substantially limit a major life activity, are covered under the first prong of the definition of disability, even if the effects of the impairment are controlled by medication.

Many commenters asked that environmental illness (also known as multiple chemical sensitivity) as well as allergy to cigarette smoke be recognized as disabilities. The Department, however, declines to state categorically that these types of allergies or sensitivities are disabilities, because the determination as to whether an impairment is a disability depends on whether, given the particular circumstances at issue, the impairment substantially limits one or more major life activities (or has a history of, or is regarded as having such an effect).

Sometimes respiratory or neurological functioning is so severely affected that an individual will satisfy the requirements to be considered disabled under the regulation. Such an individual would be entitled to all of the protections afforded by the Act and this part. In other cases, individuals may be sensitive to environmental elements or to smoke but their sensitivity will not rise to the level needed to constitute a disability. For example, their major life activity of breathing may be somewhat, but not substantially, impaired. In such circumstances, the individuals are not disabled and are not entitled to the protections of the statute despite their sensitivity to environmental agents.

In sum, the determination as to whether allergies to cigarette smoke, or allergies or sensitivities characterized by the commenters as environmental illness are disabilities covered by the regulation must be made using the same case-by-case analysis that is applied to all other physical or mental impairments. Moreover, the addition of specific regulatory provisions relating to environmental illness in the final rule would be inappropriate at this time pending future consideration of the issue by the Architectural and Transportation Barriers Compliance Board, the Environmental Protection Agency, and the Occupational Safety and Health Administration of the Department of Labor.

TEST B—A RECORD OF SUCH AN IMPAIRMENT

This test is intended to cover those who have a record of an impairment. As explained in paragraph (3) of the rule's definition of disability, this includes a person who has a history of an impairment that substantially limited a major life activity, such as someone who has recovered from an impairment. It also includes persons who have been misclassified as having an impairment.

This provision is included in the definition in part to protect individuals who have recovered from a physical or mental impairment that previously substantially limited them in a major life activity. Discrimination on the basis of such a past impairment is prohibited. Frequently occurring examples of the first group (those who have a history of an impairment) are persons with histories of mental or emotional illness, heart disease, or cancer; examples of the second group (those who have been misclassified as having an impairment) are persons who have been misclassified as having mental retardation or mental illness.

TEST C—BEING REGARDED AS HAVING SUCH AN IMPAIRMENT

This test, as contained in paragraph (4) of the definition, is intended to cover persons who are treated by a public entity as having a physical or mental impairment that substantially limits a major life activity. It applies when a person is treated as if he or she has an impairment that substantially limits a major life activity, regardless of whether that person has an impairment.

The Americans with Disabilities Act uses the same ''regarded as'' test set forth in the regulations implementing section 504 of the Rehabilitation Act. See, e.g., 28 CFR 42.540(k)(2)(iv), which provides:

(iv) ''Is regarded as having an impairment'' means (A) Has a physical or mental impairment that does not substantially limit major life activities but that is treated by a recipient as constituting such a limitation; (B) Has a physical or mental impairment that substantially limits major life activities only as a result of the attitudes of others toward such impairment; or (C) Has none of the impairments defined in paragraph (k)(2)(i) of this section but is treated by a recipient as having such an impairment.

The perception of the covered entity is a key element of this test. A person who perceives himself or herself to have an impairment, but does not have an impairment, and is not treated as if he or she has an impairment, is not protected under this test.

A person would be covered under this test if a public entity refused to serve the person because it perceived that the person had an impairment that limited his or her enjoyment of the goods or services being offered.

For example, persons with severe burns often encounter discrimination in community activities, resulting in substantial limitation of major life activities. These persons would be covered under this test based on the attitudes of others towards the impairment, even if they did not view themselves as ''impaired.''

The rationale for this third test, as used in the Rehabilitation Act of 1973, was articulated by the Supreme Court in *Arline,* 480 U.S. 273 (1987). The Court noted that although an individual may have an impairment that does not in fact substantially limit a major life activity, the reaction of others may prove just as disabling. ''Such an impairment might not diminish a person's physical or mental capabilities, but could nevertheless substantially limit that person's ability to work as a result of the negative reactions of others to the impairment.'' *Id.* at 283. The Court concluded that, by including this test in the Rehabilitation Act's definition, ''Congress acknowledged that society's accumulated myths and fears about disability and diseases are as handicapping as are the physical limitations that flow from actual impairment.'' *Id.* at 284.

Thus, a person who is denied services or benefits by a public entity because of myths, fears, and stereotypes associated with disabilities would be covered under this third test whether or not the person's physical or mental condition would be considered a disability under the first or second test in the definition.

If a person is refused admittance on the basis of an actual or perceived physical or mental condition, and the public entity can articulate no legitimate reason for the refusal (such as failure to meet eligibility criteria), a perceived concern about admitting persons with disabilities could be inferred and the individual would qualify for coverage under the ''regarded as'' test. A person who is covered because of being regarded as having an impairment is not required to show that the public entity's perception is inaccurate (e.g., that he will be accepted by others) in order to receive benefits from the public entity.

Paragraph (5) of the definition lists certain conditions that are not included within the definition of ''disability.'' The excluded conditions are: Transvestism, transsexualism, pedophilia, exhibitionism, voyeurism, gender identity disorders not resulting from physical impairments, other sexual behavior disorders, compulsive gambling, kleptomania, pyromania, and psychoactive substance use disorders resulting from current illegal use of drugs. Unlike homosexuality and bisexuality, which are not considered impairments under either section 504 or the Americans with Disabilities Act (see the definition of ''disability,'' paragraph (1)(iv)), the conditions listed in paragraph (5), except for transvestism, are not necessarily excluded as impairments under section 504. (Transvestism was excluded from the definition of disability for section 504 by the Fair Housing Amendments Act of 1988, Pub. L. 100–430, section 6(b)).

''Drug.'' The definition of the term ''drug'' is taken from section 510(d)(2) of the ADA.

''Facility.'' ''Facility'' means all or any portion of buildings, structures, sites, complexes, equipment, rolling stock or other conveyances, roads, walks, passageways, parking lots, or other real or personal property, including the site where the building, property, structure, or equipment is located. It includes both indoor and outdoor areas where human-constructed improvements, structures, equipment, or property have been added to the natural environment.

Commenters raised questions about the applicability of this part to activities operated in mobile facilities, such as bookmobiles or mobile health screening units. Such activities would be covered by the requirement for program accessibility in §35.150, and would be included in the definition of ''facility'' as

''other real or personal property,'' although standards for new construction and alterations of such facilities are not yet included in the accessibility standards adopted by §35.151. Sections 35.150 and 35.151 specifically address the obligations of public entities to ensure accessibility by providing curb ramps at pedestrian walkways.

''Historic preservation programs'' and ''Historic properties'' are defined in order to aid in the interpretation of §§35.150 (a)(2) and (b)(2), which relate to accessibility of historic preservation programs, and §35.151(d), which relates to the alteration of historic properties.

''Illegal use of drugs.'' The definition of ''illegal use of drugs'' is taken from section 510(d)(1) of the Act and clarifies that the term includes the illegal use of one or more drugs.

''Individual with a disability'' means a person who has a disability but does not include an individual who is currently illegally using drugs, when the public entity acts on the basis of such use. The phrase ''current illegal use of drugs'' is explained in §35.131.

''Public entity.'' The term ''public entity'' is defined in accordance with section 201(1) of the ADA as any State or local government; any department, agency, special purpose district, or other instrumentality of a State or States or local government; or the National Railroad Passenger Corporation, and any commuter authority (as defined in section 103(8) of the Rail Passenger Service Act).

''Qualified individual with a disability.'' The definition of ''qualified individual with a disability'' is taken from section 201(2) of the Act, which is derived from the definition of ''qualified handicapped person'' in the Department of Health and Human Services' regulation implementing section 504 (45 CFR §84.3(k)). It combines the definition at 45 CFR 84.3(k)(1) for employment (''a handicapped person who, with reasonable accommodation, can perform the essential functions of the job in question'') with the definition for other services at 45 CFR 84.3(k)(4) (''a handicapped person who meets the essential eligibility requirements for the receipt of such services'').

Some commenters requested clarification of the term ''essential eligibility requirements.'' Because of the variety of situations in which an individual's qualifications will be at issue, it is not possible to include more specific criteria in the definition. The ''essential eligibility requirements'' for participation in some activities covered under this part may be minimal. For example, most public entities provide information about their operations as a public service to anyone who requests it. In such situations, the only ''eligibility requirement'' for receipt of such information would be the request for it. Where such information is provided by telephone, even the ability to use a voice telephone is not an ''essential eligibility requirement,'' because §35.161 requires a public entity to provide equally effective telecommunication systems for individuals with impaired hearing or speech.

For other activities, identification of the ''essential eligibility requirements'' may be more complex. Where questions of safety are involved, the principles established in §36.208 of the Department's regulation implementing title III of the ADA, to be codified at 28 CFR, part 36, will be applicable. That section implements section 302(b)(3) of the Act, which provides that a public accommodation is not required to permit an individual to participate in or benefit from the goods, services, facilities, privileges, advantages and accommodations of the public accommodation, if that individual poses a direct threat to the health or safety of others.

A ''direct threat'' is a significant risk to the health or safety of others that cannot be eliminated by a modification of policies, practices, or procedures, or by the provision of auxiliary aids or services. In *School Board of Nassau County* v. *Arline*, 480 U.S. 273 (1987), the Supreme Court recognized that there is a need to balance the interests of people with disabilities against legitimate concerns for public safety. Although persons with disabilities are generally entitled to the protection of this part, a person who poses a significant risk to others will not be ''qualified,'' if reasonable modifications to the public entity's policies, practices, or procedures will not eliminate that risk.

The determination that a person poses a direct threat to the health or safety of others may not be based on generalizations or stereotypes about the effects of a particular disability. It must be based on an individualized assessment, based on reasonable judgment that relies on current medical evidence or on the best available objective evidence, to determine: the nature, duration, and severity of the risk; the probability that the potential injury will actually occur; and whether reasonable modifications of policies, practices, or procedures will mitigate the risk. This is the test established by the Supreme Court in *Arline*. Such an inquiry is essential if the law is to achieve its goal of protecting disabled individuals from discrimination based on prejudice, stereotypes, or unfounded fear, while giving appropriate weight to legitimate concerns, such as the need to avoid exposing others to significant health and safety risks. Making this assessment will not usually require the services of a physician. Sources for medical knowledge include guidance from public health authorities, such as the U.S. Public Health Service, the Centers for Disease Control, and the National Institutes of Health, including the National Institute of Mental Health.

''Qualified interpreter.'' The Department received substantial comment regarding the

lack of a definition of ''qualified interpreter.'' The proposed rule defined auxiliary aids and services to include the statutory term, ''qualified interpreters'' (§35.104), but did not define it. Section 35.160 requires the use of auxiliary aids including qualified interpreters and commenters stated that a lack of guidance on what the term means would create confusion among those trying to secure interpreting services and often result in less than effective communication.

Many commenters were concerned that, without clear guidance on the issue of ''qualified'' interpreter, the rule would be interpreted to mean ''available, rather than qualified'' interpreters. Some claimed that few public entities would understand the difference between a qualified interpreter and a person who simply knows a few signs or how to fingerspell.

In order to clarify what is meant by ''qualified interpreter'' the Department has added a definition of the term to the final rule. A qualified interpreter means an interpreter who is able to interpret effectively, accurately, and impartially both receptively and expressively, using any necessary specialized vocabulary. This definition focuses on the actual ability of the interpreter in a particular interpreting context to facilitate effective communication between the public entity and the individual with disabilities.

Public comment also revealed that public entities have at times asked persons who are deaf to provide family members or friends to interpret. In certain circumstances, notwithstanding that the family member of friend is able to interpret or is a certified interpreter, the family member or friend may not be qualified to render the necessary interpretation because of factors such as emotional or personal involvement or considerations of confidentiality that may adversely affect the ability to interpret''effectively, accurately, and impartially.''

The definition of ''qualified interpreter'' in this rule does not invalidate or limit standards for interpreting services of any State or local law that are equal to or more stringent than those imposed by this definition. For instance, the definition would not supersede any requirement of State law for use of a certified interpreter in court proceedings.

''Section 504.'' The Department added a definition of ''section 504'' because the term is used extensively in subpart F of this part.

''State.'' The definition of ''State'' is identical to the statutory definition in section 3(3) of the ADA.

Section 35.105 Self-evaluation

Section 35.105 establishes a requirement, based on the section 504 regulations for federally assisted and federally conducted programs, that a public entity evaluate its current policies and practices to identify and correct any that are not consistent with the requirements of this part. As noted in the discussion of §35.102, activities covered by the Department of Transportation's regulation implementing subtitle B of title II are not required to be included in the self-evaluation required by this section.

Experience has demonstrated the self-evaluation process to be a valuable means of establishing a working relationship with individuals with disabilities, which has promoted both effective and efficient implementation of section 504. The Department expects that it will likewise be useful to public entities newly covered by the ADA.

All public entities are required to do a self-evaluation. However, only those that employ 50 or more persons are required to maintain the self-evaluation on file and make it available for public inspection for three years. The number 50 was derived from the Department of Justice's section 504 regulations for federally assisted programs, 28 CFR 42.505(c). The Department received comments critical of this limitation, some suggesting the requirement apply to all public entities and others suggesting that the number be changed from 50 to 15. The final rule has not been changed. Although many regulations implementing section 504 for federally assisted programs do use 15 employees as the cut-off for this record-keeping requirement, the Department believes that it would be inappropriate to extend it to those smaller public entities covered by this regulation that do not receive Federal financial assistance. This approach has the benefit of minimizing paperwork burdens on small entities.

Paragraph (d) provides that the self-evaluation required by this section shall apply only to programs not subject to section 504 or those policies and practices, such as those involving communications access, that have not already been included in a self-evaluation required under an existing regulation implementing section 504. Because most self-evaluations were done from five to twelve years ago, however, the Department expects that a great many public entities will be re-examining all of their policies and programs. Programs and functions may have changed, and actions that were supposed to have been taken to comply with section 504 may not have been fully implemented or may no longer be effective. In addition, there have been statutory amendments to section 504 which have changed the coverage of section 504, particularly the Civil Rights Restoration Act of 1987, Public Law No. 100–259, 102 Stat. 28 (1988), which broadened the definition of a covered ''program or activity.''

Several commenters suggested that the Department clarify public entities' liability during the one-year period for compliance with the self-evaluation requirement. The self-evaluation requirement does not stay the effective date of the statute nor of this part. Public entities are, therefore, not

shielded from discrimination claims during that time.

Other commenters suggested that the rule require that every self-evaluation include an examination of training efforts to assure that individuals with disabilities are not subjected to discrimination because of insensitivity, particularly in the law enforcement area. Although the Department has not added such a specific requirement to the rule, it would be appropriate for public entities to evaluate training efforts because, in many cases, lack of training leads to discriminatory practices, even when the policies in place are nondiscriminatory.

Section 35.106 Notice

Section 35.106 requires a public entity to disseminate sufficient information to applicants, participants, beneficiaries, and other interested persons to inform them of the rights and protections afforded by the ADA and this regulation. Methods of providing this information include, for example, the publication of information in handbooks, manuals, and pamphlets that are distributed to the public to describe a public entity's programs and activities; the display of informative posters in service centers and other public places; or the broadcast of information by television or radio. In providing the notice, a public entity must comply with the requirements for effective communication in §35.160. The preamble to that section gives guidance on how to effectively communicate with individuals with disabilities.

Section 35.107 Designation of Responsible Employee and Adoption of Grievance Procedures

Consistent with §35.105, self-evaluation, the final rule requires that public entities with 50 or more employees designate a responsible employee and adopt grievance procedures. Most of the commenters who suggested that the requirement that self-evaluation be maintained on file for three years not be limited to those employing 50 or more persons made a similar suggestion concerning §35.107. Commenters recommended either that all public entities be subject to §35.107, or that ''50 or more persons'' be changed to ''15 or more persons.'' As explained in the discussion of §35.105, the Department has not adopted this suggestion.

The requirement for designation of an employee responsible for coordination of efforts to carry out responsibilities under this part is derived from the HEW regulation implementing section 504 in federally assisted programs. The requirement for designation of a particular employee and dissemination of information about how to locate that employee helps to ensure that individuals dealing with large agencies are able to easily find a responsible person who is familiar with the requirements of the Act and this part and can communicate those requirements to other individuals in the agency who may be unaware of their responsibilities. This paragraph in no way limits a public entity's obligation to ensure that all of its employees comply with the requirements of this part, but it ensures that any failure by individual employees can be promptly corrected by the designated employee.

Section 35.107(b) requires public entities with 50 or more employees to establish grievance procedures for resolving complaints of violations of this part. Similar requirements are found in the section 504 regulations for federally assisted programs (see, e.g., 45 CFR 84.7(b)). The rule, like the regulations for federally assisted programs, provides for investigation and resolution of complaints by a Federal enforcement agency. It is the view of the Department that public entities subject to this part should be required to establish a mechanism for resolution of complaints at the local level without requiring the complainant to resort to the Federal complaint procedures established under subpart F. Complainants would not, however, be required to exhaust the public entity's grievance procedures before filing a complaint under subpart F. Delay in filing the complaint at the Federal level caused by pursuit of the remedies available under the grievance procedure would generally be considered good cause for extending the time allowed for filing under §35.170(b).

Subpart B—General Requirements

Section 35.130 General Prohibitions Against Discrimination

The general prohibitions against discrimination in the rule are generally based on the prohibitions in existing regulations implementing section 504 and, therefore, are already familiar to State and local entities covered by section 504. In addition, §35.130 includes a number of provisions derived from title III of the Act that are implicit to a certain degree in the requirements of regulations implementing section 504.

Several commenters suggested that this part should include the section of the proposed title III regulation that implemented section 309 of the Act, which requires that courses and examinations related to applications, licensing, certification, or credentialing be provided in an accessible place and manner or that alternative accessible arrangements be made. The Department has not adopted this suggestion. The requirements of this part, including the general prohibitions of discrimination in this section, the program access requirements of subpart D, and the communications requirements of subpart E, apply to courses and examinations provided by public entities. The Department considers these requirements to

be sufficient to ensure that courses and examinations administered by public entities meet the requirements of section 309. For example, a public entity offering an examination must ensure that modifications of policies, practices, or procedures or the provision of auxiliary aids and services furnish the individual with a disability an equal opportunity to demonstrate his or her knowledge or ability. Also, any examination specially designed for individuals with disabilities must be offered as often and in as timely a manner as are other examinations. Further, under this part, courses and examinations must be offered in the most integrated setting appropriate. The analysis of §35.130(d) is relevant to this determination.

A number of commenters asked that the regulation be amended to require training of law enforcement personnel to recognize the difference between criminal activity and the effects of seizures or other disabilities such as mental retardation, cerebral palsy, traumatic brain injury, mental illness, or deafness. Several disabled commenters gave personal statements about the abuse they had received at the hands of law enforcement personnel. Two organizations that commented cited the Judiciary report at 50 as authority to require law enforcement training.

The Department has not added such a training requirement to the regulation. Discriminatory arrests and brutal treatment are already unlawful police activities. The general regulatory obligation to modify policies, practices, or procedures requires law enforcement to make changes in policies that result in discriminatory arrests or abuse of individuals with disabilities. Under this section law enforcement personnel would be required to make appropriate efforts to determine whether perceived strange or disruptive behavior or unconsciousness is the result of a disability. The Department notes that a number of States have attempted to address the problem of arresting disabled persons for noncriminal conduct resulting from their disability through adoption of the Uniform Duties to Disabled Persons Act, and encourages other jurisdictions to consider that approach.

Paragraph (a) restates the nondiscrimination mandate of section 202 of the ADA. The remaining paragraphs in §35.130 establish the general principles for analyzing whether any particular action of the public entity violates this mandate.

Paragraph (b) prohibits overt denials of equal treatment of individuals with disabilities. A public entity may not refuse to provide an individual with a disability with an equal opportunity to participate in or benefit from its program simply because the person has a disability.

Paragraph (b)(1)(i) provides that it is discriminatory to deny a person with a disability the right to participate in or benefit from the aid, benefit, or service provided by a public entity. Paragraph (b)(1)(ii) provides that the aids, benefits, and services provided to persons with disabilities must be equal to those provided to others, and paragraph (b)(1)(iii) requires that the aids, benefits, or services provided to individuals with disabilities must be as effective in affording equal opportunity to obtain the same result, to gain the same benefit, or to reach the same level of achievement as those provided to others. These paragraphs are taken from the regulations implementing section 504 and simply restate principles long established under section 504.

Paragraph (b)(1)(iv) permits the public entity to develop separate or different aids, benefits, or services when necessary to provide individuals with disabilities with an equal opportunity to participate in or benefit from the public entity's programs or activities, but only when necessary to ensure that the aids, benefits, or services are as effective as those provided to others. Paragraph (b)(1)(iv) must be read in conjunction with paragraphs (b)(2), (d), and (e). Even when separate or different aids, benefits, or services would be more effective, paragraph (b)(2) provides that a qualified individual with a disability still has the right to choose to participate in the program that is not designed to accommodate individuals with disabilities. Paragraph (d) requires that a public entity administer services, programs, and activities in the most integrated setting appropriate to the needs of qualified individuals with disabilities.

Paragraph (b)(2) specifies that, notwithstanding the existence of separate or different programs or activities provided in accordance with this section, an individual with a disability shall not be denied the opportunity to participate in such programs or activities that are not separate or different. Paragraph (e), which is derived from section 501(d) of the Americans with Disabilities Act, states that nothing in this part shall be construed to require an individual with a disability to accept an accommodation, aid, service, opportunity, or benefit that he or she chooses not to accept.

Taken together, these provisions are intended to prohibit exclusion and segregation of individuals with disabilities and the denial of equal opportunities enjoyed by others, based on, among other things, presumptions, patronizing attitudes, fears, and stereotypes about individuals with disabilities. Consistent with these standards, public entities are required to ensure that their actions are based on facts applicable to individuals and not on presumptions as to what a class of individuals with disabilities can or cannot do.

Integration is fundamental to the purposes of the Americans with Disabilities Act. Provision of segregated accommodations and services relegates persons with disabilities to second-class status. For example, it would be a violation of this provision to require persons with disabilities to eat in the back room of a government cafeteria or to refuse to allow a person with a disability the full use of recreation or exercise facilities because of stereotypes about the person's ability to participate.

Many commenters objected to proposed paragraphs (b)(1)(iv) and (d) as allowing continued segregation of individuals with disabilities. The Department recognizes that promoting integration of individuals with disabilities into the mainstream of society is an important objective of the ADA and agrees that, in most instances, separate programs for individuals with disabilities will not be permitted. Nevertheless, section 504 does permit separate programs in limited circumstances, and Congress clearly intended the regulations issued under title II to adopt the standards of section 504. Furthermore, Congress included authority for separate programs in the specific requirements of title III of the Act. Section 302(b)(1)(A)(iii) of the Act provides for separate benefits in language similar to that in §35.130(b)(1)(iv), and section 302(b)(1)(B) includes the same requirement for ''the most integrated setting appropriate'' as in §35.130(d).

Even when separate programs are permitted, individuals with disabilities cannot be denied the opportunity to participate in programs that are not separate or different. This is an important and overarching principle of the Americans with Disabilities Act. Separate, special, or different programs that are designed to provide a benefit to persons with disabilities cannot be used to restrict the participation of persons with disabilities in general, integrated activities.

For example, a person who is blind may wish to decline participating in a special museum tour that allows persons to touch sculptures in an exhibit and instead tour the exhibit at his or her own pace with the museum's recorded tour. It is not the intent of this section to require the person who is blind to avail himself or herself of the special tour. Modified participation for persons with disabilities must be a choice, not a requirement.

In addition, it would not be a violation of this section for a public entity to offer recreational programs specially designed for children with mobility impairments. However, it would be a violation of this section if the entity then excluded these children from other recreational services for which they are qualified to participate when these services are made available to nondisabled children, or if the entity required children with disabilities to attend only designated programs.

Many commenters asked that the Department clarify a public entity's obligations within the integrated program when it offers a separate program but an individual with a disability chooses not to participate in the separate program. It is impossible to make a blanket statement as to what level of auxiliary aids or modifications would be required in the integrated program. Rather, each situation must be assessed individually. The starting point is to question whether the separate program is in fact necessary or appropriate for the individual. Assuming the separate program would be appropriate for a particular individual, the extent to which that individual must be provided with modifications in the integrated program will depend not only on what the individual needs but also on the limitations and defenses of this part. For example, it may constitute an undue burden for a public accommodation, which provides a full-time interpreter in its special guided tour for individuals with hearing impairments, to hire an additional interpreter for those individuals who choose to attend the integrated program. The Department cannot identify categorically the level of assistance or aid required in the integrated program.

Paragraph (b)(1)(v) provides that a public entity may not aid or perpetuate discrimination against a qualified individual with a disability by providing significant assistance to an agency, organization, or person that discriminates on the basis of disability in providing any aid, benefit, or service to beneficiaries of the public entity's program. This paragraph is taken from the regulations implementing section 504 for federally assisted programs.

Paragraph (b)(1)(vi) prohibits the public entity from denying a qualified individual with a disability the opportunity to participate as a member of a planning or advisory board.

Paragraph (b)(1)(vii) prohibits the public entity from limiting a qualified individual with a disability in the enjoyment of any right, privilege, advantage, or opportunity enjoyed by others receiving any aid, benefit, or service.

Paragraph (b)(3) prohibits the public entity from utilizing criteria or methods of administration that deny individuals with disabilities access to the public entity's services, programs, and activities or that perpetuate the discrimination of another public entity, if both public entities are subject to common administrative control or are agencies of the same State. The phrase ''criteria or methods of administration'' refers to official written policies of the public entity and to the actual practices of the public entity. This paragraph prohibits both blatantly exclusionary

policies or practices and nonessential policies and practices that are neutral on their face, but deny individuals with disabilities an effective opportunity to participate. This standard is consistent with the interpretation of section 504 by the U.S. Supreme Court in *Alexander* v. *Choate*, 469 U.S. 287 (1985). The Court in *Choate* explained that members of Congress made numerous statements during passage of section 504 regarding eliminating architectural barriers, providing access to transportation, and eliminating discriminatory effects of job qualification procedures. The Court then noted: ''These statements would ring hollow if the resulting legislation could not rectify the harms resulting from action that discriminated by effect as well as by design.'' *Id.* at 297 (footnote omitted).

Paragraph (b)(4) specifically applies the prohibition enunciated in §35.130(b)(3) to the process of selecting sites for construction of new facilities or selecting existing facilities to be used by the public entity. Paragraph (b)(4) does not apply to construction of additional buildings at an existing site.

Paragraph (b)(5) prohibits the public entity, in the selection of procurement contractors, from using criteria that subject qualified individuals with disabilities to discrimination on the basis of disability.

Paragraph (b)(6) prohibits the public entity from discriminating against qualified individuals with disabilities on the basis of disability in the granting of licenses or certification. A person is a ''qualified individual with a disability'' with respect to licensing or certification if he or she can meet the essential eligibility requirements for receiving the license or certification (see §35.104).

A number of commenters were troubled by the phrase ''essential eligibility requirements'' as applied to State licensing requirements, especially those for health care professions. Because of the variety of types of programs to which the definition of ''qualified individual with a disability'' applies, it is not possible to use more specific language in the definition. The phrase ''essential eligibility requirements,'' however, is taken from the definitions in the regulations implementing section 504, so caselaw under section 504 will be applicable to its interpretation. In *Southeastern Community College* v. *Davis*, 442 U.S. 397, for example, the Supreme Court held that section 504 does not require an institution to ''lower or effect substantial modifications of standards to accommodate a handicapped person,'' 442 U.S. at 413, and that the school had established that the plaintiff was not ''qualified'' because she was not able to ''serve the nursing profession in all customary ways,'' *id.* Whether a particular requirement is ''essential'' will, of course, depend on the facts of the particular case.

In addition, the public entity may not establish requirements for the programs or activities of licensees or certified entities that subject qualified individuals with disabilities to discrimination on the basis of disability. For example, the public entity must comply with this requirement when establishing safety standards for the operations of licensees. In that case the public entity must ensure that standards that it promulgates do not discriminate against the employment of qualified individuals with disabilities in an impermissible manner.

Paragraph (b)(6) does not extend the requirements of the Act or this part directly to the programs or activities of licensees or certified entities themselves. The programs or activities of licensees or certified entities are not themselves programs or activities of the public entity merely by virtue of the license or certificate.

Paragraph (b)(7) is a specific application of the requirement under the general prohibitions of discrimination that public entities make reasonable modifications in policies, practices, or procedures where necessary to avoid discrimination on the basis of disability. Section 302(b)(2)(A)(ii) of the ADA sets out this requirement specifically for public accommodations covered by title III of the Act, and the House Judiciary Committee Report directs the Attorney General to include those specific requirements in the title II regulation to the extent that they do not conflict with the regulations implementing section 504. Judiciary report at 52.

Paragraph (b)(8), a new paragraph not contained in the proposed rule, prohibits the imposition or application of eligibility criteria that screen out or tend to screen out an individual with a disability or any class of individuals with disabilities from fully and equally enjoying any service, program, or activity, unless such criteria can be shown to be necessary for the provision of the service, program, or activity being offered. This prohibition is also a specific application of the general prohibitions of discrimination and is based on section 302(b)(2)(A)(i) of the ADA. It prohibits overt denials of equal treatment of individuals with disabilities, or establishment of exclusive or segregative criteria that would bar individuals with disabilities from participation in services, benefits, or activities.

Paragraph (b)(8) also prohibits policies that unnecessarily impose requirements or burdens on individuals with disabilities that are not placed on others. For example, public entities may not require that a qualified individual with a disability be accompanied by an attendant. A public entity is not, however, required to provide attendant care, or assistance in toileting, eating, or dressing to

individuals with disabilities, except in special circumstances, such as where the individual is an inmate of a custodial or correctional institution.

In addition, paragraph (b)(8) prohibits the imposition of criteria that ''tend to'' screen out an individual with a disability. This concept, which is derived from current regulations under section 504 (*see, e.g.,* 45 CFR 84.13), makes it discriminatory to impose policies or criteria that, while not creating a direct bar to individuals with disabilities, indirectly prevent or limit their ability to participate. For example, requiring presentation of a driver's license as the sole means of identification for purposes of paying by check would violate this section in situations where, for example, individuals with severe vision impairments or developmental disabilities or epilepsy are ineligible to receive a driver's license and the use of an alternative means of identification, such as another photo I.D. or credit card, is feasible.

A public entity may, however, impose neutral rules and criteria that screen out, or tend to screen out, individuals with disabilities if the criteria are necessary for the safe operation of the program in question. Examples of safety qualifications that would be justifiable in appropriate circumstances would include eligibility requirements for drivers' licenses, or a requirement that all participants in a recreational rafting expedition be able to meet a necessary level of swimming proficiency. Safety requirements must be based on actual risks and not on speculation, stereotypes, or generalizations about individuals with disabilities.

Paragraph (c) provides that nothing in this part prohibits a public entity from providing benefits, services, or advantages to individuals with disabilities, or to a particular class of individuals with disabilities, beyond those required by this part. It is derived from a provision in the section 504 regulations that permits programs conducted pursuant to Federal statute or Executive order that are designed to benefit only individuals with disabilities or a given class of individuals with disabilities to be limited to those individuals with disabilities. Section 504 ensures that federally assisted programs are made available to all individuals, without regard to disabilities, unless the Federal program under which the assistance is provided is specifically limited to individuals with disabilities or a particular class of individuals with disabilities. Because coverage under this part is not limited to federally assisted programs, paragraph (c) has been revised to clarify that State and local governments may provide special benefits, beyond those required by the nondiscrimination requirements of this part, that are limited to individuals with disabilities or a particular class of individuals with disabilities, without thereby incurring additional obligations to persons without disabilities or to other classes of individuals with disabilities.

Paragraphs (d) and (e), previously referred to in the discussion of paragraph (b)(1)(iv), provide that the public entity must administer services, programs, and activities in the most integrated setting appropriate to the needs of qualified individuals with disabilities, *i.e.,* in a setting that enables individuals with disabilities to interact with nondisabled persons to the fullest extent possible, and that persons with disabilities must be provided the option of declining to accept a particular accommodation.

Some commenters expressed concern that §35.130(e), which states that nothing in the rule requires an individual with a disability to accept special accommodations and services provided under the ADA, could be interpreted to allow guardians of infants or older people with disabilities to refuse medical treatment for their wards. Section 35.130(e) has been revised to make it clear that paragraph (e) is inapplicable to the concern of the commenters. A new paragraph (e)(2) has been added stating that nothing in the regulation authorizes the representative or guardian of an individual with a disability to decline food, water, medical treatment, or medical services for that individual. New paragraph (e) clarifies that neither the ADA nor the regulation alters current Federal law ensuring the rights of incompetent individuals with disabilities to receive food, water, and medical treatment. See, *e.g.,* Child Abuse Amendments of 1984 (42 U.S.C. 5106a(b)(10), 5106g(10)); Rehabilitation Act of 1973, as amended (29 U.S.C. 794); the Developmentally Disabled Assistance and Bill of Rights Act (42 U.S.C. 6042).

Sections 35.130(e) (1) and (2) are based on section 501(d) of the ADA. Section 501(d) was designed to clarify that nothing in the ADA requires individuals with disabilities to accept special accommodations and services for individuals with disabilities that may segregate them:

The Committee added this section [501(d)] to clarify that nothing in the ADA is intended to permit discriminatory treatment on the basis of disability, even when such treatment is rendered under the guise of providing an accommodation, service, aid or benefit to the individual with disability. For example, a blind individual may choose not to avail himself or herself of the right to go to the front of a line, even if a particular public accommodation has chosen to offer such a modification of a policy for blind individuals. Or, a blind individual may choose to decline to participate in a special museum tour that allows persons to touch sculptures in an exhibit and instead tour the exhibits at his or her own pace with the museum's recorded tour.

Judiciary report at 71–72. The Act is not to be construed to mean that an individual with

disabilities must accept special accommodations and services for individuals with disabilities when that individual can participate in the regular services already offered. Because medical treatment, including treatment for particular conditions, is not a special accommodation or service for individuals with disabilities under section 501(d), neither the Act nor this part provides affirmative authority to suspend such treatment. Section 501(d) is intended to clarify that the Act is not designed to foster discrimination through mandatory acceptance of special services when other alternatives are provided; this concern does not reach to the provision of medical treatment for the disabling condition itself.

Paragraph (f) provides that a public entity may not place a surcharge on a particular individual with a disability, or any group of individuals with disabilities, to cover any costs of measures required to provide that individual or group with the nondiscriminatory treatment required by the Act or this part. Such measures may include the provision of auxiliary aids or of modifications required to provide program accessibility.

Several commenters asked for clarification that the costs of interpreter services may not be assessed as an element of ''court costs.'' The Department has already recognized that imposition of the cost of courtroom interpreter services is impermissible under section 504. The preamble to the Department's section 504 regulation for its federally assisted programs states that where a court system has an obligation to provide qualified interpreters, ''it has the corresponding responsibility to pay for the services of the interpreters.'' (45 FR 37630 (June 3, 1980)). Accordingly, recouping the costs of interpreter services by assessing them as part of court costs would also be prohibited.

Paragraph (g), which prohibits discrimination on the basis of an individual's or entity's known relationship or association with an individual with a disability, is based on sections 102(b)(4) and 302(b)(1)(E) of the ADA. This paragraph was not contained in the proposed rule. The individuals covered under this paragraph are any individuals who are discriminated against because of their known association with an individual with a disability. For example, it would be a violation of this paragraph for a local government to refuse to allow a theater company to use a school auditorium on the grounds that the company had recently performed for an audience of individuals with HIV disease.

This protection is not limited to those who have a familial relationship with the individual who has a disability. Congress considered, and rejected, amendments that would have limited the scope of this provision to specific associations and relationships. Therefore, if a public entity refuses admission to a person with cerebral palsy and his or her companions, the companions have an independent right of action under the ADA and this section.

During the legislative process, the term ''entity'' was added to section 302(b)(1)(E) to clarify that the scope of the provision is intended to encompass not only persons who have a known association with a person with a disability, but also entities that provide services to or are otherwise associated with such individuals. This provision was intended to ensure that entities such as health care providers, employees of social service agencies, and others who provide professional services to persons with disabilities are not subjected to discrimination because of their professional association with persons with disabilities.

Section 35.131 Illegal Use of Drugs

Section 35.131 effectuates section 510 of the ADA, which clarifies the Act's application to people who use drugs illegally. Paragraph (a) provides that this part does not prohibit discrimination based on an individual's current illegal use of drugs.

The Act and the regulation distinguish between illegal use of drugs and the legal use of substances, whether or not those substances are ''controlled substances,'' as defined in the Controlled Substances Act (21 U.S.C. 812). Some controlled substances are prescription drugs that have legitimate medical uses. Section 35.131 does not affect use of controlled substances pursuant to a valid prescription under supervision by a licensed health care professional, or other use that is authorized by the Controlled Substances Act or any other provision of Federal law. It does apply to illegal use of those substances, as well as to illegal use of controlled substances that are not prescription drugs. The key question is whether the individual's use of the substance is illegal, not whether the substance has recognized legal uses. Alcohol is not a controlled substance, so use of alcohol is not addressed by §35.131 (although alcoholics are individuals with disabilities, subject to the protections of the statute).

A distinction is also made between the use of a substance and the status of being addicted to that substance. Addiction is a disability, and addicts are individuals with disabilities protected by the Act. The protection, however, does not extend to actions based on the illegal use of the substance. In other words, an addict cannot use the fact of his or her addiction as a defense to an action based on illegal use of drugs. This distinction is not artificial. Congress intended to deny protection to people who engage in the illegal use of drugs, whether or not they are addicted, but to provide protection to addicts so long as they are not currently using drugs.

A third distinction is the difficult one between current use and former use. The definition of ''current illegal use of drugs'' in §35.104, which is based on the report of the Conference Committee, H.R. Conf. Rep. No. 596, 101st Cong., 2d Sess. 64 (1990) (hereinafter ''Conference report''), is ''illegal use of drugs that occurred recently enough to justify a reasonable belief that a person's drug use is current or that continuing use is a real and ongoing problem.''

Paragraph (a)(2)(i) specifies that an individual who has successfully completed a supervised drug rehabilitation program or has otherwise been rehabilitated successfully and who is not engaging in current illegal use of drugs is protected. Paragraph (a)(2)(ii) clarifies that an individual who is currently participating in a supervised rehabilitation program and is not engaging in current illegal use of drugs is protected. Paragraph (a)(2)(iii) provides that a person who is erroneously regarded as engaging in current illegal use of drugs, but who is not engaging in such use, is protected.

Paragraph (b) provides a limited exception to the exclusion of current illegal users of drugs from the protections of the Act. It prohibits denial of health services, or services provided in connection with drug rehabilitation to an individual on the basis of current illegal use of drugs, if the individual is otherwise entitled to such services. A health care facility, such as a hospital or clinic, may not refuse treatment to an individual in need of the services it provides on the grounds that the individual is illegally using drugs, but it is not required by this section to provide services that it does not ordinarily provide. For example, a health care facility that specializes in a particular type of treatment, such as care of burn victims, is not required to provide drug rehabilitation services, but it cannot refuse to treat an individual's burns on the grounds that the individual is illegally using drugs.

Some commenters pointed out that abstention from the use of drugs is an essential condition of participation in some drug rehabilitation programs, and may be a necessary requirement in inpatient or residential settings. The Department believes that this comment is well-founded. Congress clearly intended to prohibit exclusion from drug treatment programs of the very individuals who need such programs because of their use of drugs, but, once an individual has been admitted to a program, abstention may be a necessary and appropriate condition to continued participation. The final rule therefore provides that a drug rehabilitation or treatment program may prohibit illegal use of drugs by individuals while they are participating in the program.

Paragraph (c) expresses Congress' intention that the Act be neutral with respect to testing for illegal use of drugs. This paragraph implements the provision in section 510(b) of the Act that allows entities ''to adopt or administer reasonable policies or procedures, including but not limited to drug testing,'' that ensure that an individual who is participating in a supervised rehabilitation program, or who has completed such a program or otherwise been rehabilitated successfully is no longer engaging in the illegal use of drugs. The section is not to be ''construed to encourage, prohibit, restrict, or authorize the conducting of testing for the illegal use of drugs.''

Paragraph 35.131(c) clarifies that it is not a violation of this part to adopt or administer reasonable policies or procedures to ensure that an individual who formerly engaged in the illegal use of drugs is not currently engaging in illegal use of drugs. Any such policies or procedures must, of course, be reasonable, and must be designed to identify accurately the illegal use of drugs. This paragraph does not authorize inquiries, tests, or other procedures that would disclose use of substances that are not controlled substances or are taken under supervision by a licensed health care professional, or other uses authorized by the Controlled Substances Act or other provisions of Federal law, because such uses are not included in the definition of ''illegal use of drugs.'' A commenter argued that the rule should permit testing for lawful use of prescription drugs, but most commenters preferred that tests must be limited to unlawful use in order to avoid revealing the lawful use of prescription medicine used to treat disabilities.

Section 35.132 Smoking

Section 35.132 restates the clarification in section 501(b) of the Act that the Act does not preclude the prohibition of, or imposition of restrictions on, smoking in transportation covered by title II. Some commenters argued that this section is too limited in scope, and that the regulation should prohibit smoking in all facilities used by public entities. The reference to smoking in section 501, however, merely clarifies that the Act does not require public entities to accommodate smokers by permitting them to smoke in transportation facilities.

Section 35.133 Maintenance of Accessible Features

Section 35.133 provides that a public entity shall maintain in operable working condition those features of facilities and equipment that are required to be readily accessible to and usable by persons with disabilities by the Act or this part. The Act requires that, to the maximum extent feasible, facilities must be accessible to, and usable by, individuals with disabilities. This section recognizes that it is not sufficient to provide

features such as accessible routes, elevators, or ramps, if those features are not maintained in a manner that enables individuals with disabilities to use them. Inoperable elevators, locked accessible doors, or ''accessible'' routes that are obstructed by furniture, filing cabinets, or potted plants are neither ''accessible to'' nor ''usable by'' individuals with disabilities.

Some commenters objected that this section appeared to establish an absolute requirement and suggested that language from the preamble be included in the text of the regulation. It is, of course, impossible to guarantee that mechanical devices will never fail to operate. Paragraph (b) of the final regulation provides that this section does not prohibit isolated or temporary interruptions in service or access due to maintenance or repairs. This paragraph is intended to clarify that temporary obstructions or isolated instances of mechanical failure would not be considered violations of the Act or this part. However, allowing obstructions or ''out of service'' equipment to persist beyond a reasonable period of time would violate this part, as would repeated mechanical failures due to improper or inadequate maintenance. Failure of the public entity to ensure that accessible routes are properly maintained and free of obstructions, or failure to arrange prompt repair of inoperable elevators or other equipment intended to provide access would also violate this part.

Other commenters requested that this section be expanded to include specific requirements for inspection and maintenance of equipment, for training staff in the proper operation of equipment, and for maintenance of specific items. The Department believes that this section properly establishes the general requirement for maintaining access and that further details are not necessary.

Section 35.134 Retaliation or Coercion

Section 35.134 implements section 503 of the ADA, which prohibits retaliation against any individual who exercises his or her rights under the Act. This section is unchanged from the proposed rule. Paragraph (a) of §35.134 provides that no private or public entity shall discriminate against any individual because that individual has exercised his or her right to oppose any act or practice made unlawful by this part, or because that individual made a charge, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under the Act or this part.

Paragraph (b) provides that no private or public entity shall coerce, intimidate, threaten, or interfere with any individual in the exercise of his or her rights under this part or because that individual aided or encouraged any other individual in the exercise or enjoyment of any right granted or protected by the Act or this part.

This section protects not only individuals who allege a violation of the Act or this part, but also any individuals who support or assist them. This section applies to all investigations or proceedings initiated under the Act or this part without regard to the ultimate resolution of the underlying allegations. Because this section prohibits any act of retaliation or coercion in response to an individual's effort to exercise rights established by the Act and this part (or to support the efforts of another individual), the section applies not only to public entities subject to this part, but also to persons acting in an individual capacity or to private entities. For example, it would be a violation of the Act and this part for a private individual to harass or intimidate an individual with a disability in an effort to prevent that individual from attending a concert in a State-owned park. It would, likewise, be a violation of the Act and this part for a private entity to take adverse action against an employee who appeared as a witness on behalf of an individual who sought to enforce the Act.

Section 35.135 Personal Devices and Services

The final rule includes a new §35.135, entitles ''Personal devices and services,'' which states that the provision of personal devices and services is not required by title II. This new section, which serves as a limitation on all of the requirements of the regulation, replaces §35.160(b)(2) of the proposed rule, which addressed the issue of personal devices and services explicitly only in the context of communications. The personal devices and services limitation was intended to have general application in the proposed rule in all contexts where it was relevant. The final rule, therefore, clarifies this point by including a general provision that will explicitly apply not only to auxiliary aids and services but across-the-board to include other relevant areas such as, for example, modifications in policies, practices, and procedures (§35.130(b)(7)). The language of §35.135 parallels an analogous provision in the Department's title III regulations (28 CFR 36.306) but preserves the explicit reference to ''readers for personal use or study'' in §35.160(b)(2) of the proposed rule. This section does not preclude the short-term loan of personal receivers that are part of an assistive listening system.

Subpart C—Employment

Section 35.140 Employment Discrimination Prohibited

Title II of the ADA applies to all activities of public entities, including their employment practices. The proposed rule cross-referenced the definitions, requirements, and

procedures of title I of the ADA, as established by the Equal Employment Opportunity Commission in 29 CFR part 1630. This proposal would have resulted in use, under §35.140, of the title I definition of ''employer,'' so that a public entity with 25 or more employees would have become subject to the requirements of §35.140 on July 26, 1992, one with 15 to 24 employees on July 26, 1994, and one with fewer than 15 employees would have been excluded completely.

The Department received comments objecting to this approach. The commenters asserted that Congress intended to establish nondiscrimination requirements for employment by all public entities, including those that employ fewer than 15 employees; and that Congress intended the employment requirements of title II to become effective at the same time that the other requirements of this regulation become effective, January 26, 1992. The Department has reexamined the statutory language and legislative history of the ADA on this issue and has concluded that Congress intended to cover the employment practices of all public entities and that the applicable effective date is that of title II.

The statutory language of section 204(b) of the ADA requires the Department to issue a regulation that is consistent with the ADA and the Department's coordination regulation under section 504, 28 CFR part 41. The coordination regulation specifically requires nondiscrimination in employment, 28 CFR 41.52–41.55, and does not limit coverage based on size of employer. Moreover, under all section 504 implementing regulations issued in accordance with the Department's coordination regulation, employment coverage under section 504 extends to all employers with federally assisted programs or activities, regardless of size, and the effective date for those employment requirements has always been the same as the effective date for nonemployment requirements established in the same regulations. The Department therefore concludes that §35.140 must apply to all public entities upon the effective date of this regulation.

In the proposed regulation the Department cross-referenced the regulations implementing title I of the ADA, issued by the Equal Employment Opportunity Commission at 29 CFR part 1630, as a compliance standard for §35.140 because, as proposed, the scope of coverage and effective date of coverage under title II would have been coextensive with title I. In the final regulation this language is modified slightly. Subparagraph (1) of new paragraph (b) makes it clear that the standards established by the Equal Employment Opportunity Commission in 29 CFR part 1630 will be the applicable compliance standards if the public entity is subject to title I. If the public entity is not covered by title I, or until it is covered by title I, subparagraph (b)(2) cross-references section 504 standards for what constitutes employment discrimination, as established by the Department of Justice in 28 CFR part 41. Standards for title I of the ADA and section 504 of the Rehabilitation Act are for the most part identical because title I of the ADA was based on requirements set forth in regulations implementing section 504.

The Department, together with the other Federal agencies responsible for the enforcement of Federal laws prohibiting employment discrimination on the basis of disability, recognizes the potential for jurisdictional overlap that exists with respect to coverage of public entities and the need to avoid problems related to overlapping coverage. The other Federal agencies include the Equal Employment Opportunity Commission, which is the agency primarily responsible for enforcement of title I of the ADA, the Department of Labor, which is the agency responsible for enforcement of section 503 of the Rehabilitation Act of 1973, and 26 Federal agencies with programs of Federal financial assistance, which are responsible for enforcing section 504 in those programs. Section 107 of the ADA requires that coordination mechanisms be developed in connection with the administrative enforcement of complaints alleging discrimination under title I and complaints alleging discrimination in employment in violation of the Rehabilitation Act. Although the ADA does not specifically require inclusion of employment complaints under title II in the coordinating mechanisms required by title I, Federal investigations of title II employment complaints will be coordinated on a government-wide basis also. The Department is currently working with the EEOC and other affected Federal agencies to develop effective coordinating mechanisms, and final regulations on this issue will be issued on or before January 26, 1992.

Subpart D—Program Accessibility

Section 35.149 Discrimination Prohibited

Section 35.149 states the general nondiscrimination principle underlying the program accessibility requirements of §§35.150 and 35.151.

Section 35.150 Existing Facilities

Consistent with section 204(b) of the Act, this regulation adopts the program accessibility concept found in the section 504 regulations for federally conducted programs or activities (e.g., 28 CFR part 39). The concept of ''program accessibility'' was first used in the section 504 regulation adopted by the Department of Health, Education, and Welfare for its federally assisted programs and activities in 1977. It allowed recipients to make

their federally assisted programs and activities available to individuals with disabilities without extensive retrofitting of their existing buildings and facilities, by offering those programs through alternative methods. Program accessibility has proven to be a useful approach and was adopted in the regulations issued for programs and activities conducted by Federal Executive agencies. The Act provides that the concept of program access will continue to apply with respect to facilities now in existence, because the cost of retrofitting existing facilities is often prohibitive.

Section 35.150 requires that each service, program, or activity conducted by a public entity, when viewed in its entirety, be readily accessible to and usable by individuals with disabilities. The regulation makes clear, however, that a public entity is not required to make each of its existing facilities accessible (§35.150(a)(1)). Unlike title III of the Act, which requires public accommodations to remove architectural barriers where such removal is ''readily achievable,'' or to provide goods and services through alternative methods, where those methods are ''readily achievable,'' title II requires a public entity to make its programs accessible in all cases, except where to do so would result in a fundamental alteration in the nature of the program or in undue financial and administrative burdens. Congress intended the ''undue burden'' standard in title II to be significantly higher than the ''readily achievable'' standard in title III. Thus, although title II may not require removal of barriers in some cases where removal would be required under title III, the program access requirement of title II should enable individuals with disabilities to participate in and benefit from the services, programs, or activities of public entities in all but the most unusual cases.

Paragraph (a)(2), which establishes a special limitation on the obligation to ensure program accessibility in historic preservation programs, is discussed below in connection with paragraph (b).

Paragraph (a)(3), which is taken from the section 504 regulations for federally conducted programs, generally codifies case law that defines the scope of the public entity's obligation to ensure program accessibility. This paragraph provides that, in meeting the program accessibility requirement, a public entity is not required to take any action that would result in a fundamental alteration in the nature of its service, program, or activity or in undue financial and administrative burdens. A similar limitation is provided in §35.164.

This paragraph does not establish an absolute defense; it does not relieve a public entity of all obligations to individuals with disabilities. Although a public entity is not required to take actions that would result in a fundamental alteration in the nature of a service, program, or activity or in undue financial and administrative burdens, it nevertheless must take any other steps necessary to ensure that individuals with disabilities receive the benefits or services provided by the public entity.

It is the Department's view that compliance with §35.150(a), like compliance with the corresponding provisions of the section 504 regulations for federally conducted programs, would in most cases not result in undue financial and administrative burdens on a public entity. In determining whether financial and administrative burdens are undue, all public entity resources available for use in the funding and operation of the service, program, or activity should be considered. The burden of proving that compliance with paragraph (a) of §35.150 would fundamentally alter the nature of a service, program, or activity or would result in undue financial and administrative burdens rests with the public entity.

The decision that compliance would result in such alteration or burdens must be made by the head of the public entity or his or her designee and must be accompanied by a written statement of the reasons for reaching that conclusion. The Department recognizes the difficulty of identifying the official responsible for this determination, given the variety of organizational forms that may be taken by public entities and their components. The intention of this paragraph is that the determination must be made by a high level official, no lower than a Department head, having budgetary authority and responsibility for making spending decisions.

Any person who believes that he or she or any specific class of persons has been injured by the public entity head's decision or failure to make a decision may file a complaint under the compliance procedures established in subpart F.

Paragraph (b)(1) sets forth a number of means by which program accessibility may be achieved, including redesign of equipment, reassignment of services to accessible buildings, and provision of aides.

The Department wishes to clarify that, consistent with longstanding interpretation of section 504, carrying an individual with a disability is considered an ineffective and therefore an unacceptable method for achieving program accessibility. Department of Health, Education, and Welfare, Office of Civil Rights, Policy Interpretation No. 4, 43 FR 36035 (August 14, 1978). Carrying will be permitted only in manifestly exceptional cases, and only if all personnel who are permitted to participate in carrying an individual with a disability are formally instructed on the safest and least humiliating means of carrying. ''Manifestly exceptional'' cases in which carrying would be permitted

might include, for example, programs conducted in unique facilities, such as an oceanographic vessel, for which structural changes and devices necessary to adapt the facility for use by individuals with mobility impairments are unavailable or prohibitively expensive. Carrying is not permitted as an alternative to structural modifications such as installation of a ramp or a chairlift.

In choosing among methods, the public entity shall give priority consideration to those that will be consistent with provision of services in the most integrated setting appropriate to the needs of individuals with disabilities. Structural changes in existing facilities are required only when there is no other feasible way to make the public entity's program accessible. (It should be noted that ''structural changes'' include all physical changes to a facility; the term does not refer only to changes to structural features, such as removal of or alteration to a load-bearing structural member.) The requirements of §35.151 for alterations apply to structural changes undertaken to comply with this section. The public entity may comply with the program accessibility requirement by delivering services at alternate accessible sites or making home visits as appropriate.

Historic Preservation Programs

In order to avoid possible conflict between the congressional mandates to preserve historic properties, on the one hand, and to eliminate discrimination against individuals with disabilities on the other, paragraph (a)(2) provides that a public entity is not required to take any action that would threaten or destroy the historic significance of an historic property. The special limitation on program accessibility set forth in paragraph (a)(2) is applicable only to historic preservation programs, as defined in §35.104, that is, programs that have preservation of historic properties as a primary purpose. Narrow application of the special limitation is justified because of the inherent flexibility of the program accessibility requirement. Where historic preservation is not a primary purpose of the program, the public entity is not required to use a particular facility. It can relocate all or part of its program to an accessible facility, make home visits, or use other standard methods of achieving program accessibility without making structural alterations that might threaten or destroy significant historic features of the historic property. Thus, government programs located in historic properties, such as an historic State capitol, are not excused from the requirement for program access.

Paragraph (a)(2), therefore, will apply only to those programs that uniquely concern the preservation and experience of the historic property itself. Because the primary benefit of an historic preservation program is the experience of the historic property, paragraph (b)(2) requires the public entity to give priority to methods of providing program accessibility that permit individuals with disabilities to have physical access to the historic property. This priority on physical access may also be viewed as a specific application of the general requirement that the public entity administer programs in the most integrated setting appropriate to the needs of qualified individuals with disabilities (§35.130(d)). Only when providing physical access would threaten or destroy the historic significance of an historic property, or would result in a fundamental alteration in the nature of the program or in undue financial and administrative burdens, may the public entity adopt alternative methods for providing program accessibility that do not ensure physical access. Examples of some alternative methods are provided in paragraph (b)(2).

Time Periods

Paragraphs (c) and (d) establish time periods for complying with the program accessibility requirement. Like the regulations for federally assisted programs (e.g., 28 CFR 41.57(b)), paragraph (c) requires the public entity to make any necessary structural changes in facilities as soon as practicable, but in no event later than three years after the effective date of this regulation.

The proposed rule provided that, aside from structural changes, all other necessary steps to achieve compliance with this part must be taken within sixty days. The sixty day period was taken from regulations implementing section 504, which generally were effective no more than thirty days after publication. Because this regulation will not be effective until January 26, 1992, the Department has concluded that no additional transition period for non-structural changes is necessary, so the sixty day period has been omitted in the final rule. Of course, this section does not reduce or eliminate any obligations that are already applicable to a public entity under section 504.

Where structural modifications are required, paragraph (d) requires that a transition plan be developed by an entity that employs 50 or more persons, within six months of the effective date of this regulation. The legislative history of title II of the ADA makes it clear that, under title II, ''local and state governments are required to provide curb cuts on public streets.'' Education and Labor report at 84. As the rationale for the provision of curb cuts, the House report explains, ''The employment, transportation, and public accommodation sections of * * * (the ADA) would be meaningless if people who use wheelchairs were not afforded the opportunity to travel on and between the

streets.'' Id. Section 35.151(e), which establishes accessibility requirements for new construction and alterations, requires that all newly constructed or altered streets, roads, or highways must contain curb ramps or other sloped areas at any intersection having curbs or other barriers to entry from a street level pedestrian walkway, and all newly constructed or altered street level pedestrian walkways must have curb ramps or other sloped areas at intersections to streets, roads, or highways. A new paragraph (d)(2) has been added to the final rule to clarify the application of the general requirement for program accessibility to the provision of curb cuts at existing crosswalks. This paragraph requires that the transition plan include a schedule for providing curb ramps or other sloped areas at existing pedestrian walkways, giving priority to walkways serving entities covered by the Act, including State and local government offices and facilities, transportation, public accommodations, and employers, followed by walkways serving other areas. Pedestrian ''walkways'' include locations where access is required for use of public transportation, such as bus stops that are not located at intersections or crosswalks.

Similarly, a public entity should provide an adequate number of accessible parking spaces in existing parking lots or garages over which it has jurisdiction.

Paragraph (d)(3) provides that, if a public entity has already completed a transition plan required by a regulation implementing section 504, the transition plan required by this part will apply only to those policies and practices that were not covered by the previous transition plan. Some commenters suggested that the transition plan should include all aspects of the public entity's operations, including those that may have been covered by a previous transition plan under section 504. The Department believes that such a duplicative requirement would be inappropriate. Many public entities may find, however, that it will be simpler to include all of their operations in the transition plan than to attempt to identify and exclude specifically those that were addressed in a previous plan. Of course, entities covered under section 504 are not shielded from their obligations under that statute merely because they are included under the transition plan developed under this section.

Section 35.151 New Construction and Alterations

Section 35.151 provides that those buildings that are constructed or altered by, on behalf of, or for the use of a public entity shall be designed, constructed, or altered to be readily accessible to and usable by individuals with disabilities if the construction was commenced after the effective date of this part. Facilities under design on that date will be governed by this section if the date that bids were invited falls after the effective date. This interpretation is consistent with Federal practice under section 504.

Section 35.151(c) establishes two standards for accessible new construction and alteration. Under paragraph (c), design, construction, or alteration of facilities in conformance with the Uniform Federal Accessibility Standards (UFAS) or with the Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (hereinafter ADAAG) shall be deemed to comply with the requirements of this section with respect to those facilities except that, if ADAAG is chosen, the elevator exemption contained at §§36.401(d) and 36.404 does not apply. ADAAG is the standard for private buildings and was issued as guidelines by the Architectural and Transportation Barriers Compliance Board (ATBCB) under title III of the ADA. It has been adopted by the Department of Justice and is published as appendix A to the Department's title III rule in today's FEDERAL REGISTER. Departures from particular requirements of these standards by the use of other methods shall be permitted when it is clearly evident that equivalent access to the facility or part of the facility is thereby provided. Use of two standards is a departure from the proposed rule.

The proposed rule adopted UFAS as the only interim accessibility standard because that standard was referenced by the regulations implementing section 504 of the Rehabilitation Act promulgated by most Federal funding agencies. It is, therefore, familiar to many State and local government entities subject to this rule. The Department, however, received many comments objecting to the adoption of UFAS. Commenters pointed out that, except for the elevator exemption, UFAS is not as stringent as ADAAG. Others suggested that the standard should be the same to lessen confusion.

Section 204(b) of the Act states that title II regulations must be consistent not only with section 504 regulations but also with ''this Act.'' Based on this provision, the Department has determined that a public entity should be entitled to choose to comply either with ADAAG or UFAS.

Public entities who choose to follow ADAAG, however, are not entitled to the elevator exemption contained in title III of the Act and implemented in the title III regulation at §36.401(d) for new construction and §36.404 for alterations. Section 303(b) of title III states that, with some exceptions, elevators are not required in facilities that are less than three stories or have less than 3000 square feet per story. The section 504 standard, UFAS, contains no such exemption. Section 501 of the ADA makes clear that nothing in the Act may be construed to apply a lesser

standard to public entities than the standards applied under section 504. Because permitting the elevator exemption would clearly result in application of a lesser standard than that applied under section 504, paragraph (c) states that the elevator exemption does not apply when public entities choose to follow ADAAG. Thus, a two-story courthouse, whether built according to UFAS or ADAAG, must be constructed with an elevator. It should be noted that Congress did not include an elevator exemption for public transit facilities covered by subtitle B of title II, which covers public transportation provided by public entities, providing further evidence that Congress intended that public buildings have elevators.

Section 504 of the ADA requires the ATBCB to issue supplemental Minimum Guidelines and Requirements for Accessible Design of buildings and facilities subject to the Act, including title II. Section 204(c) of the ADA provides that the Attorney General shall promulgate regulations implementing title II that are consistent with the ATBCB's ADA guidelines. The ATBCB has announced its intention to issue title II guidelines in the future. The Department anticipates that, after the ATBCB's title II guidelines have been published, this rule will be amended to adopt new accessibility standards consistent with the ATBCB's rulemaking. Until that time, however, public entities will have a choice of following UFAS or ADAAG, without the elevator exemption.

Existing buildings leased by the public entity after the effective date of this part are not required by the regulation to meet accessibility standards simply by virtue of being leased. They are subject, however, to the program accessibility standard for existing facilities in §35.150. To the extent the buildings are newly constructed or altered, they must also meet the new construction and alteration requirements of §35.151.

The Department received many comments urging that the Department require that public entities lease only accessible buildings. Federal practice under section 504 has always treated newly leased buildings as subject to the existing facility program accessibility standard. Section 204(b) of the Act states that, in the area of ''program accessibility, existing facilities,'' the title II regulations must be consistent with section 504 regulations. Thus, the Department has adopted the section 504 principles for these types of leased buildings. Unlike the construction of new buildings where architectural barriers can be avoided at little or no cost, the application of new construction standards to an existing building being leased raises the same prospect of retrofitting buildings as the use of an existing Federal facility, and the same program accessibility standard should apply to both owned and leased existing buildings. Similarly, requiring that public entities only lease accessible space would significantly restrict the options of State and local governments in seeking leased space, which would be particularly burdensome in rural or sparsely populated areas.

On the other hand, the more accessible the leased space is, the fewer structural modifications will be required in the future for particular employees whose disabilities may necessitate barrier removal as a reasonable accommodation. Pursuant to the requirements for leased buildings contained in the Minimum Guidelines and Requirements for Accessible Design published under the Architectural Barriers Act by the ATBCB, 36 CFR 1190.34, the Federal Government may not lease a building unless it contains (1) One accessible route from an accessible entrance to those areas in which the principal activities for which the building is leased are conducted, (2) accessible toilet facilities, and (3) accessible parking facilities, if a parking area is included within the lease (36 CFR 1190.34). Although these requirements are not applicable to buildings leased by public entities covered by this regulation, such entities are encouraged to look for the most accessible space available to lease and to attempt to find space complying at least with these minimum Federal requirements.

Section 35.151(d) gives effect to the intent of Congress, expressed in section 504(c) of the Act, that this part recognize the national interest in preserving significant historic structures. Commenters criticized the Department's use of descriptive terms in the proposed rule that are different from those used in the ADA to describe eligible historic properties. In addition, some commenters criticized the Department's decision to use the concept of ''substantially impairing'' the historic features of a property, which is a concept employed in regulations implementing section 504 of the Rehabilitation Act of 1973. Those commenters recommended that the Department adopt the criteria of ''adverse effect'' published by the Advisory Council on Historic Preservation under the National Historic Preservation Act, 36 CFR 800.9, as the standard for determining whether an historic property may be altered.

The Department agrees with these comments to the extent that they suggest that the language of the rule should conform to the language employed by Congress in the ADA. A definition of ''historic property,'' drawn from section 504 of the ADA, has been added to §35.104 to clarify that the term applies to those properties listed or eligible for listing in the National Register of Historic Places, or properties designated as historic under State or local law.

The Department intends that the exception created by this section be applied only in those very rare situations in which it is not possible to provide access to an historic

property using the special access provisions established by UFAS and ADAAG. Therefore, paragraph (d)(1) of §35.151 has been revised to clearly state that alterations to historic properties shall comply, to the maximum extent feasible, with section 4.1.7 of UFAS or section 4.1.7 of ADAAG. Paragraph (d)(2) has been revised to provide that, if it has been determined under the procedures established in UFAS and ADAAG that it is not feasible to provide physical access to an historic property in a manner that will not threaten or destroy the historic significance of the property, alternative methods of access shall be provided pursuant to the requirements of §35.150.

In response to comments, the Department has added to the final rule a new paragraph (e) setting out the requirements of §36.151 as applied to curb ramps. Paragraph (e) is taken from the statement contained in the preamble to the proposed rule that all newly constructed or altered streets, roads, and highways must contain curb ramps at any intersection having curbs or other barriers to entry from a street level pedestrian walkway, and that all newly constructed or altered street level pedestrian walkways must have curb ramps at intersections to streets, roads, or highways.

Subpart E—Communications

Section 35.160 General

Section 35.160 requires the public entity to take such steps as may be necessary to ensure that communications with applicants, participants, and members of the public with disabilities are as effective as communications with others.

Paragraph (b)(1) requires the public entity to furnish appropriate auxiliary aids and services when necessary to afford an individual with a disability an equal opportunity to participate in, and enjoy the benefits of, the public entity's service, program, or activity. The public entity must provide an opportunity for individuals with disabilities to request the auxiliary aids and services of their choice. This expressed choice shall be given primary consideration by the public entity (§35.160(b)(2)). The public entity shall honor the choice unless it can demonstrate that another effective means of communication exists or that use of the means chosen would not be required under §35.164.

Deference to the request of the individual with a disability is desirable because of the range of disabilities, the variety of auxiliary aids and services, and different circumstances requiring effective communication. For instance, some courtrooms are now equipped for ''computer-assisted transcripts,'' which allow virtually instantaneous transcripts of courtroom argument and testimony to appear on displays. Such a system might be an effective auxiliary aid or service for a person who is deaf or has a hearing loss who uses speech to communicate, but may be useless for someone who uses sign language.

Although in some circumstances a notepad and written materials may be sufficient to permit effective communication, in other circumstances they may not be sufficient. For example, a qualified interpreter may be necessary when the information being communicated is complex, or is exchanged for a lengthy period of time. Generally, factors to be considered in determining whether an interpreter is required include the context in which the communication is taking place, the number of people involved, and the importance of the communication.

Several commenters asked that the rule clarify that the provision of readers is sometimes necessary to ensure access to a public entity's services, programs or activities. Reading devices or readers should be provided when necessary for equal participation and opportunity to benefit from any governmental service, program, or activity, such as reviewing public documents, examining demonstrative evidence, and filling out voter registration forms or forms needed to receive public benefits. The importance of providing qualified readers for examinations administered by public entities is discussed under §35.130. Reading devices and readers are appropriate auxiliary aids and services where necessary to permit an individual with a disability to participate in or benefit from a service, program, or activity.

Section 35.160(b)(2) of the proposed rule, which provided that a public entity need not furnish individually prescribed devices, readers for personal use or study, or other devices of a personal nature, has been deleted in favor of a new section in the final rule on personal devices and services (see §35.135).

In response to comments, the term ''auxiliary aids and services'' is used in place of ''auxiliary aids'' in the final rule. This phrase better reflects the range of aids and services that may be required under this section.

A number of comments raised questions about the extent of a public entity's obligation to provide access to television programming for persons with hearing impairments. Television and videotape programming produced by public entities are covered by this section. Access to audio portions of such programming may be provided by closed captioning.

Section 35.161 Telecommunication Devices for the Deaf (TDD's)

Section 35.161 requires that, where a public entity communicates with applicants and beneficiaries by telephone, TDD's or equally effective telecommunication systems be used to communicate with individuals with impaired speech or hearing.

Problems arise when a public entity which does not have a TDD needs to communicate with an individual who uses a TDD or vice versa. Title IV of the ADA addresses this problem by requiring establishment of telephone relay services to permit communications between individuals who communicate by TDD and individuals who communicate by the telephone alone. The relay services required by title IV would involve a relay operator using both a standard telephone and a TDD to type the voice messages to the TDD user and read the TDD messages to the standard telephone user.

Section 204(b) of the ADA requires that the regulation implementing title II with respect to communications be consistent with the Department's regulation implementing section 504 for its federally conducted programs and activities at 28 CFR part 39. Section 35.161, which is taken from §39.160(a)(2) of that regulation, requires the use of TDD's or equally effective telecommunication systems for communication with people who use TDD's. Of course, where relay services, such as those required by title IV of the ADA are available, a public entity may use those services to meet the requirements of this section.

Many commenters were concerned that public entities should not rely heavily on the establishment of relay services. The commenters explained that while relay services would be of vast benefit to both public entities and individuals who use TDD's, the services are not sufficient to provide access to all telephone services. First, relay systems do not provide effective access to the increasingly popular automated systems that require the caller to respond by pushing a button on a touch tone phone. Second, relay systems cannot operate fast enough to convey messages on answering machines, or to permit a TDD user to leave a recorded message. Third, communication through relay systems may not be appropriate in cases of crisis lines pertaining to rape, domestic violence, child abuse, and drugs. The Department believes that it is more appropriate for the Federal Communications Commission to address these issues in its rulemaking under title IV.

Some commenters requested that those entities with frequent contacts with clients who use TDD's have on-site TDD's to provide for direct communication between the entity and the individual. The Department encourages those entities that have extensive telephone contact with the public such as city halls, public libraries, and public aid offices, to have TDD's to insure more immediate access. Where the provision of telephone service is a major function of the entity, TDD's should be available.

Section 35.162 Telephone Emergency Services

Many public entities provide telephone emergency services by which individuals can seek immediate assistance from police, fire, ambulance, and other emergency services. These telephone emergency services—including ''911'' services—are clearly an important public service whose reliability can be a matter of life or death. The legislative history of title II specifically reflects congressional intent that public entities must ensure that telephone emergency services, including 911 services, be accessible to persons with impaired hearing and speech through telecommunication technology (Conference report at 67; Education and Labor report at 84–85).

Proposed §35.162 mandated that public entities provide emergency telephone services to persons with disabilities that are ''functionally equivalent'' to voice services provided to others. Many commenters urged the Department to revise the section to make clear that direct access to telephone emergency services is required by title II of the ADA as indicated by the legislative history (Conference report at 67–68; Education and Labor report at 85). In response, the final rule mandates ''direct access,'' instead of ''access that is functionally equivalent'' to that provided to all other telephone users. Telephone emergency access through a third party or through a relay service would not satisfy the requirement for direct access.

Several commenters asked about a separate seven-digit emergency call number for the 911 services. The requirement for direct access disallows the use of a separate seven-digit number where 911 service is available. Separate seven-digit emergency call numbers would be unfamiliar to many individuals and also more burdensome to use. A standard emergency 911 number is easier to remember and would save valuable time spent in searching in telephone books for a local seven-digit emergency number.

Many commenters requested the establishment of minimum standards of service (e.g., the quantity and location of TDD's and computer modems needed in a given emergency center). Instead of establishing these scoping requirements, the Department has established a performance standard through the mandate for direct access.

Section 35.162 requires public entities to take appropriate steps, including equipping their emergency systems with modern technology, as may be necessary to promptly receive and respond to a call from users of TDD's and computer modems. Entities are allowed the flexibility to determine what is the appropriate technology for their particular needs. In order to avoid mandating

use of particular technologies that may become outdated, the Department has eliminated the references to the Baudot and ASCII formats in the proposed rule.

Some commenters requested that the section require the installation of a voice amplification device on the handset of the dispatcher's telephone to amplify the dispatcher's voice. In an emergency, a person who has a hearing loss may be using a telephone that does not have an amplification device. Installation of speech amplification devices on the handsets of the dispatchers' telephones would respond to that situation. The Department encourages their use.

Several commenters emphasized the need for proper maintenance of TDD's used in telephone emergency services. Section 35.133, which mandates maintenance of accessible features, requires public entities to maintain in operable working condition TDD's and other devices that provide direct access to the emergency system.

Section 35.163 Information and Signage

Section 35.163(a) requires the public entity to provide information to individuals with disabilities concerning accessible services, activities, and facilities. Paragraph (b) requires the public entity to provide signage at all inaccessible entrances to each of its facilities that directs users to an accessible entrance or to a location with information about accessible facilities.

Several commenters requested that, where TDD-equipped pay phones or portable TDD's exist, clear signage should be posted indicating the location of the TDD. The Department believes that this is required by paragraph (a). In addition, the Department recommends that, in large buildings that house TDD's, directional signage indicating the location of available TDD's should be placed adjacent to banks of telephones that do not contain a TDD.

Section 35.164 Duties

Section 35.164, like paragraph (a)(3) of §35.150, is taken from the section 504 regulations for federally conducted programs. Like paragraph (a)(3), it limits the obligation of the public entity to ensure effective communication in accordance with *Davis* and the circuit court opinions interpreting it. It also includes specific requirements for determining the existence of undue financial and administrative burdens. The preamble discussion of §35.150(a) regarding that determination is applicable to this section and further explains the public entity's obligation to comply with §§35.160–35.164. Because of the essential nature of the services provided by telephone emergency systems, the Department assumes that §35.164 will rarely be applied to §35.162.

Subpart F—Compliance Procedures

Subpart F sets out the procedures for administrative enforcement of this part. Section 203 of the Act provides that the remedies, procedures, and rights set forth in section 505 of the Rehabilitation Act of 1973 (29 U.S.C. 794a) for enforcement of section 504 of the Rehabilitation Act, which prohibits discrimination on the basis of handicap in programs and activities that receive Federal financial assistance, shall be the remedies, procedures, and rights for enforcement of title II. Section 505, in turn, incorporates by reference the remedies, procedures, and rights set forth in title VI of the Civil Rights Act of 1964 (42 U.S.C. 2000d to 2000d–4a). Title VI, which prohibits discrimination on the basis of race, color, or national origin in federally assisted programs, is enforced by the Federal agencies that provide the Federal financial assistance to the covered programs and activities in question. If voluntary compliance cannot be achieved, Federal agencies enforce title VI either by the termination of Federal funds to a program that is found to discriminate, following an administrative hearing, or by a referral to this Department for judicial enforcement.

Title II of the ADA extended the requirements of section 504 to all services, programs, and activities of State and local governments, not only those that receive Federal financial assistance. The House Committee on Education and Labor explained the enforcement provisions as follows:

It is the Committee's intent that administrative enforcement of section 202 of the legislation should closely parallel the Federal government's experience with section 504 of the Rehabilitation Act of 1973. The Attorney General should use section 504 enforcement procedures and the Department's coordination role under Executive Order 12250 as models for regulation in this area.

The Committee envisions that the Department of Justice will identify appropriate Federal agencies to oversee compliance activities for State and local governments. As with section 504, these Federal agencies, including the Department of Justice, will receive, investigate, and where possible, resolve complaints of discrimination. If a Federal agency is unable to resolve a complaint by voluntary means, * * * the major enforcement sanction for the Federal government will be referral of cases by these Federal agencies to the Department of Justice.

The Department of Justice may then proceed to file suits in Federal district court. As with section 504, there is also a private right of action for persons with disabilities, which includes the full panoply of remedies. Again, consistent with section 504, it is not the

Committee's intent that persons with disabilities need to exhaust Federal administrative remedies before exercising their private right of action.

Education & Labor report at 98. See also S. Rep. No. 116, 101st Cong., 1st Sess., at 57–58 (1989).

Subpart F effectuates the congressional intent by deferring to section 504 procedures where those procedures are applicable, that is, where a Federal agency has jurisdiction under section 504 by virtue of its provision of Federal financial assistance to the program or activity in which the discrimination is alleged to have occurred. Deferral to the 504 procedures also makes the sanction of fund termination available where necessary to achieve compliance. Because the Civil Rights Restoration Act (Pub. L. 100–259) extended the application of section 504 to all of the operations of the public entity receiving the Federal financial assistance, many activities of State and local governments are already covered by section 504. The procedures in subpart F apply to complaints concerning services, programs, and activities of public entities that are covered by the ADA.

Subpart G designates the Federal agencies responsible for enforcing the ADA with respect to specific components of State and local government. It does not, however, displace existing jurisdiction under section 504 of the various funding agencies. Individuals may still file discrimination complaints against recipients of Federal financial assistance with the agencies that provide that assistance, and the funding agencies will continue to process those complaints under their existing procedures for enforcing section 504. The substantive standards adopted in this part for title II of the ADA are generally the same as those required under section 504 for federally assisted programs, and public entities covered by the ADA are also covered by the requirements of section 504 to the extent that they receive Federal financial assistance. To the extent that title II provides greater protection to the rights of individuals with disabilities, however, the funding agencies will also apply the substantive requirements established under title II and this part in processing complaints covered by both this part and section 504, except that fund termination procedures may be used only for violations of section 504.

Subpart F establishes the procedures to be followed by the agencies designated in subpart G for processing complaints against State and local government entities when the designated agency does not have jurisdiction under section 504.

Section 35.170 Complaints

Section 35.170 provides that any individual who believes that he or she or a specific class of individuals has been subjected to discrimination on the basis of disability by a public entity may, by himself or herself or by an authorized representative, file a complaint under this part within 180 days of the date of the alleged discrimination, unless the time for filing is extended by the agency for good cause. Although §35.107 requires public entities that employ 50 or more persons to establish grievance procedures for resolution of complaints, exhaustion of those procedures is not a prerequisite to filing a complaint under this section. If a complainant chooses to follow the public entity's grievance procedures, however, any resulting delay may be considered good cause for extending the time allowed for filing a complaint under this part.

Filing the complaint with any Federal agency will satisfy the requirement for timely filing. As explained below, a complaint filed with an agency that has jurisdiction under section 504 will be processed under the agency's procedures for enforcing section 504.

Some commenters objected to the complexity of allowing complaints to be filed with different agencies. The multiplicity of enforcement jurisdiction is the result of following the statutorily mandated enforcement scheme. The Department has, however, attempted to simplify procedures for complainants by making the Federal agency that receives the complaint responsible for referring it to an appropriate agency.

The Department has also added a new paragraph (c) to this section providing that a complaint may be filed with any agency designated under subpart G of this part, or with any agency that provides funding to the public entity that is the subject of the complaint, or with the Department of Justice. Under §35.171(a)(2), the Department of Justice will refer complaints for which it does not have jurisdiction under section 504 to an agency that does have jurisdiction under section 504, or to the agency designated under subpart G as responsible for complaints filed against the public entity that is the subject of the complaint or in the case of an employment complaint that is also subject to title I of the Act, to the Equal Employment Opportunity Commission. Complaints filed with the Department of Justice may be sent to the Coordination and Review Section, P.O. Box 66118, Civil Rights Division, U.S. Department of Justice, Washington, DC 20035–6118.

Section 35.171 Acceptance of Complaints

Section 35.171 establishes procedures for determining jurisdiction and responsibility for processing complaints against public entities. The final rule provides complainants an opportunity to file with the Federal funding agency of their choice. If that agency does not have jurisdiction under section 504, however, and is not the agency designated

under subpart G as responsible for that public entity, the agency must refer the complaint to the Department of Justice, which will be responsible for referring it either to an agency that does have jurisdiction under section 504 or to the appropriate designated agency, or in the case of an employment complaint that is also subject to title I of the Act, to the Equal Employment Opportunity Commission.

Whenever an agency receives a complaint over which it has jurisdiction under section 504, it will process the complaint under its section 504 procedures. When the agency designated under subpart G receives a complaint for which it does not have jurisdiction under section 504, it will treat the complaint as an ADA complaint under the procedures established in this subpart.

Section 35.171 also describes agency responsibilities for the processing of employment complaints. As described in connection with §35.140, additional procedures regarding the coordination of employment complaints will be established in a coordination regulation issued by DOJ and EEOC. Agencies with jurisdiction under section 504 for complaints alleging employment discrimination also covered by title I will follow the procedures established by the coordination regulation for those complaints. Complaints covered by title I but not section 504 will be referred to the EEOC, and complaints covered by this part but not title I will be processed under the procedures in this part.

Section 35.172 Resolution of Complaints

Section 35.172 requires the designated agency to either resolve the complaint or issue to the complainant and the public entity a Letter of Findings containing findings of fact and conclusions of law and a description of a remedy for each violation found.

The Act requires the Department of Justice to establish administrative procedures for resolution of complaints, but does not require complainants to exhaust these administrative remedies. The Committee Reports make clear that Congress intended to provide a private right of action with the full panoply of remedies for individual victims of discrimination. Because the Act does not require exhaustion of administrative remedies, the complainant may elect to proceed with a private suit at any time.

Section 35.173 Voluntary Compliance Agreements

Section 35.173 requires the agency to attempt to resolve all complaints in which it finds noncompliance through voluntary compliance agreements enforceable by the Attorney General.

Section 35.174 Referral

Section 35.174 provides for referral of the matter to the Department of Justice if the agency is unable to obtain voluntary compliance.

Section 35.175 Attorney's Fees

Section 35.175 states that courts are authorized to award attorneys fees, including litigation expenses and costs, as provided in section 505 of the Act. Litigation expenses include items such as expert witness fees, travel expenses, etc. The Judiciary Committee Report specifies that such items are included under the rubric of ''attorneys fees'' and not ''costs'' so that such expenses will be assessed against a plaintiff only under the standard set forth in *Christiansburg Garment Co.* v. *Equal Employment Opportunity Commission,* 434 U.S. 412 (1978). (Judiciary report at 73.)

Section 35.176 Alternative Means of Dispute Resolution

Section 35.176 restates section 513 of the Act, which encourages use of alternative means of dispute resolution.

Section 35.177 Effect of Unavailability of Technical Assistance

Section 35.177 explains that, as provided in section 506(e) of the Act, a public entity is not excused from compliance with the requirements of this part because of any failure to receive technical assistance.

Section 35.178 State Immunity

Section 35.178 restates the provision of section 502 of the Act that a State is not immune under the eleventh amendment to the Constitution of the United States from an action in Federal or State court for violations of the Act, and that the same remedies are available for any such violations as are available in an action against an entity other than a State.

Subpart G—Designated Agencies

Section 35.190 Designated Agencies

Subpart G designates the Federal agencies responsible for investigating complaints under this part. At least 26 agencies currently administer programs of Federal financial assistance that are subject to the nondiscrimination requirements of section 504 as well as other civil rights statutes. A majority of these agencies administer modest programs of Federal financial assistance and/or devote minimal resources exclusively to ''external'' civil rights enforcement activities. Under Executive Order 12250, the Department of Justice has encouraged the use of delegation agreements under which certain civil rights compliance responsibilities

for a class of recipients funded by more than one agency are delegated by an agency or agencies to a ''lead'' agency. For example, many agencies that fund institutions of higher education have signed agreements that designate the Department of Education as the ''lead'' agency for this class of recipients.

The use of delegation agreements reduces overlap and duplication of effort, and thereby strengthens overall civil rights enforcement. However, the use of these agreements to date generally has been limited to education and health care recipients. These classes of recipients are funded by numerous agencies and the logical connection to a lead agency is clear (e.g., the Department of Education for colleges and universities, and the Department of Health and Human Services for hospitals).

The ADA's expanded coverage of State and local government operations further complicates the process of establishing Federal agency jurisdiction for the purpose of investigating complaints of discrimination on the basis of disability. Because all operations of public entities now are covered irrespective of the presence or absence of Federal financial assistance, many additional State and local government functions and organizations now are subject to Federal jurisdiction. In some cases, there is no historical or single clear-cut subject matter relationship with a Federal agency as was the case in the education example described above. Further, the 33,000 governmental jurisdictions subject to the ADA differ greatly in their organization, making a detailed and workable division of Federal agency jurisdiction by individual State, county, or municipal entity unrealistic.

This regulation applies the delegation concept to the investigation of complaints of discrimination on the basis of disability by public entities under the ADA. It designates eight agencies, rather than all agencies currently administering programs of Federal financial assistance, as responsible for investigating complaints under this part. These ''designated agencies'' generally have the largest civil rights compliance staffs, the most experience in complaint investigations and disability issues, and broad yet clear subject area responsibilities. This division of responsibilities is made functionally rather than by public entity type or name designation. For example, all entities (regardless of their title) that exercise responsibilities, regulate, or administer services or programs relating to lands and natural resources fall within the jurisdiction of the Department of Interior.

Complaints under this part will be investigated by the designated agency most closely related to the functions exercised by the governmental component against which the complaint is lodged. For example, a complaint against a State medical board, where such a board is a recognizable entity, will be investigated by the Department of Health and Human Services (the designated agency for regulatory activities relating to the provision of health care), even if the board is part of a general umbrella department of planning and regulation (for which the Department of Justice is the designated agency). If two or more agencies have apparent responsibility over a complaint, §35.190(c) provides that the Assistant Attorney General shall determine which one of the agencies shall be the designated agency for purposes of that complaint.

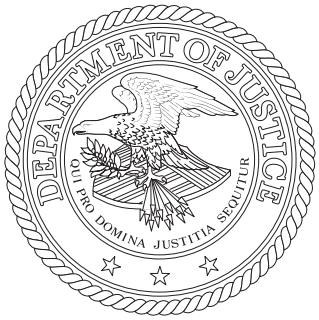
Thirteen commenters, including four proposed designated agencies, addressed the Department of Justice's identification in the proposed regulation of nine ''designated agencies'' to investigate complaints under this part. Most comments addressed the proposed specific delegations to the various individual agencies. The Department of Justice agrees with several commenters who pointed out that responsibility for ''historic and cultural preservation'' functions appropriately belongs with the Department of Interior rather than the Department of Education. The Department of Justice also agrees with the Department of Education that ''museums'' more appropriately should be delegated to the Department of Interior, and that ''preschool and daycare programs'' more appropriately should be assigned to the Department of Health and Human Services, rather than to the Department of Education. The final rule reflects these decisions.

The Department of Commerce opposed its listing as the designated agency for ''commerce and industry, including general economic development, banking and finance, consumer protection, insurance, and small business''. The Department of Commerce cited its lack of a substantial existing section 504 enforcement program and experience with many of the specific functions to be delegated. The Department of Justice accedes to the Department of Commerce's position, and has assigned itself as the designated agency for these functions.

In response to a comment from the Department of Health and Human Services, the regulation's category of ''medical and nursing schools'' has been clarified to read ''schools of medicine, dentistry, nursing, and other health-related fields''. Also in response to a comment from the Department of Health and Human Services, ''correctional institutions'' have been specifically added to the public safety and administration of justice functions assigned to the Department of Justice.

The regulation also assigns the Department of Justice as the designated agency responsible for all State and local government functions not assigned to other designated agencies. The Department of Justice, under an agreement with the Department of the

Treasury, continues to receive and coordinate the investigation of complaints filed under the Revenue Sharing Act. This entitlement program, which was terminated in 1986, provided civil rights compliance jurisdiction for a wide variety of complaints regarding the use of Federal funds to support various general activities of local governments. In the absence of any similar program of Federal financial assistance administered by another Federal agency, placement of designated agency responsibilities for miscellaneous and otherwise undesignated functions with the Department of Justice is an appropriate continuation of current practice.



The Department of Education objected to the proposed rule's inclusion of the functional area of ''arts and humanities'' within its responsibilities, and the Department of Housing and Urban Development objected to its proposed designation as responsible for activities relating to rent control, the real estate industry, and housing code enforcement. The Department has deleted these areas from the lists assigned to the Departments of Education and Housing and Urban Development, respectively, and has added a new paragraph (c) to §35.190, which provides that the Department of Justice may assign responsibility for components of State or local governments that exercise responsibilities, regulate, or administer services, programs, or activities relating to functions not assigned to specific designated agencies by paragraph (b) of this section to other appropriate agencies. The Department believes that this approach will provide more flexibility in determining the appropriate agency for investigation of complaints involving those components of State and local governments not specifically addressed by the listings in paragraph (b). As provided in §§35.170 and 35.171, complaints filed with the Department of Justice will be referred to the appropriate agency.

Several commenters proposed a stronger role for the Department of Justice, especially with respect to the receipt and assignment of complaints, and the overall monitoring of the effectiveness of the enforcement activities of Federal agencies. As discussed above, §§35.170 and 35.171 have been revised to provide for referral of complaints by the Department of Justice to appropriate enforcement agencies. Also, language has been added to §35.190(a) of the final regulation stating that the Assistant Attorney General shall provide policy guidance and interpretations to designated agencies to ensure the consistent and effective implementation of this part.

NOTICE:

The title III regulation was modified by the Pool Extension Final Rule, the ADA Amendments Act Final Rule, and the Movie Captioning and Audio Description Final Rule, which can be found in the Title III Regulation Supplement. This document and the supplement should be read together for the most up-to-date regulation.

Alternatively, the fully updated regulation is available in html.

RIN 1190–AA44

Nondiscrimination on the Basis of Disability by Public Accommodations and in Commercial Facilities

AGENCY: Department of Justice, Civil Rights Division.
ACTION: Final rule.

SUMMARY: This final rule revises the Department of Justice (Department) regulation that implements title III of the Americans with Disabilities Act (ADA), relating to nondiscrimination on the basis of disability by public accommodations and in commercial facilities. The Department is issuing this final rule in order to adopt enforceable accessibility standards under the Americans with Disabilities Act of 1990 (ADA) that are consistent with the minimum guidelines and requirements issued by the Architectural and Transportation Barriers Compliance Board, and to update or amend certain provisions of the title III regulation so that they comport with the Department's legal and practical experiences in enforcing the ADA since 1991. Concurrently with the publication of the final rule for title III, the Department is publishing a final rule amending its ADA title II regulation, which covers nondiscrimination on the basis of disability in State and local government services.

DATES: *Effective Date*: March 15, 2011.

Janet L. Blizard, Deputy Chief, or Christina Galindo-Walsh, Attorney Advisor, Disability Rights Section, Civil Rights Division, U.S. Department of Justice, at (202) 307–0663 (voice or TTY). This is not a toll-free number. Information may also be obtained from the Department's toll-free ADA Information Line at (800) 514–0301 (voice) or (800) 514–0383 (TTY).

This rule is also available in an accessible format on the ADA Home Page at *http://www.ada.gov*. You may obtain copies of this rule in large print or on computer disk by calling the ADA Information Line listed above.

SUPPLEMENTARY INFORMATION:

The Roles of the Access Board and the Department of Justice

The Access Board was established by section 502 of the Rehabilitation Act of 1973. 29 U.S.C. 792. The Board consists of 13 public members appointed by the President, the majority of whom must be individuals with disabilities, and the heads of 12 Federal departments and agencies specified by statute, including the heads of the Department of Justice and the Department of Transportation (DOT). Originally, the Access Board was established to develop and maintain accessibility guidelines for facilities designed, constructed, altered, or leased with Federal dollars under the Architectural Barriers Act of 1968 (ABA). 42 U.S.C. 4151 *et seq.* The passage of the ADA expanded the Access Board's responsibilities.

The ADA requires the Access Board to ''issue minimum guidelines that shall supplement the existing Minimum Guidelines and Requirements for Accessible Design for purposes of subchapters II and III of this chapter * * * to ensure that buildings, facilities, rail passenger cars, and vehicles are accessible, in terms of architecture and design, transportation, and communication, to individuals with disabilities.'' 42 U.S.C. 12204. The ADA requires the Department to issue regulations that include enforceable accessibility standards applicable to facilities subject to title II or title III that are consistent with the ''minimum guidelines'' issued by the Access Board, 42 U.S.C. 12134(c),

12186(c), but vests in the Attorney General sole responsibility for the promulgation of those standards that fall within the Department's jurisdiction and enforcement of the regulations.

The ADA also requires the Department to develop regulations with respect to existing facilities subject to title II (Subtitle A) and title III. How and to what extent the Access Board's guidelines are used with respect to the barrier removal requirement applicable to existing facilities under title III of the ADA and to the provision of program accessibility under title II of the ADA are solely within the discretion of the Department.

Enactment of the ADA and Issuance of the 1991 Regulations

On July 26, 1990, President George H.W. Bush signed into law the ADA, a comprehensive civil rights law prohibiting discrimination on the basis of disability.[1] The ADA broadly protects the rights of individuals with disabilities in employment, access to State and local government services, places of public accommodation, transportation, and other important areas of American life. The ADA also requires newly designed and constructed or altered State and local government facilities, public accommodations, and commercial facilities to be readily accessible to and usable by individuals with disabilities. 42 U.S.C. 12101 *et seq*. Section 306(a) of the ADA directs the Secretary of Transportation to issue regulations for demand responsive or fixed route systems operated by private entities not primarily engaged in the business of transporting people (sections 302(b)(2)(B) and (C)) and for private entities that are primarily engaged in the business of transporting people (section 304). *See* 42 U.S.C. 12182(b), 12184, 12186(a). Section 306(b) directs the Attorney General to promulgate regulations to carry out the provisions of the rest of title III. 42 U.S.C. 12186(b).

Title II applies to State and local government entities, and, in Subtitle A, protects qualified individuals with disabilities from discrimination on the basis of disability in services, programs, and activities provided by State and local government entities. Title II extends the prohibition on discrimination established by section 504 of the Rehabilitation Act of 1973, as amended, 29 U.S.C. 794 (section 504), to all activities of State and local governments regardless of whether these entities receive Federal financial assistance. 42 U.S.C. 12131–65.

Title III, which this rule addresses, prohibits discrimination on the basis of disability in the activities of places of public accommodation (businesses that are generally open to the public and that fall into one of 12 categories listed in the ADA, such as restaurants, movie theaters, schools, day care facilities, recreation facilities, and doctors' offices) and requires newly constructed or altered places of public accommodation—as well as commercial facilities (privately owned, nonresidential facilities such as factories, warehouses, or office buildings)—to comply with the ADA Standards. 42 U.S.C. 12181–89.

On July 26, 1991, the Department issued rules implementing title II and title III, which are codified at 28 CFR part 35 (title II) and part 36 (title III). Appendix A of the 1991 title III regulation, which is republished as Appendix D to 28 CFR part 36, contains the ADA Standards for Accessible Design (1991 Standards), which were based upon the version of the Americans with Disabilities Act Accessibility Guidelines (1991 ADAAG) published by the Access Board on the same date. Under the Department's 1991 title III regulation,

[1] On September 25, 2008, President George W.Bush signed into law the Americans with Disabilities Amendments Act of 2008 (ADA Amendments Act), Public Law 110–325. The ADA Amendments Act amended the ADA definition of disability to clarify its coverage of persons with disabilities and to provide guidance on the application of the definition. This final rule does not contain regulatory language implementing the ADA Amendments Act. The Department intends to publish a supplemental rule to amend the regulatory definition of ''disability'' to implement the changes mandated by that law.

places of public accommodation and commercial facilities currently are required to comply with the 1991 Standards with respect to newly constructed or altered facilities.

The Access Board's publication of the 2004 ADA/ABA Guidelines was the culmination of a long-term effort to facilitate ADA compliance by eliminating, to the extent possible, inconsistencies among Federal accessibility requirements and between Federal accessibility requirements and State and local building codes. In support of this effort, the Department is amending its regulation implementing title III and adopting standards consistent with ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines. The Department is also amending its title II regulation, which prohibits discrimination on the basis of disability in State and local government services, concurrently with the publication of this rule in this issue of the **Federal Register.**

Development of the 2004 ADA/ABA Guidelines

In 1994, the Access Board began the process of updating the 1991 ADAAG by establishing an advisory committee composed of members of the design and construction industry, the building code community, and State and local government entities, as well as individuals with disabilities. In 1998, the Access Board added specific guidelines on State and local government facilities, 63 FR 2000 (Jan. 13, 1998), and building elements designed for use by children, 63 FR 2060 (Jan. 13, 1998). In 1999, based largely on the report and recommendations of the advisory committee, the Access Board issued a notice of proposed rulemaking (NPRM) to update and revise its ADA and ABA Accessibility Guidelines. *See* 64 FR 62248 (Nov. 16, 1999). In 2000, the Access Board added specific guidelines on play areas. *See* 65 FR 62498 (Oct. 18, 2000). The Access Board released an interim draft of its guidelines to the public on April 2, 2002, 67 FR 15509, in order to provide an opportunity for entities with model codes to consider amendments that would promote further harmonization. In September of 2002, the Access Board set forth specific guidelines on recreation facilities. 67 FR 56352 (Sept. 3, 2002).

By the date of its final publication on July 23, 2004, the 2004 ADA/ABA Guidelines had been the subject of extraordinary review and public participation. The Access Board received more than 2,500 comments from individuals with disabilities, affected industries, State and local governments, and others. The Access Board provided further opportunity for participation by holding public hearings.

The Department was involved extensively in the development of the 2004 ADA/ABA Guidelines. As a Federal member of the Access Board, the Attorney General's representative voted to approve the revised guidelines. ADA Chapter 1 and ADA Chapter 2 of the 2004 ADA/ABA Guidelines provide scoping requirements for facilities subject to the ADA; ''scoping'' is a term used in the 2004 ADA/ABA Guidelines to describe requirements that prescribe which elements and spaces—and, in some cases, how many—must comply with the technical specifications. ABA Chapter 1 and ABA Chapter 2 provide scoping requirements for facilities subject to the ABA (*i.e.,* facilities designed, built, altered, or leased with Federal funds). Chapters 3 through 10 of the 2004 ADA/ABA Guidelines provide uniform technical specifications for facilities subject to either the ADA or the ABA. This revised format is designed to eliminate unintended conflicts between the two sets of Federal accessibility standards and to minimize conflicts between the Federal regulations and the model codes that form the basis of many State and local building codes. For the purposes of this final rule, the Department will refer to ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines as the 2004 ADAAG.

These amendments to the 1991 ADAAG have not been adopted previously by the Department as ADA Standards. Through this rule, the Depart-

ment is adopting revised ADA Standards consistent with the 2004 ADAAG, including all of the amendments to the 1991 ADAAG since 1998. For the purposes of this part, the Department's revised standards are entitled ''The 2010 Standards for Accessible Design'' and consist of the 2004 ADAAG and the requirements contained in subpart D of 28 CFR part 36. Because the Department has adopted the 2004 ADAAG as part of its title II and title III regulations, once the Department's final rules become effective, the 2004 ADAAG will have legal effect with respect to the Department's title II and title III regulations and will cease to be mere guidance for those areas regulated by the Department. In 2006, DOT adopted the 2004 ADAAG. With respect to those areas regulated by DOT, these guidelines, as adopted by DOT, have had legal effect since 2006.

Under this regulation, the Department of Justice covers passenger vessels operated by private entities not primarily engaged in the business of transporting people with respect to the provision of goods and services of a public accommodation on the vessel. For example, a vessel operator whose vessel departs from Point A, takes passengers on a recreational trip, and returns passengers to Point A without ever providing for disembarkation at a Point B (*e.g.,* a dinner or harbor cruise, a fishing charter) is a public accommodation operated by a private entity not primarily engaged in the business of transporting people. This regulation covers those aspects of the vessel's operation relating to the use and enjoyment of the public accommodation, including, for example, the boarding process, safety policies, accessible routes on the vessel, and the provision of effective communication. Persons with complaints or concerns about discrimination on the basis of disability by vessel operators who are private entities not primarily engaged in the business of transporting people, or questions about how this regulation applies to such operators and vessels, should contact the Department of Justice.

Vessels operated by private entities primarily engaged in the business of transporting people and that provide the goods and services of a public accommodation are covered by this regulation and the Department of Transportation's passenger vessel rule, 49 CFR part 39. A vessel operator whose vessel takes passengers from Point A to Point B (*e.g.,* a cruise ship that sails from Miami to one or more Caribbean islands, a private ferry boat between two points on either side of a river or bay, a water taxi between two points in an urban area) is most likely a private entity primarily engaged in the business of transporting people. Persons with questions about how this regulation applies to such operators and vessels may contact the Department of Justice or the Department of Transportation for guidance or further information. However, the Department of Justice has enforcement authority for all private entities under title III of the ADA, so individuals with complaints about noncompliance with part 39 should provide those complaints to the Department of Justice.

The provisions of this rule and 49 CFR part 39 are intended to be substantively consistent with one another. Consequently, in interpreting the application of this rule to vessel operators who are private entities not primarily engaged in the business of transporting people, the Department of Justice views the obligations of those vessel operators as being similar to those of private entities primarily engaged in the business of transporting people under the provisions of 49 CFR part 39.

The Department's Rulemaking History

The Department published an advance notice of proposed rulemaking (ANPRM) on September 30, 2004, 69 FR 58768 for two reasons: (1) To begin the process of adopting the 2004 ADAAG by soliciting public input on issues relating to the potential application of the Access Board's revisions once the Department adopts them as revised standards; and (2) to request background information that would assist the Department in preparing a regulatory analysis under the guidance provided in Office of Management and

Budget (OMB) Circular A–4 sections D (Analytical Approaches) and E (Identifying and Measuring Benefits and Costs) (Sept. 17, 2003), available at *http://www.whitehouse.gov/OMB/ circulars/ a004/a-4.pdf* (last visited June 24, 2010). While underscoring that the Department, as a member of the Access Board, already had reviewed comments provided to the Access Board during its development of the 2004 ADAAG, the Department specifically requested public comment on the potential application of the 2004 ADAAG to existing facilities. The extent to which the 2004 ADAAG is used with respect to the barrier removal requirement applicable to existing facilities under title III (as well as with respect to the program access requirement in title II) is within the sole discretion of the Department. The ANPRM dealt with the Department's responsibilities under both title II and title III.

The public response to the ANPRM was substantial. The Department extended the comment deadline by four months at the public's request. 70 FR 2992 (Jan. 19, 2005). By the end of the extended comment period, the Department had received more than 900 comments covering a broad range of issues. Many of the commenters responded to questions posed specifically by the Department, including questions regarding the Department's application of the 2004 ADAAG once adopted by the Department and the Department's regulatory assessment of the costs and benefits of particular elements. Many other commenters addressed areas of desired regulation or of particular concern.

To enhance accessibility strides made since the enactment of the ADA, commenters asked the Department to focus on previously unregulated areas, such as ticketing in assembly areas; reservations for hotel rooms, rental cars, and boat slips; and captioning. They also asked for clarification on some issues in the 1991 regulations, such as the requirements regarding service animals. Other commenters dealt with specific requirements in the 2004 ADAAG or responded to questions regarding elements scoped for the first time in the 2004 ADAAG, including recreation facilities and play areas. Commenters also provided some information on how to assess the cost of elements in small facilities, office buildings, hotels and motels, assembly areas, hospitals and long-term care facilities, residential units, recreation facilities, and play areas. Still other commenters addressed the effective date of the proposed standards, the triggering event by which the effective date is calculated for new construction, and variations on a safe harbor that would excuse elements built in compliance with the 1991 Standards from compliance with the proposed standards.

After careful consideration of the public comments in response to the ANPRM, on June 17, 2008, the Department published an NPRM covering title III. 73 FR 34508. The Department also published an NPRM on that day covering title II. 73 FR 34466. The NPRMs addressed the issues raised in the public's comments to the ANPRM and sought additional comment, generally and in specific areas, such as the Department's adoption of the 2004 ADAAG, the Department's regulatory assessment of the costs and benefits of the rule, its updates and amendments of certain provisions of the existing title II and III regulations, and areas that were in need of additional clarification or specificity.

A public hearing was held on July 15, 2008, in Washington, DC. Forty-five individuals testified in person or by phone. The hearing was streamed live over the Internet. By the end of the 60-day comment period, the Department had received 4,435 comments addressing a broad range of issues, many of which were common to the title II and title III NPRMs, from representatives of businesses and industries, State and local government agencies, disability advocacy organizations, and private individuals.

The Department notes that this rulemaking was unusual in that much of the proposed regulatory text and many of the questions asked across titles II and III were the same. Consequently,

many of the commenters did not provide separate sets of documents for the proposed title II and title III rules, and in many instances, the commenters did not specify which title was being commented upon. As a result, where comments could be read to apply to both titles II and III, the Department included them in the comments and responses for each final rule.

Most of the commenters responded to questions posed specifically by the Department, including what were the most appropriate definitions for terms such as ''wheelchair,'' ''mobility device,'' and ''service animal''; how to quantify various benefits that are difficult to monetize; what requirements to adopt for ticketing and assembly areas; whether to adopt safe harbors for small businesses; and how best to regulate captioning. Some comments addressed specific requirements in the 2004 ADAAG or responded to questions regarding elements scoped for the first time in the 2004 ADAAG, including recreation facilities and play areas. Other comments responded to questions posed by the Department concerning certain specific requirements in the 2004 ADAAG.

Relationship to Other Laws

The Department of Justice regulation implementing title III, 28 CFR 36.103, provides the following:

(a) *Rule of interpretation*. Except as otherwise provided in this part, this part shall not be construed to apply a lesser standard than the standards applied under title V of the Rehabilitation Act of 1973 (29 U.S.C. 791) or the regulations issued by Federal agencies pursuant to that title.

(b) *Section 504*. This part does not affect the obligations of a recipient of Federal financial assistance to comply with the requirements of section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794) and regulations issued by Federal agencies implementing section 504.

(c) *Other laws*. This part does not invalidate or limit the remedies, rights, and procedures of any other Federal, State, or local laws (including State common law) that provide greater or equal protection for the rights of individuals with disabilities or individuals associated with them.

These provisions remain unchanged by the final rule. The Department recognizes that public accommodations subject to title III of the ADA may also be subject to title I of the ADA, which prohibits discrimination on the basis of disability in employment; section 504 of the Rehabilitation Act of 1973 and other Federal statutes that prohibit discrimination on the basis of disability in the programs and activities of recipients of Federal financial assistance; and other Federal statutes such as the Air Carrier Access Act (ACAA), 49 U.S.C. 41705 *et seq.*, and the Fair Housing Act (FHAct), 42 U.S.C. 3601 *et seq*. Compliance with the Department's title II and title III regulations does not ensure compliance with other Federal statutes.

Public accommodations that are subject to the ADA as well as other Federal disability discrimination laws must be aware of the requirements of all applicable laws and must comply with these laws and their implementing regulations. Although in many cases similar provisions of different statutes are interpreted to impose similar requirements, there are circumstances in which similar provisions are applied differently because of the nature of the covered entity or activity, or because of distinctions between the statutes. For example, emotional support animals that do not qualify as service animals under the Department's title III regulations may nevertheless qualify as permitted reasonable accommodations for persons with disabilities under the FHAct and the ACAA. *See, e.g., Overlook Mutual Homes, Inc. v. Spencer,* 666 F. Supp. 2d 850 (S.D. Ohio 2009). Public accommodations that operate housing facilities must ensure that they apply the reasonable accommodation requirements of the FHAct in determining whether to allow a particular animal needed by a person with a disability into housing and may not use the ADA definition as a justification for reducing their FHAct obligations. In addition, nothing

in the ADA prevents a public accommodation subject to one statute from modifying its policies and providing greater access in order to assist individuals with disabilities in achieving access to entities subject to other Federal statutes. For example, a quick service restaurant at an airport is, as a public accommodation, subject to the title III requirements, not to the ACAA requirements. Conversely, an air carrier that flies in and out of the same airport is required to comply with the ACAA, but is not covered by title III of the ADA. If a particular animal is a service animal for purposes of the ACAA and is thus allowed on an airplane, but is not a service animal for purposes of the ADA, nothing in the ADA prohibits an airport restaurant from allowing a ticketed passenger with a disability who is traveling with a service animal that meets the ACAA's definition of a service animal to bring that animal into the facility even though under the ADA's definition of service animal the animal lawfully could be excluded.

Organization of This Rule

Throughout this rule, the original ADA Standards, which are republished as Appendix D to 28 CFR part 36, will be referred to as the ''1991 Standards.'' The original title III regulation, codified at 28 CFR part 36 (2009), will be referred to as the ''1991 regulation'' or the ''1991 title III regulation.'' ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines, 36 CFR part 1191, app. B and D (2009), will be referred to as the ''2004 ADAAG.'' The Department's Notice of Proposed Rulemaking, 73 FR 34508 (June 17, 2008), will be referred to as the ''NPRM.'' As noted above, the 2004 ADAAG, taken together with the requirements contained in subpart D of 28 CFR part 36 (New Construction and Alterations) of the final rule, will be referred to as the ''2010 Standards.'' The amendments made to the 1991 title III regulation and the adoption of the 2004 ADAAG, taken together, will be referred to as the ''final rule.''

In performing the required periodic review of its existing regulation, the Department has reviewed the title III regulation section by section, and, as a result, has made several clarifications and amendments in this rule. Appendix A of the final rule, ''Guidance on Revisions to ADA Regulation on Nondiscrimination on the Basis of Disability by Public Accommodations and Commercial Facilities,'' codified as Appendix A to 28 CFR part 36, provides the Department's response to comments and its explanations of the changes to the regulation. The section entitled ''Section-by-Section Analysis and Response to Comments'' in Appendix A provides a detailed discussion of the changes to the title III regulation. The Section-by-Section Analysis follows the order of the 1991 title III regulation, except that regulatory sections that remain unchanged are not referenced. The discussion within each section explains the changes and the reasoning behind them, as well as the Department's response to related public comments. Subject areas that deal with more than one section of the regulation include references to the related sections, where appropriate. The Section-by-Section Analysis also discusses many of the questions asked by the Department for specific public response. The section of Appendix A entitled ''Other Issues'' discusses public comment on several issues of concern to the Department that were the subject of questions that are not specifically addressed in the Section-by-Section Analysis.

The Department's description of the 2010 Standards, as well as a discussion of the public comments on specific sections of the 2004 ADAAG, is found in Appendix B of this final rule, ''Analysis and Commentary on the 2010 ADA Standards for Accessible Design,'' codified as Appendix B to 28 CFR part 36.

The provisions of this rule generally take effect six months from its publication in the **Federal Register.** The Department has determined, however, that compliance with the requirements related to new construction and alterations and reservations at a place of lodging shall not be

required until 18 months from the publication date of this rule. These exceptions are set forth in §§ 36.406(a) and 36.302(e)(3), respectively, and are discussed in greater detail in Appendix A. *See* discussions in Appendix A entitled ''Section 36.406 Standards for New Construction and Alterations'' and ''Section 36.302(e) Hotel Reservations.''

This final rule only addresses issues that were identified in the NPRM as subjects the Department intended to regulate through this rulemaking proceeding. Because the Department indicated in the NPRM that it did not intend to regulate certain areas, including equipment and furniture, accessible golf cars, and movie captioning and video description, as part of this rulemaking proceeding, the Department believes it would be appropriate to solicit more public comment about these areas prior to making them the subject of a rulemaking. The Department intends to engage in additional rulemaking in the near future addressing accessibility in these areas and others, including next generation 9–1–1 and accessibility of Web sites operated by covered public entities and public accommodations.

ADDITIONAL INFORMATION:

Regulatory Process Matters (SBREFA, Regulatory Flexibility Act, and Executive Orders)

The Department must provide two types of assessments as part of its final rule: An analysis of the costs and benefits of adopting the changes contained in this rule, and a periodic review of its existing regulations to consider their impact on small entities, including small businesses, small nonprofit organizations, and small governmental jurisdictions. *See* E.O. 12866, 58 FR 51735, 3 CFR, 1994 Comp., p. 638, as amended; Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), 5 U.S.C. 610(a); OMB Circular A–4, available at *http://www.whitehouse.gov/OMB/circulars/a004/a-4.pdf* (last visited June 24, 2010); E.O. 13272, 67 FR 53461, 3 CFR, 2003 Comp., p. 247.

In the NPRM, the Department kept open the possibility that, if warranted by public comments received on an issue raised by the 2004 ADAAG or by the results of the Department's Initial Regulatory Impact Analysis (Initial RIA), available at *http://www.ada.gov/NPRM2008/ria.htm*, showing that the likely costs of making a particular feature or facility accessible were disproportionate to the benefits (including both monetized and nonmonetized benefits) to persons with disabilities, the Attorney General, as a member of the Access Board, could return the issue to the Access Board for further consideration. After careful consideration, the Department has determined that it is unnecessary to return any issues to the Access Board for additional consideration.

Executive Order 12866

This rule has been reviewed by the Office of Management and Budget (OMB) under Executive Order 12866. The Department has evaluated its existing regulations for title II and title III section by section, and many of the provisions in the final rule for both titles reflect its efforts to mitigate any negative effects on small entities. A Final Regulatory Impact Analysis (Final RIA or RIA) was prepared by the Department's contractor, HDR|HLB Decision Economics, Inc. (HDR). In accordance with Executive Order 12866, as amended, and OMB Circular A–4, the Department has reviewed and considered the Final RIA and has accepted the results of this analysis as its assessment of the benefits and costs of the final rules.

Executive Order 12866 refers explicitly not only to monetizable costs and benefits but also to ''distributive impacts'' and ''equity,'' *see* E.O. 12866, section 1(a), and it is important to recognize that the ADA is intended to provide important benefits that are distributional and equitable in character. The ADA states, ''[i]t is the purpose

of this [Act] (1) to provide a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities; [and] (2) to provide clear, strong, consistent, enforceable standards addressing discrimination against individuals with disabilities[.]'' 42 U.S.C. 12101(b). Many of the benefits of this rule stem from the provision of such standards, which will promote inclusion, reduce stigma and potential embarrassment, and combat isolation, segregation, and second-class citizenship of individuals with disabilities. Some of these benefits are, in the words of Executive Order 12866, ''difficult to quantify, but nevertheless essential to consider.'' E.O. 12866, section 1(a). The Department has considered such benefits here.

Final Regulatory Impact Analysis

The Final RIA embodies a comprehensive benefit-cost analysis of the final rules for both title II and title III and assesses the incremental benefits and costs of the 2010 Standards relative to a primary baseline scenario (1991 Standards). In addition, the Department conducted additional research and analyses for requirements having the highest negative net present values under the primary baseline scenario. This approach was taken because, while the 1991 Standards are the only uniform set of accessibility standards that apply to public accommodations, commercial facilities, and State and local government facilities nationwide, it is also understood that many State and local jurisdictions have already adopted IBC/ANSI model code provisions that mirror those in the 2004 ADAAG. The assessments based on this approach assume that covered entities currently implementing codes that mirror the 2004 ADAAG will not need to modify their code requirements once the rules are finalized. They also assume that, even without the final rules, the current level of compliance would be unchanged. The Final RIA contains specific information, including data in chart form, detailing which States have already adopted the accessibility standards for this subset of six requirements. The Department believes that the estimates resulting from this approach represent a reasonable upper and lower measure of the likely effects these requirements will have that the Department was able to quantify and monetize.

The Final RIA estimates the benefits and costs for all new (referred to as ''supplemental'') requirements and revised requirements across all types of newly constructed and existing facilities. The Final RIA also incorporates a sophisticated risk analysis process that quantifies the inherent uncertainties in estimating costs and benefits and then assesses (through computer simulations) the relative impact of these factors when varied simultaneously. A copy of the Final RIA will be made available online for public review on the Department's ADA Home Page (*http://www.ada.gov*).

From an economic perspective (as specified in OMB Circular A–B4), the results of the Final RIA demonstrate that the Department's final rules increase social resources and thus represent a public good because monetized benefits exceed monetized costs—that is, the regulations have a positive net present value (NPV). Indeed, under every scenario assessed in the Final RIA, the final rules have a positive NPV. The Final RIA's first scenario examines the incremental impact of the final rules using the ''main'' set of assumptions (*i.e.,* assuming a primary baseline (1991 Standards), that the safe harbor applies, and that for title III entities barrier removal is readily achievable for 50 percent of elements subject to supplemental requirements).

Under this set of assumptions, the final rules have an expected NPV of $9.3 billion (7 percent discount rate) and $40.4 billion (3 percent discount rate). *See* Final RIA, table ES–1 & figure ES–2.

Expected Impact of the Rules[2]
(in billions)

Discount rate	Expected NPV	Total Expected PV (Benefits)	Total Expected PV (Costs)
3%	$40.4	$66.2	$25.8
7%	$9.3	$22.0	$12.8

Water Closet Clearances

The Department gave careful consideration to the costs and benefits of its adoption of the standards relating to water closet clearances in single-user toilet rooms. The primary effect of the Department's proposed final rules governing water closet clearances in single-user toilet rooms with in-swinging and out-swinging doors is to allow sufficient room for ''side'' or ''parallel'' methods of transferring from a wheelchair to a toilet. Under the current 1991 Standards, the requisite clearance space in single-user toilet rooms between and around the toilet and the lavatory does not permit these methods of transfer. Side or parallel transfers are used by large numbers of persons who use wheelchairs and are regularly taught in rehabilitation and occupational therapy. Currently, persons who use side or parallel transfer methods from their wheelchairs are faced with a stark choice at establishments with single-user toilet rooms—*i.e.,* patronize the establishment but run the risk of needing assistance when using the restroom, travel with someone who would be able to provide assistance in toileting, or forgo the visit entirely. The revised water closet clearance regulations would make single-user toilet rooms accessible to all persons who use wheelchairs, not just those with the physical strength, balance, and dexterity and the training to use a front-transfer method. Single-user toilet rooms are located in a wide variety of public and private facilities, including restaurants, fast-food establishments, schools, retail stores, parks, sports stadiums, and hospitals. Final promulgation of these requirements might thus, for example, enable a person who uses a side or parallel transfer method to use the restroom (or use the restroom independently) at his or her local coffee shop for the first time.

Because of the complex nature of its cost-benefit analysis, the Department is providing ''plain language'' descriptions of the benefits calculations for the two revised requirements with the highest estimated total costs: Water closet clearance in single-user toilet rooms with out-swinging doors (RIA Req. #28) (section 604.3 of the 2010 Standards) and water closet clearance in single-user toilet rooms with in-swinging doors (RIA Req. #32) (sections 604.3 and 603.2.3 Exception 2 of the 2010 Standards). Since many of the concepts and calculations in the Final RIA are highly technical, it is hoped that, by providing ''lay'' descriptions of how benefits are monetized for an illustrative set of requirements, the Final RIA will be more transparent and afford readers a more complete understanding of the benefits model generally. Because of the widespread adoption of the water closet clearance standards in existing State and local building codes, the following calculations use the IBC/ANSI baseline.

General description of monetized benefits for water closet clearance in single-user toilet rooms—out-swinging doors (Req. #28). In order to assess monetized benefits for the requirement covering water closet clearances in single-user toilet rooms with out-swinging doors, a determination needed to be made concerning the population of users with disabilities who would

[2] The analysis assumes these regulations will be in force for 15 years. Incremental costs and benefits are calculated for all construction, alterations, and barrier removal that is expected to occur during these 15 years. The analysis also assumes that any new or revised ADA rules enacted 15 years from now will include a safe harbor provision. Thus, any facilities constructed in year 14 of the final rules are assumed to continue to generate benefits to users, and to incur any operating or replacement costs for the life of these buildings, which is assumed to be 40 years.

likely benefit from this revised standard. Based on input received from a panel of experts jointly convened by HDR and the Department to discuss benefits-related estimates and assumptions used in the RIA model, it was assumed that accessibility changes brought about by this requirement would benefit persons with any type of ambulatory (*i.e*., mobility-related) disability, such as persons who use wheelchairs, walkers, or braces. Recent census figures estimate that about 11.9 percent of Americans ages 15 and older have an ambulatory disability, or about 35 million people. This expert panel also estimated that single-user toilet rooms with out-swinging doors would be used slightly less than once every other visit to a facility with such toilet rooms covered by the final rules (or, viewed another way, about once every two hours spent at a covered facility assumed to have one or more single-user toilet rooms with out-swinging doors) by an individual with an ambulatory disability. The expert panel further estimated that, for such individuals, the revised requirement would result in an average time savings of about five and a half minutes when using the restroom. This time savings is due to the revised water closet clearance standard, which permits, among other things, greater flexibility in terms of access to the toilet by parallel or side transfer, thereby perhaps reducing the wait for another person to assist with toileting and the need to twist or struggle to access the toilet independently. Based on average hourly wage rates compiled by the U.S. Department of Labor, the time savings for Req. #28 is valued at just under $10 per hour.

For public and private facilities covered by the final rules, it is estimated that there are currently about 11 million single-user toilet rooms with out-swinging doors. The majority of these types of single-user toilet rooms, nearly 7 million, are assumed to be located at ''Indoor Service Establishments,'' a broad facility group that encompasses various types of indoor retail stores such as bakeries, grocery stores, clothing stores, and hardware stores. Based on construction industry data, it was estimated that approximately 3 percent of existing single-user toilet rooms with out-swinging doors would be altered each year, and that the number of newly constructed facilities with these types of toilet rooms would increase at the rate of about 1 percent each year. However, due to the widespread adoption at the State and local level of model code provisions that mirror Req. #28, it is further understood that about half of all existing facilities assumed to have single-user toilet rooms with out-swinging doors already are covered by State or local building codes that require equivalent water closet clearances. Due to the general element-by-element safe harbor provision in the final rules, no unaltered single-user toilet rooms that comply with the current 1991 Standards will be required to retrofit to meet the revised clearance requirements in the final rules.

With respect to new construction, it is assumed that each single-user toilet room with an out-swinging door will last the life of the building, about 40 years. For alterations, the amount of time such a toilet room will be used depends upon the remaining life of the building (*i.e.,* a period of time between 1 and 39 years).

Summing up monetized benefits to users with disabilities across all types of public and private facilities covered by the final rules, and assuming 46 percent of covered facilities nationwide are located in jurisdictions that have adopted the relevant equivalent IBC/ ANSI model code provisions, it is expected that the revised requirement for water closet clearance in single-user toilet rooms with out-swinging doors will result in net benefits of approximately $900 million over the life of these regulations.

General description of monetized benefits for water closet clearance in single-user toilet rooms—in-swinging doors (Req. # 32). For the water closet clearance in single-user toilet rooms with the in-swinging door requirement (Req. #32), the expert panel determined that the primary beneficiaries would be persons who use wheelchairs. As compared to single-user toilet rooms with out-

swinging doors, those with in-swinging doors tend to be larger (in terms of square footage) in order to accommodate clearance for the in-swinging door and, thus, are already likely to have adequate clear floor space for persons with disabilities who use other types of mobility aids such as walkers and crutches.

The expert benefits panel estimated that single-user toilet rooms with in-swinging doors are used less frequently on average—about once every 20 visits to a facility with such a toilet room by a person who uses a wheelchair—than their counterpart toilet rooms with out-swinging doors. This panel also determined that, on average, each user would realize a time savings of about 9 minutes as a result of the enhanced clearances required by this revised standard.

The RIA estimates that there are about 4 million single-user toilet rooms with in-swinging doors in existing facilities. About half of the single-user toilet rooms with in-swinging doors are assumed to be located in single-level stores, and about a quarter of them are assumed to be located in restaurants. Based on construction industry data, it was estimated that approximately 3 percent of existing single-user toilet rooms with in-swinging doors would be altered each year, and that the number of newly constructed facilities with these types of toilet rooms would increase at the rate of about 1 percent each year. However, due to the widespread adoption at the State and local level of model code provisions that mirror Req. #32, it is further understood that slightly more than 70 percent of all existing facilities assumed to have single-user toilet rooms with in-swinging doors already are covered by State or local building codes that require equivalent water closet clearances. Due to the general element-by-element safe harbor provision in the final rules, no unaltered single-user toilet rooms that comply with the current 1991 Standards will be required to retrofit to meet the revised clearance requirements in the final rules.

Similar to the assumptions for Req. #28, it is assumed that newly constructed single-user toilet rooms with in-swinging doors will last the life of the building, about 40 years. For alterations, the amount of time such a toilet room will be used depends upon the remaining life of the building (*i.e.,* a period of time between 1 and 39 years). Over this time period, the total estimated value of benefits to users of water closets with in-swinging doors from the time they will save and decreased discomfort they will experience is nearly $12 million.

Additional benefits of water closet clearance standards. The standards requiring sufficient space in single-user toilet rooms for a wheelchair user to effect a side or parallel transfer are among the most costly (in monetary terms) of the new provisions in the Access Board's guidelines that the Department adopts in this rule—but also, the Department believes, one of the most beneficial in non-monetary terms. Although the monetized costs of these requirements substantially exceed the monetized benefits, the additional benefits that persons with disabilities will derive from greater safety, enhanced independence, and the avoidance of stigma and humiliation— benefits that the Department's economic model could not put in monetary terms—are, in the Department's experience and considered judgment, likely to be quite high. Wheelchair users, including veterans returning from our Nation's wars with disabilities, are taught to transfer onto toilets from the side. Side transfers are the safest, most efficient, and most independence-promoting way for wheelchair users to get onto the toilet. The opportunity to effect a side transfer will often obviate the need for a wheelchair user or individual with another type of mobility impairment to obtain the assistance of another person to engage in what is, for most people, among the most private of activities. Executive Order 12866 refers explicitly not only to monetizable costs and benefits but also to ''distributive impacts'' and ''equity,'' *see* E.O. 12866, section 1(a), and it is important to recognize that the ADA is intended to provide important benefits that are distributional and equitable in character. These

water closet clearance provisions will have non-monetized benefits that promote equal access and equal opportunity for individuals with disabilities, and will further the ADA' s purpose of providing ''a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities.'' 42 U.S.C. 12101(b)(1).

The Department's calculations indicated that, in fact, people with the relevant disabilities would have to place only a very small monetary value on these quite substantial benefits for the costs and benefits of these water closet clearance standards to break even. To make these calculations, the Department separated out toilet rooms with out-swinging doors from those with in-swinging doors, because the costs and benefits of the respective water closet clearance requirements are significantly different. The Department estimates that, assuming 46 percent of covered facilities nationwide are located in jurisdictions that have adopted the relevant equivalent IBC/ANSI model code provisions, the costs of the requirement as applied to toilet rooms with out-swinging doors will exceed the monetized benefits by $454 million, an annualized net cost of approximately $32.6 million. But a large number of people with disabilities will realize benefits of independence, safety, and avoided stigma and humiliation as a result of the requirement's application in this context. Based on the estimates of its expert panel and its own experience, the Department believes that both wheelchair users and people with a variety of other mobility disabilities will benefit. The Department estimates that people with the relevant disabilities will use a newly accessible single-user toilet room with an out-swinging door approximately 677 million times per year. Dividing the $32.6 million annual cost by the 677 million annual uses, the Department concludes that for the costs and benefits to break even in this context, people with the relevant disabilities will have to value safety, independence, and the avoidance of stigma and humiliation at just under 5 cents per visit. The Department believes, based on its experience and informed judgment, that 5 cents substantially understates the value people with the relevant disabilities would place on these benefits in this context.

There are substantially fewer single-user toilet rooms with in-swinging doors, and substantially fewer people with disabilities will benefit from making those rooms accessible. While both wheelchair users and individuals with other ambulatory disabilities will benefit from the additional space in a room with an out-swinging door, the Department believes, based on the estimates of its expert panel and its own experience, that wheelchair users likely will be the primary beneficiaries of the in-swinging door requirement. The Department estimates that people with the relevant disabilities will use a newly accessible single-user toilet room with an in-swinging door approximately 8.7 million times per year. Moreover, the alteration costs to make a single-user toilet room with an in-swinging door accessible are substantially higher (because of the space taken up by the door) than the equivalent costs of making a room with an out-swinging door accessible. Thus, the Department calculates that, assuming 72 percent of covered facilities nationwide are located in jurisdictions that have adopted the relevant equivalent IBC/ANSI model code provisions, the costs of applying the toilet room accessibility standard to rooms with in-swinging doors will exceed the monetized benefits of doing so by $266.3 million over the life of the regulations, or approximately $19.14 million per year. Dividing the $19.14 million annual cost by the 8.7 million annual uses, the Department concludes that for the costs and benefits to break even in this context, people with the relevant disabilities will have to value safety, independence, and the avoidance of stigma and humiliation at approximately $2.20 per visit. The Department believes, based on its experience and informed judgment, that this figure approximates, and probably understates, the value wheelchair users place on safety, independence, and the avoidance of stigma and humiliation in this context.

Alternate Scenarios

Another scenario in the Final RIA explores the incremental impact of varying the assumptions concerning the percentage of existing elements subject to supplemental requirements for which barrier removal would be readily achievable. Readily achievable barrier removal rates are modeled at 0 percent, 50 percent, and 100 percent levels. The results of this scenario show that the expected NPV is positive for each readily achievable barrier removal rate and that varying this assumed rate has little impact on expected NPV. *See* Final RIA, figure ES–3.

A third set of analyses in the Final RIA demonstrates the impact of using alternate baselines based on model codes instead of the primary baseline. The IBC model codes, which have been widely adopted by State and local jurisdictions around the country, are significant because many of the requirements in the final rules mirror accessibility provisions in the IBC model codes (or standards incorporated therein by reference, such as ANSI A117.1). The actual economic impact of the Department's final rules is, therefore, tempered by the fact that many jurisdictions nationwide have already adopted and are enforcing portions of the final rules—indeed, this was one of the goals underlying the Access Board's efforts to harmonize the 2004 ADAAG Standards with the model codes. However, capturing the economic impact of this reality poses a difficult modeling challenge due to the variety of methods by which States and localities have adopted the IBC/ANSI model codes (*e.g.,* in whole, in part, and with or without amendments), as well as the lack of a national ''facility census' establishing the location, type, and age of existing ADA-covered facilities.

As a result, in the first set of alternate IBC baseline analyses, the Final RIA assumes that all of the three IBC model codes—IBC 2000, IBC 2003, and IBC 2006—have been fully adopted by all jurisdictions and apply to all facilities nationwide. As with the primary baseline scenarios examined in the Final RIA, use of these three alternate IBC baselines results in positive expected NPVs in all cases. *See* Final RIA, figure ES–4. These results also indicate that IBC 2000 and IBC 2006 respectively have the highest and lowest expected NPVs. These results are due to changes in the make-up of the set of requirements that is included in each alternative baseline.

Additionally, a second, more limited alternate baseline analysis in the Final RIA uses a State-specific and requirement-specific alternate IBC/ANSI baseline in order to demonstrate the likely actual incremental impact of an illustrative subset of 20 requirements under current conditions nationwide. For this analysis, research was conducted on a subset of 20 requirements in the final rules that have negative net present values under the primary baseline and readily identifiable IBC/ANSI counterparts to determine the extent to which they each respectively have been adopted at the State or local level. With respect to facilities, the population of adopting jurisdictions was used as a proxy for facility location. In other words, it was assumed that the number of ADA-covered facilities respectively compliant with these 20 requirements was equal to the percentage of the United States population (based on statistics from the Census Bureau) currently residing in those States or local jurisdictions that have adopted the IBC/ANSI counterparts to these requirements. The results of this more limited analysis, using State-specific and requirement-specific alternate IBC/ANSI baselines for these 20 requirements, demonstrate that the widespread adoption of IBC model codes by States and localities significantly lessens the financial impact of these specific requirements. Indeed, the Final RIA estimates that, if the NPVs for these 20 requirements resulting from the requirement-specific alternate IBC/ANSI baseline are substituted for their respective results under the primary baseline, the overall NPV for the final rules increases from $9.2 billion to $12.0 billion. *See* Final RIA, section 6.2.2 & table 10.

Benefits Not Monetized in the Formal Analysis

Finally, the RIA recognizes that additional benefits are likely to result from the new standards. Many of these benefits are more difficult to quantify. Among the potential benefits that have been discussed by researchers and advocates are reduced administrative costs due to harmonized guidelines, increased business opportunities, increased social development, and improved health benefits. For example, the final rules will substantially increase accessibility at newly scoped facilities such as recreation facilities and judicial facilities, which previously have been very difficult for persons with disabilities to access. Areas where the Department believes entities may incur benefits that are not monetized in the formal analysis include, but may not be limited to, the following:

Use benefits accruing to persons with disabilities. The final rules should improve the overall sense of well-being of persons with disabilities, who will know that public entities and places of public accommodation are generally accessible, and who will have improved individual experiences. Some of the most frequently cited qualitative benefits of increased access are the increase in one's personal sense of dignity that arises from increased access and the decrease in possibly humiliating incidents due to accessibility barriers. Struggling to join classmates on a stage, to use a bathroom with too little clearance, or to enter a swimming pool all negatively affect a person's sense of independence and can lead to humiliating accidents, derisive comments, or embarrassment. These humiliations, together with feelings of being stigmatized as different or inferior from being relegated to use other, less comfortable or pleasant elements of a facility (such as a bathroom instead of a kitchen sink for rinsing a coffee mug at work), all have a negative effect on persons with disabilities.

Use benefits accruing to persons without disabilities. Improved accessibility can affect more than just the rule's target population; persons without disabilities may also benefit from many of the requirements. Even though the requirements were not designed to benefit persons without disabilities, any time savings or easier access to a facility experienced by persons without disabilities are also benefits that should properly be attributed to that change in accessibility. Curb cuts in sidewalks make life easier for those using wheeled suitcases or pushing a baby stroller. For people with a lot of luggage or a need to change clothes, the larger bathroom stalls can be highly valued. A ramp into a pool can allow a child (or adult) with a fear of water to ease into that pool. All are examples of ''unintended'' benefits of the rule. And ideally, all should be part of the calculus of the benefits to society of the rule.

Social benefits. Evidence supports the notion that children with and without disabilities benefit in their social development from interaction with one another. Therefore, there will likely be social development benefits generated by an increase in accessible play areas. However, these benefits are nearly impossible to quantify for several reasons. First, there is no guarantee that accessibility will generate play opportunities between children with and without disabilities. Second, there may be substantial overlap between interactions at accessible play areas and interactions at other facilities, such as schools and religious facilities. Third, it is not certain what the unit of measurement for social development should be.

Non-use benefits. There are additional, indirect benefits to society that arise from improved accessibility. For instance, resource savings may arise from reduced social service agency outlays when people are able to access centralized points of service delivery rather than receiving home-based care. Home-based and other social services may include home health care visits and welfare benefits. Third-party employment effects can arise when enhanced accessibility results in increasing rates of consumption by disabled and non-disabled populations, which in turn results in reduced unemployment.

Two additional forms of benefits are discussed less often, let alone quantified: Option value and existence value. Option value is the value that people with and without disabilities derive from the option of using accessible facilities at some point in the future. As with insurance, people derive benefit from the knowledge that the option to use the accessible facility exists, even if it ultimately goes unused. Simply because an individual is a nonuser of accessible elements today does not mean that he or she will remain so tomorrow. In any given year, there is some probability that an individual will develop a disability (either temporary or permanent) that will necessitate use of these features. For example, the 2000 Census found that 41.9 percent of adults 65 years and older identified themselves as having a disability. Census Bureau figures, moreover, project that the number of people 65 years and older will more than double between 2000 and 2030—from 35 million to 71.5 million. Therefore, even individuals who have no direct use for accessibility features today get a direct benefit from the knowledge of their existence should such individuals need them in the future.

Existence value is the benefit that individuals get from the plain existence of a good, service or resource—in this case, accessibility. It can also be described as the value that people both with and without disabilities derive from the guarantees of equal treatment and non-discrimination that are accorded through the provision of accessible facilities. In other words, people value living in a country that affords protections to individuals with disabilities, whether or not they themselves are directly or indirectly affected. Unlike use benefits and option value, existence value does not require an individual ever to use the resource or plan on using the resource in the future. There are numerous reasons why individuals might value accessibility even if they do not require it now and do not anticipate needing it in the future.

Costs Not Monetized in the Formal Analysis

The Department also recognizes that in addition to benefits that cannot reasonably be quantified or monetized, there may be negative consequences and costs that fall into this category as well. The absence of a quantitative assessment of such costs in the formal regulatory analysis is not meant to minimize their importance to affected entities; rather, it reflects the inherent difficulty in estimating those costs. Areas where the Department believes entities may incur costs that are not monetized in the formal analysis include, but may not be limited to, the following:

Costs from deferring or forgoing alterations. Entities covered by the final rules may choose to delay otherwise desired alterations to their facilities due to the increased incremental costs imposed by compliance with the new requirements. This may lead to facility deterioration and decrease in the value of such facilities. In extreme cases, the costs of complying with the new requirements may lead some entities to opt to not build certain facilities at all. For example, the Department estimates that the incremental costs of building a new wading pool associated with the final rules will increase by about $142,500 on average. Some facilities may opt to not build such pools to avoid incurring this increased cost.

Loss of productive space while modifying an existing facility. During complex alterations, such as where moving walls or plumbing systems will be necessary to comply with the final rules, productive space may be unavailable until the alterations are complete. For example, a hotel altering its bathrooms to comply with the final rules will be unable to allow guests to occupy these rooms while construction activities are underway, and thus the hotel may forgo revenue from these rooms during this time. While the amount of time necessary to perform alterations varies significantly, the costs associated with unproductive space could be high in certain cases, especially if space is already limited or if an entity or facility is

located in an area where real estate values are particularly high (*e.g.,* New York or San Francisco).

Expert fees. Another type of cost to entities that is not monetized in the formal analysis is legal fees to determine what, if anything, a facility needs to do in order to comply with the new rules or to respond to lawsuits. Several commenters indicated that entities will incur increased legal costs because the requirements are changing for the first time since 1991. Since litigation risk could increase, entities could spend more on legal fees than in the past. Likewise, covered entities may face incremental costs when undertaking alterations because their engineers, architects, or other consultants may also need to consider what modifications are necessary to comply with the new requirements. The Department has not quantified the incremental costs of the services of these kinds of experts.

Reduction in facility value and losses to individuals without disabilities due to the new accessibility requirements. It is possible that some changes made by entities to their facilities in order to comply with the new requirements may result in fewer individuals without disabilities using such facilities (because of decreased enjoyment) and may create a disadvantage for individuals without disabilities, even though the change might increase accessibility for individuals with disabilities. For example, the new requirements for wading pools might decrease the value of the pool to the entity that owns it due to fewer individuals using it (because the new requirements for a sloped entry might make the pool too shallow). Similarly, several commenters from the miniature golf industry expressed concern that it would be difficult to comply with the regulations for accessible holes without significantly degrading the experience for other users. Finally, with respect to costs to individuals who do not have disabilities, a very tall person, for example, may be inconvenienced by having to reach further for a lowered light switch.

Section 610 Review

The Department also is required to conduct a periodic regulatory review pursuant to section 610 of the RFA, as amended by the SBREFA.

The review requires agencies to consider five factors: (1) The continued need for the rule; (2) the nature of complaints or comments received concerning the rule from the public; (3) the complexity of the rule; (4) the extent to which the rule overlaps, duplicates, or conflicts with other Federal rules, and, to the extent feasible, with State and local governmental rules; and (5) the length of time since the rule has been evaluated or the degree to which technology, economic conditions, or other factors have changed in the area affected by the rule. 5 U.S.C. 610(b). Based on these factors, the agency is required to determine whether to continue the rule without change or to amend or rescind the rule, to minimize any significant economic impact of the rule on a substantial number of small entities. *See id.* 610(a).

In developing the 2010 Standards, the Department reviewed the 1991 Standards section by section, and, as a result, has made several clarifications and amendments in both the title II and title III implementing regulations. The changes reflect the Department's analysis and review of complaints or comments from the public, as well as changes in technology. Many of the amendments aim to clarify and simplify the obligations of covered entities. As discussed in greater detail above, one significant goal of the development of the 2004 ADAAG was to eliminate duplication or overlap in Federal accessibility guidelines, as well as to harmonize the Federal guidelines with model codes. The Department also has worked to create harmony where appropriate between the requirements of titles II and III. Finally, while the regulation is required by statute and there is a continued need for it as a whole, the Department proposes several modifications that are intended to reduce its effects on small entities.

The Department has consulted with the Small Business Administration's Office of Advocacy

about this process. The Office of Advocacy has advised that although the process followed by the Department was ancillary to the proposed adoption of revised ADA Standards, the steps taken to solicit public input and to respond to public concerns are functionally equivalent to the process required to complete a section 610 review. Therefore, this rulemaking fulfills the Department's obligations under the RFA.

Final Regulatory Flexibility Analysis

This final rule also has been reviewed by the Small Business Administration's Office of Advocacy (Advocacy) in accordance with Executive Order 13272, 67 FR 53461, 3 CFR, 2003 Comp., p. 247. Chapter Seven of the Final RIA demonstrates that the final rule will not have a significant economic impact on a substantial number of small entities. The Department has also conducted a final regulatory flexibility analysis (FRFA) as a component of this rulemaking. Collectively, the ANPRM, NPRM, Initial RIA, Final RIA, and 2010 Standards include all of the elements of a FRFA required by the RFA. *See* 5 U.S.C. 604(a)(1)–(5).

Section 604(a) lists the specific requirements for a FRFA. The Department has addressed these RFA requirements throughout the ANPRM, NPRM, the 2010 Standards, and the RIA. In summary, the Department has satisfied its FRFA obligations under section 604(a) by providing the following:

1. *Succinct summaries of the need for, and objectives of, the final rule.* The Department is issuing this final rule in order to comply with its obligations under both the ADA and the SBREFA. The Department is also updating or amending certain provisions of the existing title III regulation so that they are consistent with the title II regulations and comport with the Department's legal and practical experiences in enforcing the ADA.

The ADA requires the Department to adopt enforceable accessibility standards under the ADA that are consistent with the Access Board's minimum accessibility guidelines and requirements. Accordingly, this rule adopts ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines as part of the 2010 Standards, which will give the guidelines legal effect with respect to the Department's title II and title III regulations.

Under the SBREFA, the Department is required to perform a periodic review of its 1991 rule because the rule may have a significant economic impact on a substantial number of small entities. The SBREFA also requires the Department to make a regulatory assessment of the costs and benefits of any significant regulatory action. *See* preamble sections of the final rules for titles II and III entitled ''Summary''; Department of Justice Advanced Notice of Proposed Rulemaking, 69 FR 58768, 58768B70, (Sept. 30, 2004) (outlining the regulatory history, goals, and rationale underlying the Department's proposal to revise its regulations implementing titles II and III of the ADA); and Department of Justice Notice of Proposed Rulemaking, 73 FR 34508, 34508B14 (June 17, 2008) (outlining the regulatory history and rationale underlying the Department's proposal to revise its regulations implementing titles II and III of the ADA).

2. *Summaries of significant issues raised by public comments in response to the Department's initial regulatory flexibility analysis (IRFA) and discussions of regulatory revisions made as a result of such comments.* The majority of the comments received by the Department addressing its IRFA set forth in the title III NPRM were submitted by the Advocacy. Advocacy acknowledged that the Department took into account the comments and concerns of small businesses; however, Advocacy remained concerned about certain items in the Department's NPRM and requested clarification or additional guidance on certain items.

General Safe Harbor. Advocacy expressed support for the Department's proposal to allow an

element-by-element safe harbor for elements that now comply with the 1991 Standards and encouraged the Department to include specific technical assistance in the Small Business Compliance Guide that the Department is required to publish pursuant to section 212 of the SBREFA, 5 U.S.C. 610 *et seq*. Advocacy requested that technical assistance outlining which standards are subject to the safe harbor be included in the Department's guidance. The Department has provided a list of the new requirements in the 2010 Standards that are not eligible for the safe harbor in § 36.304(d)(2)(iii)(A)–(L) of the final rule and plans to include additional information about the application of the safe harbor in the Department's Small Business Compliance Guide. Advocacy also requested that guidance regarding the two effective dates for regulations also be provided, and the Department plans to include such guidance in its Small Business Compliance Guide.

Small Business Safe Harbor. Advocacy expressed disappointment that the Department did not include a small business safe harbor in the final rule. In the NPRM, the Department proposed to include a small business safe harbor. Advocacy conceptually supported this safe harbor but had concerns regarding its application. Commenters from both the disability community and the business community uniformly, and quite adamantly, opposed the Department's proposal. Some business commenters suggested alternative safe harbors, but there was no common thread among their suggestions that would enable the Department to craft a proposal that would draw support from the affected communities.

Advocacy recommended that the Department continue to study how the proposed small business safe harbor might be made workable in future rulemakings, and recommended that the Department also seek other alternatives that minimize the economic impact of the ADA rulemakings in the future. The Department is mindful of its obligations under the SBREFA and will be sensitive to the need to mitigate costs for small businesses in any future rulemaking; however, based on the information currently available, the Department has declined to commit to a specific regulatory approach in the final rule.

Indirect Costs. Advocacy and other commenters representing business interests expressed concern that businesses would incur substantial indirect costs under the final rule for accessibility consultants, legal counsel, training, and the development of new policies and procedures. The Department believes that such ''indirect costs,'' even assuming they would occur as described by these commenters, are not properly attributed to the Department's final rule implementing the ADA.

The vast majority of the new requirements are incremental changes subject to a safe harbor. All businesses currently in compliance with the 1991 Standards will neither need to undertake further retrofits nor require the services of a consultant to tell them so. If, on the other hand, elements at an existing facility are not currently in compliance with the 1991 Standards, then the cost of making such a determination and bringing these elements into compliance are not properly attributed to the final rule, but to lack of compliance with the 1991 Standards.

For the limited number of requirements in the final rule that are supplemental, the Department believes that covered entities simply need to determine whether they have an element covered by a supplemental requirement (*e.g.,* a swimming pool) and then conduct any necessary barrier removal work either in-house or by contacting a local contractor. Determining whether such an element exists is expected to take only a minimal amount of staff time. Nevertheless, Chapter 5 of the Final RIA has a high-end estimate of the additional management costs of such evaluation (from 1 to 8 hours of staff time).

The Department also anticipates that businesses will incur minimal costs for accessibility consultants to ensure compliance with the new requirements for New Construction and Altera-

tions in the final rule. Both the 2004 ADAAG and the proposed requirements have been made public for some time and are already being incorporated into design plans by architects and builders. Further, in adopting the final rule, the Department has sought to harmonize, to the greatest extent possible, the ADA Standards with model codes that have been adopted on a widespread basis by State and local jurisdictions across the country. Accordingly, many of the requirements in the final rule are already incorporated into building codes nationwide. Additionally, it is assumed to be part of the regular course of business—and thereby incorporated into standard professional services or construction contracts—for architects and contractors to keep abreast of changes in applicable Federal, State, and local laws and building codes. Given these considerations, the Department has determined that the additional costs, if any, for architectural or contractor services that arise out of the final rule should be minimal.

Some commenters stated that the final rule would require them to develop new policies or manuals to retrain employees on the revised ADA standards. However, it is the Department's view that because the revised and supplemental requirements address architectural issues and features, the final rule would require minimal, if any, changes to the overall policies and procedures of covered entities.

Finally, commenters representing business interests expressed the view that the final rule would cause businesses to incur significant legal costs in order to defend ADA lawsuits. However, regulatory impact analyses are not an appropriate forum for assessing the cost covered entities may bear, or the repercussions they may face, for failing to comply (or allegedly failing to comply) with current law. *See* Final RIA, Ch. 3, section 3.1.4, ''Other Management Transition Costs''; Ch. 5,''Updates to the Regulatory Impact Analysis''; and table 15, ''Impact of NPV of Estimated Managerial Costs for Supplemental Requirements at All Facilities.''

3. *Estimates of the number and type of small entities to which the final rule will apply*. The Department estimates that the final rule will apply to approximately three million small entities or facilities covered by title III. *See* Final RIA, Ch. 7, ''Small Business Impact Analysis,'' table 17, and app. 5, ''Small Business Data''; *see also* 73 FR 36964, 36996–37009 (June 30, 2008) (estimating the number of small entities the Department believes may be impacted by the NPRM and calculating the likely incremental economic impact of the rule on small facilities/entities versus ''typical'' (*i.e.,* average-sized facilities/entities).

4. *A description of the projected reporting, record-keeping, and other compliance requirements of the final rule, including an estimate of the classes of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record.* The final rule imposes no new recordkeeping or reporting requirements. *See* preamble section entitled ''Paperwork Reduction Act.'' Small entities may incur costs as a result of complying with the final rules. These costs are detailed in the Final RIA, Chapter 7, ''Small Business Impact Analysis'' and accompanying Appendix 5, ''Small Business Data.''

5. *Descriptions of the steps taken by the Department to minimize any significant economic impact on small entities consistent with the stated objectives of the ADA, including the reasons for selecting the alternatives adopted in the final rule and for rejecting other significant alternatives.* From the outset of this rulemaking, the Department has been mindful of small entities and has taken numerous steps to minimize the impact of the final rule on small businesses. Several of these steps are summarized below.

As an initial matter, the Department— as a voting member of the Access Board—was extensively involved in the development of the 2004 ADAAG. These guidelines, which are incorporated into the 2010 Standards, reflect a conscious effort to mitigate any significant economic impact

on small businesses in several respects. First, one of the express goals of the 2004 ADAAG is harmonization of Federal accessibility guidelines with industry standards and model codes that often form the basis of State and local building codes, thereby minimizing the impact of these guidelines on all covered entities, but especially small businesses. Second, the 2004 ADAAG is the product of a 10-year rulemaking effort in which a host of private and public entities, including small business groups, worked cooperatively to develop accessibility guidelines that achieved an appropriate balance between accessibility and cost. For example, as originally recommended by the Access Board's Recreation Access Advisory Committee, all holes on a miniature golf course would be required to be accessible except for sloped surfaces where the ball could not come to rest. *See, e.g.,* ''ADA Accessibility Guidelines for Buildings and Facilities—Recreation Facilities and Outdoor Developed Areas,'' Access Board Advance Notice of Proposed Rulemaking, 59 FR 48542 (Sept. 21, 1994). Miniature golf trade groups and facility operators, who are nearly all small businesses, expressed significant concern that such requirements would be prohibitively expensive, would require additional space, and might fundamentally alter the nature of their courses. *See, e.g.*, ''ADA Accessibility Guidelines for Buildings and Facilities—Recreation Facilities,'' Access Board Notice of Proposed Rulemaking, 64 FR 37326 (July 9, 1999). In consideration of such concerns and after holding informational meetings with miniature golf representatives and persons with disabilities, the Access Board significantly revised the final miniature golf guidelines. The final guidelines not only reduced significantly the number of holes required to be accessible to 50 percent of all holes (with one break in the sequence of consecutive holes permitted), but also added an exemption for carpets used on playing surfaces, modified ramp landing slope and size requirements, and reduced the space required for start of play areas. *See, e.g.,* Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities—Recreation Facilities Final Rule, 36 CFR parts 1190 and 1191.

The Department also published an ANPRM to solicit public input on the adoption of the 2004 ADAAG as the revised Federal accessibility standards implementing titles II and III of the ADA. Among other things, the ANPRM specifically invited comment from small entities regarding the proposed rule's potential economic impact and suggested regulatory alternatives to ameliorate any such impact. *See* ''Nondiscrimination on the Basis of Disability by Public Accommodations and in Commercial Facilities,'' Department of Justice Advance Notice of Proposed Rulemaking, 69 FR 58768, 58778–79 (Sept. 30, 2004). The Department received over 900 comments, and small business interests figured prominently. *See* ''Nondiscrimination on the Basis of Disability by Public Accommodations and in Commercial Facilities,'' Department of Justice Notice of Proposed Rulemaking, 73 FR 34508, 34511, 34550 (June 17, 2008).

Subsequently, when the Department published its NPRM in June 2008, several regulatory proposals were included to address concerns raised by the small business community in ANPRM comments. First, to mitigate costs to existing facilities, the Department proposed an element-by-element safe harbor that would exempt elements in compliance with applicable technical and scoping requirements in the 1991 Standards from any retrofit obligations under the revised title III rule. *Id.* at 34514–15, 34532–33. While this proposed safe harbor applied to title III covered entities irrespective of size, it was small businesses that especially stood to benefit since, according to comments from small business advocates, small businesses are more likely to operate in older buildings and facilities. The title III NPRM also offered for public comment a novel safe harbor provision specifically designed to address small business advocates' request for clearer guidance on the readily achievable barrier removal requirement.

This proposal provided that qualified small businesses would be deemed to have satisfied their readily achievable barrier removal obligations for a given year if, during that tax year, they had spent at least 1 percent of their respective gross revenues undertaking measures in compliance with title III barrier removal requirements. *Id.* at 34538–39. Lastly, the NPRM sought public input on the inclusion of reduced scoping provisions for certain types of small existing recreation facilities (*i.e.,* swimming pools, play areas, and saunas). *Id.* at 34515, 34534–37.

During the NPRM comment period, the Department engaged in considerable public outreach to the small business community. A public hearing was held in Washington, D.C., during which nearly 50 persons, including several small business owners, testified in person or by phone. *See Transcript of the Public Hearing on Notices of Proposed Rulemaking* (July 15, 2008), available at *www.ada.gov/NPRM2008/ public_hearing_transcript.htm*. This hearing was also streamed live over the Internet. By the end of the 60-day comment period, the Department had also received nearly 4,500 public comments on the title III NPRM, including a significant number of comments reflecting small businesses' perspectives on a wide range of regulatory issues.

In addition to soliciting input from small entities through the formal process for public comment, the Department also targeted the small business community with less formal regulatory discussions, including a Small Business Roundtable convened by the Office of Advocacy and held at the offices of the Small Business Administration in Washington, D.C., and an informational question-and-answer session concerning the titles II and III NPRMs at the Department of Justice in which business representatives attended in-person and by telephone. These outreach efforts provided the small business community with information on the NPRM proposals being considered by the Department and gave small businesses the opportunity to ask questions of the Department and provide feedback.

As a result of the feedback provided by representatives of small business interests on the title III NPRM, the Department was able to assess the impact of various alternatives on small businesses before adopting its final rule and took steps to minimize any significant impact on small entities. Most notably, the final rule retains the element-by-element safe harbor for which the small business community voiced strong support. *See* Appendix A discussion of removal of barriers (§ 36.304). The Department believes that this element-by-element safe harbor provision will go a long way toward mitigating the economic impact of the final rule on existing facilities owned or operated by small businesses. Indeed, as demonstrated in the Final RIA, the element-by-element safe harbor will provide substantial relief to small businesses that is estimated at $ 7.5 billion over the expected life of the final rule.

Additional regulatory measures mitigating the economic impact of the final rule on title III-covered entities (including small businesses) include deletion of the proposed requirement for captioning of safety and emergency information on scoreboards at sporting venues, retention of the proposed path of travel safe harbor, extension of the compliance date of the 2010 Standards as applied to new construction and alterations from 6 months to 18 months after publication of the final rule, and, in response to public comments, modification of the triggering event for application of the 2010 Standards to new construction and alterations from a unitary approach (commencement of physical construction) to a two-pronged approach (date of last application for building permit or commencement of physical construction) depending on whether a building permit is or is not required for the type of construction at issue by State or local building authorities. *See* Appendix A discussions of captioning at sporting venues (§36.303), alterations and path of travel (§ 36.403), and com-

pliance dates and triggering events for new construction and alterations (§ 36.406).

Two sets of proposed alternative measures that would have potentially provided some cost savings to small businesses—the safe harbor for qualified small businesses and reduced scoping for certain existing recreation facilities—were not adopted by the Department in the final rule. As discussed in more depth previously, the safe harbor for qualified small businesses was omitted from the final rule because the general safe harbor already provides significant relief for small businesses located in existing facilities, the proposed safe harbor provision lacked support from the small business community and no consensus emerged from business commenters concerning feasible bases for the final regulatory provision, and commenters noted practical considerations that would potentially make some small businesses incur greater expense or administrative burden. *See* Appendix A discussion of the safe harbor for qualified small businesses (§ 36.304).

The Department also omitted the proposals to reduce scoping for certain existing recreation facilities in the final rule. While these proposals were not specific to small entities, they nonetheless might have mitigated the impact of the final rule for some small businesses that owned or operated existing facilities at which these recreational elements were located. *See* Appendix A discussion of reduced scoping for play areas and other recreation facilities (§ 36.304). The Department gave careful consideration to how best to insulate small businesses from overly burdensome barrier removal costs under the 2010 Standards for existing small play areas, swimming pools, and saunas, while still providing accessible and integrated recreation facilities that are of great importance to persons with disabilities. The Department concluded that the existing readily achievable barrier removal standard, rather than specific exemptions for these types of existing facilities, is the most efficacious method by which to protect small businesses.

Once the final rule is promulgated, small businesses will also have a wealth of documents to assist them in complying with the 2010 Standards. For example, accompanying the final rule in the **Federal Register** is the Department's"Analysis and Commentary on the 2010 ADA Standards for Accessible Design," which provides a plain language description of the revised scoping and technical requirements in these Standards and provides illustrative figures. The Department also expects to publish guidance specifically tailored to small businesses in the form of a small business compliance guide, as well as to publish technical assistance materials of general interest to all covered entities following promulgation of the final rule. Additionally, the Access Board has published a number of guides that discuss and illustrate application of the 2010 Standards to play areas and various types of recreation facilities.

Executive Order 13132: Federalism

Executive Order 13132, 64 FR 43255, 3 CFR, 2000 Comp., p. 206, requires executive branch agencies to consider whether a rule will have federalism implications. That is, the rulemaking agency must determine whether the rule is likely to have substantial direct effects on State and local governments, a substantial direct effect on the relationship between the Federal government and the States and localities, or a substantial direct effect on the distribution of power and responsibilities among the different levels of government. If an agency believes that a rule is likely to have federalism implications, it must consult with State and local elected officials about how to minimize or eliminate the effects.

Title III of the ADA covers public accommodations and commercial facilities. These facilities are generally subject to regulation by different levels of government, including Federal, State, and local governments. The ADA and the 2010 Standards set minimum civil rights protections for individuals with disabilities that in turn may affect the implementation of State and local laws,

particularly building codes. The 2010 Standards address federalism concerns and mitigate federalism implications, particularly the provisions that streamline the administrative process for State and local governments seeking ADA code certification under title III.

As a member of the Access Board, the Department was privy to substantial feedback from State and local governments throughout the development of the Board's 2004 guidelines. Before those guidelines were finalized as the 2004 ADA/ABA Guidelines, they addressed and minimized federalism concerns expressed by State and local governments during the development process. Because the Department adopted ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the 2004 ADA/ABA Guidelines as part of the 2010 Standards, the steps taken in the 2004 ADA/ABA Guidelines to address federalism concerns are reflected in the 2010 Standards.

The Department also solicited and received input from public entities in the September 2004 ANPRM and the June 2008 NPRM. Through the ANPRM and NPRM processes, the Department solicited comments from elected State and local officials and their representative national organizations about the potential federalism implications. The Department received comments addressing whether the ANPRM and NPRM directly affected State and local governments, the relationship between the Federal government and the States, and the distribution of power and responsibilities among the various levels of government. The rule preempts State laws affecting entities subject to the ADA only to the extent that those laws conflict with the requirements of the ADA, as set forth in the rule.

National Technology Transfer and Advancement Act of 1995

The National Technology Transfer and Advancement Act of 1995 (NTTAA) directs that, as a general matter, all Federal agencies and departments shall use technical standards that are developed or adopted by voluntary consensus standards bodies, which are private, generally non-profit organizations that develop technical standards or specifications using well-defined procedures that require openness, balanced participation among affected interests and groups, fairness and due process, and an opportunity for appeal, as a means to carry out policy objectives or activities. Public Law 104–113 section 12(d)(1) (15 U.S.C. 272 Note). In addition, the NTTAA directs agencies to consult with voluntary, private sector, consensus standards bodies and requires that agencies participate with such bodies in the development of technical standards when such participation is in the public interest and is compatible with agency and departmental missions, authorities, priorities, and budget resources. *Id.* section 12(d)1). The Department, as a member of the Access Board, was an active participant in the lengthy process of developing the 2004 ADAAG, on which the 2010 Standards are based. As part of this update, the Board has made its guidelines more consistent with model building codes, such as the IBC, and industry standards. It coordinated extensively with model code groups and standard-setting bodies throughout the process so that differences could be reconciled. As a result, an historic level of harmonization has been achieved that has brought about improvements to the guidelines, as well as to counterpart provisions in the IBC and key industry standards, including those for accessible facilities issued through the American National Standards Institute.

Plain Language Instructions

The Department makes every effort to promote clarity and transparency in its rulemaking. In any regulation, there is a tension between drafting language that is simple and straightforward and drafting language that gives full effect to issues of legal interpretation. The Department operates a toll-free ADA Information Line (800) 514–0301(voice); (800) 514–0383 (TTY) that the public is welcome to call at any time to obtain assistance in under-

standing anything in this rule. If any commenter has suggestions for how the regulation could be written more clearly, please contact Janet L. Blizard, Deputy Chief, Disability Rights Section, whose contact information is provided in the introductory section of this rule, entitled **FOR FURTHER INFORMATION CONTACT.**

Paperwork Reduction Act

The Paperwork Reduction Act of 1980 (PRA) requires agencies to clear forms and recordkeeping requirements with OMB before they can be introduced. 44 U.S.C. 3501 *et seq*. This rule does not contain any paperwork or recordkeeping requirements and does not require clearance under the PRA.

Unfunded Mandates Reform Act

Section 4(2) of the Unfunded Mandates Reform Act of 1995, 2 U.S.C. 1503(2), excludes from coverage under that Act any proposed or final Federal regulation that ''establishes or enforces any statutory rights that prohibit discrimination on the basis of race, color, religion, sex, national origin, age, handicap, or disability.'' Accordingly, this rulemaking is not subject to the provisions of the Unfunded Mandates Reform Act.

List of Subjects for 28 CFR Part 36

Administrative practice and procedure, Buildings and facilities, Business and industry, Civil rights, Individuals with disabilities, Penalties, Reporting and recordkeeping requirements.

•By the authority vested in me as Attorney General by law, including 28 U.S.C. 509 and 510, 5 U.S.C. 301, and section 306 of the Americans with Disabilities Act of 1990, Public Law 101–336 (42 U.S.C. 12186), and for the reasons set forth in Appendix A to 28 CFR part 36, chapter I of title 28 of the Code of Federal Regulations is amended as follows:

Title III Regulations

Revised Final Title III Regulation with Integrated Text

Department of Justice

Part 36 Nondiscrimination on the Basis of Disability in Public Accommodations and Commercial Facilities (as amended by the final rule published on September 15, 2010)

Authority:
5 U.S.C. 301; 28 U.S.C. 509, 510; 42 U.S.C. 12186(b).

Subpart A – General

§ 36.101 Purpose.

The purpose of this part is to implement title III of the Americans with Disabilities Act of 1990 (42 U.S.C. 12181), which prohibits discrimination on the basis of disability by public accommodations and requires places of public accommodation and commercial facilities to be designed, constructed, and altered in compliance with the accessibility standards established by this part.

§ 36.102 Application.

(a) *General*. This part applies to any –

(1) Public accommodation;

(2) Commercial facility; or

(3) Private entity that offers examinations or courses related to applications, licensing, certification, or credentialing for secondary or postsecondary education, professional, or trade purposes.

(b) *Public accommodations*.

(1) The requirements of this part applicable to public accommodations are set forth in subparts B, C, and D of this part.

(2) The requirements of subparts B and C of this part obligate a public accommodation only with respect to the operations of a place of public accommodation.

(3) The requirements of subpart D of this part obligate a public accommodation only with respect to –

(i) A facility used as, or designed or constructed for use as, a place of public accommodation; or

(ii) A facility used as, or designed and constructed for use as, a commercial facility.

(c) *Commercial facilities*. The requirements of this part applicable to commercial facilities are set forth in subpart D of this part.

(d) *Examinations and courses.* The requirements of this part applicable to private entities that offer examinations or courses as specified in paragraph (a) of this section are set forth in § 36.309.

(e) *Exemptions and exclusions*. This part does not apply to any private club (except to the extent that the facilities of the private club are made available to customers or patrons of a place of public accommodation), or to any religious entity or public entity.

§ 36.103 Relationship to other laws.

(a) *Rule of interpretation.* Except as otherwise provided in this part, this part shall not be construed to apply a lesser standard than the standards applied under title V of the Rehabilitation Act of 1973 (29 U.S.C. 791) or the regulations issued by Federal agencies pursuant to that title.

(b) *Section 504*. This part does not affect the obligations of a recipient of Federal financial assistance to comply with the requirements of section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794) and regulations issued by Federal agencies implementing section 504.

(c) *Other laws.* This part does not invalidate or limit the remedies, rights, and procedures of any other Federal laws, or State or local laws (including State common law) that provide greater or equal protection for the rights of individuals with disabilities or individuals associated with them.

§ 36.104 Definitions.

For purposes of this part, the term–

1991 Standards means requirements set forth in the ADA Standards for Accessible Design, originally published on July 26, 1991, and republished as Appendix D to this part.

2004 ADAAG means the requirements set forth in appendices B and D to 36 CFR part 1191 (2009).

2010 Standards means the 2010 ADA Standards for Accessible Design, which consist of the 2004 ADAAG and the requirements contained in subpart D of this part.

Act means the Americans with Disabilities Act of 1990 (Pub. L. 101 - 336, 104 Stat. 327, 42 U.S.C. 12101 - 12213 and 47 U.S.C. 225 and 611).

Commerce means travel, trade, traffic, commerce, transportation, or communication –

(1) Among the several States;

(2) Between any foreign country or any territory or possession and any State; or

(3) Between points in the same State but through another State or foreign country.

Commercial facilities means facilities –

(1) Whose operations will affect commerce;

(2) That are intended for nonresidential use by a private entity; and

(3) That are not –

(i) Facilities that are covered or expressly exempted from coverage under the Fair Housing Act of 1968, as amended (42 U.S.C. 3601 - 3631);

(ii) Aircraft; or

(iii) Railroad locomotives, railroad freight cars, railroad cabooses, commuter or intercity passenger rail cars (including coaches, dining cars, sleeping cars, lounge cars, and food service cars), any other railroad cars described in section 242 of the Act or covered under title II of the Act, or railroad rights-of-way. For purposes of this definition, "rail" and "railroad" have the meaning given the term "railroad" in section 202(e) of the Federal Railroad Safety Act of 1970 (45 U.S.C. 431(e)).

Current illegal use of drugs means illegal use of drugs that occurred recently enough to justify a reasonable belief that a person´s drug use is current or that continuing use is a real and ongoing problem.

Direct threat means a significant risk to the health or safety of others that cannot be eliminated by a modification of policies, practices, or procedures, or by the provision of auxiliary aids or services, as provided in § 36.208.

Disability means, with respect to an individual, a physical or mental impairment that substantially limits one or more of the major life activities of such individual; a record of such an impairment; or being regarded as having such an impairment.

(1) The phrase *physical or mental impairment* means –

(i) Any physiological disorder or condition, cosmetic disfigurement, or anatomical loss affecting one or more of the following body systems: neurological; musculoskeletal; special sense organs; respiratory, including speech organs; cardiovascular; reproductive; digestive; genitourinary; hemic and lymphatic; skin; and endocrine;

(ii) Any mental or psychological disorder such as mental retardation, organic brain syndrome, emotional or mental illness, and specific learning disabilities;

(iii) The phrase *physical or mental impairment* includes, but is not limited to, such contagious and noncontagious diseases and conditions as orthopedic, visual, speech, and hearing impairments, cerebral palsy, epilepsy, muscular dystrophy, multiple sclerosis, cancer, heart disease, diabetes, mental retardation, emotional illness, specific learning disabilities, HIV disease (whether symptomatic or asymptomatic), tuberculosis, drug addiction, and alcoholism;

(iv) The phrase *physical or mental impairment* does not include homosexuality or bisexuality.

2) The phrase *major life activities* means functions such as caring for one´s self, performing

manual tasks, walking, seeing, hearing, speaking, breathing, learning, and working.

(3) The phrase *has a record of such an impairment* means has a history of, or has been misclassified as having, a mental or physical impairment that substantially limits one or more major life activities.

(4) The phrase *is regarded as having an impairment* means –

(i) Has a physical or mental impairment that does not substantially limit major life activities but that is treated by a private entity as constituting such a limitation;

(ii) Has a physical or mental impairment that substantially limits major life activities only as a result of the attitudes of others toward such impairment; or

(iii) Has none of the impairments defined in paragraph (1) of this definition but is treated by a private entity as having such an impairment.

(5) The term *disability* does not include –

(i) Transvestism, transsexualism, pedophilia, exhibitionism, voyeurism, gender identity disorders not resulting from physical impairments, or other sexual behavior disorders;

(ii) Compulsive gambling, kleptomania, or pyromania; or

(iii) Psychoactive substance use disorders resulting from current illegal use of drugs.

Drug means a controlled substance, as defined in schedules I through V of section 202 of the Controlled Substances Act (21 U.S.C. 812).

Existing facility means a facility in existence on any given date, without regard to whether the facility may also be considered newly constructed or altered under this part.

Facility means all or any portion of buildings, structures, sites, complexes, equipment, rolling stock or other conveyances, roads, walks, passageways, parking lots, or other real or personal property, including the site where the building, property, structure, or equipment is located.

Housing at a place of education means housing operated by or on behalf of an elementary, secondary, undergraduate, or postgraduate school, or other place of education, including dormitories, suites, apartments, or other places of residence.

Illegal use of drugs means the use of one or more drugs, the possession or distribution of which is unlawful under the Controlled Substances Act (21 U.S.C. 812). The term "illegal use of drugs" does not include the use of a drug taken under supervision by a licensed health care professional, or other uses authorized by the Controlled Substances Act or other provisions of Federal law.

Individual with a disability means a person who has a disability. The term "individual with a disability" does not include an individual who is currently engaging in the illegal use of drugs, when the private entity acts on the basis of such use.

Other power-driven mobility device means any mobility device powered by batteries, fuel, or other engines – whether or not designed primarily for use by individuals with mobility disabilities – that is used by individuals with mobility disabilities for the purpose of locomotion, including golf cars, electronic personal assistance mobility devices (EPAMDs), such as the Segway® PT, or any mobility device designed to operate in areas without defined pedestrian routes, but that is not a wheelchair within the meaning of this section. This definition does not apply to Federal wilderness areas; wheelchairs in such areas are defined in section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2).

Place of public accommodation means a facility operated by a private entity whose operations affect commerce and fall within at least one of the following categories –

(1) Place of lodging, except for an establishment located within a facility that contains not more than five rooms for rent or hire and that actually is occupied by the proprietor of the establishment as the residence of the proprietor. For purposes of this part, a facility is a "place of lodging" if it is –

(i) An inn, hotel, or motel; or

(ii) A facility that –

(A) Provides guest rooms for sleeping for stays that primarily are short-term in nature (generally 30 days or less) where the occupant does not have the right to return to a specific room or unit after the conclusion of his or her stay; and

(B) Provides guest rooms under conditions and with amenities similar to a hotel, motel, or inn, including the following –

(*1*) On- or off-site management and reservations service;

(*2*) Rooms available on a walk-up or call-in basis;

(*3*) Availability of housekeeping or linen service; and

(*4*) Acceptance of reservations for a guest room type without guaranteeing a particular unit or room until check-in, and without a prior lease or security deposit.

(2) A restaurant, bar, or other establishment serving food or drink;

(3) A motion picture house, theater, concert hall, stadium, or other place of exhibition or entertainment;

(4) An auditorium, convention center, lecture hall, or other place of public gathering;

(5) A bakery, grocery store, clothing store, hardware store, shopping center, or other sales or rental establishment;

(6) A laundromat, dry-cleaner, bank, barber shop, beauty shop, travel service, shoe repair service, funeral parlor, gas station, office of an accountant or lawyer, pharmacy, insurance office, professional office of a health care provider, hospital, or other service establishment;

(7) A terminal, depot, or other station used for specified public transportation;

(8) A museum, library, gallery, or other place of public display or collection;

(9) A park, zoo, amusement park, or other place of recreation;

(10) A nursery, elementary, secondary, undergraduate, or postgraduate private school, or other place of education;

(11) A day care center, senior citizen center, homeless shelter, food bank, adoption agency, or other social service center establishment; and

(12) A gymnasium, health spa, bowling alley, golf course, or other place of exercise or recreation.

Private club means a private club or establishment exempted from coverage under title II of the Civil Rights Act of 1964 (42 U.S.C. 2000a(e)).

Private entity means a person or entity other than a public entity.

Public accommodation means a private entity that owns, leases (or leases to), or operates a place of public accommodation.

Public entity means –

(1) Any State or local government;

(2) Any department, agency, special purpose district, or other instrumentality of a State or States or local government; and

(3) The National Railroad Passenger Corporation, and any commuter authority (as defined in section 103(8) of the Rail Passenger Service Act). (45 U.S.C. 541)

Qualified interpreter means an interpreter who, via a video remote interpreting (VRI) service or an on-site appearance, is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized

vocabulary. Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.

Qualified reader means a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary.

Readily achievable means easily accomplishable and able to be carried out without much difficulty or expense. In determining whether an action is readily achievable factors to be considered include –

(1) The nature and cost of the action needed under this part;

(2) The overall financial resources of the site or sites involved in the action; the number of persons employed at the site; the effect on expenses and resources; legitimate safety requirements that are necessary for safe operation, including crime prevention measures; or the impact otherwise of the action upon the operation of the site;

(3) The geographic separateness, and the administrative or fiscal relationship of the site or sites in question to any parent corporation or entity;

(4) If applicable, the overall financial resources of any parent corporation or entity; the overall size of the parent corporation or entity with respect to the number of its employees; the number, type, and location of its facilities; and

(5) If applicable, the type of operation or operations of any parent corporation or entity, including the composition, structure, and functions of the workforce of the parent corporation or entity.

Religious entity means a religious organization, including a place of worship.

Service animal means any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability. Other species of animals, whether wild or domestic, trained or untrained, are not service animals for the purposes of this definition. The work or tasks performed by a service animal must be directly related to the individual´s disability. Examples of work or tasks include, but are not limited to, assisting individuals who are blind or have low vision with navigation and other tasks, alerting individuals who are deaf or hard of hearing to the presence of people or sounds, providing non-violent protection or rescue work, pulling a wheelchair, assisting an individual during a seizure, alerting individuals to the presence of allergens, retrieving items such as medicine or the telephone, providing physical support and assistance with balance and stability to individuals with mobility disabilities, and helping persons with psychiatric and neurological disabilities by preventing or interrupting impulsive or destructive behaviors. The crime deterrent effects of an animal´s presence and the provision of emotional support, well-being, comfort, or companionship do not constitute work or tasks for the purposes of this definition.

Specified public transportation means transportation by bus, rail, or any other conveyance (other than by aircraft) that provides the general public with general or special service (including charter service) on a regular and continuing basis.

State means each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the Virgin Islands, the Trust Territory of the Pacific Islands, and the Commonwealth of the Northern Mariana Islands.

Undue burden means significant difficulty or expense. In determining whether an action would result in an undue burden, factors to be considered include –

(1) The nature and cost of the action needed under this part;

(2) The overall financial resources of the site or sites involved in the action; the number of per-

sons employed at the site; the effect on expenses and resources; legitimate safety requirements that are necessary for safe operation, including crime prevention measures; or the impact otherwise of the action upon the operation of the site;

(3) The geographic separateness, and the administrative or fiscal relationship of the site or sites in question to any parent corporation or entity;

(4) If applicable, the overall financial resources of any parent corporation or entity; the overall size of the parent corporation or entity with respect to the number of its employees; the number, type, and location of its facilities; and

(5) If applicable, the type of operation or operations of any parent corporation or entity, including the composition, structure, and functions of the workforce of the parent corporation or entity.

Video remote interpreting (VRI) service means an interpreting service that uses video conference technology over dedicated lines or wireless technology offering high-speed, wide-bandwidth video connection that delivers high-quality video images as provided in § 36.303(f).

Wheelchair means a manually-operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor or of both indoor and outdoor locomotion. This definition does not apply to Federal wilderness areas; wheelchairs in such areas are defined in section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2).

§§ 36.105 – 36.199 [Reserved]

Subpart B – General Requirements

§ 36.201 General.

(a) *Prohibition of discrimination*. No individual shall be discriminated against on the basis of disability in the full and equal enjoyment of the goods, services, facilities, privileges, advantages, or accommodations of any place of public accommodation by any private entity who owns, leases (or leases to), or operates a place of public accommodation.

(b) *Landlord and tenant responsibilities.* Both the landlord who owns the building that houses a place of public accommodation and the tenant who owns or operates the place of public accommodation are public accommodations subject to the requirements of this part. As between the parties, allocation of responsibility for complying with the obligations of this part may be determined by lease or other contract.

§ 36.202 Activities.

(a) *Denial of participation*. A public accommodation shall not subject an individual or class of individuals on the basis of a disability or disabilities of such individual or class, directly, or through contractual, licensing, or other arrangements, to a denial of the opportunity of the individual or class to participate in or benefit from the goods, services, facilities, privileges, advantages, or accommodations of a place of public accommodation.

(b) *Participation in unequal benefit.* A public accommodation shall not afford an individual or class of individuals, on the basis of a disability or disabilities of such individual or class, directly, or through contractual, licensing, or other arrangements, with the opportunity to participate in or benefit from a good, service, facility, privilege, advantage, or accommodation that is not equal to that afforded to other individuals.

(c) *Separate benefit*. A public accommodation shall not provide an individual or class of individuals, on the basis of a disability or disabilities of such individual or class, directly, or through contractual, licensing, or other arrangements with a good, service, facility, privilege, advantage, or accommodation that is different or separate from that provided to other individuals, unless such action is necessary to provide the individual or class of individuals with a good, service, facility, privilege, advantage, or accommodation, or other

opportunity that is as effective as that provided to others.
(d) *Individual or class of individuals.* For purposes of paragraphs (a) through (c) of this section, the term "individual or class of individuals" refers to the clients or customers of the public accommodation that enters into the contractual, licensing, or other arrangement.

§ 36.203 Integrated settings.
(a) *General*. A public accommodation shall afford goods, services, facilities, privileges, advantages, and accommodations to an individual with a disability in the most integrated setting appropriate to the needs of the individual.
(b) *Opportunity to participate*. Notwithstanding the existence of separate or different programs or activities provided in accordance with this subpart, a public accommodation shall not deny an individual with a disability an opportunity to participate in such programs or activities that are not separate or different.
(c) *Accommodations and services.*

(1) Nothing in this part shall be construed to require an individual with a disability to accept an accommodation, aid, service, opportunity, or benefit available under this part that such individual chooses not to accept.

(2) Nothing in the Act or this part authorizes the representative or guardian of an individual with a disability to decline food, water, medical treatment, or medical services for that individual.

§ 36.204 Administrative methods.
A public accommodation shall not, directly or through contractual or other arrangements, utilize standards or criteria or methods of administration that have the effect of discriminating on the basis of disability, or that perpetuate the discrimination of others who are subject to common administrative control.

§ 36.205 Association.
A public accommodation shall not exclude or otherwise deny equal goods, services, facilities, privileges, advantages, accommodations, or other opportunities to an individual or entity because of the known disability of an individual with whom the individual or entity is known to have a relationship or association.

§ 36.206 Retaliation or coercion.
(a) No private or public entity shall discriminate against any individual because that individual has opposed any act or practice made unlawful by this part, or because that individual made a charge, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under the Act or this part.
(b) No private or public entity shall coerce, intimidate, threaten, or interfere with any individual in the exercise or enjoyment of, or on account of his or her having exercised or enjoyed, or on account of his or her having aided or encouraged any other individual in the exercise or enjoyment of, any right granted or protected by the Act or this part.
(c) Illustrations of conduct prohibited by this section include, but are not limited to:

(1) Coercing an individual to deny or limit the benefits, services, or advantages to which he or she is entitled under the Act or this part;

(2) Threatening, intimidating, or interfering with an individual with a disability who is seeking to obtain or use the goods, services, facilities, privileges, advantages, or accommodations of a public accommodation;

(3) Intimidating or threatening any person because that person is assisting or encouraging an individual or group entitled to claim the rights granted or protected by the Act or this part to exercise those rights; or

(4) Retaliating against any person because that person has participated in any investigation or action to enforce the Act or this part.

§ 36.207 Places of public accommodation located in private residences.

(a) When a place of public accommodation is located in a private residence, the portion of the residence used exclusively as a residence is not covered by this part, but that portion used exclusively in the operation of the place of public accommodation or that portion used both for the place of public accommodation and for residential purposes is covered by this part.

(b) The portion of the residence covered under paragraph (a) of this section extends to those elements used to enter the place of public accommodation, including the homeowner´s front sidewalk, if any, the door or entryway, and hallways; and those portions of the residence, interior or exterior, available to or used by customers or clients, including restrooms.

§ 36.208 Direct threat.

(a) This part does not require a public accommodation to permit an individual to participate in or benefit from the goods, services, facilities, privileges, advantages and accommodations of that public accommodation when that individual poses a direct threat to the health or safety of others.

(b) In determining whether an individual poses a direct threat to the health or safety of others, a public accommodation must make an individualized assessment, based on reasonable judgment that relies on current medical knowledge or on the best available objective evidence, to ascertain: The nature, duration, and severity of the risk; the probability that the potential injury will actually occur; and whether reasonable modifications of policies, practices, or procedures or the provision of auxiliary aids or services will mitigate the risk.

§ 36.209 Illegal use of drugs.

(a) *General.*

(1) Except as provided in paragraph (b) of this section, this part does not prohibit discrimination against an individual based on that individual´s current illegal use of drugs.

(2) A public accommodation shall not discriminate on the basis of illegal use of drugs against an individual who is not engaging in current illegal use of drugs and who –

(i) Has successfully completed a supervised drug rehabilitation program or has otherwise been rehabilitated successfully;

(ii) Is participating in a supervised rehabilitation program; or

(iii) Is erroneously regarded as engaging in such use.

(b) *Health and drug rehabilitation services.*

(1) A public accommodation shall not deny health services, or services provided in connection with drug rehabilitation, to an individual on the basis of that individual´s current illegal use of drugs, if the individual is otherwise entitled to such services.

(2) A drug rehabilitation or treatment program may deny participation to individuals who engage in illegal use of drugs while they are in the program.

(c) Drug testing.

(1) This part does not prohibit a public accommodation from adopting or administering reasonable policies or procedures, including but not limited to drug testing, designed to ensure that an individual who formerly engaged in the illegal use of drugs is not now engaging in current illegal use of drugs.

(2) Nothing in this paragraph (c) shall be construed to encourage, prohibit, restrict, or authorize the conducting of testing for the illegal use of drugs.

§ 36.210 Smoking.

This part does not preclude the prohibition of, or the imposition of restrictions on, smoking in places of public accommodation.

§ 36.211 Maintenance of accessible features.

(a) A public accommodation shall maintain in operable working condition those features of facilities and equipment that are required to be readily

accessible to and usable by persons with disabilities by the Act or this part.
(b) This section does not prohibit isolated or temporary interruptions in service or access due to maintenance or repairs.
(c) If the 2010 Standards reduce the technical requirements or the number of required accessible elements below the number required by the 1991 Standards, the technical requirements or the number of accessible elements in a facility subject to this part may be reduced in accordance with the requirements of the 2010 Standards.

§ 36.212 Insurance.
(a) This part shall not be construed to prohibit or restrict –

(1) An insurer, hospital or medical service company, health maintenance organization, or any agent, or entity that administers benefit plans, or similar organizations from underwriting risks, classifying risks, or administering such risks that are based on or not inconsistent with State law; or

(2) A person or organization covered by this part from establishing, sponsoring, observing or administering the terms of a bona fide benefit plan that are based on underwriting risks, classifying risks, or administering such risks that are based on or not inconsistent with State law; or

(3) A person or organization covered by this part from establishing, sponsoring, observing or administering the terms of a bona fide benefit plan that is not subject to State laws that regulate insurance.

(b) Paragraphs (a) (1), (2), and (3) of this section shall not be used as a subterfuge to evade the purposes of the Act or this part.
(c) A public accommodation shall not refuse to serve an individual with a disability because its insurance company conditions coverage or rates on the absence of individuals with disabilities.

§ 36.213 Relationship of subpart B to subparts C and D of this part.
Subpart B of this part sets forth the general principles of nondiscrimination applicable to all entities subject to this part. Subparts C and D of this part provide guidance on the application of the statute to specific situations. The specific provisions, including the limitations on those provisions, control over the general provisions in circumstances where both specific and general provisions apply.

§§ 36.214 – 36.299 [Reserved]

Subpart C – Specific Requirements

§ 36.301 Eligibility criteria.
(a) *General.* A public accommodation shall not impose or apply eligibility criteria that screen out or tend to screen out an individual with a disability or any class of individuals with disabilities from fully and equally enjoying any goods, services, facilities, privileges, advantages, or accommodations, unless such criteria can be shown to be necessary for the provision of the goods, services, facilities, privileges, advantages, or accommodations being offered.
(b) *Safety.* A public accommodation may impose legitimate safety requirements that are necessary for safe operation. Safety requirements must be based on actual risks and not on mere speculation, stereotypes, or generalizations about individuals with disabilities.
(c) *Charges*. A public accommodation may not impose a surcharge on a particular individual with a disability or any group of individuals with disabilities to cover the costs of measures, such as the provision of auxiliary aids, barrier removal, alternatives to barrier removal, and reasonable modifications in policies, practices, or procedures, that are required to provide that individual or group with the nondiscriminatory treatment required by the Act or this part.

§ 36.302 Modifications in policies, practices, or procedures.

(a) *General.* A public accommodation shall make reasonable modifications in policies, practices, or procedures, when the modifications are necessary to afford goods, services, facilities, privileges, advantages, or accommodations to individuals with disabilities, unless the public accommodation can demonstrate that making the modifications would fundamentally alter the nature of the goods, services, facilities, privileges, advantages, or accommodations.

(b) *Specialties –*

(1) *General.* A public accommodation may refer an individual with a disability to another public accommodation, if that individual is seeking, or requires, treatment or services outside of the referring public accommodation´s area of specialization, and if, in the normal course of its operations, the referring public accommodation would make a similar referral for an individual without a disability who seeks or requires the same treatment or services.

(2) *Illustration – medical specialties*. A health care provider may refer an individual with a disability to another provider, if that individual is seeking, or requires, treatment or services outside of the referring provider´s area of specialization, and if the referring provider would make a similar referral for an individual without a disability who seeks or requires the same treatment or services. A physician who specializes in treating only a particular condition cannot refuse to treat an individual with a disability for that condition, but is not required to treat the individual for a different condition.

(c) *Service animals.*

(1) *General.* Generally, a public accommodation shall modify policies, practices, or procedures to permit the use of a service animal by an individual with a disability.

(c)(2) *Exceptions.* A public accommodation may ask an individual with a disability to remove a service animal from the premises if:

(i) The animal is out of control and the animal´s handler does not take effective action to control it; or

(ii) The animal is not housebroken.

(3) *If an animal is properly excluded.* If a public accommodation properly excludes a service animal under § 36.302(c)(2), it shall give the individual with a disability the opportunity to obtain goods, services, and accommodations without having the service animal on the premises.

(4) *Animal under handler´s control.* A service animal shall be under the control of its handler. A service animal shall have a harness, leash, or other tether, unless either the handler is unable because of a disability to use a harness, leash, or other tether, or the use of a harness, leash, or other tether would interfere with the service animal´s safe, effective performance of work or tasks, in which case the service animal must be otherwise under the handler´s control (*e.g.,* voice control, signals, or other effective means).

(5) *Care or supervision*. A public accommodation is not responsible for the care or supervision of a service animal.

(6) *Inquiries*. A public accommodation shall not ask about the nature or extent of a person´s disability, but may make two inquiries to determine whether an animal qualifies as a service animal. A public accommodation may ask if the animal is required because of a disability and what work or task the animal has been trained to perform. A public accommodation shall not require documentation, such as proof that the animal has been certified, trained, or licensed as a service animal. Generally, a public accommodation may not make these inquiries about a service animal when it is readily apparent that an animal is trained to do work or perform tasks for an individual with a disability (*e.g.,* the dog is observed guiding an individual who is blind or has low vision, pulling a person´s wheelchair, or providing assistance with stability or balance to an individual with an observable mobility disability).

(7) *Access to areas of a public accommodation*. Individuals with disabilities shall be permitted to be accompanied by their service animals in all areas of a place of public accommodation where members of the public, program participants, clients, customers, patrons, or invitees, as relevant, are allowed to go.

(8) *Surcharges*. A public accommodation shall not ask or require an individual with a disability to pay a surcharge, even if people accompanied by pets are required to pay fees, or to comply with other requirements generally not applicable to people without pets. If a public accommodation normally charges individuals for the damage they cause, an individual with a disability may be charged for damage caused by his or her service animal.

(9) *Miniature horses.*

(i) A public accommodation shall make reasonable modifications in policies, practices, or procedures to permit the use of a miniature horse by an individual with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability.

(ii) *Assessment factors*. In determining whether reasonable modifications in policies, practices, or procedures can be made to allow a miniature horse into a specific facility, a public accommodation shall consider –

(A) The type, size, and weight of the miniature horse and whether the facility can accommodate these features;

(B) Whether the handler has sufficient control of the miniature horse;

(C) Whether the miniature horse is housebroken; and

(D) Whether the miniature horse´s presence in a specific facility compromises legitimate safety requirements that are necessary for safe operation.

(iii) *Other requirements*. Sections 36.302(c)(3) through (c)(8), which apply to service animals, shall also apply to miniature horses.

(d) *Check-out aisles*. A store with check-out aisles shall ensure that an adequate number of accessible check-out aisles are kept open during store hours, or shall otherwise modify its policies and practices, in order to ensure that an equivalent level of convenient service is provided to individuals with disabilities as is provided to others. If only one check-out aisle is accessible, and it is generally used for express service, one way of providing equivalent service is to allow persons with mobility impairments to make all their purchases at that aisle.

(e)

(1) *Reservations made by places of lodging*. A public accommodation that owns, leases (or leases to), or operates a place of lodging shall, with respect to reservations made by any means, including by telephone, in-person, or through a third party –

(i) Modify its policies, practices, or procedures to ensure that individuals with disabilities can make reservations for accessible guest rooms during the same hours and in the same manner as individuals who do not need accessible rooms;

(ii) Identify and describe accessible features in the hotels and guest rooms offered through its reservations service in enough detail to reasonably permit individuals with disabilities to assess independently whether a given hotel or guest room meets his or her accessibility needs;

(iii) Ensure that accessible guest rooms are held for use by individuals with disabilities until all other guest rooms of that type have been rented and the accessible room requested is the only remaining room of that type;

(iv) Reserve, upon request, accessible guest rooms or specific types of guest rooms and ensure that the guest rooms requested are blocked and removed from all reservations systems; and

(v) Guarantee that the specific accessible guest room reserved through its reservations

service is held for the reserving customer, regardless of whether a specific room is held in response to reservations made by others.

(2) *Exception*. The requirements in paragraphs (iii), (iv), and (v) of this section do not apply to reservations for individual guest rooms or other units not owned or substantially controlled by the entity that owns, leases, or operates the overall facility.

(3) *Compliance date*. The requirements in this section will apply to reservations made on or after March 15, 2012.

(f) *Ticketing*.

(1)

(i) For the purposes of this section, "accessible seating" is defined as wheelchair spaces and companion seats that comply with sections 221 and 802 of the 2010 Standards along with any other seats required to be offered for sale to the individual with a disability pursuant to paragraph (4) of this section.

(ii) *Ticket sales*. A public accommodation that sells tickets for a single event or series of events shall modify its policies, practices, or procedures to ensure that individuals with disabilities have an equal opportunity to purchase tickets for accessible seating –

(A) During the same hours;

(B) During the same stages of ticket sales, including, but not limited to, presales, promotions, lotteries, wait-lists, and general sales;

(C) Through the same methods of distribution;

(D) In the same types and numbers of ticketing sales outlets, including telephone service, in-person ticket sales at the facility, or third-party ticketing services, as other patrons; and

(E) Under the same terms and conditions as other tickets sold for the same event or series of events.

(2) *Identification of available accessible seating.* A public accommodation that sells or distributes tickets for a single event or series of events shall, upon inquiry –

(i) Inform individuals with disabilities, their companions, and third parties purchasing tickets for accessible seating on behalf of individuals with disabilities of the locations of all unsold or otherwise available accessible seating for any ticketed event or events at the facility;

(ii) Identify and describe the features of available accessible seating in enough detail to reasonably permit an individual with a disability to assess independently whether a given accessible seating location meets his or her accessibility needs; and

(iii) Provide materials, such as seating maps, plans, brochures, pricing charts, or other information, that identify accessible seating and information relevant thereto with the same text or visual representations as other seats, if such materials are provided to the general public.

(3) *Ticket prices.* The price of tickets for accessible seating for a single event or series of events shall not be set higher than the price for other tickets in the same seating section for the same event or series of events. Tickets for accessible seating must be made available at all price levels for every event or series of events. If tickets for accessible seating at a particular price level cannot be provided because barrier removal in an existing facility is not readily achievable, then the percentage of tickets for accessible seating that should have been available at that price level but for the barriers (determined by the ratio of the total number of tickets at that price level to the total number of tickets in the assembly area) shall be offered for purchase, at that price level, in a nearby or similar accessible location.

(4) *Purchasing multiple tickets.*

(i) *General.* For each ticket for a wheelchair space purchased by an individual with a disability or a third-party purchasing such a ticket at his or her request, a public accommodation shall make available for purchase three addi-

tional tickets for seats in the same row that are contiguous with the wheelchair space, provided that at the time of purchase there are three such seats available. A public accommodation is not required to provide more than three contiguous seats for each wheelchair space. Such seats may include wheelchair spaces.

(ii) *Insufficient additional contiguous seats available*. If patrons are allowed to purchase at least four tickets, and there are fewer than three such additional contiguous seat tickets available for purchase, a public accommodation shall offer the next highest number of such seat tickets available for purchase and shall make up the difference by offering tickets for sale for seats that are as close as possible to the accessible seats.

(iii) *Sales limited to fewer than four tickets*. If a public accommodation limits sales of tickets to fewer than four seats per patron, then the public accommodation is only obligated to offer as many seats to patrons with disabilities, including the ticket for the wheelchair space, as it would offer to patrons without disabilities.

(iv) *Maximum number of tickets patrons may purchase exceeds four.* If patrons are allowed to purchase more than four tickets, a public accommodation shall allow patrons with disabilities to purchase up to the same number of tickets, including the ticket for the wheelchair space.

(v) *Group sales.* If a group includes one or more individuals who need to use accessible seating because of a mobility disability or because their disability requires the use of the accessible features that are provided in accessible seating, the group shall be placed in a seating area with accessible seating so that, if possible, the group can sit together. If it is necessary to divide the group, it should be divided so that the individuals in the group who use wheelchairs are not isolated from their group.

(5) *Hold and release of tickets for accessible seating*.

(i) *Tickets for accessible seating may be released for sale in certain limited circumstances.* A public accommodation may release unsold tickets for accessible seating for sale to individuals without disabilities for their own use for a single event or series of events only under the following circumstances –

(A) When all non-accessible tickets (excluding luxury boxes, club boxes, or suites) have been sold;

(B) When all non-accessible tickets in a designated seating area have been sold and the tickets for accessible seating are being released in the same designated area; or

(C) When all non-accessible tickets in a designated price category have been sold and the tickets for accessible seating are being released within the same designated price category.

(ii) *No requirement to release accessible tickets.* Nothing in this paragraph requires a facility to release tickets for accessible seating to individuals without disabilities for their own use.

(iii) *Release of series-of-events tickets on a series-of-events basis*.

(A) *Series-of-events tickets sell-out when no ownership rights are attached*. When series-of-events tickets are sold out and a public accommodation releases and sells accessible seating to individuals without disabilities for a series of events, the public accommodation shall establish a process that prevents the automatic reassignment of the accessible seating to such ticket holders for future seasons, future years, or future series, so that individuals with disabilities who require the features of accessible seating and who become newly eligible to purchase tickets when these series-of-events tickets are available for purchase have an opportunity to do so.

(B) *Series-of-events tickets when ownership rights are attached.* When series-of-events tickets with an ownership right in accessible seating areas are forfeited or otherwise returned to a public accommodation, the public accommodation shall make reasonable modifications in its policies, practices, or procedures to afford individuals with mobility disabilities or individuals with disabilities that require the features of accessible seating an opportunity to purchase such tickets in accessible seating areas.

(6) *Ticket transfer.* Individuals with disabilities who hold tickets for accessible seating shall be permitted to transfer tickets to third parties under the same terms and conditions and to the same extent as other spectators holding the same type of tickets, whether they are for a single event or series of events.

(7) *Secondary ticket market.*

(i) A public accommodation shall modify its policies, practices, or procedures to ensure that an individual with a disability may use a ticket acquired in the secondary ticket market under the same terms and conditions as other individuals who hold a ticket acquired in the secondary ticket market for the same event or series of events.

(ii) If an individual with a disability acquires a ticket or series of tickets to an inaccessible seat through the secondary market, a public accommodation shall make reasonable modifications to its policies, practices, or procedures to allow the individual to exchange his ticket for one to an accessible seat in a comparable location if accessible seating is vacant at the time the individual presents the ticket to the public accommodation.

(8) *Prevention of fraud in purchase of tickets for accessible seating.* A public accommodation may not require proof of disability, including, for example, a doctor´s note, before selling tickets for accessible seating.

(i) *Single-event tickets.* For the sale of single-event tickets, it is permissible to inquire whether the individual purchasing the tickets for accessible seating has a mobility disability or a disability that requires the use of the accessible features that are provided in accessible seating, or is purchasing the tickets for an individual who has a mobility disability or a disability that requires the use of the accessible features that are provided in the accessible seating.

(ii) *Series-of-events tickets.* For series-of-events tickets, it is permissible to ask the individual purchasing the tickets for accessible seating to attest in writing that the accessible seating is for a person who has a mobility disability or a disability that requires the use of the accessible features that are provided in the accessible seating.

(iii) *Investigation of fraud.* A public accommodation may investigate the potential misuse of accessible seating where there is good cause to believe that such seating has been purchased fraudulently.

§ 36.303 Auxiliary aids and services.

(a) *General*. A public accommodation shall take those steps that may be necessary to ensure that no individual with a disability is excluded, denied services, segregated or otherwise treated differently than other individuals because of the absence of auxiliary aids and services, unless the public accommodation can demonstrate that taking those steps would fundamentally alter the nature of the goods, services, facilities, privileges, advantages, or accommodations being offered or would result in an undue burden, *i.e.,* significant difficulty or expense.

(b) *Examples.* The term "auxiliary aids and services" includes –

(1) Qualified interpreters on-site or through video remote interpreting (VRI) services; notetakers; real-time computer-aided transcription services; written materials; exchange of written

notes; telephone handset amplifiers; assistive listening devices; assistive listening systems; telephones compatible with hearing aids; closed caption decoders; open and closed captioning, including real-time captioning; voice, text, and video-based telecommunications products and systems, including text telephones (TTYs), videophones, and captioned telephones, or equally effective telecommunications devices; videotext displays; accessible electronic and information technology; or other effective methods of making aurally delivered information available to individuals who are deaf or hard of hearing;

(2) Qualified readers; taped texts; audio recordings; Brailled materials and displays; screen reader software; magnification software; optical readers; secondary auditory programs (SAP); large print materials; accessible electronic and information technology; or other effective methods of making visually delivered materials available to individuals who are blind or have low vision;

(3) Acquisition or modification of equipment or devices; and

(4) Other similar services and actions.

(c) *Effective communication.*

(1) A public accommodation shall furnish appropriate auxiliary aids and services where necessary to ensure effective communication with individuals with disabilities. This includes an obligation to provide effective communication to companions who are individuals with disabilities.

(i) For purposes of this section, "companion" means a family member, friend, or associate of an individual seeking access to, or participating in, the goods, services, facilities, privileges, advantages, or accommodations of a public accommodation, who, along with such individual, is an appropriate person with whom the public accommodation should communicate.

(ii) The type of auxiliary aid or service necessary to ensure effective communication will vary in accordance with the method of communication used by the individual; the nature, length, and complexity of the communication involved; and the context in which the communication is taking place. A public accommodation should consult with individuals with disabilities whenever possible to determine what type of auxiliary aid is needed to ensure effective communication, but the ultimate decision as to what measures to take rests with the public accommodation, provided that the method chosen results in effective communication. In order to be effective, auxiliary aids and services must be provided in accessible formats, in a timely manner, and in such a way as to protect the privacy and independence of the individual with a disability.

(2) A public accommodation shall not require an individual with a disability to bring another individual to interpret for him or her.

(3) A public accommodation shall not rely on an adult accompanying an individual with a disability to interpret or facilitate communication, except –

(i) In an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available; or

(ii) Where the individual with a disability specifically requests that the accompanying adult interpret or facilitate communication, the accompanying adult agrees to provide such assistance, and reliance on that adult for such assistance is appropriate under the circumstances.

(4) A public accommodation shall not rely on a minor child to interpret or facilitate communication, except in an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available.

(d) *Telecommunications*.

(1) When a public accommodation uses an automated-attendant system, including, but not

limited to, voicemail and messaging, or an interactive voice response system, for receiving and directing incoming telephone calls, that system must provide effective real-time communication with individuals using auxiliary aids and services, including text telephones (TTYs) and all forms of FCC-approved telecommunications relay systems, including Internet-based relay systems.

(2) A public accommodation that offers a customer, client, patient, or participant the opportunity to make outgoing telephone calls using the public accommodation´s equipment on more than an incidental convenience basis shall make available public telephones, TTYs, or other telecommunications products and systems for use by an individual who is deaf or hard of hearing, or has a speech impairment.

(3) A public accommodation may use relay services in place of direct telephone communication for receiving or making telephone calls incident to its operations.

(4) A public accommodation shall respond to telephone calls from a telecommunications relay service established under title IV of the ADA in the same manner that it responds to other telephone calls.

(5) This part does not require a public accommodation to use a TTY for receiving or making telephone calls incident to its operations.

(e) *Closed caption decoders.* Places of lodging that provide televisions in five or more guest rooms and hospitals that provide televisions for patient use shall provide, upon request, a means for decoding captions for use by an individual with impaired hearing.

(f) *Video remote interpreting (VRI) services*. A public accommodation that chooses to provide qualified interpreters via VRI service shall ensure that it provides –

(1) Real-time, full-motion video and audio over a dedicated high-speed, wide-bandwidth video connection or wireless connection that delivers high-quality video images that do not produce lags, choppy, blurry, or grainy images, or irregular pauses in communication;

(2) A sharply delineated image that is large enough to display the interpreter´s face, arms, hands, and fingers, and the participating individual´s face, arms, hands, and fingers, regardless of his or her body position;

(3) A clear, audible transmission of voices; and

(4) Adequate training to users of the technology and other involved individuals so that they may quickly and efficiently set up and operate the VRI.

(g) *Alternatives.* If provision of a particular auxiliary aid or service by a public accommodation would result in a fundamental alteration in the nature of the goods, services, facilities, privileges, advantages, or accommodations being offered or in an undue burden, *i.e.,* significant difficulty or expense, the public accommodation shall provide an alternative auxiliary aid or service, if one exists, that would not result in an alteration or such burden but would nevertheless ensure that, to the maximum extent possible, individuals with disabilities receive the goods, services, facilities, privileges, advantages, or accommodations offered by the public accommodation.

§ 36.304 Removal of barriers.

(a) *General.* A public accommodation shall remove architectural barriers in existing facilities, including communication barriers that are structural in nature, where such removal is readily achievable, *i.e.,* easily accomplishable and able to be carried out without much difficulty or expense.

(b) *Examples*. Examples of steps to remove barriers include, but are not limited to, the following actions –

(1) Installing ramps;

(2) Making curb cuts in sidewalks and entrances;

(3) Repositioning shelves;

(4) Rearranging tables, chairs, vending machines, display racks, and other furniture;

(5) Repositioning telephones;

(6) Adding raised markings on elevator control buttons;

(7) Installing flashing alarm lights;

(8) Widening doors;

(9) Installing offset hinges to widen doorways;

(10) Eliminating a turnstile or providing an alternative accessible path;

(11) Installing accessible door hardware;

(12) Installing grab bars in toilet stalls;

(13) Rearranging toilet partitions to increase maneuvering space;

(14) Insulating lavatory pipes under sinks to prevent burns;

(15) Installing a raised toilet seat;

(16) Installing a full-length bathroom mirror;

(17) Repositioning the paper towel dispenser in a bathroom;

(18) Creating designated accessible parking spaces;

(19) Installing an accessible paper cup dispenser at an existing inaccessible water fountain;

(20) Removing high pile, low density carpeting; or

(21) Installing vehicle hand controls.

(c) *Priorities.* A public accommodation is urged to take measures to comply with the barrier removal requirements of this section in accordance with the following order of priorities.

(1) First, a public accommodation should take measures to provide access to a place of public accommodation from public sidewalks, parking, or public transportation. These measures include, for example, installing an entrance ramp, widening entrances, and providing accessible parking spaces.

(2) Second, a public accommodation should take measures to provide access to those areas of a place of public accommodation where goods and services are made available to the public. These measures include, for example, adjusting the layout of display racks, rearranging tables, providing Brailled and raised character signage, widening doors, providing visual alarms, and installing ramps.

(3) Third, a public accommodation should take measures to provide access to restroom facilities. These measures include, for example, removal of obstructing furniture or vending machines, widening of doors, installation of ramps, providing accessible signage, widening of toilet stalls, and installation of grab bars.

(4) Fourth, a public accommodation should take any other measures necessary to provide access to the goods, services, facilities, privileges, advantages, or accommodations of a place of public accommodation.

(d) *Relationship to alterations requirements of subpart D of this part*.

(1) Except as provided in paragraph (d)(3) of this section, measures taken to comply with the barrier removal requirements of this section shall comply with the applicable requirements for alterations in § 36.402 and §§ 36.404 through 36.406 of this part for the element being altered. The path of travel requirements of §36.403 shall not apply to measures taken solely to comply with the barrier removal requirements of this section.

(2)

(i) *Safe harbor*. Elements that have not been altered in existing facilities on or after March 15, 2012, and that comply with the corresponding technical and scoping specifications for those elements in the 1991 Standards are not required to be modified in order to comply with the requirements set forth in the 2010 Standards.

(ii)

(A) Before March 15, 2012, elements in existing facilities that do not comply with the corresponding technical and scoping specifications for those elements in the 1991 Standards must be modified to the extent readily achievable to comply with either the 1991 Standards or the 2010 Standards. Noncomplying newly constructed and altered elements may also be

subject to the requirements of § 36.406(a)(5).

(B) On or after March 15, 2012, elements in existing facilities that do not comply with the corresponding technical and scoping specifications for those elements in the 1991 Standards must be modified to the extent readily achievable to comply with the requirements set forth in the 2010 Standards. Noncomplying newly constructed and altered elements may also be subject to the requirements of § 36.406(a)(5).

(iii) The safe harbor provided in § 36.304(d)(2)(i) does not apply to those elements in existing facilities that are subject to supplemental requirements (*i.e.,* elements for which there are neither technical nor scoping specifications in the 1991 Standards), and therefore those elements must be modified to the extent readily achievable to comply with the 2010 Standards. Noncomplying newly constructed and altered elements may also be subject to the requirements of § 36.406(a)(5). Elements in the 2010 Standards not eligible for the element-by-element safe harbor are identified as follows –

(A) *Residential facilities and dwelling units*, sections 233 and 809.

(B) *Amusement rides*, sections 234 and 1002; 206.2.9; 216.12.

(C) *Recreational boating facilities*, sections 235 and 1003; 206.2.10.

(D) *Exercise machines and equipment,* sections 236 and 1004; 206.2.13.

(E) *Fishing piers and platforms,* sections 237 and 1005; 206.2.14.

(F) *Golf facilities,* sections 238 and 1006; 206.2.15.

(G) *Miniature golf facilities*, sections 239 and 1007; 206.2.16.

(H) *Play areas*, sections 240 and 1008; 206.2.17.

(I) *Saunas and steam rooms,* sections 241 and 612.

(J) *Swimming pools, wading pools, and spas*, sections 242 and 1009.

(K) *Shooting facilities with firing positions,* sections 243 and 1010.

(L) *Miscellaneous.*

(1) Team or player seating, section 221.2.1.4.

(2) Accessible route to bowling lanes, section 206.2.11.

(3) Accessible route in court sports facilities, section 206.2.12.

(3) If, as a result of compliance with the alterations requirements specified in paragraph (d)(1) and (d)(2) of this section, the measures required to remove a barrier would not be readily achievable, a public accommodation may take other readily achievable measures to remove the barrier that do not fully comply with the specified requirements. Such measures include, for example, providing a ramp with a steeper slope or widening a doorway to a narrower width than that mandated by the alterations requirements. No measure shall be taken, however, that poses a significant risk to the health or safety of individuals with disabilities or others.

(e) *Portable ramps.* Portable ramps should be used to comply with this section only when installation of a permanent ramp is not readily achievable. In order to avoid any significant risk to the health or safety of individuals with disabilities or others in using portable ramps, due consideration shall be given to safety features such as nonslip surfaces, railings, anchoring, and strength of materials.

(f) *Selling or serving space*. The rearrangement of temporary or movable structures, such as furniture, equipment, and display racks is not readily achievable to the extent that it results in a significant loss of selling or serving space.

Appendix to § 36.304(d)

Compliance Dates and Applicable Standards for Barrier Removal and Safe Harbor		
Date	Requirement	Applicable Standards
Before March 15, 2012	Elements that do not comply with the requirements for those elements in the 1991 Standards must be modified to the extent readily achievable. Note: Noncomplying newly constructed and altered elements may also be subject to the requirements of § 36.406(a)(5).	1991 Standards or 2010 Standards
On or after March 15, 2012	Elements that do not comply with the requirements for those elements in the 1991 Standards or that do not comply with the supplemental requirements (i.e., elements for which there are neither technical nor scoping specifications in the 1991 Standards) must be modified to the extent readily achievable. Note: Noncomplying newly constructed and altered elements may also be subject to the requirements of § 36.406(a)(5).	2010 Standards
Elements not altered after March 15, 2012	Elements that comply with the requirements for those elements in the 1991 Standards do not need to be modified.	Safe Harbor

(g) *Limitation on barrier removal obligations*. (1) The requirements for barrier removal under § 36.304 shall not be interpreted to exceed the standards for alterations in subpart D of this part.

(2) To the extent that relevant standards for alterations are not provided in subpart D of this part, then the requirements of § 36.304 shall not be interpreted to exceed the standards for new construction in subpart D of this part.

(3) This section does not apply to rolling stock and other conveyances to the extent that § 36.310 applies to rolling stock and other conveyances.

(4) This requirement does not apply to guest rooms in existing facilities that are places of lodging where the guest rooms are not owned by the entity that owns, leases, or operates the overall facility and the physical features of the guest room interiors are controlled by their individual owners.

§ 36.305 Alternatives to barrier removal.

(a) *General.* Where a public accommodation can demonstrate that barrier removal is not readily achievable, the public accommodation shall not fail to make its goods, services, facilities, privileges, advantages, or accommodations available through alternative methods, if those methods are readily achievable.

(b) *Examples.* Examples of alternatives to barrier

removal include, but are not limited to, the following actions –

(1) Providing curb service or home delivery;

(2) Retrieving merchandise from inaccessible shelves or racks;

(3) Relocating activities to accessible locations;

(c) *Multiscreen cinemas.* If it is not readily achievable to remove barriers to provide access by persons with mobility impairments to all of the theaters of a multiscreen cinema, the cinema shall establish a film rotation schedule that provides reasonable access for individuals who use wheelchairs to all films. Reasonable notice shall be provided to the public as to the location and time of accessible showings.

§ 36.306 Personal devices and services.

This part does not require a public accommodation to provide its customers, clients, or participants with personal devices, such as wheelchairs; individually prescribed devices, such as prescription eyeglasses or hearing aids; or services of a personal nature including assistance in eating, toileting, or dressing.

§ 36.307 Accessible or special goods.

(a) This part does not require a public accommodation to alter its inventory to include accessible or special goods that are designed for, or facilitate use by, individuals with disabilities.

(b) A public accommodation shall order accessible or special goods at the request of an individual with disabilities, if, in the normal course of its operation, it makes special orders on request for unstocked goods, and if the accessible or special goods can be obtained from a supplier with whom the public accommodation customarily does business.

(c) Examples of accessible or special goods include items such as Brailled versions of books, books on audio cassettes, closed-captioned video tapes, special sizes or lines of clothing, and special foods to meet particular dietary needs.

§ 36.308 Seating in assembly areas.

A public accommodation shall ensure that wheelchair spaces and companion seats are provided in each specialty seating area that provides spectators with distinct services or amenities that generally are not available to other spectators. If it is not readily achievable for a public accommodation to place wheelchair spaces and companion seats in each such specialty seating area, it shall provide those services or amenities to individuals with disabilities and their companions at other designated accessible locations at no additional cost. The number of wheelchair spaces and companion seats provided in specialty seating areas shall be included in, rather than in addition to, wheelchair space requirements set forth in table 221.2.1.1 in the 2010 Standards.

§ 36.309 Examinations and courses.

(a) *General.* Any private entity that offers examinations or courses related to applications, licensing, certification, or credentialing for secondary or postsecondary education, professional, or trade purposes shall offer such examinations or courses in a place and manner accessible to persons with disabilities or offer alternative accessible arrangements for such individuals.

(b) *Examinations.*

(1) Any private entity offering an examination covered by this section must assure that –

(i) The examination is selected and administered so as to best ensure that, when the examination is administered to an individual with a disability that impairs sensory, manual, or speaking skills, the examination results accurately reflect the individual´s aptitude or achievement level or whatever other factor the examination purports to measure, rather than reflecting the individual´s impaired sensory, manual, or speaking skills (except where those skills are the factors that the examination purports to measure);

(ii) An examination that is designed for individuals with impaired sensory, manual, or

speaking skills is offered at equally convenient locations, as often, and in as timely a manner as are other examinations; and

(iii) The examination is administered in facilities that are accessible to individuals with disabilities or alternative accessible arrangements are made.

(iv) Any request for documentation, if such documentation is required, is reasonable and limited to the need for the modification, accommodation, or auxiliary aid or service requested.

(v) When considering requests for modifications, accommodations, or auxiliary aids or services, the entity gives considerable weight to documentation of past modifications, accommodations, or auxiliary aids or services received in similar testing situations, as well as such modifications, accommodations, or related aids and services provided in response to an Individualized Education Program (IEP) provided under the Individuals with Disabilities Education Act or a plan describing services provided pursuant to section 504 of the Rehabilitation Act of 1973, as amended (often referred as a Section 504 Plan).

(vi) The entity responds in a timely manner to requests for modifications, accommodations, or aids to ensure equal opportunity for individuals with disabilities.

(2) Required modifications to an examination may include changes in the length of time permitted for completion of the examination and adaptation of the manner in which the examination is given.

(3) A private entity offering an examination covered by this section shall provide appropriate auxiliary aids for persons with impaired sensory, manual, or speaking skills, unless that private entity can demonstrate that offering a particular auxiliary aid would fundamentally alter the measurement of the skills or knowledge the examination is intended to test or would result in an undue burden. Auxiliary aids and services required by this section may include taped examinations, interpreters or other effective methods of making orally delivered materials available to individuals with hearing impairments, Brailled or large print examinations and answer sheets or qualified readers for individuals with visual impairments or learning disabilities, transcribers for individuals with manual impairments, and other similar services and actions.

(4) Alternative accessible arrangements may include, for example, provision of an examination at an individual´s home with a proctor if accessible facilities or equipment are unavailable. Alternative arrangements must provide comparable conditions to those provided for nondisabled individuals.

(c) *Courses*.

(1) Any private entity that offers a course covered by this section must make such modifications to that course as are necessary to ensure that the place and manner in which the course is given are accessible to individuals with disabilities.

(2) Required modifications may include changes in the length of time permitted for the completion of the course, substitution of specific requirements, or adaptation of the manner in which the course is conducted or course materials are distributed.

(3) A private entity that offers a course covered by this section shall provide appropriate auxiliary aids and services for persons with impaired sensory, manual, or speaking skills, unless the private entity can demonstrate that offering a particular auxiliary aid or service would fundamentally alter the course or would result in an undue burden. Auxiliary aids and services required by this section may include taped texts, interpreters or other effective methods of making orally delivered materials available to individuals with hearing impairments, Brailled or large print texts or qualified readers for individuals with visual impairments and learning disabilities, classroom equipment adapted for use by

individuals with manual impairments, and other similar services and actions.

(4) Courses must be administered in facilities that are accessible to individuals with disabilities or alternative accessible arrangements must be made.

(5) Alternative accessible arrangements may include, for example, provision of the course through videotape, cassettes, or prepared notes. Alternative arrangements must provide comparable conditions to those provided for nondisabled individuals.

§ 36.310 Transportation provided by public accommodations.

(a) *General.*

(1) A public accommodation that provides transportation services, but that is not primarily engaged in the business of transporting people, is subject to the general and specific provisions in subparts B, C, and D of this part for its transportation operations, except as provided in this section.

(2) *Examples*. Transportation services subject to this section include, but are not limited to, shuttle services operated between transportation terminals and places of public accommodation, customer shuttle bus services operated by private companies and shopping centers, student transportation systems, and transportation provided within recreational facilities such as stadiums, zoos, amusement parks, and ski resorts.

(b) *Barrier removal.* A public accommodation subject to this section shall remove transportation barriers in existing vehicles and rail passenger cars used for transporting individuals (not including barriers that can only be removed through the retrofitting of vehicles or rail passenger cars by the installation of a hydraulic or other lift) where such removal is readily achievable.

(c) *Requirements for vehicles and systems.* A public accommodation subject to this section shall comply with the requirements pertaining to vehicles and transportation systems in the regulations issued by the Secretary of Transportation pursuant to section 306 of the Act.

§ 36.311 Mobility devices.

(a) *Use of wheelchairs and manually-powered mobility aids.* A public accommodation shall permit individuals with mobility disabilities to use wheelchairs and manually-powered mobility aids, such as walkers, crutches, canes, braces, or other similar devices designed for use by individuals with mobility disabilities in any areas open to pedestrian use.

(b)

(1) *Use of other power-driven mobility devices.* A public accommodation shall make reasonable modifications in its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with mobility disabilities, unless the public accommodation can demonstrate that the class of other power-driven mobility devices cannot be operated in accordance with legitimate safety requirements that the public accommodation has adopted pursuant to § 36.301(b).

(2) *Assessment factors.* In determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification under paragraph (b)(1) of this section, a public accommodation shall consider –

(i) The type, size, weight, dimensions, and speed of the device;

(ii) The facility´s volume of pedestrian traffic (which may vary at different times of the day, week, month, or year);

(iii) The facility´s design and operational characteristics (*e.g.,* whether its business is conducted indoors, its square footage, the density and placement of stationary devices, and the availability of storage for the device, if requested by the user);

(iv) Whether legitimate safety requirements can be established to permit the safe operation of the other power-driven mobility device in the specific facility; and

(v) Whether the use of the other power-driven mobility device creates a substantial risk of serious harm to the immediate environment or natural or cultural resources, or poses a conflict with Federal land management laws and regulations.

(c)

(1) *Inquiry about disability.* A public accommodation shall not ask an individual using a wheelchair or other power-driven mobility device questions about the nature and extent of the individual´s disability.

(2) *Inquiry into use of other power-driven mobility device*. A public accommodation may ask a person using an other power-driven mobility device to provide a credible assurance that the mobility device is required because of the person´s disability. A public accommodation that permits the use of an other power-driven mobility device by an individual with a mobility disability shall accept the presentation of a valid, State-issued disability parking placard or card, or State-issued proof of disability, as a credible assurance that the use of the other power-driven mobility device is for the individual´s mobility disability. In lieu of a valid, State-issued disability parking placard or card, or State-issued proof of disability, a public accommodation shall accept as a credible assurance a verbal representation, not contradicted by observable fact, that the other power-driven mobility device is being used for a mobility disability. A "valid" disability placard or card is one that is presented by the individual to whom it was issued and is otherwise in compliance with the State of issuance´s requirements for disability placards or cards.

§§ 36.312 – 36.399 [Reserved]

Subpart D – New Construction and Alterations

§ 36.401 New construction.

(a) *General.*

(1) Except as provided in paragraphs (b) and (c) of this section, discrimination for purposes of this part includes a failure to design and construct facilities for first occupancy after January 26, 1993, that are readily accessible to and usable by individuals with disabilities.

(2) For purposes of this section, a facility is designed and constructed for first occupancy after January 26, 1993, only –

(i) If the last application for a building permit or permit extension for the facility is certified to be complete, by a State, County, or local government after January 26, 1992 (or, in those jurisdictions where the government does not certify completion of applications, if the last application for a building permit or permit extension for the facility is received by the State, County, or local government after January 26, 1992); and

(ii) If the first certificate of occupancy for the facility is issued after January 26, 1993.

(b) *Commercial facilities located in private residences.*

(1) When a commercial facility is located in a private residence, the portion of the residence used exclusively as a residence is not covered by this subpart, but that portion used exclusively in the operation of the commercial facility or that portion used both for the commercial facility and for residential purposes is covered by the new construction and alterations requirements of this subpart.

(2) The portion of the residence covered under paragraph (b)(1) of this section extends to those elements used to enter the commercial facility, including the homeowner´s front sidewalk, if any, the door or entryway, and hallways; and those portions of the residence, interior or exterior, available to or used by employees or visitors

of the commercial facility, including restrooms.

(c) *Exception for structural impracticability.*

(1) Full compliance with the requirements of this section is not required where an entity can demonstrate that it is structurally impracticable to meet the requirements. Full compliance will be considered structurally impracticable only in those rare circumstances when the unique characteristics of terrain prevent the incorporation of accessibility features.

(2) If full compliance with this section would be structurally impracticable, compliance with this section is required to the extent that it is not structurally impracticable. In that case, any portion of the facility that can be made accessible shall be made accessible to the extent that it is not structurally impracticable.

(3) If providing accessibility in conformance with this section to individuals with certain disabilities (*e.g.,* those who use wheelchairs) would be structurally impracticable, accessibility shall nonetheless be ensured to persons with other types of disabilities (*e.g.,* those who use crutches or who have sight, hearing, or mental impairments) in accordance with this section.

(d) *Elevator exemption.*

(1) For purposes of this paragraph (d) –

(i) Professional office of a health care provider means a location where a person or entity regulated by a State to provide professional services related to the physical or mental health of an individual makes such services available to the public. The facility housing the "professional office of a health care provider" only includes floor levels housing at least one health care provider, or any floor level designed or intended for use by at least one health care provider.

(ii) Shopping center or shopping mall means –

(A) A building housing five or more sales or rental establishments; or

(B) A series of buildings on a common site, either under common ownership or common control or developed either as one project or as a series of related projects, housing five or more sales or rental establishments. For purposes of this section, places of public accommodation of the types listed in paragraph (5) of the definition of "place of public accommodation" in section § 36.104 are considered sales or rental establishments. The facility housing a "shopping center or shopping mall" only includes floor levels housing at least one sales or rental establishment, or any floor level designed or intended for use by at least one sales or rental establishment.

(2) This section does not require the installation of an elevator in a facility that is less than three stories or has less than 3000 square feet per story, except with respect to any facility that houses one or more of the following:

(i) A shopping center or shopping mall, or a professional office of a health care provider.

(ii) A terminal, depot, or other station used for specified public transportation, or an airport passenger terminal. In such a facility, any area housing passenger services, including boarding and debarking, loading and unloading, baggage claim, dining facilities, and other common areas open to the public, must be on an accessible route from an accessible entrance.

(3) The elevator exemption set forth in this paragraph (d) does not obviate or limit, in any way the obligation to comply with the other accessibility requirements established in paragraph (a) of this section. For example, in a facility that houses a shopping center or shopping mall, or a professional office of a health care provider, the floors that are above or below an accessible ground floor and that do not house sales or rental establishments or a professional office of a health care provider, must meet the requirements of this section but for the elevator.

§ 36.402 Alterations.

(a) *General.*

(1) Any alteration to a place of public accommodation or a commercial facility, after January 26, 1992, shall be made so as to ensure that, to the maximum extent feasible, the altered portions of the facility are readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs.

(2) An alteration is deemed to be undertaken after January 26, 1992, if the physical alteration of the property begins after that date.

(b) *Alteration.* For the purposes of this part, an alteration is a change to a place of public accommodation or a commercial facility that affects or could affect the usability of the building or facility or any part thereof.

(1) Alterations include, but are not limited to, remodeling, renovation, rehabilitation, reconstruction, historic restoration, changes or rearrangement in structural parts or elements, and changes or rearrangement in the plan configuration of walls and full-height partitions. Normal maintenance, reroofing, painting or wallpapering, asbestos removal, or changes to mechanical and electrical systems are not alterations unless they affect the usability of the building or facility.

(2) If existing elements, spaces, or common areas are altered, then each such altered element, space, or area shall comply with the applicable provisions of appendix A to this part.

(c) *To the maximum extent feasible.* The phrase "to the maximum extent feasible," as used in this section, applies to the occasional case where the nature of an existing facility makes it virtually impossible to comply fully with applicable accessibility standards through a planned alteration. In these circumstances, the alteration shall provide the maximum physical accessibility feasible. Any altered features of the facility that can be made accessible shall be made accessible. If providing accessibility in conformance with this section to individuals with certain disabilities (*e.g.,* those who use wheelchairs) would not be feasible, the facility shall be made accessible to persons with other types of disabilities (*e.g.,* those who use crutches, those who have impaired vision or hearing, or those who have other impairments).

§ 36.403 Alterations: Path of travel.

(a) *General.*

(1) An alteration that affects or could affect the usability of or access to an area of a facility that contains a primary function shall be made so as to ensure that, to the maximum extent feasible, the path of travel to the altered area and the restrooms, telephones, and drinking fountains serving the altered area, are readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs, unless the cost and scope of such alterations is disproportionate to the cost of the overall alteration.

(2) If a private entity has constructed or altered required elements of a path of travel at a place of public accommodation or commercial facility in accordance with the specifications in the 1991 Standards, the private entity is not required to retrofit such elements to reflect the incremental changes in the 2010 Standards solely because of an alteration to a primary function area served by that path of travel.

(b) *Primary function.* A "primary function" is a major activity for which the facility is intended. Areas that contain a primary function include, but are not limited to, the customer services lobby of a bank, the dining area of a cafeteria, the meeting rooms in a conference center, as well as offices and other work areas in which the activities of the public accommodation or other private entity using the facility are carried out. Mechanical rooms, boiler rooms, supply storage rooms, employee lounges or locker rooms, janitorial closets, entrances, corridors, and restrooms are not areas containing a primary function.

(c) *Alterations to an area containing a primary function*.

(1) Alterations that affect the usability of or access to an area containing a primary function include, but are not limited to –

(i) Remodeling merchandise display areas or employee work areas in a department store;

(ii) Replacing an inaccessible floor surface in the customer service or employee work areas of a bank;

(iii) Redesigning the assembly line area of a factory; or

(iv) Installing a computer center in an accounting firm.

(2) For the purposes of this section, alterations to windows, hardware, controls, electrical outlets, and signage shall not be deemed to be alterations that affect the usability of or access to an area containing a primary function.

(d) *Landlord/tenant:* If a tenant is making alterations as defined in § 36.402 that would trigger the requirements of this section, those alterations by the tenant in areas that only the tenant occupies do not trigger a path of travel obligation upon the landlord with respect to areas of the facility under the landlord´s authority, if those areas are not otherwise being altered.

(e) *Path of travel.*

(1) A "path of travel" includes a continuous, unobstructed way of pedestrian passage by means of which the altered area may be approached, entered, and exited, and which connects the altered area with an exterior approach (including sidewalks, streets, and parking areas), an entrance to the facility, and other parts of the facility.

(2) An accessible path of travel may consist of walks and sidewalks, curb ramps and other interior or exterior pedestrian ramps; clear floor paths through lobbies, corridors, rooms, and other improved areas; parking access aisles; elevators and lifts; or a combination of these elements.

(3) For the purposes of this part, the term "path of travel" also includes the restrooms, telephones, and drinking fountains serving the altered area.

(f) *Disproportionality.*

(1) Alterations made to provide an accessible path of travel to the altered area will be deemed disproportionate to the overall alteration when the cost exceeds 20% of the cost of the alteration to the primary function area.

(2) Costs that may be counted as expenditures required to provide an accessible path of travel may include:

(i) Costs associated with providing an accessible entrance and an accessible route to the altered area, for example, the cost of widening doorways or installing ramps;

(ii) Costs associated with making restrooms accessible, such as installing grab bars, enlarging toilet stalls, insulating pipes, or installing accessible faucet controls;

(iii) Costs associated with providing accessible telephones, such as relocating the telephone to an accessible height, installing amplification devices, or installing a text telephone (TTY);

(iv) Costs associated with relocating an inaccessible drinking fountain.

(g) *Duty to provide accessible features in the event of disproportionality.*

(1) When the cost of alterations necessary to make the path of travel to the altered area fully accessible is disproportionate to the cost of the overall alteration, the path of travel shall be made accessible to the extent that it can be made accessible without incurring disproportionate costs.

(2) In choosing which accessible elements to provide, priority should be given to those elements that will provide the greatest access, in the following order:

(i) An accessible entrance;

(ii) An accessible route to the altered area;

(iii) At least one accessible restroom for each sex or a single unisex restroom;

(iv) Accessible telephones;

(v) Accessible drinking fountains; and

(vi) When possible, additional accessible elements such as parking, storage, and alarms.

(h) *Series of smaller alterations.*

(1) The obligation to provide an accessible path of travel may not be evaded by performing a series of small alterations to the area served by a single path of travel if those alterations could have been performed as a single undertaking.

(2)

(i) If an area containing a primary function has been altered without providing an accessible path of travel to that area, and subsequent alterations of that area, or a different area on the same path of travel, are undertaken within three years of the original alteration, the total cost of alterations to the primary function areas on that path of travel during the preceding three year period shall be considered in determining whether the cost of making that path of travel accessible is disproportionate.

(ii) Only alterations undertaken after January 26, 1992, shall be considered in determining if the cost of providing an accessible path of travel is disproportionate to the overall cost of the alterations.

§ 36.404 Alterations: Elevator exemption.

(a) This section does not require the installation of an elevator in an altered facility that is less than three stories or has less than 3,000 square feet per story, except with respect to any facility that houses a shopping center, a shopping mall, the professional office of a health care provider, a terminal, depot, or other station used for specified public transportation, or an airport passenger terminal.

(1) For the purposes of this section, "professional office of a health care provider" means a location where a person or entity regulated by a State to provide professional services related to the physical or mental health of an individual makes such services available to the public. The facility that houses a "professional office of a health care provider" only includes floor levels housing by at least one health care provider, or any floor level designed or intended for use by at least one health care provider.

(2) For the purposes of this section, shopping center or shopping mall means –

(i) A building housing five or more sales or rental establishments; or

(ii) A series of buildings on a common site, connected by a common pedestrian access route above or below the ground floor, that is either under common ownership or common control or developed either as one project or as a series of related projects, housing five or more sales or rental establishments. For purposes of this section, places of public accommodation of the types listed in paragraph (5) of the definition of "place of public accommodation" in § 36.104 are considered sales or rental establishments. The facility housing a "shopping center or shopping mall" only includes floor levels housing at least one sales or rental establishment, or any floor level designed or intended for use by at least one sales or rental establishment.

(b) The exemption provided in paragraph (a) of this section does not obviate or limit in any way the obligation to comply with the other accessibility requirements established in this subpart. For example, alterations to floors above or below the accessible ground floor must be accessible regardless of whether the altered facility has an elevator.

§ 36.405 Alterations: Historic preservation.

(a) Alterations to buildings or facilities that are eligible for listing in the National Register of Historic Places under the National Historic Preservation Act (16 U.S.C. 470 *et seq*.) or are designated as historic under State or local law, shall comply to the maximum extent feasible with this part.

(b) If it is determined that it is not feasible to provide physical access to an historic property that

is a place of public accommodation in a manner that will not threaten or destroy the historic significance of the building or the facility, alternative methods of access shall be provided pursuant to the requirements of subpart C of this part.

§ 36.406 Standards for new construction and alterations.

(a) *Accessibility standards and compliance date.*

(1) New construction and alterations subject to §§ 36.401 or 36.402 shall comply with the 1991 Standards if the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government (or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government) is before September 15, 2010, or if no permit is required, if the start of physical construction or alterations occurs before September 15, 2010.

(2) New construction and alterations subject to §§ 36.401 or 36.402 shall comply either with the 1991 Standards or with the 2010 Standards if the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government (or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government) is on or after September 15, 2010, and before March 15, 2012, or if no permit is required, if the start of physical construction or alterations occurs on or after September 15, 2010, and before March 15, 2012.

(3) New construction and alterations subject to §§ 36.401 or 36.402 shall comply with the 2010 Standards if the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government (or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government) is on or after March 15, 2012, or if no permit is required, if the start of physical construction or alterations occurs on or after March 15, 2012.

(4) For the purposes of this section, "start of physical construction or alterations" does not mean ceremonial groundbreaking or razing of structures prior to site preparation.

(5) *Noncomplying new construction and alterations.* (i) Newly constructed or altered facilities or elements covered by §§ 36.401 or 36.402 that were constructed or altered before March 15, 2012, and that do not comply with the 1991 Standards shall, before March 15, 2012, be made accessible in accordance with either the 1991 Standards or the 2010 Standards.

(ii) Newly constructed or altered facilities or elements covered by §§ 36.401 or 36.402 that were constructed or altered before March 15, 2012 and that do not comply with the 1991 Standards shall, on or after March 15, 2012, be made accessible in accordance with the 2010 Standards.

Appendix to § 36.406(a)

Compliance Dates for New Construction and Alterations	Applicable Standards
On or after January 26, 1993 and before September 15, 2010	1991 Standards
On or after September 15, 2010 and before March 15, 2012	1991 Standards or 2010 Standards
On or after March 15, 2012	2010 Standards

(b) *Scope of coverage.* The 1991 Standards and the 2010 Standards apply to fixed or built-in elements of buildings, structures, site improvements, and pedestrian routes or vehicular ways located on a site. Unless specifically stated otherwise, advisory notes, appendix notes, and figures contained in the 1991 Standards and 2010 Standards explain or illustrate the requirements of the rule; they do not establish enforceable requirements.

(c) *Places of lodging.* Places of lodging subject to this part shall comply with the provisions of the 2010 Standards applicable to transient lodging, including, but not limited to, the requirements for transient lodging guest rooms in sections 224 and 806 of the 2010 Standards.

(1) *Guest rooms*. Guest rooms with mobility features in places of lodging subject to the transient lodging requirements of 2010 Standards shall be provided as follows –

(i) Facilities that are subject to the same permit application on a common site that each have 50 or fewer guest rooms may be combined for the purposes of determining the required number of accessible rooms and type of accessible bathing facility in accordance with table 224.2 to section 224.2 of the 2010 Standards.

(ii) Facilities with more than 50 guest rooms shall be treated separately for the purposes of determining the required number of accessible rooms and type of accessible bathing facility in accordance with table 224.2 to section 224.2 of the 2010 Standards.

(2) *Exception.* Alterations to guest rooms in places of lodging where the guest rooms are not owned or substantially controlled by the entity that owns, leases, or operates the overall facility and the physical features of the guest room interiors are controlled by their individual owners are not required to comply with § 36.402 or the alterations requirements in section 224.1.1 of the 2010 Standards.

(3) *Facilities with residential units and transient lodging units.* Residential dwelling units that are designed and constructed for residential use exclusively are not subject to the transient lodging standards.

(d) *Social service center establishments.* Group homes, halfway houses, shelters, or similar social service center establishments that provide either temporary sleeping accommodations or residential dwelling units that are subject to this part shall comply with the provisions of the 2010 Standards applicable to residential facilities, including, but not limited to, the provisions in sections 233 and 809.

(1) In sleeping rooms with more than 25 beds covered by this part, a minimum of 5% of the beds shall have clear floor space complying with section 806.2.3 of the 2010 Standards.

(2) Facilities with more than 50 beds covered by this part that provide common use bathing facilities shall provide at least one roll-in shower with a seat that complies with the relevant provisions of section 608 of the 2010 Standards. Transfer-type showers are not permitted in lieu of a roll-in shower with a seat, and the exceptions in sections 608.3 and 608.4 for residential dwelling units are not permitted. When separate shower facilities are provided for men and for women, at least one roll-in shower shall be provided for each group.

(e) *Housing at a place of education.* Housing at a place of education that is subject to this part shall comply with the provisions of the 2010 Standards applicable to transient lodging, including, but not limited to, the requirements for transient lodging guest rooms in sections 224 and 806, subject to the following exceptions. For the purposes of the application of this section, the term "sleeping room" is intended to be used interchangeably with the term "guest room" as it is used in the transient lodging standards.

(1) Kitchens within housing units containing accessible sleeping rooms with mobility features (including suites and clustered sleeping rooms)

or on floors containing accessible sleeping rooms with mobility features shall provide turning spaces that comply with section 809.2.2 of the 2010 Standards and kitchen work surfaces that comply with section 804.3 of the 2010 Standards.

(2) Multi-bedroom housing units containing accessible sleeping rooms with mobility features shall have an accessible route throughout the unit in accordance with section 809.2 of the 2010 Standards.

(3) Apartments or townhouse facilities that are provided by or on behalf of a place of education, which are leased on a year-round basis exclusively to graduate students or faculty and do not contain any public use or common use areas available for educational programming, are not subject to the transient lodging standards and shall comply with the requirements for residential facilities in sections 233 and 809 of the 2010 Standards.

(f) *Assembly areas*. Assembly areas that are subject to this part shall comply with the provisions of the 2010 Standards applicable to assembly areas, including, but not limited to, sections 221 and 802. In addition, assembly areas shall ensure that –

(1) In stadiums, arenas, and grandstands, wheelchair spaces and companion seats are dispersed to all levels that include seating served by an accessible route;

(2) In assembly areas that are required to horizontally disperse wheelchair spaces and companion seats by section 221.2.3.1 of the 2010 Standards and that have seating encircling, in whole or in part, a field of play or performance, wheelchair spaces and companion seats are dispersed around that field of play or performance area;

(3) Wheelchair spaces and companion seats are not located on (or obstructed by) temporary platforms or other movable structures, except that when an entire seating section is placed on temporary platforms or other movable structures in an area where fixed seating is not provided, in order to increase seating for an event, wheelchair spaces and companion seats may be placed in that section. When wheelchair spaces and companion seats are not required to accommodate persons eligible for those spaces and seats, individual, removable seats may be placed in those spaces and seats;

(4) In stadium-style movie theaters, wheelchair spaces and companion seats are located on a riser or cross-aisle in the stadium section that satisfies at least one of the following criteria –

(i) It is located within the rear 60% of the seats provided in an auditorium; or

(ii) It is located within the area of an auditorium in which the vertical viewing angles (as measured to the top of the screen) are from the 40th to the 100th percentile of vertical viewing angles for all seats as ranked from the seats in the first row (1st percentile) to seats in the back row (100th percentile).

(g) *Medical care facilities.* Medical care facilities that are subject to this part shall comply with the provisions of the 2010 Standards applicable to medical care facilities, including, but not limited to, sections 223 and 805. In addition, medical care facilities that do not specialize in the treatment of conditions that affect mobility shall disperse the accessible patient bedrooms required by section 223.2.1 of the 2010 Standards in a manner that is proportionate by type of medical specialty.

§ §36.407 – 36.499 [Reserved]

Subpart E – Enforcement

§ 36.501 Private suits.

(a) *General*. Any person who is being subjected to discrimination on the basis of disability in violation of the Act or this part or who has reasonable grounds for believing that such person is about to be subjected to discrimination in violation of section 303 of the Act or subpart D of this part may institute a civil action for preventive relief, includ-

ing an application for a permanent or temporary injunction, restraining order, or other order. Upon timely application, the court may, in its discretion, permit the Attorney General to intervene in the civil action if the Attorney General or his or her designee certifies that the case is of general public importance. Upon application by the complainant and in such circumstances as the court may deem just, the court may appoint an attorney for such complainant and may authorize the commencement of the civil action without the payment of fees, costs, or security. Nothing in this section shall require a person with a disability to engage in a futile gesture if the person has actual notice that a person or organization covered by title III of the Act or this part does not intend to comply with its provisions.

(b) *Injunctive relief.* In the case of violations of § 36.304, §§ 36.308, 36.310(b), 36.401, 36.402, 36.403, and 36.405 of this part, injunctive relief shall include an order to alter facilities to make such facilities readily accessible to and usable by individuals with disabilities to the extent required by the Act or this part. Where appropriate, injunctive relief shall also include requiring the provision of an auxiliary aid or service, modification of a policy, or provision of alternative methods, to the extent required by the Act or this part.

§ 36.502 Investigations and compliance reviews.

(a) The Attorney General shall investigate alleged violations of the Act or this part.

(b) Any individual who believes that he or she or a specific class of persons has been subjected to discrimination prohibited by the Act or this part may request the Department to institute an investigation.

(c) Where the Attorney General has reason to believe that there may be a violation of this part, he or she may initiate a compliance review.

§ 36.503 Suit by the Attorney General.

Following a compliance review or investigation under § 36.502, or at any other time in his or her discretion, the Attorney General may commence a civil action in any appropriate United States district court if the Attorney General has reasonable cause to believe that –

(a) Any person or group of persons is engaged in a pattern or practice of discrimination in violation of the Act or this part; or

(b) Any person or group of persons has been discriminated against in violation of the Act or this part and the discrimination raises an issue of general public importance.

§ 36.504 Relief.

(a) *Authority of court*. In a civil action under § 36.503, the court –

(1) May grant any equitable relief that such court considers to be appropriate, including, to the extent required by the Act or this part –

(i) Granting temporary, preliminary, or permanent relief;

(ii) Providing an auxiliary aid or service, modification of policy, practice, or procedure, or alternative method; and

(iii) Making facilities readily accessible to and usable by individuals with disabilities;

(2) May award other relief as the court considers to be appropriate, including monetary damages to persons aggrieved when requested by the Attorney General; and

(3) May, to vindicate the public interest, assess a civil penalty against the entity in an amount

(i) Not exceeding $50,000 for a first violation occurring before September 29, 1999, and not exceeding $55,000 for a first violation occurring on or after September 29, 1999; and

(ii) Not exceeding $100,000 for any subsequent violation occurring before September 29, 1999, and not exceeding $110,000 for any subsequent violation occurring on or after September 29, 1999.

(b) *Single violation*. For purposes of paragraph (a)(3) of this section, in determining whether a first or subsequent violation has occurred, a determination in a single action, by judgment or settlement,

that the covered entity has engaged in more than one discriminatory act shall be counted as a single violation.

(c) *Punitive damages*. For purposes of paragraph (a)(2) of this section, the terms "monetary damages" and "such other relief" do not include punitive damages.

(d) *Judicial consideration*. In a civil action under § 36.503, the court, when considering what amount of civil penalty, if any, is appropriate, shall give consideration to any good faith effort or attempt to comply with this part by the entity. In evaluating good faith, the court shall consider, among other factors it deems relevant, whether the entity could have reasonably anticipated the need for an appropriate type of auxiliary aid needed to accommodate the unique needs of a particular individual with a disability.

§ 36.505 Attorneys fees.

In any action or administrative proceeding commenced pursuant to the Act or this part, the court or agency, in its discretion, may allow the prevailing party, other than the United States, a reasonable attorney´s fee, including litigation expenses, and costs, and the United States shall be liable for the foregoing the same as a private individual.

§ 36.506 Alternative means of dispute resolution.

Where appropriate and to the extent authorized by law, the use of alternative means of dispute resolution, including settlement negotiations, conciliation, facilitation, mediation, factfinding, minitrials, and arbitration, is encouraged to resolve disputes arising under the Act and this part.

§ 36.507 Effect of unavailability of technical assistance.

A public accommodation or other private entity shall not be excused from compliance with the requirements of this part because of any failure to receive technical assistance, including any failure in the development or dissemination of any technical assistance manual authorized by the Act.

§ 36.508 Effective date.

(a) *General*. Except as otherwise provided in this section and in this part, this part shall become effective on January 26, 1992.

(b) *Civil actions.* Except for any civil action brought for a violation of section 303 of the Act, no civil action shall be brought for any act or omission described in section 302 of the Act that occurs –

(1) Before July 26, 1992, against businesses with 25 or fewer employees and gross receipts of $1,000,000 or less.

(2) Before January 26, 1993, against businesses with 10 or fewer employees and gross receipts of $500,000 or less.

(c) Transportation services provided by public accommodations. Newly purchased or leased vehicles required to be accessible by § 36.310 must be readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs, if the solicitation for the vehicle is made after August 25, 1990.

§§ 36.509 – 36.599 [Reserved]

Subpart F – Certification of State Laws or Local Building Codes

§ 36.601 Definitions.

Assistant Attorney General means the Assistant Attorney General for Civil Rights or his or her designee.

Certification of equivalency means a final certification that a code meets or exceeds the minimum requirements of title III of the Act for accessibility and usability of facilities covered by that title.

Code means a State law or local building code or similar ordinance, or part thereof, that establishes accessibility requirements.

Model code means a nationally recognized document developed by a private entity for use by State or local jurisdictions in developing codes as

defined in this section. A model code is intended for incorporation by reference or adoption in whole or in part, with or without amendment, by State or local jurisdictions.

Preliminary determination of equivalency means a preliminary determination that a code appears to meet or exceed the minimum requirements of title III of the Act for accessibility and usability of facilities covered by that title.

Submitting official means the State or local official who –

(1) Has principal responsibility for administration of a code, or is authorized to submit a code on behalf of a jurisdiction; and

(2) Files a request for certification under this subpart.

§ 36.602 General rule.

On the application of a State or local government, the Assistant Attorney General may certify that a code meets or exceeds the minimum requirements of the Act for the accessibility and usability of places of public accommodation and commercial facilities under this part by issuing a certification of equivalency. At any enforcement proceeding under title III of the Act, such certification shall be rebuttable evidence that such State law or local ordinance does meet or exceed the minimum requirements of title III.

§ 36.603 Preliminary determination. (*Redesignated from Section 36.604*)

Upon receipt and review of all information relevant to a request filed by a submitting official for certification of a code, and after consultation with the Architectural and Transportation Barriers Compliance Board, the Assistant Attorney General shall make a preliminary determination of equivalency or a preliminary determination to deny certification.

§ 36.604 Procedure following preliminary determination of equivalency. ***(Redesignated from Section 36.605)***

(a) If the Assistant Attorney General makes a preliminary determination of equivalency under § 36.603, he or she shall inform the submitting official, in writing, of that preliminary determination. The Assistant Attorney General also shall –

(1) Publish a notice in the **Federal Register** that advises the public of the preliminary determination of equivalency with respect to the particular code, and invite interested persons and organizations, including individuals with disabilities, during a period of at least 60 days following publication of the notice, to file written comments relevant to whether a final certification of equivalency should be issued;

(2) After considering the information received in response to the notice described in paragraph (a) of this section, and after publishing a separate notice in the **Federal Register,** hold an informal hearing, in the State or local jurisdiction charged with administration and enforcement of the code, at which interested individuals, including individuals with disabilities, are provided an opportunity to express their views with respect to the preliminary determination of equivalency; and

(b) The Assistant Attorney General, after consultation with the Architectural and Transportation Barriers Compliance Board and consideration of the materials and information submitted pursuant to this section, as well as information provided previously by the submitting official, shall issue either a certification of equivalency or a final determination to deny the request for certification. The Assistant Attorney General shall publish notice of the certification of equivalency or denial of certification in the **Federal Register.**

§ 36.605 Procedure following preliminary denial of certification. (*Redesignated from Section 36.606*)

(a) If the Assistant Attorney General makes a preliminary determination to deny certification of a code under § 36.603, he or she shall notify the submitting official of the determination.

(b) The Assistant Attorney General shall allow the submitting official not less than 15 days to submit data, views, and arguments in opposition to the preliminary determination to deny certification. If the submitting official does not submit materials, the Assistant Attorney General shall not be required to take any further action. If the submitting official submits materials, the Assistant Attorney General shall evaluate those materials and any other relevant information. After evaluation of any newly submitted materials, the Assistant Attorney General shall make either a final denial of certification or a preliminary determination of equivalency.

§ 36.606 Effect of certification. (*Redesignated from Section 36.607*)

(a)

(1) A certification shall be considered a certification of equivalency only with respect to those features or elements that are both covered by the certified code and addressed by the standards against which equivalency is measured.

(2) For example, if certain equipment is not covered by the code, the determination of equivalency cannot be used as evidence with respect to the question of whether equipment in a building built according to the code satisfies the Act´s requirements with respect to such equipment. By the same token, certification would not be relevant to construction of a facility for children, if the regulations against which equivalency is measured do not address children´s facilities.

(b) A certification of equivalency is effective only with respect to the particular edition of the code for which certification is granted. Any amendments or other changes to the code after the date of the certified edition are not considered part of the certification.

(c) A submitting official may reapply for certification of amendments or other changes to a code that has already received certification.

(d) When the standards of the Act against which a code is deemed equivalent are revised or amended substantially, a certification of equivalency issued under the preexisting standards is no longer effective, as of the date the revised standards take effect. However, construction in compliance with a certified code during the period when a certification of equivalency was effective shall be considered rebuttable evidence of compliance with the Standards then in effect as to those elements of buildings and facilities that comply with the certified code. A submitting official may reapply for certification pursuant to the Act´s revised standards, and, to the extent possible, priority will be afforded the request in the review process.

§ 36.607 Guidance concerning model codes. (*Redesignated from Section 36.608*)

Upon application by an authorized representative of a private entity responsible for developing a model code, the Assistant Attorney General may review the relevant model code and issue guidance concerning whether and in what respects the model code is consistent with the minimum requirements of the Act for the accessibility and usability of places of public accommodation and commercial facilities under this part.

Title III Regulations

2010 Guidance and Section-by-Section Analysis

Department of Justice

This revised title III regulation integrates the Department's new regulatory provisions with the text of the existing title III regulation that was unchanged by the 2010 revisions.

Appendix A to Part 36—Guidance on Revisions to ADA Regulation on Nondiscrimination on the Basis of Disability by Public Accommodations and Commercial Facilities

Note: This Appendix contains guidance providing a section-by-section analysis of the revisions to 28 CFR part 36 published on September 15, 2010.

Section-By-Section Analysis and Response to Public Comments

This section provides a detailed description of the Department's changes to the title III regulation, the reasoning behind those changes, and responses to public comments received on these topics. The Section-by-Section Analysis follows the order of the title III regulation itself, except that if the Department has not changed a regulatory section, the unchanged section has not been mentioned.

Subpart A—General

Section 36.104 Definitions

''1991 Standards'' and ''2004 ADAAG''

The Department has included in the final rule new definitions of both the ''1991 Standards'' and the ''2004 ADAAG.'' The term ''1991 Standards'' refers to the ADA Standards for Accessible Design, originally published on July 26, 1991, and republished as Appendix D to 28 CFR part 36. The term ''2004 ADAAG'' refers to ADA Chapter 1, ADA Chapter 2, and Chapters 3 through 10 of the Americans with Disabilities Act and the Architectural Barriers Act Accessibility Guidelines, which were issued by the Access Board on July 23, 2004, codified at 36 CFR 1191, app. B and D (2009), and which the Department has adopted in this final rule. These terms are included in the definitions section for ease of reference.

''2010 Standards''

The Department has added to the final rule a definition of the term ''2010 Standards.'' The term ''2010 Standards'' refers to the 2010 ADA Standards for Accessible Design, which consist of the 2004 ADAAG and the requirements contained in subpart D of 28 CFR part 36.

''Direct Threat''

The final rule moves the definition of direct threat from § 36.208(b) to the definitions section at §36.104. This is an editorial change. Consequently, § 36.208(c) becomes § 36.208(b) in the final rule.

''Existing Facility''

The 1991 title III regulation provided definitions for ''new construction'' at § 36.401(a) and ''alterations'' at § 36.402(b). In contrast, the term ''existing facility'' was not explicitly defined, although it is used in the statute and regulations for titles II and III. *See, e.g.,* 42 U.S.C. 12182(b)(2)(A)(iv); 28 CFR 35.150. It has been the Department's view that newly constructed or altered facilities are also existing facilities subject to title III's continuing barrier removal obligation, and that view is made explicit in this rule.

The classification of facilities under the ADA is neither static nor mutually exclusive. Newly constructed or altered facilities are also existing facilities. A newly constructed facility remains subject to the accessibility standards in effect at the time of design and construction, with respect to those elements for which, at that time, there were applicable ADA Standards. That same facility, however, after construction, is also an existing facility, and subject to the public accommodation's continuing obligation to remove barriers where it is readily achievable to do so. The fact that the facility is also an existing facility does not relieve the public accommodation of its obligations under the new construction requirements of this part. Rather, it means that in addition to the new construction

requirements, the public accommodation has a continuing obligation to remove barriers that arise, or are deemed barriers, only after construction. Such barriers include but are not limited to the elements that are first covered in the 2010 Standards, as that term is defined in § 36.104.

At some point, the same facility may undergo alterations, which are subject to the alterations requirements in effect at that time. This facility remains subject to its original new construction standards for elements and spaces not affected by the alterations; the facility is subject to the alterations requirements and standards in effect at the time of the alteration for the elements and spaces affected by the alteration; and, throughout, the facility remains subject to the continuing barrier removal obligation.

The Department's enforcement of the ADA is premised on a broad understanding of ''existing facility.'' The ADA contemplates that as the Department's knowledge and understanding of accessibility advances and evolves, this knowledge will be incorporated into and result in increased accessibility in the built environment. Title III's barrier removal provisions strike the appropriate balance between ensuring that accessibility advances are reflected in the built environment and mitigating the costs of those advances to public accommodations. With adoption of the final rule, public accommodations engaged in barrier removal measures will now be guided by the 2010 Standards, defined in § 36.104, and the safe harbor in § 36.304(d)(2).

The NPRM included the following proposed definition of ''existing facility'': ''[A] facility that has been constructed and remains in existence on any given date.'' 73 FR 34508, 34552 (June 17, 2008). While the Department intended the proposed definition to provide clarity with respect to public accommodations' continuing obligation to remove barriers where it is readily achievable to do so, some commenters pointed out arguable ambiguity in the language and the potential for misapplication of the rule in practice.

The Department received a number of comments on this issue. The commenters urged the Department to clarify that all buildings remain subject to the standards in effect at the time of their construction, that is, that a facility designed and constructed for first occupancy between January 26, 1993, and the effective date of the final rule is still considered ''new construction'' and that alterations occurring between January 26, 1993, and the effective date of the final rule are still considered ''alterations.''

The final rule includes clarifying language to ensure that the Department's interpretation is accurately reflected. As established by this rule, existing facility means a facility in existence on any given date, without regard to whether the facility may also be considered newly constructed or altered under this part. Thus, this definition reflects the Department's longstanding interpretation that public accommodations have obligations in existing facilities that are independent of but may coexist with requirements imposed by new construction or alteration requirements in those same facilities.

''Housing at a Place of Education''

The Department has added a new definition to § 36.104, ''housing at a place of education,'' to clarify the types of educational housing programs that are covered by this title. This section defines ''housing at a place of education'' as ''housing operated by or on behalf of an elementary, secondary, undergraduate, or postgraduate school, or other place of education, including dormitories, suites, apartments, or other places of residence.'' This definition does not apply to social service programs that combine residential housing with social services, such as a residential job training program.

''Other Power-Driven Mobility Device'' and ''Wheelchair''

Because relatively few individuals with disabili-

ties were using nontraditional mobility devices in 1991, there was no pressing need for the 1991 title III regulation to define the terms ''wheelchair'' or ''other power-driven mobility device,'' to expound on what would constitute a reasonable modification in policies, practices, or procedures under § 36.302, or to set forth within that section specific requirements for the accommodation of mobility devices. Since the issuance of the 1991 title III regulation, however, the choices of mobility devices available to individuals with disabilities have increased dramatically. The Department has received complaints about and has become aware of situations where individuals with mobility disabilities have utilized devices that are not designed primarily for use by an individual with a mobility disability, including the Segway® Personal Transporter (Segway® PT), golf cars, all-terrain vehicles (ATVs), and other locomotion devices.

The Department also has received questions from public accommodations and individuals with mobility disabilities concerning which mobility devices must be accommodated and under what circumstances. Indeed, there has been litigation concerning the legal obligations of covered entities to accommodate individuals with mobility disabilities who wish to use an electronic personal assistance mobility device (EPAMD), such as the Segway® PT, as a mobility device. The Department has participated in such litigation as amicus curiae. *See Ault v. Walt Disney World Co*., No. 6:07–cv–1785–Orl–31KRS, 2009 WL 3242028 (M.D. Fla. Oct. 6, 2009). Much of the litigation has involved shopping malls where businesses have refused to allow persons with disabilities to use EPAMDs. *See, e.g., McElroy v. Simon Property Group,* No. 08– 404 RDR, 2008 WL 4277716 (D. Kan. Sept. 15, 2008) (enjoining mall from prohibiting the use of a Segway® PT as a mobility device where an individual agrees to all of a mall's policies for use of the device, except indemnification); Shasta Clark, *Local Man Fighting Mall Over Right to Use Segway,* WATE 6 News, July 26, 2005, available at http://*www.wate.com/ Global/ story.asp?s=3643674* (last visited June 24, 2010).

In response to questions and complaints from individuals with disabilities and covered entities concerning which mobility devices must be accommodated and under what circumstances, the Department began developing a framework to address the use of unique mobility devices, concerns about their safety, and the parameters for the circumstances under which these devices must be accommodated. As a result, the Department's NPRM proposed two new approaches to mobility devices. First, the Department proposed a two-tiered mobility device definition that defined the term ''wheelchair'' separately from ''other power-driven mobility device.'' Second, the Department proposed requirements to allow the use of devices in each definitional category. In § 36.311(a), the NPRM proposed that wheelchairs and manually-powered mobility aids used by individuals with mobility disabilities shall be permitted in any areas open to pedestrian use. Section 36.311(b) of the NPRM proposed that a public accommodation ''shall make reasonable modifications in its policies, practices, and procedures to permit the use of other power-driven mobility devices by individuals with disabilities, unless the public accommodation can demonstrate that the use of the device is not reasonable or that its use will result in a fundamental alteration in the nature of the public accommodation's goods, services, facilities, privileges, advantages, or accommodations.'' 73 FR 34508, 34556 (June 17, 2008).

The Department sought public comment with regard to whether these steps would, in fact, achieve clarity on these issues. Toward this end, the Department's NPRM asked several questions relating to the definitions of ''wheelchair,'' ''other power-driven mobility device,'' and ''manually-powered mobility aids''; the best way to categorize different classes of mobility devices, the types of devices that should be included in each category; and the circumstances under which certain

types of mobility devices must be accommodated or may be excluded pursuant to the policy adopted by the public accommodation.

Because the questions in the NPRM that concerned mobility devices and their accommodation were interrelated, many of the commenters' responses did not identify the specific question to which they were responding. Instead, commenters grouped the questions together and provided comments accordingly. Most commenters spoke to the issues addressed in the Department's questions in broad terms and using general concepts. As a result, the responses to the questions posed are discussed below in broadly grouped issue categories rather than on a question-by-question basis.

T*wo-tiered definitional approach.* Commenters supported the Department's proposal to use a two-tiered definition of mobility device. Commenters nearly universally said that wheelchairs always should be accommodated and that they should never be subject to an assessment with regard to their admission to a particular public accommodation. In contrast, the vast majority of commenters indicated they were in favor of allowing public accommodations to conduct an assessment as to whether, and under which circumstances, other power-driven mobility devices will be allowed onsite.

Many commenters also indicated their support for the two-tiered approach in responding to questions concerning the definition of ''wheelchair'' and ''other power-driven mobility device.'' Nearly every disability advocacy group said that the Department's two-tiered approach strikes the proper balance between ensuring access for individuals with disabilities and addressing fundamental alteration and safety concerns held by public accommodations; however, a minority of disability advocacy groups wanted other power-driven mobility devices to be included in the definition of ''wheelchair.'' Most advocacy, nonprofit, and individual commenters supported the concept of a separate definition for ''other power-driven mobility device'' because a separate definition would maintain existing legal protections for wheelchairs while recognizing that some devices that are not designed primarily for individuals with mobility disabilities have beneficial uses for individuals with mobility disabilities. They also favored this concept because it recognizes technological developments and that innovative uses of varying devices may provide increased access to individuals with mobility disabilities.

While two business associations indicated that they opposed the concept of ''other power-driven mobility device'' in its entirety, other business commenters expressed general and industry-specific concerns about permitting their use. They indicated that such devices create a host of safety, cost, and fraud issues that do not exist with wheelchairs. On balance, however, business commenters indicated that they support the establishment of a two-tiered regulatory approach because defining ''other power-driven mobility device'' separately from ''wheelchair'' means that businesses will be able to maintain some measure of control over the admission of the former. Virtually all of these commenters indicated that their support for the dual approach and the concept of other power-driven mobility devices was, in large measure, due to the other power-driven mobility device assessment factors in § 36.311(c) of the NPRM.

By maintaining the two-tiered approach to mobility devices and defining ''wheelchair'' separately from ''other power-driven mobility device,'' the Department is able to preserve the protection users of traditional wheelchairs and other manually-powered mobility aids have had since the ADA was enacted, while also recognizing that human ingenuity, personal choice, and new technologies have led to the use of devices that may be more beneficial for individuals with certain mobility disabilities.

Moreover, the Department believes the two-tiered approach gives public accommodations guidance to follow in assessing whether reasonable modifications can be made to permit the use of other power-driven mobility devices on-site

and to aid in the development of policies describing the circumstances under which persons with disabilities may use such devices. The two-tiered approach neither mandates that all other power-driven mobility devices be accommodated in every circumstance, nor excludes these devices from all protection. This approach, in conjunction with the factor assessment provisions in § 36.311(b)(2), will serve as a mechanism by which public accommodations can evaluate their ability to accommodate other power-driven mobility devices. As will be discussed in more detail below, the assessment factors in § 36.311(b)(2) are specifically designed to provide guidance to public accommodations regarding whether it is permissible to bar the use of a specific other power-driven mobility device in a specific facility. In making such a determination, a public accommodation must consider the device's type, size, weight dimensions, and speed; the facility's volume of pedestrian traffic; the facility's design and operational characteristics; whether the device conflicts with legitimate safety requirements; and whether the device poses a substantial risk of serious harm to the immediate environment or natural or cultural resources, or conflicts with Federal land management laws or regulations. In addition, under § 36.311(b)(i) if the public accommodation claims that it cannot make reasonable modifications to its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with disabilities, the burden of proof to demonstrate that such devices cannot be operated in accordance with legitimate safety requirements rests upon the public accommodation.

Categorization of wheelchair versus other power-driven mobility devices. Implicit in the creation of the two-tiered mobility device concept is the question of how to categorize which devices are wheelchairs and which are other power-driven mobility devices. Finding weight and size to be too restrictive, the vast majority of advocacy, nonprofit, and individual commenters opposed using the Department of Transportation's definition of ''common wheelchair'' to designate the mobility device's appropriate category. Business commenters who generally supported using weight and size as the method of categorization did so because of their concerns about having to make physical changes to their facilities to accommodate oversized devices. The vast majority of business commenters also favored using the device's intended use to categorize which devices constitute wheelchairs and which are other power-driven mobility devices. Furthermore, the intended-use determinant received a fair amount of support from advocacy, nonprofit, and individual commenters, either because they sought to preserve the broad accommodation of wheelchairs or because they sympathized with concerns about individuals without mobility disabilities fraudulently bringing other power-driven mobility devices into places of public accommodation.

Commenters seeking to have the Segway® PT included in the definition of ''wheelchair'' objected to classifying mobility devices on the basis of their intended use because they felt that such a classification would be unfair and prejudicial to Segway® PT users and would stifle personal choice, creativity, and innovation. Other advocacy and nonprofit commenters objected to employing an intended-use approach because of concerns that the focus would shift to an assessment of the device, rather than the needs or benefits to the individual with the mobility disability. They were of the view that the mobility-device classification should be based on its function—whether it is used to address a mobility disability. A few commenters raised the concern that an intended-use approach might embolden public accommodations to assess whether an individual with a mobility disability really needs to use the other power-driven mobility device at issue or to question why a wheelchair would not provide sufficient mobility. Those citing objections to the intended-use determinant indicated it would be more appropriate to make the categorization determination based on whether the device is being used for a mobility

disability in the context of the impact of its use in a specific environment. Some of these commenters preferred this approach because it would allow the Segway® PT to be included in the definition of ''wheelchair.''

Some commenters were inclined to categorize mobility devices by the way in which they are powered, such as battery-powered engines versus fuel or combustion engines. One commenter suggested using exhaust level as the determinant. Although there were only a few commenters who would make the determination based on indoor or outdoor use, there was nearly universal support for banning from indoor use devices that are powered by fuel or combustion engines.

A few commenters thought it would be appropriate to categorize the devices based on their maximum speed. Others objected to this approach, stating that circumstances should dictate the appropriate speed at which mobility devices should be operated— for example, a faster speed may be safer when crossing streets than it would be for sidewalk use—and merely because a device can go a certain speed does not mean it will be operated at that speed.

The Department has decided to maintain the device's intended use as the appropriate determinant for which devices are categorized as ''wheelchairs.'' However, because wheelchairs may be intended for use by individuals who have temporary conditions affecting mobility, the Department has decided that it is more appropriate to use the phrase ''primarily designed'' rather than ''solely designed'' in making such categorizations. The Department will not foreclose any future technological developments by identifying or banning specific devices or setting restrictions on size, weight, or dimensions. Moreover, devices designed primarily for use by individuals with mobility disabilities often are considered to be medical devices and are generally eligible for insurance reimbursement on this basis. Finally, devices designed primarily for use by individuals with mobility disabilities are less subject to fraud concerns because they were not designed to have a recreational component. Consequently, rarely, if ever, is any inquiry or assessment as to their appropriateness for use in a public accommodation necessary.

Definition of ''wheelchair.'' In seeking public feedback on the NPRM's definition of ''wheelchair,'' the Department explained its concern that the definition of ''wheelchair'' in section 508(c)(2) of the ADA (formerly section 507(c)(2), July 26, 1990, 104 Stat. 372, 42 U.S.C. 12207, renumbered section 508(c)(2), Public Law 110–325 section 6(a)(2), Sept. 25, 2008, 122 Stat. 3558), which pertains to Federal wilderness areas, is not specific enough to provide clear guidance in the array of settings covered by title III and that the stringent size and weight requirements for the Department of Transportation's definition of ''common wheelchair'' are not a good fit in the context of most public accommodations. The Department noted in the NPRM that it sought a definition of ''wheelchair'' that would include manually-operated and power-driven wheelchairs and mobility scooters (*i.e.,* those that typically are single-user, have three to four wheels, and are appropriate for both indoor and outdoor pedestrian areas), as well as a variety of types of wheelchairs and mobility scooters with individualized or unique features or models with different numbers of wheels. The NPRM defined a wheelchair as ''a device designed solely for use by an individual with a mobility impairment for the primary purpose of locomotion in typical indoor and outdoor pedestrian areas. A wheelchair may be manually-operated or power-driven.'' 73 FR 34508, 34553 (June 17, 2008).

Although the NPRM's definition of ''wheelchair'' excluded mobility devices that are not designed solely for use by individuals with mobility disabilities, the Department, noting that the use of the Segway® PT by individuals with mobility disabilities is on the upswing, inquired as to whether this device should be included in the definition of

''wheelchair.''

Most business commenters wished the definition of ''wheelchair'' had included size, weight, and dimension maximums. Ultimately, however, they supported the definition because it excludes other power-driven mobility devices and enables them to engage in an assessment to determine whether a particular device can be allowed as a reasonable modification. These commenters felt this approach gave them some measure of control over whether, and under what circumstances, other power-driven mobility devices may be used in their facilities by individuals with mobility disabilities. Two commenters noted that because many mobility scooters are oversized, they are misplaced in the definition of ''wheelchair'' and belong with other power-driven mobility devices. Another commenter suggested using maximum size and weight requirements to allocate which mobility scooters should be categorized as wheelchairs, and which should be categorized as other power-driven mobility devices.

Many advocacy, nonprofit, and individual commenters indicated that as long as the Department intends the scope of the term ''mobility impairments'' to include other disabilities that cause mobility impairments (*e.g.,* respiratory, circulatory, stamina, etc.), they were in support of the language. Several commenters indicated a preference for the definition of ''wheelchair'' in section 508(c)(2) of the ADA. One commenter indicated a preference for the term ''assistive device,'' as it is defined in the Rehabilitation Act of 1973, over the term ''wheelchair.'' A few commenters indicated that strollers should be added to the preamble's list of examples of wheelchairs because parents of children with disabilities frequently use strollers as mobility devices until their children get older.

In the final rule, the Department has rearranged some wording and has made some changes in the terminology used in the definition of ''wheelchair,'' but essentially has retained the definition, and therefore the rationale, that was set forth in the NPRM. Again, the text of the ADA makes the definition of ''wheelchair'' contained in section 508(c)(2) applicable only to the specific context of uses in designated wilderness areas, and therefore does not compel the use of that definition for any other purpose. Moreover, the Department maintains that limiting the definition to devices suitable for use in an ''indoor pedestrian area'' as provided for in section 508(c)(2) of the ADA would ignore the technological advances in wheelchair design that have occurred since the ADA went into effect and that the inclusion of the phrase''indoor pedestrian area'' in the definition of ''wheelchair'' would set back progress made by individuals with mobility disabilities who, for many years now, have been using devices designed for locomotion in indoor and outdoor settings. The Department has concluded that same rationale applies to placing limits on the size, weight, and dimensions of wheelchairs.

With regard to the term ''mobility impairments,'' the Department intended a broad reading so that a wide range of disabilities, including circulatory and respiratory disabilities, that make walking difficult or impossible, would be included. In response to comments on this issue, the Department has revisited the issue and has concluded that the most apt term to achieve this intent is ''mobility disability.''

In addition, the Department has decided that it is more appropriate to use the phrase, ''primarily'' designed for use by individuals with disabilities in the final rule, rather than, ''solely'' designed for use by individuals with disabilities—the phrase, proposed in the NPRM. The Department believes that this phrase more accurately covers the range of devices the Department intends to fall within the definition of ''wheelchair.''

After receiving comments that the word ''typical'' is vague and the phrase ''pedestrian areas'' is confusing to apply, particularly in the context of similar, but not identical, terms used in the proposed Standards, the Department decided to delete the term ''typical indoor and outdoor pedestrian areas'' from the final rule. Instead, the final rule

references ''indoor or * * * both indoor and outdoor locomotion,'' to make clear that the devices that fall within the definition of ''wheelchair'' are those that are used for locomotion on indoor and outdoor pedestrian paths or routes and not those that are intended exclusively for traversing undefined, unprepared, or unimproved paths or routes. Thus, the final rule defines the term ''wheelchair'' to mean ''a manually operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor or of both indoor and outdoor locomotion.''

Whether the definition of ''wheelchair'' includes the Segway® PT. As discussed above, because individuals with mobility disabilities are using the Segway® PT as a mobility device, the Department asked whether it should be included in the definition of ''wheelchair.'' The basic Segway® PT model is a two-wheeled, gyroscopically-stabilized, battery-powered personal transportation device. The user stands on a platform suspended three inches off the ground by wheels on each side, grasps a T-shaped handle, and steers the device similarly to a bicycle. Most Segway® PTs can travel up to 12½ miles per hour, compared to the average pedestrian walking speed of 3 to 4 miles per hour and the approximate maximum speed for power-operated wheelchairs of 6 miles per hour. In a study of trail and other non-motorized transportation users including EPAMDs, the Federal Highway Administration (FHWA) found that the eye height of individuals using EPAMDs ranged from approximately 69 to 80 inches. *See* Federal Highway Administration, *Characteristics of Emerging Road and Trail Users and Their Safety* (Oct. 14, 2004), available at *http://www.tfhrc.gov/safety/pubs/04103* (last visited June 24, 2010). Thus, the Segway® PT can operate at much greater speeds than wheelchairs, and the average user stands much taller than most wheelchair users.

The Segway® PT has been the subject of debate among users, pedestrians, disability advocates, State and local governments, businesses, and bicyclists. The fact that the Segway® PT is not designed primarily for use by individuals with disabilities, nor used primarily by persons with disabilities, complicates the question of to what extent individuals with disabilities should be allowed to operate them in areas and facilities where other power-driven mobility devices are not allowed. Those who question the use of the Segway® PT in pedestrian areas argue that the speed, size, and operating features of the devices make them too dangerous to operate alongside pedestrians and wheelchair users.

Comments regarding whether to include the Segway® PT in the definition of ''wheelchair'' were, by far, the most numerous received in the category of comments regarding wheelchairs and other power-driven mobility devices. Significant numbers of veterans with disabilities, individuals with multiple sclerosis, and those advocating on their behalf made concise statements of general support for the inclusion of the Segway® PT in the definition of ''wheelchair.'' Two veterans offered extensive comments on the topic, along with a few advocacy and nonprofit groups and individuals with disabilities for whom sitting is uncomfortable or impossible.

While there may be legitimate safety issues for EPAMD users and bystanders in some circumstances, EPAMDs and other nontraditional mobility devices can deliver real benefits to individuals with disabilities. Among the reasons given by commenters to include the Segway® PT in the definition of ''wheelchair'' were that the Segway® PT is well-suited for individuals with particular conditions that affect mobility including multiple sclerosis, Parkinson's disease, chronic obstructive pulmonary disease, amputations, spinal cord injuries, and other neurological disabilities, as well as functional limitations, such as gait limitation, inability to sit or discomfort in sitting, and diminished stamina issues. Such individuals often find that EPAMDs are more comfortable and easier to use than more traditional mobility devices and assist with balance, circulation, and digestion in ways that wheelchairs do not. *See* Rachel Metz,

D*isabled Embrace Segway*, New York Times, Oct. 14, 2004. Commenters specifically cited pressure relief, reduced spasticity, increased stamina, and improved respiratory, neurologic, and muscular health as secondary medical benefits from being able to stand.

Other arguments for including the Segway® PT in the definition of ''wheelchair'' were based on commenters' views that the Segway® PT offers benefits not provided by wheelchairs and mobility scooters, including its intuitive response to body movement, ability to operate with less coordination and dexterity than is required for many wheelchairs and mobility scooters, and smaller footprint and turning radius as compared to most wheelchairs and mobility scooters. Several commenters mentioned improved visibility, either due to the Segway® PT's raised platform or simply by virtue of being in a standing position. And finally, some commenters advocated for the inclusion of the Segway® PT simply based on civil rights arguments and the empowerment and self-esteem obtained from having the power to select the mobility device of choice.

Many commenters, regardless of their position on whether to include the Segway® PT in the definition of ''wheelchair,'' noted that the Segway® PT's safety record is as good as, if not better, than the record for wheelchairs and mobility scooters.

Most business commenters were opposed to the inclusion of the Segway® PT in the definition of ''wheelchair'' but were supportive of its inclusion as an ''other power-driven mobility device.'' They raised industry- or venue-specific concerns about including the Segway® PT in the definition of ''wheelchair.'' For example, civic centers, arenas, and theaters were concerned about the impact on sight-line requirements if Segway® PT users remain on their devices in a designated wheelchair seating area; amusement parks expressed concern that rides have been designed, purchased, and installed to enable wheelchair users to transfer easily or to accommodate wheelchairs on the ride itself; and retail stores mentioned size constraints in some stores. Nearly all business commenters expressed concern—and perceived liability issues—related to having to store or stow the Segway® PT, particularly if it could not be stored in an upright position. These commenters cited concerns about possible damage to the device, injury to customers who may trip over it, and theft of the device as a result of not being able to stow the Segway® PT securely.

Virtually every business commenter mentioned concerns about rider safety, as well as concerns for pedestrians unexpectedly encountering these devices or being hit or run over by these devices in crowded venues where maneuvering space is limited. Their main safety objection to the inclusion of the Segway® PT in the definition of ''wheelchair'' was that the maximum speed at which the Segway® PT can operate is far faster than that of motorized wheelchairs. There was a universal unease among these commenters with regard to relying on the judgment of the Segway® PT user to exercise caution because its top speed is far in excess of a wheelchair's top speed. Many other safety concerns were industry-specific. For example, amusement parks were concerned that the Segway® PT is much taller than children; that it is too quiet to warn pedestrians, particularly those with low vision or who are blind, of their presence; that it may keep moving after a rider has fallen off or power system fails; and that it has a full-power override which automatically engages when an obstacle is encountered. Hotels and retail stores mentioned that maneuvering the Segway® PT through their tight quarters would create safety hazards.

Business commenters also expressed concern that if the Segway® PT were included in the definition of ''wheelchair'' they would have to make physical changes to their facilities to accommodate Segway® PT riders who stand much taller in these devices than do users of wheelchairs. They also were concerned that if the Segway® 7 PT was included in the definition of ''wheelchair,'' they would have no ability to assess whether it is ap-

propriate to allow the entry of the Segway® PT into their facilities the way they would have if the device is categorized as an ''other power-driven mobility device.''

Many disability advocacy and nonprofit commenters did not support the inclusion of the Segway® PT in the definition of ''wheelchair.'' Paramount to these commenters was the maintenance of existing protections for wheelchair users. Because there was unanimous agreement that wheelchair use rarely, if ever, may be restricted, these commenters strongly favored categorizing wheelchairs separately from the Segway® PT and other power-driven mobility devices and applying the intended-use determinant to assign the devices to either category. They indicated that while they support the greatest degree of access in public accommodations for all persons with disabilities who require the use of mobility devices, they recognize that under certain circumstances allowing the use of other power-driven mobility devices would result in a fundamental alteration or run counter to legitimate safety requirements necessary for the safe operation of a public accommodation. While these groups supported categorizing the Segway® PT as an ''other power-driven mobility device,'' they universally noted that because the Segway® PT does not present environmental concerns and is as safe to use as, if not safer than, a wheelchair, it should be accommodated in most circumstances.

The Department has considered all the comments and has concluded that it should not include the Segway® PT in the definition of ''wheelchair.'' The final rule provides that the test for categorizing a device as a wheelchair or an other power-driven mobility device is whether the device is designed primarily for use by individuals with mobility disabilities. Mobility scooters are included in the definition of ''wheelchair'' because they are designed primarily for users with mobility disabilities. However, because the current generation of EPAMDs, including the Segway® PT, was designed for recreational users and not primarily for use by individuals with mobility disabilities, the Department has decided to continue its approach of excluding EPAMDs from the definition of ''wheelchair'' and including them in the definition of ''other power-driven mobility device.'' Although EPAMDs, such as the Segway® PT, are not included in the definition of a ''wheelchair,'' public accommodations must assess whether they can make reasonable modifications to permit individuals with mobility disabilities to use such devices on their premises. The Department recognizes that the Segway® PT provides many benefits to those who use them as mobility devices, including a measure of privacy with regard to the nature of one's particular disability, and believes that in the vast majority of circumstances, the application of the factors described in § 36.311 for providing access to other powered mobility devices will result in the admission of the Segway® PT.

Treatment of ''manually-powered mobility aids.'' The Department's NPRM did not define the term ''manually-powered mobility aids.'' Instead, the NPRM included a non-exhaustive list of examples in § 36.311(a). The NPRM queried whether the Department should maintain this approach to manually-powered mobility aids or whether it should adopt a more formal definition.

Only a few commenters addressed ''manually-powered mobility aids.'' Virtually all commenters were in favor of maintaining a non-exhaustive list of examples of ''manually-powered mobility aids'' rather than adopting a definition of the term. Of those who commented, a couple sought clarification of the term ''manually-powered.'' One commenter suggested that the term be changed to ''human-powered.'' Other commenters requested that the Department include ordinary strollers in the non-exhaustive list of manually-powered mobility aids. Since strollers are not devices designed primarily for individuals with mobility disabilities, the Department does not consider them to be manually-powered mobility aids; however, strollers used in the context of transporting individuals with disabilities are subject to the same

assessment required by the ADA's reasonable modification standards at § 36.302. The Department believes that because the existing approach is clear and understood easily by the public, no formal definition of the term ''manually-powered mobility aids'' is required.

Definition of ''other power-driven mobility device.'' The Department's NPRM defined the term ''other power-driven mobility device'' in § 36.104 as ''any of a large range of devices powered by batteries, fuel, or other engines— whether or not designed solely for use by individuals with mobility impairments—that are used by individuals with mobility impairments for the purpose of locomotion, including golf cars, bicycles, electronic personal assistance mobility devices (EPAMDs), or any mobility aid designed to operate in areas without defined pedestrian routes.'' 73 FR 34508, 34552 (June 17, 2008).

Business commenters mostly were supportive of the definition of ''other power-driven mobility device'' because it gave them the ability to develop policies pertaining to the admission of these devices, but they expressed concern that individuals will feign mobility disabilities so that they can use devices that are otherwise banned in public accommodations. Advocacy, nonprofit, and several individual commenters supported the definition of ''other power-driven mobility device'' because it allows new technologies to be added in the future, maintains the existing legal protections for wheelchairs, and recognizes that some devices, particularly the Segway® PT, which are not designed primarily for individuals with mobility disabilities, have beneficial uses for individuals with mobility disabilities.

Despite support for the definition of ''other power-driven mobility device,'' however, most advocacy and nonprofit commenters expressed at least some hesitation about the inclusion of fuel-powered mobility devices in the definition. While virtually all of these commenters noted that a blanket exclusion of any device that falls under the definition of ''other power-driven mobility device'' would violate basic civil rights concepts, they also specifically stated that certain devices, particularly off-highway vehicles, cannot be permitted in certain circumstances. They also made a distinction between the Segway® PT and other power-driven mobility devices, noting that the Segway® PT should be accommodated in most circumstances because it satisfies the safety and environmental elements of the policy analysis. These commenters indicated that they agree that other power-driven mobility devices must be assessed, particularly as to their environmental impact, before they are accommodated.

Business commenters were even less supportive of the inclusion of fuel-powered devices in the other power-driven mobility devices category. They sought a complete ban on fuel-powered devices because they believe they are inherently dangerous and pose environmental and safety concerns.

Although many commenters had reservations about the inclusion of fuel-powered devices in the definition of other power-driven mobility devices, the Department does not want the definition to be so narrow that it would foreclose the inclusion of new technological developments, whether powered by fuel or by some other means. It is for this reason that the Department has maintained the phrase ''any mobility device designed to operate in areas without defined pedestrian routes'' in the final rule's definition of other power-driven mobility devices. The Department believes that the limitations provided by ''fundamental alteration'' and the ability to impose legitimate safety requirements will likely prevent the use of fuel and combustion engine-driven devices indoors, as well as in outdoor areas with heavy pedestrian traffic. The Department notes, however, that in the future technological developments may result in the production of safe fuel-powered mobility devices that do not pose environmental and safety concerns. The final rule allows consideration to be given as to whether the use of a fuel-powered device would create a substantial risk of serious harm to the

environment or natural or cultural resources, and to whether the use of such a device conflicts with Federal land management laws or regulations; this aspect of the final rule will further limit the inclusion of fuel-powered devices where they are not appropriate. Consequently, the Department has maintained fuel-powered devices in the definition of ''other power-driven mobility devices.'' The Department has also added language to the definition of ''other power-driven mobility device'' to reiterate that the definition does not apply to Federal wilderness areas, which are not covered by title II of the ADA; the use of wheelchairs in such areas is governed by section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2).

''Place of Public Accommodation''

Definition of "place of lodging." The NPRM stated that a covered ''place of lodging'' is a facility that provides guest rooms for sleeping for stays that are primarily short-term in nature (generally two weeks or less), to which the occupant does not have the right or intent to return to a specific room or unit after the conclusion of his or her stay, and which operates under conditions and with amenities similar to a hotel, motel, or inn, particularly including factors such as: (1) An on-site proprietor and reservations desk; (2) rooms available on a walk-up basis; (3) linen service; and (4) a policy of accepting reservations for a room type without guaranteeing a particular unit or room until check-in, without a prior lease or security deposit. The NPRM stated that timeshares and condominiums or corporate hotels that did not meet this definition would not be covered by § 36.406(c) of the proposed regulation, but may be covered by the requirements of the Fair Housing Act (FHAct).

In the NPRM, the Department sought comment on its definition of ''place of lodging,'' specifically seeking public input on whether the most appropriate time period for identifying facilities used for stays that primarily are short-term in nature should be set at 2 weeks or 30 days.

The vast majority of the comments received by the Department supported the use of a 30-day limitation on places of lodging as more consistent with building codes, local laws, and common real estate practices that treat stays of 30 days or less as transient rather than residential use. One commenter recommended using the phrase ''fourteen days or less.'' Another commenter objected to any bright line standard, stating that the difference between two weeks and 30 days for purposes of title III is arbitrary, viewed in light of conflicting regulations by the States. This commenter argued the Department should continue its existing practice under title III of looking to State law as one factor in determining whether a facility is used for stays that primarily are short-term in nature.

The Department is persuaded by the majority of commenters to adopt a 30-day guideline for the purposes of identifying facilities that primarily are short-term in nature and has modified the section accordingly. The 30-day guideline is intended only to determine when the final rule's transient lodging provisions apply to a facility. It does not alter an entity's obligations under any other applicable statute. For example, the Department recognizes that the FHAct does not employ a bright line standard for determining which facilities qualify as residential facilities under that Act and that there are circumstances where units in facilities that meet the definition of places of lodging will be covered under both the ADA and the FHAct and will have to comply with the requirements of both laws.

The Department also received comments about the factors used in the NPRM's definition of ''place of lodging.'' One commenter proposed modifications to the definition as follows: changing the words ''guest rooms'' to ''accommodations for sleeping''; and adding a fifth factor that states that ''the in-room decor, furnishings and equipment being specified by the owner or operator of the lodging operation rather than generally being determined by the owner of the individual unit or room.'' The Department does not believe that ''guest room'' should be changed to ''accommoda-

tions for sleeping.'' Such a change would create confusion because the transient lodging provisions in the 2004 ADAAG use the term ''guest rooms'' and not ''accommodations for sleeping.'' In addition, the Department believes that it would be confusing to add a factor relating to who dictates the in-room decor and furnishings in a unit or room, because there may be circumstances where particular rental programs require individual owners to use certain decor and furnishings as a condition of participating in that program.

One commenter stated that the factors the Department has included for determining whether a rental unit is a place of lodging for the purposes of title III, and therefore a ''place of public accommodation'' under the ADA, address only the way an establishment appears to the public. This commenter recommended that the Department also consider the economic relationships among the unit owners, rental managers, and homeowners' associations, noting that where revenues are not pooled (as they are in a hotel), the economic relationships do not make it possible to spread the cost of providing accessibility features over the entire business enterprise. Another commenter argued that private ownership of sleeping accommodations sets certain facilities apart from traditional hotels, motels, and inns, and that the Department should revise the definition of places of lodging to exempt existing places of lodging that have sleeping accommodations separately owned by individual owners (*e.g.*, condominiums) from the accessible transient lodging guest room requirements in sections 224 and 806 of the 2004 ADAAG, although the commenter agreed that newly constructed places of lodging should meet those standards.

One commenter argued that the Department's proposed definition of place of lodging does not reflect fully the nature of a timeshare facility and one single definition does not fit timeshares, condo hotels, and other types of rental accommodations. This commenter proposed that the Department adopt a separate definition for timeshare resorts as a subcategory of place of lodging. The commenter proposed defining timeshare resorts as facilities that provide the recurring right to occupancy for overnight accommodations for the owners of the accommodations, and other occupancy rights for owners exchanging their interests or members of the public for stays that primarily are short-term in nature (generally 30 consecutive days or less), where neither the owner nor any other occupant has the right or intent to use the unit or room on other than a temporary basis for vacation or leisure purposes. This proposed definition also would describe factors for determining when a timeshare resort is operating in a manner similar to a hotel, motel, or inn, including some or all of the following: rooms being available on a walk-in or call-in basis; housekeeping or linen services being available; on-site management; and reservations being accepted for a room type without guaranteeing any guest or owner use of a particular unit or room until check-in, without a prior lease or security deposit. Timeshares that do not meet this definition would not be subject to the transient lodging standards.

The Department has considered these comments and has revised the definition of ''place of accommodation'' in § 36.104 to include a revised subcategory (B), which more clearly defines the factors that must be present for a facility that is not an inn, motel, or hotel to qualify as a place of lodging. These factors include conditions and amenities similar to an inn, motel, or hotel, including on- or off-site management and reservations service, rooms available on a walk-up or call-in basis, availability of housekeeping or linen service, and accepting reservations for a room type without guaranteeing a particular unit or room until check-in without a prior lease or security deposit.

Although the Department understands some of the concerns about the application of the ADA requirements to places of lodging that have ownership structures that involve individually owned units, the Department does not believe that the

definitional section of the regulation is the place to address these concerns and has addressed them in § 36.406(c)(2) and the accompanying discussion in Appendix A.

''Qualified Interpreter''

In the NPRM, the Department proposed adding language to the definition of ''qualified interpreter'' to clarify that the term includes, but is not limited to, sign language interpreters, oral interpreters, and cued-speech interpreters. As the Department explained, not all interpreters are qualified for all situations. For example, a qualified interpreter who uses American Sign Language (ASL) is not necessarily qualified to interpret orally. In addition, someone with only a rudimentary familiarity with sign language or finger spelling is not qualified, nor is someone who is fluent in sign language but unable to translate spoken communication into ASL or to translate signed communication into spoken words.

As further explained, different situations will require different types of interpreters . For example, an oral interpreter who has special skill and training to mouth a speaker's words silently for individuals who are deaf or hard of hearing may be necessary for an individual who was raised orally and taught to read lips or was diagnosed with hearing loss later in life and does not know sign language. An individual who is deaf or hard of hearing may need an oral interpreter if the speaker's voice is unclear, if there is a quick-paced exchange of communication *(e.g.*, in a meeting), or when the speaker does not directly face the individual who is deaf or hard of hearing. A cued-speech interpreter functions in the same manner as an oral interpreter except that he or she also uses a hand code or cue to represent each speech sound.

The Department received many comments regarding the proposed modifications to the definition of ''qualified interpreter.'' Many commenters requested that the Department include within the definition a requirement that interpreters be certified, particularly if they reside in a State that licenses or certifies interpreters. Other commenters opposed a certification requirement as unduly limiting, noting that an interpreter may well be qualified even if that same interpreter is not certified. These commenters noted the absence of nationwide standards or universally accepted criteria for certification.

On review of this issue, the Department has decided against imposing a certification requirement under the ADA. It is sufficient under the ADA that the interpreter be qualified. With respect to the proposed additions to the rule, most commenters supported the expansion of the list of qualified interpreters, and some advocated for the inclusion of other types of interpreters on the list as well, such as deaf-blind interpreters, certified deaf interpreters, and speech-to-speech interpreters. As these commenters explained, deaf-blind interpreters are interpreters who have specialized skills and training to interpret for individuals who are deaf and blind. Certified deaf interpreters are deaf or hard of hearing interpreters who work with hearing sign language interpreters to meet the specific communication needs of deaf individuals. Speech-to-speech interpreters have special skill and training to interpret for individuals who have speech disabilities.

The list of interpreters in the definition of ''qualified interpreter'' is illustrative, and the Department does not believe it is necessary or appropriate to attempt to provide an exhaustive list of qualified interpreters. Accordingly, the Department has decided not to expand the proposed list. However, if a deaf and blind individual needs interpreting services, an interpreter who is qualified to handle the interpreting needs of that individual may be required. The guiding criterion is that the public accommodation must provide appropriate auxiliary aids and services to ensure effective communication with the individual.

Commenters also suggested various definitions for the term ''cued-speech interpreters,'' and different descriptions of the tasks they performed. After reviewing the various comments, the De-

partment has determined that it is more accurate and appropriate to refer to such individuals as ''cued-language transliterators.'' Likewise, the Department has changed the term ''oral interpreters'' to ''oral transliterators.'' These two changes have been made to distinguish between sign language interpreters, who translate one language into another language (*e.g.*, ASL to English and English to ASL), from transliterators, who interpret within the same language between deaf and hearing individuals. A cued-language transliterator is an interpreter who has special skill and training in the use of the Cued Speech system of handshapes and placements, along with non-manual information, such as facial expression and body language, to show auditory information visually, including speech and environmental sounds. An oral transliterator is an interpreter who has special skill and training to mouth a speaker's words silently for individuals who are deaf or hard of hearing. While the Department included definitions for ''cued speech interpreter'' and ''oral interpreter'' in the regulatory text proposed in the NPRM, the Department has decided that it is unnecessary to include such definitions in the text of the final rule.

Many commenters questioned the proposed deletion of the requirement that a qualified interpreter be able to interpret both receptively and expressively, noting the importance of both these skills. Commenters noted that this phrase was carefully crafted in the original regulation to make certain that interpreters both (1) are capable of understanding what a person with a disability is saying and (2) have the skills needed to convey information back to that individual. These are two very different skill sets and both are equally important to achieve effective communication. For example, in a medical setting, a sign language interpreter must have the necessary skills to understand the grammar and syntax used by an ASL user (receptive skills) and the ability to interpret complicated medical information—presented by medical staff in English—back to that individual in ASL (expressive skills). The Department agrees and has put the phrase ''both receptively and expressively'' back in the definition.

Several advocacy groups suggested that the Department make clear in the definition of qualified interpreter that the interpreter may appear either on-site or remotely using a video remote interpreting (VRI) service. Given that the Department has included in this rule both a definition of VRI services and standards that such services must satisfy, such an addition to the definition of qualified interpreter is appropriate.

After consideration of all relevant information submitted during the public comment period, the Department has modified the definition from that initially proposed in the NPRM. The final definition now states that ''[q]ualified interpreter means an interpreter who, via a video remote interpreting (VRI) service or an on-site appearance, is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary. Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.''

''Qualified Reader''

The 1991 title III regulation identified a qualified reader as an auxiliary aid, but did not define the term. Based upon the Department's investigation of complaints alleging that some entities have provided ineffective readers, the Department proposed in the NPRM to define ''qualified reader'' similarly to ''qualified interpreter'' to ensure that public accommodations select qualified individuals to read an examination or other written information in an effective, accurate, and impartial manner. This proposal was suggested in order to make clear to public accommodations that a failure to provide a qualified reader to a person with a disability may constitute a violation of the requirement to provide appropriate auxiliary aids and services.

The Department received comments supporting

the inclusion in the regulation of a definition of a ''qualified reader.'' Some commenters suggested the Department add to the definition a requirement prohibiting the use of a reader whose accent, diction, or pronunciation makes full comprehension of material being read difficult. Another commenter requested that the Department include a requirement that the reader ''will follow the directions of the person for whom he or she is reading.'' Commenters also requested that the Department define ''accurately'' and ''effectively'' as used in this definition.

While the Department believes that the regulatory definition proposed in the NPRM adequately addresses these concerns, the Department emphasizes that a reader, in order to be ''qualified,'' must be skilled in reading the language and subject matter and must be able to be easily understood by the individual with the disability. For example, if a reader is reading aloud the questions for a bar examination, that reader, in order to be qualified, must know the proper pronunciation of all legal terminology used and must be sufficiently articulate to be easily understood by the individual with a disability for whom he or she is reading. In addition, the terms ''effectively'' and ''accurately'' have been successfully used and understood in the Department's existing definition of ''qualified interpreter'' since 1991 without specific regulatory definitions. Instead, the Department has relied upon the common use and understanding of those terms from standard English dictionaries. Thus, the definition of ''qualified reader'' has not been changed from that contained in the NPRM. The final rule defines a ''qualified reader'' to mean ''a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary.''

''Service Animal''

Section 36.104 of the 1991 title III regulation defines a ''service animal'' as ''any guide dog, signal dog, or other animal individually trained to do work or perform tasks for the benefit of an individual with a disability, including, but not limited to, guiding individuals with impaired vision, alerting individuals with impaired hearing to intruders or sounds, providing minimal protection or rescue work, pulling a wheelchair, or fetching dropped items.'' Section 36.302(c)(1) of the 1991 title III regulation requires that ''[g]enerally, a public accommodation shall modify policies, practices, or procedures to permit the use of a service animal by an individual with a disability.'' Section 36.302(c)(2) of the 1991 title III regulation states that ''a public accommodation [is not required] to supervise or care for a service animal.''

The Department has issued guidance and provided technical assistance and publications concerning service animals since the 1991 regulations became effective. In the NPRM, the Department proposed to modify the definition of service animal and asked for public input on several issues related to the service animal provisions of the 1991 title III regulation: whether the Department should clarify the phrase ''providing minimal protection'' in the definition or remove it; whether there are any circumstances where a service animal ''providing minimal protection'' would be appropriate or expected; whether certain species should be eliminated from the definition of ''service animal,'' and, if so, which types of animals should be excluded; whether ''common domestic animal'' should be part of the definition; and whether a size or weight limitation should be imposed for common domestic animals, even if the animal satisfies the ''common domestic animal'' part of the NPRM definition.

The Department received extensive comments on these issues, as well as requests to clarify the obligations of public accommodations to accommodate individuals with disabilities who use service animals, and has modified the final rule in response. In the interests of avoiding unnecessary repetition, the Department has elected to discuss the issues raised in the NPRM questions about service animals and the corresponding public comments in the following discussion of the definition

of ''service animal.''

The Department's final rule defines ''service animal'' as ''any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability. Other species of animals, whether wild or domestic, trained or untrained, are not service animals for the purposes of this definition. The work or tasks performed by a service animal must be directly related to the individual's disability. Examples of work or tasks include, but are not limited to, assisting individuals who are blind or have low vision with navigation and other tasks, alerting individuals who are deaf or hard of hearing to the presence of people or sounds, providing non-violent protection or rescue work, pulling a wheelchair, assisting an individual during a seizure, alerting individuals to the presence of allergens, retrieving items such as medicine or the telephone, providing physical support and assistance with balance and stability to individuals with mobility disabilities, and helping persons with psychiatric and neurological disabilities by preventing or interrupting impulsive or destructive behaviors. The crime deterrent effects of an animal's presence and the provision of emotional support, well-being, comfort, or companionship do not constitute work or tasks for the purposes of this definition.''

This definition has been designed to clarify a key provision of the ADA. Many covered entities indicated that they are confused regarding their obligations under the ADA with regard to individuals with disabilities who use service animals. Individuals with disabilities who use trained guide or service dogs are concerned that if untrained or unusual animals are termed ''service animals,'' their own right to use guide or service dogs may become unnecessarily restricted or questioned. Some individuals who are not individuals with disabilities have claimed, whether fraudulently or sincerely (albeit mistakenly), that their animals are service animals covered by the ADA, in order to gain access to hotels, restaurants, and other places of public accommodation. The increasing use of wild, exotic, or unusual species, many of which are untrained, as service animals has also added to the confusion.

Finally, individuals with disabilities who have the legal right under the Fair Housing Act (FHAct) to use certain animals in their homes as a reasonable accommodation to their disabilities have assumed that their animals also qualify under the ADA. This is not necessarily the case, as discussed below.

The Department recognizes the diverse needs and preferences of individuals with disabilities protected under the ADA, and does not wish to unnecessarily impede individual choice. Service animals play an integral role in the lives of many individuals with disabilities, and with the clarification provided by the final rule, individuals with disabilities will continue to be able to use their service animals as they go about their daily activities. The clarification will also help to ensure that the fraudulent or mistaken use of other animals not qualified as service animals under the ADA will be deterred. A more detailed analysis of the elements of the definition and the comments responsive to the service animal provisions of the NPRM follows.

Providing minimal protection. The 1991 title III regulation included language stating that ''minimal protection'' was a task that could be performed by an individually trained service animal for the benefit of an individual with a disability. In the Department's ''ADA Business Brief on Service Animals'' (2002), the Department interpreted the ''minimal protection'' language within the context of a seizure (*i.e.,* alerting and protecting a person who is having a seizure). The Department received many comments in response to the question of whether the ''minimal protection'' language should be clarified. Many commenters urged the removal of the ''minimal protection'' language from the service animal definition for two reasons: (1) The phrase can be interpreted to

allow any dog that is trained to be aggressive to qualify as a service animal simply by pairing the animal with a person with a disability; and (2) The phrase can be interpreted to allow any untrained pet dog to qualify as a service animal, since many consider the mere presence of a dog to be a crime deterrent, and thus sufficient to meet the minimal protection standard. These commenters argued, and the Department agrees, that these interpretations were not contemplated under the original title III regulation.

While many commenters stated that they believe that the ''minimal protection'' language should be eliminated, other commenters recommended that the language be clarified, but retained. Commenters favoring clarification of the term suggested that the Department explicitly exclude the function of attack or exclude those animals that are trained solely to be aggressive or protective. Other commenters identified nonviolent behavioral tasks that could be construed as minimally protective, such as interrupting self-mutilation, providing safety checks and room searches, reminding the individual to take medications, and protecting the individual from injury resulting from seizures or unconsciousness.

Several commenters noted that the existing direct threat defense, which allows the exclusion of a service animal if the animal exhibits unwarranted or unprovoked violent behavior or poses a direct threat, prevents the use of ''attack dogs'' as service animals. One commenter noted that the use of a service animal trained to provide ''minimal protection'' may impede access to care in an emergency, for example, where the first responder is unable or reluctant to approach a person with a disability because the individual's service animal is in a protective posture suggestive of aggression.

Many organizations and individuals stated that in the general dog training community, ''protection'' is code for attack or aggression training and should be removed from the definition. Commenters stated that there appears to be a broadly held misconception that aggression-trained animals are appropriate service animals for persons with post traumatic stress disorder (PTSD). While many individuals with PTSD may benefit by using a service animal, the work or tasks performed appropriately by such an animal would not involve unprovoked aggression, but could include actively cuing the individual by nudging or pawing the individual to alert to the onset of an episode and removing the individual from the anxiety-provoking environment.

The Department recognizes that despite its best efforts to provide clarification, the ''minimal protection'' language appears to have been misinterpreted. While the Department maintains that protection from danger is one of the key functions that service animals perform for the benefit of persons with disabilities, the Department recognizes that an animal individually trained to provide aggressive protection, such as an attack dog, is not appropriately considered a service animal. Therefore, the Department has decided to modify the ''minimal protection'' language to read ''nonviolent protection,'' thereby excluding so-called 'attack dogs'' or dogs with traditional ''protection training'' as service animals. The Department believes that this modification to the service animal definition will eliminate confusion, without restricting unnecessarily the type of work or tasks that service animals may perform. The Department's modification also clarifies that the crime-deterrent effect of a dog's presence, by itself, does not qualify as work or tasks for purposes of the service animal definition.

Alerting to intruders. The phrase ''alerting to intruders'' is related to the issues of minimal protection and the work or tasks an animal may perform to meet the definition of a service animal. In the original 1991 regulatory text, this phrase was intended to identify service animals that alert individuals who are deaf or hard of hearing to the presence of others. This language has been misinterpreted by some to apply to dogs that are trained specifically to provide aggressive protection, resulting in the assertion that such training

qualifies a dog as a service animal under the ADA. The Department reiterates that public accommodations are not required to admit any animal whose use poses a direct threat. In addition, the Department has decided to remove the word ''intruders'' from the service animal definition and replace it with the phrase ''the presence of people or sounds.'' The Department believes this clarifies that so-called ''attack training'' or other aggressive response types of training that cause a dog to provide an aggressive response do not qualify a dog as a service animal under the ADA.

Conversely, if an individual uses a breed of dog that is perceived to be aggressive because of breed reputation, stereotype, or the history or experience the observer may have with other dogs, but the dog is under the control of the individual with a disability and does not exhibit aggressive behavior, the public accommodation cannot exclude the individual or the animal from the place of public accommodation. The animal can only be removed if it engages in the behaviors mentioned in § 36.302(c) (as revised in the final rule) or if the presence of the animal constitutes a fundamental alteration to the nature of the goods, services, facilities, and activities of the place of public accommodation.

''Doing work'' or ''performing tasks.'' The NPRM proposed that the Department maintain the requirement first articulated in the 1991 title III regulation that in order to qualify as a service animal, the animal must ''perform tasks'' or ''do work'' for the individual with a disability. The phrases ''perform tasks'' and ''do work'' describe what an animal must do for the benefit of an individual with a disability in order to qualify as a service animal.

The Department received a number of comments in response to the NPRM proposal urging the removal of the term ''do work'' from the definition of a service animal. These commenters argued that the Department should emphasize the performance of tasks instead. The Department disagrees. Although the common definition of work includes the performance of tasks, the definition of work is somewhat broader, encompassing activities that do not appear to involve physical action.

One service dog user stated that, in some cases, ''critical forms of assistance can't be construed as physical tasks,'' noting that the manifestations of ''brain-based disabilities,'' such as psychiatric disorders and autism, are as varied as their physical counterparts. The Department agrees with this statement but cautions that unless the animal is individually trained to do something that qualifies as work or a task, the animal is a pet or support animal and does not qualify for coverage as a service animal. A pet or support animal may be able to discern that the individual is in distress, but it is what the animal is trained to do in response to this awareness that distinguishes a service animal from an observant pet or support animal.

The NPRM contained an example of ''doing work'' that stated ''a psychiatric service dog can help some individuals with dissociative identity disorder to remain grounded in time or place.'' 73 FR 34508, 34521 (June 17, 2008). Several commenters objected to the use of this example, arguing that grounding was not a ''task'' and therefore the example inherently contradicted the basic premise that a service animal must perform a task in order to mitigate a disability. Other commenters stated that ''grounding'' should not be included as an example of ''work'' because it could lead to some individuals claiming that they should be able to use emotional support animals in public because the dog makes them feel calm or safe. By contrast, one commenter with experience in training service animals explained that grounding is a trained task based upon very specific behavioral indicators that can be observed and measured. These tasks are based upon input from mental health practitioners, dog trainers, and individuals with a history of working with psychiatric service dogs.

It is the Department's view that an animal that is trained to ''ground'' a person with a psychiatric disorder does work or performs a task that would

qualify it as a service animal as compared to an untrained emotional support animal whose presence affects a person's disability. It is the fact that the animal is trained to respond to the individual's needs that distinguishes an animal as a service animal. The process must have two steps: Recognition and response. For example, if a service animal senses that a person is about to have a psychiatric episode and it is trained to respond, for example, by nudging, barking, or removing the individual to a safe location until the episode subsides, then the animal has indeed performed a task or done work on behalf of the individual with the disability, as opposed to merely sensing an event.

One commenter suggested defining the term ''task,'' presumably to improve the understanding of the types of services performed by an animal that would be sufficient to qualify the animal for coverage. The Department believes that the common definition of the word ''task'' is sufficiently clear and that it is not necessary to add to the definitions section. However, the Department has added examples of other kinds of work or tasks to help illustrate and provide clarity to the definition. After careful evaluation of this issue, the Department has concluded that the phrases ''do work'' and ''perform tasks'' have been effective during the past two decades to illustrate the varied services provided by service animals for the benefit of individuals with all types of disabilities. Thus, the Department declines to depart from its longstanding approach at this time.

Species limitations. When the Department originally issued its title III regulation in the early 1990s, the Department did not define the parameters of acceptable animal species. At that time, few anticipated the variety of animals that would be promoted as service animals in the years to come, which ranged from pigs and miniature horses to snakes, iguanas, and parrots. The Department has followed this particular issue closely, keeping current with the many unusual species of animals represented to be service animals. Thus, the Department has decided to refine further this aspect of the service animal definition in the final rule.

The Department received many comments from individuals and organizations recommending species limitations. Several of these commenters asserted that limiting the number of allowable species would help stop erosion of the public's trust, which has resulted in reduced access for many individuals with disabilities who use trained service animals that adhere to high behavioral standards. Several commenters suggested that other species would be acceptable if those animals could meet nationally recognized behavioral standards for trained service dogs. Other commenters asserted that certain species of animals *(e.g.,* reptiles) cannot be trained to do work or perform tasks, so these animals would not be covered.

In the NPRM, the Department used the term ''common domestic animal'' in the service animal definition and excluded reptiles, rabbits, farm animals (including horses, miniature horses, ponies, pigs, and goats), ferrets, amphibians, and rodents from the service animal definition. 73 FR 34508, 34553 (June 17, 2008). However, the term ''common domestic animal'' is difficult to define with precision due to the increase in the number of domesticated species. Also, several State and local laws define a ''domestic'' animal as an animal that is not wild.

The Department is compelled to take into account the practical considerations of certain animals and to contemplate their suitability in a variety of public contexts, such as restaurants, grocery stores, hospitals, and performing arts venues, as well as suitability for urban environments. The Department agrees with commenters' views that limiting the number and types of species recognized as service animals will provide greater predictability for public accommodations as well as added assurance of access for individuals with disabilities who use dogs as service animals. As a consequence, the Department has decided to limit this rule's coverage of service animals to dogs, which are the most common service animals used by individuals with disabilities.

Wild animals, monkeys, and other nonhuman primates. Numerous business entities endorsed a narrow definition of acceptable service animal species, and asserted that there are certain animals *(e.g.,* reptiles) that cannot be trained to do work or perform tasks. Other commenters suggested that the Department should identify excluded animals, such as birds and llamas, in the final rule. Although one commenter noted that wild animals bred in captivity should be permitted to be service animals, the Department has decided to make clear that all wild animals, whether born or bred in captivity or in the wild, are eliminated from coverage as service animals. The Department believes that this approach reduces risks to health or safety attendant with wild animals. Some animals, such as certain nonhuman primates, including certain monkeys, pose a direct threat; their behavior can be unpredictably aggressive and violent without notice or provocation. The American Veterinary Medical Association (AVMA) issued a position statement advising against the use of monkeys as service animals, stating that ''[t]he AVMA does not support the use of nonhuman primates as assistance animals because of animal welfare concerns, and the potential for serious injury and zoonotic [animal to human disease transmission] risks.'' AVMA Position Statement, *Nonhuman Primates as Assistance Animals* (2005), available at h*ttp://www.avma.org/issues/policy/ nonhuman_ primates.asp* (last visited June 24, 2010).

An organization that trains capuchin monkeys to provide in-home services to individuals with paraplegia and quadriplegia was in substantial agreement with the AVMA's views but requested a limited recognition in the service animal definition for the capuchin monkeys it trains to provide assistance for persons with disabilities. The organization commented that its trained capuchin monkeys undergo scrupulous veterinary examinations to ensure that the animals pose no health risks, and are used by individuals with disabilities exclusively in their homes. The organization acknowledged that the capuchin monkeys it trains are not necessarily suitable for use in a place of public accommodation but noted that the monkeys may need to be used in circumstances that implicate title III coverage, *e.g.,* in the event the handler had to leave home due to an emergency, to visit a veterinarian, or for the initial delivery of the monkey to the individual with a disability. The organization noted that several State and local government entities have local zoning, licensing, health, and safety laws that prohibit non-human primates, and that these prohibitions would prevent individuals with disabilities from using these animals even in their homes.

The organization argued that including capuchin monkeys under the service animal umbrella would make it easier for individuals with disabilities to obtain reasonable modifications of State and local licensing, health, and safety laws that would permit the use of these monkeys. The organization argued that this limited modification to the service animal definition was warranted in view of the services these monkeys perform, which enable many individuals with paraplegia and quadriplegia to live and function with increased independence.

The Department has carefully considered the potential risks associated with the use of nonhuman primates as service animals in places of public accommodation, as well as the information provided to the Department about the significant benefits that trained capuchin monkeys provide to certain individuals with disabilities in residential settings. The Department has determined, however, that nonhuman primates, including capuchin monkeys, will not be recognized as service animals for purposes of this rule because of their potential for disease transmission and unpredictable aggressive behavior. The Department believes that these characteristics make nonhuman primates unsuitable for use as service animals in the context of the wide variety of public settings subject to this rule. As the organization advocating the inclusion of capuchin monkeys acknowledges, capuchin monkeys are not suitable for use in public

facilities.

The Department emphasizes that it has decided only that capuchin monkeys will not be included in the definition of service animals for purposes of its regulation implementing the ADA. This decision does not have any effect on the extent to which public accommodations are required to allow the use of such monkeys under other Federal statutes, like the FHAct or the Air Carrier Access Act (ACAA). For example, a public accommodation that also is considered to be a ''dwelling'' may be covered under both the ADA and the FHAct. While the ADA does not require such a public accommodation to admit people with service monkeys, the FHAct may. Under the FHAct an individual with a disability may have the right to have an animal other than a dog in his or her home if the animal qualifies as a ''reasonable accommodation'' that is necessary to afford the individual equal opportunity to use and enjoy a dwelling, assuming that the use of the animal does not pose a direct threat. In some cases, the right of an individual to have an animal under the FHAct may conflict with State or local laws that prohibit all individuals, with or without disabilities, from owning a particular species. However, in this circumstance, an individual who wishes to request a reasonable modification of the State or local law must do so under the FHAct, not the ADA.

Having considered all of the comments about which species should qualify as service animals under the ADA, the Department has determined the most reasonable approach is to limit acceptable species to dogs.

Size or weight limitations. The vast majority of commenters did not support a size or weight limitation. Commenters were typically opposed to a size or weight limit because many tasks performed by service animals require large, strong dogs. For instance, service animals may perform tasks such as providing balance and support or pulling a wheelchair. Small animals may not be suitable for large adults. The weight of the service animal user is often correlated with the size and weight of the service animal. Others were concerned that adding a size and weight limit would further complicate the difficult process of finding an appropriate service animal. One commenter noted that there is no need for a limit because ''if, as a practical matter, the size or weight of an individual's service animal creates a direct threat or fundamental alteration to a particular public entity or accommodation, there are provisions that allow for the animal's exclusion or removal.'' Some common concerns among commenters in support of a size and weight limit were that a larger animal may be less able to fit in various areas with its handler, such as toilet rooms and public seating areas, and that larger animals are more difficult to control.

Balancing concerns expressed in favor of and against size and weight limitations, the Department has determined that such limitations would not be appropriate. Many individuals of larger stature require larger dogs. The Department believes it would be inappropriate to deprive these individuals of the option of using a service dog of the size required to provide the physical support and stability these individuals may need to function independently. Since large dogs have always served as service animals, continuing their use should not constitute fundamental alterations or impose undue burdens on public accommodations.

Breed limitations. A few commenters suggested that certain breeds of dogs should not be allowed to be used as service animals. Some suggested that the Department should defer to local laws restricting the breeds of dogs that individuals who reside in a community may own. Other commenters opposed breed restrictions, stating that the breed of a dog does not determine its propensity for aggression and that aggressive and non-aggressive dogs exist in all breeds.

The Department does not believe that it is either appropriate or consistent with the ADA to defer to local laws that prohibit certain breeds of dogs based on local concerns that these breeds may have a history of unprovoked aggression or attacks. Such deference would have the effect

of limiting the rights of persons with disabilities under the ADA who use certain service animals based on where they live rather than on whether the use of a particular animal poses a direct threat to the health and safety of others. Breed restrictions differ significantly from jurisdiction to jurisdiction. Some jurisdictions have no breed restrictions. Others have restrictions that, while well-meaning, have the unintended effect of screening out the very breeds of dogs that have successfully served as service animals for decades without a history of the type of unprovoked aggression or attacks that would pose a direct threat, *e.g.,* German Shepherds. Other jurisdictions prohibit animals over a certain weight, thereby restricting breeds without invoking an express breed ban. In addition, deference to breed restrictions contained in local laws would have the unacceptable consequence of restricting travel by an individual with a disability who uses a breed that is acceptable and poses no safety hazards in the individual's home jurisdiction but is nonetheless banned by other jurisdictions. Public accommodations have the ability to determine, on a case-by-case basis, whether a particular service animal can be excluded based on that particular animal's actual behavior or history—not based on fears or generalizations about how an animal or breed might behave. This ability to exclude an animal whose behavior or history evidences a direct threat is sufficient to protect health and safety.

Recognition of psychiatric service animals, but not "emotional support animals." The definition of "service animal" in the NPRM stated the Department's longstanding position that emotional support animals are not included in the definition of "service animal." The proposed text provided that "[a]nimals whose sole function is to provide emotional support, comfort, therapy, companionship, therapeutic benefits, or to promote emotional well-being are not service animals." 73 FR 34508, 34553 (June 17, 2008).

Many advocacy organizations expressed concern and disagreed with the exclusion of comfort and emotional support animals. Others have been more specific, stating that individuals with disabilities may need their emotional support animals in order to have equal access. Some commenters noted that individuals with disabilities use animals that have not been trained to perform tasks directly related to their disability. These animals do not qualify as service animals under the ADA. These are emotional support or comfort animals.

Commenters asserted that excluding categories such as "comfort" and "emotional support" animals recognized by laws such as the FHAct or the ACAA is confusing and burdensome. Other commenters noted that emotional support and comfort animals perform an important function, asserting that animal companionship helps individuals who experience depression resulting from multiple sclerosis.

Some commenters explained the benefits emotional support animals provide, including emotional support, comfort, therapy, companionship, therapeutic benefits, and the promotion of emotional well-being. They contended that without the presence of an emotional support animal in their lives they would be disadvantaged and unable to participate in society. These commenters were concerned that excluding this category of animals will lead to discrimination against and excessive questioning of individuals with non-visible or non-apparent disabilities. Other commenters expressing opposition to the exclusion of individually trained "comfort" or "emotional support" animals asserted that the ability to soothe or de-escalate and control emotion is "work" that benefits the individual with the disability.

Many commenters requested that the Department carve out an exception that permits current or former members of the military to use emotional support animals. They asserted that a significant number of service members returning from active combat duty have adjustment difficulties due to combat, sexual assault, or other traumatic experiences while on active duty. Commenters noted that some current or former members of the mili-

tary service have been prescribed animals for conditions such as PTSD. One commenter stated that service women who were sexually assaulted while in the military use emotional support animals to help them feel safe enough to step outside their homes. The Department recognizes that many current and former members of the military have disabilities as a result of service-related injuries that may require emotional support and that such individuals can benefit from the use of an emotional support animal and could use such animal in their home under the FHAct. However, having carefully weighed the issues, the Department believes that its final rule appropriately addresses the balance of issues and concerns of both the individual with a disability and the public accommodation. The Department also notes that nothing in this part prohibits a public entity from allowing current or former military members or anyone else with disabilities to utilize emotional support animals if it wants to do so.

Commenters asserted the view that if an animal's ''mere presence'' legitimately provides such benefits to an individual with a disability and if those benefits are necessary to provide equal opportunity given the facts of the particular disability, then such an animal should qualify as a ''service animal.'' Commenters noted that the focus should be on the nature of a person's disability, the difficulties the disability may impose and whether the requested accommodation would legitimately address those difficulties, not on evaluating the animal involved. The Department understands this approach has benefitted many individuals under the FHAct and analogous State law provisions, where the presence of animals poses fewer health and safety issues and where emotional support animals provide assistance that is unique to residential settings. The Department believes, however, that the presence of such animals is not required in the context of public accommodations, such as restaurants, hospitals, hotels, retail establishments, and assembly areas.

Under the Department's previous regulatory framework, some individuals and entities assumed that the requirement that service animals must be individually trained to do work or perform tasks excluded all individuals with mental disabilities from having service animals. Others assumed that any person with a psychiatric condition whose pet provided comfort to them was covered by the 1991 title III regulation. The Department reiterates that psychiatric service animals that are trained to do work or perform a task for individuals whose disability is covered by the ADA are protected by the Department's present regulatory approach. Psychiatric service animals can be trained to perform a variety of tasks that assist individuals with disabilities to detect the onset of psychiatric episodes and ameliorate their effects. Tasks performed by psychiatric service animals may include reminding the individual to take medicine, providing safety checks or room searches for individuals with PTSD, interrupting self-mutilation, and removing disoriented individuals from dangerous situations.

The difference between an emotional support animal and a psychiatric service animal is the work or tasks that the animal performs. Traditionally, service dogs worked as guides for individuals who were blind or had low vision. Since the original regulation was promulgated, service animals have been trained to assist individuals with many different types of disabilities.

In the final rule, the Department has retained its position on the exclusion of emotional support animals from the definition of ''service animal.'' The definition states that ''[t]he provision of emotional support, well-being, comfort, or companionship * * * do[es] not constitute work or tasks for the purposes of this definition.'' The Department notes, however, that the exclusion of emotional support animals from coverage in the final rule does not mean that individuals with psychiatric or mental disabilities cannot use service animals that meet the regulatory definition. The final rule defines service animal as follows: ''Service animal means any dog that is individually trained to do work or

perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability.'' This language simply clarifies the Department's longstanding position.

The Department's position is based on the fact that the title II and title III regulations govern a wider range of public settings than the housing and transportation settings for which the Department of Housing and Urban Development (HUD) and the DOT regulations allow emotional support animals or comfort animals. The Department recognizes that there are situations not governed by the title II and title III regulations, particularly in the context of residential settings and transportation, where there may be a legal obligation to permit the use of animals that do not qualify as service animals under the ADA, but whose presence nonetheless provides necessary emotional support to persons with disabilities. Accordingly, other Federal agency regulations, case law, and possibly State or local laws governing those situations may provide appropriately for increased access for animals other than service animals as defined under the ADA. Public officials, housing providers, and others who make decisions relating to animals in residential and transportation settings should consult the Federal, State, and local laws that apply in those areas (*e.g.,* the FHAct regulations of HUD and the ACAA) and not rely on the ADA as a basis for reducing those obligations.

Retain term "service animal." Some commenters asserted that the term ''assistance animal'' is a term of art and should replace the term ''service animal''; however, the majority of commenters preferred the term ''service animal'' because it is more specific. The Department has decided to retain the term ''service animal'' in the final rule. While some agencies, like HUD, use the terms ''assistance animal, ''assistive animal,'' or ''support animal,'' these terms are used to denote a broader category of animals than is covered by the ADA. The Department has decided that changing the term used in the final rule would create confusion, particularly in view of the broader parameters for coverage under the FHAct, *cf.* Preamble to HUD's Final Rule for Pet Ownership for the Elderly and Persons with Disabilities, 73 FR 63834–38 (Oct. 27, 2008); HUD Handbook No. 4350.3 Rev–1, Chapter 2, *Occupancy Requirements of Subsidized Multifamily Housing Programs* (June 2007), available at *http://www.hud.gov/offices/adm/ hudclips/handbooks/hsgh/4350.3* (last visited June 24, 2010). Moreover, as discussed above, the Department's definition of ''service animal'' in the final rule does not affect the rights of individuals with disabilities who use assistance animals in their homes under the FHAct or who use ''emotional support animals'' that are covered under the ACAA and its implementing regulations. *See* 14 CFR 382.7 *et seq.; see also* Department of Transportation, *Guidance Concerning Service Animals in Air Transportation,* 68 FR 24874, 24877 (May 9, 2003) (discussing accommodation of service animals and emotional support animals on aircraft).

''Video Remote Interpreting (VRI) Services''
In the NPRM, the Department proposed adding ''Video Interpreting Services (VIS)'' to the list of auxiliary aids available to provide effective communication. In the preamble to the NPRM, VIS was defined as ''a technology composed of a video phone, video monitors, cameras, a high-speed Internet connection, and an interpreter. The video phone provides video transmission to a video monitor that permits the individual who is deaf or hard of hearing to view and sign to a video interpreter (*i.e.,* a live interpreter in another location), who can see and sign to the individual through a camera located on or near the monitor, while others can communicate by speaking. The video monitor can display a split screen of two live images, with the interpreter in one image and the individual who is deaf or hard of hearing in the other image.'' 73 FR 34508, 34522 (June 17, 2008). Comments from advocacy organizations and individuals unanimously requested that the

Department use the term ''video remote interpreting (VRI),'' instead of VIS, for consistency with Federal Communications Commission (FCC) regulations, FCC Public Notice, DA–0502417 (Sept. 7, 2005), and with common usage by consumers. The Department has made that change throughout the regulation to avoid confusion and to make the regulation more consistent with existing regulations.

Many commenters also requested that the Department distinguish between VRI and ''video relay service (VRS).'' Both VRI and VRS use a remote interpreter who is able to see and communicate with a deaf person and a hearing person, and all three individuals may be connected by a video link. VRI is a fee-based interpreting service conveyed via videoconferencing where at least one person, typically the interpreter, is at a separate location. VRI can be provided as an on-demand service or by appointment. VRI normally involves a contract in advance for the interpreter who is usually paid by the covered entity.

VRS is a telephone service that enables persons with disabilities to use the telephone to communicate using video connections and is a more advanced form of relay service than the traditional voice to text telephones (TTY) relay systems that were recognized in the 1991 title III regulation. More specifically, VRS is a video relay service using interpreters connected to callers by video hook-up and is designed to provide telephone services to persons who are deaf and use American Sign Language that are functionally equivalent to those services provided to users who are hearing. VRS is funded through the Interstate Telecommunications Relay Services Fund and overseen by the FCC. *See* 47 CFR 64.601(a)(26). There are no fees for callers to use the VRS interpreters and the video connection, although there may be relatively inexpensive initial costs to the title III entities to purchase the videophone or camera for on-line video connection, or other equipment to connect to the VRS service. The FCC has made clear that VRS functions as a telephone service and is not intended to be used for interpreting services where both parties are in the same room; the latter is reserved for VRI. The Department agrees that VRS cannot be used as a substitute for in-person interpreters or for VRI in situations that would not, absent one party's disability, entail use of the telephone.

Many commenters strongly recommended limiting the use of VRI to circumstances where it will provide effective communication. Commenters from advocacy groups and persons with disabilities expressed concern that VRI may not always be appropriate to provide effective communication, especially in hospitals and emergency rooms. Examples were provided of patients who are unable to see the video monitor because they are semi-conscious or unable to focus on the video screen; other examples were given of cases where the video monitor is out of the sightline of the patient or the image is out of focus; still other examples were given of patients who could not see the image because the signal was interrupted, causing unnatural pauses in the communication, or the image was grainy or otherwise unclear. Many commenters requested more explicit guidelines on the use of VRI and some recommended requirements for equipment maintenance, high-speed, wide-bandwidth video links using dedicated lines or wireless systems, and training of staff using VRI, especially in hospital and health care situations. Several major organizations requested a requirement to include the interpreter's face, head, arms, hands, and eyes in all transmissions.

After consideration of the comments and the Department's own research and experience, the Department has determined that VRI can be an effective method of providing interpreting services in certain circumstances, but not in others. For example, VRI should be effective in many situations involving routine medical care, as well as in the emergency room where urgent care is important, but no in-person interpreter is available; however, VRI may not be effective in situations involving surgery or other medical procedures where the

patient is limited in his or her ability to see the video screen. Similarly, VRI may not be effective in situations where there are multiple people in a room and the information exchanged is highly complex and fast paced. The Department recognizes that in these and other situations, such as where communication is needed for persons who are deaf-blind, it may be necessary to summon an in-person interpreter to assist certain individuals. To ensure that VRI is effective in situations where it is appropriate, the Department has established performance standards in § 36.303(f).

Subpart B—General Requirements

Section 36.208(b) Direct Threat

The Department has revised the language of § 36.208(b) (formerly § 36.208(c) in the 1991 title III regulation) to include consideration of whether the provision of auxiliary aids or services will mitigate the risk that an individual will pose a direct threat to the health or safety of others. Originally, the reference to auxiliary aids or services as a mitigating factor was part of § 36.208. However, that reference was removed from the section when, for editorial purposes, the Department removed the definition of ''direct threat'' from § 36.208 and placed it in § 36.104. The Department has put the reference to auxiliary aids or services as a mitigating factor back into § 36.208(b) in order to maintain consistency with the current regulation.

Section 36.211 Maintenance of Accessible Features

Section 36.211 of the 1991 title III regulation provides that a public accommodation must maintain in operable working condition those features of facilities and equipment that are required to be readily accessible to and usable by individuals with disabilities. 28 CFR 36.211. In the NPRM, the Department clarified the application of this provision and proposed one change to the section to address the discrete situation in which the scoping requirements provided in the 2010 Standards reduce the number of required elements below the requirements of the 1991 Standards. In that discrete event, a public accommodation may reduce such accessible features in accordance with the requirements in the 2010 Standards.

The Department received only four comments on this proposed amendment. None of the commenters opposed the change. In the final rule, the Department has revised the section to make it clear that if the 2010 Standards reduce either the technical requirements or the number of required accessible elements below that required by the 1991 Standards, then the public accommodation may reduce the technical requirements or the number of accessible elements in a covered facility in accordance with the requirements of the 2010 Standards. One commenter, an association of convenience stores, urged the Department to expand the language of the section to include restocking of shelves as a permissible activity for isolated or temporary interruptions in service or access. It is the Department's position that a temporary interruption that blocks an accessible route, such as restocking of shelves, is already permitted by existing § 36.211(b), which clarifies that ''isolated or temporary interruptions in service or access due to maintenance or repairs'' are permitted. Therefore, the Department will not make any additional changes in the language of § 36.211 other than those discussed in the preceding paragraph.

Subpart C—Specific Requirements

Section 36.302 Modifications in Policies, Practices, or Procedures

Section 36.302(c) Service Animals Section 36.302(c)(1) of the 1991 title III regulation states that ''[g]enerally, a public accommodation shall modify [its] policies, practices, or procedures to permit the use of service animals by an individual with a disability.'' Section 36.302(c)(2) of the 1991 title III regulation states that ''[n]othing in

this part requires a public accommodation to supervise or care for a service animal.'' The Department has decided to retain the scope of the 1991 title III regulation while clarifying the Department's longstanding policies and interpretations. Toward that end, the final rule has been revised to include the Department's policy interpretations as outlined in published technical assistance, *Commonly Asked Questions about Service Animals in Places of Business* (1996), available at *http://www.ada.gov/qasrvc.htm,*and *ADA Guide for Small Businesses* (1999), available at *http://www.ada.gov/smbustxt.htm,* and to add that a public accommodation may exclude a service animal in certain circumstances where the service animal fails to meet certain behavioral standards. The Department received extensive comments in response to proposed § 36.302(c) from individuals, disability advocacy groups, organizations involved in training service animals, and public accommodations. Those comments and the Department's response are discussed below.

Exclusion of service animals. The 1991 regulatory provision in § 36.302(c) addresses reasonable modification and remains unchanged in the final rule. However, based on comments received and the Department's analysis, the Department has decided to clarify those circumstances where otherwise eligible service animals may be excluded by public accommodations.

In the NPRM, in § 36.302(c)(2)(i), the Department proposed that a public accommodation may ask an individual with a disability to remove a service animal from the place of public accommodation if ''[t]he animal is out of control and the animal's handler does not take effective action to control it.'' 73 FR 34508, 34553 (June 17, 2008). The Department has long held that a service animal must be under the control of the handler at all times. Commenters overwhelmingly were in favor of this language, but noted that there are occasions when service animals are provoked to disruptive or aggressive behavior by agitators or troublemakers, as in the case of a blind individual whose service dog is taunted or pinched. While all service animals are trained to ignore and overcome these types of incidents, misbehavior in response to provocation is not always unreasonable. In circumstances where a service animal misbehaves or responds reasonably to a provocation or injury, the public accommodation must give the handler a reasonable opportunity to gain control of the animal. Further, if the individual with a disability asserts that the animal was provoked or injured, or if the public accommodation otherwise has reason to suspect that provocation or injury has occurred, the public accommodation should seek to determine the facts and, if provocation or injury occurred, the public accommodation should take effective steps to prevent further provocation or injury, which may include asking the provocateur to leave the place of public accommodation. This language is unchanged in the final rule.

The NPRM also proposed language at § 36.302(c)(2)(ii) to permit a public accommodation to exclude a service animal if the animal is not housebroken (*i.e.,* trained so that, absent illness or accident, the animal controls its waste elimination) or the animal's presence or behavior fundamentally alters the nature of the service the public accommodation provides (*e.g.,* repeated barking during a live performance). Several commenters were supportive of this NPRM language, but cautioned against overreaction by the public accommodation in these instances. One commenter noted that animals get sick, too, and that accidents occasionally happen. In these circumstances, simple clean up typically addresses the incident. Commenters noted that the public accommodation must be careful when it excludes a service animal on the basis of ''fundamental alteration,'' asserting for example, that a public accommodation should not exclude a service animal for barking in an environment where other types of noise, such as loud cheering or a child crying, is tolerated. The Department maintains that the appropriateness of an exclusion can be assessed by reviewing how a public accommodation addresses comparable situ-

ations that do not involve a service animal. The Department has retained in § 36.302(c)(2) of the final rule the exception requiring animals to be housebroken. The Department has not retained the specific NPRM language stating that animals can be excluded if their presence or behavior fundamentally alters the nature of the service provided by the public accommodation, because the Department believes that this exception is covered by the general reasonable modification requirement contained in § 36.302(c)(1).

The NPRM also proposed in § 36.302(c)(2)(iii) that a service animal can be excluded where ''[t]he animal poses a direct threat to the health or safety of others that cannot be eliminated by reasonable modifications.'' 73 FR 34508, 34553 (June 17, 2008). Commenters were universally supportive of this provision as it makes express the discretion of a public accommodation to exclude a service animal that poses a direct threat. Several commenters cautioned against the overuse of this provision and suggested that the Department provide an example of the rule's application. The Department has decided not to include regulatory language specifically stating that a service animal can be excluded if it poses a direct threat. The Department believes that the direct threat provision in § 36.208 already provides this exception to public accommodations.

Access to a public accommodation following the proper exclusion of a service animal. The NPRM proposed that in the event a public accommodation properly excludes a service animal, the public accommodation must give the individual with a disability the opportunity to obtain the goods and services of the public accommodation without having the service animal on the premises. Most commenters welcomed this provision as a common sense approach. These commenters noted that they do not wish to preclude individuals with disabilities from the full and equal enjoyment of the goods and services simply because of an isolated problem with a service animal. The Department has elected to retain this provision in § 36.302(c)(2).

Other requirements. The NPRM also proposed that the regulation include the following requirements: that the work or tasks performed by the service animal must be directly related to the handler's disability; that a service animal must be individually trained to do work or perform a task, be housebroken, and be under the control of the handler; and that a service animal must have a harness, leash, or other tether. Most commenters addressed at least one of these issues in their responses. Most agreed that these provisions are important to clarify further the 1991 service animal regulation. The Department has moved the requirement that the work or tasks performed by the service animal must be related directly to the individual's disability to the definition of ''service animal'' in § 36.104. In addition, the Department has modified the proposed language relating to the handler's control of the animal with a harness, leash, or other tether to state that ''[a] service animal shall have a harness, leash, or other tether, unless either the handler is unable because of a disability to use a harness, leash, or other tether, or the use of a harness, leash, or other tether would interfere with the service animal's safe, effective performance of work or tasks, in which case the service animal must be otherwise under the handler's control (*e.g.,* voice control, signals, or other effective means).'' The Department has retained the requirement that the service animal must be individually trained, as well as the requirement that the service animal be housebroken.

Responsibility for supervision and care of a service animal. The 1991 title III regulation, in § 36.302(c)(2), states that ''[n]othing in this part requires a public accommodation to supervise or care for a service animal.'' The NPRM modified this language to state that ''[a] public accommodation is not responsible for caring for or supervising a service animal.'' 73 FR 34508, 34553 (June 17, 2008). Most commenters did not address this particular provision. The Department notes that there are occasions when a person with a disability is

confined to bed in a hospital for a period of time. In such an instance, the individual may not be able to walk or feed the service animal. In such cases, if the individual has a family member, friend, or other person willing to take on these responsibilities in the place of the individual with a disability, the individual's obligation to be responsible for the care and supervision of the service animal would be satisfied. The language of this section is retained, with minor modifications, in § 36.302(c)(5) of the final rule.

Inquiries about service animals. The NPRM proposed language at § 36.302(c)(6) setting forth parameters about how a public accommodation may determine whether an animal qualifies as a service animal. The proposed section stated that a public accommodation may ask if the animal is required because of a disability and what task or work the animal has been trained to do but may not require proof of service animal certification or licensing. Such inquiries are limited to eliciting the information necessary to make a decision without requiring disclosure of confidential disability-related information that a public accommodation does not need.

This language is consistent with the policy guidance outlined in two Department publications, *Commonly Asked Questions about Service Animals in Places of Business* (1996), available at *http://www.ada.gov/ qasrvc.htm*, and *ADA Guide for Small Businesses* (1999), available a*t http://www.ada.gov/smbustxt.htm*.

Although some commenters contended that the NPRM service animal provisions leave unaddressed the issue of how a public accommodation can distinguish between a psychiatric service animal, which is covered under the final rule, and a comfort animal, which is not, other commenters noted that the Department's published guidance has helped public accommodations to distinguish between service animals and pets on the basis of an individual's response to these questions. Accordingly, the Department has retained the NPRM language incorporating its guidance concerning the permissible questions into the final rule.

Some commenters suggested that a title III entity be allowed to require current documentation, no more than one year old, on letterhead from a mental health professional stating the following: (1) That the individual seeking to use the animal has a mental health-related disability; (2) that having the animal accompany the individual is necessary to the individual's mental health or treatment or to assist the person otherwise; and (3) that the person providing the assessment of the individual is a licensed mental health professional and the individual seeking to use the animal is under that individual's professional care. These commenters asserted that this will prevent abuse and ensure that individuals with legitimate needs for psychiatric service animals may use them. The Department believes that this proposal would treat persons with psychiatric, intellectual, and other mental disabilities less favorably than persons with physical or sensory disabilities. The proposal would also require persons with disabilities to obtain medical documentation and carry it with them any time they seek to engage in ordinary activities of daily life in their communities— something individuals without disabilities have not been required to do. Accordingly, the Department has concluded that a documentation requirement of this kind would be unnecessary, burdensome, and contrary to the spirit, intent, and mandates of the ADA.

Service animal access to areas of a public accommodation. The NPRM proposed at § 36.302(c)(7) that an individual with a disability who uses a service animal has the same right of access to areas of a public accommodation as members of the public, program participants, and invitees. Commenters indicated that allowing individuals with disabilities to go with their service animals into the same areas as members of the public, program participants, clients, customers, patrons, or invitees is accepted practice by most places of public accommodation. The Department has included a slightly modified version of this provision in § 36.302(c)(7) of the final rule. The Department

notes that under the final rule, a healthcare facility must also permit a person with a disability to be accompanied by a service animal in all areas of the facility in which that person would otherwise be allowed. There are some exceptions, however. The Department follows the guidance of the Centers for Disease Control and Prevention (CDC) on the use of service animals in a hospital setting. Zoonotic diseases can be transmitted to humans through bites, scratches, direct contact, arthropod vectors, or aerosols.

Consistent with CDC guidance, it is generally appropriate to exclude a service animal from limited-access areas that employ general infection-control measures, such as operating rooms and burn units. *See* Centers for Disease Control and Prevention, *Guidelines for Environmental Infection Control in Health-Care Facilities: Recommendations of CDC and the Healthcare Infection Control Practices Advisory Committee* (June 2003), available at *http://www.cdc.gov/hicpac/pdf/guidelines/ eic_in_HCF_03.pdf* (last visited June 24, 2010). A service animal may accompany its handler to such areas as admissions and discharge offices, the emergency room, inpatient and outpatient rooms, examining and diagnostic rooms, clinics, rehabilitation therapy areas, the cafeteria and vending areas, the pharmacy, restrooms, and all other areas of the facility where healthcare personnel, patients, and visitors are permitted without taking added precautions.

Prohibition against surcharges for use of a service animal. In the NPRM, the Department proposed to incorporate the previously mentioned policy guidance, which prohibits the assessment of a surcharge for the use of a service animal, into proposed § 36.302(c)(8). Several commenters agreed that this provision makes clear the obligation of a place of public accommodation to admit an individual with a service animal without surcharges, and that any additional costs imposed should be factored into the overall cost of doing business and passed on as a charge to all participants, rather than an individualized surcharge to the service animal user. Commenters also noted that service animal users cannot be required to comply with other requirements that are not generally applicable to other persons. If a public accommodation normally charges individuals for the damage they cause, an individual with a disability may be charged for damage caused by his or her service animals. The Department has retained this language, with minor modifications, in the final rule at § 36.302(c)(8).

Training requirement. Certain commenters recommended the adoption of formal training requirements for service animals. The Department has rejected this approach and will not impose any type of formal training requirements or certification process, but will continue to require that service animals be individually trained to do work or perform tasks for the benefit of an individual with a disability. While some groups have urged the Department to modify this position, the Department has determined that such a modification would not serve the full array of individuals with disabilities who use service animals, since individuals with disabilities may be capable of training, and some have trained, their service animal to perform tasks or do work to accommodate their disability. A training and certification requirement would increase the expense of acquiring a service animal and might limit access to service animals for individuals with limited financial resources.

Some commenters proposed specific behavior or training standards for service animals, arguing that without such standards, the public has no way to differentiate between untrained pets and service animals. Many of the suggested behavior or training standards were lengthy and detailed. The Department believes that this rule addresses service animal behavior sufficiently by including provisions that address the obligations of the service animal user and the circumstances under which a service animal may be excluded, such as the requirements that an animal be housebroken and under the control of its handler.

Miniature horses. The Department has been

persuaded by commenters and the available research to include a provision that would require public accommodations to make reasonable modifications to policies, practices, or procedures to permit the use of a miniature horse by a person with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability. The traditional service animal is a dog, which has a long history of guiding individuals who are blind or have low vision, and over time dogs have been trained to perform an even wider variety of services for individuals with all types of disabilities. However, an organization that developed a program to train miniature horses, modeled on the program used for guide dogs, began training miniature horses in 1991.

Although commenters generally supported the species limitations proposed in the NPRM, some were opposed to the exclusion of miniature horses from the definition of a service animal. These commenters noted that these animals have been providing assistance to persons with disabilities for many years. Miniature horses were suggested by some commenters as viable alternatives to dogs for individuals with allergies, or for those whose religious beliefs preclude the use of dogs. Another consideration mentioned in favor of the use of miniature horses is the longer life span and strength of miniature horses in comparison to dogs. Specifically, miniature horses can provide service for more than 25 years while dogs can provide service for approximately seven years, and, because of their strength, miniature horses can provide services that dogs cannot provide. Accordingly, use of miniature horses reduces the cost involved to retire, replace, and train replacement service animals.

The miniature horse is not one specific breed, but may be one of several breeds, with distinct characteristics that produce animals suited to service animal work. These animals generally range in height from 24 inches to 34 inches measured to the withers, or shoulders, and generally weigh between 70 and 100 pounds. These characteristics are similar to those of large breed dogs, such as Labrador Retrievers, Great Danes, and Mastiffs. Similar to dogs, miniature horses can be trained through behavioral reinforcement to be ''housebroken.'' Most miniature service horse handlers and organizations recommend that when the animals are not doing work or performing tasks, the miniature horses should be kept outside in a designated area instead of indoors in a house.

According to information provided by an organization that trains service horses, these miniature horses are trained to provide a wide array of services to their handlers, primarily guiding individuals who are blind or have low vision, pulling wheelchairs, providing stability and balance for individuals with disabilities that impair the ability to walk, and supplying leverage that enables a person with a mobility disability to get up after a fall. According to the commenter, miniature horses are particularly effective for large stature individuals. The animal can be trained to stand (and in some cases, lie down) at the handler's feet in venues where space is at a premium, such as assembly areas or inside some vehicles that provide public transportation. Some individuals with disabilities have traveled by train and have flown commercially with their miniature horses.

The miniature horse is not included in the definition of service animal, which is limited to dogs. However, the Department has added a specific provision at § 36.302(c)(9) of the final rule covering miniature horses. Under this provision, public accommodations must make reasonable modifications in policies, practices, or procedures to permit the use of a miniature horse by an individual with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability. The public accommodation may take into account a series of assessment factors in determining whether to allow a miniature horse into a specific facility. These include the type, size, and weight of the miniature horse, whether the handler has

sufficient control of the miniature horse, whether the miniature horse is housebroken, and whether the miniature horse's presence in a specific facility compromises legitimate safety requirements that are necessary for safe operation. In addition, paragraphs (c)(3)B–(8) of this section, which are applicable to dogs, also apply to miniature horses.

Ponies and full-size horses are not covered by § 36.302(c)(9). Also, because miniature horses can vary in size and can be larger and less flexible than dogs, covered entities may exclude this type of service animal if the presence of the miniature horse, because of its larger size and lower level of flexibility, results in a fundamental alteration to the nature of the services provided.

Section 36.302(e) Hotel Reservations

Section 36.302 of the 1991 title III regulation requires public accommodations to make reasonable modifications in policies, practices, or procedures when such modifications are necessary to afford access to any goods, services, facilities, privileges, advantages, or accommodations, unless the entity can demonstrate that making such modifications would fundamentally alter the nature of such goods, services, facilities, privileges, advantages, or accommodations. Hotels, timeshare resorts, and other places of lodging are subject to this requirement and must make reasonable modifications to reservations policies, practices, or procedures when necessary to ensure that individuals with disabilities are able to reserve accessible hotel rooms with the same efficiency, immediacy, and convenience as those who do not need accessible guest rooms.

Each year the Department receives many complaints concerning failed reservations. Most of these complaints involve individuals who have reserved an accessible hotel room only to discover upon arrival that the room they reserved is either not available or not accessible. Although problems with reservations services were not addressed in the ANPRM, commenters independently noted an ongoing problem with hotel reservations and urged the Department to provide regulatory guidance. In response, the Department proposed specific language in the NPRM to address hotel reservations. In addition, the Department posed several questions regarding the current practices of hotels and other reservations services including questions about room guarantees and the holding and release of accessible rooms. The Department also questioned whether public accommodations that provide reservations services for a place or places of lodging but do not own, lease (or lease to), or operate a place of lodging—referred to in this discussion as ''third-party reservations services''—should also be subject to the NPRM's proposals concerning hotel reservations.

Although reservations issues were discussed primarily in the context of traditional hotels, the new rule modifies the definition of ''places of lodging'' to clarify the scope of the rule's coverage of rental accommodations in timeshare properties, condominium hotels, and mixed-use and corporate hotel facilities that operate as places of public accommodation (as that term is now defined in § 36.104), and the Department received detailed comments, discussed below, regarding the application of reservations requirements to this category of rental accommodations.

General rule on reservations. Section 36.302(e)(1) of the NPRM required a public accommodation that owns, leases (or leases to), or operates a place of lodging to:

Modify its policies, practices, or procedures to ensure that individuals with disabilities can make reservations, including reservations made by telephone, in-person, or through a third party, for accessible guest rooms during the same hours and in the same manner as individuals who do not need accessible rooms. 73 FR 34508, 34553 (June 17, 2008).

Most individual commenters and organizations that represent individuals with disabilities strongly supported the requirement that individuals with disabilities should be able to make reservations

for accessible guest rooms during the same hours and in the same manner as individuals who do not need accessible rooms. In many cases individuals with disabilities expressed frustration because, while they are aware of improvements in architectural access brought about as a result of the ADA, they are unable to take advantage of these improvements because of shortcomings in current hotel reservations systems. A number of these commenters pointed out that it can be difficult or impossible to obtain information about accessible rooms and hotel features and that even when information is provided it often is found to be incorrect upon arrival. They also noted difficulty reserving accessible rooms and the inability to guarantee or otherwise ensure that the appropriate accessible room is available when the guest arrives. The ability to obtain information about accessible guest rooms, to make reservations for accessible guest rooms in the same manner as other guests, and to be assured of an accessible room upon arrival was of critical importance to these commenters.

Other commenters, primarily hotels, resort developers, travel agencies, and organizations commenting on their behalf, did not oppose the general rule on reservations, but recommended that the language requiring that reservations be made ''in the same manner'' be changed to require that reservations be made ''in a substantially similar manner.'' These commenters argued that hotel reservations are made in many different ways and through a variety of systems. In general, they argued that current reservations database systems may not contain s guests, travel agents, or other third-party reservations services to select the most appropriate room without consulting directly with the hotel, and that updating these systems might be expensive and time consuming. They also noted that in some cases, hotels do not always automatically book accessible rooms when requested to do so. Instead, guests may select from a menu of accessibility and other room options when making reservations. This information is transmitted to the hotel's reservations staff, who then contact the individual to verify the guest's accessibility needs. Only when such verification occurs will the accessible room be booked.

The Department is not persuaded that individuals who need to reserve accessible rooms cannot be served in the same manner as those who do not, and it appears that there are hotels of all types and sizes that already meet this requirement. Further, the Department has been able to accomplish this goal in settlement agreements resolving complaints about this issue. As stated in the preamble to the NPRM, basic nondiscrimination principles mandate that individuals with disabilities should be able to reserve hotel rooms with the same efficiency, immediacy, and convenience as those who do not need accessible guest rooms. The regulation does not require reservations services to create new methods for reserving hotel rooms or available timeshare units; instead, covered entities must make the modifications needed to ensure that individuals who need accessible rooms are able to reserve them in the same manner as other guests. If, for example, hotel reservations are not final until all hotel guests have been contacted by the hotel to discuss the guest's needs, a hotel may follow the same process when reserving accessible rooms. Therefore, the Department declines to change this language, which has been moved to § 36.302(e)(1)(i). However, in response to the commenters who recommended a transition period that would allow reservations services time to modify existing reservations systems to meet the requirements of this rule, § 36.302(e)(3) now provides a 18-month transition period before the requirements of § 36.302(e)(1) will be enforced.

Hotels and organizations commenting on their behalf also requested that the language be changed to eliminate any liability for reservations made through third parties, arguing that they are unable to control the actions of unrelated parties. The rule, both as proposed and as adopted, requires

covered public accommodations to ensure that reservations made on their behalf by third parties are made in a manner that results in parity between those who need accessible rooms and those who do not.

Hotels and other places of lodging that use third-party reservations services must make reasonable efforts to make accessible rooms available through at least some of these services and must provide these third-party services with information concerning the accessible features of the hotel and the accessible rooms. To the extent a hotel or other place of lodging makes available such rooms and information to a third-party reservation provider, but the third party fails to provide the information or rooms to people with disabilities in accordance with this section, the hotel or other place of lodging will not be responsible.

Identification of accessible features in hotels and guest rooms. NPRM § 36.302(e)(2) required public accommodations that provide hotel reservations services to identify and describe the accessible features in the hotels and guest rooms offered through that service. This requirement is essential to ensure that individuals with disabilities receive the information they need to benefit from the services offered by the place of lodging. As a practical matter, a public accommodation's designation of a guest room as ''accessible'' will not ensure necessarily that the room complies with all of the 1991 Standards. In older facilities subject to barrier removal requirements, strict compliance with the 1991 Standards is not required. Instead, public accommodations must remove barriers to the extent that it is readily achievable to do so.

Further, hotel rooms that are in full compliance with current standards may differ, and individuals with disabilities must be able to ascertain which features—in new and existing facilities—are included in the hotel's accessible guest rooms. For example, under certain circumstances, an accessible hotel bathroom may meet accessibility requirements with either a bathtub or a roll-in shower. The presence or absence of particular accessible features such as these may be the difference between a room that is usable by a particular person with a disability and one that is not.

Individuals with disabilities strongly supported this requirement. In addition to the importance of information about specific access features, several commenters pointed out the importance of knowing the size and number of beds in a room. Many individuals with disabilities travel with family members, personal care assistants, or other companions and require rooms with at least two beds. Although most hotels provide this information when generally categorizing the type or class of room (*e.g.,* deluxe suite with king bed), as described below, all hotels should consider the size and number of beds to be part of the basic information they are required to provide.

Comments made on behalf of reservations services expressed concern that unless the word ''hotels'' is stricken from the text, § 36.302(e)(2) of the NPRM essentially would require reservations systems to include a full accessibility report on each hotel or resort property in its system. Along these lines, commenters also suggested that the Department identify the specific accessible features of hotel rooms that must be described in the reservations system. For example, commenters suggested limiting features that must be included to bathroom type (tub or roll-in shower) and communications features.

The Department recognizes that a reservations system is not intended to be an accessibility survey. However, specific information concerning accessibility features is essential to travelers with disabilities. Because of the wide variations in the level of accessibility that travelers will encounter, the Department cannot specify what information must be included in every instance. For hotels that were built in compliance with the 1991 Standards, it may be sufficient to specify that the hotel is accessible and, for each accessible room, to describe the general type of room (*e.g.,* deluxe executive suite), the size and number of beds (*e.g.,* two queen beds), the type of accessible bathing facility

(*e.g.,* roll-in shower), and communications features available in the room (*e.g.*, alarms and visual notification devices). Based on that information, many individuals with disabilities will be comfortable making reservations.

For older hotels with limited accessibility features, information about the hotel should include, at a minimum, information about accessible entrances to the hotel, the path of travel to guest check-in and other essential services, and the accessible route to the accessible room or rooms. In addition to the room information described above, these hotels should provide information about important features that do not comply with the 1991 Standards. For example, if the door to the ''accessible'' room or bathroom is narrower than required, this information should be included (*e.g.*, door to guest room measures 30 inches clear). This width may not meet current standards but may be adequate for some wheelchair users who use narrower chairs. In many cases, older hotels provide services through alternatives to barrier removal, for example, by providing check-in or concierge services at a different, accessible location. Reservations services for these entities should include this information and provide a way for guests to contact the appropriate hotel employee for additional information. To recognize that the information and level of detail needed will vary based on the nature and age of the facility, § 36.302(e)(2) has been moved to § 36.302(e)(1)(ii) in the final rule and modified to require reservations services to:

Identify and describe accessible features in the hotels and guest rooms offered through its reservations service *in enough detail to reasonably permit individuals with disabilities to assess independently whether a given hotel or guest room meets his or her accessibility needs*. [Emphasis added]

As commenters representing hotels have described, once reservations are made, some hotels may wish to contact the guest to offer additional information and services. Or, many individuals with disabilities may wish to contact the hotel or reservations service for more detailed information. At that point, trained staff (including staff located on-site at the hotel and staff located off-site at a reservations center) should be available to provide additional information such as the specific layout of the room and bathroom, shower design, grab-bar locations, and other amenities available (*e.g.,* bathtub bench).

In the NPRM, the Department sought guidance concerning whether this requirement should be applied to third-party reservations services. Comments made by or on behalf of hotels, resort managers, and other members of the lodging and resort industry pointed out that, in most cases, these third parties do not have direct access to this information and must obtain it from the hotel or other place of lodging. Because third-party reservations services must rely on the place of lodging to provide the requisite information and to ensure that it is accurate and timely, the Department has declined to extend this requirement directly to third-party reservations services.

Hold and release of accessible guest rooms. The Department has addressed the hold and release of accessible guest rooms in settlement agreements and recognizes that current practices vary widely. The Department is concerned about current practices by which accessible guest rooms are released to the general public even though the hotel is not sold out. In such instances, individuals with disabilities may be denied an equal opportunity to benefit from the services offered by the public accommodation, *i.e.*, a hotel guest room. In the NPRM, the Department requested information concerning the current practices of hotels and third-party reservations services with respect to (1) holding accessible rooms for individuals with disabilities and (2) releasing accessible rooms to individuals without disabilities.

Individuals with disabilities and organizations commenting on their behalf strongly supported requiring accessible rooms to be held back for rental by individuals with disabilities. In some cases commenters supported holding back all accessible

rooms until all non-accessible rooms were rented. Others supported holding back accessible rooms in each category of rooms until all other rooms of that type were reserved. This latter position was also supported in comments received on behalf of the lodging industry; commenters also noted that this is the current practice of many hotels. In general, holding accessible rooms until requested by an individual who needs a room with accessible features or until it is the only available room of its type was viewed widely as a sensible approach to allocating scarce accessible rooms without imposing unnecessary costs on hotels.

The Department agrees with this latter approach and has added § 36.302(e)(1)(iii), which requires covered entities to hold accessible rooms for use by individuals with disabilities until all other guest rooms of that type have been rented and the accessible room requested is the only remaining room of that type. For example, if there are 25 rooms of a given type and two of these rooms are accessible, the reservations service is required to rent all 23 non-accessible rooms before it is permitted to rent these two accessible rooms to individuals without disabilities. If a one-of-a-kind room is accessible, that room is available to the first party to request it. The Department believes that this is the fairest approach available since it reserves accessible rooms for individuals who require them until all non-accessible rooms of that type have been reserved, and then provides equal access to any remaining rooms. It is also fair to hotels because it does not require them to forego renting a room that actually has been requested in favor of the possibility that an individual with a disability may want to reserve it at a later date.

Requirement to block accessible guest room reservations. NPRM § 36.302(e)(3) required a public accommodation that owns, leases (or leases to), or operates a place of lodging to guarantee accessible guest rooms that are reserved through a reservations service to the same extent that it guarantees rooms that are not accessible. In the NPRM, the Department sought comment on the current practices of hotels and third party reservations services with respect to ''guaranteed'' hotel reservations and on the impact of requiring a public accommodation to guarantee accessible rooms to the extent it guarantees other rooms.

Comments received by the Department by and on behalf of both individuals with disabilities and public accommodations that provide reservations services made clear that, in many cases, when speaking of room guarantees, parties who are not familiar with hotel terminology actually mean to refer to policies for blocking and holding specific hotel rooms. Several commenters explained that, in most cases, when an individual makes ''reservations,'' hotels do not reserve specific rooms; rather the individual is reserving a room with certain features at a given price. When the hotel guest arrives, he or she is provided with a room that has those features.

In most cases, this does not pose a problem because there are many available rooms of a given type. However, in comparison, accessible rooms are much more limited in availability and there may be only one room in a given hotel that meets a guest's needs. As described in the discussion on the identification of accessible features in hotels and guest rooms, the presence or absence of particular accessible features may be the difference between a room that is usable by a particular person with a disability and one that is not.

For that reason, the Department has added § 36.302(e)(1)(iv) to the final rule. Section 36.302(e)(1)(iv) requires covered entities to reserve, upon request, accessible guest rooms or specific types of guest rooms and ensure that the guest rooms requested are blocked and removed from all reservations systems (to eliminate double-booking, which is a common problem that arises when rooms are made available to be reserved through more than one reservations service). Of course, if a public accommodation typically requires a payment or deposit from its patrons in order to reserve a room, it may require the same payment or deposit from individuals with dis-

abilities before it reserves an accessible room and removes it from all its reservations systems. These requirements should alleviate the widely-reported problem of arriving at a hotel only to discover that, although an accessible room was reserved, the room available is not accessible or does not have the specific accessible features needed. Many hotels already have a similar process in place for other guest rooms that are unique or one-of-a-kind, such as ''Presidential'' suites. The Department has declined to extend this requirement directly to third-party reservations services. Comments the Department received in response to the NPRM indicate that most of the actions required to implement these requirements primarily are within the control of the entities that own the place of lodging or that manage it on behalf of its owners.

Guarantees of reservations for accessible guest rooms. The Department recognizes that not all reservations are guaranteed, and the rule does not impose an affirmative duty to guarantee reservations. When a public accommodation does guarantee hotel or other room reservations, it must provide the same guarantee for accessible guest rooms as it makes for other rooms, except that it must apply that guarantee to the specific room reserved and blocked, even if in other situations, its guarantee policy only guarantees that a room of a specific type will be available at the guaranteed price. Without this reasonable modification to its guarantee policy, any guarantee for accessible rooms would be meaningless. If, for example, a hotel makes reservations for an accessible ''Executive Suite'' but, upon arrival, offers its guest an inaccessible Executive Suite that the guest is unable to enter, it would be meaningless to consider the hotel's guarantee fulfilled. As with the requirements for identifying, holding, and blocking accessible rooms, the Department has declined to extend this requirement directly to third-party reservations services because the fulfillment of guarantees largely is beyond their power to control.

Application to rental units in timeshare, vacation communities, and condo-hotels. Because the Department has revised the definition of ''Places of Lodging'' in the final rule, the reservations requirements now apply to guest rooms and other rental units in timeshares, vacation communities, and condo-hotels where some or all of the units are owned and controlled by individual owners and rented out some portion of time to the public, as compared to traditional hotels and motels that are owned, controlled, and rented to the public by one entity. If a reservations service owns and controls one or more of the guest rooms or other units in the rental property (*e.g.,* a developer who retains and rents out unsold inventory), it is subject to the requirements set forth in § 36.302(e).

Several commenters expressed concern about any rule that would require accessible units that are owned individually to be removed from the rental pool and rented last. Commenters pointed out that this would be a disadvantage to the owners of accessible units because they would be rented last, if at all. Further, certain vacation property managers consider holding specific units back to be a violation of their ethical responsibility to present all properties they manage at an equal advantage. To address these concerns, the Department has added § 36.302(e)(2), which exempts reservations for individual guest rooms and other units that are not owned or substantially controlled by the entity that owns, leases, or operates the overall facility from the requirement that accessible guest rooms be held back from rental until all other guest rooms of that type have been rented. Section 36.302(e)(2) also exempts such rooms from requirements for blocking and guaranteeing reserved rooms. In resort developments with mixed ownership structures, such as a resort where some units are operated as hotel rooms and others are owned and controlled individually, a reservations service operated by the owner of the hotel portion may apply the exemption only to the rooms that are not owned or substantially controlled by the entity that owns, manages, or other-

wise controls the overall facility.

Other reservations-related comments made on behalf of these entities reflected concerns similar to the general concerns expressed with respect to traditional hotel properties. For example, commenters noted that because of the unique nature of the timeshare industry, additional flexibility is needed when making reservations for accessible units. One commenter explained that reservations are sometimes made through unusual entities such as exchange companies, which are not public accommodations and which operate to trade ownership interests of millions of individual owners. The commenter expressed concern that developers or resort owners would be held responsible for the actions of these exchange entities. If, as described, the choice to list a unit with an exchange company is made by the individual owner of the property and the exchange company does not operate on behalf of the reservations service, the reservations service is not liable for the exchange company's actions.

As with hotels, the Department believes that within the 18-month transition period these reservations services should be able to modify their systems to ensure that potential guests with disabilities who need accessible rooms can make reservations during the same hours and in the same manner as those who do not need accessible rooms.

Section 36.302(f) Ticketing

The 1991 title III regulation did not contain specific regulatory language on ticketing. The ticketing policies and practices of public accommodations, however, are subject to title III's nondiscrimination provisions. Through the investigation of complaints, enforcement actions, and public comments related to ticketing, the Department became aware that some venue operators, ticket sellers, and distributors were violating title III's nondiscrimination mandate by not providing individuals with disabilities the same opportunities to purchase tickets for accessible seating as provided to spectators purchasing conventional seats. In the NPRM, the Department proposed § 36.302(f) to provide explicit direction and guidance on discriminatory practices for entities involved in the sale or distribution of tickets.

The Department received comments from advocacy groups, assembly area trade associations, public accommodations, and individuals. Many commenters supported the addition of regulatory language pertaining to ticketing and urged the Department to retain it in the final rule. Several commenters, however, questioned why there were inconsistencies between the title II and title III provisions and suggested that the same language be used for both titles. The Department has decided to retain ticketing regulatory language and to ensure consistency between the ticketing provisions in title II and title III.

Because many in the ticketing industry view season tickets and other multi-event packages differently from individual tickets, the Department bifurcated some season ticket provisions from those concerning single-event tickets in the NPRM. This structure, however, resulted in some provisions being repeated for both types of tickets but not for others even though they were intended to apply to both types of tickets. The result was that it was not entirely clear that some of the provisions that were not repeated also were intended to apply to season tickets. The Department is addressing the issues raised by these commenters using a different approach. For the purposes of this section, a single event refers to an individual performance for which tickets may be purchased. In contrast, a series of events includes, but is not limited to, subscription events, event packages, season tickets, or any other tickets that may be purchased for multiple events of the same type over the course of a specified period of time whose ownership right reverts to the public accommodation at the end of each season or time period. Series-of-events tickets that give their holders an enhanced ability to purchase such tick-

ets from the public accommodation in seasons or periods of time that follow, such as a right of first refusal or higher ranking on waiting lists for more desirable seats, are subject to the provisions in this section. In addition, the final rule merges together some NPRM paragraphs that dealt with related topics and has reordered and renamed some of the paragraphs that were in the NPRM.

Ticket sales. In the NPRM, the Department proposed, in § 36.302(f)(1), a general rule that a public accommodation shall modify its policies, practices, or procedures to ensure that individuals with disabilities can purchase tickets for accessible seating for an event or series of events in the same way as others (*i.e.,* during the same hours and through the same distribution methods as other seating is sold). ''Accessible seating'' is defined in § 36.302(f)(1)(i) of the final rule to mean ''wheelchair spaces and companion seats that comply with sections 221 and 802 of the 2010 Standards along with any other seats required to be offered for sale to the individual with a disability pursuant to paragraph (4) of this section.'' The defined term does not include designated aisle seats. A ''wheelchair space'' refers to a space for a single wheelchair and its occupant.

The NPRM proposed requiring that accessible seats be sold through the ''same methods of distribution'' as non-accessible seats. 73 FR 34508, 34554 (June 17, 2008). Comments from venue managers and others in the business community, in general, noted that multiple parties are involved in ticketing, and because accessible seats may not be allotted to all parties involved at each stage, such parties should be protected from liability. For example, one commenter noted that a third-party ticket vendor, like Ticketmaster, can only sell the tickets it receives from its client. Because § 36.302(f)(1) of the final rule requires venue operators to make available accessible seating through the same methods of distribution they use for their regular tickets, venue operators that provide tickets to third-party ticket vendors are required to provide accessible seating to the third-party ticket vendor. This provision will enhance third-party ticket vendors' ability to acquire and sell accessible seating for sale in the future. The Department notes that once third-party ticket vendors acquire accessible tickets, they are obligated to sell them in accordance with these rules.

The Department also has received frequent complaints that individuals with disabilities have not been able to purchase accessible seating over the Internet, and instead have had to engage in a laborious process of calling a customer service line, or sending an email to a customer service representative and waiting for a response. Not only is such a process burdensome, but it puts individuals with disabilities at a disadvantage in purchasing tickets for events that are popular and may sell out in minutes. Because § 36.302(f)(5) of the final rule authorizes venues to release accessible seating in case of a sell-out, individuals with disabilities effectively could be cut off from buying tickets unless they also have the ability to purchase tickets in real time over the Internet. The Department's new regulatory language is designed to address this problem.

Several commenters representing assembly areas raised concerns about offering accessible seating for sale over the Internet. They contended that this approach would increase the incidence of fraud since anyone easily could purchase accessible seating over the Internet. They also asserted that it would be difficult technologically to provide accessible seating for sale in real time over the Internet, or that to do so would require simplifying the rules concerning the purchase of multiple additional accompanying seats. Moreover, these commenters argued that requiring an individual purchasing accessible seating to speak with a customer service representative would allow the venue to meet the patron's needs most appropriately and ensure that wheelchair spaces are reserved for individuals with disabilities who require wheelchair spaces. Finally, these commenters argued that individuals who can transfer

effectively and conveniently from a wheelchair to a seat with a movable armrest seat could instead purchase designated aisle seats.

The Department considered these concerns carefully and has decided to continue with the general approach proposed in the NPRM. Although fraud is an important concern, the Department believes that it is best combated by other means that would not have the effect of limiting the ability of individuals with disabilities to purchase tickets, particularly since restricting the purchase of accessible seating over the Internet will, of itself, not curb fraud. In addition, the Department has identified permissible means for covered entities to reduce the incidence of fraudulent accessible seating ticket purchases in § 36.302(f)(8) of the final rule.

Several commenters questioned whether ticket Web sites themselves must be accessible to individuals who are blind or have low vision, and if so, what that requires. The Department has consistently interpreted the ADA to cover Web sites that are operated by public accommodations and stated that such sites must provide their services in an accessible manner or provide an accessible alternative to the Web site that is available 24 hours a day, seven days a week. The final rule, therefore, does not impose any new obligation in this area. The accessibility of Web sites is discussed in more detail in the section entitled ''Other Issues.''

In § 36.302(f)(2) of the NPRM, the Department also proposed requiring public accommodations to make accessible seating available during all stages of tickets sales including, but not limited to, presales, promotions, lotteries, waitlists, and general sales. For example, if tickets will be presold or an event that is open only to members of a fan club, or to holders of a particular credit card, then tickets for accessible seating must be made available for purchase through those means. This requirement does not mean that any individual with a disability would be able to purchase those seats. Rather, it means that an individual with a disability who meets the requirement for such a sale (*e.g.,* who is a member of the fan club or holds that credit card) will be able to participate in the special promotion and purchase accessible seating. The Department has maintained the substantive provisions of the NPRM's §§ 36.302(f)(1) and (f)(2) but has combined them in a single paragraph at § 36.302(f)(1)(ii) of the final rule so that all of the provisions having to do with the manner in which tickets are sold are located in a single paragraph.

Identification of available accessible seating. In the NPRM, the Department proposed § 36.302(f)(3), which, as modified and renumbered § 36.302(f)(2)(iii) in the final rule, requires a facility to identify available accessible seating through seating maps, brochures, or other methods if that information is made available about other seats sold to the general public. This rule requires public accommodations to provide information about accessible seating to the same degree of specificity that it provides information about general seating. For example, if a seating map displays color-coded blocks pegged to prices for general seating, then accessible seating must be similarly color-coded. Likewise, if covered entities provide detailed maps that show exact seating and pricing for general seating, they must provide the same for accessible seating.

The NPRM did not specify a requirement to identify prices for accessible seating. The final rule requires that if such information is provided for general seating, it must be provided for accessible seating as well.

In the NPRM, the Department proposed in § 36.302(f)(4) that a public accommodation, upon being asked, must inform persons with disabilities and their companions of the locations of all unsold or otherwise available seating. This provision is intended to prevent the practice of ''steering'' individuals with disabilities to certain accessible seating so that the facility can maximize potential ticket sales by releasing unsold accessible seating, especially in preferred or desirable locations, for sale to the general public. The Department received no significant comment on this proposal.

The Department has retained this provision in the final rule but has added it, with minor modifications, to § 36.302(f)(2) as paragraph (i).

Ticket prices. In the NPRM, the Department proposed § 36.302(f)(7) requiring that ticket prices for accessible seating be set no higher than the prices for other seats in that seating section for that event. The NPRM's provision also required that accessible seating be made available at every price range, and if an existing facility has barriers to accessible seating within a particular price range, a proportionate amount of seating (determined by the ratio of the total number of seats at that price level to the total number of seats in the assembly area) must be offered in an accessible location at that same price. Under this rule, for example, if it is not readily achievable for a 20,000-seat facility built in 1980 to place accessible seating in the $20-price category, which is on the upper deck, it must place a proportionate number of seats in an accessible location for $20. If the upper deck has 2,000 seats, then the facility must place 10 percent of its accessible seating in an accessible location for $20 provided that it is part of a seating section where ticket prices are equal to or more than $20—a facility may not place the $20-accessible seating in a $10-seating section. The Department received no significant comment on this rule, and it has been retained, as amended, in the final rule in § 36.302(f)(3).

Purchase of multiple tickets. In the NPRM, the Department proposed § 36.302(f)(9) to address one of the most common ticketing complaints raised with the Department: that individuals with disabilities are not able to purchase more than two tickets. The Department proposed this provision to facilitate the ability of individuals with disabilities to attend events with friends, companions, or associates who may or may not have a disability by enabling individuals with disabilities to purchase the maximum number of tickets allowed per transaction to other spectators; by requiring venues to place accompanying individuals in general seating as close as possible to accessible seating (in the event that a group must be divided because of the large size of the group); and by allowing an individual with a disability to purchase up to three additional contiguous seats per wheelchair space if they are available at the time of sale. Section 36.302(f)(9)(ii) of the NPRM required that a group containing one or more wheelchair users must be placed together, if possible, and that in the event that the group could not be placed together, the individuals with disabilities may not be isolated from the rest of the group.

The Department asked in the NPRM whether this rule was sufficient to effectuate the integration of individuals with disabilities. Many advocates and individuals praised it as a welcome and much-needed change, stating that the trade-off of being able to sit with their family or friends was worth reducing the number of seats available for individuals with disabilities. Some commenters went one step further and suggested that the number of additional accompanying seats should not be restricted to three.

Although most of the substance of the proposed provision on the purchase of multiple tickets has been maintained in the final rule, it has been renumbered as § 36.302(f)(4), reorganized, and supplemented. To preserve the availability of accessible seating for other individuals with disabilities, the Department has not expanded the rule beyond three additional contiguous seats. Section 36.302(f)(4)(i) of the final rule requires public accommodations to make available for purchase three additional tickets for seats in the same row that are contiguous with the wheelchair space, provided that at the time of purchase there are three such seats available. The requirement that the additional seats be ''contiguous with the wheelchair space'' does not mean that each of the additional seats must be in actual contact or have a border in common with the wheelchair space; however, at least one of the additional seats should be immediately adjacent to the wheelchair space. The Department recognizes that it will often be necessary to use vacant wheelchair spaces to pro-

vide for contiguous seating.

The Department has added paragraphs (4)(ii) and (4)(iii) to clarify that in situations where there are insufficient unsold seats to provide three additional contiguous seats per wheelchair space or a ticket office restricts sales of tickets to a particular event to less than four tickets per customer, the obligation to make available three additional contiguous seats per wheelchair space would be affected. For example, if at the time of purchase, there are only two additional contiguous seats available for purchase because the third has been sold already, then the ticket purchaser would be entitled to two such seats. In this situation, the public entity would be required to make up the difference by offering one additional ticket for sale that is as close as possible to the accessible seats. Likewise, if ticket purchases for an event are limited to two per customer, a person who uses a wheelchair who seeks to purchase tickets would be entitled to purchase only one additional contiguous seat for the event.

The Department has also added paragraph (4)(iv) to clarify that the requirement for three additional contiguous seats is not intended to serve as a cap if the maximum number of tickets that may be purchased by members of the general public exceeds the four tickets an individual with a disability ordinarily would be allowed to purchase (*i.e.,* a wheelchair space and three additional contiguous seats). If the maximum number of tickets that may be purchased by members of the general public exceeds four, an individual with a disability is to be allowed to purchase the maximum number of tickets; however, additional tickets purchased by an individual with a disability beyond the wheelchair space and the three additional contiguous seats provided in § 36.302(f)(4)(i) do not have to be contiguous with the wheelchair space.

The NPRM proposed at § 36.302(f)(9)(ii) that for group sales, if a group includes one or more individuals who use a wheelchair, then the group shall be placed in a seating area with accessible seating so that, if possible, the group can sit together. If it is necessary to divide the group, it should be divided so that the individuals in the group who use wheelchairs are not isolated from the rest of the members of their group. The final rule retains the NPRM language in paragraph (4)(v).

Hold and release of unsold accessible seating. The Department recognizes that not all accessible seating will be sold in all assembly areas for every event to individuals with disabilities who need such seating and that public accommodations may have opportunities to sell such seating to the general public. The Department proposed in the NPRM a provision aimed at striking a balance between affording individuals with disabilities adequate time to purchase accessible seating and the entity's desire to maximize ticket sales. In the NPRM, the Department proposed § 36.302(f)(6), which allowed for the release of accessible seating under the following circumstances: (i) When all seating in the facility has been sold, excluding luxury boxes, club boxes, or suites; (ii) when all seating in a designated area has been sold and the accessible seating being released is in the same area; or (iii) when all seating in a designated price range has been sold and the accessible seating being released is within the same price range.

The Department's NPRM asked ''whether additional regulatory guidance is required or appropriate in terms of a more detailed or set schedule for the release of tickets in conjunction with the three approaches described above. For example, does the proposed regulation address the variable needs of assembly areas covered by the ADA? Is additional regulatory guidance required to eliminate discriminatory policies, practices and procedures related to the sale, hold, and release of accessible seating? What considerations should appropriately inform the determination of when unsold accessible seating can be released to the general public?'' 73 FR 34508, 34527 (June 17, 2008).

The Department received comments both supporting and opposing the inclusion of a hold-and-release provision. One side proposed loosening

the restrictions on the release of unsold accessible seating. One commenter from a trade association suggested that tickets should be released regardless of whether there is a sell-out, and that these tickets should be released according to a set schedule. Conversely, numerous individuals, advocacy groups, and at least one public entity urged the Department to tighten the conditions under which unsold tickets for accessible seating may be released. These commenters suggested that venues should not be permitted to release tickets during the first two weeks of sale, or alternatively, that they should not be permitted to be released earlier than 48 hours before a sold-out event. Many of these commenters criticized the release of accessible seating under the second and third prongs of § 36.302(f)(6) in the NPRM (when there is a sell-out in general seating in a designated seating area or in a price range), arguing that it would create situations where general seating would be available for purchase while accessible seating would not be.

Numerous commenters—both from the industry and from advocacy groups—asked for clarification of the term ''sell-out.'' Business groups commented that industry practice is to declare a sell-out when there are only ''scattered singles'' available— isolated seats that cannot be purchased as a set of adjacent pairs. Many of those same commenters also requested that ''sell-out'' be qualified with the phrase ''of all seating available for sale'' since it is industry practice to hold back from release tickets to be used for groups connected with that event (*e.g.,* the promoter, home team, or sports league). They argued that those tickets are not available for sale and any return of these tickets to the general inventory happens close to the event date. Noting the practice of holding back tickets, one advocacy group suggested that covered entities be required to hold back accessible seating in proportion to the number of tickets that are held back for later release.

The Department has concluded that it would be inappropriate to interfere with industry practice by defining what constitutes a ''sell-out'' and that a public accommodation should continue to use its own approach to defining a ''sell-out.'' If, however, a public accommodation declares a sell-out by reference to those seats that are available for sale, but it holds back tickets that it reasonably anticipates will be released later, it must hold back a proportional percentage of accessible seating to be released as well.

Adopting any of the alternatives proposed n the comments summarized above would have upset the balance between protecting the rights of individuals with disabilities and meeting venues' concerns about lost revenue from unsold accessible seating. As a result, the Department has retained § 36.302(f)(6) renumbered as § 36.302(f)(5) in the final rule. The Department has, however, modified the regulation text to specify that accessible seating may be released only when ''all non-accessible tickets in a designated seating area have been sold and the tickets for accessible seating are being released in the same designated area.'' As stated in the NPRM, the Department intended for this provision to allow, for example, the release of accessible seating at the orchestra level when all other seating at the orchestra level is sold. The Department has added this language to the final rule at § 36.302(f)(5)(B) to clarify that venues cannot designate or redesignate seating areas for the purpose of maximizing the release of unsold accessible seating. So, for example, a venue may not determine on an ad hoc basis that a group of seats at the orchestra level is a designated seating area in order to release unsold accessible seating in that area.

The Department also has maintained the hold-and-release provisions that appeared in the NPRM, but has added a provision to address the release of accessible seating for series-of-events tickets on a series-of-events basis. Many commenters asked the Department whether unsold accessible seating may be converted to general seating and released to the general public on a season-ticket basis or longer when tickets typically are

sold as a season-ticket package or other long-term basis. Several disability rights organizations and individual commenters argued that such a practice should not be permitted, and, if it were, that conditions should be imposed to ensure that individuals with disabilities have future access to those seats.

The Department interprets the fundamental principle of the ADA as a requirement to give individuals with disabilities equal, not better, access to those opportunities available to the general public. Thus, for example, a public accommodation that sells out its facility on a season-ticket only basis is not required to leave unsold its accessible seating if no persons with disabilities purchase those season-ticket seats. Of course, public accommodations may choose to go beyond what is required by reserving accessible seating for individuals with disabilities (or releasing such seats for sale to the general public) on an individual-game basis.

If a covered entity chooses to release unsold accessible seating for sale on a season-ticket or other long-term basis, it must meet at least two conditions. Under § 36.302(f)(5)(iii) of the final rule, public accommodations must leave flexibility for game-day change-outs to accommodate ticket transfers on the secondary market. And public accommodations must modify their ticketing policies so that, in future years, individuals with disabilities will have the ability to purchase accessible seating on the same basis as other patrons (*e.g.,* as season tickets). Put differently, releasing accessible seating to the general public on a season-ticket or other long-term basis cannot result in that seating being lost to individuals with disabilities in perpetuity. If, in future years, season tickets become available and persons with disabilities have reached the top of the waiting list or have met any other eligibility criteria for season ticket purchases, public accommodations must ensure that accessible seating will be made available to the eligible individuals. In order to accomplish this, the Department has added § 36.302(f)(5)(iii)(A) to require public accommodations that release accessible season tickets to individuals who do not have disabilities that require the features of accessible seating to establish a process to prevent the automatic reassignment of such ticket holders to accessible seating. For example, a public accommodation could have in place a system whereby accessible seating that was released because it was not purchased by individuals with disabilities is not in the pool of tickets available for purchase for the following season unless and until the conditions for ticket release have been satisfied in the following season. Alternatively, a public accommodation might release tickets for accessible seating only when a purchaser who does not need its features agrees that he or she has no guarantee of or right to the same seats in the following season, or that if season tickets are guaranteed for the following season, the purchaser agrees that the offer to purchase tickets is limited to non-accessible seats with, to the extent practicable, comparable price, view, and amenities to the accessible seats such individuals held in the prior year. The Department is aware that this rule may require some administrative changes but believes that this process will not create undue financial and administrative burdens. The Department believes that this approach is balanced and beneficial. It will allow public accommodations to sell all of their seats and will leave open the possibility, in future seasons or series of events, that persons who need accessible seating may have access to it.

The Department also has added § 36.302(f)(5)(iii)(B) to address how season tickets or series-of-events tickets that have attached ownership rights should be handled if the ownership right returns to the public accommodation (*e.g.,* when holders forfeit their ownership right by failing to purchase season tickets or sell their ownership right back to a public accommodation). If the ownership right is for accessible seating, the public accommodation is required to adopt a process that allows an eligible individual with a disability who requires the features of such seating to purchase the rights and tickets for such seating.

Nothing in the regulatory text prevents a public accommodation from establishing a process whereby such ticket holders agree to be voluntarily reassigned from accessible seating to another seating area so that individuals with mobility disabilities or disabilities that require the features of accessible seating and who become newly eligible to purchase season tickets have an opportunity to do so. For example, a public accommodation might seek volunteers to relocate to another location that is at least as good in terms of its location, price, and amenities or a public accommodation might use a seat with forfeited ownership rights as an inducement to get a ticket holder to give up accessible seating he or she does not need.

Ticket transfer. The Department received many comments asking whether accessible seating has the same transfer rights as general seats. The proposed regulation at § 36.302(f)(5) required that individuals with disabilities must be allowed to purchase season tickets for accessible seating on the same terms and conditions as individuals purchasing season tickets for general seating, including the right—if it exists for other ticketholders—to transfer individual tickets to friends or associates. Some commenters pointed out that the NPRM proposed explicitly allowing individuals with disabilities holding season tickets to transfer tickets but did not address the transfer of tickets purchased for individual events. Several commenters representing assembly areas argued that persons with disabilities holding tickets for an individual event should not be allowed to sell or transfer them to third parties because such ticket transfers would increase the risk of fraud or would make unclear the obligation of the entity to accommodate secondary ticket transfers. They argued that individuals holding accessible seating should either be required to transfer their tickets to another individual with a disability or return them to the facility for a refund.

Although the Department is sympathetic to concerns about administrative burden, curtailing transfer rights for accessible seating when other ticket holders are permitted to transfer tickets would be inconsistent with the ADA's guiding principle that individuals with disabilities must have rights equal to others. Thus, the Department has added language in the final rule in § 36.302(f)(6) that requires that individuals with disabilities holding accessible seating for any event have the same transfer rights accorded other ticket holders for that event. Section 36.302(f)(6) also preserves the rights of individuals with disabilities who hold tickets to accessible seats for a series of events to transfer individual tickets to others, regardless of whether the transferee needs accessible seating. This approach recognizes the common practice of individuals splitting season tickets or other multi-event ticket packages with friends, colleagues, or other spectators to make the purchase of season tickets affordable; individuals with disabilities should not be placed in the burdensome position of having to find another individual with a disability with whom to share the package.

This provision, however, does not require public accommodations to seat an individual who holds a ticket to an accessible seat in such seating if the individual does not need the accessible features of the seat. A public accommodation may reserve the right to switch these individuals to different seats if they are available, but a public accommodation is not required to remove a person without a disability who is using accessible seating from that seating, even if a person who uses a wheelchair shows up with a ticket from the secondary market for a non-accessible seat and wants accessible seating.

Secondary ticket market. Section 36.302(f)(7) is a new provision in the final rule that requires a public accommodation to modify its policies, practices, or procedures to ensure that an individual with a disability, who acquires a ticket in the secondary ticket market, may use that ticket under the same terms and conditions as other ticket holders who acquire a ticket in the secondary market for an event or series of events. This principle was discussed in the NPRM in connection with

§ 36.302(f)(5), pertaining to season-ticket sales. There, the Department asked for public comment regarding a public accommodation's proposed obligation to accommodate the transfer of accessible seating tickets on the secondary ticket market to those who do not need accessible seating and vice versa.

The secondary ticket market, for the purposes of this rule, broadly means any transfer of tickets after the public accommodation's initial sale of tickets to individuals or entities. It thus encompasses a wide variety of transactions, from ticket transfers between friends to transfers using commercial exchange systems. Many commenters noted that the distinction between the primary and secondary ticket market has become blurred as a result of agreements between teams, leagues, and secondary market sellers. These commenters noted that the secondary market may operate independently of the public accommodation, and parts of the secondary market, such as ticket transfers between friends, undoubtedly are outside the direct jurisdiction of the public accommodation. To the extent that venues seat persons who have purchased tickets on the secondary market, they must similarly seat persons with disabilities who have purchased tickets on the secondary market. In addition, some public accommodations may acquire ADA obligations directly by formally entering the secondary ticket market.

The Department's enforcement experience with assembly areas also has revealed that venues regularly provide for and make last-minute seat transfers. As long as there are vacant wheelchair spaces, requiring venues to provide wheelchair spaces for patrons who acquired inaccessible seats and need wheelchair spaces is an example of a reasonable modification of a policy under title III of the ADA. Similarly, a person who has a ticket for a wheelchair space but who does not require its accessible features could be offered non-accessible seating if such seating is available.

The Department's longstanding position that title III of the ADA requires venues to make reasonable modifications in their policies to allow individuals with disabilities who acquired non-accessible tickets on the secondary ticket market to be seated in accessible seating, where such seating is vacant, is supported by the only Federal court to address this issue. *See* I*ndependent Living Resources v. Oregon Arena Corp.,* 1 F. Supp. 2d 1159, 1171 (D. Or. 1998). The Department has incorporated this position into the final rule at § 36.302(f)(7)(ii).

The NPRM contained two questions aimed at gauging concern with the Department's consideration of secondary ticket market sales. The first question asked whether a secondary purchaser who does not have a disability and who buys an accessible seat should be required to move if the space is needed for someone with a disability.

Many disability rights advocates answered that the individual should move provided that there is a seat of comparable or better quality available for him and his companion. Some venues, however, expressed concerns about this provision, and asked how they are to identify who should be moved and what obligations apply if there are no seats available that are equivalent or better in quality.

The Department's second question asked whether there are particular concerns about the obligation to provide accessible seating, including a wheelchair space, to an individual with a disability who purchases an inaccessible seat through the secondary market.

Industry commenters contended that this requirement would create a ''logistical nightmare,'' with venues scrambling to reseat patrons in the short time between the opening of the venues' doors and the commencement of the event. Furthermore, they argued that they might not be able to reseat all individuals and that even if they were able to do so, patrons might be moved to inferior seats (whether in accessible or non-accessible seating). These commenters also were concerned that they would be sued by patrons moved under such circumstances.

These commenters seem to have misconstrued the rule. Covered entities are not required to seat every person who acquires a ticket for inaccessible seating but needs accessible seating, and are not required to move any individual who acquires a ticket for accessible seating but does not need it. Covered entities that allow patrons to buy and sell tickets on the secondary market must make reasonable modifications to their policies to allow persons with disabilities to participate in secondary ticket transfers. The Department believes that there is no one-size-fits-all rule that will suit all assembly areas. In those circumstances where a venue has accessible seating vacant at the time an individual with a disability who needs accessible seating presents his ticket for inaccessible seating at the box office, the venue must allow the individual to exchange his ticket for an accessible seat in a comparable location if such an accessible seat is vacant. Where, however, a venue has sold all of its accessible seating, the venue has no obligation to provide accessible seating to the person with a disability who purchased an inaccessible seat on the secondary market. Venues may encourage individuals with disabilities who hold tickets for inaccessible seating to contact the box office before the event to notify them of their need for accessible seating, even though they may not require ticketholders to provide such notice.

The Department notes that public accommodations are permitted, though not required, to adopt policies regarding moving patrons who do not need the features of an accessible seat. If a public accommodation chooses to do so, it might mitigate administrative concerns by marking tickets for accessible seating as such, and printing on the ticket that individuals who purchase such seats but who do not need accessible seating are subject to being moved to other seats in the facility if the accessible seating is required for an individual with a disability. Such a venue might also develop and publish a ticketing policy to provide transparency to the general public and to put holders of tickets for accessible seating who do not require it on notice that they may be moved.

Prevention of fraud in purchase of accessible seating. Assembly area managers and advocacy groups have informed the Department that the fraudulent purchase of accessible seating is a pressing concern. Curbing fraud is a goal that public accommodations and individuals with disabilities share. Steps taken to prevent fraud, however, must be balanced carefully against the privacy rights of individuals with disabilities. Such measures also must not impose burdensome requirements upon, nor restrict the rights of, individuals with disabilities.

In the NPRM, the Department struck a balance between these competing concerns by proposing § 36.302(f)(8), which prohibited public accommodations from asking for proof of disability before the purchase of accessible seating but provided guidance in two paragraphs on appropriate measures for curbing fraud. Paragraph (i) proposed allowing a public accommodation to ask individuals purchasing single-event tickets for accessible seating whether they are wheelchair users. Paragraph (ii) proposed allowing a public accommodation to require individuals purchasing accessible seating for season tickets or other multi-event ticket packages to attest in writing that the accessible seating is for a wheelchair user. Additionally, the NPRM proposed to permit venues, when they have good cause to believe that an individual has fraudulently purchased accessible seating, to investigate that individual.

Several commenters objected to this rule on the ground that it would require a wheelchair user to be the purchaser of tickets. The Department has reworded this paragraph to reflect that the individual with a disability does not have to be the ticket purchaser. The final rule allows third parties to purchase accessible tickets at the request of an individual with a disability.

Commenters also argued that other individuals with disabilities who do not use wheelchairs should be permitted to purchase accessible seating. Some individuals with disabilities who do not

use wheelchairs urged the Department to change the rule, asserting that they, too, need accessible seating. The Department agrees that such seating, although designed for use by a wheelchair user, may be used by non-wheelchair users, if those persons are persons with a disability who need to use accessible seating because of a mobility disability or because their disability requires the use of the features that accessible seating provides (*e.g.,* individuals who cannot bend their legs because of braces, or individuals who, because of their disability, cannot sit in a straight-back chair).

Some commenters raised concerns that allowing venues to ask questions to determine whether individuals purchasing accessible seating are doing so legitimately would burden individuals with disabilities in the purchase of accessible seating. The Department has retained the substance of this provision in § 36.302(f)(8) of the final rule, but emphasizes that such questions should be asked at the initial time of purchase. For example, if the method of purchase is via the Internet, then the question(s) should be answered by clicking a yes or no box during the transaction. The public accommodation may warn purchasers that accessible seating is for individuals with disabilities and that individuals purchasing such tickets fraudulently are subject to relocation.

One commenter argued that face-to-face contact between the venue and the ticket holder should be required in order to prevent fraud and suggested that individuals who purchase accessible seating should be required to pick up their tickets at the box office and then enter the venue immediately. The Department has declined to adopt that suggestion. It would be discriminatory to require individuals with disabilities to pick up tickets at the box office when other spectators are not required to do so. If the assembly area wishes to make face-to-face contact with accessible seating ticket holders to curb fraud, it may do so through its ushers and other customer service personnel located within the seating area.

Some commenters asked whether it is permissible for assembly areas to have voluntary clubs where individuals with disabilities self-identify to the public accommodation in order to become a member of a club that entitles them to purchase accessible seating reserved for club members or otherwise receive priority in purchasing accessible seating. The Department agrees that such clubs are permissible, provided that a reasonable amount of accessible seating remains available at all prices and dispersed at all locations for individuals with disabilities who are non-members.

Section 36.303 Auxiliary Aids and Services

Section 36.303(a) of the 1991 title III regulation requires a public accommodation to take such steps as may be necessary to ensure that no individual with a disability is excluded, denied services, segregated, or otherwise treated differently than other individuals because of the absence of auxiliary aids and services, unless the public accommodation can demonstrate that taking such steps would fundamentally alter the nature of the goods, services, facilities, advantages, or accommodations being offered or would result in an undue burden. Implicit in this duty to provide auxiliary aids and services is the underlying obligation of a public accommodation to communicate effectively with customers, clients, patients, companions, or participants who have disabilities affecting hearing, vision, or speech. The Department notes that § 36.303(a) does not require public accommodations to provide assistance to individuals with disabilities that is unrelated to effective communication, although requests for such assistance may be otherwise subject to the reasonable modifications or barrier removal requirements.

The Department has investigated hundreds of complaints alleging that public accommodations have failed to provide effective communication, and many of these investigations have resulted in settlement agreements and consent decrees. During the course of these investigations, the Department has determined that public accommodations

sometimes misunderstand the scope of their obligations under the statute and the regulation. Section 36.303 in the final rule codifies the Department's longstanding policies in this area, and includes provisions based on technological advances and breakthroughs in the area of auxiliary aids and services that have occurred since the 1991 title III regulation was published.

Video remote interpreting (VRI). Section 36.303(b)(1) sets out examples of auxiliary aids and services. In the NPRM, the Department proposed adding video remote services (hereafter referred to as ''video remote interpreting'' or ''VRI'') and the exchange of written notes among the examples. The Department also proposed amending the provision to reflect technological advances, such as the wide availability of real-time capability in transcription services and captioning.

VRI is defined in the final rule at § 36.104 as ''an interpreting service that uses video conference technology over dedicated lines or wireless technology offering high-speed, wide-bandwidth video connection or wireless connection that delivers high-quality video images as provided in § 36.303(f).'' The Department notes that VRI generally consists of a videophone, monitors, cameras, a high-speed video connection, and an interpreter provided by the public accommodation pursuant to a contract for services. The term's inclusion within the definition of ''qualified interpreter'' makes clear that a public accommodation's use of VRI satisfies its title III obligations only where VRI affords effective communication. Comments from advocates and persons with disabilities expressed concern that VRI may not always provide effective communication, especially in hospitals and emergency rooms. Examples were provided of patients who are unable to see the video monitor because they are semi-conscious or unable to focus on the video screen; other examples were given of cases where the video monitor is out of the sightline of the patient or the image is out of focus; still other examples were given of patients who cannot see the screen because the signal is interrupted, causing unnatural pauses in communication, or the image is grainy or otherwise unclear. Many commenters requested more explicit guidelines on the use of VRI, and some recommended requirements for equipment maintenance, dedicated high-speed, wide-bandwidth video connections, and training of staff using VRI, especially in hospital and health care situations. Several major organizations requested a requirement to include the interpreter's face, head, arms, hands, and eyes in all transmissions.

The Department has determined that VRI can be an effective method of providing interpreting service in certain situations, particularly when a live interpreter cannot be immediately on the scene. To ensure that VRI is effective, the Department has established performance standards for VRI in § 36.303(f).The Department recognizes that reliance on VRI may not be effective in certain situations, such as those involving the exchange of complex information or involving multiple parties, and for some individuals, such as for persons who are deaf-blind, and using VRI in those circumstances would not satisfy a public accommodation's obligation to provide effective communication.

Comments from several disability advocacy organizations and individuals discouraged the Department from adding the exchange of written notes to the list of available auxiliary aids in § 36.303(b). The Department consistently has recognized that the exchange of written notes may provide effective communication in certain contexts. The NPRM proposed adding an explicit reference to written notes because some title III entities do not understand that exchange of written notes using paper and pencil may be an available option in some circumstances. Advocates and persons with disabilities requested explicit limits on the use of written notes as a form of auxiliary aid because, they argued, most exchanges are not simple, and handwritten notes do not afford effective communication. One major advocacy organization,

for example, noted that the speed at which individuals communicate orally or use sign language averages about 200 words per minute or more, and thus, the exchange of notes may provide only truncated or incomplete communication. For persons whose primary language is American Sign Language (ASL), some commenters pointed out, using written English in exchange of notes often is ineffective because ASL syntax and vocabulary is dissimilar from English. By contrast, some commenters from professional medical associations sought more specific guidance on when notes are allowed, especially in the context of medical offices and health care situations.

Exchange of notes likely will be effective in situations that do not involve substantial conversation, for example, when blood is drawn for routine lab tests or regular allergy shots are administered. However, interpreters should be used when the matter involves more complexity, such as in communication of medical history or diagnoses, in conversations about medical procedures and treatment decisions, or in communication of instructions for care at home or elsewhere. The Department discussed in the NPRM the kinds of situations in which use of interpreters or captioning is necessary. Additional guidance on this issue can be found in a number of agreements entered into with health care providers and hospitals that are available on the Department's Web site at *http://www.ada.gov.*

In addition, commenters requested that the Department include ''real-time'' before any mention of ''computer-aided'' or ''captioning'' technology to highlight the value of simultaneous translation of any communication. The Department has added to the final rule appropriate references to ''real-time'' to recognize this aspect of effective communication. Lastly, in this provision and elsewhere in the title III regulation, the Department has replaced the term ''telecommunications devices for deaf persons (TDD)'' with ''text telephones (TTYs).'' As noted in the NPRM, TTY has become the commonly accepted term and is consistent with the terminology used by the Access Board in the 2004 ADAAG. Comments from advocates and persons with disabilities expressed approval of the substitution of TTY for TDD in the proposed regulation, but expressed the view that the Department should expand the definition to ''voice, text, and video-based telecommunications products and systems, including TTY's, videophones, and captioned telephones, or equally effective telecommunications systems.'' The Department has expanded its definition of 'auxiliary aids and services'' in § 36.303 to include those examples in the final rule. Other additions proposed in the NPRM, and retained in the final rule, include Brailled materials and displays, screen reader software, magnification software, optical readers, secondary auditory programs (SAP), and accessible electronic and information technology.

As the Department noted in the preamble to the NPRM, the list of auxiliary aids in § 36.303(b) is merely illustrative. The Department does not intend that every public accommodation covered by title III must have access to every device or all new technology at all times, as long as the communication provided is effective.

Companions who are individuals with disabilities. The Department has added several new provisions to § 36.303(c), but these provisions do not impose new obligations on places of public accommodation. Rather, these provisions simply codify the Department's longstanding positions. Section 36.303(c)(1) now states that ''[a] public accommodation shall furnish appropriate auxiliary aids and services where necessary to ensure effective communication with individuals with disabilities. This includes an obligation to provide effective communication to companions who are individuals with disabilities.'' Section 36.303(c)(1)(i) defines ''companion'' as ''a family member, friend, or associate of an individual seeking access to, or participating in, the goods, services, facilities, privileges, advantages, or accommodations of a public accommodation, who, along with such individual, is an appropriate person with whom

the public accommodation should communicate.''

This provision makes clear that if the companion is someone with whom the public accommodation normally would or should communicate, then the public accommodation must provide appropriate auxiliary aids and services to that companion to ensure effective communication with the companion. This commonsense rule provides the necessary guidance to public accommodations to implement properly the nondiscrimination requirements of the ADA. Commenters also questioned why, in the NPRM, the Department defined companion as ''a family member, friend, or associate of a program participant * * *,'' noting that the scope of a public accommodation's obligation is not limited to ''program participants'' but rather includes all individuals seeking access to, or participating in, the goods, services, facilities, privileges, advantages, or accommodations of the public accommodation. 73 FR 34508, 34554 (June 17, 2008). The Department agrees and has amended the regulatory language accordingly. Many commenters supported inclusion of companions in the rule and requested that the Department clarify that a companion with a disability may be entitled to effective communication from the public accommodation, even though the individual seeking access to, or participating in, the goods, services, facilities, privileges, advantages, or accommodations of the public accommodation is not an individual with a disability. Some commenters asked the Department to make clear that if the individual seeking access to or participating in the public accommodation's program or services is an individual with a disability and the companion is not, the public accommodation may not limit its communication to the companion, instead of communicating directly with the individual with a disability, when it would otherwise be appropriate to communicate with the individual with the disability.

Most entities and individuals from the medical field objected to the Department's proposal, suggesting that medical and health care providers, and they alone, should determine to whom medical information should be communicated and when auxiliary aids and services should be provided to companions. Others asked that the Department limit the public accommodation's obligation to communicate effectively with a companion to situations where such communication is necessary to serve the interests of the person who is receiving the public accommodation's services. It also was suggested that companions should receive auxiliary aids and services only when necessary to ensure effective communication with the person receiving the public accommodation's services, with an emphasis on the particular needs of the patient requiring assistance, not the patient's family or guardian. Some in the medical community objected to the inclusion of any regulatory language regarding companions, asserting that such language is overbroad, seeks services for individuals whose presence is neither required by the public accommodation nor necessary for the delivery of the services or good, places additional burdens on the medical community, and represents an uncompensated mandate. One medical association commenter stated that such a mandate was particularly burdensome in situations where a patient is fully and legally capable of participating in the decision-making process and needs little or no assistance in obtaining care and following through on physician's instructions.

The final rule codifies the Department's longstanding interpretation of the ADA, and clarifies that public accommodations have effective communication obligations with respect to companions who are individuals with disabilities even where the individual seeking to participate in or benefit from what a public accommodation offers does not have a disability. There are many instances in which such an individual may not be an individual with a disability but his or her companion is an individual with a disability. The effective communication requirement applies equally to that companion.

Effective communication with companions is

particularly critical in health care settings where miscommunication may lead to misdiagnosis and improper or delayed medical treatment. The Department has encountered confusion and reluctance by medical care providers regarding the scope of their obligation with respect to such companions. Effective communication with a companion is necessary in a variety of circumstances. For example, a companion may be legally authorized to make health care decisions on behalf of the patient or may need to help the patient with information or instructions given by hospital personnel. In addition, a companion may be the patient's next of kin or health care surrogate with whom hospital personnel need to communicate concerning the patient's medical condition. Moreover, a companion could be designated by the patient to communicate with hospital personnel about the patient's symptoms, needs, condition, or medical history. Furthermore, the companion could be a family member with whom hospital personnel normally would communicate. It has been the Department's longstanding position that public accommodations are required to provide effective communication to companions when they accompany patients to medical care providers for treatment.

The individual with a disability does not need to be present physically to trigger the public accommodation's obligation to provide effective communication to a companion. The controlling principle regarding whether appropriate auxiliary aids and services should be provided is whether the companion is an appropriate person with whom the public accommodation should communicate. Examples of such situations include back-to-school night or parent-teacher conferences at a private school. If the faculty writes on the board or otherwise displays information in a visual context during back-to-school night, this information must be communicated effectively to parents or guardians who are blind or have low vision. At a parent-teacher conference, deaf parents or guardians are to be provided with appropriate auxiliary aids and service to communicate effectively with the teacher and administrators. Likewise, when a deaf spouse attempts to communicate with private social service agencies about the services necessary for the hearing spouse, appropriate auxiliary aids and services must be provided to the deaf spouse by the public accommodation to ensure effective communication.

One medical association sought approval to impose a charge against an individual with a disability, either the patient or the companion, where that person had stated he or she needed an interpreter for a scheduled appointment, the medical provider had arranged for an interpreter to appear, and then the individual requiring the interpreter did not show up for the scheduled appointment. Section 36.301(c) of the 1991 title III regulation prohibits the imposition of surcharges to cover the costs of necessary auxiliary aids and services. As such, medical providers cannot pass along to their patients with disabilities the cost of obtaining an interpreter, even in situations where the individual cancels his or her appointment at the last minute or is a ''no-show'' for the scheduled appointment. The medical provider, however, may charge for the missed appointment if all other patients are subject to such a charge in the same circumstances.

Determining appropriate auxiliary aids. The type of auxiliary aid the public accommodation provides is dependent on which auxiliary aid is appropriate under the particular circumstances. Section 36.303(c)(1)(ii) codifies the Department's longstanding interpretation that the type of auxiliary aid or service necessary to ensure effective communication will vary in accordance with the method of communication used by the individual; the nature, length, and complexity of the communication involved; and the context in which the communication is taking place. As the Department explained in the NPRM, this provision lists factors the public accommodation should consider in determining which type of auxiliary aids and services are necessary. For example, an individual with a disability who is deaf or hard of hearing

may need a qualified interpreter to discuss with hospital personnel a diagnosis, procedures, tests, treatment options, surgery, or prescribed medication (*e.g.,* dosage, side effects, drug interactions, etc.). In comparison, an individual who is deaf or hard of hearing who purchases an item in the hospital gift shop may need only an exchange of written notes to achieve effective communication.

The language in the first sentence of § 36.303(c)(1)(ii) is derived from the Department's Technical Assistance Manual. *See* Department of Justice, Americans with Disabilities Act, *ADA Title III Technical Assistance Manual Covering Public Accommodations and Commercial Facilities*, III–4.3200, available at *http://www.ada.gov/taman3.html*. There were few comments regarding inclusion of this policy in the regulation itself, and those received were positive.

Many advocacy groups, particularly those representing blind individuals and those with low vision, urged the Department to add language in the final rule requiring the provision of accessible material in a manner that is timely, accurate, and private. This, they argued, would be especially important with regard to billing information, other time-sensitive material, or confidential information. The Department has added a provision in § 36.303(c)(1)(ii) stating that in ''order to be effective, auxiliary aids and services must be provided in accessible formats, in a timely manner, and in such a way so as to protect the privacy and independence of the individual with a disability.''

The second sentence of § 36.303(c)(1)(ii) states that ''[a] public accommodation should consult with individuals with disabilities whenever possible to determine what type of auxiliary aid is needed to ensure effective communication, but the ultimate decision as to what measures to take rests with the public accommodation, provided that the method chosen results in effective communication.'' Many commenters urged the Department to amend this provision to require public accommodations to give primary consideration to the expressed choice of an individual with a disability. However, as the Department explained when it initially promulgated the 1991 title III regulation, the Department believes that Congress did not intend under title III to impose upon a public accommodation the requirement that it give primary consideration to the request of the individual with a disability. *See* 28 CFR part 36, app. B at 726 (2009). The legislative history does, however, demonstrate congressional intent to strongly encourage consulting with persons with disabilities. *Id.* As the Department explained in the 1991 preamble, ''the House Education and Labor Committee stated that it 'expects' that 'public accommodation(s) will consult with the individual with a disability before providing a particular auxiliary aid or service.' (Education and Labor report at 107).'' *Id.*

The commenters who urged that primary consideration be given to the individual with a disability noted, for example, that a public accommodation would not provide effective communication by using written notes where the individual requiring an auxiliary aid is in severe pain, or by providing a qualified ASL interpreter when an individual needs an oral interpreter instead. Both examples illustrate the importance of consulting with the individual with a disability in order to ensure that the communication provided is effective. When a public accommodation ignores the communication needs of the individual requiring an auxiliary aid or service, it does so at its peril, for if the communication provided is not effective, the public accommodation will have violated title III of the ADA.

Consequently, the regulation strongly encourages the public accommodation to engage in a dialogue with the individual with a disability to determine what auxiliary aids and services are appropriate under the circumstances. This dialogue should include a communication assessment of the individual with a disability initially, regularly, and as needed, because the auxiliary aids and services necessary to provide effective communication to the individual may fluctuate. For example, a deaf

individual may go to a private community health center with what is at first believed to be a minor medical emergency, such as a sore knee, and the individual with a disability and the community health center both may believe that exchanging written notes will be effective; however, during that individual's visit, it may be determined that the individual is, in fact, suffering from an anterior cruciate ligament tear and must have surgery to repair the torn ligament. As the situation develops and the diagnosis and recommended course of action evolve into surgery, an interpreter likely will be necessary. The community health center has a continuing obligation to assess the auxiliary aids and services it is providing, and should consult with individuals with disabilities on a continuing basis to assess what measures are required to ensure effective communication.

Similarly, the Department strongly encourages public accommodations to keep individuals with disabilities apprised of the status of the expected arrival of an interpreter or the delivery of other requested or anticipated auxiliary aids and services. Also, when the public accommodation decides not to provide the auxiliary aids and services requested by an individual with a disability, the public accommodation should provide that individual with the reason for its decision.

Family members and friends as interpreters. Section 36.303(c)(2), which was proposed in the NPRM, has been included in the final rule to make clear that a public accommodation shall not require an individual with a disability to bring another individual to interpret for him or her. The Department has added this regulatory requirement to emphasize that when a public accommodation is interacting with a person with a disability, it is the public accommodation's responsibility to provide an interpreter to ensure effective communication. It is not appropriate to require the person with a disability to bring another individual to provide such services. any commenters supported inclusion of this language in the new rule. A representative from a cruise line association opined, however, that if a guest chose to cruise without an interpreter or companion, the ship would not be compelled to provide an interpreter for the medical facility. On the contrary, when an individual with a disability goes on a cruise, the cruise ship has an obligation to provide effective communication, including, if necessary, a qualified interpreter as defined in the rule.

Some representatives of pediatricians objected to this provision, stating that parents of children with disabilities often know best how to interpret their children's needs and health status and relay that information to the child's physician, and to remove that parent, or add a stranger into the examining room, may frighten children. These commenters requested clarification in the regulation that public accommodations should permit parents, guardians, or caregivers of children with disabilities to accompany them in medical settings to ensure effective communication. The regulation does not prohibit parents, guardians, or caregivers from being present or providing effective communication for children. Rather, it prohibits medical professionals (and other public accommodations) from requiring or forcing individuals with disabilities to bring other individuals with them to facilitate communication so that the public accommodation will not have to provide appropriate auxiliary aids and services. The public accommodation cannot avoid its obligation to provide an interpreter except under the circumstances described in § 36.303(c)(3)–(4).

A State medical association also objected to this provision, opining that medical providers should have the authority to ask patients to bring someone with them to provide interpreting services if the medical provider determines that such a practice would result in effective communication and that patient privacy and confidentiality would be maintained. While the public accommodation has the obligation to determine what type of auxiliary aids and services are necessary to ensure effective communication, it cannot unilaterally determine whether the patient's privacy and confidentiality

would be maintained.

Section 36.303(c)(3) of the final rule codifies the Department's position that there are certain limited instances when a public accommodation may rely on an accompanying adult to interpret or facilitate communication: (1) In an emergency involving an imminent threat to the safety or welfare of an individual or the public; or (2) f the individual with a disability specifically requests it, the accompanying adult agrees to provide the assistance, and reliance on that adult for this assistance is appropriate under the circumstances. In such instances, the public accommodation should first offer to provide appropriate auxiliary aids and services free of charge.

Commenters requested that the Department make clear that the public accommodation cannot request, rely on, or coerce an accompanying adult to provide effective communication for an individual with a disability, and that only a voluntary offer of assistance is acceptable. The Department states unequivocally that consent of, and for, the accompanying adult to facilitate communication must be provided freely and voluntarily both by the individual with a disability and the accompanying adult— absent an emergency involving an imminent threat to the safety or welfare of an individual or the public. The public accommodation cannot coerce or attempt to persuade another adult to provide effective communication for the individual with a disability.

Several commenters asked that the Department make clear that children are not to be used to provide effective communication for family members and friends and that it is the responsibility of the public accommodation to provide effective communication, stating that interpreters often are needed in settings where it would not be appropriate for children to be interpreting, such as those involving medical issues, domestic violence, or other situations involving the exchange of confidential or adult-related material. Children often are hesitant to decline requests to provide communication services, which puts them in a very difficult position vis-a-vis family members and friends. The Department agrees. It is the Department's position that a public accommodation shall not rely on a minor child to facilitate communication with a family member, friend, or other individual except in an emergency involving an imminent threat to the safety or welfare of an individual or the public where no interpreter is available. Accordingly, the Department has revised the rule to state that ''[a] public accommodation shall not rely on a minor child to interpret or facilitate communication, except in an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available.'' § 36.303(c)(4). Sections 36.303(c)(3) and (c)(4) have no application in circumstances where an interpreter would not otherwise be required in order to provide effective communication (*e.g.*, in simple transactions such as purchasing movie tickets at a theater).

The Department stresses that privacy and confidentiality must be maintained but notes that covered entities, such as hospitals, that are subject to the Privacy Rules, 45 CFR parts 160 and 164, of the Health Insurance Portability and Accountability Act of 1996 (HIPAA), Public Law 104–191, are permitted to disclose to a patient's relative, close friend, or any other person identified by the patient (such as an interpreter) relevant patient information if the patient agrees to such disclosures. *See* 45 CFR parts 160 and 164. The agreement need not be in writing. Covered entities should consult the HIPAA Privacy Rules regarding other ways disclosures may be made to such persons.

With regard to emergency situations, proposed § 36.303(c)(3) permitted reliance on an individual accompanying an individual with a disability to interpret or facilitate communication in an emergency involving a threat to the safety or welfare of an individual or the public. Commenters requested that the Department make clear that often a public accommodation can obtain appropriate auxiliary aids and services in advance of an emergency, particularly in anticipated emergencies, such as

predicted dangerous weather, or in certain medical situations, such as pending childbirth, by making necessary pre-arrangements. These commenters did not want public accommodations to be relieved of their responsibilities to provide effective communication in emergency situations noting that the need for effective communication in emergencies is heightened. For the same reason, several commenters requested a separate rule that requires public accommodations to provide timely and effective communication in the event of an emergency.

One group of commenters asked that the Department narrow the regulation permitting reliance on a companion to interpret or facilitate communication in emergency situations so that it is not available to entities with responsibilities for emergency preparedness and response. Some commenters noted that certain exigent circumstances, such as those that exist during and, perhaps, immediately after a major hurricane, temporarily may excuse public accommodations of their responsibilities to provide effective communication. However, they asked that the Department clarify that these obligations are ongoing, and that as soon as such situations begin to abate or become stabilized, the public accommodation must provide effective communication.

The Department recognizes the need for effective communication is critical in emergency situations. After due consideration of all of these concerns raised by commenters, the Department has revised § 36.303(c) to narrow the exception-permitting reliance on individuals accompanying the individual with a disability during an emergency to make it clear that it applies only to emergencies involving an ''imminent threat to the safety or welfare of an individual or the public * * *.'' § 36.303(c)(3)–(4). The Department wishes to emphasize, however, that application of this exception is narrowly tailored to emergencies involving an imminent threat to the safety or welfare of individuals or the public. Arguably, all visits to an emergency room are by definition emergencies. Likewise, an argument can be made that most situations to which emergency workers respond involve, in one way or another, a threat to the safety or welfare of an individual or the public. The imminent threat exception in § 36.303(c)(3)– (4) is not intended to apply to typical and foreseeable emergency situations that are part of the normal operations of these institutions. As such, a public accommodation may rely on an accompanying individual to interpret or facilitate communication under the § 36.303(c)(3)–(4) imminent threat exception only where there is a true emergency, *i.e.,* where any delay in providing immediate services to the individual could have life-altering or life-ending consequences.

Telecommunications. In addition to the changes discussed in § 36.303(b) regarding telecommunications, telephones, and text telephones, the Department has adopted provisions in § 36.303(d) of the final rule (which also were included in the NPRM) requiring that public accommodations must not disconnect or refuse to take calls from FCC-approved telecommunications relay systems, including Internet-based relay systems. Commenters from some State agencies, many advocacy organizations, and individuals strongly urged the Department to mandate such action because of the high proportion of TTY calls and relay service calls to title III entities that are not completed because of phone systems or employees not taking the calls. This refusal presents a significant obstacle for persons using TTYs who do business with public accommodations and denies persons with disabilities telephone access for business that typically is handled over the telephone.

Section 36.303(d)(1)(ii) of the NPRM added public telephones equipped with volume control mechanisms and hearing aid compatible telephones to the examples of types of telephone equipment to be provided. Commenters from the disability community and from telecommunications relay service providers argued that requirements for these particular features on telephones are obsolete not only because the deaf and hard of

hearing community uses video technology more frequently than other types of telecommunication, but also because all public coin phones have been hearing-aid compatible since 1983, pursuant to the Telecommunications for the Disabled Act of 1982, 47 U.S.C. 610. The Hearing Aid Compatibility Act of 1988, 47 U.S.C. 610, extended this requirement to all wireline telephones imported into or manufactured in the United States since 1989. In 1997, the FCC further required that all such phones also be equipped with volume control. *See* 47 CFR 68.6. Given these existing statutory obligations, the proposed language is unnecessary. Accordingly, the Department has deleted that language from the final rule.

The Department understands that there are many new devices and advances in technology that should be included in the definition of available auxiliary aids and is including many of the telecommunications devices and some new technology. While much of this technology is not expensive and should be available to most title III entities, there may be legitimate reasons why in a particular situation some of these new and developing auxiliary aids may not be available, may be prohibitively costly (thus supporting an undue burden defense), or may otherwise not be suitable given other circumstances related to the particular terrain, situation, or functionality in specialized areas where security, among other things, may be a factor limiting the appropriateness of the use of a particular technology or device. The Department recognizes that the available new technology may provide more effective communication than existing technology and that providing effective communication often will include use of new technology and video relay services, as well as interpreters. However, the Department has not mandated that title III entities make all technology or services available upon demand in all situations. When a public accommodation provides the opportunity to make outgoing phone calls on more than an incidental-convenience basis, it shall make available accessible public telephones, TTYs, or other telecommunications products and systems for use by an individual who is deaf or hard of hearing, or has a speech impairment.

Video remote interpreting (VRI) services. In § 36.303(f) of the NPRM, the Department proposed the inclusion of four performance standards for VRI (which the NPRM termed video interpreting services (VIS)), for effective communication: (1) High-quality, clear, real-time, full-motion video, and audio over a dedicated high-speed Internet connection; (2) a clear, sufficiently large, and sharply delineated picture of the participants' heads, arms, hands, and fingers, regardless of their body position; (3) clear transmission of voices; and (4) persons who are trained to set up and operate the VIS quickly and efficiently.

Commenters generally approved of these proposed performance standards, but recommended that some additional standards be included in the final rule. For persons who are deaf with limited vision, commenters requested that the Department include an explicit requirement that interpreters wear high-contrast clothing with no patterns that might distract from their hands as they are interpreting, so that a person with limited vision could still see the signs made by the interpreter. While the Department reiterates the importance of such practices in the delivery of effective VRI as well as in-person interpreting, the Department declines to adopt such performance standards as part of this rule. In general, professional interpreters already follow such practices, as the Code of Professional Conduct for interpreters the Deaf and the National Association of the Deaf incorporates attire considerations into their standards of professionalism and conduct. Moreover, as a result of this code, many VRI agencies have adopted detailed dress standards that interpreters hired by the agency must follow. Commenters also urged explicit requirement of a clear image of the face and eyes of the interpreter and others. Because the face includes the eyes, the Department has amended § 36.303(f)(2) of the final rule to include a requirement that the interpreter's face be displayed. Other

commenters requested requirement of a wide-bandwidth video connection for the VRI system, and the Department has included this requirement in § 36.303(f)(1) of the final rule.

ATMs. The 2010 Standards set out detailed requirements for ATMs, including communication-related requirements to make ATMs usable by individuals who are blind or have low vision. In the NPRM, the Department discussed the application of a safe harbor to the communication-related elements of ATMs. The NPRM explained that the Department considers the communication-related elements of ATMs to be auxiliary aids and services, to which the safe harbor for elements built in compliance with the 1991 standards does not apply.

The Department received several comments regarding this issue. Several commenters representing banks objected to the exclusion of communication-related aspects of ATMs from the safe harbor provision. They explained that the useful life of ATMs—on average 10 years—was longer than the Department noted; thus, without the safe harbor, banks would be forced to retrofit many ATMs in order to comply with the proposed regulation. Such retrofitting, they noted, would be costly to the industry. A few representatives of the disability community commented that communication-related aspects of ATMs should be excluded from the safe harbor.

The Department consistently has taken the position that the communication-related elements of ATMs are auxiliary aids and services, rather than structural elements. *See* 28 CFR part 36, app. B at 728 (2009). Thus, the safe harbor provision does not apply to these elements. The Department believes that the limitations on the effective communication requirements, which provide that a covered entity does not have to take measures that would result in a fundamental alteration of its program or would cause undue burdens, provide adequate protection to covered entities that operate ATMs.

Captioning at sporting venues. In § 36.303(g) of the NPRM, the Department proposed that sports stadiums that have a capacity of 25,000 or more shall provide captioning for safety and emergency information on scoreboards and video monitors. In addition, the Department posed four questions about captioning of information, especially safety and emergency information announcements, provided over public address (PA) systems. The Department received many detailed and divergent responses to each of the four questions and the proposed regulatory text. Because comments submitted on the Department's title II and title III proposals were intertwined, because of the similarity of issues involved for title II entities and title III entities, and in recognition of the fact that many large sports stadiums are covered by both title II and title III as joint operations of State or local government and one or more public accommodations, the Department presents here a single consolidated review and summary of the issues raised in comments.

The Department asked whether requiring captioning of safety and emergency information made over the public address system in stadiums seating fewer than 25,000 would create an undue burden for smaller entities, and whether it would be feasible for small stadiums to provide such captioning, or whether a larger threshold, such as sports stadiums with a capacity of 50,000 or more, would be appropriate.

There was a consensus among the commenters, including disability advocates as well as venue owners and stadium designers and operators, that using the stadium size or seating capacity should not be the exclusive deciding factor for any obligation to provide captioning for safety and emergency information broadcast over the PA system. Most disability advocacy organizations and individuals with disabilities complained that using size or seating capacity as a threshold for captioning safety and emergency information would undermine the ''undue burden'' defense found in both titles II and III. Many commenters provided examples of facilities such as professional hockey

arenas that seat less than 25,000 fans but that, commenters argued, should be able to provide real-time captioning. Other commenters suggested that some high school or college stadiums, for example, may hold 25,000 fans or more and yet lack the resources to provide real-time captioning. Many commenters noted that real-time captioning would require use of trained stenographers, and that most high school and college sports facilities rely upon volunteers to operate scoreboards and PA systems and they would not be qualified stenographers, especially in case of an emergency. One national association noted that the typical stenographer expense for a professional football game in Washington, DC, is about $550 per game. Similarly, one trade association representing venues estimated that the cost for a professional stenographer at a sporting event runs between $500 and $1,000 per game or event, the cost of which, they argued, would be unduly burdensome in many cases. Some commenters posited that schools that do not sell tickets to athletic events would be challenged to meet such expenses, in contrast to major college athletic programs and professional sports teams, which would be less likely to prevail using an ''undue burden'' defense.

Some venue owners and operators and other covered entities also argued that stadium size should not be the key consideration for whether scoreboard captioning will be required. Instead, these entities suggested that equipment already installed in the stadium, including necessary electrical equipment and backup power supply, should be the determining factor for whether captioning is mandated. Many commenters argued that the requirement to provide captioning should apply only to stadiums with scoreboards that meet the National Fire Protection Association (NFPA) National Fire Alarm Code. Commenters reported that NFPA 72 requires at least two independent and reliable power supplies for emergency information systems, including one source that is a generator or a battery sufficient to run the system in the event the primary power fails. Alternatively, some stadium designers and title II entities commented that the requirement should arise when the facility has at least one elevator providing firefighter emergency operation, along with approval of authorities with responsibility for fire safety. An organization concerned with fire safety codes commented that the Department lacks the expertise to regulate on this topic. Other commenters argued for flexibility in the requirements for providing captioning and contended that any requirement should apply only to stadiums constructed after the effective date of the regulation.

In the NPRM, the Department also asked whether the rule should address the specific means of captioning equipment, whether captioning should be provided through any effective means (*e.g.,* scoreboards, line boards, handheld devices, or other means), or whether some means, such as handheld devices, should be eliminated as options. This question elicited many comments from advocates for persons with disabilities as well as from covered entities. Advocacy organizations and individuals with experience using handheld devices argued that such devices do not provide effective communication. These commenters noted that information is often delayed in the transmission to such devices, making them hard to use when following action on the playing field or in the event of an emergency when the crowd is already reacting to aural information provided over the PA system well before it is received on the handheld device.

Several venue owners and operators and others commented that handheld technology offers advantages of flexibility and portability so that it may be used successfully regardless of where in the facility the user is located, even when not in the line of sight of a scoreboard or other captioning system. Still other commenters urged the Department not to regulate in such a way as to limit innovation and use of such technology now and in the future. Cost considerations were included in comments from some stadium designers and venue owners and operators who reported that

the cost of providing handheld systems is far less than the cost of providing real-time captioning on scoreboards, especially in facilities that do not currently have the capacity to provide real-time captions on existing equipment. Others noted that handheld technology is not covered by fire and safety model codes, including the NFPA, and thus would be more easily adapted into existing facilities if captioning were required by the Department.

The Department also asked about requiring open captioning of all public address announcements, rather than limiting the captioning requirement to safety and emergency information. A variety of advocates and persons with disabilities argued that all information broadcast over a PA system should be captioned in real time at all facilities in order to provide effective communication, and that a requirement only to provide emergency and safety information would not be sufficient. A few organizations representing persons with disabilities commented that installation of new systems should not be required, but that all systems within existing facilities that are capable of providing captioning should provide captioning of information to the maximum extent possible. Several organizations for persons with disabilities commented that all facilities should include in their safety planning measures a requirement that all aurally provided information for patrons with communication disabilities be captioned. Some advocates suggested that demand for captions will only increase as the number of deaf and hard of hearing persons grows with the aging of the general population and with increasing numbers of veterans returning from war with disabilities. Multiple commenters noted that the captioning would benefit others as well as those with communication disabilities.

By contrast, venue owners and operators and others commented that the action on the sports field is self-explanatory and does not require captioning. These commenters objected to an explicit requirement to provide real-time captioning for all information broadcast on the PA system at a sporting event. Other commenters objected to requiring captioning even for emergency and safety information over the scoreboard rather than through some other means. By contrast, venue operators, State government agencies, and some model code groups, including the NFPA, commented that emergency and safety information must be provided in an accessible format and that public safety is a paramount concern. Other commenters argued that the best method to deliver safety and emergency information would be television monitors showing local TV broadcasts with captions already mandated by the FCC. Some commenters posited that the most reliable information about a major emergency would be provided on the television news broadcasts. They argued that television monitors may be located throughout the facility, improving line of sight for patrons, some of whom might not be able to see the scoreboard from their seats or elsewhere in the facility. Some stadium designers, venue operators, and model code groups pointed out that video monitors are not regulated by the NFPA or other agencies, so that such monitors could be more easily provided. Video monitors may receive transmissions from within the facility and could provide real-time captions if there is the necessary software and equipment to feed the captioning signal to a closed video network within the facility. Several commenters suggested that using monitors would be preferable to requiring captions on the scoreboard if the regulation mandates real-time captioning. Some venue owners and operators argued that retrofitting existing stadiums with new systems could easily cost in the hundreds of thousands of dollars per scoreboard or system. Some stadium designers and others argued that captioning should be required only in stadiums built after the effective date of the regulation. For stadiums with existing systems that allow for real-time captioning, one commenter posited that dedicating the system exclusively to real-time captioning would lead to an annual loss of between two and three million

dollars per stadium in revenue from advertising currently running in that space.

After carefully considering the wide range of public comments on this issue, the Department has concluded that the final rule will not provide additional requirements for effective communication or emergency information provided at sports stadiums at this time. The 1991 title II and title III regulations and statutory requirements are not in any way affected by this decision. The decision to postpone rulemaking on this complex issue is based on a number of factors, including the multiple layers of existing regulations by various agencies and levels of government, and the wide array of information, requests, and recommendations related to developing technology offered by the public. The diversity of existing information and communication systems and other characteristics among sports stadiums also complicates the regulation of captioning. The Department has concluded that further consideration and review is prudent before it issues specific regulatory requirements.

Movie captioning. In the NPRM, the Department stated that options were being considered to require movie theater owners and operators to exhibit movies that are captioned for patrons who are deaf or hard of hearing. Captioning makes films accessible to individuals whose hearing is too limited to benefit from assistive listening devices. Both open and closed captioning are examples of auxiliary aids and services required under the Department's 1991 title III regulation. *See* 28 CFR 36.303(b)(1). Open captions are similar to subtitles in that the text is visible to everyone in the theater, while closed captioning displays the written text of the audio only to those individuals who request it.

In the NPRM, the Department also stated that options were being considered to require movie theater owners and operators to exhibit movies with video description,[3] a technology that enables individuals who are blind or have low vision to enjoy movies by providing a spoken interpretation of key visual elements of a movie, such as actions, settings, facial expressions, costumes, and scene changes. The descriptions are narrated and recorded onto an audiotape or disk that can be synchronized with the film as it is projected. An audio recording is an example of an auxiliary aid and service required under the Department's 1991 title III regulation. *See* 28 CFR 36.303(b)(2).

The NPRM stated that technological advances since the early 1990s have made open and closed captioning and video description for movies more readily available and effective and noted that the Department was considering options to require captioning and video description for movies exhibited by public accommodations. The NPRM also noted that the Department is aware that the movie industry is transitioning, in whole or in part, to movies in digital format and that movie theater owners and operators are beginning to purchase digital projectors. The Department noted in the NPRM that movie theater owners and operators with digital projectors may have available to them different capabilities than those without digital projectors. The Department sought comment regarding whether and how to require captioning and video description while the film industry makes this transition. In addition, the NPRM stated the Department's concern about the potential cost to exhibit captioned movies, noting that cost may vary depending upon whether open or closed captioning is used and whether or not digital projectors are used, and stated that the cost of captioning must stay within the parameters of the undue burden requirement in 28 CFR 36.303(a). The Department further noted that it understands the cost of video description equipment to be less than that for closed captioning. The Department then stated that it was considering the possibility

[3] In the NPRM, the Department referred to this technology as ''narrative description.'' 73 FR 34508, 34531 (June 17, 2008). Several commenters informed the Department that the more accurate and commonly understood term is ''videodescription,'' even though the subject is movies, not video, and so the Department decided to employ that term.

of requiring public accommodations to exhibit all new movies in captioned format and with video description at every showing. The NPRM stated that the Department would not specify the types of captioning required, leaving such decisions to the discretion of the movie theater owners and operators.

In the NPRM, the Department requested public comment as to whether public accommodations should be required to exhibit all new movies in captioned format at every showing, whether it would be more appropriate to require captioning less frequently, and, if so, with what frequency captioning should be provided. The Department also inquired as to whether the requirement for captioning should be tied to the conversion of movies from film to the use of a digital format. The Department also asked for public comment regarding the exhibition of all new movies with narrative description, whether it would it be more appropriate to require narrative description less frequently, and whether narrative description of movies should be tied to the use of a digital format.

Representatives from the movie industry, a commenter from a non-profit organization, and a disability rights advocacy group provided information in their comments on the status of captioning and video description technology today as well as an update on the transition to digital cinema in the industry. A representative of major movie producers and distributors commented that traditionally open captions were created by ''burning'' the captions onto a special print of a selected movie, which the studios would make available to the exhibitors (movie theater owners and operators). Releases with open captions typically would be presented at special screenings. More recently, according to this commenter, alternative methods have been developed for presenting movies with open captions, but their common feature is that the captions are visible to all theater-goers. Closed captioning is an innovation in technology that was first made available in a feature film presentation in late 1997. Closed captioning technology currently in use allows viewers to see captions using a clear panel that is mounted in front of the viewer's seat.[4] According to commenters from the industry, the panel reflects captions that are shown in reverse on an LED display in the back of the theater, with captions appearing on or near the movie image. Moviegoers may use this technology at any showing at a theater that has been equipped with the technology, so that the theater does not have to arrange limited special screenings.

Video description technology also has existed since 1997, according to a commenter who works with the captioning and video description industry. According to a movie industry commenter, video description requires the creation of a separate script written by specially trained writers called ''describers.'' As the commenter explained, a describer initially listens to the movie without watching it in order to approximate the experience of an audience member who is blind or has low vision. Using software to map out the pauses in the soundtrack, the describer writes a description in the space available. After an initial script is written for video description, it is edited and checked for timing, continuity, accuracy, and a natural flow. A narrator then records the new script to match the corresponding movie. This same industry commenter said that video description currently is provided in theaters through screens equipped with the same type of technology as that used for closed captioning. As commenters explained, technologies in use today deliver video descriptions via infrared or FM listening systems to headsets worn by individuals who are blind or

[4] Other closed captioning technologies for movies that have been developed but are not in use at this time include hand-held displays similar to a PDA (personal digital assistant); eyeglasses fitted with a prism over one lens; and projected bitmap captions. The PDA and eyeglass systems use a wireless transmitter to send the captions to the display device.

have low vision.

According to the commenter representing major movie producers and distributors, the percentage of motion pictures produced with closed captioning by its member studios had grown to 88 percent of total releases by 2007; the percentage of motion pictures produced with open captioning by its member studios had grown to 78 percent of total releases by 2007; and the percentage of motion pictures provided with video description has ranged consistently between 50 percent and 60 percent of total releases. It is the movie producers and distributors, not the movie theater owners and operators, who determine what to caption and describe, the type of captioning to use, and the content of the captions and video description script. These same producers and distributors also assume the costs of captioning and describing movies. Movie theater owners and operators simply purchase the equipment to display the captions and play the video description in their auditoria.

The transition to digital cinema, considered by the industry to be one of the most profound advancements in motion picture production and technology of the last 100 years, will provide numerous advantages both for the industry and the audience. According to one commenter, currently there are sufficient standards and interim solutions to support captioning and video description now in digital format. Additionally, movie studios are supporting those efforts by providing accessibility tracks (captioning and video description) in many digital cinema content packages. Moreover, a group of industry commenters composed in pertinent part of members of the motion picture industry, the central standards organizations for this industry, and key digital equipment vendors, noted that they are participating in a joint venture to establish the remaining accessibility specifications and standards for access audio tracks. Access audio tracks are supplemental sound audio tracks for the hard of hearing and narrative audio tracks for individuals who have vision disabilities. According to a commenter and to industry documents, these standards were expected to be in place by spring 2009. According to a commenter, at that time, all of the major digital cinema equipment vendors were expected to have support for a variety of closed caption display and video description products. This same commenter stated that these technologies will be supported by the studios that produce and distribute feature films, by the theaters that show these films to the public, and by the full complement of equipment in the production, distribution, and display chain.

The initial investment for movie theater owners and operators to convert to digital cinema is expensive. One industry commenter estimated that converting theaters to digital projection costs between $70,000 and $100,000 per screen and that maintenance costs for digital projectors are estimated to run between $5,000 and $10,000 a year—approximately five times as expensive as the maintenance costs for film projectors. According to this same commenter, while there has been progress in making the conversion, only approximately 5,000 screens out of 38,794 nationwide have been converted, and the cost to make the remaining conversions involves a total investment of several billion dollars. According to another commenter, predictions as to when more than half of all screens will have been converted to digital projection are 10 years or more, depending on the finances of the movie theater owners and operators, the state of the economy, and the incentives supporting conversion. That said, according to one commenter who represents movie theater owners and operators, the majority of screens in the United States were expected to enter into agreements by the end of 2008 to convert to digital cinema. Most importantly, however, according to a few commenters, the systems in place today for captioning and video description will not become obsolete once a theater has converted to digital cinema but still can be used by the movie theater owner and operator to exhibit captions and video

description. The only difference for a movie theater owner or operator will be the way the data is delivered to the captioning and video description equipment in place in an auditorium. Despite the current availability of movies that are captioned and provide video description, movie theater owners and operators rarely exhibit the captions or descriptions. According to several commenters, less than 1 percent of all movies being exhibited in theaters are shown with captions.

Individuals with disabilities, advocacy groups, the representative from a non-profit, and representatives of State governments, including 11 State attorneys general, overwhelmingly supported issuance of a regulation requiring movie theater owners and operators to exhibit captioned and video described movies at all showings unless doing so would result in an undue burden or fundamental alteration of the goods and services offered by the public accommodation. In addition, this same group of commenters urged that any such regulation should be made effective now, and should not be tied to the conversion to digital cinema by the movie theater owners and operators. In support of such arguments, these commenters stated that the technology exists now to display movies with captions and video descriptions, regardless of whether the movie is exhibited on film or using digital cinema. Moreover, since the technology in use for displaying captions and video descriptions on film will be compatible with digital projection systems, they argued, there is no need to postpone implementation of a captioning or video description regulation until the conversion to digital has been made. Furthermore, since the conversion to digital may take years, commenters urged the Department to issue a regulation requiring captioning and video description now, rather than several years from now.

Advocacy groups and the 11 State attorneys general also requested that any regulation include factors describing what constitutes effective captioning and video description. Recommendations included requiring that captioning be within the same line of sight to the screen as the movie so that individuals who are deaf or hard of hearing can watch the movie and read the captions at the same time; that the captioning be accessible from each seat; that the captions be of sufficient size and contrast to the background so as to be readable easily; and that the recent recommendations of the Telecommunications and Electronics and Information Technology Advisory Committee Report to the Access Board that captions be ''timely, accurate, complete, and efficient'' [5] also be included.

The State attorneys general supported the Department's statement in the NPRM that the Department did not anticipate specifying which type of captioning to provide or what type of technology to use to provide video description, but would instead leave that to the discretion of the movie theater owners and operators. These State attorneys general opined that such discretion in the selection of the type of technology was consistent with the statutory and regulatory scheme of the ADA and would permit any new regulation to keep pace with future advancements in captioning and video description technology. These same commenters stated that such discretion may result in a mixed use of both closed captioning and open captioning, affording more choices both for the movie theater owners and operators and for individuals who are deaf or hard of hearing.

The representatives from the movie theater industry strongly urged the Department against issuing a regulation requiring captioning or video description. These commenters argued that the legislative history of the ADA expressly precluded regulating in the area of captioning. (These same commenters were silent with regard to video de-

[5] *Refreshed Accessibility Standards and Guidelines in Telecommunications and Electronic and Information Technology* (April 2008), available at *http://www.access-board.gov/sec508/refresh/report/* (last visited June 24, 2010).

scription on this issue.) The industry commenters also argued that to require movie theater owners and operators to exhibit captioned and video described movies would constitute a fundamental alteration in the nature of the goods and services offered by the movie theater owners and operators. In addition, some industry commenters argued that any such regulation by the Department would be inconsistent with the Access Board's guidelines. Also, these commenters noted the progress that has been made in the industry in making cinema more accessible even though there is no mandate to caption or describe movies, and they questioned whether any mandate is necessary. Finally, all the industry commenters argued that to require captioning or video description in 100 percent of movie theater screens for all showings would constitute an undue burden.

The comments have provided the Department with significant information on the state of the movie industry with regard to the availability of captioning and video description, the status of closed captioning technology, and the status of the transition to digital cinema. The Department also has given due consideration to the comments it has received from individuals, advocacy groups, governmental entities, and representatives of the movie industry. Recently, the United States Court of Appeals for the Ninth Circuit held that the ADA requires a chain of movie theaters to exhibit movies with closed captioning and video description unless the theaters can show that to do so would amount to a fundamental alteration or undue burden. *Arizona ex rel. Goddard v. Harkins Amusement Enterprises, Inc.*, 603 F.3d 666 (9th Cir. 2010). However, rather than issue specific regulatory text at this time, the Department has determined that it should obtain additional information regarding issues raised by commenters that were not contemplated at the time of the 2008 NPRM, supplemental technical information, and updated information regarding the current and future status of the conversion to digital cinema by movie theater owners and operators. To this end, the Department is planning to engage in rulemaking relating specifically to movie captioning under the ADA in the near future.

Section 36.304 Removal of Barriers

With the adoption of the 2010 Standards, an important issue that the Department must address is the effect that the new (referred to as ''supplemental'') and revised ADA Standards will have on the continuing obligation of public accommodations to remove architectural, transportation, and communication barriers in existing facilities to the extent that it is readily achievable to do so. *See* 42 U.S.C. 12182(b)(2)(A)(iv). This issue was not addressed in the 2004 ADAAG because it was outside the scope of the Access Board's statutory authority under the ADA and section 502 of the Rehabilitation Act of 1973. *See* 29 U.S.C. 792(b)(3)(A)–(B) (authorizing the Access Board to establish and maintain minimum guidelines for the standards issued pursuant to the Architectural Barriers Act of 1968 and titles II and III of the ADA). Responsibility for implementing title III's requirement that public accommodations eliminate barriers in existing facilities where such removal is readily achievable rests solely with the Department. The term ''existing facility'' is defined in § 36.104 of the final rule. This definition is discussed in more detail above. *See* Appendix A discussion of definitions (§ 36.104).

The requirements for barrier removal by public accommodations are established in the Department's title III regulation. 28 CFR 36.304. Under this regulation, the Department used the 1991 Standards as a guide to identify what constitutes an architectural barrier, as well as the specifications that covered entities must follow in making architectural changes to remove the barrier to the extent that such removal is readily achievable. 28 CFR 36.304(d); 28 CFR part 36, app. A (2009). With adoption of the final rule, public accommodations will now be guided by the 2010 Standards,

defined in § 36.104 as the 2004 ADAAG and the requirements contained in subpart D of 28 CFR part 36.

The 2010 Standards include technical and scoping specifications for a number of elements that were not addressed specifically in the 1991 Standards; these new requirements were identified as ''supplemental requirements'' in the NPRM. The 2010 Standards also include revisions to technical or scoping specifications for certain elements that were addressed in the 1991 Standards, *i.e.,* elements for which there already were technical and scoping specifications. Requirements for which there are revised technical or scoping specifications in the 2010 Standards are referred to in the NPRM as ''incremental changes.''

The Department expressed concern that requiring barrier removal for incremental changes might place unnecessary cost burdens on businesses that already had removed barriers in existing facilities in compliance with the 1991 Standards. With this rulemaking, the Department sought to strike an appropriate balance between ensuring that individuals with disabilities are provided access to facilities and mitigating potential financial burdens from barrier removal on existing places of public accommodation that satisfied their obligations under the 1991 Standards.

In the NPRM, the Department proposed several potential additions to § 36.304(d) that might reduce such financial burdens. First, the Department proposed a safe harbor for elements in existing facilities that were compliant with the 1991 Standards. Under this approach, an element that is not altered after the effective date of the 2010 Standards and that complies with the scoping and technical requirements for that element in the 1991 Standards would not be required to undergo modification to comply with the 2010 Standards to satisfy the ADA's barrier removal obligations. The public accommodation would thus be deemed to have met its barrier removal obligation with respect to that element.

The Department received many comments on this issue during the 60-day public comment period. After consideration of all relevant information presented on the issue, it is the Department's view that this element-by-element safe harbor provision should be retained in the final rule. This issue is discussed further below.

Second, the NPRM proposed several exceptions and exemptions from certain supplemental requirements to mitigate the barrier removal obligations of existing play areas and recreation facilities under the 2004 ADAAG. These proposals elicited many comments from both the business and disability communities. After consideration of all relevant information presented on the issue, it is the Department's view that these exceptions and exemptions should not be retained in the final rule. The specific proposals and comments, and the Department's conclusions, are discussed below.

Third, the NPRM proposed a new safe harbor approach to readily achievable barrier removal as applied to qualified small businesses. This proposed small business safe harbor was based on suggestions from small business advocacy groups that requested clearer guidance on the barrier removal obligations for small businesses. According to these groups, the Department's traditional approach to barrier removal disproportionately affects small businesses. They argued that most small businesses owners neither are equipped to understand the ADA Standards nor can they afford the architects, consultants, and attorneys that might provide some level of assurance of compliance with the ADA. For these same reasons, these commenters contended, small business owners are vulnerable to litigation, particularly lawsuits arising under title III, and often are forced to settle because the ADA Standards' complexity makes inadvertent noncompliance likely, even when a small business owner is acting in good faith, or because the business cannot afford the costs of litigation.

To address these and similar concerns, the
